

Symposia Abstracts of the 2024 SAA 89th Annual Meeting, New Orleans, Louisiana

The ANNUAL MEETING of the Society for American Archaeology provides a forum for the dissemination of knowledge and discussion. The views expressed at the sessions are solely those of the speakers and the Society does not endorse, approve, or censor them. Descriptions of events and titles are those of the organizers, not the Society.

[1] Symposium · EQUITY IN THE ARCHAEOLOGY OF DISASTER, PAST, PRESENT, AND FUTURE

Ongoing experiences with severe weather events, global environmental change, war, and epidemic disease demonstrate that impacts of disasters are rarely distributed equitably. Marginalized communities tend to be the most vulnerable and may have limited capacities to recover. Similarly, cultural heritage, tangible and intangible, is subject to damage and destruction during disasters and disaster response. But is everyone's heritage at equal risk, and who defines what heritage is? This forum explores intersections of disaster and equity in archaeology. What have we learned about relationships among inequality, vulnerability, and resilience in past societies? How have disasters, and responses to them, affected social inequality? Under the rapid pace of modern disaster response and recovery, whose heritage is preserved and whose is sacrificed? Whose voices are considered during disaster planning when it comes to the protection of archaeological sites, collections, and cultural landscapes? And finally, what lessons from past disasters would improve the equity of disaster preparedness and recovery today? Although these issues and interests have global significance in archaeology, they have particular salience in New Orleans and the Gulf South, where disasters, preparedness, recovery, and aftermath have been recurrent and will continue to affect future generations.

[2] Symposium · AI-PROOF LEARNING: FOOD-CENTERED EXPERIMENTAL ARCHAEOLOGY IN THE CLASSROOM

The session aims to discuss ways to engage students in hands-on, high-impact learning while delving into the captivating world of culinary archaeology. Food and cooking are a shared human experience and can be an essential entrée for students into understanding the skill, decision-making, and challenges past people navigated. Bring us your baked, boiled, and butchered! The session will provide a platform to share successes and lessons related to food-themed activities for students at various levels and modalities, with an eye for how these activities may help colleagues seeking to replace or reform assessments (exams, essays, online discussions, etc.) whose evaluation is problematized by AI text generators. We encourage you to contribute your expertise around the following themes: (1) Food-related Experimental Archaeology and Teaching Research Design for early undergraduate, late undergraduate, and postgraduate levels. How can we use food in the classroom as a lens to teach the research design? How can we use it to humanize and teach about social structures, technology, trade networks, and cultural identities of different periods? (2) Integrating AI-Proof (or AI-Cooperative!) Approaches. With the increasing integration of AI in education, many instructors are rethinking their usual assignments, presenting new opportunities for engagement.

[3] Symposium · “THE SOUTH ALSO EXISTS”: THE CURRENT STATE OF PREHISTORIC ARCHAEOLOGY IN BRAZIL: DIALOGUES ACROSS DIFFERENT THEORETICAL APPROACHES AND RESEARCH AGENDAS

The Brazilian archaeological record is greatly diverse and reflects widely different periods of colonization and occupation of several diverse biomes associated with a heterogeneous social complexity throughout time and space. In the last decades, many different theoretical frameworks, as well as many various methodological approaches, have been successfully applied in Brazilian archaeology to explore further traditional questions regarding cultural and biological diversity, chronology, landscape, and resource use, as well as to strengthen the dialogues between these themes and traditional communities' practices. This symposium aims to present the current theoretical diversity used to approach the abovementioned research topics and promote a conversation about the intersection among different theoretical and methodological approaches.

[4] Symposium · US ARMY CORPS OF ENGINEERS: CURRENT WORK IN CRM, RESEARCH, AND CREATIVE MITIGATION

The US Army Corps of Engineers (Corps) is one of the nation's oldest federal agencies. The Corps has multiple missions, including navigation improvement, erosion and flood control, military construction, emergency response, and authorization of work and structures in waters of the United States. Due to the

diversity of its missions and regional specificities, there is an equally diverse amount of work conducted by Corps archaeologists and cultural resource managers that includes working with many different stakeholders, ranging from private individuals to federally recognized tribes to state and federal agencies. This session explores some of the Corps' current work, including ongoing compliance with Section 106 and Section 110 of the National Historic Preservation Act of 1966, as amended; archaeological investigations; and development of creative mitigation alternatives.

[5] Symposium · UNDERWATER MAYA: ANALYTICAL APPROACHES FOR INTERPRETING ANCIENT MAYA ACTIVITIES AT THE PAYNES CREEK SALT WORKS, BELIZE

The remarkable preservation of pole and thatch buildings below the seafloor allows for an opportunity to investigate the organization of households at an ancient Maya salt industry known as the Paynes Creek Salt Works, Belize. Papers in this session will focus on the abandoned and inundated salt works that were preserved by sea-level rise and red mangrove peat. Chemical analysis of marine sediment has found patterns associated with buildings as well as plazas that support the interpretation that some of the buildings are residences. Brine was enriched outside of salt kitchens. The only two salt works above sea level aid in the reconstruction of activities inside and outside of wooden buildings. Analysis of marine sediment using loss-on-ignition provides information regarding the rate of sea-level rise and activities that occurred inside and outside of wooden buildings. The Paynes Creek Salt Works were integrated into the Classic Maya economy through trade and exchange as evidenced by stone tool analysis.

[6] General Session · PUBLIC AND COMMUNITY ARCHAEOLOGY

[7] Symposium · COMMUNITY-ENGAGED BIOARCHAEOLOGY: CENTERING DESCENDANTS

(SPONSORED BY BIOARCHAEOLOGY INTEREST GROUP [BIG])

An engaged bioarchaeological project includes Indigenous or descendant communities from the start of the project, centering their questions and bringing forward their knowledge of the past with that of the anthropologists. This model creates deeper, more nuanced conversations about their ancestors. The engaged bioarchaeological projects presented here all center Indigenous and descendant questions in different contexts (landscapes, geographies, cultures), intertwining their voices and stories with the gathering of information from ancestral and cultural remains resulting in broader understandings of the past. Each paper offers a glimpse into the different ways descendant communities can and do engage with bioarchaeological research projects. In some cases, the research is initiated by the community, and in others the bioarchaeologists seek out the descendant community for their input and questions, to guide the research. No matter the origin of the initiation, what is revealed here is the ways in which we can reframe our work to be inclusive of the knowledge of the descendant community. Further, many of these projects also reveal how community-engaged bioarchaeological projects are decolonizing practices and working toward restorative justice by recalibrating how knowledge is produced and who benefits from the work.

[8] Symposium · IN SEARCH OF SOLUTIONS: EXPLORING PATHWAYS TO REPATRIATION FOR NAGPRA PRACTITIONERS (PART I)

(SPONSORED BY THE COMMITTEE ON REPATRIATION)

Now in its fourth decade, the Native American Graves Protection and Repatriation Act (NAGPRA) remains one of the most important legislative acts shaping the discipline of archaeology today. To adequately discuss the range of topics and provide examples and case studies incorporating shifting discourses of repatriation, policies, and collections management concerning Ancestors and their belongings subject to NAGPRA, the Committee on Museums, Collections, and Curation and the Curation Interest group have arranged a five-part series. Practitioners across the discipline work to respectfully return the Ancestors and cultural heritage of Indigenous nations, tribes, and communities, often without specialized training, and frequently without sufficient financial, administrative, or political institutional support. Collections professionals, especially, are expected to become instant NAGPRA experts, simply because their day is spent in curation spaces within which Ancestors and their belongings reside. Collections professionals contend with institutional pressure

balanced against the importance of carrying out the law in a respectful manner, attempting to mitigate further trauma to Indigenous Peoples, and they must do so, often, while learning the law themselves. This session discusses past experiences of current practitioners, highlights challenges, and offers potential solutions to those and similar challenges that new and existing practitioners alike may face.

[9] General Session · PALEOAMERICAN SITES AND ARTIFACTS ACROSS THE AMERICAS

[10] Forum · HOW TO WIN DEANS AND INFLUENCE STUDENTS: “SELLING” YOUR ARCHAEOLOGY PROGRAM TO UNIVERSITY STAKEHOLDERS

(SPONSORED BY CURRICULUM COMMITTEE)

The need to provide more relevant professional training for archaeology students has been a frequent theme at the SAA annual meetings. In today’s evolving economic and academic landscape, it is essential to find innovative ways to “sell” archaeology as a compelling discipline and viable career track to both university deans and students. Yet academic bureaucracies can be difficult to navigate and governing bodies resistant to change. Updating syllabi for individual classes is a good start, but in many cases, more fundamental change is needed to allow archaeology programs to continue to be relevant. This conference panel aims to explore strategies and insights for promoting archaeology within higher education institutions. Coming from a range of professional contexts, our panelists will discuss the challenges and opportunities in convincing university deans of the value of archaeology programs, as well as engaging and inspiring students to pursue archaeological studies. Key topics to be addressed include communication strategies, curriculum innovation, and collaborative initiatives to create career pipelines for students. By examining these strategies and drawing on real-world experiences, this panel aims to provide a comprehensive guide for effectively selling archaeology to university decision-makers and inspiring the next generation of archaeologists.

[11] Forum · RECONSIDERATIONS OF EPICLASSIC AND POSTCLASSIC MIGRATIONS IN MESOAMERICA

After the collapse of Teotihuacan in the mid-to-late sixth century CE, large-scale migrations became recurring features in the realignments and adjustments of the sociopolitical landscape of Mesoamerica during the Epiclassic and Postclassic periods. A number of independent research projects conducted in several different regions, at various scales, and incorporating multiple lines of evidence have established the historical reality of these migrations. Decades of coordinated research combining data and interpretations from archaeology, ethnohistory, epigraphy, linguistics, biological anthropology, and earth sciences have contributed to empirical knowledge of ancient migrations throughout Mesoamerica during these crucial time periods. The forum panel includes leading authorities and active participants in the development of this research. Their discussion will highlight current understandings and identify important questions that we need to address in future research on ancient Mesoamerican migrations. Common threads include the impact of climate change and natural disasters as migration triggers, the possible role of religious cults, migrations as both causes and effects of sociopolitical collapse and other forms of disruption, the effects of migrations on changing trade routes and other economic patterns, the impact of migrations on ethnic identities and political affiliations, and the interplay of these factors with material culture.

[12] Symposium · ARCHAEOGASTRONOMY: GROCERY LISTS AS SEEN FROM A MULTIDIMENSIONAL PERSPECTIVE

From an archaeological perspective, studying food and food processing is a complex task that requires specialized tools and techniques. The development of new techniques, or new applications of well-established techniques, to apprehend the transformation of ingredients (plants, animals) into complex foods has permitted scholars to deepen their understanding of the ingredients used and also the manner in which foods were prepared in the past. In this session, entitled “Archaeogastronomy: Grocery Lists as Seen from a Multidimensional Perspective,” we wish to bring together scholars working in different parts of the world and on different periods to present their recent advances. We hope this session will stimulate future research and new collaborations.

[13] Symposium · PAISAJES ARQUEOLÓGICOS DE PAÑAMARCA: FINDINGS FROM THE 2018–2023 FIELD SEASONS

This symposium will present the work of four field seasons of ongoing work at the site of Pañamarca, Nepeña Valley, Peru. Pañamarca contains an array of adobe monumental platforms, walls, and temples. The first mural discoveries at the site were revealed to the world in the 1950s, which included a famous mural of a Moche priestess. Recent work has focused on defining the cultural chronology of the site through AMS dating, exploring the farming landscape of the surrounding valley, and excavation, conservation, and documentation of remarkably preserved painted architectural surfaces dating to the Moche period (500–850 CE). Overall, the new discoveries confirm that the site played an important role in the region well before and after Moche presence. The work also supports our theory that during the Moche period, Pañamarca was a place of unusual creativity and a crucible for artistic invention. The artists and patrons of Pañamarca did not conform to what otherwise is thought to have been a very rigid society and artistic Moche style.

[14] Symposium · LEVELING UP: GAMING AND GAME DESIGN IN ARCHAEOLOGICAL EDUCATION AND OUTREACH

Recent pedagogical research has shown that “flipping the classroom,” or shifting education from an emphasis on traditional lectures and exams to more active, student-led projects, improves morale and information retention. Beyond the classroom, interactive projects are useful tools for engaging with the public and specific stakeholders about cultural heritage. While some lecture content is necessary and valuable, these higher-impact practices can help archaeological professionals bridge educational gaps and reach wider audiences than ever before. This symposium explores several applications of gaming and game design (broadly conceived) for archaeological education and outreach. Discussing topics such as analog role-playing games, tabletop games, video games, virtual reality, and even “gamified” syllabi and course structures, these presentations consider a few ways we might employ gaming to foster fun, engaging interactions with students and the public.

[15] Symposium · HOOD ARCHAEOLOGIES: IMPACTS OF THE SCHOOL-TO-PRISON PIPELINE ON ARCHAEOLOGICAL PRACTICE AND PEDAGOGY

The literature on equity in archaeology and related human resource DEI initiatives are seeing a steep rise in efforts to understand intersectionality among professional archaeologists and to use that knowledge to build a more inclusive discipline. While those efforts typically serve to benefit archaeology, exploration of the intersection between BIPOC identities and socioeconomic class among archaeologists is curiously absent. We ask a few questions in that vein, including: Why are so few archaeologists interested in exploring the intersection between ethnicity and class among practitioners in our discipline? How do the personal and professional experiences of ethnically and socioeconomically marginalized archaeologists compare to those of their peers in academic archaeology, CRM, and museum contexts? In what ways does the intersection between BIPOC identity and familial poverty shape one’s career pathways, peer relationships, practices, and pedagogies? We believe those are questions best answered by hood archaeologists, practitioners whose BIPOC identities originate in the projects, Section 8 clusters, the rez, the barrio, the trailer park, or the encampment and who grew up in low-income households where the school-to-prison pipeline loomed large. We bring together a professionally diverse group of those archaeologists to do so, including faculty, graduate students, CRM professionals, and museum personnel.

[16] Symposium · INDIVIDUALS KNOWN AND UNKNOWN: CASE STUDIES FROM TWO BURIAL CONTEXTS AT COLONIAL WILLIAMSBURG

Encountering human remains during archaeological excavations within the historic area of Colonial Williamsburg is not uncommon. As ethical and methodological considerations for the archaeological treatment of human remains and cemeteries have evolved, two recent projects in Williamsburg have presented an opportunity to conduct research and engage descendant communities within new frameworks. This session will explore two projects dealing with burials from contexts that couldn’t be more different: the cemetery of one of the oldest Baptist churches established by African Americans and a mass grave for Confederate casualties near the city’s powder magazine. One project was initiated by the descendant community of the First Baptist Church of Williamsburg while the other was conducted out of necessity to remove human remains from areas to be impacted by restoration work. Papers will discuss the

archaeological and osteological findings, our differential abilities to identify individuals, the opportunities and challenges of DNA analysis, the role conservators and curators can play in providing humanizing details through material remains, and our efforts to empower the appropriate descendant communities. The ultimate outcome of these projects is to appropriately restore the humanity to the individuals buried at these sites.

[17] Symposium · WORLD-SYSTEMS AND GLOBALIZATION IN ARCHAEOLOGY: ASSESSING MODELS OF INTERSOCIETAL CONNECTIONS 50 YEARS SINCE WALLERSTEIN'S "THE MODERN WORLD-SYSTEM"

2024 marks 50 years since the publication of Immanuel Wallerstein's seminal volume on world-systems theory (WST). Wallerstein focused on the emergence of the capitalist world-system in the sixteenth century, but his model attracted the attention of archaeologists, historians, and others who applied the approach to precapitalist societies. Through reconfiguring of concepts such as core, periphery, semi-periphery, and incorporation, and the development of additional elements, most notably globalization, these researchers expanded the application of WST to periods reaching far back into antiquity. WST has evolved into a broader paradigm encompassing theories that share a focus on intersocietal interaction and the myriad ways that is expressed in the political, economic, social, and religious spheres. The term world-systems analysis (WSA) has been adopted to describe this more expansive perspective. In addition to the concepts developed by Wallerstein, Frank, Hall, Chase-Dunn, and others, notions concerning globalization, the nature and function of frontiers, network analysis, small worlds, and deep history have come to play major roles in WSA. This session examines the status of WSA and related approaches as frameworks that explain cultural conditions through time. Participants explore such linkages in East and Central Asia, Europe, Africa, and the Americas and also consider future directions.

[18] Symposium · SOCIAL ARCHAEOLOGIES AND ISLANDS

Island archaeology has advanced significantly during the past two decades, from exponential increases in empirical data to new theoretical breakthroughs, particularly in ecological and evolutionary approaches. While these bodies of knowledge are essential for understanding islands, a predominance of "scientific" theoretical frameworks for interpreting islands could be complemented by more social understandings of life on islands in the past, with implications for islander presents and futures. Island studies in general have moved from using islands as laboratories to research of islands and islanders on their own terms. From the early 2000s the field of island studies has been growing vastly, mainly due to multidisciplinary studies of current global issues and phenomena from the perspective of islands and islanders. The studies of past island life and islanders' maritime relationships can contribute in major ways to understanding current sustainability issues and conservation strategies. This session brings together perspectives from islands around the world to engage with the diversity of social archaeologies that emerge from the perspective of smaller and larger landmasses surrounded by rivers, lakes, seas, and oceans. The session highlights engagement with the water itself as a medium of human experiences in the past as they link to the present.

[19] Symposium · RESOURCES AND SOCIETY IN ANCIENT CHINA

The connection between society and resources does not involve a deterministic relationship whereby resources directly and inevitably determine social organization, benefit, and survival. Instead, the relationship entails a dialectic, and social forces exert an impact on, and sometimes completely determine aspects of the use of resources and their distribution. In archaeological contexts, various subjects have been explored concerning the interaction between resources and society. The deep history of societies in East Asia and the diversity of associated resources provide a unique opportunity for studying the interaction between resources and society in the past, present, and future. By bringing together the recent archaeological work on a wide range of topics and approaches, including metals, ceramics, lithics, animals, plants, and various other forms of natural and social resources, this session hopes to provide a more comprehensive understanding of resources and society in ancient East Asia.

[20] Symposium · AMERICAN FORAGERS: HUMAN-ENVIRONMENTAL INTERACTIONS ACROSS THE CONTINENTS

The Americas exhibit a massive range of environmental settings and hunter-gatherer lifeways that are often considered at a regional level. However, consideration of archaeological records more broadly across different ecologies and regions is essential for understanding the relationship between environmental variables and human behavior. Exploring the archaeological records of diverse North and South American landscapes in relation to each other facilitates the exploration of topics such as cultural transmission, mobility and migration, resource exploitation, and the ways that humans' adaptation to their local environments shaped the archaeological record we study today. By considering the many manifestations of the foraging economy in the Americas, this session will strengthen our ability to make cross-regional comparisons for continents unique for their relatively recent peopling. This symposium brings together early-career and established scholars to present research on forager-environmental interactions in regions across the Americas, including the Arctic, the Andes, the Great Plains, the Colorado Plateau, the Great Basin, the North American Southeast, and Patagonia. Discussion at this level will demonstrate the importance of considering different regions in relation to each other when interpreting past human behaviors.

[21] Symposium · MISINFORMATION AND MISREPRESENTATION PART I: RECONSIDERING "HUMAN SACRIFICE," RELIGION, SLAVERY, MODERNITY, AND OTHER EUROPEAN-DERIVED CONCEPTS

This session examines how European-derived analytical concepts that have gained academic legitimacy and given rise to particular methods of understanding have fostered misleading claims, ideas, images, and narratives about ancient Mesoamerica. The presentations reconsider and reevaluate concepts that have gained ground as valid sources of insight into conditions, motivations, and representations in civilizations and societies of the past. Although Mesoamerica figures importantly in this session, the discussion of the prevalent use of European-derived analytical concepts and how usage impacts our understanding of ancient cultures is pertinent to all archaeologists working in non-European contexts.

[22] Symposium · NEW WORK IN MEDIEVAL ARCHAEOLOGY, PART I: LANDSCAPES, FOOD, AND HEALTH

In this first of two sessions presenting new work in medieval archaeology, papers focus on questions centered on landscape, food, and health as well as new methods and theoretical frameworks being developed to investigate these issues from Late Antiquity to the late Middle Ages in the lands stretching from the eastern Mediterranean to northwestern Europe.

[23] Symposium · STEPPE BY STEPPE: ADVANCES IN THE ARCHAEOLOGY OF EASTERN EURASIA

This session seeks to highlight the wide array of innovations in recent scholarship of the prehistory of eastern Eurasia. Any attempt to parse the complexity and variable scale of the social, biogeographical, ecological, and historical dynamics that interdependently shaped the archaeological record of eastern Eurasia requires continual development of practice and theory as well as the synthesis of many regional perspectives. With this in mind we provide a forum that puts scholars working across a range of regions, timespans, theoretical approaches, and methods into broader conversation. Topics include multispecies perspectives, trade and exchange, mobilities, paleoecology and human-environmental reconstruction, zooarchaeology, archaeobotany, spatial analysis, monumentality, biomolecular applications, metallurgical technologies, osteoarchaeology, foodways, and more. Here we feature research that highlights new archaeological case studies, new theoretical directions, and new analytical techniques. From the grassy expanses of the steppe to the back shelves of institutional collections, this session explores recent developments in the archaeology of eastern Eurasia and provides a window into the state of the field.

[24] Symposium · *SE NOT YOUR FATHER'S POVERTY POINT: REWRITING OLD NARRATIVES THROUGH NEW RESEARCH

Two decades ago, Weinstein et al. (2003:103) noted that "Poverty Point has been dug into, written about, and speculated about probably more often than any other site in Louisiana or the entire Lower Mississippi

Valley.” Since then, fieldwork and collections research at the Poverty Point site and, more broadly, at culturally affiliated sites in the US Southeast have continued to enhance our understanding of the Poverty Point cultural phenomenon. These recent and ongoing investigations explore questions about the landscapes, subsistence, material culture, and chronology of the Poverty Point culture. The data reveal new levels of complexity that challenge archaeological models of site development and indigenous lifeways during the Late Archaic period.

[25] Symposium · EMBODIED ESSENCE: ANTHROPOLOGICAL, HISTORICAL, AND ARCHAEOLOGICAL PERSPECTIVES ON THE USE OF BODY PARTS AND BODILY SUBSTANCES IN RELIGIOUS BELIEFS AND PRACTICES

Anthropological and historical research suggests that anatomical parts and bodily substances of humans and nonhuman animals (e.g., crania, mandibles, horns, blood, fat, brains, marrow) likely played an important role in the religious beliefs and practices of many past societies because they were considered to be imbued with spiritual power. That such is the case is not widely appreciated in archaeology at the moment, however. This is a problem not only because it means we are probably overlooking data that shed light on the religious beliefs and practices of a number of past societies, but also because it means we are probably misinterpreting some of the animal bones at some archaeological sites: we are interpreting the bones in terms of economic behavior when they were actually deposited in connection with religious rituals. The present symposium’s goal is to begin the process of changing this state of affairs. The symposium brings together several of the most prominent of the small group of researchers currently working on the phenomenon of the religious use of anatomical parts and bodily substances with a view to identifying commonalities and differences among the societies and archaeological cultures in which it has been documented and stimulating collaborative research.

[26] Symposium · ARCHAEOLOGIES OF SURVEILLANCE: SEEING AND POWER IN THE MATERIAL WORLD

Surveillance—the act and apparatus of observation—is a key fixture in the behaviors and materials of human societies. While narratives of power, authority, domination, and resistance feature prominently in the literature, surveillance remains undertheorized in archaeology. This relative lack of attention is perhaps because articulations of surveillance in other contexts, such as Bentham’s panopticon and Foucault’s essays on power and knowledge, were explicitly modern in their conception and application. Nevertheless, the social significance of watching and being watched is also apparent in the archaeological record of many premodern societies, especially states and empires. This session presents case studies on the archaeology of surveillance from a variety of disciplinary and societal contexts. In particular, it aims to examine the materiality and landscapes of surveillance. What are the material culture correlates for watching and, equally important, for the watched? Where and when do human groups invest in the architecture of surveillance and what effects can be detected or inferred from such investments? Where are material vestiges of surveillance conspicuous in their absence? By examining the conditions of surveillance (forced labor, borderlands, colonialism, imperialism, bureaucracy) in a number of global contexts, we also demonstrate how archaeology can contribute to broader dialogues in surveillance studies.

[27] Symposium · CHAVÍN DE HUÁNTAR’S CONTRIBUTION TO UNDERSTANDING THE CENTRAL ANDEAN FORMATIVE: RESULTS AND PERSPECTIVES

Chavín de Huántar is an important Middle-Late Formative site (1200–500 BC) of the north-central highlands of Peru, recognized for its precocious worked stone monumental construction, enigmatic architectural forms including subterranean galleries, and extensive stone art that decorated many architectural contexts. The site’s primary function was religious, judging from the elaborate development of ritual contexts and material culture. The Programa de Investigación Arqueológica y Conservación en Chavín de Huántar began in 1994, addressing the multidimensional complexity of the site. Its transdisciplinary research marked a significant shift in the generation of knowledge about the emergence of authority in the Andes. Greater understanding of previously known contexts and discovery of new ritual spaces have revealed an iconic tradition marked by both continuity and innovation. Detailed excavations of galleries, including those in the Atrium of the Circular Plaza, have sophisticated understanding of function and organization of the Chavín entity. Across 30 years of fieldwork and analysis a variety of locations in and around the monumental site have been investigated. This

session focuses on the Programa's new knowledge and research perspectives, reevaluating concepts of Andean Formative organization and its complexity, and questioning how or if the Formative was elemental in development of Andean states.

[28] Symposium · DEVELOPMENTS AND CHALLENGES IN LANDSCAPE ARCHAEOLOGY

The aim of this symposium is to present and discuss a series of papers that focus broadly on any new developments as well as pending challenges in the archaeological study of landscapes. More specifically, the presentations in this symposium seek to reflect on the overall aims of landscape archaeology, evaluate what kind of knowledge is generated by this subdiscipline, review and/or compare theoretical frameworks, identify and reflect on the role new technologies play in the study of landscapes (what and where is their impact), discuss current and future challenges, and determine its role and impact in society.

[29] Symposium · THE TIES THAT BIND: CORDAGE, ITS SOURCES, AND THE ARTIFACTS OF ITS CREATION AND USE

Cordage is typically the earliest fiber technology to develop in ancient societies, and it tends quickly to form the basis of most constructed interworked fibrous textiles and fabrics. Nevertheless, cordage has continued to exist and function independently of textiles in a wide variety of roles, as in the rope, yarn, and string used for wrapping, binding, and transporting, as well as for rigging, torques, quipus, nets, and other cordage-based tools and devices. In contexts where the cordage no longer survives, the presence of cordage technology is revealed by the presence of tools for making cordage, including spindles, whorls, and rope spinners, and by the presence of paraphernalia that relies on cordage, such as netting gauges, cleats, moorings, slings, harpoons, and suspended objects. This session explores the enduring production, function, and meaning of cordage in ancient through contemporary societies worldwide.

[30] Symposium · BRIDGING TIME, SPACE, AND SPECIES: OVER 20 YEARS OF ARCHAEOLOGICAL INSIGHTS FROM THE CAÑONCILLO COMPLEX, JEQUETEPEQUE VALLEY, PERU, PART I

Long-term research in the Cañoncillo Archaeological Complex on the north coast of Peru, conducted by an international, collaborative team of archaeologists, has offered important insights into changing social organization, political structures, and ritual practices over the last 2,000 years in the ancient central Andes. Situated on the southern margin of the Jequetepeque Valley, the complex includes over 25 km² of monumental architecture, domestic zones, relict fields, and abandoned canals dating from the Formative period to the Spanish colonial era. Sustained archaeological analysis of well-preserved contexts has facilitated analysis of macroscale sociocultural processes that unfolded across the central Andean region. Indeed, the Jequetepeque Valley, the "Crossroads of Empire," marks an important contact zone between the highlands and the coast and between the northern and southern Moche regions, offering alternative perspectives on dominant archaeological narratives. In this session, we focus on the Late Formative, Late Moche, Transitional (Early Lambayeque), and Late Intermediate period components, examining ritual modes of place-making, intergenerational memory, variable materializations of house and home, and differential enactments of kinship and collectivity. By juxtaposing data from different time periods, we situate sociopolitical transition as an agent-driven process and understand human efforts to build bridges across time, space, and species.

[31] Symposium · NEW AND EMERGING PERSPECTIVES ON THE BAJO EL LABERINTO REGION OF THE MAYA LOWLANDS, PART I

The Bajo el Laberinto region of the Maya lowlands was an important locus of cultural development, continuities, and transformations for over two millennia. Beginning around the time of the earliest sedentary communities and extending through to the Postclassic period, the Maya of this region established and developed communities along the margins of bajos (karst seasonal wetlands), transforming and managing complex and diverse landscapes to meet the demands of urban populations. During the Preclassic (900 BCE–200 CE), autonomous cities such as Yaxnohcah and Calakmul flourished in this sociospatial landscape. However, by 450 CE, Calakmul emerged as the center of a network of economically integrated urban settlements, ultimately becoming one of the largest cities in Mesoamerica and the most politically significant and influential Maya city from 650 to 850 CE. Interdisciplinary investigations in this region have generated

robust data relevant to understanding the distribution of settlement, land use and water management strategies, and livelihood practices. More recently, new avenues of research have focused on continuities and disruptions in urban landscapes and social, political, and economic dynamics. This two-part symposium explores these themes, with contributors presenting findings and interpretations from new, ongoing, and recently completed work in the Bajo el Laberinto region.

[32] General Session · MAYA MONUMENTS AND ARCHITECTURE

[33] General Session · ARTIFACT STUDIES AND SOCIAL ANALYSIS IN NORTH AMERICAN ARCHAEOLOGY

[34] General Session · BIOARCHAEOLOGY AND MORTUARY ANALYSES IN MESOAMERICA

[35] General Session · PALEOAMERICAN RESEARCH IN WESTERN NORTH AMERICA

[36] General Session · ENVIRONMENTAL ARCHAEOLOGY IN THE AMERICAS

[37] General Session · ANDEAN MATERIALS AND MUSEUM RESEARCH

[38] General Session · PUBLIC-FACING ARCHAEOLOGY

[39] Forum · IN SEARCH OF SOLUTIONS: EXPLORING PATHWAYS TO REPATRIATION FOR NAGPRA PRACTITIONERS (PART II)

(SPONSORED BY COMMITTEE ON MUSEUMS, COLLECTIONS, AND CURATION)

Now in its fourth decade, the Native American Graves Protection and Repatriation Act (NAGPRA) remains one of the most important legislative acts shaping the discipline of archaeology today. To adequately discuss the range of topics and provide examples and case studies incorporating shifting discourses of repatriation, policies, and collections management concerning Ancestors and their belongings subject to NAGPRA, the Committee on Museums, Collections, and Curation and the Curation Interest Group have arranged a five-part series. This forum brings together practitioners from different agencies, as well as tribal collaborators, to engage in dialogue concerning the need for NAGPRA policies enacted and carried out at different institutional levels to ensure that the legislation is being followed in a true consultative, transparent, and respectful manner. Moreover, we discuss the need for policies that go beyond NAGPRA legislation. This includes, but is not limited to, policies concerning traditional care practices, curation and collection management, and research access that are developed out of truly collaborative relationships between archaeologist, museum and governmental agencies, and Indigenous communities, tribes, and nations.

[40] Forum · AIRLIE HOUSE REVISITED: ENVISIONING NEW DIRECTIONS FOR CRM ARCHAEOLOGY

(SPONSORED BY SAA PRESIDENT)

The National Historic Preservation Act of 1966 set the course for archaeology in the United States. The SAA and National Park Service's 1977 report entitled "The Management of Archaeological Resources: The Airlie House Report" brought cultural resource management to the fore and continues to influence it. However, as we enter the third decade of the twenty-first century, archaeology is facing new challenges not foreseen in the Airlie House Report. In recent years the profession has changed, guided by newer laws and regulations, technological innovations, a curation crisis, and social issues such as climate change, environmental justice, the rights of Indigenous and descendant communities, and Traditional Ecological Knowledge. These changes and innovations are affecting how archaeology is practiced today. Further, necessary changes to professional training and a projected shortfall in workforce capacity pose additional challenges. We have urgent work to do to ensure that cultural resource management and the discipline writ large reflect and are responsive to these changes. This forum seeks to discuss major topics affecting our profession in the coming decades, led by facilitators in the Airlie House Revisited workshop to be held in May 2024.

[41] Poster Session · ARCHAEOOMETRY AND MATERIALS ANALYSIS PART I: NORTH AMERICA**[42] Poster Session · ARCHAEOOMETRY AND MATERIALS ANALYSIS PART II: MESOAMERICA, SOUTH AMERICA, AND WORLDWIDE****[43] Poster Session · IT'S NOT ALL ANCIENT HISTORY: HISTORICAL ARCHAEOLOGY PART II****[44] Poster Session · IT'S NOT ALL ANCIENT HISTORY: HISTORICAL ARCHAEOLOGY PART I****[45] Poster Session · BRIDGING GAPS: CONNECTING LEARNERS WITH ARCHAEOLOGICAL RESOURCES DURING COVID AND BEYOND**

(SPONSORED BY TEACHING ARCHAEOLOGY INTEREST GROUP)

The coronavirus pandemic altered the state of education, outreach, and learning, resulting in a shift in teaching from classrooms, museums, and other physical locations to remote and hybrid modalities. In the wake of the pandemic, educators have bridged gaps created by limited face-to-face contact to reach out to students, communities, and the public. This session presents the challenges, successes, and lessons learned in archaeology education, as they pertain to teaching, collaboration, and outreach during COVID and moving into the post-pandemic years.

[46] Poster Session · MAKING HISTORICAL ARCHAEOLOGY MATTER: RETHINKING AN ENGAGED ARCHAEOLOGY OF NINETEENTH- TO TWENTY-FIRST-CENTURY RURAL COMMUNITIES OF WESTERN IRELAND AND SOUTHERN ITALY

This poster symposium brings together researchers from the Cultural Landscapes of the Irish Coast project and the Bova Marina Archaeological Project, southern Italy, to facilitate a broader discussion and comparison of rural communities in two different settings: the western Irish coast and southwestern Calabria of Italy. Although many surface differences exist—chiefly climate and environment—deeper similarities may reveal themselves when archaeologists embed themselves in local communities and seek to work with community members to tell broad stories about life, sustenance, and continuity and change in local ways of life. How do people in these communities relate to and manage their local tangible and intangible heritage practices? How did people work together in largely self-sustaining ways to build livelihoods? How are these communities affected by processes of globalization, modernization, and out-migration? This session aims to start a dialogue between two groups of researchers in order to elucidate these and other questions related to rural coastal livelihoods over the past two centuries.

[47] Poster Session · ARCHAEOLOGICAL FUTURES THROUGH A VIRTUAL PAST

This session illustrates the usefulness of 3D and immersive archaeological storytelling strategies for public engagement, collaborative research, and experiential education. Archaeologists are increasingly relying on Augmented Reality (AR), Virtual Reality (VR), 3D modeling, video game design, and photogrammetry to preserve and dynamically visualize archaeological contexts, data, and narratives. Through diverse strategies of sensorial engagement, inaccessible contexts and objects become globally available on personal devices or public web-based experiences. This poster session provides innovative examples of the ways in which archaeologists deploy virtual methods to create opportunities for accessible exploration and intimate engagement with material culture and historical landscapes. Session participants will demonstrate the future of archaeological methods through play and experimentation within virtual pasts.

[48] Poster Session · SMALL DWELLINGS ON THE VIKING FRONTIER: NEW RESEARCH FROM KOTIÐ, NORTH ICELAND

Excavations at Kotið in 2022 and 2023 have revealed a very small, Viking Age domestic dwelling that dates to the initial settlement of Iceland in the late ninth century. Compared to known settlement farms, the site is significantly smaller and lacks access to good farmland even though better land was unoccupied at the time.

The site suggests an important social and ecological role for non-elite households in the Icelandic settlement process and requires a new consideration of inequalities and complex relationships among early settler households on the Norse frontier. This poster symposium presents data from multiple aspects of the excavation, including geoarchaeology of the domestic floors and extramural spaces, material culture of adornment items, zooarchaeology and paleoethnobotany, later reuse of the site as agricultural infrastructure, and artistic visualization of the dwelling.

[49] Poster Session · POSTERS ON THE ARCHAEOLOGY OF THE SOUTHERN YUKON-ALASKA BORDERLANDS

This session collects posters related to the archaeology of the Southern Yukon-Alaska Borderlands (SY-AB). The SY-AB is here defined as the region north and south of the Alaska Highway and east and west of the international border for about 100 km. It encompasses the highway corridor from the north end of Kluane Lake, Yukon, to the Tanacross, Alaska, regions, with the Wellesley Basin/Yukon-Tanana uplands to the north and the St. Elias–Wrangell Mountain range to the south. It includes Pleistocene southeast Beringia glaciations and fauna, and sites of human occupation in the Allerød and Younger Dryas through the Holocene and historic periods. The posters focus on detailed presentations of quantitative data such as collections of radiocarbon dates and statistical summaries of artifact and fauna inventories, or any topic that is enhanced by consideration of graphical representations. A related presentation symposium is also scheduled (Session ID: 5937).

[50] Poster Session · TWENTY YEARS OF ARCHAEOLOGICAL SCIENCE AT THE FIELD MUSEUM'S ELEMENTAL ANALYSIS FACILITY

Since 2004, the Elemental Analysis Facility at the Field Museum has conducted advanced research projects in archaeological chemistry to study research on trade and exchange, examine craft production, and assess the nature of archaeological materials. Housed in one of the world's great natural history museums, the labs promote research on museum collections but also on objects from collaborating institutions and researchers. Applications from techniques including laser ablation–inductively coupled plasma–mass spectrometry and portable X-ray fluorescence have been instrumental in this work. Collaborative projects have ranged from explorations of glass bead production and exchange to sourcing earthenware ceramics and the development of portable laser ablation systems. Dozens of publications and large databases have been built, the latter of which provide for large-scale comparative analysis of exchange systems on continental scales. The posters presented in this session fulfill the spirit of the EAF showcasing the results of some of its recent projects.

[51] General Session · ASIAN SUBSISTENCE AND FOODWAYS

[52] General Session · ARCHAEOLOGY OF THE AMERICAN SOUTHWEST

[53] General Session · COASTAL ANDEAN SOCIETIES

[54] General Session · AMAZONIAN SOUTH AMERICA

[55] General Session · ENVIRONMENTAL ARCHAEOLOGY IN AFRICA

[56] Symposium · STATES, CONFEDERACIES, AND NATIONS: REENVISIONING EARLY LARGE-SCALE COLLECTIVES

How did the world's first large-scale collectives come into being? For much of our discipline's history, the answer was the state: a centralized, hierarchical, political organization with a ruler who directed a command-and-control economy and held a monopoly on force. Scholars identified regions of pristine state formation and then tried to fit their case studies into a unified evolutionary model of culture change. This vision of the early state began to erode near the end of the twentieth century, as archaeological fieldwork revealed a diversity of political organizations that could not be easily shoehorned into the field's narrow expectations. The last three decades has seen a recalibration in studies of early large scale-collectives, both of those long deemed to qualify as states and others that did not. This session brings together perspectives from around

the world on the constellation of practices, institutions, and ideologies that allowed for shared identities and coordinated actions across broad collectives. Their work demonstrates that violence and hierarchies often played pivotal roles, but so did gender complementarity, markets, kinship, and egalitarianism. A better understanding of how large groups come together enables a richer understanding of our past and governance alternatives for a better future.

[57] Symposium · SUBMERGED PALEOLANDSCAPE INVESTIGATIONS IN THE GULF OF MEXICO

Changing sea levels have drastically changed the shape and amount of land available for habitation throughout human history. Using modern marine technologies, portions of these formerly exposed landscapes can be identified on or buried below the modern seafloor and data gathered to illustrate what life would have been like in these areas. This session will include papers that present the basis for and results of recent exploration along the northwestern Gulf of Mexico to map and illustrate these landscapes. These papers will summarize the results of predictive modeling, geophysical survey, geotechnical testing, and geoarchaeological analyses conducted offshore of the relict Sabine River Valley, on the Gulf of Mexico outer continental shelf. These papers will also address challenges associated with presenting submerged paleolandscapes research to various audiences and highlight opportunities to engage the next generation of explorers and archaeologists in this research.

[58] Symposium · EXAMINING SPATIAL-TEMPORAL VARIATION IN THE LITHIC TECHNOLOGY OF THE EARLY UPPER PALEOLITHIC

This session presents ongoing research into the lithic technology of the Swabian Aurignacian and invites researchers working in other regions to contribute to a discussion on how best to characterize lithic variability during the period roughly between 45 and 35 ka BP. Papers present case studies of lithic variability at various spatial and temporal scales in an effort to identify both unifying and distinctive aspects of Eurasian lithic traditions. In the Swabian case, the Upper Paleolithic begins suddenly following an occupational hiatus around 42 ka BP with the Aurignacian assemblages from the caves of the Upper Danube region. After decades of excavation and study, researchers are gaining a better understanding of lithic variability in this region. Clearly, both neighboring and far off regions show radically different sequences than in the Swabian case study. The archaeological record of the early Upper Paleolithic reflects distinctive processes of cultural evolution and different cultural trajectories during the period of the last archaic hominins and the spread of early modern humans into Eurasia. Following a comparative approach, we hope better to contextualize the local signatures within a more general model for the beginnings of the Upper Paleolithic.

[59] Symposium · MISINFORMATION AND MISREPRESENTATION PART 2: RECONSIDERING “HUMAN SACRIFICE,” RELIGION, SLAVERY, MODERNITY, AND OTHER EUROPEAN-DERIVED CONCEPTS

This second part of the session, “Misinformation and Misrepresentation,” continues to examine how European-derived analytical concepts that have gained academic legitimacy and given rise to particular methods of understanding have fostered misleading claims, ideas, images, and narratives about ancient Mesoamerica. The presentations reconsider and reevaluate concepts that have gained ground as valid sources of insight into conditions, motivations, and representations in civilizations and societies of the past. Although Mesoamerica figures importantly in this session, the discussion of the prevalent use of European-derived analytical concepts and how usage impacts our understanding of ancient cultures is pertinent to all archaeologists working in non-European contexts.

[60] General Session · ADVANCES IN ARCHAEOLOGICAL DATING AND CHRONOLOGY BUILDING I

[61] General Session · ADVANCES IN GIS APPLICATIONS TO ARCHAEOLOGY

[62] General Session · TALES OF SEVERAL CITIES: ARCHAEOLOGIES OF URBANISM

[63] Forum · CONTROLLED VOCABULARIES IN ARCHAEOLOGY

Do archaeologists need a controlled vocabulary? Controlled vocabularies are agreed, dynamic sets of single- or multiple-word phrases used as key research terms. These exist for other disciplines, including psychology, chemistry, and astronomy, with agreed sets of standardized keywords for journal articles. Existing archaeological vocabularies are partial and fragmented, while simultaneously archaeological research grows. More than 120,000 archaeological articles have been published since 1960, with the total number doubling every 10 years. By 2030 metadata will exist for more than 200,000 published documents. And this is a severe underestimate; no more than 30% of the literature is currently indexed in databases that are focused on publications in English and major journals. More importantly, this does not include metadata on research documents generated by CRM. A controlled vocabulary might ensure consistency of research descriptions and could be a step toward the development of a metadata database for all published research. But it is not without potential problems. We will discuss any aspects of the possible development or nature of a controlled vocabulary for archaeology. We will also consider existing vocabulary projects in archaeology, and potential issues or problems that might hinder the development and introduction of a controlled vocabulary.

[64] Forum · A PRACTITIONER'S GUIDE TO PUBLIC ARCHAEOLOGY: INTENTIONAL PROGRAMMING FOR EFFECTIVE OUTREACH

(CO-SPONSORED BY PUBLIC EDUCATION COMMITTEE; PUBLIC ARCHAEOLOGY INTEREST GROUP)

Many archaeologists learn by trial and error while developing public programs and events and are mostly unaware that others in the profession are undergoing similar challenges. Those who do public outreach are required to become jacks-of-all-trades, often with little funding, capacity, or pedagogical training. When planning an event, where do you begin? How do you improve your programming to make a stronger impact? Simply put, we don't know what we don't know. Realizing that it has been over 20 years since archaeologists created anything instructional about public outreach, a cohort of experienced archaeology educators came together to share our knowledge and learn from each other's strengths. We produced the forthcoming book, "A Practitioner's Guide to Public Archaeology: Intentional Programming for Effective Outreach," to assist others who create public programs with the process of planning, implementation, and assessment. In this forum, several authors provide an overview and preview of the book, including how to create intentional goals and outcomes; connect with your audience; identify resources, collaborators, and other logistical needs; and understand your impact. We examine challenges and considerations for all ages, K–12, and specialized community programming, and discuss the need for stronger communication among public archaeology practitioners.

[65] Forum · ALTERNATIVE MODALITIES: MULTIMEDIA APPROACHES TO ARCHAEOLOGICAL OUTREACH AND SCHOLARSHIP

Peer-reviewed journal articles and journal citation impact factors may dominate the concerns of more traditional archaeological scholarship. These metrics do not take into consideration alternative modalities, especially those that focus on outreach to members of the public—outreach that is part of our ethical guidelines. Alternative modalities—comic books, podcasts, blogs, museum exhibitions, documentaries/TV shows, TikTok videos, cosplay—have a broader reach than academic efforts. Yet, these alternative modalities are not without their challenges. This forum will explore some of these challenges but also emphasize the tremendous potential of alternative modalities for outreach and scholarship.

[66] Forum · NOT YOUR PARENTS' ARCHAEOLOGY: RESULTS AND IMPLICATIONS OF THE GAC'S 2023 SECRETARY OF THE INTERIOR'S STANDARDS AND GUIDELINES SURVEY

(SPONSORED BY SAA GOVERNMENT AFFAIRS COMMITTEE)

The Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation (Standards) were originally published in 1983 and have guided the trajectory of the cultural resource management (CRM) industry in the United States over the past 40 years. The US Department of the Interior (DOI) announced they are currently reviewing the Standards for revisions to the Professional Qualifications Standards. The SAA Government Affairs Committee (GAC) plans to use this opportunity to advocate to DOI for the accurate addressing of the archaeological community's concerns and contemporary practices in

the DOI's revisions. To ensure the GAC's advocacy efforts reflect the interests of US archaeologists, from August 9, 2023, to September 9, 2023, the GAC polled practicing archaeologists to determine the utility of the current Standards and how the Standards can be updated to better account for today's and tomorrow's CRM industry. The answers provided by over 1,050 professional archaeologists (both members and nonmembers of the SAA) will be used to guide the GAC's advocacy efforts. This forum's panelists will present the results of the survey, explain what they see in the results, and what the results mean for the future of archaeological practice in the United States.

[67] Poster Session · HUMAN RELATIONSHIPS WITH THEIR ENVIRONMENT AND CLIMATE

[68] Poster Session · BIOARCHAEOLOGY AND MORTUARY ANALYSIS PART I: ASIA AND EUROPE

[69] Poster Session · BIOARCHAEOLOGY AND MORTUARY ANALYSIS PART II: NORTH AMERICA AND MESOAMERICA

[70] Poster Session · BIOARCHAEOLOGY AND MORTUARY ANALYSIS PART III: SOUTH AMERICA AND WORLDWIDE

[71] Poster Session · PUTTING ARCHAEOLOGY TO WORK: EXPANDING CLIMATE AND ENVIRONMENTAL STUDIES WITH THE ARCHAEOLOGICAL RECORD

Interdisciplinary applications in environmental archaeology commonly use environmental records such as sea-level indicators, geochemistry, and geomorphological studies to interpret the human record. However, environmental studies rarely consider the archaeological record when modeling paleoclimate or reconstructing environmental histories. Yet, the archaeological record is rich with unique datasets that provide useful indicators of rates and magnitudes of environmental change. This poster session provides examples of the contributions of the archaeological record to larger questions of the environmental past and to modeling the environmental future, especially related to climate change impacts. Archaeological evidence sharpens the understanding of environmental response through scaled geographic and temporal studies of human migration events, settlement pattern shifts, site abandonment, and social reorientation. Archaeologists who can communicate this knowledge base in multidisciplinary contexts have the potential to shift the discussion so that cultural heritage becomes central to the scientific enterprise.

[72] Poster Session · IN SEARCH OF SOLUTIONS: EXPLORING PATHWAYS TO REPATRIATION FOR NAGPRA PRACTITIONERS (PART IV): NAGPRA IN POLICY, PROTOCOL, AND PRACTICE

(SPONSORED BY CURATION INTEREST GROUP)

Now in its fourth decade, the Native American Graves Protection and Repatriation Act (NAGPRA) remains one of the most important legislative acts shaping the discipline of archaeology today. To adequately discuss the range of topics and provide examples and case studies incorporating shifting discourses of repatriation, policies, and collections management concerning Ancestors and objects subject to NAGPRA, the Committee on Museums, Collections, and Curation and the Curation Interest Group have arranged a five-part series. NAGPRA impacts every sector of archaeological practice in the United States. Federal agencies and "museums," including state and local government agencies, universities, private institutions, and even cultural resource management firms, may be required to comply with the law by reporting, inviting consultation, and repatriating eligible collections. Federally recognized Indian Tribes must also follow specific procedures to regain their Ancestral remains and belongings. Many Tribes and institutions have developed NAGPRA policies to guide compliance, while a growing number of professional communities debate best practices for exceeding federal requirements. Yet numerous Tribes and institutions remain new to NAGPRA, and archaeological curricula frequently lack explicit training. This symposium circulates the latest policies, protocols, and practices that facilitate compliance alongside updates from the professional communities moving the field forward.

[73] Symposium · IN SEARCH OF SOLUTIONS: EXPLORING PATHWAYS TO REPATRIATION FOR NAGPRA PRACTITIONERS (PART III)

(SPONSORED BY CURATION INTEREST GROUP)

Now in its fourth decade, the Native American Graves Protection and Repatriation Act (NAGPRA) remains one of the most important legislative acts shaping the discipline of archaeology today. To adequately discuss the range of topics and provide examples and case studies incorporating shifting discourses of repatriation, policies, and collections management concerning Ancestors and objects subject to NAGPRA, the Committee on Museums, Collections, and Curation and the Curation Interest group have arranged a five-part series. This session discusses the long path to repatriation and the evolving needs of care for Ancestors and objects that fall under NAGPRA. While Western ideas about curation and acceptable archival practices may be partially adequate, it is necessary to incorporate Indigenous voices and decision-making into the everyday choices that are made regarding their cultural heritage. This is particularly relevant as proposed regulation changes to NAGPRA include language regarding an institution's duty of care to ancestral remains and cultural items. This session brings together a diverse array of voices to discuss how to respectfully curate this sensitive cultural heritage.

[74] Lightning Round · MULTISCALAR APPROACHES TO RECONSTRUCTING STRATEGIES OF CEREMONIAL INCLUSION THROUGH THE ACCESSIBILITY OF ARCHITECTURE IN THE MAYA LOWLANDS

Classic Maya (AD 300–900) architecture echoes the political and cultural decision-making of the social actors who commissioned these spaces. Specifically, the degrees of accessibility encoded within architectural layouts offer an avenue to examine the intentions of their sponsors. This lightning round focuses on variability in the accessibility of architecture from the Maya Lowlands at the inter- and intra-polity levels. We calculate an accessibility index, which uses the sum of architectural entryways (m) divided by the area of the site (m²), wherein higher index values represent greater accessibility. To assess the degree to which additional factors impacted architectural accessibility, we compare the accessibility index with variables such as the architectural volume of a site (m³), number of surrounding commoner house groups, size of the plazas, elevation, and nearby slope gradient. Comparisons of accessibility between sites at the apical and intermediate elite levels provide novel perspectives on the hierarchical use of plaza space, social control, privacy, and the diverse ritual activities that occurred in these spaces. Results of these analyses are presented from archaeological projects with comparable datasets across the Maya region, demonstrating the applicability of these methods and amplifying our understanding of human sociospatial organization across the different landscapes.

[75] Symposium · 13,000 YEARS OF ADAPTATION IN THE SONORAN DESERT AT LA PLAYA, SONORA

The La Playa archaeological site of northwest Sonora, Mexico, presents a well-preserved record of human land use from the Pleistocene to the historic period. The Early Agricultural period San Pedro and Cienega (1200 BCE–150 CE) phases are particularly well represented by burial, canal, and roasting pit features. These and other features have been the target of over two decades of research by transnational teams from the United States and Mexico. This session presents a cultural-historical account of the longue durée of human occupation at La Playa and the varied adaptations represented in the archaeological record. Issues of broad theoretical significance include human responses to climate change from the Pleistocene to Late Holocene, the emergence of sedentism and farming, the development of ritual and religious systems, the prevalence of violence, technological change, mobility and migration, and the formation of regional identities.

[76] Symposium · BRIDGING TIME, SPACE, AND SPECIES: OVER 20 YEARS OF ARCHAEOLOGICAL INSIGHTS FROM THE CAÑONCILLO COMPLEX, JEQUETEPEQUE VALLEY, PERU, PART 2

Long-term research in the Cañoncillo Archaeological Complex on the North Coast Peru, conducted by an international, collaborative team of archaeologists, has offered important insights into changing social organization, political structures, and ritual practices over the last 2,000 years in the ancient central Andes. Situated on the southern margin of the Jequetepeque Valley, the complex includes over 25 km² of

monumental architecture, domestic zones, relict fields, and abandoned canals dating from the Formative period to the Spanish colonial era. Sustained archaeological analysis of well-preserved contexts has facilitated analysis of macroscale sociocultural processes that unfolded across the central Andean region. Indeed, the Jequetepeque Valley, the “Crossroads of Empire,” marks an important contact zone between the highlands and the coast and between the northern and southern Moche regions, offering alternative perspectives on dominant archaeological narratives. In this session, we focus on the Late Formative, Late Moche, Transitional (Early Lambayeque), and Late Intermediate period components, examining ritual modes of place-making, intergenerational memory, variable materializations of house and home, and differential enactments of kinship and collectivity. By juxtaposing data from different time periods, we situate sociopolitical transition as an agent-driven process and understand human efforts to build bridges across time, space, and species.

[77] Symposium · CURRENT PERSPECTIVES ON HISTORICAL AND CONTEMPORARY ARCHAEOLOGY OF THE SOUTHERN CONE

A growing body of research in historical and contemporary archaeologies in southern South America has developed over the last decades. Novel issues are being discussed within different theoretical frameworks and methodological approaches. This symposium aims to integrate current trends in studies while articulating future lines of research. In general terms, the expansion of historical archaeology in South America has followed a path similar to that in the Global North, although with a more recent development. At first, an important part of the work focused particularly on the corroboration of data recorded in historical documents through the work on ruins, forts, and urban centers. Over time, these studies incorporated new frameworks and broader scales of analysis. Historical archaeology of the southern cone now includes the study of the expansion of capitalism, the processes of change, resistance and/or resilience in contact situations, ideology and power, gender and racism studies, the rural occupation of ranches and missions, and life in cities, among others. Current case studies illustrate the diversity involved in this knowledge area, exemplifying archaeology’s crucial role in the study of social processes close to the present.

[78] Symposium · NEW AND EMERGING PERSPECTIVES ON THE BAJO EL LABERINTO REGION OF THE MAYA LOWLANDS, PART 2

The Bajo el Laberinto region of the Maya lowlands was an important locus of cultural development, continuities, and transformations for over two millennia. Beginning around the time of the earliest sedentary communities and extending through to the Postclassic period, the Maya of this region established and developed communities along the margins of bajos (karst seasonal wetlands), transforming and managing complex and diverse landscapes to meet the demands of urban populations. During the Preclassic (900 BCE–200 CE), autonomous cities such as Yaxnohcah and Calakmul flourished in this sociospatial landscape. However, by 450 CE, Calakmul emerged as the center of a network of economically integrated urban settlements, ultimately becoming one of the largest cities in Mesoamerica and the most politically significant and influential Maya city from 650 to 850 CE. Interdisciplinary investigations in this region have generated robust data relevant to understanding the distribution of settlement, land use and water management strategies, and livelihood practices. More recently, new avenues of research have focused on continuities and disruptions in urban landscapes and social, political, and economic dynamics. This two-part symposium explores these themes, with contributors presenting findings and interpretations from new, ongoing, and recently completed work in the Bajo el Laberinto region.

[79] Symposium · SACRIFICIAL AND AUTOSACRIFICE INSTRUMENTS IN MESOAMERICA: SYMBOLISM AND TECHNOLOGY

In Mesoamerican cultures, blood was procured through sacrifice and autosacrifice with the intention of ensuring the acts of creation and feeding supernatural beings in exchange for their favors. The analysis of this deeply rooted phenomenon, widely spread throughout the region and across different time periods, has offered insight into several aspects of Indigenous cosmovision in Mesoamerica. Thanks to spectacular artistic representations by the Indigenous peoples, the ethnohistoric records left by European chroniclers, and the rigorous studies of the archaeological record, as well as ethnographic research in present-day Indigenous communities, fundamental evidence has been gathered to reconstruct the purposes, protagonists, spaces, techniques, and instruments involved in the practice of sacrifice and self-sacrifice. Despite the considerable

amount of existing literature on the subject, continued investigation of these rituals is critical to our understanding of these cultures. This session focuses on a meticulous exploration of some implements that facilitated blood extraction: maguey spines, bone awls, flint knives, and obsidian blades, among others. Archaeologists, historians, ethnohistorians, bioanthropologists, and cultural anthropologists will use various approaches and methodologies to discuss the function, symbolism, iconography, and technology of these implements.

[80] Symposium · LIFE AND DEATH IN MEDIEVAL CENTRAL EUROPE

The term “Central Europe” is a modern idea that has been adopted mainly out of convenience for historians. Most historians and archaeologists consider the region to include the modern-day nations of Poland, Czechia, Slovakia, and Hungary. To a lesser extent, the region also includes parts of Austria, Germany, and Romania. The general archaeological and historical records for Central Europe are overshadowed by the neighboring Western and Southern European regions. Part of this can be attributed to a long-term historical perspective during the twentieth century of the region being politically and economically “backward,” with an economy mainly centered around agriculture and extraction of raw materials. Despite these biases and the relative lack of data for the region during the Medieval period (eighth to fifteenth century), particularly regarding the lives of people in general, there remains sufficient information to suggest a high level of sociocultural complexity throughout the region. In this session we will combine studies across a wide spectrum of topics within bioarchaeology and mortuary archaeology, with a focus on providing representation of life and death in Medieval Central Europe, including mortuary patterns and concepts of death, mortality, health and nutrition, labor and physical activity, migration and mobility, and childhood.

[81] Symposium · AFTER THE FELINE CULT: SOCIAL DYNAMICS AND CULTURAL REINVENTION AFTER CHAVÍN

What happens in the north highlands of Peru after Chavín? The current record indicates major cultural transformations, which manifested in many regions and scales. The most prominent developments are associated with major population centers and complexes, yet there has been scant explicit comparison. The orthodox account involves the proliferation of large demographic centers associated with strategic hilltops at the expense of ceremonial centers. Parallel to this is the move away from priestly elites to more secular leaders, more typical of lineage and village heads (*kurakas*), often “chiefly” leaders who emerge to manage aspects of production (e.g., surplus, herding, warfare, irrigation). But is this right? To what extent do we see variability across the north highlands and adjacent regions? How good is the analogy to historical forms? This session explores post-Chavín “centers” and cultures, taking stock of changing patterns of exchange, stylistic interaction, and pathways to authority. Contributors explore, among other things, the kinds of social interactions encouraged through centers, and perhaps just as important, silenced by them; the ways centers embody, symbolize, and condition people; foci of social life and cosmopolitics in the rise of native leadership and corporate living; Chavín material legacies; and processes of sacralization and de-sacralization.

[82] Symposium · *SE THE STATE OF THEORY IN SOUTHEASTERN ARCHAEOLOGY

The US Southeast is known for its robust methodology and interpretation of sites (Paleo-Indigenous through the twentieth century) generated in part from the diversity of work conducted by the Works Progress Administration. Yet, it is less known for its creation of theory. Southeastern archaeology focused on applying concepts of culture history and modeling human behavior while adapting theories from other regions (e.g., processual, postprocessual, agency, political economy). This session examines the current state of theory in the Southeast across all time periods and includes economic, political, and social understandings of human culture grounded in methodology with applications cross-culturally. In addition, participants reflect on how the interpretation of archaeological data from the Southeast impacts contemporary social issues like climate change, social justice, and the production of knowledge. The goal of this session is to recognize the diversity of theoretical approaches being developed in the region and to examine the value Southeast archaeology brings to understanding how persons engage with social, environmental, and political change over time. Participants will engage with different time periods, subregions, and methodologies to demonstrate the contributions of the Southeast to archaeological and anthropological theory.

[83] Symposium · ADVENTURES IN BEEKEEPING: RECENT STUDIES IN ECOLOGY, ARCHAEOLOGY, HISTORY, AND ETHNOGRAPHY IN YUCATÁN

Beekeeping in Yucatán is a prime example of how the entangled ecologies among bees, humans, and plants were transformed over the last 2,500 years to create a shared heritage and vibrant array of communities of cultural practice. The stingless *Melipona* bees native to Mesoamerica supplied honey and wax to markets and consumers throughout the Mesoamerican world. After the Spanish invasion, the introduction of new plants, domesticates, and bee species from Europe, Africa, and Asia fomented new ecologies, social networks, commodity chains, and shifts in cultural practices. Beekeepers confronted a wide range of global technological and political-economic changes that shaped the historical contingencies of the last 500 years. The reproduction of traditional ecological knowledge, agroforestry, and environmental management needed to sustain beekeeping is currently at the forefront of grassroots conservation efforts to stop deforestation and the use of the herbicide glyphosate on the Yucatán peninsula. Participants offer new studies and insights about variation in multispecies ecologies, sustainability initiatives, iconography, the production, distribution, and consumption of honey, wax, and other bee products in the past and the present.

[84] Symposium · COLLABORATIVE ARCHAEOLOGY AT PICURIS PUEBLO: THE NEW HISTORY

At the onset of Spanish colonialism, Picuris Pueblo was one of the largest settlements in the Rio Grande Valley of New Mexico, serving as a key point of articulation in a regional economy that brought together the people and resources of the southern Plains, Rocky Mountains, and Pueblo region. After playing a leading role in the Pueblo Revolt of 1680, however, the resident population at Picuris declined precipitously, the combined effect of ongoing colonial violence, epidemics, and voluntary out-migration. Today, a resilient tribal community of roughly 300 enrolled members is seeking to extend traditional Indigenous knowledge of their ancestry using archaeological research. This session summarizes the findings of the first five years of the Picuris collaborative archaeology project, bringing together tribal members and outside researchers. Collectively, the research is transforming our understanding of the depth, scale, complexity, and regional connections of Ancestral Tiwa history in the northern Rio Grande region.

[85] Symposium · BREAKING THE MOLD: A CONSIDERATION OF THE IMPACTS AND LEGACIES OF RICHARD W. REDDING

Richard Redding's scholarship, leadership, and teaching has left profound and lasting impacts on generations of scholars. This session strives to honor his intellectual impact and scientific legacies, particularly on those studying human-animal interactions in the Near East, Europe, and Africa. Scholars working in diverse areas and periods owe a debt of gratitude to his intellectual curiosity and creativity. Papers in this session highlight the foundational contributions of Richard's work, the creativity with which he combined his background in biology and ecology with his intricate knowledge of archaeology, and his ability to link the archaeological record and modern-day pastoral strategies.

[86] Symposium · THE ELEMENTAL ANALYSIS FACILITY AT THE FIELD MUSEUM: CELEBRATING 20 YEARS SERVING THE ARCHAEOLOGICAL COMMUNITY

In 2004, the Field Museum (FM) established the Elemental Analysis Facility (EAF), dedicated to studying ancient materials to advance the research on trade and exchange of archaeologists working at this institution and to collaborate with scholars around the country and beyond. The EAF housed minimally destructive and completely non-destructive analytical techniques, including laser ablation–inductively coupled plasma–mass spectrometry (LA-ICP-MS) and portable X-ray fluorescence (XRF). These instruments are used to investigate FM objects and other artifacts that are part of research conducted by a variety of collaborating institutions. Several avenues of research have been developed over the years, including the circulation of obsidian in Mesoamerica and South America, the provenance of various stones of cultural importance, the exchange of ceramics in Peru, and the trade of glass beads in different parts of the world. During the life of the EAF, large databases have been built, offering comparative data that could be used to address complex questions related to ancient societies. The presentations in this session will present different projects conducted with the help of the EAF.

[87] Symposium · CULTIVATING FOOD, LAND, AND COMMUNITIES

Ancestral foods and landscapes are vital to the autonomy, identity, health, and well-being of Indigenous peoples, yet climate change is profoundly impacting their distribution and availability, and access to resources and knowledge about their nutrition, safety, and conservation is an immediate challenge. With a lineup of diverse voices, subjects, and perspectives, this symposium centers on the historical ecology and persistence of Indigenous food systems and landscapes. Studies push applied, temporal, and theoretical frontiers in the archaeology of food consumption, medicines, and human health and expand understanding of varied procurement and logistical strategies, processing and storage traditions, and environmental collective action in antiquity and modernity. We reflect on questions including, How might archaeological and historical data intersect with and speak to Tribal and local community needs and modern conservation issues? What are the challenges and potentials of research designed to support—directly or indirectly—programs focused on healthy communities and ecologies? By embracing multivocal, collaborative research and braiding Indigenous wisdom with Western science, we collectively aim to not only advance archaeological understandings but also contribute to the sustenance, resilience, decision-making autonomy, and well-being of Indigenous communities and their precious ecological heritage in the face of pressing conservation and climate change concerns.

[88] Symposium · COLLABORATIVE ARCHAEOLOGY: HOW NATIVE AMERICAN KNOWLEDGE ENHANCES OUR COLLECTIVE UNDERSTANDING OF THE PAST

Within the last several decades, Native communities in the United States have increasingly taken on the management of their own cultural resources, including the establishment of Tribal Historic Preservation Offices. Furthermore, federal agencies now require archaeologists to consult with Native Americans, and legislation has also altered how research institutions interact with tribal communities. These developments have increased connections among cultural resource managers and Native people, which in turn has led to greater incorporation of traditional knowledge into narratives regarding the past. At the same time, a dichotomy remains between prehistory and history, with some archaeologists still maintaining that certain prehistoric cultures such as the “Hohokam” no longer existed after prehistory. Not only are separate terms still applied to prehistoric and historic societies, largely different researchers investigate them, with archaeologists considering the former and historians the latter. Bridging the remaining gaps in our understanding requires continued integration of archaeological, historical, and traditional Native knowledge. This symposium presents recent contributions to this process, including research by a tribal cultural resource management department, as well as positive outcomes of the Native American consultation process.

[89] Symposium · STOREROOM TAPHONOMIES: SITE FORMATION IN THE ARCHAEOLOGICAL ARCHIVE

Traditionally, archaeology and bioarchaeology have been defined by excavation. Increasingly archaeologists are setting their “sites” on the storeroom and the archive. Engaging with collections, legacy data, accession forms, and excavation reports aligns with sustainability, open and slow science movements, and decolonial aims. Many also interrogate and respond to the colonial and imperialist histories of collections. Although collections-oriented studies are gaining visibility, few have fully engaged with the notion of curatorial institutions—museums, government repositories, nonprofit agencies, universities, private collections, and databases—as archaeological sites themselves. Yet, collections and archives are not neutral spaces. All have social and material histories shaped by entanglements with other objects, people, politics, events, and nonhuman actors. In turn, these histories shape the questions we ask and the conclusions we draw from them. The storeroom, archive, and database exhibit site formation processes—taphonomies—that also require excavation. Session papers investigate these “storeroom taphonomies.” What new questions or insights emerge when we turn our attention to the materialities of storage facilities and archives? We welcome discussions related to the various institutional settings where these processes occur and consideration of a range of artifacts and materials, such as, but not limited to, paper, bone, and organics alongside glass, metals, and ceramics.

[90] Symposium · THE ROLLOUT KEEPERS: PAPERS ON MAYA CERAMIC TEXTS, SCENES, AND STYLES IN HONOR OF JUSTIN AND BARBARA KERR

(SPONSORED BY DUMBARTON OAKS)

The work of Justin and Barbara Kerr has significantly advanced our understanding of ancient Maya ceramics. With his development of a special roll-out camera, Justin Kerr was able to create single photographs of the scenes decorating the surface of cylindrical vases. Using this technique, the Kerrs built a substantial image corpus of vessels from public and private collections and made these widely available to the scholarly community—first in print, with the “Maya Vase Book,” and later with the creation of the searchable online database Mayavase.com. In 2013, the Kerrs donated their photographic collection of over 60,000 images of Mesoamerican ceramics and artifacts to Dumbarton Oaks. As stewards of this material, we are working to provide new high-resolution scans and catalogue them according to the latest iconographic and epigraphic standards. Using images from the Kerr corpus as well as other comparative material, the papers in this session will examine how ceramic styles, iconographic themes, and hieroglyphic texts interrelate and what this may tell us about Classic period political, economic, or cultural developments. We hope that the Kerr Archive can continue to be a catalyst for cutting-edge research on text and image in Maya ceramic art.

[91] Symposium · NEW WORK IN MEDIEVAL ARCHAEOLOGY, PART 2: CROSSING BOUNDARIES, MATERIALITIES, AND IDENTITIES

In this second of two sessions presenting new work in medieval archaeology, papers focus on questions centered on identity, materiality, and interdisciplinarity, as well as new methods and theoretical frameworks being developed to investigate these issues from Late Antiquity to the late Middle Ages across Europe.

[92] General Session · TAKING A DEEP DIVE: NEW RESEARCH IN UNDERWATER ARCHAEOLOGY

[93] General Session · PALEOLITHIC SITES AND LITHIC TECHNOLOGIES

[94] General Session · ADVANCES IN ARCHAEOLOGICAL DATING AND CHRONOLOGY BUILDING II

[95] General Session · AFRICAN URBANISM AND HERITAGE

[96] General Session · REGIONAL AND COMPARATIVE ARCHAEOLOGY

[97] Forum · IN SEARCH OF SOLUTIONS: EXPLORING PATHWAYS TO REPATRIATION FOR NAGPRA PRACTITIONERS (PART V)

(SPONSORED BY CURATION INTEREST GROUP)

Now in its fourth decade, the Native American Graves Protection and Repatriation Act (NAGPRA) remains one of the most important legislative acts shaping the discipline of archaeology today. To adequately discuss the range of topics and provide examples and case studies incorporating shifting discourses of repatriation, policies, and collections management concerning Ancestors and objects subject to NAGPRA, the Committee on Museums, Collections, and Curation and the Curation Interest Group have arranged a five-part series. This forum seeks to engage in open dialogue on current but also ongoing issues with NAGPRA. These include the upcoming changes to NAGPRA regulations, Indigenous decision-making during NAGPRA implementation, NAGPRA policy implementation, practices beyond compliance, repatriation delays, Indigenous led curation care, among the other issues discussed in Parts I–III.

[98] Poster Session · ETHICS, EDUCATION, AND PUBLIC ARCHAEOLOGY PART II: THE WORLD AT LARGE

[99] Poster Session · ETHNOHISTORY AND ETHNOARCHAEOLOGY

[100] Poster Session · ETHICS, EDUCATION, AND PUBLIC ARCHAEOLOGY PART I: MUSEUMS AND THE CLASSROOM**[101] Poster Session · IMPROVING AND DECOLONIZING PRECONTACT LEGACY COLLECTIONS WITH FIELDWORK: MAKING SENSE OF HARVARD'S TURPIN SITE EXPEDITION (OHIO)**

In the formative years of professional archaeology in the United States, Harvard's Peabody Museum of Archaeology and Ethnology (PMAE) conducted many archaeology expeditions throughout the world, not least of which were those among Ohio's "mound builders." In Ohio, these were most often hasty and sloppy undertakings occurring in the wake of forced removals and land grabs in the Old Northwest Territory. The Turpin site is one such case where several acres were "excavated" over a few months in one winter season by four local laborers and a medical doctor under the direction of Frederic Ward Putnam, one of the first PMAE directors and "father" of American archaeology. Instead of only lamenting the dramatic loss and inadequacy of the PMAE collection, this session compares work I have led at the site over last several years that has focused on a systematic effort to remedy these shortcomings through additional fieldwork and one that seeks to be collaborative with tribal descendants and local communities.

[102] Poster Session · TRAINING A NEW GENERATION OF HERITAGE PROFESSIONALS IN THE VALLEY OF THE SUN: THE ASU FIELD SCHOOL AT S'EDAV VA'AKI

In spring 2023, Arizona State University held a new archaeological field school program, designed in collaboration with the City of Phoenix Archaeologist's Office, focused on a portion of S'edav Va'aki (formerly known as Pueblo Grande). The City of Phoenix archaeologist approached ASU in 2021 with a proposal to develop a field school that would help the city create a management plan for a parcel of land within the boundaries of S'edav Va'aki. This session presents the results of our collaboration, as well as critical assessments of the lessons learned from the process for both the university and the city, including challenges, successes, and ways that future such activities could be improved. These lessons are not only relevant to course participants but also archaeology instructors beyond ASU looking to develop more easily accessible field training opportunities and governmental employees hoping to establish partnerships with colleges and universities that can serve to train the next generation of heritage professionals.

[103] Poster Session · ARCHAEOLOGY OF THE VIRGIN BRANCH PUEBLOAN REGION

Inhabiting the far western edge of the Puebloan world, the Virgin Branch people have been subjected to far less research than those of most other Southwest archaeological cultures. Recent academic and contract projects in the region, however, are beginning to illuminate previously underexplored aspects of Virgin Branch lifeways. This poster session brings together archaeologists working in the Virgin Branch region to explore new findings from this culture area.

[104] Poster Session · *SE THE NEW NORMAL: APPROACHES TO STUDYING, DOCUMENTING, AND MITIGATING CLIMATE CHANGE IMPACTS TO ARCHAEOLOGICAL SITES

While public debate continues unabated regarding human-induced climate change, archaeologists have long since accepted this reality and have managed impacts to our collective cultural patrimony through a variety of research and mitigation strategies. In the past decade the numbers of students and scholars whose work focuses on climate change impacts to cultural resources has only increased; as the impacts of climate change become more prominent and intense, the need for additional scholarship and coordinated, collaborative action has become more apparent. Posters herein highlight the work of students and scholars who are leading a new wave of climate change research and pioneering novel approaches to studying and mitigating the effects of an intensifying climate on the material record of humanity.

[105] Poster Session · FULFILLING A NATION'S PROMISE: THE SEARCH, RECOVERY, AND ACCOUNTING EFFORTS OF DPAA AND ITS PARTNERS

The Defense POW/MIA Accounting Agency's (DPAA) mission is to provide the fullest possible accounting for missing personnel from past conflicts to their families and the nation. The search for these 80,000+

servicemen and servicewomen is an enormous task that requires innovation, adaptation, and teamwork. Since 2016, a growing number of universities, CRM companies, and other nongovernmental organizations around the world have joined the DPAA team in the ongoing search, recovery, and accounting effort. This poster symposium highlights the range of technological innovations, archaeological approaches, and expert collaborations DPAA and its partner organizations around the globe leverage during archaeological field work as they search for, attempt to recover, and account for missing US service members from World War II, the Vietnam War, and other conflicts. Applying these innovations, adaptations, and collaborations, DPAA is able to increase its capacity, sharpen its methods, and strengthen its relationships, all of which contribute to the ongoing success of the mission.

[106] Poster Session · LOOKING TO THE WEST: NEW INSIGHTS INTO POSTCLASSIC ARCHAEOLOGY IN MICHOACÁN

The Postclassic period in western Mexico is an exciting time. It is a time when both people and objects moved and transformed, forging very particular characteristics to the area, finally leading to the creation of the Tarascan empire. This poster session aims to present new ideas that have been developed in recent years on the archaeology of Michoacán during the Postclassic period, in terms of genetics, rock art, burial customs, and the presence of multiple archaeological objects.

[107] Poster Session · GLOBAL PERSPECTIVES ON HUMAN POPULATION DYNAMICS, INNOVATION, AND ECOSYSTEM CHANGE

A revolution in archaeological research now reveals that human populations often grew exponentially for long periods of time over the last 20,000 years, disrupted by periods of recession. This deep history of long-term population expansion and recession requires an explanation. In this symposium, we bring together scholars investigating feedbacks between human population, social and technological innovations, and ecosystems. The goals of the symposium are to explore what mechanisms drove exponential-like growth among many archaeological regions over thousands of years and to explain why some regions display more violent cycles of expansion and recession (sometimes called boom-busts) than other regions. To explore these questions, our posters bring together a collection of case studies, comparative studies, and formal models. The formal models will provide a foundation to critically evaluate the mechanistic relationships between innovation, constraints on innovation, and population dynamics across multiple types of ecosystems. The case studies and comparative studies will develop methods for integrating times-series of multiple types of data to document and test for causal relationships between population, social and technological innovation, and ecosystem change.

[108] Poster Session · RECENT ARCHAEOLOGICAL WORK BY CHRONICLE HERITAGE

Cultural resource management is the primary employer of archaeologists in the United States and has seen an increase in the number and scale of projects conducted in the past several years. This poster session presents examples of recent work by Chronicle Heritage staff in Arizona, New Mexico, Oregon, California, and Florida, including survey, excavation, artifact analyses, ethnography, and broader considerations of ethical issues in archaeology. These posters demonstrate the scope of work being conducted by CRM archaeologists and its research potential.

[109] Symposium · AND THEY LOOK INTO THE MIRROR FOR ANSWERS: MIRROR ANALYSIS TO UNDERSTAND ITS HOLDER

No matter what material they were made of, stone, metal, or crystal, or if it was cheap or expensive (gold, silver, copper, bronze, obsidian, or pyrite), mirrors are one of the most fascinating artifacts made by artisans in the past. The users of these items were normally high-class members of society (political figures, high military members, merchants, holy men, or priests), and due to their complex manufacture, they were not easy or cheap to get their hands on them. Mirrors were considered a high-status item and used as a commodity for commercial, ceremonial, and even political performances. Mirror studies have gained a lot of attention lately in order to understand how they were made, who used them, how they used them, and/or what they mean for holders. In this symposium, we will present the results of those analyses.

[110] Symposium · HYDRO-ECOLOGICAL SYSTEM OF THE MAYA IN PETÉN, GUATEMALA

Because water is necessary for human life and for agriculture, water management was critical for the survival of past societies and is a significant issue for the archaeology of climate change and sustainability. How were water sources controlled/not controlled? How did people utilize and maintain water sources? How was water involved in ecological, ideological, and symbolic systems? How was water related to ecological, ideological, and symbolic systems? In the Petén lakes region, Guatemala, freshwater ecosystems served as nurseries for many animals and fishes for the Maya around the region. In this session, we consider water management strategies and techniques in archaeological sites in Petén. Session participants discuss a wide range of water management practices, including water uses of lacustrine resources. By understanding the ways in which the Maya communities managed their water in the region, we might be able to solve present-day problems.

[111] Symposium · EMERGING VOICES IN MOGOLLON ARCHAEOLOGY

The Mogollon subregion of the US Southwest / Mexican Northwest is situated in Southwest archaeological history as the least understood of the “Big Three” regional cultural traditions that were established while culture history was the dominant paradigm in American archaeology. This is partially credited to the Mogollon exhibiting less grandeur than its sister region to the north (Ancestral Puebloan) and less cultural resource management work conducted there compared to its sister region in the west (Hohokam), resulting in the Mogollon being further situated from the public and archaeological eye. The Mogollon region is arguably one of the most diverse of the three subregions, spanning from the southern edge of the Colorado Plateau to north-central Mexico, encompassing a broad range of environments and site types. Further research into the Mogollon across time would contribute to a better overall understanding of Southwest archaeology. This session seeks to expand on well-established scholarship in the Mogollon area by adding work from rising scholars using diverse methodologies to that of the established (and changing) narratives of the region. We hope that this symposium will encourage the further renewal of research and collaboration within the Mogollon area.

[112] General Session · ROCK ART STUDIES**[113] General Session · THE MEDITERRANEAN DIETS****[114] General Session · MATERIALS ANALYSIS IN MESOAMERICA****[115] Symposium · ARCHAEOLOGIES OF MOTHERHOOD**

Since Conkey and Spector’s groundbreaking work on feminist archaeology, the field has significantly expanded its scope to encompass gender archaeology, queer archaeology, and archaeology of children, women, and indigeneity. While archaeology of motherhood has been discussed and examined, it has largely remained “in the shadow” of other significant topics. This session aims to understand how mothers have healed the maternal body; what practical (magical) solutions did they use to prevent pregnancies, have safe deliveries, and induce lactation? This session presents papers from various disciplines that will examine topics that vary from wet nurses in Ancient Egypt to grandmothers in Ancient Greece; while also presenting the material culture of mothers and infants from the Eastern Mediterranean to Roman Britain. Two other papers will study devotional therapeutics for (in)fertility and motherhood in Austria, in addition to maternal marginalization and infant mortality in New Zealand.

[116] General Session · NEW RESEARCH ON THE NEOLITHIC**[117] General Session · EARLY ANDEAN SOCIETIES****[118] Symposium · MATERIALS IN MOVEMENT IN THE ISTHMO-COLOMBIAN AREA**

Archaeological research in Central America has traditionally focused on the material culture of its precolonial inhabitants. While objects have long been used to infer cultural identities, filiation, and migration patterns

from cultural-historical approaches, the last decades have seen more nuanced practices. Discussions around authenticity have redirected attention to integration processes within local traditions, further benefiting the interpretation of foreign versus local. Moreover, new foci on materiality beyond artifacts have contributed to new understandings of mobility. In providing a regional overview of recent research on trajectories and biographies of circulating materials and their role in local lifeways across the Isthmo-Colombian Area, this symposium seeks to explore the material culture, exchange mechanisms, and cultural interconnections within the region. Contributions will provide insights into the movement of artifacts, (raw) materials, and resources within and across the Central Americas. In doing so, we aim to further understand the local reception, integration, or exclusion of foreign materials.

[119] Symposium · ARCHAEOPHYCOLOGY: NEW (ETHNO)ARCHAEOLOGICAL APPROACHES TO UNDERSTAND THE CONTRIBUTION OF SEAWEED TO THE SUBSISTENCE AND SOCIAL LIFE OF COASTAL POPULATIONS

Seaweeds have been occasionally documented in archaeological sites with outstanding preservation conditions, and though they have received minor attention from an archaeological perspective, coastal archaeology is heightening interest in these resources as a significant portion of the archaeological record of coastal areas that might be systematically dismissed. To the scarce historical information and their poor preservation, we might add theoretical and ideological aspects that result in the invisibilization of these resources (such as their current use by Indigenous societies). Furthermore, many coastal environments (such as the Arctic or coastal deserts) exhibit poor terrestrial plant production, which may result in an increased consumption of seaweeds, a unique, valuable, ubiquitous, and low-risk resource. Seaweed foraging practices constitute the expression of the continuity of a gathering way of life deeply rooted in coastal environments, thus traditional ecological knowledge related to seaweeds is essential for evaluating harvesting methods and their potential uses today. This symposium aims to provide an overview of the current state of a field focused on seaweeds, including several approaches ranging from contributions concerning all the different methodologies that can be used to detect seaweeds in the archaeological record or experimental archaeology to cross-cultural ethnographic approaches.

[120] Symposium · THE ARCHAEOLOGY OF THE SOUTHERN YUKON-ALASKA BORDERLANDS

This session will discuss the archaeology of the southern Yukon-Alaska borderlands (SY-AB), defined as the region north and south of the Alaska Highway and east and west of the international border for about 100 km. It encompasses the highway corridor from the north end of Kluane Lake, Yukon, to the Tanacross, Alaska, regions, with the Wellesley Basin/Yukon-Tanana uplands to the north and the St. Elias–Wrangell Mountain range to the south. Sites such as Little John in Yukon and Linda's Point and Nateł Na' in Alaska date human occupations of the region to the Beringian Allerød (ca. 14 to 13 Kya). It is the area of origin for native copper and the crossroads of contact of the four major obsidian sources—Wiki Peak, Batza Tena, Hoodoo Mountain, and Edziza—for northwest America. The SY-AB also contains a continuous history of Holocene occupations and a rich record of Late Prehistoric and Postcontact Amerindian-European interaction. This symposium will highlight specific sites and topics of research in the SY-AB and cumulatively argue for increased attention to an often overlooked but fecund area for future archaeological research in eastern-most Beringia.

[121] Symposium · GEOLOGICAL AND TECHNOLOGICAL CONTRIBUTIONS TO THE INTERPRETATION OF RADIOGENIC ISOTOPE DATA

Radiogenic isotopic systems (e.g., Sr, Nd, Os, Pb) have become widely applied for inferring the geological sources of archaeological materials and for reconstructing technologies integral to their production. Large databases of geological materials (including GlobaLID, IberLID, and Killick et al. [2020]) are now contributing to the growth of these analyses and helping increase access to necessary data for their interpretation. Despite this rise in the use of these techniques and the resources available to these studies, the interpretation of isotopic ratios in archaeological materials is often attempted without a clear understanding of how geological processes produce natural variation or how technological processes (smelting, alloying, recycling, mixing, etc.) can alter isotopic ratios of natural materials. Therefore, we invite papers that address

these issues and incorporate geological and/or technological foci for the interpretation of radiogenic isotopic data in archaeological materials.

[122] Symposium · HOLTUN: INVESTIGATIONS AT A PRECLASSIC MAYA CENTER

This session will detail investigations by the Holtun Archaeological Project (HAP) over the course of almost 10 years of archaeological research in the Maya Lowlands of Guatemala. Our primary focus has been the development of social inequality during the Preclassic period, but we have also investigated other topics such as human resiliency, heterarchy, and power dynamics in the Preclassic and beyond. Papers will cover the history of research at the site in general and focus on recent materials analysis such as fauna, obsidian, and ceramics, as well as methods like geochemical analysis of soils and isotope analysis of human bone. We will also touch on elements of social organization and political and economic control in terms of water management, trade and redistribution, craft production, and commensalism. In addition, we will review conservation recommendations and avenues for future research.

[123] Symposium · THE ARCH STREET PROJECT: MULTIDISCIPLINARY RESEARCH OF A PHILADELPHIA CEMETERY

In 2016 human remains were discovered in Philadelphia at 218 Arch Street during a private construction project. The site was formerly the First Baptist Church of Philadelphia's cemetery and, according to historical documents, the cemetery was relocated in 1860. The ensuing excavation in three phases during 2017 recovered nearly 500 burials. Research efforts surrounding the excavation and analysis of the remains created a multidisciplinary collaborative of academics and professionals dubbed the "Arch Street Project." The court in Philadelphia granted permission for the Arch Street remains to be analyzed until September 2023. On September 1, all human remains, material culture, and associated samples were reburied at Mt. Moriah cemetery, the relocation destination from 1860. This session presents several of the research projects stemming from the Arch Street material. The synthesis of these projects into a final interpretation offers a fuller and broader picture of this unique site and provides an unprecedented glimpse into the city's community from the colonial period to the early republic.

[124] Symposium · POLITICS OF HERITAGE VALUES: HOW ARCHAEOLOGISTS DEAL WITH PLACE, SOCIAL MEMORIES, IDENTITIES, AND SOCIOECONOMICS

(SPONSORED BY HERITAGE VALUES INTEREST GROUP)

The last decades have moved the concept of "heritage" to the forefront of cultural resources management, historic preservation legislation, the tourism industry, academic institutions, and nonprofits. Since the official definition by UNESCO in 1972, heritage discussions have become increasingly fluid and contested. In the Americas, archaeologists engage with descendant communities over questions of ownership and rights to certain places and excavated materials. The core challenge in these conflicts is that in Indigenous knowledge systems, sense of place, boundaries, law, and history do not align with the Western system. Social memory may lay claim to places and cultural objects contradicting Western constructions of borders and histories. The concept of heritage raises related questions when we look at countries in Europe and the Middle East, where modern people live in and around archaeological sites and have strong feelings about place and history. This panel asks how can heritage discourse be made meaningful and productive in the social sciences in the twenty-first century? How could heritage objectives empower archaeology and grow knowledge by decolonizing? And how can fruitful and trusting partnerships form between archaeologists and Indigenous people? Archaeology-based case studies from different parts of the world are welcome.

[125] Symposium · AGUADA FÉNIX AND THE MIDDLE USUMACINTA REGION: INTERREGIONAL INTERACTIONS AND SOCIAL TRANSFORMATIONS IN THE MIDDLE PRECLASSIC PERIOD

Data recovered in Aguada Fénix and the Middle Usumacinta Region has significantly contributed to understanding Mesoamerica's early history, particularly early Maya societies. Since 2017, research by the Middle Usumacinta Archaeological Project (MUAP) has focused on understanding the interregional interactions of groups inhabiting the Isthmian Interaction Sphere that led to the development of early Maya societies, as well as the ways in which these groups adapted to the environment. Ongoing investigations

address inquiries related to monumentality as a collective effort, social and symbolic practices, sedentarism and semi-mobile ways of life, intensification of maize agriculture and mixed subsistence, and modification of the landscape. In this session, we will present research advances by MUAP and their implications for the study of Middle Preclassic Mesoamerica.

[126] Symposium · EXPEDIENT TECHNOLOGICAL BEHAVIOR: GLOBAL PERSPECTIVES AND FUTURE DIRECTIONS

Stone tools and technological behavior can be considered to lie along a continuum from curation to expediency. While the topic of tool curation has received substantial attention since introduced by Binford, the significance and interpretive potential of expedient technologies—often alternatively described as low-cost, informal, simple, or opportunistic technologies—have enjoyed less explicit discussion. Even so, expediency can be said to characterize an important portion—indeed, perhaps even most—of hominin technological behavior since the Oldowan. Expediency here refers to employing low-cost solutions to technological problems and it may characterize any stage of tool-related behaviors, from raw material procurement to tool manufacture, use, and discard. This session aims to bring together perspectives on expedient lithic technological behavior from a variety of chronological and geographic contexts to reach broader reflections on the theoretical and practical place of expediency in the archaeological interpretation of stone tool technological variability. Within this framework, certain underlying questions are proposed: How is expediency best defined? What sorts of questions can the study of technological expediency answer? What analytical tools should be used to study expedient technology? Does expediency largely “look the same” across contexts, or does expediency have different, culturally grounded manifestations?

[127] Symposium · COLORING OUTSIDE THE LINES: RE-SITUATING UNDERSTANDINGS OF THE LIFEWAYS OF EARLIEST PEOPLES OF THE CIRCUM-CARIBBEAN

A century of research on the early inhabitants (previously called “Archaic” peoples) of the Caribbean has, too often, been restricted by boundaries and labels, be they geopolitical borders or the temporal and cultural categories assigned by colonial historical sources or early archaeologists. Recent decades have seen many relevant advances, both methodological and theoretical, in the reconstruction and conceptions of these early lifeways, and yet conversations and discussions that cross these lines/boundaries are too few (with the exception of work like Hofman and Antczak 2019), thereby reifying the labels and forestalling the development of more refined understandings of this early period, its people, their ways of being, sociocultural interactions, and transcendence to other spaces and moments of the precolonial Caribbean. This symposium features the research of scholars working across the insular and mainland Caribbean and intends to scale-up discussions about recent findings and theoretical and methodological perspectives concerning the first Caribbean population from local or regional research to the entirety of the circum-Caribbean area. The objective is to build new understandings of the diversity and commonalities of the early Caribbean populations from a multiscale perspective and create research synergies that cross the diverse boundaries that have limited their better comprehension.

[128] Symposium · BEYOND MAIZE AND CACAO: REFLECTIONS ON VISUAL AND TEXTUAL REPRESENTATION AND ARCHAEOLOGICAL EVIDENCE OF OTHER PLANTS IN PRECOLUMBIAN MESOAMERICA

Discussions of plant use in Mesoamerica have historically focused on two agricultural resources: maize and cacao. While recognizing the importance of these resources, we call attention to the critical contributions of other foraged and horticultural plants to nourishing the bodies and souls of indigenous Mesoamericans. Agroforestry systems in Mesoamerica were multilayered, species-rich, and adaptive. This session asks how less studied plants contributed to these anthropogenic landscapes (perhaps even as keystone species), what economic roles they played, and how such plants also factored, on a more ideological level, into visual and textual communication systems. Each participant takes up the task of considering visual, textual, and/or archaeological evidence of a species or category of food/nonfood plants (other than maize or cacao). Papers will expand our understanding of how a diverse suite of wild and domesticated resources contributed to sustaining human life and relationships with non-human agents. By placing various time periods, subregions,

and methodological frameworks in discussion with one another, this symposium will bridge the gap between humanistic and scientific discussions of less discussed but nevertheless invaluable plant resources.

[129] Symposium · GENDER IN ARCHAEOLOGY OVER THE LAST 30+ YEARS

(SPONSORED BY WOMEN IN ARCHAEOLOGY INTEREST GROUP AND COMMITTEE FOR THE STATUS OF WOMEN IN ARCHAEOLOGY)

How far have gendered studies in archaeology come since the 1990s, when the Women in Archaeology Interest Group (WAIG) was formed? At the time, women constituted a minority of the gender ratio, while today there is near parity between these binaries. Additionally, there was no formal representation by gender non-binary/non-conforming/queer archaeologists at the SAA until 2014. How has the field changed with better representation? How have we expanded, deepened, and enhanced our understandings of gender, broadly writ? In this session, participants will grapple with the concept of gender, as can be understood from archaeological data and theory but also experientially from within the discipline. Discussion will center on the articulation of modern conceptions and past interpretations of gender and will reflect on how gender scholarship—and the gender of scholars—has changed in the last 30+ years.

[130] Symposium · THE ARCHAEOLOGY OF WETLANDS

Covering just over 6% of the Earth's surface, wetlands contain more than 40% of the Earth's biodiversity. Because of this, wetlands—the transitional feature between terrestrial and aquatic ecologies—are considered one of the most important ecosystems on the planet. However, due to climate change and human-environmental modifications, wetlands are disappearing. About 50% of the world's wetlands have already been destroyed, presenting an enormous ecological catastrophe. By showcasing archaeological examples of human-wetland interaction through time and around the world, this session combats the stereotype of wetlands as uninhabitable and unutilized places in the human past. The papers presented here will investigate the ways in which wetlands—from fresh to salty, and from low- to high-altitudes—have been exploited. With these investigations, we stress the need for the protection of, and in some cases, the restoration of these critical ecosystems.

[131] Symposium · *SE NEW ORLEANS AND ITS ENVIRONS: HISTORICAL ARCHAEOLOGY AND ENVIRONMENTAL PRECARIETY

Since New Orleans celebrated its tricentennial in 2018, archaeological research has continued in and around the city at a rapid pace, much of it triggered by federal involvement in construction and infrastructure projects. This session brings together a diverse collection of recent work on historical archaeology in southeastern Louisiana, where environmental precarity and a shared history of extractive economies, from the plantation to the petrochemical, links urban and rural landscapes.

[132] Symposium · THE ARCHAEOLOGY OF FAILURE

Failure is a fundamental part of the human condition yet remains undertheorized in archaeology. Failure is admittedly definitionally tricky and can operate at multiple scales, from the catastrophic downfalls of ancient societies to everyday blunders and mishaps. Yet the challenges make it all the more interesting. In this session, we bring together papers and researchers working on material from various periods in the New and Old Worlds, mixing case studies and theory. We examine what it means to fail, what failure looks like in the archaeological record, and what happens when we fail to fully appreciate failure.

[133] General Session · ARCHAEOLOGY OF THE PACIFIC NORTHWEST AND PLATEAU

[134] Symposium · WEAVING EPISTEMES: COMMUNITY-BASED RESEARCH IN LATIN AMERICA

Research in Latin America has constantly rethought its approach toward communities. Even though the transformations vary in each country and region, only epistemological dialogue on an equal footing will allow each country to revisit data, rethink practices, and better understand the relationships between materiality (space/nature) and human interactions. This epistemological dialogue can synchronize different cognitive regimes from the rich cultural diversity of the Americas, making it possible to understand power relations,

ways of life, political hierarchies, practices, and social interactions among people in different contexts. This symposium aims to promote a conversation about the possibilities of establishing equivalent dialogues between academia and communities, especially among Latin American women.

[135] General Session · CARIBBEAN ARCHAEOLOGY

[136] General Session · INDIGENOUS AND COMMUNITY-BASED ARCHAEOLOGIES IN NORTH AMERICA I

[137] General Session · MANAGING ARCHAEOLOGICAL DATA AND COLLECTIONS

[138] Symposium · ADVANCES IN PERISHABLE WEAPONRY STUDIES: DEVELOPING PERSPECTIVES FROM DATED CONTEXTS TO EXPERIMENTAL ANALYSES

This symposium includes insights from researchers dating and analyzing extant perishable weapons systems and those replicating and experimenting with these organic materials. Because weapons are the primary tools by which human groups obtain animal protein and resolve (or exacerbate) conflicts over territory and resources, a holistic study of these systems (including experiential, replicative, and ballistic dimensions) is critical for forming an accurate view of past land-use patterns and economic systems. By bringing together a range of papers spanning dated and sourced weaponry to actualistic studies, this symposium aims to provide a more cohesive understanding of the emergence and applied use of weapons.

[139] Symposium · WATER IN THE DESERT: HUMAN RESILIENCE IN THE AZRAQ BASIN AND EASTERN DESERT OF JORDAN

For thousands of years, plants and animals including humans moved back and forth along the Levantine corridor—a geographic region that connects Africa to Eurasia. At the margin of this corridor lies the Azraq Basin in the Eastern Desert of Jordan, which previously had extensive spring-fed wetlands at its center. These wetlands remained intact until the early 1990s when the combination of climate change and years of water overdraw led to desiccation of the springs. This session explores human resilience in the face of climate change and documents the shifting relationships between people, plants, animals, and objects in this challenging ecosystem from the Lower Paleolithic to historic times.

[140] General Session · SUBSISTENCE AND FOODWAYS IN THE US SOUTHEAST

[141] General Session · PUBLIC AND COMMUNITY ARCHAEOLOGY IN EUROPE AND BEYOND

[142] Forum · AMERICAN URBAN ARCHAEOLOGY IN THE TWENTY-FIRST CENTURY: REFLECTIONS AND FUTURE DIRECTIONS

The archaeology of urban places has a long disciplinary history, though the tradition of urban archaeology in the United States was largely spurred by the introduction of cultural heritage legislation, broader historic preservation movements, and so-called urban renewal projects mid-twentieth century. Since then, individual cities have developed long traditions and literatures (see Rothschild and Wall 2014). In the 1980s and 1990s, a collaborative group of urban archaeologists in the United States met regularly to discuss ideas and issues unique to excavation and research in urban spaces. This panel is intended to be a reflection upon the challenges, goals, and themes of and in urban archaeology throughout the Americas and beyond as it stands in 2024 with the intent of developing an Urban Archaeology Working Group in the spirit of this previous collective. This revived group would be geared toward collaborating on issues—both in theory and praxis—faced in cities today. Researchers invested in these questions are encouraged to attend for open discussion among panelists and audience members.

[143] Forum · BONES IN THE IVORY TOWER: CONSIDERING THE ETHICS OF TEACHING WITH HUMAN OSTEOLOGICAL COLLECTIONS

As conversations have proliferated around the ethics of working with human remains (including the SAA's Statement Concerning the Treatment of Human Remains, 2021), much of the focus has been on research and curation within museum settings. Significant work remains to consider if, or how, human osteological collections can ethically be used for teaching and training in universities. Often these collections of human remains have been acquired and curated over multiple generations of researchers; they are poorly provenanced, fragmentary, and incomplete. In the United States, these collections have largely exploited the remains of Indigenous Ancestors and impoverished and/or minoritized communities. NAGPRA forced universities to review their human osteological collections and current events have renewed scrutiny about who is acquired and used in osteological teaching collections. This forum aims to contribute to conversations on teaching with and about human remains in anthropology departments. Topics will include curation, documentation, access, repatriation, and pedagogical approaches. Discussants will offer case studies of the ethical considerations facing teachers, researchers, and other practitioners in our field. Together, we will discuss the work that we must do to contextualize the persons within our care, train the next generation of archaeologists, and reaffirm our commitment as ethical stewards.

[144] Forum · CONTEXTUALIZING SITE EVALUATIONS WITHIN THE CULTURAL LANDSCAPE

While Section 106 consultation focuses largely on the significance and eligibility of individual sites, we must recognize that sites are not necessarily discrete units but are part of a broader cultural landscape. To what extent then, can and should we be examining this relationship within the confines of archaeological survey and Section 106? We will focus on sites with ancestral affiliation and presumptively ask, what do Indigenous people want to know? What approach can be taken when we can assume that different descendant communities will have different associations with the landscape? This is an exploratory forum to discuss potential agency and tribal responsibilities, methods of inquiry and documentation, and the applicability of cultural landscape identification in the Section 106 process. Lastly, what are the long-term management implications of these places once they are identified?

[145] General Session · INTERDISCIPLINARY RESEARCH ON SUBSISTENCE AND FOODWAYS**[146] Lightning Round · HOW DO WE KNOW WHAT WE KNOW? IN HONOR OF TERENCE D'ALTROY**

Terence D'Altroy has had a profound impact on the archaeology study of the ancient societies of the Andes and beyond. His work in the 1980s established the important theoretical concepts of staple finance and wealth finance in the discipline, while his publications in the 1990s on provincial manifestations of imperialism changed the way Inka politics was understood. In the twenty-first century, he has continued to break new ground in his research on imperial social epistemologies. Despite his shifting thematic interests over the decades, D'Altroy has always insisted on a having a rigorous basis for connecting field or laboratory observations to theoretical abstractions. This session will be a forum in which various archaeologists who have been influenced by D'Altroy's work will have an opportunity to discuss its ongoing value and significance for research in the Andes and elsewhere.

[147] Symposium · ARCHAEOLOGY TO TRANSFORM AND DISRUPT: TEACHING, LEARNING, AND THE PEDAGOGIES OF THE FUTURE

In 2007 Burke and Smith published "Archaeology to Delight and Instruct: Active Learning in the University Classroom," a groundbreaking book on teaching and learning archaeology through creative, inclusive, and novel teaching activities for students of archaeology in higher education. In this session, we celebrate the legacies of this book and invite papers that think about teaching and learning in archaeology and heritage today, encouraging participants to reflect on how teaching and learning can and does challenge the status quo. We are particularly interested in new innovations in teaching and learning, particularly where they challenge inequalities, support climate resilience, and break down boundaries. We invite papers from all career stages,

including the experiences of students. This will be a nonjudgmental and safe space to discuss challenges, successes, and the future of teaching and learning in archaeology and heritage in universities and beyond. Papers are invited from across the globe, and we welcome discussions of teaching in any setting, from classrooms to more practical spaces such as the field and labs.

[148] Symposium · AT THE FRONTIER OF BIG CLIMATE, DISASTER CAPITALISM, AND ENDANGERED CULTURAL HERITAGE IN BARBUDA, LESSER ANTILLES

Small Island Developing States (SIDS) of the Caribbean are vulnerable to the effects of climatic change. The damaging impacts of contemporary sea-level rise and increasing hurricane activity have had a significant influence on the region's physical, economic, and sociocultural landscapes. In 2017, Category 5 Hurricane Irma made a direct hit on the island of Barbuda, of the nation Antigua & Barbuda, which resulted in the evacuation of the island's entire population and widespread devastation. This symposium focuses on the first year of an NSF IRES international research effort to study current issues in Caribbean archaeology, historical anthropology, geoarchaeology, bioarchaeology, osteobiography, photogrammetry, site management, geobotany, and community cultural heritage. Collaborators in this project explore the long durée in a transdisciplinary perspective from the first peopling to the present day. The peer mentorship of junior colleagues is at the core of this endeavor, so as they move into their chosen fields, they are better prepared to address the unprecedented effects of the Anthropocene in a holistic perspective.

[149] Symposium · ENDURING RELATIONSHIPS: PEOPLE, PLANTS, AND THE CONTRIBUTIONS OF KAREN R. ADAMS

This symposium honors the outstanding research and mentorship contributions of Dr. Karen R. Adams in archaeology, paleoethnobotany, and the plant sciences. Dr. Adams's broad research contributions include significant work on archaeobotanical sample collection and analysis techniques, interdisciplinary work on Indigenous maize landraces, and influential work on the cultivation, domestication, and movement of plants native to the US Southwest and Northwest Mexico. For nearly five decades, she has been at the forefront of analyzing and interpreting diverse archaeological plant remains, the results of which are reported in nearly 150 peer-reviewed publications and hundreds of technical reports. Beyond this, Dr. Adams has also excelled as a mentor to young scholars, particularly in her role guiding and training three decades of environmental interns in paleoethnobotanical methods and interpretation at the Crow Canyon Archaeological Center in southwestern Colorado. In this session, colleagues and former students present research and applied work inspired by and celebrating Dr. Adams's unparalleled career.

[150] Symposium · COLLABORATIVE AND COMMUNITY ARCHAEOLOGY

Collaborative and Community Engaged Scholarship (CES) is an important topic in our profession, encompassing a growing diversity of activities. We continue nine years discussing issues and best CES practices in archaeology. This session displays a commitment to conducting research and historic preservation in effective partnership with multiple stakeholders as a matter of fairness, ethics, and as a way to create and co-create robust and useful final products. Archaeological projects affect Indigenous peoples, local residents, and descendant communities in many ways. These groups often have relatively little input into what "others" say about, or do with, their heritage. We advance inclusive, community-engaged scholarship that is co-created with relevant communities. The goal of this session and many of the projects discussed is to use community involvement and participation as a way not only to give a voice to groups that have been essentially voiceless, but to empower all stakeholders—especially on projects that involve "multiple pasts." We discuss trajectories of developing relationships and projects that can become respectful, useful, and productive CES.

[151] Symposium · EXPLORING LONG-TERM PASTORAL DYNAMICS: METHODS, THEORIES, STORIES

This session aims to delve into the multifaceted realm of long-term pastoral dynamics, employing the perspectives of archaeology and ethnoarchaeology to unravel the methods, theories, and stories that shed light on the intricacies of pastoralist lifeways. The objective is to deepen our understanding of the longevity and sustainability of pastoral practices, emphasizing the complex interactions between humans, animals, and

the environment over extended periods. Specifically, this session has been organized to examine the social and cultural transformations within pastoral societies over time in different regions of the world where pastoralism continues today in order to try and understand the resilience and flexibility of these communities in response to environmental, social, political, and economic changes. We hope that this exploration will shed light on the strategies employed by pastoralists to adapt and thrive. We also hope that by drawing on the lessons learned from long-term pastoral dynamics, we can identify time-tested and innovative practices to ensure the sustainability of pastoralist lifeways.

[152] Symposium · WHAT HAPPENED AFTER THE FALL OF TEOTIHUACAN?

The great metropolis of Teotihuacan in Central Mexico was a unique settlement in Classic Mesoamerica due to its huge size, orthogonal urban grid, and multiethnic society. The contradiction between the corporate base or the ruling council and the competitive behavior of the intermediate elite tore the multiethnic pact and provoked a revolt that set the core of the city on fire, the settings associated with the ruling elite. This event was contemporary with the heavy impact of urban sprawl in its immediate environment as well as a long-lasting drought in Central Mexico. The effects of the fall of Teotihuacan impacted all Mesoamerica. Most of the population fled from the city and was replaced by newcomers. This symposium will review the information we have on the Epiclassic and Postclassic groups that lived in the valley of Teotihuacan after the collapse of the Classic metropolis. The project I headed since 1987, "The Study of Tunnels and Caves in Teotihuacan," offered a vast amount of information on subsistence; manufacture of objects; and funerary, fertility, and deity rituals of the Coyotlatelco people with links to the Bajío region, the Mazapa groups with relations to the Tula Valley, and the Aztecs.

[153] Symposium · RECENT COLONIAL ARCHAEOLOGICAL RESEARCH IN THE AMERICAN MIDCONTINENT

The colonial era has attracted considerable archaeological interest in the American Midcontinent over the past few decades. Recent research aims to examine how that record is interpreted and the role it plays in contemporary social science inquiry. Before and during the early years of nationhood, French, French-Canadian, British, Native American, African/African American, and the Métis/métis peoples struggled to create and maintain their identities in a rapidly changing social, political, and economic world. The papers in this session explore the daily lives of these shifting colonial populations through archaeological study of gender, materiality, power, survivance, ontology, and landscape.

[154] Symposium · WHAT'S CANOE? RECENT RESEARCH ON DUGOUTS

Climate change and associated shifts in the modern use of landforms and waterways has led to a number of recent discoveries of dugout canoes. Approaches to the study of these objects draw on historical, ethnohistorical, material, and archaeological sources of evidence and include writing the biographies of individual canoes; regional multivariate analyses of dugouts; efforts to model water transportation along canals, rivers, and lakes; Indigenous and non-Indigenous experimental efforts to craft and use dugouts; innovative methods to search for dugouts mired in lake bottoms; and more. Papers in this session offer an overview of current investigations of dugout canoes.

[155] Symposium · THEORIZING PREHISTORIC LARGE LOW-DENSITY SETTLEMENTS BEYOND URBANISM AND OTHER CONVENTIONAL CLASSIFICATORY CONVENTIONS

Archaeologists are increasingly unveiling evidence that defies conventional classificatory models whereby the development of sociopolitical complexity was a unilinear, stepwise, and standardized process. The prehistoric large low-density settlements are among such evidence and are enabling scholars to acknowledge the organizational plurality and diversity intrinsic to the human past. After decades of being neglected analytically and comparatively, at best considered anomalous cases of ancient urbanism, these settlements are becoming a prolific field for archaeological discussions about the challenges of large population aggregation. Recently documented cases strongly suggest that they can appear without following the incremental increase in complexity that previous anthropological models predicted. In the absence of this prescriptive prelude, archaeologists have started recognizing various developmental trajectories not even considered possible in the past. This session aims to contribute to these discussions by analyzing and comparing worldwide low-

density settlements, allowing us to theorize the social, cultural, economic, and political processes underpinning them. By foregrounding the issues above, we avoid imposing long-lasting classificatory conventions that tend to assume monolithic governance apparatuses, integration mechanisms, ideological systems, and subsistence regimes. The session adds to the scholarship on low-density settlement patterns by providing new datasets and avoids the yardstick problem by critically analyzing these data.

[156] Symposium · PAINTING THE PAST: INTERPRETIVE APPROACHES IN GLOBAL ROCK ART RESEARCH

Rock art research transitioned beyond descriptive–typological studies four decades ago, initially using ethnographic analyses followed by the addition of neuropsychological models and subsequently with a wide variety of approaches, the circumstance today. Current interpretive studies range from traditional but intensive iconographic research through quantitative analyses to landscape studies to collaborations with Indigenous peoples. Concern with the metaphysical beliefs—epistemology and ontology—of the creators of rock art underlies many of these studies, reflecting the continuing influence of the initial ethnographic turn in rock art. Papers in this session highlight the diverse approaches to current global rock art research, in the process illustrating the interpretive advances that have been made in our understanding of this aspect of the archaeological record.

[157] Symposium · CENTRALIZING CENTRAL AMERICA: NEW EVIDENCE, FRESH PERSPECTIVES, AND WORKING ON NEW PARADIGMS

Ironically, Central America has tended to be peripheral in Latin American archaeology, as scholars (and their funding agencies) have gravitated to the more glamorous cultures of Mesoamerica and Andean South America. Nevertheless, a growing cadre of young Central American archaeologists (and a handful of intrepid international scholars) have followed in the footsteps of such trailblazers as Baudez, Coe, Cooke, Haberland, Lange, Lothrop, Stone, and Willey. This session will present new evidence and fresh perspectives from Central America (including El Salvador, Honduras, Nicaragua, Costa Rica, and Panama), organized around the themes of cultural ecology, complexity, regional interaction, and social identities. Presenters include scholars who have recently contributed to a publication series on the cultural mosaic of ancient Central America, as an opportunity to further expand their research and develop stronger linkages across the region. As we move from the substantive to the more theoretical, we hope to move Central American archaeology toward more anthropologically engaged interpretations.

[158] Symposium · UNDERWATER AND COASTAL ARCHAEOLOGY IN LATIN AMERICA (SPONSORED BY ISLAND AND COASTAL ARCHAEOLOGY INTEREST GROUP)

Today, underwater and coastal cultural landscapes—whether from maritime, lacustrine, or fluvial origins—are primary data sources for numerous scientific disciplines, offering deeper insights into the dynamic relationship between humans and aquatic environments. A growing body of case studies is concentrating on underwater and coastal records from Latin America. Archaeological research in this area spans from the Mexican highlands to Patagonia and covers periods ranging from prehispanic to historical times. An increasing amount of material evidence from prehispanic societies in the region underscores Latin America's long-standing traditions centered on aquatic environment exploitation and management. This session will focus on the results obtained from underwater and coastal contexts in Latin America, aiming to strengthen the connections between coastal and underwater archaeological communities by building methodological bridges.

[159] Symposium · THE RISE AND APOGEE OF THE CLASSIC MAYA KAAU'L HEGEMONIC STATE AT DZIBANCHE

In recent years the notion that a hegemonic state known as the Kaanu'l dynasty dominated the Classic Maya Lowlands has become more widely accepted supplanting previous views of Maya states as inherently fragmented and volatile. This has occurred thanks to a series of epigraphic and archaeological discoveries throughout the Maya world. Since the early 2000s, it has been known that in the Early Classic period, the dynasty was situated at Dzibanche in southern Quintana Roo, before its long-known seat at Calakmul, Campeche. However, many aspects of this regime remain the subject of debate. First among them is the time and place of origin, its internal governing organization, the nature of its expansionism, and the political

control of kingdoms within its sphere of influence. In this session, we attempt to bring clarity to these issues by presenting new archaeological and epigraphic data from the most recent research projects at Dzibanche and other sites with political ties to the Kaanu'l dynasty. The resulting new perspectives on this regime from a variety of sources and contexts will support a more informed understanding of the nature of Classic Maya political organization.

[160] Symposium · CHECKING THE PULSE II, CURRENT RESEARCH IN OAXACA PART I

Building on the success of last year's symposium, Diálogos en Oaxaca Archaeology once again welcomes Mexican and American archaeologists to discuss ongoing research, upcoming projects, or any other questions and inquiries they may have in mind. By checking in with each other as often as possible, we can continue building this collaborative dialogue among archaeologists with a common goal—recording and preserving Oaxaca's ancient history for future generations. Presenters will discuss research projects from different regions and time periods of Oaxaca, expanding our knowledge about this important but understudied area of Mesoamerica.

[161] Symposium · CUANDO LOS SENDEROS DIVERGEN: RECONSIDERANDO LAS INTERACCIONES ENTRE LOS ANDES SEPTENTRIONALES Y LOS ANDES CENTRALES DURANTE EL 1RO Y 2DO MILENIO AEC / WHEN PATHS DIVERGE: RECONSIDERING INTERACTIONS BETWEEN THE NORTHERN AND CENTRAL ANDES, FIRST-SECOND MILLENNIUM BCE

En la región andina, la frontera política entre Ecuador y Perú ha sido concebida como un antiguo límite que definió dos áreas con distintos procesos de desarrollo cultural —Los Andes septentrionales y centrales. Aunque varios investigadores han identificado conexiones entre ambas regiones, las investigaciones en cada país se han desarrollado generalmente de forma independiente, y con escasas colaboraciones y comparaciones. El presente simposio busca re-evaluar las interacciones entre las antiguas poblaciones de los Andes septentrionales y centrales durante el primer y segundo milenio AEC, cuando este borde empieza a fortalecerse, haciendo hincapié en las comparaciones que incorporan nueva información disponible de proyectos que se han desarrollado desde la década de los 90s. Como ejemplos de estas interacciones, invitamos a presentar trabajos que consideren discusiones sobre temas tales como comercio, intercambio, y análisis arqueométricos; además de evaluaciones a nivel local y regional sobre las similitudes y diferencias tanto tecnológicas, estilísticas, como de organización socio política. Esperamos que este simposio sirva para tender puentes y abrir espacios de diálogo con el fin de avivar futuras colaboraciones binacionales; al mismo tiempo que examinamos las distintas manifestaciones de esta división cultural en el pasado.

In the Andean region, the modern national border between Ecuador and Peru has become reified as an ancient cultural boundary separating two areas of distinct cultural development—the Northern and Central Andes. While researchers on each side have pointed to prehistoric connections that cross this boundary, scholarship in each cultural area has largely developed independently; comparisons and collaborations are infrequent. This symposium aims to reevaluate the interactions and relationships between the peoples of the Central and Northern Andes during the final two millennia BCE, when this cultural boundary is assumed to have begun to harden, emphasizing data-driven comparisons that incorporate new information made available by projects since the 1990s. As examples of the interactions under discussion, we invite papers considering both point-to-point discussions of trade and exchange, archaeometric compositional analyses of trade artifacts, and evaluations of zonal and regional similarities and differences evidenced through technology, style, and sociopolitical organization and dynamics. We hope that this symposium serves to stoke future binational collaborations that bridge both sides of this present political divide, as we examine the manifestations of that divide in the past.

[162] Symposium · LOCAL AND/OR EXOTIC INTERACTIONS: SYMBOLS, MATERIALS, AND SOCIETIES

Across the ages, prehistoric societies have interacted with each other, generating flows of finished artifacts, raw materials, symbolic items, and last but not least, people themselves that can be discerned archaeologically both among hunter-gatherer groups and farmers. Allochthonous materials and long-distance relationships

implied by their presence have usually played a major role within archaeological narratives, especially as signifiers of social and cultural complexity. Meanwhile the employ of local materials has usually been linked to domestic day-to-day activities, and less attention has been paid to their acquisition and movement within societies as a result. However, ethnographic and archaeological sources show us the importance of recognizing a dialectic interaction between both categories of materials in maintaining social and cultural entities in addition to representing social interactions in the archaeological record. We have brought together a group of papers that address the interactions between exotic and local materials and their complexity by making use of provenance studies, morpho-stylistic approaches, and spatial analysis. Our aim is to generate new insights into the mechanics of exchange across scales and the roles that it played within ancient societies.

[163] Symposium · EL PRINCIPIO DEL FIN, EL INICIO DEL PRINCIPIO: ARQUEOLOGÍA DE LA TRANSICIÓN DEL FORMATIVO AL CLÁSICO EN LOS TUXTLAS, VERACRUZ, MÉXICO

El sur de Veracruz es mejor conocido por dos ocupaciones culturales en el pasado prehispánico: los periodos formativo y el clásico; ambos con diferencias y evidencias visibles que los caracterizan. Sin embargo, como sabemos, los periodos cronológicos que establecemos, son artificiales y a veces nos impiden observar los procesos de cambio que articulan los fenómenos culturales. Así, este simposio pretende establecer diálogos que nos permitan comprender los cambios sutiles o profundos que se dieron en la región de Los Tuxtlas a través de las evidencias cerámicas y líticas, los patrones arquitectónicos, escultóricos y de asentamiento durante la transición del periodo Formativo al Clásico.

[164] General Session · MESOAMERICAN LITHICS

[165] General Session · SOUTHEASTERN SITES AND CULTURAL RESOURCE MANAGEMENT

[177] Poster Session · NEW AND EMERGING GEOPHYSICAL AND GEOSPATIAL RESEARCH IN THE NATIONAL PARKS

The posters featured in this session highlight the work of the National Park Service archaeology program, which conducts essential research to improve and expand on our understanding of our cultural heritage using new and emerging technologies. This session highlights ongoing surveys and research of the cultural landscapes, battlefields, and historic sites across the National Park Service with an emphasis on geospatial and geophysical surveys. With an emphasis on novel applications of minimally invasive methods, the presenters highlight exciting new research from across the National Park Service and in collaboration with partner organizations.

[178] General Session · EASTERN AND SOUTHERN SOUTH AMERICA**[179] Electronic Symposium · THE ARCHAEOLOGY OF FOOD AND FOODWAYS: EMERGING TRENDS AND NEW PERSPECTIVES**

This electronic symposium presents a cross-section of emerging trends and new perspectives on the archaeology of food and foodways. Ancient food studies comprise a field of inquiry that touches on all specializations in archaeology, including artifacts, biochemical and microbotanical residue analysis, archaeobotany, zooarchaeology, isotope analysis, studies of features and activity areas, experimental archaeology, and ethnographic research. Significant advances in environmental archaeology and archaeological science have enabled us to view and study human relationships with food in more depth and detail than ever before. Meanwhile, novel interpretive approaches have rendered new foodways visible and changed our understandings of food, a substance deeply imbued with cultural, economic, spiritual, and political significance. Scaffolding from this work, scholars and culinary specialists alike have applied archaeological findings to such domains as public policy (e.g., agricultural sustainability), culinary arts (e.g., the revitalization of food traditions), and dietary regimes (e.g., the decolonization of diets). In this symposium, we explore diverse perspectives on ancient foodways, from a number of geographical regions, material analyses, and interpretive approaches.

[180] Forum · HOW AMERICAN ARCHAEOLOGISTS CAN HELP COMBAT LOOTING

Cultural Property Agreements (CPAs) between the United States and foreign governments help to stop criminal activity at US borders by keeping looted and stolen art and artifacts out of American markets. Under US and international law, the United States can join CPAs to prevent looted and stolen antiquities and artifacts from entering the American art market, fighting the illicit trade while allowing the legal trade to continue and even thrive. Moreover, bilateral agreements aim to lessen global demand for illicitly obtained or looted objects—especially since the United States makes up some 45% of the global art market—while increasing responsible cultural exchange. The United States has signed CPAs with a growing number of countries around the world generating mutual respect, strengthening global law enforcement, and protecting archaeological heritage in situ. This forum will bring together experts from the fields of law, archaeology, and government to discuss the importance of these agreements and explain how American archaeologists can play an important role in supporting these agreements through testimony to the US government on emergent and enduring threats to cultural property.

[181] Forum · HIGHER EDUCATION IN CRISIS? A CONVERSATION ON ARCHAEOLOGY EDUCATION

In the last several years, cultural, political, and technological transformations have introduced both new challenges and opportunities in higher education, especially as related to diversity and inclusivity, rigor, and realized or communicated value. This roundtable addresses what archaeologists, students, and other educators see as the current and future landscape of archaeology education and strategies for moving forward in an increasingly complex environment. Issues under consideration include but are not limited to (1) classroom pedagogy, (2) new digital tools and the debate over the role of AI, (3) the centrality of Western canon in archaeological curricula, (4) and the liminal position of archaeology between the “hard” and “soft” sciences. Through this community discussion, we bring together a range of educators and students to speak on these critical topics, facilitating open discussion and identifying new paths forward.

[182] Forum · BRAIDING INDIGENOUS KNOWLEDGE IN ARCHAEOLOGY: SKODEN!

Indigenous archaeology has been characterized as being biased, amorphous, and not conducive to the rigid conventions of Western-based research paradigms. Such characterizations have derailed the underlying importance of utilizing locally based, Indigenous perspectives of the past. Practitioners of Indigenous archaeology contend that by grounding archaeological research within Indigenous perspectives and lifeworlds, archaeology begins to tell stories of the past that incorporate the lands, waters, and nonhuman relatives with which humans have always held relationships. These new stories provide us with a greater understanding of the breadth and variety of knowledge and relationships held in the past. This session will focus on sharing through storytelling by panelists of how Indigenous archaeology is being articulated in Indigenous ways by (1) sharing an example of how Indigenous archaeological methods have changed the story of the past, (2) what some of the approaches/methods/knowledge that have been braided with archaeological data/interpretations, and (3) what can be shared as being some of the ways that we can braid Indigenous knowledge and archaeological praxis? By the end of this forum, we hope to have shared stories that challenge notions of what research “is and should be” and share experiences and knowledge of enacting Indigenous archaeology.

[183] General Session · PLANTS AND PEOPLE**[184] General Session · EDUCATION AND ARCHAEOLOGICAL CAREERS****[185] Symposium · BEYOND THE ANCESTORS: NEW APPROACHES TO ANDEAN "OPEN SEPULCHERS"**

Spanish chroniclers stated that prehispanic Andean populations put more care into the construction of their sepulchers than their own houses. These sepulchers, collective tombs in which the dead were deposited allowing postmortem access for the living, are an integral part of Andean highland landscapes. They vary in both location and construction: whether positioned above- or belowground, partially or completely constructed, or situated within natural cave formations. Yet what all these monuments have in common is their geographic ubiquity in the highlands, ranging from the north of Peru to the north of Argentina. They have been given various names according to variations in typology (chullpa, machay, pucullo), but all can be gathered under the term “open sepulchers.” Based on ethnohistory, open sepulchers have long been interpreted through the lens of ancestor veneration. However, despite their prevalence, it is only recently that they have been systematically excavated. Over the last two decades, the application and integration of archaeological methodologies and scientific techniques have uncovered new information regarding these monuments. With this symposium, we aim to gather recent research on open sepulchers in order to understand and interpret their variations, meanings, and functions over time and across the geography of the Andes.

[186] General Session · TOOLS, TECHNOLOGY, AND CRAFTING IN ASIA**[187] Symposium · POWER TO THE PEOPLE: CULTURAL RESOURCE INVESTIGATIONS ALONG UTILITY LINES GIVING A VOICE TO PAST AND PRESENT COMMUNITIES**

Cultural resource surveys being conducted for various types of utility lines under Section 106 and other federal permitting have allowed archaeologists the opportunity to investigate expansive, linear spaces that may have otherwise been overlooked by traditional research and sampling methods. Most importantly, the federal regulations afford consultation with Native American and other local stakeholders in a process that helps bring the past to the present and contributes to the present conversation about crucial cultural heritage and land management issues. Papers in this session illustrate recent CRM investigations conducted in southern New England by the Public Archaeology Laboratory Inc. (PAL).

[188] General Session · CENTRAL AMERICA AND NORTHERN SOUTH AMERICA**[189] General Session · ARCHAIC PERIOD ARCHAEOLOGY IN THE US SOUTHEAST****[190] General Session · AFRICAN FOODWAYS, SUBSISTENCE, AND SUBSTANCES**

[191] General Session · ISLAND AND COASTAL ARCHAEOLOGY**[192] General Session · CULTURAL RESOURCES AND HERITAGE MANAGEMENT****[193] General Session · THE INCA AND LATE HORIZON ANDEAN SOCIETIES****[194] General Session · MESOAMERICAN SUBSISTENCE AND FOODWAYS****[195] Forum · *SE HOW FEMA, MDAH, AND TRIBAL NATIONS WORKED TOGETHER TO ADDRESS A MOUND SLUMP ON MOUND A AT WINTERVILLE MOUNDS***(SPONSORED BY THE SOUTHEASTERN ARCHAEOLOGICAL CONFERENCE)*

In 2016, a catastrophic rain event caused Mound A at Winterville Mounds to slump. After a Federal Disaster Declaration, the Federal Emergency Management Agency (FEMA), the Mississippi Division of Archives and History (MDAH), and Tribal Nations began a process to address the mound slump. This panel will tell that story from the perspective of the lead participants, demonstrating the power of collaboration.

[196] Forum · IS ANYONE LISTENING? ETHICAL ACCOUNTABILITY IN THE SAA

Over the past 20 years, the SAA has strategically worked to promote ethical practices within the field of archaeology through such forums as the Ethics Bowl, the Ethics Committee, the Committee on Native American Relations, and discussions on repatriation. In addition, it maintains a partnership with the Register of Professional Archaeologists, which lays out standards for ethical archaeological research and offers a platform for filing grievances. While the SAA continues to make strides toward addressing problematic disciplinary conduct, recent public concerns over the organization's programming, membership policies, and approach to transparency and inclusion draw attention to a critical tension between ethical discourse and how these principles are enacted and enforced. This forum will explore two questions: How can the SAA and the field of archaeology be more accountable to the ethical principles and discourse of social justice that it seeks to foster? And, what does "support" look like at an interpersonal and institutional level? Through storytelling and critical discussion, this forum will work to develop actionable items that the SAA can implement in its broader decolonizing efforts and what membership (collective and individual) can do to facilitate these changes.

[197] Poster Session · DIGITAL ARCHAEOLOGY: 3D MODELING**[198] Poster Session · DIGITAL ARCHAEOLOGY: SIMULATION AND MODELING****[199] Poster Session · FRIENDS NOT FOOD: HUMAN AND ANIMAL INTERACTIONS BEYOND HUMAN DIET PART I****[200] Poster Session · FRIENDS NOT FOOD: HUMAN AND ANIMAL INTERACTIONS BEYOND HUMAN DIET PART II****[201] Poster Session · WHAT'S ON THE MENU? PART I: ISOTOPIC AND BIOMOLECULAR ANALYSIS****[202] Poster Session · WHAT'S ON THE MENU? PART II: BOTANICAL ANALYSIS AND STORAGE VESSELS****[203] Poster Session · CAPTURING AND SHARING VERMONT'S PAST: 3D IMAGING AS A TOOL FOR UNDERGRADUATE RESEARCH AND COMMUNITY ENGAGEMENT**

Since 2019, the Vermont State University Digital Archaeology Project, in partnership with the Castleton Innovation Lab, has focused on documenting and sharing Vermont's past through the use of diverse 3D technologies. Our activities have included documenting both archaeological and private artifact collections, collaborating with museums and historical societies to create interactive content, and extensive outreach

with K–12 school groups. 3D technologies have proven to be highly effective for digitally curating artifacts, reaching new online audiences, and connecting with younger students. The application of 3D imaging has also proven to be a remarkably effective tool for undergraduate research. Undergraduate archaeology, geography, and history students, trained in advanced 3D imaging and provided with open access to state-of-the-art 3D scanners, have engaged with Vermont’s past in new and innovative ways. Their work, in turn, has provided fresh opportunities to engage with local communities. The posters in this session highlight collaborative undergraduate research utilizing 3D imaging technologies to capture and share Vermont’s past in accessible and interactive formats.

[204] Symposium · THE VILLAGE, THE REGION, AND BEYOND: STUART STRUEVER (1931–2022) AND THE LOWER ILLINOIS RIVER VALLEY RESEARCH PROGRAM

Archaeology in the North American midcontinent and beyond has been keenly influenced by Stuart McKee Struever (1931–2022). Struever’s achievements between 1958 and 1984 in the lower Illinois River valley (LIV) helped shape knowledge of the regional archaeological record, studies of subsistence-settlement systems, multidisciplinary archaeology, archaeological database development, public archaeology, contract archaeology, deep site archaeology, and bioarchaeology. Struever’s archaeological projects attracted specialists from across fields such as zoology, botany, palynology, malacology, and geology. These scientists studied LIV archaeological materials and influenced subsequent developments of archaeological specialties. The Koster Project (1969–1979) was Struever’s most visible archaeological research and outreach effort, attracting thousands of professionals, students, and volunteers to the LIV. Struever’s charisma drew many to Kampsville, which was variously characterized as an exciting cauldron of new ideas and an archaeological commune. Struever pioneered deep site archaeology, multidisciplinary archaeology, and archaeological outreach at a grand scale. These research, education, and outreach efforts continue to guide programming in Kampsville, where the Center for American Archeology celebrates its 71st year. Here we emphasize Struever’s quarter century of midcontinental archaeological achievements and explore their influence in and beyond the region.

[205] General Session · ARCHAEOLOGIES OF GENDER AND SEXUALITY

[206] General Session · HISTORICAL ARCHAEOLOGY IN THE AMERICAS

[207] General Session · ARCHAEOLOGICAL LANDSCAPES AND DIGITAL ARCHAEOLOGY

[208] Lightning Round · WEIRD STUFF: ARCHAEOLOGICAL THINGS THAT EXCEED ANTHROPOLOGICAL CATEGORIES

Archaeological classification, with its tendency to generalize, can too often disregard peculiar and unexpected items that do not fit conventional cultural categories for materials, periods, or styles. Archaeologists tend to label findings according to assumptions regarding normative culture, and therefore they frequently avoid publishing anomalous or inexplicable things—or, worse, they rob those things of their significance by generically classifying them as examples of symbolic or ritual behavior. In this lightning round, participants will address this problem by exploring findings from excavations in the Andes and Amazon that are “weird” in the sense that they appear uncanny, odd, or singular when viewed from either an insider’s or outsider’s perspective. Participants will consider why—epistemologically or methodologically—archaeologists seldom account for “weird stuff.” Presentations may explore multiple interpretations for weird items, moving beyond preconceived anthropological or normative categories to offer a more grounded discussion of human-object relations in particular contexts. Although questions about the “weird” may be raised in many geographical contexts, this session focuses on South America, where materially distinctive objects have possessed special significance in many cultural traditions, and where Western ontological categories such as animate/inanimate, human/thing, spirit/body are often at odds with Indigenous modes of practice.

[209] Symposium · THINKING WITH, THROUGH, AND AGAINST ARCHAEOLOGY'S POLITICS OF KNOWLEDGE

For decades, advances in various strands of critical archaeologies have forced the discipline to grapple with its politics of knowledge. Building on these conversations, we examine the “categories, concepts, and ways of knowing” with which archaeological narratives are generated and reconfigured (Stoler 2016:10). This session reflects on the politico-ethical worlds that are interpellated when engaging “regimes of truth” (Stoler 2016). We ask participants to scrutinize topics pulled into the orbit of, and excised from, various research and political agendas. Topics include, but are not limited to, “labor,” “queer,” “difference,” “indigenous,” “race,” “enslavement,” “disability,” “religion,” and “ethics.” What histories emerge from attending to what constitutes our knowledge and what our knowledge constitutes? What politics, perspectives, and realities are created and foreclosed? What subtle forms of violence are revealed, but also deepened, concealed, or perpetuated? What “ethics” does this necessitate? Participants are also encouraged to draw on history, ethnography, literature, and language to engage archaeology’s politico-ethics of knowledge, as well as the politico-ethics of their own practices. What ways of narrating are interrupted? What does this mean for archaeology’s place in the world—personally, professionally, and in classrooms? What are the limits of such a project?

[210] Symposium · CHECKING THE PULSE II: CURRENT RESEARCH IN OAXACA PART 2

Building on the success of last year’s symposium, *Diálogos en Oaxaca Archaeology* once again welcomes Mexican and American archaeologists to discuss ongoing research, upcoming projects, or any other questions and inquires they may have in mind. By checking in with each other as often as possible, we can continue building this collaborative dialogue among archaeologists with a common goal—recording and preserving Oaxaca’s ancient history for future generations. Presenters will discuss research projects from different regions and time periods of Oaxaca, expanding our knowledge about this important but understudied area of Mesoamerica.

Basados en el éxito del simposio del año pasado, *Diálogos en Oaxaca* una vez más da la bienvenida a arqueólogas y arqueólogos mexicanos y estadounidenses y canadienses para discutir investigaciones en curso, próximos proyectos o cualquier otra pregunta o consulta que puedan tener en mente. Al comunicarnos entre nosotros con la mayor frecuencia posible, podemos continuar construyendo este diálogo colaborativo entre arqueólogos con un objetivo común: registrar y preservar la historia antigua de Oaxaca para las generaciones futuras. Los presentadores discutirán proyectos de investigación de diferentes regiones y períodos de tiempo de Oaxaca, ampliando nuestro conocimiento sobre esta importante pero poco estudiada área de Mesoamérica.

[211] Symposium · CONTINUED ADVANCES IN METHOD AND THEORY FOR COMMINGLED REMAINS

In 2012, Kathryn Baustian, Debra Martin, and Anna Osterholtz organized a session at the SAAs on commingled human remains in archaeological contexts, partly to get people in the same room talking about assemblages of human remains long thought to be data-poor and often relegated to appendices in site reports. In the 12 years since that session, a tremendous amount of research has been conducted highlighting the importance of commingled remains to overall site interpretation. Commingling, no matter how it occurs, tells a significant story about mortuary activity, site formation, and/or the changing curatorial standards within which we work as bioarchaeologists. In this session, we highlight methodological rigor and new viewpoints on how the interpretation of commingled remains brings depth and breadth to the understanding of lived experience in the past through methodological advances and/or richly nuanced interpretation into the actions that lead to commingling.

[212] Symposium · RITUAL VIOLENCE AND HUMAN SACRIFICE IN THE ANCIENT ANDES: NEW DIRECTIONS IN THE FIELD

Examples of ritualized violence, specifically human sacrifice, are often interpreted as religious/political acts and tools of statecraft employed to terrorize a population into submission. Alternate scenarios include a response to climate calamities and political disasters and the establishment of political/social alliances or

sociopolitical integration. To what extent are these proposals integrated into long-standing ideological and political structures in the Andean world? How should we understand the sustained occurrence of ritual violence in the central Andes for centuries before the arrival of the Spanish in the sixteenth century? The organizers of this symposium believe it is appropriate to hold an academic gathering to learn about new discoveries and analyses carried out by different research teams. More importantly, we want to delve deeper into the theoretical perspectives' scholars employ to interpret their case studies. Our main objective is to evaluate whether the examples presented belong to organized and sustained rituals imbedded in the social structure of the groups studied or if they resulted from exceptional circumstances. Although a combination of both could be the case, presentations and discussion in this symposium will foster new ideas and a better understanding of the complicated world of ritualized violence and human sacrifice.

[213] Symposium · PREHISPANIC MAYA MARKETPLACE INVESTIGATIONS IN THE THREE RIVERS REGION OF BELIZE: FIRST RESULTS

With National Science Foundation funding, in 2022 a group of eight independent projects, assisted by several consultants, began collaborating to investigate the hypothesized existence of an integrated market system in the Three Rivers Region of northwestern Belize during the Late Classic period (CE 600–850). While such systems are best understood on a regional level, regional integration and other aspects of exchange are difficult to gauge in the absence of known marketplace locations, which remain an important missing component of premodern market research worldwide. The coordinated research had four overlapping goals, two theoretical and two methodological. The principal theoretical objective was to confirm the existence of suspected marketplaces in the region; the second was to examine the comparability of goods between these marketplaces, specifically ceramics. Methodologically, the main goal was to test the feasibility of the configurational approach in identifying actual marketplace locations by applying a cross-culturally developed set of archaeological indicators. Additionally, researchers sought to assess the potential for coordinated investigation and data sharing across neighboring projects to mitigate the limitations of the usual, narrower geographical scope and problem-solving focus of each individual archaeological project. While research and analyses are still ongoing, this symposium presents the first results.

[214] Symposium · INTERACTIONS DURING THE EPICLASSIC AND EARLY POSTCLASSIC (AD 650–1100) IN THE CENTRAL HIGHLANDS: NEW INSIGHTS FROM MATERIAL AND VISUAL CULTURE

Interactions were an integral part of cultural dynamics since early times in Mesoamerica. Migration, exchange, conflict, trade, alliances, and marriages are just some of the mechanisms through which these relationships have been interpreted. Their manifestations in a diversity of material culture allow us to infer the nature and geographic scope of the contacts maintained by the societies under study. One of the characteristics of the Epiclassic/Early Postclassic, recognized since the 1950s, is the identification of similarities among materials, artifacts, forms, and styles over wide spatial and cultural distances. The objective of this session is to deepen in the meaning, implications, and mechanisms of interactions established between AD 650 and 1100 in and between the political entities of Central Mexico, and beyond, based on material culture as well as the different modalities of approach (typological, technical, iconographic, spatial).

**[215] Symposium · ANCIENT PASTORALISM IN A GLOBAL PERSPECTIVE
(SPONSORED BY ZOOARCHAEOLOGY INTEREST GROUP)**

Pastoralism and its cultural intersections link people and herd animals in close synergy. Around the globe today, millions of households continue to practice aspects of pastoralism, and the archaeological record is rich with evidence of pastoralists having substantial impact on the environment, political dynamics, dietary intake, ritual behaviors, and belief systems. While archaeological interest in ancient pastoralists has received increased attention over the past two decades, analyses seem to remain divided along the lines of specific methodologies or topical branches of archaeological inquiry. This session has two goals: (1) to reposition pastoralism as a foundation for critical anthropological theory, and (2) to encourage the blending of methodological approaches to the study of ancient pastoralist societies and how contemporary pastoralists fit into these new reflections. We invite participants who investigate pastoralism in any region of the world from a variety of theoretical perspectives (multispecies, political ecology, social network, and others) and

archaeological methodologies (such as zooarchaeology, spatial analysis, material culture analysis, iconography, and biomolecular analyses). We hope to create a new dialogue between researchers working in diverse regions in order to find common threads that animal-human relationships entangle.

[216] Symposium · LOS RITUALES DEL JUEGO DE PELOTA EN LA COSTA DEL GOLFO / BALLGAME RITUALS IN THE GULF LOWLANDS

El Juego de Pelota es una compleja y antigua celebración de los pueblos indígenas en Mesoamérica. En la Costa del Golfo de México, durante el Clásico, se desarrolló como un evento en que participaron población, élites y especialistas del juego, con implicaciones políticas, económicas, ideológicas y de cohesión comunitaria. Considerado como un ritual de fertilidad y sacrificio, el Juego de Pelota probablemente incluyó otros rituales, durante la construcción del edificio, antes del juego, de purificación por ayunos y temazcal, entrenamiento, festejos después del juego y otros. En esta sesión, se explora y dialoga entre varias fuentes de datos para ampliar la discusión. [The Ballgame is a complex and ancient celebration of indigenous people in Mesoamerica. In the Gulf Lowlands of Mexico, during the Classic, the Ballgame became an event that involved the participation of the population, elites and game specialists, with implications for politics, economics, ideology and community cohesion. Considered as a fertility and sacrificial ritual, the Ballgame may have included other public rituals, during the building of the court, before the game of purification by fasting or sweat bath, training, after-game feasting, and others. In this session, we want to explore various data sources to broaden the discussion.]

[217] Symposium · THE ARCHAEOBOTANY OF EARLY PEOPLING: PLANT EXPERIMENTATION AND CULTURAL INHERITANCE

Plants, and their products, are key to our lives. They provide the basis for foods, medicines, technologies, architecture, and well-being practices. Our interaction with plants in the present is supported by a wealth of cultural and ecological knowledge built up over millennia of living in different environments around the world. In this symposia, we will engage with current and emerging evidence for the early use of plants, focusing on the movement of early humans and our closest ancestors into new environments globally. This process of colonization incorporates interaction with new plant species, vegetation communities, and landscapes. As such it draws both on culturally inherited ecological knowledge and the ability to learn and experiment. We aim to foster discussion about this process and the archaeobotanical techniques required to examine it, and to consider the relationship of these early interactions to long-term trajectories of human-environment interaction.

[218] Symposium · 2024 FRYXELL AWARD SYMPOSIUM: PAPERS IN HONOR OF LUIS BARBA

(SPONSORED BY FRYXELL COMMITTEE)

Luis Barba has received this year's Fryxell Award for Interdisciplinary Research. To honor his long, prolific, and multifaceted career, we welcome research or review papers emphasizing the techniques, culture areas, and archaeological sites in which he has worked, including archaeological science studies in Mexican archaeology and Teotihuacan in particular, field geophysics, field geochemistry, and chemical residue analysis.

[219] Symposium · THREE SIDES OF A CAREER: PAPERS IN HONOR OF ROBERT L. KELLY

Robert (Bob) L. Kelly's career as an anthropological archaeologist spans five decades. In that time, he has authored 100+ articles, chapters, reviews, and books; been instrumental in shaping our field through his extensive engagement with the SAA; and conducted archaeological and ethnographic work around the world. One of the most significant elements of Bob's legacy is the students he has mentored throughout his career, many of whom today pursue research that aligns closely with his own interests. Papers in this symposium honor Bob by focusing on three topics that align with his own long-term research interests: radiocarbon chronologies, lithic technology, and hunter-gatherer archaeology.

[220] Symposium · THE BARBACOAN WORLD: RECOGNIZING AND PRESERVING THE UNIQUE INDIGENOUS CULTURAL DEVELOPMENTS OF THE NORTHERN ANDES

Barbacoan populations resided throughout Ecuador and southwestern Colombia during the Spanish conquest of the northern Andes. The Barbacoan World was a cultural matrix of comparable mortuary traditions (shaft tombs and burial mounds), monumental platform mounds, land-use strategies, statuary corpuses, rock art, ceramic forms, iconography, and more. There were extensive market economies with interregional exchange systems that connected the highlands, Pacific coast, and Upper Amazon. These societies demonstrated various adaptive responses to a period of increased volcanic activity emblematically characterized by the eruption of the Quilotoa volcano around AD 1280, which covered much of Ecuador in ashfall, marked the climatic transition from the Medieval Climate Anomaly to the Little Ice Age, and arguably led to several ethnogeneses through social reorganization. Several Barbacoan societies were colonized during the Inka Empire's northern expansion, but many of their cultural practices and languages survived into early Spanish colonialism, after which some highland Barbacoan languages were gradually replaced by Quechua. Today, only several societies still speak Barbacoan languages and maintain their respective traditions: the Chachi, Tsáchila, Áwa Pit/Kwaiker, Misak, and Totoró. The aim of this session is to recognize and preserve the unique cultural articulations and histories of Barbacoan societies, their neighbors, and their predecessors.

[221] Symposium · MULTIDISCIPLINARY APPROACHES TO THE SUBTERRANEAN

Subterranean features are particularly significant archaeologically because of the importance of the sacred, animate Earth in Amerindian indigenous cosmology. The subterranean is additionally important in often holding purely ritual assemblages that represent the field's best context for studying the archaeology of religion. A focus of growing importance is the examination of subterranean spaces where human remains are found because it is our contention that the deposition of human remains is always a significant event. In recent years the use of aDNA has helped to clarify the nature of the remains. This session brings together papers providing the latest insights from field investigation and laboratory research.

[222] Symposium · UNRAVELING THE MYSTERIES OF THE ISTHMO-COLOMBIAN AREA'S PAST: A SYMPOSIUM IN HONOR OF ARCHAEOLOGIST RICHARD COOKE AND HIS CONTRIBUTIONS

Archaeologist Richard Cooke has left an indelible mark on the study of our shared human history. This symposium seeks to commemorate his groundbreaking work and celebrate his extraordinary contributions. The symposium will commence with an exploration of Cooke's pioneering investigations that shed light on the history of Panama. His unwavering dedication to the past has enriched our knowledge of diverse indigenous cultures, revealing connections and interactions that span centuries. Attendees will share studies that exemplify how Cooke's discoveries transformed the way we perceive past societies and their legacies in lower Central America and northern South America. Moreover, Cooke's zooarchaeological innovations have redefined the practice of archaeology. From pioneering reference collections in Latin America and actualistic studies, his work has revolutionized the way we approach environmental archaeology. The final segment of the symposium will reflect on Cooke's lasting impact on the broader archaeological community. Colleagues discuss how his ideas influenced their own research and how his mentorship shaped the careers of budding archaeologists in Latin America. In essence, this symposium is a testament to Richard Cooke's remarkable contributions to archaeology. Participants will pay tribute to his enduring legacy, share knowledge inspired by his work, and reinforce their commitment to our past.

[223] General Session · THE ANDEAN LATE HORIZON AND HISTORIC PERIODS

[224] General Session · ARCHAIC PERIOD EASTERN WOODLANDS

[225] General Session · PALEOLITHIC AFRICA

[226] General Session · CULTURAL HERITAGE IN MESOAMERICA

[227] General Session · AFRODESCENDANT COMMUNITIES AND THE AFRICAN DIASPORA IN THE AMERICAS

[228] General Session · WOODLAND PERIOD EASTERN WOODLANDS

[229] Electronic Symposium · *SE HOPE FOR THE FUTURE: A MESSAGE OF RESILIENCY FROM ARCHAEOLOGICAL SITES IN SOUTH FLORIDA

As South Florida faces sea-level rise, increased hurricane strength, fires, and other impacts from modern anthropogenic climate change, what messages can we learn from the eons of human use and occupation of the area? This session is dedicated to resiliency in South Florida as revealed through archaeological research. How do we define resiliency? How can the archaeological record inform modern efforts at adaptation? This session includes research that focuses on the ability of past groups in South Florida to adapt to shifting resources, face the aftermath of hurricanes, build and modify their environments to exist during rapid fluctuations in sea-level rise, and thrive by exploiting natural resources in the South Florida environment. Given the unprecedented amount of new archaeological research focused on early Florida contexts, the time is right to draw together concrete examples from specific case studies as well as synthesize the long history of climate resilience that could have relevance to contemporary climate-based challenges.

[230] Symposium · RECENT ARCHAEOLOGICAL INVESTIGATIONS IN CHIAPAS, MEXICO

The Mexican state of Chiapas contains a diversity of cultural regions and ecological zones—Maya and Mixe-Zoque; highland, lowland, and coastal. In spite of the presence of several large projects, such as those focused on Palenque and the Grijalva Valley, there are large swaths of Chiapas that have been almost totally overlooked, and any understanding of Chiapan archaeology is fragmented and focused on the better-known sites. In this session, scholars will discuss the results of their recent investigations in diverse parts of the state. Papers can be in English or Spanish.

[231] General Session · SEEING AND NOT SEEING: FOSTERING INCLUSIVE ARCHAEOLOGIES

[232] General Session · WOODLAND PERIOD ARCHAEOLOGY IN THE US SOUTHEAST

[233] General Session · HISTORICAL ARCHAEOLOGY IN EUROPE

[234] Forum · NEW LIVES FOR OLD BONES: NEW APPROACHES TO THE ZOOARCHAEOLOGY OF HERITAGE COLLECTIONS

(SPONSORED BY ZOOARCHAEOLOGY INTEREST GROUP)

Zooarchaeological remains have been systematically collected from archaeological sites since at least the 1970s. At that time, many studies focused on basic identification, quantification, ageing and sexing, and osteometry. In the past 50 years, many important new methods and approaches to zooarchaeological and archaeological analyses have been developed. These include isotopic and ancient DNA studies, geometric morphometrics, community archaeology, paleopathological studies, and systematic butchery analyses, among others. This forum will explore how new methods and approaches have been applied to heritage faunal collections, and it will also address the challenges zooarchaeologists face in dealing with these heritage collections.

[235] Symposium · JUUKAN GORGE: THE STORY OF DESTRUCTION, EXCAVATION, AND REBUILDING

On the 24th of May 2020 the world was shocked to learn of the destruction of Juukan Gorge by mining company Rio Tinto as part of their mine expansion. Blasting of the gorge included severe damage to rockshelters known to be over 40,000 years old and containing a unique cultural history of the Puutu Kuntj Kurrama People. Public outcry ensued. The Australian Federal Government conducted a Parliamentary enquiry, and heritage protection legislation was changed. However, we question how effective have these

changes been and what lessons have been learned from this disaster. This session is provided by the PKKP Aboriginal Corporation and those who assisted with the archaeological investigations; originally and now as the Gorge is rehabilitated. In the session we present the history of excavations, destruction, re-excavation and attempts to move forward. This is the first public presentation of this information, discussing the extreme archaeological significance of Juukan and its place in the cultural landscape of the PKK.

[236] Symposium · THE INTERSECTION OF ARCHAEOLOGICAL SCIENCE AND FORENSIC SCIENCE

This symposium will focus on how the scientific methods used by archaeological scientists can contribute to forensic science investigations. Archaeological and biological anthropology methods have been applied in forensic investigations, especially for the recovery and analysis of human remains. This symposium will highlight how archaeological science can contribute meaningfully to validation and error rate studies of scientific methods applied in forensic investigations to meet evidentiary standards.

[237] Symposium · EXPANDING OUR UNDERSTANDING OF THE MOJAVE DESERT: EMERGING RESEARCH AND NEW PERSPECTIVES ON OLD DATA

The prehistory of the Mojave Desert is rich, expansive, variable, and applicable to a variety of research queries. For over 25 years, many archaeologists have expressed concern for the alarming underrepresentation of archaeological research in this region. These concerns include insufficient attention to issues that highlight the importance of variation across different sectors of the Mojave Desert and its adjacent areas. Despite the obvious opportunities for research, there have been limited investigations beyond compliance-based military installation and public works projects. Much of this research has been inadequately disseminated, which has been attributed to “gray” or unpublished data that remains unknown or inaccessible to the larger archaeological community. This session aims to highlight various archaeological research within the Mojave Desert in which researchers have examined old data to investigate past lifeways. By revisiting old data with new perspectives, methodologies, technologies, and theoretical frameworks, these researchers have posed multiplex inquiries that seek to apply broader spatial scales that unveil the inter- and intraregional complexity of the Mojave Desert.

[238] Forum · ARCHAEOLOGY SARA(H)S ROCK! A SESSION OF SARA(H)S

After years of being confused with another Sara(h)—don’t worry, we know it happens all the time—the Archaeology Sara(h)s that Rock Facebook group was established in 2019. Since then, the group grew to 42 members with two things in common: their love of archaeology and a lifetime of hearing “with or without an H.” Over the years the Sara(h)s’ support of one another and networking opportunities have grown. This session celebrates five years of the network of Sara(h)s and highlights collaborations between Sara(h)s. With Sara(h) stories aside, what can such a varied group of people from different backgrounds, educational experiences, and specializations do to support one another and advance our practice? This session is recommended for students and young professionals to hear from a variety of professional archaeologists in the field and how they found safe communities to collaborate with within the SAA. Also, fans of Sara(h)s. And of course any Sara(h) who wants to join us up at the podium.

[239] Symposium · ANCIENT LANDSCAPES AND COSMIC CITIES OUT OF EURASIA: TRANSDISCIPLINARY STUDIES WITH NEW LIDAR MAPPING

We search for models of distinctive human biocultural evolutionary processes through transdisciplinary studies of purely aboriginal complex societies that developed out of Eurasia for millennia, particularly in the New World. Since they formed independently without the influence of the Old World civilizations until European contact, we expect to extract evolving behavioral characteristics of *Homo sapiens* through time. We particularly focus on human’s uniquely developed cognitive systems through which we conceptualize, categorize, and often quantify time, space, nature, and societies (ourselves). We record ancient ritual centers and/or cities three-dimensionally with newly developed mapping systems to elucidate ideological, technological, and social advances as materialized. Combining detailed and precise maps created by drone-lidar, Slam-lidar, scanner, or photogrammetry devices, with archaeological information, we apply them to our enhanced archaeoastronomy programs to better understand how humans developed cognitive systems to

meaningfully divide and quantify time and space, often in relation to astronomical movements creating calendar systems, and finally located the nature and societies in them. We hope to ambitiously discuss the themes with experts in brain sciences, evolutionary psychology, and astronomy, among other related natural and social sciences.

[240] Symposium · REASSESSING CHUPÍCUARO–CUICUILCO RELATIONSHIPS IN LIGHT OF CERAMIC PRODUCTION (FORMATIVE MESOAMERICA)

This session focuses on the relationships between two Formative cultural cores: Chupícuaro in the Lerma valley and Cuicuilco in the Basin of Mexico, exploring the ceramic materials. In order to clarify the nature and intensity of these relationships, this symposium presents the first results of an interdisciplinary research project (CHUPICERAM) that focuses on the ceramic production processes, from the raw materials acquisition strategy to the finished product. A range of complementary tools used by archaeology, geology, and physico-chemical sciences are mobilized in order to identify the raw material provenance, define the manufacturing methods and recipes, and retrace the possible circulation networks. The methodical comparative approach is based on a representative sampling and integrating recent archaeological assemblages from the Chupícuaro region, and museum collections built up during excavations carried out in the first half of the twentieth century, both in Chupícuaro and Cuicuilco. These collections are evaluated with high-performance instrumentation adapted to sherds and/or complete objects: techno-stylistic study based on the analytical tool of chaîne opératoire, petrographic and mineralogical characterization, a wide range of chemical analyses, and a full set of noninvasive techniques. The crossing of all these data will make it possible to overcome the limits induced by stylistic analogies.

[241] Symposium · THE BIOARCHAEOLOGY OF THE PHALERON CEMETERY, ARCHAIC GREECE: CURRENT RESEARCH AND INSIGHTS

The Phaleron Bioarchaeological Project explores the complex lifeways of Archaic Greece during a particularly volatile period, which culminated in the formation of Athens as a polis and a complex democracy. One of the largest known cemeteries of ancient Greece, the Phaleron cemetery was in use from the eighth to fourth century BCE and was situated outside the boundaries and walls of Athens. It was located approximately 4 km southwest of the Acropolis near the port of Faliro, which served Athens during this period. Between 2012 and 2017, approximately 2,000 burials were excavated by Dr. Stella Chryssoulaki of the Ephorate of Antiquities of West Attica, Piraeus, and Islands. Most of these burials were simple pit burials, but other common forms include cists, jars, and cremations. This cemetery is also known for the interment of shackled, executed individuals in graves of varied size. As the individuals from Phaleron cemetery are the first to be systematically studied from the Archaic period, this project has the unique opportunity to not only explore the lived experiences of this non-elite population but also consider the impact of fluctuating socioeconomic, political, and cultural conditions during the creation and implementation of democracy and the rise of classical Athens.

[242] Symposium · WATER MANAGEMENT IN THE ANDES: PAST, PRESENT, AND FUTURE

Water is fundamental for life on earth, and, across the Andes, its fluctuating availability shaped the development of a broad range of hydraulic technologies. The vertical landscapes of this tropical mountain range saw surface runoff channeled from the high Cordilleras to broaden hydraulic catchments, water retention in lakes and wetlands feeding wide-ranging and complex interconnected canal systems, and groundwater dug up for sunken fields and wachaque systems across salinity gradients. Based on applicability, this session showcases the potential lessons for the present from the past hydraulic technologies. Therefore, this symposium sits at the interface of technology, ecology, and civilization. We call for papers that demonstrate current thinking on Andean hydraulic technology from perspectives including, but not limited to (1) developments in water harnessing technologies; (2) climate and environmental change adaptation in the past, including synching of cultural and environmental change; (3) dormant infrastructure restoration as low-cost measures to adapt to present impacts of climate change; and (4) studies on water symbolism in iconography, mortuary, and public ritual.

[243] Symposium · ARQUEOLOGÍA COLABORATIVA EN LOS ANDES: CASOS DE ESTUDIOS Y REFLEXIONES

La arqueología colaborativa parte de una auto-reflexión crítica que fomenta cuestionar el impacto de la arqueología en las comunidades vivas que rodean los sitios arqueológicos o espacios patrimoniales. Este tipo de arqueología promueve la incorporación de un componente ético y dialogante entre la praxis de la arqueología y los intereses, necesidades y expectativas de las comunidades donde se investiga (Colwell-Chanthaphonh y Ferguson 2008; Meskell, Sibongile y Van Damme 2008). Es así, que esta sesión tiene el objetivo de reflexionar y debatir sobre la relación entre los sitios arqueológicos y las comunidades vinculadas. Se invitan iniciativas centradas en diferentes partes de América Latina que presenten experiencias colaborativas que permitan generar un debate académico sobre el rol que juegan los sitios patrimoniales y, arqueólogas y arqueólogos en el contexto regional y nacional. Este debate nos permitirá discutir la vinculación entre arqueología, patrimonio, derechos culturales, desigualdad, manejo territorial, urbanismo, entre otros. Igualmente, se incentiva las propuestas de casos de estudio donde a través de educación patrimonial, arqueología comunitaria, arqueología pública, o una combinación de estas, los espacios patrimoniales hayan fomentado sinergias entre diferentes actores interesados, municipalidades, voluntarios, grupos de vecinos, comunidades descendientes, instituciones educativas, entre otros.

[244] Symposium · INTERDISCIPLINARY APPROACHES TO ROCK ART DOCUMENTATION, RESEARCH, AND ANALYSIS

(SPONSORED BY ROCK ART INTEREST GROUP)

Current rock art research is interdisciplinary, drawing methods from various fields and knowledge from multiple lines of evidence. These approaches augment and enhance rock art documentation, offer new strategies for effective site management, and facilitate new interpretive insights for rock art provinces around the world. This Rock Art Interest Group-sponsored session provides a forum to share recent rock art research from a wide range of topics that help us to better understand and contextualize rock art, including interpretive analyses, iconographic comparisons, photogrammetric and imaging techniques, Indigenous knowledge, landscape-based approaches, spatial analysis, and radiocarbon dating. The presenters in this symposium will discuss rock art from a global perspective, including regions within the USA, Mexico, Ireland, Oman, Australia, and Guatemala to offer a shared understanding of rock art research.

[245] Symposium · ISLANDS AROUND AFRICA: STATE-OF-THE-ART AND FUTURE DIRECTIONS

Inspired by recent publications, notably Mitchell's long-anticipated and much-needed "African Islands: A Comparative Archaeology," this session seeks to bring together leading research that centralizes the contribution of, and future directions in, African island archaeology. Africa has relatively few islands compared to other continents. However, Africa's islands have been central to the cultural, material, political, and socioeconomic growth of the continent in the past, and remain so today. Presentations that promote and showcase the rigorous work that has brought to light the enduring influence of Africa's islands on the continent and the wider world are encouraged. Presentations are welcome across thematic topics but may emphasize the long history of island cultural development, environmental outcomes of archaeological research, the impacts of colonialism on African society, the dynamic and influential role of religion, cuisine, and craft on island culture, the maritime context as a mechanism for connecting African islands to the world, and how molecular studies are helping reshape our knowledge of the fascinating islands that circumvent the continent. Speakers are encouraged to devote some time to discussing how to continue renewing and reinvigorating interest in the region's islands, as well as future directions for research.

[246] Symposium · THE MARKING AND MAKING OF SOCIAL PERSONS: EMBODIED UNDERSTANDINGS IN THE ARCHAEOLOGIES OF CHILDHOOD AND ADOLESCENCE

In the last 30 years, the archaeology of childhood and adolescence has gained traction to become an effervescent part of the broader discipline of archaeology. Childhood is a crucial period of life in which identity is formed as a dialogic process of social, environmental, material, spiritual, and cultural entanglements. This session examines embodied perspectives of children and/or adolescent experiences in archaeology, recognizing the body as a key site for ways of becoming, social practices, rites of passage, and

cultural transmission and its reworkings. In line with many earlier studies of childhood in the past, this session is multidisciplinary in nature, combining biological and social approaches. It is also rooted in critical, reflexive approaches to social lives in antiquity. In particular, it seeks to emphasize the diversity, temporality, and intersectionality of the making of social persons in the past that considers the dynamics of sex, gender, kinship, community affiliations, and, of course, age.

[247] Symposium · INTERDISCIPLINARY RESEARCH INTO THE LATE PLEISTOCENE OF EUROPE

Recent years have seen a rise in cross-disciplinary research into the Late Pleistocene from across Europe including paleogenomics, stable isotopes, remote sensing, and paleoproteomics. These techniques sit alongside traditional paleoanthropological and archaeological methodologies where the fusion of traditional and novel approaches leads to new and cutting-edge research. The Late Pleistocene is a crucial period for understanding biocultural interactions, movement, and population dynamics between Neanderthals and modern humans, as well as interesting and, at the moment, still poorly understood aspects of various Upper Paleolithic peoples. These new techniques, combined with standard archaeological approaches, are particularly well suited to addressing questions about how, when, and perhaps why these groups may have interacted, as well as when and where certain cultural innovations appeared.

[248] Symposium · ANCIENT MESOAMERICAN AND ANDEAN CITIES: OLD DEBATES, NEW PERSPECTIVES

Over the past 20 years, archaeologists working in the Andes and Mesoamerica have broadened the definitions on urbanism and emphasized the social, political, and economic relations within and between urban settlements. Urban centers in these regions developed much differently from other parts of the world and as such do not conform to Western notions of urbanism. This has prompted the use of new theories, technologies, and methods. Participants in this session revisit perennial questions and debates in Americanist urban archaeology and consider how our understanding of urbanism has changed over the last 20 years. In the process, contributors might also highlight both methodological and technological innovations, the diversity of urban forms and life in ancient Mesoamerica and the Andes, and how such spaces were constituted, experienced, or perceived in the past. Themes to be explored include, among other things, the economic foundations of cities; the spatial organization of urban centers, including dispersed and low-density urbanism; the materiality of urban places and things; urban planning and infrastructures; social arrangements; identities and inequalities; the relational aspects of urban-rural assemblages; and the dynamics and tensions between top-down and bottom-up political processes.

[249] Symposium · INTERDISCIPLINARY APPROACHES IN ZOOARCHAEOLOGY: ADDRESSING BIG QUESTIONS WITH ANCIENT ANIMALS

(SPONSORED BY ZOOARCHAEOLOGICAL INTEREST GROUP [ZIG])

Zooarchaeology is a powerful subfield in archaeology that can provide critical information on a wide range of topics including past foodway practices, ancient environments, taphonomic conditions of a site, and the nature of religious and social organizations of the past. Indeed, the analysis of faunal remains is an inherent part of archaeological research, providing vital insights into past peoples and societies. Contemporary archaeological research has become increasingly interdisciplinary through the integration of disparate datasets, perspectives, and techniques from outside disciplines. What can we learn about how human activities shaped past ecosystems through the integration of faunal and ecological datasets? What does the historic and archaeological record tell us about past societies? And how do community-based research methods help answer archaeology's big questions? The goal of this session is to highlight creative approaches that address fundamental questions about past societies and human culture that cannot be answered by zooarchaeology alone.

[250] Symposium · CRAFTING ARCHAEOLOGICAL PRACTICE IN AFRICA AND BEYOND: CELEBRATING THE CONTRIBUTIONS OF ANN B. STAHL TO GLOBAL ARCHAEOLOGY

Over the last four decades, Ann B. Stahl has been at the leading edge of Africanist and Americanist archaeology. Through a series of multiple, overlapping engagements across theoretical and methodological

registers, Stahl has crafted a new kind of archaeological practice that is simultaneously community-engaged, theoretically innovative, and future-oriented. In this session, we reflect on her intellectual improvisations and how they emerged out of a commitment to community-based, long-term fieldwork in Banda, Ghana. We consider the “communities of archaeological practice” inspired and built through Ann’s work and mentorship, as well as their implications for the direction of archaeology as a whole. Key themes include (1) how pasts, presents, and futures mingle in archaeological and digital worlds; (2) interdisciplinary engagements with materiality; (3) global entanglements and taste; (4) relationality and communities of practice; and (5) archaeology and education.

[251] Symposium · “THE CENTER AND THE EDGE”: HOW THE ARCHAEOLOGY OF BELIZE IS FOUNDATIONAL FOR UNDERSTANDING THE ANCIENT MAYA

In 1841, following his first historic trip to the Maya World, John Lloyd Stephens commented that between Belize City and the “inhabited part of Central America is a wilderness, unbroken even by an Indian path” and that “residence there is more confining than living on an island” (1841:19). While spectacular architectural remains and carved monuments pertaining to the ancient Maya were almost immediately recorded in the center of the Yucatán Peninsula, coastal areas like Belize had yet to yield similar results. Thus, many early archaeologists automatically assumed that what became the modern country of Belize was peripheral or, at best, on the edge of ancient Maya development. For many researchers in the Maya area, especially in modern countries surrounding Belize, this perspective continues to be espoused with little attention being paid to the Belizean archaeological data. Yet, the archaeology that has been undertaken in Belize has contributed disproportionately and significantly to our collective knowledge of ancient Maya civilization. This session highlights the many contributions that Belizean archaeology has made to the broader area of Maya studies and demonstrates how research in Belize has been at the leading edge of scholarly debates on ancient Maya prehistory.

[252] Symposium · BRINGING THE PAST TO LIFE, PART I: PAPERS IN HONOR OF JOHN M. D. POHL

This double symposium brings together a select group of archaeologists, ethnohistorians, museum professionals, and social justice advocates who have either collaborated with John M. D. Pohl directly or took inspiration from his remarkable half-century career. A trailblazer in the study of Mixtec, Nahuatl, and Zapotec civilizations of southern Mexico, Dr. Pohl is equally noted for bringing the ancient Indigenous past of the Americas to life through his numerous publications, collaborative field research, codical studies, blockbuster exhibitions, film and media production, dazzling artwork, and not least his inspired teaching at various universities across the United States. The panels are organized around two fundamental areas that reflect John Pohl’s interdisciplinary endeavors, the first in scholarship and the second in media and advocacy. The speakers are both current and former students together with emerging and senior scholars who are currently engaged in innovative research ranging from investigations into the Classic, Postclassic, and colonial cultural transformations across Mexico, Guatemala, and the United States; the use of cutting-edge technologies in the field and lab; digital media in museums and architectural reconstructions; and Indigenous representation in the public interpretation of their cultural histories.

[253] Symposium · *SE BIG DATA AND BIGGER QUESTIONS: PAPERS IN HONOR OF DAVID G. ANDERSON

This symposium celebrates the career and contributions of David G. Anderson to North American archaeology and beyond. From humble beginnings as a technician in contract archaeology, to the National Park Service, and ultimately his professorship at the University of Tennessee, Dave has had a big impact on the field, his friends and colleagues, and students at every scale of measure. Spanning the peopling of the Americas to the historic period, he has left an indelible mark on the field of archaeology in both the cultural resource management (CRM) and academic realms. Beginning with his early work on big CRM projects, such as Richard B. Russell and Fort Polk, to his later developments of big archaeological datasets, such as the Paleoindian Database of the Americas (PIDBA) and the Digital Index of North American Archaeology (DINAA), Dave has pursued ever bigger questions about the past throughout his storied career, elevating the field and all those around him.

[254] Symposium · DEMOCRATIZING HERITAGE CREATION: HOW-TO AND WHEN
(SPONSORED BY HERITAGE VALUES INTEREST GROUP)

After decades of calls for change, archaeologists are addressing the need to change our practice around knowledge production in profound ways. Archaeological practice has benefited from collaborating with diverse stakeholders and descendant communities in producing narratives around heritage. However, this can be difficult to accomplish in compliance-based work, and few archaeologists are trained to do this work. If done well, it can lead to a more democratic production of knowledge around heritage. Democratizing heritage production involves shifting power dynamics in who “rules” over the creation of narratives and investing authority in the “people” or descendant communities. Because of archaeology’s roots in colonialism, democratizing heritage is no easy task. Participants in this session provide examples of how they have employed democratic methodologies to disciplinary practice in all stages of a project and continuing after funding has ended. These case studies offer practical, how-to advice for academic and compliance-based projects.

[255] Symposium · CERAMICS AND ARCHAEOLOGICAL SCIENCES 2024
(SPONSORED BY SOCIETY FOR ARCHAEOLOGICAL SCIENCES)

The Ceramics and Archaeological Sciences is a welcoming venue for presenting research and insight on all aspects of ceramic analysis, production, consumption, and trade and their economic, political, social, aesthetic, cosmological, and phenomenological implications. Ceramics are one of humanity’s most durable products. The abundant geological presence, variability, and plasticity of their main ingredient—clay—have afforded humans in diverse world areas and times remarkable creativity and space for social expression through its manufacturing process. As a result, they are invaluable to scholars in answering diverse research questions supported by archaeological sciences, anthropological methods, and theories. In this session, supported by the Society for Archaeological Sciences, participants will approach these questions and present new data on ceramics, methodological applications, and theoretical insights.

[256] Symposium · ADVANCES IN MACROBOTANICAL AND MICROBOTANICAL ARCHAEOBOTANY PART I
(SPONSORED BY ARCHAEOBOTANY INTEREST GROUP)

This symposium, sponsored by the Archaeobotany Interest Group, provides a forum for the dissemination of recent methodological and theoretical innovations in both macrobotanical and microbotanical archaeobotany. Papers in this symposium span time and world regions and address the full range of research questions explored in archaeobotany, in order to display the current state of the field. The symposium welcomes the work of early-career scholars and established researchers alike, and invites presentations from academic, public, community, and compliance archaeology. The goal of this session is to explore recent developments in the study of human-plant interactions, and we welcome papers that highlight new archaeological case studies or new analytical techniques.

[257] Symposium · EXPERIMENTAL PEDAGOGIES: TEACHING THROUGH EXPERIMENTAL ARCHAEOLOGY PART I

Experimental archaeology has become a burgeoning field that has answered significant questions about human experience driven by the same curiosity, ingenuity, and creativity that allowed our ancestors to thrive. It has also captured the public imagination and provides thousands with a tangible link to a multitude of imagined pasts. This session aims to explore how archaeologists create those tangible links through experiential learning in the classroom, our communities, and our research sites. Papers will focus on the role of experimental archaeology in teaching students, stakeholders, and the general public about the activities of the archaeological past.

[258] Symposium · ACTIVATING HERITAGE: ENCOURAGING SUBSTANTIVE PRACTICES FOR A JUST FUTURE

Heritage isn’t a static reflection of some real (or imagined) past. Heritage does things: it engenders community, teaches history, celebrates diversity; it can also exclude people, reproduce ideologies, and create silences. Heritage is not a thing in itself but rather a set of relations (to the past and each other) that act on

and in the world. Nor is heritage beholden to the conventional disciplinary boundaries of archaeology. Instead, it puts archaeology to work in the world. Recognizing heritage's role as a nexus of social action, this session asks how archaeologists can engage in more substantive heritage practices that aim to dismantle systems of oppression and actualize a more just future. Individual papers present Indigenous and descendant community collaborations, projects that help transcend histories of conflict, and work that brings to light oppressed and silenced narratives. Contributors also offer critiques on archaeology itself, the limitations of heritage work, and the importance of redressing its failures. Reflecting on how archaeologists can and should conduct their work, the papers in this session generally share a pragmatic view that emphasizes not only how heritage does act in the world but how it might act more readily toward consciously anti-oppressive and even liberatory aims.

[259] Symposium · PAST HUMAN-SHARK INTERACTIONS

Shark remains from archaeological sites are not normally focused on, and this symposium will address that study gap. We bring together zooarchaeologists whose research has included sharks to stimulate idea exchange and further the field as a whole. Sharks were eaten, their vertebrae were used as beads and pendants, their skin used as shagreen, and their teeth were used in weaponry, jewelry, and as magico-religious items. Shark teeth in particular were traded to inland areas. Capture methods were unique among fin-fishers and included a range of unique fishing gear such as large wooden hooks, small dugout canoes, and sometimes shark rattles. Although most sharks were captured from warmer marine waters, some were also caught in more temperate areas, and so this symposium will appeal to a wide range of archaeologists.

[260] Symposium · THE COLUMBIAN EXCHANGE REVISITED: ARCHAEOLOGICAL AND ANTHROPOLOGICAL PERSPECTIVES ON EURASIAN DOMESTICATES IN THE AMERICAS

(SPONSORED BY AMERICAN ANTHROPOLOGICAL ASSOCIATION ARCHAEOLOGY DIVISION)

Over the past millennia, human communities around the globe have been profoundly impacted by increasing reliance on and entanglement with a broad range of domestic animals. In Eurasia, the early domestication of livestock like cattle, pigs, and caprines and more recent events like the domestication of horse in the Black Sea region, have conditioned diet, material culture, mobility, and worldview. Over the past few centuries, the spread of Eurasian domesticates into the Americas has occurred alongside the expansion of European colonialism—at times reinforcing the colonial project, and at other times facilitating Indigenous sovereignty and resistance. The expansion of these species in these new regions, and their adaptation to and adoption by Indigenous cultures, has often been partially chronicled in the historical record, positioning faunal analysis as an important source of insights into this key transition. This session will explore the dispersals of domestic animals in the Western Hemisphere and their roles in both colonial and Indigenous spheres through a zooarchaeological and anthropological perspective.

[261] Symposium · THE BOLONCHEN REGIONAL ARCHAEOLOGICAL PROJECT: 25 YEARS OF RESEARCH IN THE PUUC

The Bolonchen Regional Archaeological Project (BRAP) will complete its twenty-fifth year of research in the Puuc Region of the northern Maya lowlands in 2024. Codirected by Tomás Gallareta Negrón, William Ringle, and George J. Bey III, the BRAP has addressed a wide range of issues relating to the development and evolution of social complexity in the Puuc. Project findings have demonstrated that monumentality emerged in the region as early as 800 BC and that the Puuc experienced its own trajectory of demographic ebbs and flows up through a Terminal Classic period population boom. Extensive lidar coverage has ushered in a new phase of research, expanding the territorial and theoretical scopes of the project. Pursuing an integrative and extensive regionwide approach, the BRAP has overseen investigations at the sites of Kiuic, Xocnaceh, Yaxhom, Huntichmul, Muluchtzekel, Kom, and Paso del Macho, among others. Beyond its scholarly contributions, the BRAP has implemented a community engagement and environmental stewardship approach through its management of the Kaxil Kiuic Biocultural Reserve. In this session, BRAP-affiliated archaeologists review research milestones, present syntheses of findings from 25 years of research, and offer a vision for the next quarter-century of archaeological investigations in the Puuc region.

[262] General Session · ARCHAIC PERIOD IN THE WESTERN UNITED STATES**[263] General Session · ARCHAEOLOGICAL LANDSCAPES, HUMAN-ENVIRONMENT RELATIONS, AND SOCIAL RELATIONS IN OCEANIA AND AUSTRALIA****[264] Poster Session · ICONOGRAPHY, RITUAL, AND RELIGION****[265] Poster Session · LITHIC ANALYSIS PART I****[266] Poster Session · LITHIC ANALYSIS PART II****[267] Poster Session · CULTURAL RESOURCES AND HERITAGE MANAGEMENT AROUND THE WORLD****[268] Poster Session · WHAT'S ON THE MENU? PART III: FAUNAL ANALYSIS AND OTHER ANIMAL PRODUCTS****[269] Poster Session · CULTURAL RESOURCES AND HERITAGE MANAGEMENT IN THE AMERICAS****[270] Poster Session · MARS GENERAL MILITARY CRM POSTER SESSION**
(SPONSORED BY MILITARY ARCHAEOLOGICAL RESOURCES STEWARDSHIP INTEREST GROUP)

The Department of Defense's responsibility of cultural resources management and stewardship is a constantly changing and expanding challenge. As a federal agency, regulatory compliance, particularly the stewardship of archaeological resources, is a primary concern for DoD cultural resource management within a changing military environment of mission directives, goals, and challenges. Researchers within and outside of the DoD offer expertise and interest that can significantly assist the agency achieve its CRM responsibilities while maintaining military readiness.

[271] General Session · ETHNOARCHAEOLOGY AND CULTURAL HERITAGE IN THE ARCHAEOLOGY OF ASIA**[272] General Session · MORTUARY ANALYSIS****[273] General Session · TEOTIHUACAN AND ITS CENTRAL MEXICAN PREDECESSORS****[274] Forum · BEYOND ACADEMIA: PRACTICING ZOOARCHAEOLOGY IN NONACADEMIC SPACES**

(SPONSORED BY ZOOARCHAEOLOGY INTEREST GROUP)

What does it mean to work as a zooarchaeologist outside of academia? In the field of cultural resource management and other nonacademic spaces, the analysis and interpretation of faunal remains is considered a specialized and often unnecessary type of analysis. When zooarchaeologists are working with shorter project timelines and limited budgets, it can be a challenge to communicate the importance of zooarchaeological data to non-practitioners. Through collaboration with academic zooarchaeologists, it is possible to build a stronger foundation for the application of these data as a regular part of archaeological interpretation. With testimonials from professionals who have practiced zooarchaeology in both academic and nonacademic settings, this forum highlights the ways in which zooarchaeological method and theory can contribute to our work as archaeologists outside of the classroom and addresses the gap between academic and nonacademic zooarchaeology.

[275] Symposium · THE PAST, PRESENT, AND FUTURE OF WATER SUPPLIES

The Earth's population has hit 8 billion people at the same time that our climate is changing. How will governments ensure adequate supplies of clean water while some regions are becoming drier and others are

experiencing increased flooding? In this session, we present insights into the past, present, and future of water supplies using archaeological case studies across space and time. Supplying water to populations is often wrapped in local politics, requiring decisions as to who gets water and how much can be taken. Oftentimes the water source is far from the consumption point, requiring control of vast territories to ensure adequate supplies. The storage of water can be essential to a population's resiliency, but capturing water for future use requires engineering as well as conservation measures. Excessive consumption of water is often a symbol of power and prestige, but it may signal that others are going thirsty. Such lessons can be part of water heritages that teach current and future generations about the dangers of overconsumption.

[278] General Session · HISTORICAL ARCHAEOLOGY IN THE CARIBBEAN

[279] General Session · MISSISSIPPIAN PERIOD ARCHAEOLOGY IN THE US SOUTHEAST

[280] Forum · CREATING FAIR AND CAREING ZOOARCHAEOLOGICAL DATA: CHALLENGES AND SOLUTIONS

Zooarchaeological data is pivotal to answering the key anthropological questions, but it is derived using research methods from across the sciences and humanities, cross-cutting all world areas, time-periods, and cultures. It is used to understand the past while tackling the problems of the present and future. In order reach our full potential, zooarchaeological data must be made openly available for integration across disciplines, methods, and communities: it must be FAIR (Findable, Accessible, Interoperable, and Reusable). But it is also very clear that open-access zooarchaeological data must meet ethical guidelines for inclusivity and appropriate use, such as those defined in the CARE principles (Collective Benefit, Authority to Control, Responsibility, Ethics). This is a tall order, but it is essential to the future of our discipline. In this discussion-based forum, we aim to explore challenges and solutions for creating zooarchaeological data that meets the requirements of both FAIR and CARE principles. Forum goals include to (1) provide known solutions for some of the common challenges, (2) form collaborations to tackle challenges for which solutions are possible in the near future, and (3) create a forum for learning about community-voiced challenges.

[287] Poster Session · CERAMIC PETROGRAPHERS IN THE AMERICAS: RECENT RESEARCH AND METHODOLOGICAL ADVANCES

The Ceramic Petrographers in the Americas (CPA) is a network of scholars based across North and South America who are committed to the use and advancement of optical petrography in the analysis of ceramic assemblages from anywhere in the world. Having maintained a consistent presence at the SAA meetings since our first poster session back in 2018, this year's session showcases not only what petrographic data can tell us about the selection of raw materials and manufacturing techniques but also the wide array of additional

characterization methods used to determine the source of those materials (e.g., neutron activation analysis, portable X-ray fluorescence, spectroscopy, X-ray diffraction, and thermoluminescence). The research featured here involves projects based in the southeastern and southwestern United States, Jamaica, Peru, Colombia, Argentina, and Egypt. From the crafting of communities to geoarchaeological and chronological applications to the potential for automating data collection, the posters in this session highlight the variety of questions being addressed by this niche group of specialists whose expertise can never be fully replaced by artificial intelligence.

[288] Symposium · ADVANCES IN MACROBOTANICAL AND MICROBOTANICAL ARCHAEOBOTANY, PART II

(SPONSORED BY ARCHAEOBOTANY INTEREST GROUP)

This symposium, sponsored by the Archaeobotany Interest Group, provides a forum for the dissemination of recent methodological and theoretical innovations in both macrobotanical and microbotanical archaeobotany. Papers in this symposium span time and world regions and address the full range of research questions explored in archaeobotany in order to display the current state of the field. The symposium welcomes the work of early-career scholars and established researchers alike, and invites presentations from academic, public, community, and compliance archaeology. The goal of this session is to explore recent developments in the study of human-plant interactions, and we welcome papers that highlight new archaeological case studies or new analytical techniques.

[289] Symposium · THE CURRENT STATE OF ARCHAEOLOGICAL RESEARCH ACROSS SOUTHEAST ASIA

(SPONSORED BY SOUTHEAST ASIAN ARCHAEOLOGY INTEREST GROUP)

From Myanmar to the Philippines, Southeast Asia encompasses a deep history with a wide set of cultures. Over the last few decades, archaeological research in this area has experienced significant advancements in terms of theoretical approaches, methodological developments, and archaeological discoveries. New and continuing scholars and field projects have been substantially contributing to an evolving archaeological dataset. In an endeavor to present the rapidly changing state of archaeological discourse, a collection of scholars will discuss the progression and findings of research within their areas of interest. In this fashion, a diversity of topics will be presented from recent archaeological fieldwork throughout Southeast Asia. This will also assist in a continued effort to encourage a flourishing community of developing and established scholars.

[290] Symposium · WAYS TO DO, WAYS TO INHABIT, WAYS TO INTERACT: AN ARCHAEOLOGICAL VIEW OF COMMUNITIES AND DAILY LIFE

Archaeology reconstructs ancient daily life through material culture. The objects, spaces, and evidence of social interaction make the history of the people and community and are appreciable sources for the reconstruction of social history. The study of daily life refers to the transformation of cultural forms (objects, architecture, landscape, language, interactions) created by humans in society to satisfy their material, emotional, and spiritual needs. The study of objects through a technological perspective provides information about the persons, their needs, traditions, identity, and ritual economy. The study of urbanism and landscape looks at people's interactions in urban space and how the space is conceived, built, and inhabited by people. Interactions are essentially communication processes involving the movement of information, people, and even objects. In a dynamic of interaction, the cultural and information transmission process (which, in its broadest sense, includes technological knowledge, rituals, and symbolic concepts) becomes quite complex. In this round table we will discuss technology, language, people, landscape, urbanism, and local and long-distance interactions from different theoretical perspectives in West Mexico. The objective is to open a space for young researchers to present new proposals to get closer to the knowledge and understanding of the past.

[291] Symposium · MOUNTAINS, RAIN, AND TECHNIQUES OF GOVERNANCE IN MESOAMERICA

Mountain shrine sites have a deep history in Mesoamerica going back to the Preclassic and likely earlier. Along with the widespread proliferation of intensive agriculture, mountain sites such as Chalcatzingo appear

to be related to rain rituals, human sacrifice, and perhaps even the kinds of warfare that might produce sacrificial victims. These mountain sites often feature excellent vistas from which trade routes can be monitored visually, game-identified, and enemies checked. According to research over the last two decades, it is clear that Teotihuacan built up these sites as a technique of governance during its expansion into Oaxaca, the Isthmus of Tehuantepec, the Yucatán Peninsula, and perhaps points west. The mountain or hill sites tend to relate to Tlaloc and rain rituals, warfare, obsidian, and prime lookouts, a trend also common for the Early Classic Maya. The Postclassic peoples of Central Mexico, such as the Aztecs, may have carried on these traditions. Our session explores the proposed patterns as culture-specific or pan-Mesoamerican in nature via comparisons of site and artifact data from throughout Mesoamerica but with a special focus on Teotihuacan Expansion during the Classic period.

[292] Lightning Round · ONE HUNDRED YEARS OF EXCELLENCE: THE MIDDLE AMERICAN RESEARCH INSTITUTE AT TULANE UNIVERSITY

The Middle American Research Institute (MARI) at Tulane University has had the mission of developing innovative research, promoting responsible stewardship, and increasing appreciation for the indigenous cultures of Mexico and Central America since its inception in 1924. As evidenced by its 100-year history of groundbreaking scholarly efforts, it is one of the oldest academic institutions in the United States focusing on indigenous cultures of Mexico and Central America. MARI began supporting archaeological, ethnographic, and linguistic research in Mesoamerica through projects, expeditions, and field surveys in the 1920s. These traditions have continued without interruption to the present day. One of MARI's primary responsibilities, in addition to research, has been the proper care of the irreplaceable and one-of-a-kind archaeological and ethnological collections entrusted to it. It has also amassed an invaluable archive of documents, photographs, drawings, and notes that shed light on the professionalization of anthropological disciplines in North America. This lightning-round session includes comments from students, researchers, and colleagues who have been inspired, encouraged, and aided by the Institute's support of a diverse and interdisciplinary approach to the study of Mesoamerica.

[293] Symposium · TRANSFORMATIONS IN PROFESSIONAL ARCHAEOLOGY

Our profession is rapidly changing. Professional archaeology is currently amid a period of significant transformation. This symposium addresses the current changes in professional archaeology brought on by the effects of social justice movements, inclusion/diversity/equity initiatives, projected and current labor shortages in the private sector/consultant spaces, increased collaboration with descendant communities, prioritized safety in workplaces, disconnects between formal education/training and professional skills/responsibilities, our contribution to climate change, sustainability, and resiliency policy, infrastructure legislation and the effects on CRM/HRM industry, the focus on wellness in career management, the renewed emphasis on professional conduct and accountability, and changing views of mental health including substance use disorders. The impacts of the above, among other current issues, are resulting in a sea change for our profession and our careers. This session aims to give voice to some of these topics and the effect on the profession of archaeology—today and into the future. This is not a symposium about theoretical trends in archaeology but rather about the forces shaping professional archaeology today.

[294] Symposium · EXPERIMENTAL PEDAGOGIES: TEACHING THROUGH EXPERIMENTAL ARCHAEOLOGY PART II

Experimental archaeology has become a burgeoning field that has answered significant questions about human experience driven by the same curiosity, ingenuity, and creativity that allowed our ancestors to thrive. It has also captured the public imagination and provides thousands with a tangible link to a multitude of imagined pasts. This session aims to explore how archaeologists create those tangible links through experiential learning in the classroom, our communities, and our research sites. Papers will focus on the role of experimental archaeology in teaching students, stakeholders, and the general public about the activities of the archaeological past.

[295] Symposium · “THE CENTER AND THE EDGE”: HOW THE ARCHAEOLOGY OF BELIZE IS FOUNDATIONAL FOR UNDERSTANDING THE ANCIENT MAYA, PART II

In 1841, following his first historic trip to the Maya World, John Lloyd Stephens commented that between Belize City and the “inhabited part of Central America is a wilderness, unbroken even by an Indian path” and that “residence there is more confining than living on an island” (Stephens 1841:19). While spectacular architectural remains and carved monuments pertaining to the ancient Maya were almost immediately recorded in the center of the Yucatan Peninsula, coastal areas like Belize had yet to yield similar results. Thus, many early archaeologists automatically assumed that what became the modern country of Belize was peripheral or, at best, on the edge of ancient Maya development. For many researchers in the Maya area, especially in modern countries surrounding Belize, this perspective continues to be espoused with little attention being paid to the Belizean archaeological data. Yet, the archaeology that has been undertaken in Belize has contributed disproportionately and significantly to our collective knowledge of ancient Maya civilization. This session highlights the many contributions that Belizean archaeology has made to the broader area of Maya studies and demonstrates how research in Belize has been at the leading edge of scholarly debates on ancient Maya prehistory.

[296] Symposium · THE PROBLEM OF THE MONUMENT: WIDENING PERSPECTIVES ON MONUMENTALITY IN THE ARCHAEOLOGY OF THE ISTHMO-COLOMBIAN AREA

The first millennium CE witnessed incipient forms of monumental traces across landscapes of the Isthmo-Colombian Area, from parts of Honduras to Colombia. Still today, mounds and rock art remain the most visible traces of indigenous pasts. This symposium brings together recent research from various parts of this area and with different archaeological foci. The symposium is intended to capture a wider scope of the notion of monumentality, going beyond form and history to include studies that expand into discussions of durable traces, such as rock art, larger geomorphological features, and crossing over between material categories as, for example, stone, sediments, aquatic environments, and particular biotic spheres. The symposium asks if such features human-made or human-regarded are also monumental by positing that such durable traces define or make spaces. By doing so, the symposium intends to argue that the physical surroundings of Central America and Colombia were filled with natural features and physical forms that recalled time, as things from earlier, and structured human movement, as orienting way signs.

[297] Symposium · BUILDING BRIDGES: PAPERS IN HONOR OF TERESITA MAJEWSKI

Inspired by Teresita Majewski’s many contributions to the discipline of archaeology—especially in the areas of historical archaeology and cultural resource management—the papers in this session advance our understanding of pivotal issues in those fields. Contributors explore the central themes of Majewski’s work, including questions about variation in ceramics, food heritage and food tourism, colonialism, consumerism, collections management, tribal consultation, and the ethical and practical challenges facing the global industry of heritage management. Reflecting on her legacy of professional service and mentorship, these papers also consider how much this “invisible work” has and continues to shape our field.

[298] Symposium · IN DEFENSE OF EVERYTHING! CONSTRUCTIVE ENGAGEMENTS WITH GRAEBER AND WENGROW’S PROVOCATIVE CONTRIBUTION

“The Dawn of Everything” by David Graeber and David Wengrow has been one of the most widely read and impactful archaeological books published in recent years. The book has been enthusiastically received by the general public but has received both praise and criticism within the academic community. Many critiques of the book have focused on specific disagreements with respect to the ethnographic or archaeological record, rather than discussing the book’s main arguments and theoretical contributions. In this session we seek to engage with the book’s overarching ideas and move forward its core claims for the diversity of human social organization and lived experiences. We bring together scholars from around the world who have found the book’s claims both provocative and useful. We hope that participants will not only discuss the book’s arguments but also expand these concepts to other archaeological cases. Our goal is to build constructive criticism and foster an engaging discussion that moves these concepts and contributions forward toward a better understanding of our shared past and wider understandings of the possibilities for future forms of social relations.

[299] Symposium · BEYOND BORDERS AT THE END OF A MILLENNIUM: LIFE IN THE WESTERN ANDES CIRCA 500–50 BCE

Borders and boundaries—political, temporal, environmental, stylistic—have shaped the trajectory of Andean archaeology. While archaeologists seek to communicate beyond such boundaries, the late Early Horizon/Final Formative (ca. 500/400–200/50 BCE) remains a period in Andean history in which geographic boundaries continue to shape dialogue. This session moves beyond the invisible boundaries and opens dialogue across western South America. The only boundary suggested for this session is to address contexts dating to part of the ca. 500/400–200/50 BCE date range. Generally, findings on this time range have identified intensification of trade, exchange, and migration; marked differences in food patterns, metallurgy, and craft work (beyond gold); increased fortifications; and the emergence of social inequality. This session seeks to move beyond relationships with / events following the collapse of Chavín. It is productive to identify what groups shared across the Andes to truly appreciate their local differences and what those differences mean for the trajectory of Andean history. This session brings archaeologists of various regions, specialties, and countries together to explore the commonalities and differences beyond temporal, political, environmental, and stylistic boundaries to have regionally robust dialogue.

[300] Symposium · HUMAN REMAINS IN THE MARKETPLACE AND BEYOND: MYTHS AND REALITIES OF MONITORING, GRAPPLING WITH, AND ANTHROPOLOGIZING THE ILLICIT TRADE IN A POST-HARVARD WORLD

Human remains as curios have a long history. Following recent revelations about and arrests for trading in donated individuals' remains from medical institutions, the archaeological component of the human remains trade is again under scrutiny. Scholars have researched isolated aspects of this illicit trade, often focusing on Indigenous remains, case studies, and broad issues of the commodification of these items. This symposium gathers diverse perspectives on these issues that analyze and contextualize this trade, reviewing existing and proposed new means for monitoring and stemming the human remains market, particularly relating to elements derived from archaeological and cemetery contexts. Individual presentations include ethical considerations of the human remains marketplace; analytical examinations of various human remains markets; grappling with anthropology's own troubled past with regard to human remains; fitting traded remains into a biohistorical narrative; identifying and consulting descendant communities regarding proper treatment and disposition of remains; and fitting the marketplace within legal schemes to ensure that enforcement occurs. Discussions of these efforts among the broader changes occurring in anthropology and bioarchaeology, the trafficking of human remains is again ripe for consideration to ensure that enough protection of these remains exist and that their humanity does not get lost during commodification.

[301] Symposium · THE ARCHAEOLOGY OF PROPERTY REGIMES

Under what conditions do property regimes come to be defined? What precipitates their emergence, transformation, or collapse? What kinds of property regimes facilitate sustainable resource management? Under which kinds is sustainability unachievable? Here we engage with a wide body of work on property regimes (including themes of land tenure, property rights, common pool resources, etc.) and leverage the archaeological record to facilitate a comparative perspective on, and to productively theorize, long-term histories of resource governance. Property regimes are arrangements that define rules, distribute rights, and delineate roles with respect to particular goods. These arrangements are often formalized through key institutions responsible for the management of resources, whether lineages, councils, communities, or more complex forms of government and bureaucracy. Variability in the management of resources can be measured across (1) the resources or goods being managed (e.g., abundance, distribution, labor requirements) and (2) the characteristics of key institutions through which rules, roles, and rights are determined. Through these two dimensions, property regimes can be formally assessed and compared. How open or closed are they? What are their degrees of flexibility, stringency, durability? Are they structured from the top down or bottom up? What are the ecological contexts? How are regimes enforced?

[302] Symposium · BRINGING THE PAST TO LIFE, PART 2: PAPERS IN HONOR OF JOHN M. D. POHL

This double symposium brings together a select group of archaeologists, ethnohistorians, museum professionals, and social justice advocates who have either collaborated with John M. D. Pohl directly or took inspiration from his remarkable half-century career. A trailblazer in the study of Mixtec, Nahua, and Zapotec civilizations of southern Mexico, Dr. Pohl is equally noted for bringing the ancient Indigenous past of the Americas to life through his numerous publications, collaborative field research, codical studies, blockbuster exhibitions, film and media production, dazzling artwork, and not least his inspired teaching at various universities across the United States. The panels are organized around two fundamental areas that reflect John Pohl's interdisciplinary endeavors, the first in scholarship and the second in media and advocacy. The speakers are both current and former students together with emerging and senior scholars who are currently engaged in innovative research ranging from investigations into the Classic, Postclassic, and colonial cultural transformations across Mexico, Guatemala, and the United States; the use of cutting-edge technologies in the field and lab; digital media in museums and architectural reconstructions; and Indigenous representation in the public interpretation of their cultural histories.

[303] Symposium · ENTANGLED LEGACIES: HUMAN, FOREST, AND TREE DYNAMICS

Globally, communities have often surrounded their everyday habitats, their sociopolitical centers, their burial grounds, and their sacred sites with symbolic and/or economically useful trees and plants. Archaeological perspectives demonstrate how cultural land use was a driver of ecosystem change through time. For example, forests once considered "wild" are now in many regions seen as the direct reflection of past human activity, as communities actively managed forested foodsheds and woodlands with important economic use. In other instances, trees can remain the longest lasting legacy of otherwise short-term occupations. This session gathers scholars of diverse regions of the world and temporal foci who apply varied data sources (archaeological, anthropological, and historical or a combination thereof) to speak to the importance of particular tree species for ceremonial and/or quotidian use or to the management of forests as cultural and natural landscapes. Papers highlight particular methods (e.g., GIS, anthracology, botanical surveys, pollen analysis, community engagement), theoretical perspectives (e.g., nonhuman object agency, historical ecology), and/or specific themes (settlement pattern analysis, spatial analysis, phenomenology, cultural landscapes) in their exploration of human-forest-tree dynamics.

[304] Symposium · AD 1150 TO THE PRESENT: ANCIENT POLITICAL ECONOMY TO CONTEMPORARY MATERIALITY—ARCHAEOLOGICAL ANTHROPOLOGY IN HONOR OF JEANNE E. ARNOLD

This symposium honors the legacy of Jeanne E. Arnold, a leading voice in California archaeology and a remarkably impactful mentor who made an indelible impact on the field of archaeological anthropology. On the whole, Jeanne's scholarship reframed complex hunter-gatherer-fisher societies as not mere exceptions to normative cultural evolutionary patterns but rather exemplars of creative social, political, and economic strategies that defy easy generalization and complicate expectations of agriculture as requisite to the emergence of institutionalized power differentials in and among human societies. Jeanne wrote and published prolifically, contributing seven books and 70 articles and book chapters to myriad theory-imbued discussions—technological innovation, craft specialization, the evolution of leadership, the organization of household labor, apprenticeship, consumption and leisure, and contemporary materializations of meaning and identity, among others. This impressive record of scholarship includes numerous publications with her students as well as with scholars from a wide swath of disciplines, demonstrating a remarkable commitment to collaborative, interdisciplinary approaches to studying the human condition. This symposium brings together an ensemble of scholars whose collective work exemplifies the dispositions, methodological rigor, analytic approaches, and theoretical foci pursued and championed by Jeanne E. Arnold.

[305] Symposium · IDEAS, ETHICAL IDEALS, AND MUSEUM PRACTICE IN NORTH AMERICAN ARCHAEOLOGICAL COLLECTIONS

(SPONSORED BY SAA COMMITTEE ON MUSEUMS, COLLECTIONS, AND CURATION)

The concepts of “collecting” and “collections” are integral both to museums and to archaeological practice, and North American museums and repositories curate an immense quantity and variety of archaeological material. The curation of collections and the use of collections in research, both envisioned as preservation of the archaeological record, are enshrined in the SAA’s “Principles of Archaeological Ethics.” At the same time and in tension with this ethical ideal, archaeology has a widely acknowledged “curation crisis” that encompasses shortages of space, funding, and labor. Moreover, museums and the wider discipline of archaeology struggle to develop practices that address the colonial legacies that are embodied in archaeological collections. This session will seek explore the ideas and ideals—tacit or explicit—that underlie archaeological collections in North American museums and repositories, how the reality of collections and curation practice articulates with those ideas, and how understanding these ideas can help shape our approaches to the materials in our care and the collections we accept in the future.

[306] Symposium · THE GLOBAL “IMPACT” OF PROJECTILE TECHNOLOGIES: UPDATING METHODS AND REGIONAL OVERVIEWS OF THE INVENTION AND TRANSMISSION OF THE SPEAR-THROWER AND THE BOW AND ARROW

(SPONSORED BY LITHIC TECHNOLOGY AND ANALYSIS)

Only hominids can effectively propel objects through space—projectile weapons have helped us occupy nearly every ecosystem on the planet. The most radical refinement to this armament was the bow and arrow, which is exclusive to *Homo sapiens*. Tracking these technologies in the past is a key challenge in global archaeology. This worldwide session encourages large-scale comparative perspectives. We invite papers that discuss methods, comparative baselines, and metric thresholds for more reliably identifying weapon systems based on projectile point measurements, regional overviews on the initial invention and cultural transmission of projectile technologies, relationships with other coincident changes (for example, demographic and economic shifts such as domestic plants and animals), and the impact of projectile technologies on conflict and war. In most regions, bows replaced spear-throwers, while in some regions they coexisted. Refined chronologies are key pieces to this puzzle, which allow us to better track independent inventions, the pace of cultural transmission, and whether other changes came before or after the initial appearance of new weapon systems.

[307] Symposium · CURRENT RESEARCH AND CHALLENGES IN ARCTIC AND SUBARCTIC CULTURAL HERITAGE STUDIES

In the Arctic and Subarctic, archaeological research and related field actors face similar challenges, responsibilities, and ethical concerns, despite a diversity of regional contexts and local specificities. Various established and early career professionals and students—archaeologists, historians, conservators, curators, site and museum administrators, and others—are invited to share their personal experiences and reflections regarding significant changes, current scopes and stakes, and new developments of archaeological research and heritage management in the circumpolar regions. The papers presented in this session are a sampling of the issues pertaining to the organization of past and ongoing research at various stages, such as elaborating research projects and fieldwork, public outreach, data and collections management, and museum studies. We also address recent advances in specific tools and methods that can be applied to cultural heritage studies.

[308] Symposium · BIG IDEAS TO MATCH OUR FUTURE: BIG DATA AND MACROARCHAEOLOGY

The archaeological record is uniquely positioned to answer big questions about human cultural change due to the vast spatial and temporal scope of the data. As such, anthropologists are increasingly analyzing and building large comparative archaeological datasets. Such broadscale analyses and syntheses of existing work have been proposed as key to answering questions about human behavior and evolution that are well outside the domain of other scientific fields. However, this kind of approach presents novel challenges; from what theories should guide our research, to how data should be collected, to how data should be analyzed and stored for posterity. In this session we invite researchers taking macroscale approaches to studying human

culture and behavior to present on new findings, challenges, and solutions. Our goal is to provide a summary about the state of the art of macroscale archaeological research.

[309] General Session · PRECLASSIC OLMEC AND MAYA

[310] General Session · WATER RESOURCES AND WATER MANAGEMENT

[311] General Session · HISTORIC PERIOD ARCHAEOLOGY IN THE NORTHEASTERN UNITED STATES

[312] General Session · HISTORIC PERIOD ARCHAEOLOGY AND CULTURAL HERITAGE IN THE US SOUTHEAST

[313] Forum · HOW TO GO FROM THE CLASSROOM TO THE PROFESSION: WHAT YOU NEED TO KNOW

Archaeology is changing. Technological advances, emerging social issues, and changes in the legal framework are drastically changing how archaeology is practiced. The result is expanded employment opportunities, most of which are in cultural resource management (CRM) and outside of academia. Regardless, such opportunities are highly competitive. Consequently, students entering the profession need to understand these new opportunities and what they need to know to transition from being a graduate student to a professional. This forum brings together professionals representing different aspects of the discipline to discuss where the profession is today and what is needed to succeed. The forum is aimed at those who have recently received their degree or are about to graduate and are trying to transition into the profession. The session will explore career opportunities and the skill sets graduates need to launch and advance their career.

[314] General Session · MESOAMERICAN SOCIOPOLITICAL ORGANIZATION

[315] General Session · ARCHAOMETRY AND MATERIALS ANALYSIS IN ASIA

[316] General Session · GEOARCHAEOLOGICAL APPROACHES TO THE PALEOAMERICAN PERIOD

[317] Symposium · *SE STAKES AND STONES: CURRENT ARCHAEOLOGICAL APPROACHES TO FISH WEIR RESEARCH

Mass capture strategies for fishing have been documented worldwide and in nearly every aquatic setting including riverine, estuarine, and coastal environments. In particular, fish weirs have been in use for millennia and their archaeological remains have been documented across North America, though their location, visibility, and material disposition have contributed to a lack of sustained archaeological attention. The papers in this symposium highlight recent efforts to document fish weirs in North America and situate these sites within the cultural landscape.

[318] General Session · HUMAN-ANIMAL RELATIONS

[319] General Session · ZOOARCHAEOLOGY IN NORTH AMERICA

[320] General Session · MESOAMERICAN LANDSCAPES

[321] General Session · DIGITAL ARCHAEOLOGY IN MESOAMERICA

[322] Forum · EXPLORING THE POTENTIAL FOR SENSORY ARCHAEOLOGY WITH MULTIMODAL APPROACHES, INCLUDING ETHNOARCHAEOLOGICAL MUSIC, IN THE AMERICAS

This forum will bring together archaeologists, ethnographers, musicologists, epigraphers, art historians, and other researchers to examine traces of sound production and other sensory elements associated with performances, ceremonies, and everyday life throughout the Americas. We will explore sociopolitical, geographic, and cultural contexts for evidence of sensory events. Scholars working with soundscapes, songbooks, musical instruments, visual representations, and other traces of sensory activity will share their perspectives, working to develop multidisciplinary avenues of inquiry informed through various multimodal approaches including what South American music scholar Dale Olsen characterized as “ethnoarchaeological music.” Olsen (2002:22) defines ethnoarchaeological music as “the cultural and interpretive study of music from archaeological sources.” Much like food, sensory cultural events and practices are shared when communities interact locally, regionally, and over great distances. Innovative techniques and technologies in the production of sensory events travel along trade routes and with migrating communities. This forum seeks to connect researchers studying Mesoamerica to examine the evidence of innovations and shared traditions in the archaeological record, thorough visual cultures and iconography, and documented in ethnographic narratives, to develop a broader understanding of multimodal practices across time in the region. This cross-disciplinary and geographically diverse conversation will open new possibilities in the field.

[323] Symposium · ARCHAEOLOGICAL APPLICATIONS OF NETWORK ANALYSIS

Within the last 25 years, archaeologists have begun to use powerful computers and sophisticated statistical algorithms to identify network structures in archaeological data. This network analysis enables us to better study human interactions and the diffusion of information and cultural traditions from the scale of individuals to whole societies. Network analysis also allows archaeologists to infer the strength and direction of relationships among nodes (e.g., individuals or social units) and ties (e.g., kinship or shared identities) at multiple scales. Measures of centrality permit the identification of nodes that exert a strong influence on the structure of a network, often leading archaeologists to interpret such nodes as individuals or geographical centers of prestige, information, goods, and/or power. Researchers’ approaches to selecting archaeologically visible behavior for study, abstracting those data into formal network concepts, and transforming the archaeological data into network data varies greatly. This symposium illustrates diverse archaeological uses of network analysis and demonstrates the sophisticated interpretations of human behavior that such an approach can facilitate.

[324] General Session · ARCHAEOLOGIES OF MILITARY CONFLICT**[325] Symposium · TAPHONOMY IN FOCUS: CURRENT APPROACHES TO SITE FORMATION AND SOCIAL STRATIGRAPHY**

As the physical accumulations of artifacts, ecofacts, and sediments, archaeological deposits comprise the basic units of empirical analysis and are routinely the focus of methodological concerns. In recent decades, a growing body of literature has emerged that not only focuses on site formation as a set of cumulative taphonomic effects but also as a process of sociocultural, political, and affective negotiation both in the past and present. We seek papers that explore the complex interplay between the empirical and interpretive dimensions of deposition, assemblage, stratigraphy, and other concepts related to the formation of the archaeological record. Papers may address any geographical or temporal setting. We also welcome diverse methodological and theoretical approaches to the theme. Contributors might explore issues of scale, resolution, and temporality; the mnemonic or semiotic roles of deposits and assemblages; challenges and implications presented by contested, multivocal sites and landscapes; archaeological concepts as epistemological metaphor (*sensu Foucault*), and more.

[326] Symposium · APPLICATION OF GEOPHYSICAL TECHNIQUES TO MILITARY ARCHAEOLOGY

(SPONSORED BY MILITARY ARCHAEOLOGICAL RESOURCES STEWARDSHIP INTEREST GROUP)

Geophysical techniques, including magnetometry, resistivity, and ground-penetrating radar have been used for decades as noninvasive tools of archaeological investigation. These methods can cover large areas, access depths well beyond the length of a shovel, and uncover subsurface patterns invisible to the naked eye. New remote technologies have been critical tools in the identification of burial sites and are being used to discover structures and hearth features, to document large sites, and even for mitigation. New technologies are making geophysical methods more accessible to average cultural resources managers where they can play a critical role in decision-making around sensitive areas and resource management. This session provides examples of applications of geophysical techniques in the DOD-CRM environment and provides practical advice regarding when and how to use different techniques as well as ways to access equipment and practitioners.

[327] Symposium · REINVENT, RECLAIM, REDEFINE: CONSIDERATIONS OF "REUSE" IN ARCHAEOLOGICAL CONTEXTS

Reuse is often seen as a sustainable behavior, invoking ideas of conservation or even renewal in contemporary contexts. As an ongoing practice, reuse also plays a role in archaeological contexts—where materials such as ceramic, metal, stone, and wood can be changed, reassembled, recontextualized with varying temporalities. These periods of reuse can complicate how we understand the past at multiple scales, from individual objects up to the reuse and repurpose of spaces. To navigate these practices, archaeologists use a variety of frameworks—object biographies, itineraries, palimpsests, etc.—to conceptualize these shifting uses. By placing various approaches to archaeological material reuse into conversation, it is possible to interrogate how these frameworks are used and how the various contexts, engagements, and power structures associated with reuse can be understood archaeologically.

[328] Symposium · ADVANCES IN GEOARCHAEOLOGY AND ENVIRONMENTAL ARCHAEOLOGY PERSPECTIVES ON EARTHEN-BUILT CONSTRUCTIONS

In recent years, advancements in geoarchaeology and soil micromorphology as well as other complementary analyses from environmental archaeology (e.g., geochemistry, palynology, geochronology) have aided in reconstructing complex histories of earthen constructions, such as mounds, platform surfaces, enclosures, and terraces. Innovative analyses have revealed building materials and techniques and episodes in their construction, maintenance, and uses, as well as past environmental conditions and changes. Furthermore, micromorphology has revealed taphonomic and pedogenic processes that alter their preservation. Other recent developments in geoarchaeology that combine techniques of soil micromorphology with geochronology (e.g., radiocarbon and luminescence dating) offer promising avenues to address major challenges in providing absolute dates for earthen-built structures, including their construction phases, events of maintenance and other associated human activities, environmental changes, and postdepositional alterations. Geoarchaeology and soil micromorphology, through the identification of construction materials and techniques and their absolute dating, reveal cultural choices and meaning behind these prominent, often multigenerational, landscape features and associated human activities. This session serves as a platform for researchers to present on novel applications of geoarchaeology and soil micromorphology, regardless of temporal or geographic focus, for advancing the identification and interpretation of sociocultural processes behind comparative earthen-built constructions.

[329] Symposium · VICKSBURG IS THE KEY: RECENT ARCHAEOLOGICAL INVESTIGATIONS AND NEW PERSPECTIVES FROM THE GIBRALTAR OF THE SOUTH

Vicksburg, Mississippi, has always been a place of great strategic, political, and cultural importance, and yet comparatively little systematic archaeological investigations have taken place at this “Gibraltar” of the American South. This symposium will focus on the geological, paleontological, and ecological conditions that make Vicksburg and its environs such a unique and culturally significant feature of the Lower Mississippi Valley, as well as summarize past archaeological investigations and interpretations that have been applied to this region. Additional papers will build off of this foundation and will reconsider the role of precontact and

historic period Indigenous peoples and their interactions with colonial powers played that set the stage for why Vicksburg became such a focal point for both the North and the South during the American Civil War. This symposium will conclude with preliminary investigations of the archaeological potential of disturbed contexts from the 1863 Vicksburg Battlefield itself and will also highlight preliminary findings and unexpected insights concerning Vicksburg's Civil War-era African American population as evidenced by ongoing bioarchaeological investigations of imperiled burials under immediate threat of destruction due to recent catastrophic landslides at the Vicksburg National Cemetery.

[330] Symposium · THERE AND BACK AGAIN: CELEBRATING THE CAREER AND ONGOING CONTRIBUTIONS OF PATRICIA B. RICHARDS

Patricia B. Richards has spent more than four decades immersed in the archaeology and bioarchaeology of the American Midwest. Through her field-based research into Paleoindian, postcontact, and Euro-American lifeways of the Great Lakes region, she has explored and highlighted the importance of material culture, human actors, ethnographic research, and engaged archaeology. Her work has consistently emphasized the power of archaeology to reveal the stories of those forgotten by written history, as exemplified by her creation of and long-term commitment to the Milwaukee County Poor Farm Cemetery Project. Her ethical approach to archaeological practice has been a constant in an ever-evolving career, serving as a touchstone of her advocacy for burial site preservation legislation in Wisconsin. She has also been an inspirational and inestimable mentor and colleague, and through the work of those she has trained and supported we see the positive imprint she has made on the discipline over the last decades. This session takes her retirement from teaching as an opportunity to recognize and honor her contributions to both archaeology of the Midwest and to archaeological pedagogy. Please join us as we share our favorite memories and present research inspired by her contributions to the field.

[331] Symposium · RETHINKING PERSISTENT PLACES: RELATIONSHIPS, ATMOSPHERES, AND AFFECTS

Persistent place is a term used by archaeologists to describe places that are used, occupied, or revisited by humans over a long period of time. Most studies see places as persistent due to the type, availability, and abundance of resources or because humans attribute these places meaning and importance. In this symposium, we question such approaches and instead concentrate on the relational and experiential qualities of persistent places and how relationships make such places meaningful, animate, affective, and ultimately attractive or beneficial over a long period of time. We especially encourage participants to consider relationships between nonhuman entities, phenomena, materials, objects, natural features, and entire landscapes in creating persistent places as well as the dynamic qualities and atmospheres that these relationships generate. Overall, the goal is to move beyond behavioral and anthropocentric perspectives to consider why persistent places draw, change, and ultimately shape humans and explore the ways in which such places are active participants in the creation of history and culture.

[332] Symposium · THE ARCHAEOLOGY OF EAGLE NEST CANYON, TEXAS: PAPERS IN HONOR OF JACK AND WILMUTH SKILES

The Lower Pecos Canyonlands of southwest Texas and adjacent parts of Mexico constitute a unique region at the juncture of the Chihuahuan Desert and the Great Plains where the Pecos, the Rio Grande, and their tributaries form deep canyons in limestone bedrock. The arid environment has supported a diverse range of cultural adaptations and lifeways, and is well known for its dry rockshelters, bison kills, polychrome rock art, and extensive plant-baking features, as exemplified at Eagle Nest Canyon. Landowners Jack and Wilmuth Skiles have been an essential part of preserving that record and supporting archaeological research through stewardship, access to their land, and their supportive collaboration with students, volunteers, and professionals. The Ancient Southwest Texas Project (ASWT) of Texas State University has worked with the Skiles family for the past 15 years with the goals of understanding and protecting the archaeological record, sharing results with the scholarly community and public, and training the next generation of archaeologists. The papers in this symposium highlight research accomplished in and around Eagle Nest Canyon through the ongoing collaboration between ASWT and the Skiles family and reflect the great potential that arises from strong relations between archaeologists and stewards of the land.

[333] Symposium · MAGIC, SPIRITS, SHAMANISM, AND TRANCE

Marcell Mauss in 1950 found that trance was important to magicians and shamans seeking to control unseen forces and beings. This included magic that consisted of creating/using material culture such as charms, offerings tied to locations (e.g., paintings and shrines), feasting/potions/ointments used for blessings and protection, etc. Although early anthropologists recognized trance's importance and the role of spirits in magic, Mauss and others (e.g., Evans-Prichard) exercised the importance of spirits and trance in magical practices. In doing so, they separated the acts/materials of magic from their ontological and cosmological importance. This in turn cut magic off from its spiritual and cultural importance, transforming it into "superstition" as opposed to being central rituals that structured people's lives. Anthropology in general, and archaeology specifically, needs to reintegrate magical/spiritual practices into their broader symbolic and cultural context to meaningfully understand and explain how cosmological principles were manifested as ontological realities. In this symposium we explore the use and form of trance and spirits integrated into cultural patterns of magic as it is reflected in modern practices and the ethnographic and archaeological records. These papers look at trance and magical processes at various scales and from different theoretical perspectives.

[334] Symposium · INTEGRATING ISOTOPE ANALYSES: THE STATE OF PLAY AND FUTURE DIRECTIONS

Isotope analysis has long developed into an established method in the bioarchaeologist's toolkit, particularly for exploring mobility and paleodiet. Methodological advancements are progressing at an extreme rate, providing ever wider applications and greater interpretative potential. There is increased recognition that isotope analysis is better suited to exclude rather than place definite interpretations. Crucially, studies are now integrating isotope data with multifactorial archaeological, environmental, and osteological evidence at varying scales, a feature that was frequently absent from early studies. This session aims to take stock of the state of the field and its relationship with other subdisciplines by focusing on case studies that take an integrative approach. Starting with an inclusive definition of integration, it will showcase good practice in integrating wider scientific data or archaeological evidence to disentangle issues of equifinality. We invite studies that combine novel data sources and those that use multiple isotope/biomolecular proxies in combination. We would also welcome discursive submissions that reflect on the development of integrative approaches and consider future directions. Papers that highlight failures and offer lessons learned are especially welcome.

[335] General Session · EXPERIMENTAL ARCHAEOLOGY, ATTRIBUTE ANALYSIS, AND LITHIC TECHNOLOGY: NEW PERSPECTIVES ON SITE FUNCTION, EXCHANGE, AND SOCIAL RELATIONS**[336] Forum · THE ARCHAEOLOGICAL POWER OF GEOARCHAEOLOGY: WHERE IS IT GOING IN THE UNITED STATES?**

(SPONSORED BY GEOARCHAEOLOGY INTEREST GROUP)

Need a site probability model? Dealing with complicated site stratigraphy? Could your research questions be addressed by microanalytical studies of soils or materials? All archaeologists likely understand that well-trained geoarchaeologists have the specialized "toolkit" to tackle archaeological issues such as these and others—but did you know that US geoarchaeology is at a generational crossroads? Well-trained geoarchaeologists are in high demand, especially in CRM, but there is a shortage of qualified professionals due to retirements and limited comprehensive training opportunities in both academia and CRM. Undoubtedly, this is leading to geoarchaeology not being applied to its fullest potential. This forum brings together geoarchaeologists to discuss the current state of the field and identify ways to advance and further integrate geoarchaeology into all future archaeological projects. The goal is to begin drafting a strategic plan for US geoarchaeology that will be finalized at the following meeting in 2025.

[337] General Session · ADVANCES IN ARCHAEOLOGICAL LAB METHODS AND MODELS

Individual Abstracts of the 2024 SAA 89th Annual Meeting, New Orleans, Louisiana

The ANNUAL MEETING of the Society for American Archaeology provides a forum for the dissemination of knowledge and discussion. Approaching Identity and Gender Roles through the Alimentation Sphere in the Iberian Culture (Fifth–First Century BC)
The alimentation sphere presents a relevant context for the examination of sociopolitical dynamics within heterarchical agricultural societies of the Iberian Culture. Historically, alimentation practices have been associated with tasks primarily undertaken by women. However, there is a need to examine whether the extent of the presence of women is related to the degree of control or influence exerted. To what extent did women's leadership in this domain hold political significance and structural value? The necessity of these practices in order to maintain a group is accepted and revalued in social terms, but can we trace it in specific power spheres? In the absence of women's involvement in decision-making with the alimentation operating chain, labor appropriation in terms of work and benefits was happening. The goal of this paper is to investigate these questions through the analysis of three well-established urban settlements located in Eastern Iberia (Alicante, Spain). This study interprets the culinary practices and food preparation methodologies over an expansive chronological spectrum (fifth–first century BC). This examination entails an analysis of culinary pottery and the associated work spaces with the intent of discerning implications on gender, identity, ideology, manifestations of power, and embodiment within these communities.

Making Sense of the Hohokam Irrigation Anomaly

On a sparse prehistoric landscape where little precipitation fell, Hohokam farmers dug vast canal networks across tens of thousands of acres of xeric desert soils on the banks of the Salt River. Their large-scale hydraulics, without managerial centralization, mark the Hohokam infrastructure as a theoretical anomaly. Cross-culturally, as irrigation scales increase, so must complexity of the political apparatus to manage the expanding hydraulic works. But, not so for the Hohokam. To understand the mismatch between Hohokam scale and complexity, we start with the water. Employing a tree-ring-based reconstruction of Salt River streamflows, we estimated the water supply in each part of the valley each year. Also, we approximated water demand utilizing aerial photographs to measure the acreage served by the canals. Our calculations showed there was an abundance of moisture to meet the needs across the valley and throughout its history. Without the social strife that can boil over under the harsh conditions of chronic water scarcity, the Hohokam irrigation economy avoided the heavy-handed controls that typify other large-scale agriculturalists. For the Hohokam, it was large-scale without complexity.

Moving a Monster, Part Two: Preserving Illinois' Cultural History in Perpetuity

As a result of moving its ~24,000 ft³ Illinois Department of Transportation (IDOT) collections to a more suitable facility, the Illinois State Archaeological Survey's Curation Section is now more capable of addressing the present and future needs of the collections and its users. This paper details the move's success and our ongoing efforts to create more accessible research opportunities by revolutionizing the care of all ISAS-held collections. These efforts include updating the procedural flow from lab processing to transfers and loans, creating and utilizing a comprehensive relational database for material and documents, and stabilizing legacy collections. This work not only facilitates academic research but allows for more successful consultation with our Tribal partners. We intend for our work in moving the IDOT collections to serve as a model for other institutions to move and improve monsters of their own.

Making, Baking, Breaking, and Cutting: Experiential Learning through Enacting the Past

Concepts, such as the *chaîne opératoire* and *communities of practice* are central to material analyses and student training at the Gadachrili Gora Regional Archaeological Project Expedition (GRAPE), Republic of Georgia. Teaching abstract conceptual frameworks to undergraduate students is a challenging task for instructors in the classroom, never mind in the field where students are mentally exhausted after a long day of hard work under the sun. As such, team specialists at GRAPE have incorporated experiential teaching methods to facilitate student understanding of the *chaîne opératoire* and *communities of practice*. Through the enactment of pottery manufacture, obsidian knapping, bone tool production, and sheep carcass butchering, students have been fully able to comprehend these conceptual frameworks and apply them to analyses carried out on recovered archaeological materials from the field. This paper will look at how these experimental methods not only were a good way to build competence among students but also a deeper nuanced understanding of the entanglements attested across the various crafts and the spatiotemporal demands required in past crafting activities.

Descifrando las transformaciones y significados en Chavín de Huántar: Un análisis de los marcadores materiales en la Plaza Circular y el atrio

A través del tiempo, la Plaza Circular y su atrio en el monumento Chavín de Huántar han tenido mucha importancia. Durante la fase Blanco-Negro, estas áreas, tuvieron pleno funcionamiento y albergaron una

diversidad de contextos, donde destaca el descubrimiento de las galerías de la serie Caracolas y parte del canal Rocas (temprano y tardío), evidenciándose así transformaciones y continuas ocupaciones. Aunque conocemos la historia general del templo, aún nos enfrentamos en entender ¿Cuáles son los marcadores que permiten reconocer las innovaciones? y ¿Qué conllevó al ordenamiento de las transformaciones contextuales? Para abordar ello, exploramos el marco teórico de la memoria y agencia, conceptos ligados a la materialidad, donde cada elemento es producto de una acción que modifica la realidad; la cual, se conecta a una historia. Ambos enfoques buscan adentrarnos en el pensamiento detrás de las actividades hechas por las innovaciones y los contextos, la cual denota la complejidad de la ideología del Formativo Medio y Tardío. Por eso, presentamos los marcadores trans-temporales como evidencias físicas materiales, que además reflejan el ordenamiento y comportamiento de las innovaciones y contextos (iconográficos y ofrendatorios); ideas que fueron fundamentales y dieron pase al cúmulo de transformaciones en Chavín.

A Postclassic Maya Midden at Colha, Belize

The Ancient Maya Postclassic period (1000–1500 CE) is one of the least understood periods of Ancient Maya cultural history. Essential questions about the Postclassic remained unanswered due to a focus on the preceding period the Classic Maya Collapse (800–1000 CE). While the collapse is well studied and understood, what happens after the collapse is not. Following the collapse many sites in the central Maya Lowlands are abandoned, never to be reoccupied again, except for a few exceptions. The site of Colha, located in northwestern Belize, is one of these exceptions, the site was abandoned in the Terminal Classic but reoccupied during the Postclassic. Excavations in the summer of 2023 at the site of Colha uncovered a Postclassic midden deposit. Data from these excavations will be presented to answer essential questions about the Postclassic and illuminate cultural transformations in the Postclassic, the daily life of the Postclassic Maya of Colha, and Colha's interactions with other sites.

[22]**

Villa, Monastery, or Vicus? The Archaeology of Monasteries and Productive Centers across the West ca. 400–1000

This paper investigates the emerging questions surrounding the interpretation of archaeologically attested communities which blur the lines between religious, familial, and independent productive centers in the early medieval West. Recent scholarship has begun to appreciate the interrelationship between cult sites and economically productive centers in the premodern period. Such blurred distinctions create problems for interpreting archaeological sites and classifying them into textually created typologies. Nowhere is this more problematic than in the study of monasteries and cult sites in the early medieval period. Newly excavated settlements such as Little Carleton (UK) or Communaux (FR) challenge traditional artifact assemblages and features associated with either monastic communities or secular productive sites. Through analysis of archaeologically attested participation in production at monasteries, this paper seeks to situate early medieval monastic sites within the larger early medieval economy.

Adams, Karen**[149]***Discussant***Adams, Ron (Willamette Cultural Resources Associates)****[271]***Stone Monumentality in Tana Toraja, Indonesia: Initial Ethnoarchaeological Insights*

Stone remains a prominent feature of the natural and cultural landscape of Tana Toraja, Indonesia, where outcropping basalt and limestone karst formations create a dramatic backdrop. In this context, the manipulation of stone is an important aspect of ancient cultural traditions that persist to the present day, but which has received relatively little attention in past ethnographic and ethnoarchaeological documentation in Tana Toraja. The construction of menhirs is part of this stone-working tradition that also includes rock-cut tombs and placement of smaller freestanding stone monuments. Menhirs are quarried, transported, and erected on the occasions of elaborate funerary traditions in Tana Toraja, which can entail complex ritual practices and staggering expenses. This paper offers the results of a preliminary ethnoarchaeological documentation of Torajan menhirs and the methods, logistics, and social dynamics associated with this megalithic tradition. Quarrying and erecting menhirs requires specialized stone workers and can entail a large labor force to transport. Over time, the monuments become enduring memorials of the deceased and associated funerary traditions in a context with an otherwise perishable traditional built environment.

Adeyemo, Elizabeth (University of Notre Dame)**[250]***Engaging Materiality: Archaeology of Craft Production in Igbo Ukwu (Ninth–Twelfth Century CE)*

This paper adopts an interdisciplinary approach to the study of craft production in antiquity. It combines theoretical and methodological toolkits from archaeology, material science, studies of craft production, and ancient economies to investigate the organization of the Igbo Ukwu pottery industry (ninth–twelfth century CE). Igbo Ukwu is situated in present day Anambra State, southeastern Nigeria. The storied material corpus from Igbo Ukwu recovered from two excavation seasons between 1959 and 1960 include about 75 kg of copper objects, 21,000 ceramics, 165,000 glass beads, some textiles, stones, and other organic items. This project focuses on the study of the ceramic materials from this legacy excavation. It explores the materiality of the ceramic assemblage as markers to investigate the socioeconomic structures of the ancient Igbo Ukwu polity. It examines how technological choices are embedded in the pottery products that are then distributed and deposited in varying contexts of usage in the archaeological record. Findings from this project puts into conversation fundamental discourses on the interaction between crafts production and socioeconomics in ancient societies. It advances models of integration of craft production into studies of ancient economies as means to further understanding of the mosaic nature of sociopolitical and economic structures in antiquity.

Adler, Michael (Southern Methodist University)**[84]***Classic Picuris: Reassessing the Discoveries of Herbert Dick's Early Excavations*

In 1961, in collaboration with the Picuris Pueblo tribal nation, Dr. Herb Dick initiated a multidisciplinary research project that documented architecture, agrarian strategies, sacred landscapes, ethnohistory,

ethnobotany, avifauna, and other lines of evidence to better understand the past millennium of Picuris's history. This research resulted in the most extensively excavations of any presently occupied pueblo community, generated collections of millions of artifacts, and broadened our understandings of northern Rio Grande history and prehistory. The past 60 years these understandings have gone underpublished and, hence, underappreciated. This paper highlights the amazing accomplishments of the earlier work accomplished in concert with the people of Picuris Pueblo. It also emphasizes the intensely collaborative, and sometimes combative, nature of this early example of multidisciplinary research in living Indigenous communities.

Mea Culpa

As I have done no comparative study on the subject, I assume that it is relatively unusual to amend one's dissertation research let alone to point out its flaws. Nevertheless, this is precisely what I am doing in this presentation. While the salient points of my dissertation ("The Origin, Development, and Distributions of Western Archaic Textiles," 1970) remain unchanged, it is clear that I was dead wrong on a number of issues. Clarification of these issues is the focal point of this paper. I was wrong about the dating of the earliest perishable industries in the world and also mistaken about the antiquity of decorated basketry. I still maintain, however, that basketry and its sister crafts have a unique ability to illumine the past.

Heritage in Action at the Pauli Murray Center

Rather than argue that heritage does things, this paper explores what might happen when archaeologists (to borrow a phrase from J L Austin) "do things with heritage." Specifically, I use the points raised by Patricia Hill Collins in her weaving together of pragmatics and intersectionality to frame a discussion of archaeology and heritage at the childhood home of human rights activist Pauli Murray.

Using Archaeobotany and Historical Archaeology to Identify the Influence of Early English Science on Southeastern Plantation Development

The First Earl of Shaftesbury (1621–1683) was the prime motivator and mastermind behind the settlement and success of the English colony Carolina in 1670. John Locke, Secretary to the Lords Proprietors of Carolina, was also Shaftesbury's friend and colleague in many affairs, one being their Fellowship in the Royal Society of London. The uniquely English concept of "Improvement" was the foundation for both the Royal Society and early English science as they developed in the 1660s. When Locke wrote his "labor theory of property" he utilized Improvement as a basis for private property. I argue that when Shaftesbury planned and

launched his 12,000-acre Carolinian estate in 1674, he did so to ground-truth Locke's property theory by anchoring it to a scientifically experimental agricultural regime to improve land into property through modernized enslaved labor—a process that turned the enslaved into scientific technicians. I use Historical Political Ecology and Landscape Archaeology to pair the archaeobotanical record with artifacts from Shaftesbury's estate to identify elements of English Improvement and Royal Society influences that point out how the enslaved Africans at Shaftesbury's estate were coerced into converting English colonial estates into Carolina's first true plantations—plantations based on monocrop surplus agriculture and slavery.

Trabajo arqueológico desde la bodega: Una revisión de los objetos funerarios asociados a las tumbas de La Nopalera
A partir de un nuevo análisis de los ajueres funerarios excavados en la década de los ochenta en el sitio de La Nopalera, se lleva a cabo un replanteamiento tanto de la temporalidad como los alcances sociales de este tipo de contextos funerarios en la región de la cuenca de Cuitzeo. Se deja de lado la idea incipiente en el que los procesos sociales que dieron origen a este tipo de manifestaciones culturales son resultado del proceso de expansión militarista del Postclásico, integrarlos en una serie de manifestaciones de mayor relevancia durante el periodo Clásico.

The Acolman Cross and the Maize God

The monastery of Acolman founded by the Augustinian order is located near Teotihuacan. The most astonishing *tequitqui* (Amerindian-Christian art of the sixteenth century) monument in Acolman is the atrial cross made in 1550. Although open-air crosses existed in Europe, the Mexican crosses have a different iconography and function. The atrial cross of Acolman, provides a dual system of religious meanings: Christian and Indigenous. The cross is the central symbol of Christianity and represents the death and resurrection of Christ. Likewise, the Christian cross at the center of the atrio was understood by the Indians as another representation of the World Tree, the Axis Mundi that connected the gods of the Upperworld and Underworld with the human beings on the surface of the earth. The Indigenous cosmogram was completed with the four *posa* chapels representing the four corners of the world and the side walls of the atrio oriented to the four directions of the Universe. I will compare the Acolman cross with the Maya tablet of the Foliated Cross of Palenque to establish the convergence and relative equivalence of the two visions of the world. Based in those Amerindian-Christian concepts, I will propose an interpretation of the Acolman Cross.

Aguirre, Alejandra (Proyecto Templo Mayor/UNAM)**[79]***The Sacrificial Artifacts in the Templo Mayor Offerings*

The complex Mesoamerican cosmovision includes myths about the cultures to try to understand, their history, natural events, and their universe, through narrations and fantastic facts, which gave them an explanation about everything that they did not understand. As a consequence of this, the invention of ritual acts that everyone had to participate in, because thanks to the rituals, they stayed alive and obtained the favor of the deities. Rituals were a means of understanding the cognitive systems of Mesoamerican societies. The diversity of existing ritual acts, sacrifice, and autosacrifice served as a means to obtain the precious blood to offer the gods. To offer blood was a commonly a ritual practice in the religious festivities of Mexica society; thus, it became part of everyday life. The practice of these rituals is visible in the Templo Mayor offerings. Abundant evidence has been found of the sacrificial and autosacrificial paraphernalia like knives, bone awls, and maguey thorns.

Ahern, James (University of Wyoming), Rory Becker (Eastern Oregon University), Ivor Jankovic (Institute for Anthropological Research, Zagreb) and Lia Vidas (Institute for Anthropological Research, Zagreb)**[247]***Digital Imaging and Geophysical Prospection Techniques at Paleolithic Cave and Rockshelter Sites in Croatia*

Conducting archaeological investigations in cave and rockshelters presents researchers with multiple unique challenges as compared to typical open-air sites. Reduced space, low light, and complex stratigraphic sequences are frequently the norm. Additionally, the nature of limestone cave walls and floors is an undulating, irregular surface that creates many pockets, troughs, and ridges where sediment may accumulate unevenly beneath a relatively level surface. This creates a problem for the research team to select productive locations for excavations within time constraints for the project and within the limited space available. The application of electrical resistance tomography (ERT) to model sediment depths has been utilized at five sites in Croatia to seek a means of addressing this issue. Conversely, the smaller spaces in caves and rockshelters present an opportunity for high density image collection of the surface features and excavation in process that may, at times, include the entire site. Photogrammetry and hand-held lidar have been used for localized spatial data collection at many of the same sites where ERT was employed. This paper presents the methodologies associated with each approach and details their potential benefits or weaknesses as applied to Paleolithic cave and rockshelter sites in south central Europe.

Ahern, Kaitlin (University at Buffalo; New South Associates Inc.)**[32]***Plazas and Proxemics: Preclassic and Classic Period Plazas at the Maya Centers of Cival and Holmul*

This presentation focuses on examining Preclassic and Classic period plazas at Cival and Holmul in Guatemala to provide greater insight into the role of public spaces and ceremonies in the Central Maya Lowlands. Estimated plaza capacity and population estimates are used to determine how plazas were utilized at both Cival and Holmul, for functions such as mass-spectacle events, and how these uses changed over time. Previous evidence of ritual events found in these plazas, including caches and stelae, are incorporated to help determine the range of activities conducted in these spaces.

Post-emancipation Ceramics and Housing in the British Caribbean: A Case Study from St. Kitts' Southeast Peninsula
 Emancipation brought many changes to the lives of the formerly enslaved in the British Caribbean. On the British Caribbean island of St. Christopher (St. Kitts), true emancipation came in 1838 following a four-year apprenticeship period, which was really enslavement in just another name. Freedom meant Kittitians often could choose where they lived, the house they lived in, and the items they purchased with the money they earned for their labors. This study compares the pre- and post-emancipation housing and ceramic assemblages from two households in a plantation village on St. Kitts' southeast peninsula to understand how people adapted to freedom in the post emancipation period. We find that there are differences in housing and ceramic acquisition and discard between the two households that reflect different investment strategies and agency.

Cultural Corridors in South Central Pennsylvania

A recent cultural resource management project located in south central Pennsylvania's Path Valley identified a series of five sites oriented around one of the waterways forming the headwaters of the Potomac River Drainage. Background research and local informants indicate that a network of small- to medium-sized precontact sites can be found along the streams leading south, ultimately to the Potomac River. Data from these extreme upper Potomac Drainage sites are well positioned to test Herbstritt's (2015) "Cultural Corridor" hypotheses regarding the nature interactions between Susquehanna oriented societies and those centered in the Potomac River basin.

Ladders, Axes, and Pithouses: Elements of a Seventh-Century Pueblo Technological Complex

Earliest evidence for the widespread use of two-pole ladders and hafted stone axes in the American Southwest's Central Pueblo area tree-ring dates to the seventh century. That evidence includes, for ladders, remains of the objects themselves, but especially ladder rests found in pithouse floors and, for axes, stone tool heads and stone-axe-cut beams. These innovations were linked, technologically, because each implement relied on bindings subjected to heavy, abruptly applied loads and, historically, because both were adopted in concert with transitions in pithouse architecture. The stone axe facilitated procurement and use of stronger, more numerous, more often newly procured (vs. reused), and increasingly standardized beams, posts, and poles in pithouse superstructures—presumably to extend structure use-lives, but also to accommodate a shift from side-wall to roof-hatch entries. Changes in beam use would have enhanced pithouses' "tree-ring-datability," helping to explain a jump in dated structures from the 500s to 600s. Two-pole ladders would have facilitated use of roof hatches. Stone axes and two-pole ladders were elements—along with pithouse antechambers and improved ceramic and possibly bean-farming technologies—of a demographically expansive Basketmaker III life-way, borne by Pueblo communities whose seventh-century colonization of the Mesa Verde region contributed to the post-600 increase in dated pithouses.

Insights from the Classic to Postclassic Pottery of Belize

For many years, Belize was considered to be peripheral to major social and cultural dynamics in the ancient Maya world. Recent pottery analyses in Belize, however, document that Classic and Postclassic Belize experienced some significant regional changes that inform our current interpretations. In this paper, we

explore this more nuanced view at various developmental junctures that add to our overall understanding of Maya communities, particularly during transitional times. For example, we consider when the Classic period began and what role Belize sites played in Early Classic Maya society. While the Late Classic period is perhaps the best understood, we discuss variability in Belizean complexes that speak to regional political alliances and trade networks that distributed types across the region. Similarly, Belize is pivotal to understanding the Terminal Classic Maya world, and the region's demographic shift to riverine and coastal settlement. Finally, we think the patchy and ambiguous nature of Early Postclassic settlements reflects the real turmoil facing communities as they reinvented themselves.

Anthropology on Social Media

In 2018, only about half of Americans (49%) agreed that “human beings, as we know them today, developed from earlier species of animals,” and 38% that “the universe began with a big explosion” (Besley and Hill, 2020). These basic facts may be well understood by the scientific and academic communities, but how do we go about disseminating this sort of knowledge to the general public? What about more nuanced and detailed information that may affect people's understanding of our human heritage or health? Social media has great potential for increasing the reach and broadening the understanding of individuals. However, it must be done effectively and be mindful of the platform's methods. This poster asks a question: how can we use social media to talk about anthropology and archaeology? We will explore different social media platforms and how to use them. Platforms covered will include Instagram, YouTube, Facebook, and TikTok. It will also discuss best practices on social media and include examples of academia and scholarship on social media and hashtags to use. The content of this poster is intended to serve as a starting point for those interested in using social media as a form of public outreach.

The Archaeologist's Guide to Good Practice: A Handbook for Post-excavation Analysis of Stratigraphic and Chronological Data

Recent work on The Matrix project (AH/T002093/1) identified a number of issues with the way archaeological information is deposited in digital archives. There are noticeable differences in the completeness of data that get digitally archived from archaeological fieldwork undertaken by different organizations in the UK. This is particularly evident in the quantities and reusability of data deposited as the result of commercially funded work as opposed to academic investigations (e.g., university or national agency funded). A follow-up project, funded by the Arts and Humanities Research Council (AG2GP-Handbook), is creating a good practice guide for use in development-led archaeology (CRM). By drawing together the collective expertise of the main commercial contractors that undertake archaeological fieldwork as part of the development control process in the UK and, in consultation with other stakeholders, we have taken a consortium approach to distill, document, and support best working practice and develop online resources

for archaeological post-excavation analysis. This has established an open-source access handbook that sets out a cross-sectoral set of common procedures that reflect and enshrine best practice in post-excavation analysis work of stratigraphic and chronological data.

Feeding the Body and Mind: Artistic Genesis through Blurring Species Boundaries

Moche artistic representations are known for their composite images of plants, animals, humans, and supernatural forms. The genesis of this artistic tradition rests in the beliefs about the relations between species, environments, and worlds. Food acquisition, preparation, and communal consumption composed potent sets of practices that permitted these connections to be realized and species boundaries to be blurred. Evidence from Huaca Colorada, a Late Moche site, enables this exploration of Moche artistic genesis. Various examples of cooking and storage vessels with the remains of marine, terrestrial, and avian species have been uncovered in direct relation to human offerings. These individuals were of different ages, sex, and stages in their lives and the motivation for their association to these vessels appears to rest in their affiliation with distinct communities of practice. In this paper, we argue that the ritual deposits of storage and cooking vessels filled with a multitude of species both consumed and symbolically interred along with human offerings were powerful acts of gathering that simultaneously manifested in the forms of human and nonhuman beings blurred together in Moche material culture.

Expedient Lithic Technology at the Terminal Gravettian of the Peña Capón Site (Central Spain) during Heinrich Stadial 2

The Terminal Gravettian, first defined in Central Portugal, is a relative outlier concerning the exploitation of lithic raw materials during the Upper Paleolithic of southwest Europe, as especially shown by an intensive use of quartz. Although Terminal Gravettian assemblages often include the production of bladelets, usually made in rock crystal, most of their components suggest expedient technologies, as they show low technological investment, low typological standardization, and a preference for local rocks. However, the specific meaning of these low-cost techno-economic behaviors, and their relation to the function and duration of occupations, patterns of human-environment interactions, and cultural choices, remains unclear. We discuss the case of the Terminal Gravettian layers recently identified at the Peña Capón site (central Spain), coincident with Heinrich Stadial 2 and located in an area that was traditionally thought to be depopulated during the coldest stages of the Last Glacial. These layers show a relatively low density of artifacts, the presence of small fireplaces, and a faunal collection dominated by a single species (horse) thus suggesting short-term occupations. Therefore, the expedient technologies of the Terminal Gravettian at Peña Capón seem related to specific needs arising during short stays at the site, possibly related to game processing activities.

Watching Me, Watching You, Watching Me: Greek Helots and Their Masters

Ancient classical sources tell us that in the late eighth/seventh centuries BCE the armies of Sparta marched on their neighbors to the west, the Messenians, and conquered their wide and fertile lands. Many Messenians fled, but others remained to become the famed “helots” of the Greek world—a population subject to Sparta in a status deemed “between free men and slaves.” Unsuccessful revolts periodically disrupted the regime, but for some three centuries Spartan citizens controlled, but feared, their helots; Messenian helots feared, but labored for, their masters. This paper considers the strategies of surveillance—from both sides—that governed this fraught relationship. Sparta maintained control of its subject population through a variety of punitive measures, including the Krypteia: a curious Spartan institution sometimes referred to as a roving “secret police.” Helot reconnaissance is considerably more difficult to investigate, but recent archaeological evidence points to active internal Messenian communication networks. The agencies and methods behind such mutual “watching” require additional scrutiny, using both archaeological and textual evidence, an analysis that will be contextualized and informed by studies of surveillance of enslaved or resistant populations in other periods and places, especially populations in wider regional settings.

Water and Hydraulic Technology in the Eastern Andean Mountains: The Amarete Valley

The Puna Apolobamba pastures played a critical role in farming, pastoralism, and agropastoralism in the Kallawaya territory. Located to the east of the Titicaca basin, the area was dotted by sunken fields, bofedales, and water *qocha* reservoirs supplemented with canals. In this presentation, I discuss the nature and distribution of *tajanas*, a set of interconnected stone water receptacles and canals constructed to collect and distribute water to the system of farming terraces in the Amarete Valley. I also discuss the antiquity and variability of *tajanas* and similar water-collecting technologies and the role that they played, and still play, in the rise and expansion of farming terraces in the eastern Andes.

The Defensive Conformation of the Maritime Space in the Bay of Cartagena de Indias (Colombia) during the Eighteenth Century

Cartagena de Indias' geostrategic importance for the European colonial powers in the eighteenth century led to the creation of defense infrastructures and the development of practices to strengthen and protect the coastal territory. All the infrastructures and cultural practices inherent to the "militarization" of this territory constitute today a homogeneous cultural phenomenon interpreted as a Maritime Cultural Landscape of War and Defense, or as a Fortified Landscape. The experiences of the continuous attacks, like the English siege in 1741, contributed to the revision and evolution of the strategies and tactics of defense in the Bay of Cartagena de Indias and the improvement of the military devices for nautical control. The defense system's constitution, the war events, and the battles' results left archaeological evidence located on land, on the coast, and underwater. In this sense, the main goal of this paper is to expose the defensive conformation of the maritime space in the Bay of Cartagena de Indias (Colombia) during the eighteenth century. This, through the discussion of the archaeological investigations carried out in the different inland, intertidal, and submerged contexts of the region.

Circa 12,000-Year-Old Fiber Technologies in the Atacama Desert

Plants have been used for making fabrics for thousands of years (Hardy 2007; Hardy et al. 2020; Hurcombe 2008; Kvavadze et al. 2009, Nadel et al. 1994), and many species have been gathered and eventually cultivated for this purpose (Barber 1992; Gleba and Harris 2019; Rast-Eicher et al. 2021). Evidence of bast fiber artifacts suggests that the development of these sophisticated technologies was critical to different dimensions of past lifestyles. In this paper I present the oldest evidence of plant technologies from two open-air Pleistocene sites: Quebrada Mani 32 (12,240–11,465 cal yr BP) and Pampa Ramaditas 5 (12,140–12,225 cal yr BP) located in the Quebrada Mani drainage in the Pampa del Tamarugal, northern Chile. Through archaeobotanical and structural analysis, bast fibers of Cyperaceae and Apocynaceae family plants have been found being worked into spliced threads representing early plant fiber technologies in the south-central Andes region. These organic technologies offer an opportunity for a yet unexplored research avenue regarding early weaving technologies and the use of plants among Pleistocene hunter-gatherer groups in South America. Finally, we suggest that perishables industries played a critical role in the adaptive strategies of the late Pleistocene hunter-gatherers of the Atacama Desert.

Modeling Socioecological Transformation in Coastal East Africa: A Case Study from Unguja Island, Zanzibar, Tanzania
Archaeologists in the Pacific have viewed islands as “laboratories” for studying social, agricultural, and ecological transformations. Can a similar approach be applied to the near-shore island environments of coastal East Africa, and what might island case studies contribute to broader anthropological understandings of East African social complexity and human-environment interactions? This paper considers these dynamics on Unguja Island in Zanzibar, Tanzania, sixth to nineteenth centuries CE. Combining two seasons of systematic survey data with a synthesis of previous research, I outline four phases of transformation: (1) the initial colonization of the island’s coast by fishing, farming, and iron-working proto-Swahili people (sixth–tenth centuries CE), (2) settlement diversification across variable environments alongside the emergence of a class of social elites (eleventh–fifteenth centuries CE), (3) an orientation toward territoriality, monumentality, and seclusion during the early colonial period (sixteenth–eighteenth centuries CE), and (4) large-scale agricultural intensification during the late colonial era (nineteenth–twentieth centuries CE) as the island’s landscapes were transformed for cash crop production. This study demonstrates how the autonomous and integrative activities of rural commoners shaped socioecological systems at different junctures. Furthermore, modeling the island’s settlement trajectory informs an understanding of broader trends in the Indian Ocean and on the African continent.

Conceptualizing the Cloth of the Consecrated Child: Textiles Associated with Chimú Mass Sacrifice in Huanchaco, North Coast of Peru

This study discusses broader questions surrounding the textile remains uncovered with the victims of the largest series of mass child sacrificial events on the North Coast of ancient Peru. Recent investigations are helping to understand Chimú (approx. AD 1000–1450/1470) sacrificial practices and the ideologies fueling their performance. In contrast, little has been done to contextualize sacrificial garments within the overarching pantheon of Chimú weaving. To correct these breaks in scholarly thought, I have conducted in-depth visual analyses of 12 textiles uncovered with the child sacrificial victims buried at Pampa la Cruz, Huanchaco in July of 2022. The findings of these analyses allow me to extrapolate information revolving around the weavers who created these textiles and their conceptualization of the sacrificial child within Chimú society. Including the recent observations of more Pampa la Cruz textiles curated by the Universidad Nacional de Trujillo which sheds light on the burial program employed in these contexts, and points toward various new avenues of study. As a result, I propose three scenarios that could explain the role played by these textiles and how they could help to investigate the identity (as a sacrificial being) of the children buried atop Pampa la Cruz.

Reflexiones, posibilidades y desafíos de la arqueología colaborativa en el Perú

¿Es posible hacer arqueología colaborativa en Perú? De serlo, ¿Cuáles son las características locales de esta práctica? Debido a movimientos sociales de reivindicación de los derechos de comunidades descendientes, desde la década de 1990 la arqueología colaborativa es tendencia en el mundo anglosajón. Regulaciones y leyes impulsaron el pasó de una aproximación centrada en la educación patrimonial al desarrollo de proyectos de investigación y de gestión del patrimonio donde las voces de comunidades no especialistas son determinantes. Considerando la realidad social peruana, es relevante preguntarnos si podemos hablar de una arqueología colaborativa y qué significa para las y los investigadores, y para las comunidades con las que trabajan. En esta presentación reflexionaremos sobre qué entendemos por arqueología colaborativa en Perú, las estrategias que se han desarrollado para integrar a diversos ciudadanos en las investigaciones arqueológicas y sobre el potencial y limitantes que tiene esta manera de hacer arqueología en Perú. Debido a que existen pocos grupos autoidentificados y reconocidos legalmente como descendientes, comunidades originarias o indígenas, este escenario y el hecho de que en su mayoría son comunidades desprovistas de servicios por el Estado, determina la manera en que incluimos a las comunidades en nuestra práctica arqueológica.

Old Data, New Format: Digitizing to Increase the Accessibility of Mortuary Information at S'edav Va'aki, Phoenix, Arizona

Digital databases are critical to archaeological data management, but our increasing use of them since the 1980s means that some of them have become artifacts in themselves. Cultural resource management (CRM) firms in particular rely on different databases to document mortuary features and associated funerary objects, but as many CRM collections have already been repatriated to descendant communities, the field notes, field

maps, osteological drawings, artifact recordings, and databases from the excavations are all that remain. This poster uses the large Classic period Hohokam site of S'edav Va'aki (formerly Pueblo Grande) in Phoenix, Arizona, to show how mortuary feature information previously stored in outdated technology may be converted into an accessible online platform. While some field and osteological notes had already been digitized, many still existed only in physical form. This poster presents a methodology to digitize and compile the data from each of the recovered ancestral remains at S'edav Va'aki and organize them into a searchable database to better compare mortuary features within and beyond the site to help us better understand Hohokam society.

Conceptualizing the Study of Wood Remains in Arctic Sites: A 20-Year Short Review and a Case Study

Analyses of wood remains and artifact assemblages, while remaining few, are nevertheless developing in many areas of the American Arctic and the North Atlantic, providing a rich, diverse database for site or regional comparisons. At the same time, research on changing driftwood circulation and provenance over time has made a comeback in recent years. The results of this work are helpful to archaeologists as they examine the contribution of human and environmental factors in the complex cycle of wood production, circulation, distribution, and use. Despite such tremendous progress, the importance of wood in past Arctic societies and the high quality of preserved wood remains, Arctic archaeologists still do not make wood sampling and analyses a priority, in the same way as they would for other, more traditionally studied remains. Moreover, there is a surprising lack of understanding of what dendrochronology, even on driftwood, can contribute to understanding archaeological sites when properly sampled and documented. In this paper, I describe the sampling strategy and recording of architectural, artifact, and other wood material remains implemented at the Rising Whale site in northwestern Alaska during the Cape Espenberg Birnirk project and how analysis of these remains improves understanding of site occupation and chronology.

Colonialism, Waterways, and Relationships in the Late Eighteenth-Century Fur Trade

In the late eighteenth century, the Mississippi Headwaters and Great Lakes area bustled with mobile European- and métis-descended traders hoping to make a trade with local Indigenous peoples. Often referred to as “the fur trade,” this willful exchange provided a stage for sets of relationships to be established, negotiated, and contested on a daily basis, including connections to the landscape. Waterways were particularly important in this context, as they provided the main means of travel, permitting traders to spread their posts and influence across the landscape of the interior. As such, waterways played an often-underestimated role in the creation of contested landscapes and social relationships. In this paper, I use documentary sources as well as data from two archaeological collections (Réaume’s Leaf River Post, MN, and underwater collections currently housed at the Royal Ontario Museum) to consider the ambivalent nature of intercultural relationships. The latter arose when colonial ideals and assumptions informed daily practices and the geographic imaginary of traders. I argue that ambivalent relationships also extended to the broader landscape (and waterscape), emerging out of the traders’ mobile lifestyle (and associated labor practices, risks, and anxieties) as well as contested sharing of knowledge, practices, and geographic imaginaries.

Allard, Francis (Indiana University of Pennsylvania)**[289]***Early Maritime Interaction Networks in the South China Sea: A Multidisciplinary Approach*

Well before the establishment—during the last two centuries BCE—of a “Maritime Silk Route” linking China to maritime lands to its south, archaeological evidence indicates the existence of wide-ranging links between coastal regions of the South China Sea. By the fifth century BCE, different types of goods moved along these maritime networks, including stone and glass ornaments (especially beads), as well as ceramic vessels and vessel styles. Two elements of these early networks of interaction are worth noting. First, the evidence for long-distance contact consists mostly of exotic goods and ornaments, and second, the relevant coastal cultures were all pre-literate. Partly for these reasons, understanding the nature and impact of these early interaction networks remains a challenge, with some suggesting that they represent the maintenance of patterns of migration and interaction established during the much earlier Austronesian expansion, while others point to the participation of wide-ranging “Sea Nomad” groups. As a way to move the discussion forward, this presentation argues for a multidisciplinary approach that incorporates oceanographic (e.g., winds; currents, deltaic geomorphology; interisland visibility) and ethnographic data. Comparisons to the Mediterranean also provide insights into the nature of early networks of interaction in the South China Sea.

Allen, Forest (National Park Service) and Adam Wiewel (National Park Service)**[177]***Adobe and Sod: Recent Results from a Multi-instrument Geophysical Survey at Fort Larned National Historic Site, Kansas*

Between 2021 and 2023 archaeologists at the Midwest Archeological Center conducted a multi-instrument geophysical survey at Fort Larned National Historic Site in Kansas. The survey sought to expand on previous archaeological investigations and to provide baseline documentation of archaeological resources across multiple areas at Fort Larned. Our survey was primarily focused on accurately mapping some of the earliest non-extant adobe and sod structures at the fort, to assess their condition, and to identify other historically documented structures that have not been relocated. To achieve this goal, an earth resistance and ground-penetrating radar survey was conducted over an area of approximately 1.3 ha (3.2 acres). The results of this survey revealed significant details about several structures including exterior dimensions and interior room divisions. Additionally, we utilized a wide-area survey approach with magnetometry to address areas of the fort that previously received less attention. Using a cart-based, 16-channel magnetic gradiometer towed by a UTV, a cumulative area measuring approximately 54 ha (133 acres) was surveyed across the Fort Larned landscape. The resulting baseline geophysical inventory will be utilized in planning and management of archaeological resources at Fort Larned.

Allen, Mitchell (University of California, Berkeley), John Whitney (US Geological Service) and Silvio Pezzopane (Independent Researcher)**[310]***The Role of Groundwater and Sinkholes on Bronze and Iron Age Settlement Patterns in Sistan*

Archaeologists have leaned heavily on fluctuations in the channels of the Helmand River to explain the rise of Shahr-i Sokhta and the Helmand Civilization during the third millennium in the Sistan basin between Afghanistan and Iran, the subsequent abandonment of the region, and the return of complex settlement in the mid-first millennium BCE. Recent satellite imagery, geological modeling, and archaeological ground surveys offer new insight into regional water resources and their impact on settlement patterns. Unlike riverine settlements in Mesopotamia and the Indus Valley, Sistan is a fluvio-lacustrine environment located in a closed basin where surface and ground waters are trapped in a subsiding depression. Water collects along faults and fracture lines and dissolves the evaporitic lakebeds and bedrock beneath, forming hundreds of sinkholes. Survey data shows that many sites identified in Sistan were situated near these sinkholes or along local stream channels emanating from springs, which dried during periods of drought and filled with water in wetter periods. If local sources of water were available for human occupation and for agriculture, hunting,

and fishing, we contend changes in early Sistan settlement through time depended on groundwater availability, not primarily on changes in the Helmand channel or its distributaries.

Geochemical Investigation of Chupícuaro Ceramic Wares (Formative Mesoamerica)

In the framework of the CHUPICERAM project, we perform geochemical analyses to investigate the chemical composition of the pastes and the decorations of ceramic wares excavated from two different archaeological sites (TR6 / JR24) and assigned to two different periods (Chupícuaro / Mixtlan) of the Chupícuaro culture. A corpus of study of around 200 sherds was selected, based in particular on their representativeness of the different stylistic groups encountered, and several analytical methods were used (p-XRF, μ -Raman, hyperspectral imaging, SEM-EDX, FTIR). All the ceramic pastes are identified as non-calcareous (CaO < 2.5 wt%). Our results show compositional differences of these pastes between archaeological sites and through time (Chupícuaro sherds versus Mixtlan sherds), both for major elements and trace elements. Regarding the decorations, they consist of a mixture of clay and iron oxides for the reds, and of clay, iron oxides, and manganese oxides for the black/café ones. The clayey beige decorations are rich in calcium. A change in raw material at the Chupícuaro / Mixtlan transition is highlighted for the black/café decorations in particular. On the basis of these results, our hypotheses concerning the production of Chupícuaro ceramics and its diachronic evolution will be introduced in the present communication.

Scalar Responses to Production and Extreme Conditions in the Southern Borderlands of Aragon between AD 1248 and 1559

Alfonso I took Daroca, an important city in the Upper March of Al-Andalus since the ninth century, by conquest in AD 1120. He granted the city a large rural territory that evolved by AD 1248 into a new property regime called the Comunidad de Aldeas de Daroca. Four such entities emerged in the southern borderlands of Aragon independent of the control from (if not always the influence) of the city; they took their name from and having the royal privilege of self-governance. The Comunidad de Aldeas de Daroca eventually comprised 96 co-equal villages spatially organized into five districts (sesma) and politically organized into a quasi-sovereign council of villages. The Comunidad had usufruct over a shifting mosaic of managed forests, grazing lands, and croplands across ca. 5,000 km² subject to a Mediterranean climate regime. Most importantly, the member villages controlled up to 203 wood-pastures (dehesas) to which the Council of Villages negotiated use-contracts with the Cattleman's Association of Zaragoza. The region experienced a succession of extreme environmental and socioeconomic conditions beginning middle of the thirteenth century, yet the Comunidad de Aldeas de Daroca was buffered by scaling responses among the coalition of equal villages according to their location and context.

Liquid Nationalism: World War II Archaeology at Cerro Orquilla US Rada Station, Isabela Island, Galápagos (1940–1946)

During World War II, the US Army and Navy built joint bases on some islands and archipelagos in the northeastern Pacific to protect the Panama Canal. The Galápagos Islands played a crucial role in protecting the canal zone due to its strategic geographical location between Panama and the Gulf of Guayaquil. A central military base was built on Baltra island, and some adjunct radar stations and support bases were built on other islands. Three radar stations were built on Isabela Island to detect possible air attacks from the west. Constructions of these stations caused important landscape modifications to previously unoccupied ecosystems. During archaeological survey in summer 2023, we defined the occupation area and the layout of the Cerro Orquilla radar station, which was occupied from 1940 to 1946. During fieldwork, several abandoned structures were identified and artifacts of different types were collected. An important number of glass bottles of North American provenience were found. The goal of this study was to identify the assemblage of glass bottles to explore aspects of the daily life of the soldiers who served on Isabela Island and the Galápagos during World War II.

High-Resolution Microarchaeological Techniques for Understanding Depositional and Postdepositional Processes in Mughr-el Hamamah Cave (Jordan)

The rich archaeological record of the Mughr-el Hamamah (MHM) site in Jordan is key to understanding the Middle-Upper Paleolithic transition in the Levant. However, important postdepositional processes due to pastoral activities during the twentieth century have affected the archaeological deposits and need to be taken into account. The archaeological deposits consist of Layer A, resulting from these pastoral activities, and Layer B, dated 44.5–40.0 ky BP. Field observations suggest that Layer B has been partially altered by shepherds, affecting the Early Upper Paleolithic deposits. Here we present the results of a multiproxy microarchaeological approach applied to MHM aimed at delineating these disturbances and other postdepositional processes that may have affected the archaeological record of Layer B, including plant microremains (phytoliths). Fecal spherulites, were used to define the limits of disturbance in Layer B. Micromorphological analysis identified four intact depositional facies in Layer B, representing an interplay of natural and anthropogenic factors. Characteristic dicotyledonous phytoliths were identified in the hearths, indicating the use of wood as fuel. Fruit phytoliths also occurred in the western area, where well-preserved

charred wood and seeds were found. Finally, herb-diagnostic phytoliths correspond to C₃ and C₄ taxa indicating an overall humid environment with dry spells.

Woodland Villages in the Upper Connecticut River Valley: Landscape-Scale Geophysics as Evidence for Large Sedentary Settlements in Northern New England

The general absence of Woodland village sites within New England's archaeological record has generated considerable debate and varied interpretations of past Indigenous subsistence-settlement strategies. In Northern New England, scholarship suggests this area was dominated by hunter-gatherers until the arrival of Europeans, indicating sedentary villages were rare and only located within Southern and Coastal New England. Locating villages or even individual house sites to address the accuracy of this hypothesis is challenged by poor preservation resulting from centuries of colonization and environmental conditions. After employing ground-penetrating radar (GPR), we successfully mapped cultural features along the Connecticut River Valley. These features include dense groupings of Woodland houses. Here, we reveal a dense archaeological landscape of sites within Northern New England and provide evidence to suggest the existence of larger villages in the region.

Exploring Characteristics of Sustainable Coastal Exploitation during the Middle and Later Stone Ages in South Africa through Fish Bones and Seal Teeth

This interdisciplinary research project investigates both the emergence and defining characteristics of sustainable coastal exploitation. The southern coast of South Africa has the longest history of sustained coastal exploitation globally, despite rising and falling sea levels, changing coastal habitats, and variations in seasonality and temperature. Given this long history of coastal exploitation, with the earliest evidence of systematic coastal exploitation by 110 ka to the present, we aim to explore how humans took advantage of changing coastal environments as part of an overall sustainable subsistence strategy. Stable isotope measurements of fish bones and seal teeth (as proxies for habitat use) and analysis of fish otoliths (a proxy for seasonal exploitation) can provide insights into where and when humans were exploiting fish and seals. Meanwhile, changes in the body size of a harvested fish species over time, namely, the yellowtail amberjack (*Seriola lalandi*), can be used as a proxy for subsistence intensification. In summary, we explore the origins of and patterns within and across site-specific changes in fish and seal habitat use, seasonal exploitation, and subsistence intensification from four Stone Age sites in southern Africa: Blombos Cave, Klasies River Main Site, Hoffman's/Robberg Cave, and Nelson Bay Cave.

Visible and Invisible Workings of Cahokia

Cahokia has long been subjected to terminological contention, failing to fit categorical configurations such as state or chiefdom but has now become commonly referred to as an urbanism—effectively dodging the

chiefdom/state terminological quandary. What if much of the categorical problem lies in looking at the world through a Euro/American lens? Traditional Western definitions of sociopolitical types focus too narrowly on “power over” rather than concepts expressed as important community values by indigenous scholars, such as “in relation with,” “responsibility to,” and “responsibility with.” Shifting focus to prioritize Indigenous values emphasizes relationality, landscapes, other than human persons, communal values, and the numinous. This focus reconfigures aspects of Cahokia that have long been dismissed, misunderstood, or ignored. Here, I explore how Cahokia became an urbanism as a result of a religious movement and frame this development by calling on Indigenous understandings of community, power, authority, the numinous, and relationality. Drawing on archaeological data from Cahokia, outlying shrines, and other nodal centers as well as Indigenous values, I argue that Cahokians’ ideologies were in fact built into the architectural features that they constructed and were emphasized by the Cahokians’ chosen landscapes.

The Most Inhospitable of Environments: Enslaved Life in the Rice Fields of the Santee Delta

Located between Charleston and Myrtle Beach, South Carolina, the Santee Delta is a unique wetland habitat characterized by tidal marshes and low-lying barrier islands. Situated between the North and South Santee Rivers, the delta is a critical stopping point for a number of migratory birds and is also a popular duck hunting destination. However, historically, it played an important role in the British Atlantic world as it was also the heart of rice culture in the colonies. Once a thriving industrial complex centered on the growth and processing of rice, this wetland environment was home to thousands of enslaved people whose labor and knowledge of rice cultivation enriched the White planter class that owned these lands. Though much of the above ground evidence for processing areas and settlements are gone, there is archaeological evidence of this industry and the people that built it. By using a multiple lines of evidence, this paper will show how people utilized this remote and inhospitable landscape and why we should care about it today.

Collaborative Research, Synthesis Centers, and the Challenge of Connecting the Past to the Present

Synthesis in archaeology has traditionally been the province of the lone scholar, requiring heroic efforts of finding, integrating, and interpreting the results of published and unpublished reports. Such an approach is no longer tenable. The advent of CRM has led to a mountain of documented but only partially interpreted data. Academic and applied research projects now incorporate digital technologies which produce data at a pace that outstrips investigator’s ability to absorb them. It is telling that at a time when ample data on past human behavior and natural environments, the tools to make such data interoperable, and the desire to address long-term processes underlying many of today’s existential challenges exist, the major hinderance to synthesis are the traditions and culture of archaeology. About 30 years ago, other sciences facing similar issues came up with a novel solution: the synthesis center. These centers replaced lone scholars with working groups of collaborators who represent all sides of a problem, stress inclusivity and diversity, and who are provided the physical and digital tools to succeed. In 2017, archaeology joined these sciences with the establishment of the Coalition for Archaeological Synthesis (CfAS). In this paper, I trace CfAS’s history and accomplishments.

Renovación del templo en Chavín de Huántar en el Periodo Formativo Tardío: Una interpretación desde el estudio de los materiales

En esta presentación expondremos sobre los análisis realizados a los objetos hallados en contextos de ofrendas, asociados a lo que hemos definido como la renovación del templo en Chavín de Huántar, practica ritual realizada durante el Periodo Formativo Tardío (900-450 aC). Los resultados nos han permitido reconocer el mantenimiento de un patrón de deposición asociado a la construcción de arquitectura ceremonial por más de 500 años. Además, logramos identificar la proveniencia de estos objetos desde ecosistemas lejanos como las playas o lomas costeras.

Landscape Modifications and Water Management at Aguada Fénix

The latest archaeological evidence has shown that 10,000 years ago the landscapes of the actual Mexican territory suffered constant changes due to human activities. Fire, horticulture, species dissemination, and agriculture are among the factors that played a significant role in landscape transformations. The area occupied by the monumental site of Aguada Fénix was not an exemption. The creation of artificial reservoirs and hydraulic works dated from around 1100 BC show the advanced knowledge the builders had on water management, one of the most abundant resources found around the area. The requirements to reach the final goal took huge human force at a communitarian level to create their own environment. Archaeological works at Laguna Naranjito—a shallow lake found to the west part of the artificial plateau—evinced that the area underwent major changes. This talk is about those modifications, the hydraulic features, the landscape transformation, and the human force implied in this engineering work.

An Iconographic Study of Pottery Stamps from a Postclassic Village in Las Margaritas, Chiapas, Mexico

The abundance of pottery stamps, variety of designs and quality of its craftsmanship during the Postclassic period, contrasts with the scarce studies regarding these special artifacts whose analysis can contribute to the knowledge of significant aspects of ancient Maya culture. These stamps were used to imprint decorative motifs on the human body, fabrics, or other materials, and its designs, loaded with symbolism, merit further attention. In this paper we will present the preliminary results of a typological analysis of motifs carved on a group of 206 stamps, excavated at a Late Postclassic and colonial (AD 1250–1524) settlement in the Maya Highlands, at Las Margaritas, Chiapas, Mexico. The designs in our sample show schematic representations and animal figures, like birds, snakes and mammals, with important symbolic implications in local culture.

New Insights into Poverty Point Exchange through Lead Isotopic Analysis of Galena

The mineral galena is well established as a raw material used by prehistoric peoples of eastern North America from the Late Archaic through Mississippian periods. In the lower Mississippi River Valley, numerous specimens have been recovered at sites occupied by groups associated with the Poverty Point culture. The current study involves isotopic analysis of galena specimens from two of those sites, Poverty Point and Claiborne. These results demonstrate a strong connection between the galena specimens and source areas in southern Missouri and northern Arkansas. There is no evidence of connections to Upper Mississippi Valley source areas as reported in some previous studies. Because the specimens were recovered from excavated contexts, some of which have associated radiocarbon dates, these findings are placed within a more secure spatial and temporal framework than has been typical of previous studies into the exploitation of galena by Poverty Point culture groups.

Human-Environment Dynamics at the Arid Margin of the Levant: Fluctuating Freshwater Resources between 400,000 and 40,000 Years Ago in the Greater Azraq Oasis Area, Jordan

The Azraq Basin is a 12,000 km² internal drainage system at the eastern margin of the Levant. The center of the basin, which we refer to as the Greater Azraq Oasis Area (GAOA), is characterized by a mudflat flanked by two historical wetlands. Desiccation of these wetlands in the early 1990s and subsequent construction activities have exposed middle and late Pleistocene wetland deposits containing abundant Lower, Middle, and Upper Paleolithic stone tools and faunal remains. Landscape-focused geoarchaeological research has since demonstrated that the past 350,000 years in the GAOA is characterized by at least three local wetting-drying cycles that would have dramatically shifted the quantity and distribution of freshwater resources, ranging from expansive wetland landscapes to desert refugia characterized by isolated spring pools—changes that would have significantly impacted the mobility decisions and settlement patterns of Paleolithic inhabitants. In this paper, we present results of our ongoing efforts to integrate the Pleistocene archaeological, paleoenvironmental, and paleoclimatic records of the GAOA to elucidate the relationship between fluctuating freshwater resources and hominin adaptation in the Basin between 400,000 and 40,000 BP.

MicroCT Analysis Reveals Beginning of Rice Domestication in the Lower Yangtze Valley during the Tenth Millennium BP

The Lower Yangtze valley is widely recognized as the earliest center of rice agriculture. The process of rice domestication, based on the morphology of spikelet bases, has been traced to between 9000 and 5000 BP. However, the domestication status of rice before 9000 BP remains a subject of debate due to the near absence of macrobotanical remains in the region. This research aims to address this gap by investigating rice impressions and inclusions found in ceramic sherds from the early Shangshan site (ca. 12,711–8538 cal BP). Utilizing quantitative microCT analysis, this study examined 184 impressions of *Oryza* sp. spikelet bases from ceramic sherds, generating the most extensive database of rice remains dating to the early Shangshan phase. The results present evidence for the early onset of the rice domestication process during the tenth millennium BP, supported by the presence of 12% non-shattering-type spikelet bases. This study represents a pioneering use of microCT quantitative analysis of ceramic sherds with early plant impressions.

Paleoenvironmental Research at Yaxnohcah, Campeche, Mexico

When the Proyecto Arqueológico Yaxnohcah began 13 years ago in 2011, some of our driving questions centered on the Bajo el Laberinto and the role that this enormous wetland played in the rise and development of what was to become the great city of Yaxnohcah: Why were the early inhabitants of the Central Karstic Uplands drawn to this environment? Were the extensive wetlands the primary reason for the settlement of the region? Had this bajo depression been altered from perennial to seasonal due to erosion and deforestation? Is there evidence that the inhabitants of Yaxnohcah managed their habitat sustainably? To address these questions and others that emerged because of our investigations, we included in our research agenda actions geared toward the recovery of data that would give some insight in how the ancient inhabitants of Yaxnohcah managed their landscape. In the process several scholars joined the project adding within their disciplines more knowledge to our understanding of urban and land management processes of the bajo region. In this paper we synthesize the works that have been carried out through the life of the project, to interpret how the ancient inhabitants of the region modified their landscape.

Teaching Archaeological Epistemology through Tabletop Gaming

More often than not, the general public learns about archaeology through flashy headlines proclaiming glamorous finds and grand interpretations with little to no explanation of how those conclusions are drawn. As a result, students in their first archaeology class struggle to understand the reasons behind learning archaeological methods and the detailed work of artifact analysis. In an effort to help students come to a better understanding of how archaeologists construct knowledge of the past, I am developing a tabletop board game that models the research process in archaeology. The game can be played in 30–50 minutes by a group of 3–5 students and challenges them to select research questions, draft a team of specialists, survey, excavate, and analyze an archaeological record created by a series of card decks. Initial playtests have received positive feedback from students, and another round of playtesting will be conducted shortly before the Society for American Archaeology meetings. The ultimate goal of this work is to create a publicly accessible resource that helps students both learn how archaeologists think and have fun in the process.

Local Impact of Tiwanaku at the site of Pinami, Cochabamba: Synthesis of Diachronic Ceramic, Household, Food Production, Mortuary, and Isotopic Data

The Tiwanaku state has been shown to have had varied methods for interacting with and influencing its peripheries. This poster presents a synthesis of multiyear excavations at the site of Pinami in the Central Valley of Cochabamba that provides both diachronic depth from the Late Formative, Middle Horizon and Early Intermediate and a wide range of datasets including ceramic, household, mortuary and isotopic data. Considered as a whole the data shows evidence of significant Tiwanaku impact by the late Middle Horizon on all lifeways. I conclude that the data supports a model of Tiwanaku using indirect control in Cochabamba.

Brushstrokes of the Past: Unraveling Pecos River Style Murals with Harris Matrix Composer

Stratigraphic analysis has long been a cornerstone of archaeological research, and the practice of displaying and analyzing complex relationships between stratigraphic surfaces and layers using Harris Matrix Composer is commonplace. New methods in rock art research have incorporated an understanding of stratigraphy in the analysis of paint layers. As a part of the ongoing Hearthstone Project, archaeologists at Shumla Archaeological Research and Education Center (Texas) have analyzed the paint layers at 10 Pecos River Style (PRS) rock art sites and created Harris Matrices to graphically display the complex stratigraphic relationships revealed by this analysis. Doing so reveals novel issues that arise from using software designed for layers of sediment on rock art. With that said, using Harris Matrix Composer in this manner to differentiate between distinct painting events allows us to argue that PRS murals were primarily rendered during a single painting event as a composition rather than separate painting events accumulated over time.

Bayesian Demographic Reconstruction in the US Southwest: “Playing” with Priors

Paleodemographic reconstruction is an essential prerequisite for understanding human ecology of ancient societies. In the US Southwest several studies have employed Bayesian statistical methods to improve population estimates. This paper compares two alternative implementations of Bayesian statistics to demographic reconstruction in the US Southwest—Empirical Bayesian Analysis and a more generic Uniform Probability Density Analysis (UPDA). The two methods differ significantly in their approach to the construction of “Priors”, the creation of which is a point of contention for critics of Bayesian statistics. This study employs the UPDA approach for the first time in the VEP2N study area where previous work employed the Empirical methodology to assess the impact of this difference on final results, and to explore how alternative Prior construction within the UPDA approach affects final outcomes. The work concludes that Prior construction must be performed thoughtfully, and while the more generic UPDA approach does not produce results drastically different from the highly specific and customized Empirical approach, that is critically contingent on the specific selection of sites and ware types used for Prior construction. For example, alternative data selection for UDPA priors can generate three, rather than the two, demographic cycles of the Empirical method.

The Possibilities of Sociopolitical Forms: An Archaeological Existentialism for Collectives

In *The Dawn of Everything*, Graeber and Wengrow present a thought-provoking archaeological history of humankind that challenges common understandings of our pasts. Instead of a linear progression from egalitarian pasts to state-based hierarchies, they show the spectrum of variability of sociopolitical structures that have emerged throughout history. In so doing, they raise awareness of human sociopolitical possibilities, bringing readers to reflect on and question the apparent fixity of current state forms of rule, which are commonplace today. Here, I focus on this facet of their work, their highlighting of sociopolitical possibilities that were actualized in the past. They foster a sense of anarchic play in social and ritual practices, showcasing

other ways of living in the world and with others. While Marx and Kropotkin more often provided sketches of humanist ideals for how political arrangements could be, Graeber and Wengrow provide numerous case studies of realized possibilities from the archaeological record. I will discuss how they have provided us with a form of existentialism that is not concerned primarily with the subjective individual, but one that is anchored and operates at the level of the collective.

Macedonian Presence on the Crnobuki Gradiste Riches to Rags: Year 1

Cal Poly Humboldt and the Museum Bitola initiated a long term research project in the Pelagonia region of North Macedonia, this paper presents the results of the initial field season. Our expectations were that the site was the location of a remote Macedonian garrison defending against Roman incursions. We conducted excavations, remote sensing and in depth gray literature research in 2023 and discovered a complex fortress area with extensive habitation areas, workshops, artifact deposits, deeper time depth than expected, and tantalizing previous work that all points toward a significant Macedonian City existed at this location that persisted through Roman conquest. Remote sensing data, excavation data, and past archaeological work are analyzed and presented.

How Grassroots Initiatives Preserve and Protect Tunisian Cultural Heritage

The Medina of Tunis is an ancient Islamic city and a UNESCO World Heritage site. However, it is in a vulnerable state, with many historic palaces, ancient dwellings, and monuments confronting neglect, leading to an alarming rate of deterioration. In 2021, an independent ethnographic research study was conducted in the Medina of Tunis in collaboration with Blue Fish, a social enterprise consultancy. Through assessing local heritage values and the extent of community awareness of the significance of preserving historical assets, the research contributed to local knowledge creation in ways that help heritage advocates to better understand the challenges around preserving the Medina and implement practical strategies and interventions to strengthen preservation efforts. The results of the research highlighted the important role that grassroots heritage organizations play in shifting existing negative perspectives of the Medina, educating the public, and raising awareness around the Medina's rich heritage. In this session, a short video will first be presented to tell the story of the Medina. This will be followed by a presentation of the highlights of the research findings, demonstrating how cultivating grassroots heritage organizations and inclusive participation have proven successful in promoting awareness, revitalizing, and protecting heritage in the Medina.

Liberal Logics and Their Influence on the Management of Republican Haciendas of Yocalla and Puna in Potosí, Bolivia
This paper will present the preliminary results of an archaeological investigation, currently in progress, carried out in the ex-haciendas of Yocalla and Puna, in Potosí, Bolivia. Based on archaeological survey, surface material, architectural evidence and historical documentation from the nineteenth and twentieth centuries, it is intended to explore the influence of the liberal logics introduced by the Republican elites in the spatial management of the haciendas. These are located in spaces that were previously subjected to the forces of Potosí's mining market during the colonial period. The archaeological and historical evidence allows us to identify continuities and transformations in the spatial organization of the haciendas that reflect power relations between landowners and workers. The consequences of these changes are still visible today, 70 years after the dissolution of the hacienda system in 1953.

Sticky Places: Persistence and Relationality

The goal of this session is to explore the factors underlying persistent places, specifically thinking beyond resource availability or representationalist notions of meaning bestowed by humans. In this paper, I outline the theoretical ideas and concepts that underlie this symposium. I argue that all places exist as relational fields, and persistence comes from the emotional experiences and relationships cultivated in a particular place. Persistence, then, is not only about meaning given to a place, but about those qualities, relationships, and effects that lead to its longevity. Importantly, the relationships that generate persistence involve a plethora of nonhumans, as well as relationships and experiences across time and space, as places become linked in ontological ways of knowing the world. Additionally, while persistence implies a fixedness, I suggest instead that it is a kind of stickiness, or better yet an accumulation of things, practices, experiences, memories, emotions, and more that are generated from these relationships. What are the ways in which places gather up relationships? How does permanence fit into relational archaeologies? Thinking about persistence has implications for how we think about places over time, extending to heritage management, Indigenous rights, and how we think about the environment generally.

Cultural Footprints Unearthed: Exploring Settlement Patterns and the Constructed Landscape of Yalahau, Yucatán

The discourse surrounding the environmental impact of humans on Earth underscores the imperative to comprehensively grasp the temporal and geographical dimensions, as well as the transformative intensity of anthropogenic changes. The Parque Estatal de Yalahau Project, a multidisciplinary endeavor encompassing archaeology, paleoecology, and historical ecology, seeks to do this in Yucatán, Mexico. Its focus is to correlate historical occupation periods with landscape transformations in Yalahau's prehispanic settlement. Our objective is to elucidate the extent of impact, environmental change, and the evolving palimpsest of landscape transformations over the *longue durée*. In this paper, we report on our results which have revealed that the Yalahau site showcases a rational relationship with the environment. Its special design reflects a deliberate decision rooted in considerations involving the sustainable utilization and conservation of the natural surroundings. These decisions are underpinned by a profound understanding of the local terrain, soil characteristics, and the dynamics of wetland processes. Additionally, the paleoecological analyses on unconsolidated sediments samples, extracted from cores recovered in cenotes within the settlement and its

periphery, have shed light on substantial shifts in land use practices and climate over time. These findings suggest a dynamic adjustment response by the prehispanic population to fluctuating environmental conditions.

The Sum of Their Parts: Excavation and Inventory of Isolated Commingled Remains alongside Partially Articulated Individuals at Diablo Wasi, Peru

Funerary contexts of commingled remains generally fall into one of two categories: primary mass burials and secondary reinterments. Each of these commingled contexts has standards of documentation, collection, and inventory that have proven effective in the past. At Diablo Wasi, in the northern Peruvian Andes, the funerary contexts are a combination of primary depositions and taphonomic processes that replicate secondary deposits, requiring a new approach. The site consists of primary depositions of bundled individuals, but animal and human disturbances have destroyed many of the bundles and led to the degradation and disarticulation of the individuals placed inside the mausolea. Thus, partially articulated and bundled individuals can be found mixed with matrix and isolated skeletal elements. To more effectively excavate and inventory these contexts, we developed a mapping and numbering system that permitted us to enumerate all skeletal elements, regardless of their association or articulation, while maintaining the in situ relationships of individuals or skeletal elements that were articulated or in association. This system allowed us to calculate a minimum number of individuals using standard methods while simultaneously maintaining the contextual relationships that aid in laboratory analyses and the reassociation of individuals and isolated skeletal elements.

Preclassic Maya Economy: Lithic Production and Exchange in Aguada Fénix and Its Neighboring Sites in the Middle Usumacinta Region, Mexico

This paper discusses the results of my diachronic analysis of lithic artifacts collected in Aguada Fénix and its neighboring sites in the Middle Usumacinta region, Mexico, in order to elucidate one aspect of long-term changing patterns in the Preclassic Maya economic systems. I reconstructed the precolumbian long-distance obsidian exchange system in the study region using a combination of pXRF and technological analysis, thus identifying the sources of imported raw material and finished products. Similar to Ceibal during the early Middle Preclassic period, El Chayal was the principal source for obsidian, with minor quantities of obsidian from San Martín Jilotepeque and Ixtepeque in Aguada Fénix and La Carmelita. After the early Middle Preclassic period, San Martín Jilotepeque began to account for most of the obsidian brought to Pajonal and Rancho Zaragoza. Notably, no Mexican obsidian artifacts were imported either to Ceibal or Aguada Fénix and the other sites in the Middle Usumacinta region except Pajonal during the Middle Preclassic period. The bottom line is that virtually all obsidian artifacts from the Middle Usumacinta region originated from highland Guatemala, suggesting the boundaries of obsidian exchange systems between highland Mexico and highland Guatemala during the Middle Preclassic period.

Water Management and Symbolism in the Agrarian Landscape of the Sondondo Valley, Peru

Terraces are the clearest evidence of landscape transformation in the highlands of the South-Central Andes of Peru; they represent a magnificent and complex solution to create cultivation areas where geographical

and climatic conditions were not ideal. Water management is an important piece of this system in which the water harvested in the puna area irrigates fields in the lower altitude zones of the valley. Our team focuses on the study of the agrarian landscape and prehispanic agriculture, excavating terraces at different elevations in the Sondondo Valley, Peru. Moreover, we have studied complementary areas such as storage structures, livestock corrals, and carved petroglyphs to understand the complex assembly of this system. In this contribution, we will present the analysis of the irrigation system in the valley and the study of the engraved rocky outcrops that represent the agrarian landscape, known locally as *maquetas*. They represent the agrarian landscape including the irrigation system as engraved canals and *qochas*. The excavation of one of them has shown their remarkable symbolism. The ritual significance of water in relation to the environment is still very important for Sondondo's communities that still cultivate this landscape using ancestral knowledge.

Metal Production at Abu Muslim qala: An Analysis of Metallurgical Waste from a Medieval Site in Central Asia
Abu Muslim qala is a multi-phase site located west of the Sultanuzdag mountain range in Karakalpakstan, Uzbekistan, with an occupation beginning as early as the seventh century AD. Situated along the route connecting two of the region's most prominent medieval cities, Abu Muslim qala may have played a role in the broader network of medieval metals trade between Central Asia and Europe. Located near an iron ore deposit, the site contains a slag mound and other metallurgical debris indicative of iron smelting. PXRf analysis of metallurgical waste collected in 2018 from the surface provided preliminary corroboration. Recent metallographic analysis indicates the use of local titanium-rich ores during metal manufacturing.

Let's Put Our Differences Aside and Work Together: A Case Study in NAGPRA Consultation and Repatriation
Although the Native Americans Grave Protection and Repatriation Act (NAGPRA) was enacted in 1990, New Mexico State University Museum (NMSU) personnel struggled to complete the required inventory of their collections for more than 15 years. Personnel changes at the museum and a complex, poorly documented collection added to the difficulties of completing the NAGPRA inventory. In 2015, new museum staff reinitiated the NMSU NAGPRA process and explored new strategies for completing an inventory, initiating consultation meetings, and successfully repatriating human remains and associated funerary objects to affiliated tribes. This paper explains how we succeeded in completing our inventory and carried out our NAGPRA consultation meetings so that repatriation will occur. The lessons we learned may be useful to other small museums that still need to complete their NAGPRA obligations.

Late Pleistocene / Early Holocene Human Occupation along the Tietê River, São Paulo State, Brazil

The Tietê River is historically known as one of the main human displacement axes between the eastern portion of SE Brazil and the inner portions of the continent, being navigable for most of its course. The use of this waterway back to a distant past can be inferred, but up to now, the archaeological evidence along the Tietê is scarce, both because of a lack of academic interest and the failure of previous CRM reports to convey basic information about the sites (either in terms of lithic and ceramic classification or even to provide any ages). The scope of this paper is to present new data about the late Pleistocene / early Holocene occupation along the Tietê River, gathered during a CRM survey on the shores of two dams related to hydroelectric powerplants, as well as inserting these data into a broader scenario that can be of help in understanding the peopling of Eastern South America.

Shaping the Past: A Geometric Morphometric Approach to the Diversity of Lithic Tools in São Paulo State, Southeastern Brazil

Geometric morphometrics is a powerful analytical method developed in evolutionary biology to study, quantify, and compare shape variations in biological specimens. Archaeologists have been applying geometric morphometric methods (GMM) to study shape variations in archaeological artifacts for more than a decade. GMM finds more frequent application in the field of evolutionary archaeology and lithic studies, where researchers can draw conclusions about cultural evolution, technological innovations, and the spread of ideas or practices in ancient societies by quantifying shape variations and changes over time. In this paper, we present partial results from the doctoral research currently under development by the first author, which is in its final phase. This project is framed within a cultural evolutionary approach and Cultural Transmission Theory, aiming to describe and compare the morphological variability of lithic bifacial points and lithic unifacial tools from hunter-gatherer groups in São Paulo State, southeastern Brazil during the Holocene. Our objective here is to demonstrate how GMM is an effective tool for describing the variation in formal lithic artifacts by comparing different areas within São Paulo State.

Boundaries of Interdisciplinarity: Can Zooarchaeology Handle Ontological Diversity?

Although cross-cutting disciplinary boundaries from its inception, zooarchaeology has traditionally been most at home among the positivist sciences. As a result, interdisciplinary work has proceeded most easily with science and science-adjacent fields (stable isotopes, aDNA, ecology, etc.) with impressive results. In this paper, I think through what happens when zooarchaeologists desire to explore interdisciplinarity in other directions (e.g., nonpositivism, posthumanism). How does a discipline centered in the biosciences handle ontological diversity? As an example, I focus on a process-oriented approach (specifically Deleuzian assemblage theory) thinking about how it can be used to reframe zooarchaeological research including the questions we ask, the data we assemble, and the ways we assess data. I identify points of friction with this approach within a field defined by the expectations and values of a self-consciously scientific discipline and the resulting practices of policing which are sometimes deployed to maintain traditional disciplinary structures.

“El Agua es Vida, si no hay Agua, no hay Vida” (“Water is Life”) says Doña Francisca (community of Huehuestepe, Mayales River Valley [MRV], Nicaragua). Today more than ever this sentence holds true, given water’s increasing significance in the global climatic debate. Rivers are essential to human life, yet it can also be destructive, to connect and ultimately to shape human-environmental interaction through time and space. To what extent has this relationship changed in central Nicaragua since prehispanic times? Can we assess this through archaeological methods? This presentation will show the final results of the Interdisciplinary Archaeological Project Finca Santa Matilda (PRISMA), which integrates the geoarchaeological analysis of Roberto Amador site (RA, MRV, Chontales) and local knowledge on water and aquatic environments. Specific attention will be given to the technological, statistical, and traceological analysis of RA lithic artifacts. PRISMA unveiled how human adaptation strategies in the MRV are strictly linked to people’s understanding of the river behavior, the selective use of riverine resources, and on the predictability of hydroclimatic fluctuations. We argue that a multidisciplinary archaeological research, combined with local knowledge, could contribute to envisioning a more inclusive approach for planning sustainable water and land-use practices in Nicaragua.

Archambault, Rachel (Université de Montréal)**[148]***Island Garbology: Methodology, Challenges, and Contributions to the Archaeology of Barbuda*

Islands like Barbuda are particularly sensitive to waste management policies and behaviors; in addition to having to manage their waste daily, they also suffer the effects of tourism and the marine litter washed up on their coasts. These challenges are certainly not new, but their complexity is increasing and the consequences are interfering more every day in the daily lives of locals and are visible in the heart of terrestrial and marine environments. In this context, archaeology can contribute to the understanding of the formation of spontaneous dumps in the natural environment, such as piles of waste along roadsides, in forests, on banks and at the bottom of waterways. These sites are complex, constantly changing, and sometimes used sporadically for decades, leading to major documentation challenges. How can we archaeologically document such sites? As part of our research on the island of Barbuda, we use photography, visual prospecting, sampling and photogrammetry to document contemporary spontaneous dumps. This article provides a review of the strengths and weaknesses of this methodology, as well as the contributions and future of the garbology project in Barbuda.

Archila Montanez, Sonia (Los Andes University) and Martha Mejía Cano (Los Andes University)**[217]***Early Use of High-Altitude Tubers in the Eastern Cordillera of Colombia*

In this paper we discuss the importance of high-altitude tubers to early peopling of northern Andean area of South America and their role in the colonization of environments like Bogota plain that resulted in different ways of inhabiting and transforming the region during the early and middle Holocene. We are interested in

the study of social aspects related with plant cultivation to understand the agency of hunter-gatherers in early domestication of plants, particularly their role in the establishment of high-altitude tubers as staple foods. The archaeobotanical analysis carried out at the archaeological site of Checua allows us to suggest that hunter-gatherers were collecting and cultivating plants during the time span of the occupation of the site (9500 and 5052 cal BP), as it is evidenced by the presence of starch grain morphotypes similar to those of present day cultivated plants like cubio (*Tropaeolum tuberosum*), ibia (*Oxalis tuberosa*), ulluco (*Ullucus tuberosus*), common bean (*Phaseolus* spp.), and mays (*Zea mays*). These data are supported by the analysis of dental calculus from human individuals buried at the site. This long cultural tradition is still present in rural areas of the Colombian Andean highlands where communities cultivate tubers as part of their cultural inheritance.

Agriculture Is Not Inevitable: Lessons in Foodways from Precolumbian South Florida

Some scholars have argued that the adoption of agriculture is inevitable and that Holocene climate changes forced complex societies around the world to domesticate plants and animals. But the complex cultures of precolumbian south Florida provide a rare example of persistent reliance on wild foods exclusively. Using paleobotanical data from recent research in the Calusa and Matecumbe regions, we show how wild plant and marine foods remained a significant component of ancient diets despite the adoption of agriculture in other parts of the peninsula. New attention to the dietary advantages of wild plant foraging provides additional insights into the choices made by ancient south Floridians and suggests avenues for alternative dietary choices today. In south Florida, agriculture was not inevitable and broadening our understanding of ancient food procurement strategies may provide useful examples for modern solutions to issues of food insecurity, sustainability, and resilience.

The Inka Road and Mobility of a Fisher Community in the Cañete Valley, Peru

The Inka Road system was a critical infrastructure for expanding and consolidating the Inka empire in the Andes. From the traditional view, the existence of the Inka Road across diverse regions was seen as an indicator of how the Inkas integrated and controlled the mobility of subject communities. Other recent perspectives have emphasized the mobility of local populations by using the Inka Road without explicit imperial control. In this presentation, we will identify the Inka Road associated with the Cerro Azul site through aerial photographs, historical maps and documentation, and field visits. The Cerro Azul site is a settlement occupied by a maritime community in the Cañete Valley, South Coast, Peru. The characteristics and route of this segment of the Inka Road at Cerro Azul enable us to discuss the mobility patterns at differentiated scales of the coastal route during the Inka empire.

Carved between Cartafuel and Coangue: Spatial Analysis of the Pasto Rock Art Sites of Carchi, Ecuador

In the social context of Andean prehispanic societies, petroglyphs constitute multivocal elements that stand out from the aggregates of material expressions of culture. As such, their condition as a cumulative of symbolic particularities and their contextualization in the intentional use of cultural space allows us to read them beyond iconography. The motifs variability in the petroglyphs of the province of Carchi, Ecuador, associated with the Pasto occupations (AD 750–1532), the seven altitudinal floors of the region, its hydrography and volcanoes, elucidate this intentionality. Therefore, through their regional sampling, and its subsequent multivariate analysis with the index as the semiotic component for the carved representations and the landscape as the unit of analysis; I seek to understand the petroglyphs beyond the icon and through their significance in human and nonhuman relationships.

Entre dos frentes: Cerro Nاريو y Loma de Pinzhul durante el Periodo Formativo del Cañar, Ecuador

Nuestra exposición abordará la relación existente entre los sitios arqueológicos Cerro Nاريو y Loma de Pinzhul durante el Periodo Formativo Final (500-50 aC) de Ecuador. Proponemos que en esta sección del Cañar coexistieron ambos sitios como lugares ceremoniales que tenían relaciones de intercambio con varias regiones durante los siglos finales del formativo. Este planteamiento se sustenta en el análisis de la cerámica, la secuencia estratigráfica, los fechados de radiocarbono, la arquitectura y el estudio del paisaje formativo. Los resultados nos han permitido definir que entre el 500-50 aC ambos sitios funcionaron en paralelo, complementándose en el paisaje formativo del Cañar y desarrollando actividades ceremoniales semejantes. Asimismo, pudimos reconocer objetos cuya procedencia deriva de otras regiones de Ecuador y del norte del Perú.

El legado de Ann Cyphers en la arqueología olmeca: Investigación y vinculación comunitaria

Los trabajos de Ann Cyphers (1950-2023) sobre los olmecas son uno de los legados de la arqueología olmeca, de Mesoamérica y del mundo. A raíz de su fallecimiento, es necesario un recuento de su producción académica. Esta ponencia analiza la obra de Cyphers respecto a sus principales temas, influencias,

aportaciones y retos en más de tres décadas de trabajo en la primera capital olmeca de San Lorenzo, Veracruz. Particularmente, se concentra en las contribuciones al conocimiento arqueológico y los planteamientos que causaron una irrupción al pensamiento disciplinar que enmarcaba los estudios en la costa del Golfo de México y que se observan a través de las líneas interdisciplinarias de investigación. Algunos temas son estudios sobre subsistencia, patrones de asentamiento, análisis escultórico, modos de vida, arquitectura, y viviendas, entre otros. Asimismo, y de manera trascendental, Ann Cyphers desempeñó un papel central en el desarrollo social del sur de Veracruz a través de la vinculación comunitaria reflejada en museos, un campamento para la investigación y formación de estudiantes, exposiciones y estrategias de comunicación para la salvaguarda del patrimonio arqueológico. El legado científico, cultural y social de Cyphers resulta inmensurable para comprender, en gran medida, a la más antigua sociedad de Mesoamérica.

Modeling the Use of Seaweed for Fire by Hunter-Gatherers in the Atacama Desert

The use of fire is essential for contemporary human populations. Yet the presence of an active population in the coastal Atacama desert, with limited land-based combustible, leaves us with the intriguing possibility that the ancestral inhabitants of this region used the abundant seaweed brought by the tides as a resource to sustain fires. To test this possibility, we introduce a simulation model consisting of three primary components: land-based combustible resource production, accumulation of combustibles along the seashore, and their consumption by human communities. The model proposes the use of a logistic law to describe how resources increase over time and provide a parameter range of consumption and use of each of the components that can be tested against empirical evidence.

Research and/or Stewardship of Tribal Collections?

Research and/or stewardship? Native American cultural materials excavated or collected by archaeologists, particularly at research universities, have focused on Western-defined “scientific” and educational values of these collections. Tribal members increasingly are challenging such ideas. They dispute that items of their cultural heritage are primarily objects of value because academics can derive scientific data from them. Archaeologists are taught the physical object itself is less important than what the object may tell us about the past. The National Register of Historic Places reinforces such perspectives with the archaeological criterion focusing on the extractive value of sites yielding information. Data recovery at the expense of protection is mitigation in CRM undertakings. But universities and museums now must operate in a world in which collections, like exhibits, may be seen as a source of community relationships and engagement. Additionally, they must adapt to collections being highly regulated. In California, for example, reforms to CalNAGPRA emphasize

deference to tribal knowledge, potentially opening up the return of many collections that federal NAGPRA effectively excluded. As a member of a federally recognized tribe, RPA, former THPO and curator, I will discuss how tribal views of stewardship may alter the generations-accepted research paradigm.

Revenge of the Nerds, or Why Do Modern Archaeologists Identify with Early Antiquarians?

Laws for the preservation of tangible heritage posit historical and cultural significance as a form of intrinsic value that makes objects worth preserving. In the nineteenth century, arguments for this sort of preservation were meant to counteract vernacular practices that treated ancient ceramics or architectural remains as “mundane” objects that could legally be subjected to sale, manipulation, or destruction. Using a number of historical examples, this paper will trace how the figure of the eccentric and disdained antiquarian was used to articulate this preservationist principle in the first half of the nineteenth century. Though the legal principle of tangible heritage protection could be considered hegemonic today, the figure of the disdained antiquarian continues to figure in different performances through which heritage professionals legitimate state-sponsored preservation, even when this comes into conflict with the interests of indigenous descendant communities and other marginalized stakeholders. This disjuncture between the historical roots and contemporary realities of the heritage narrative provides a useful point of departure for rethinking core assumptions of preservation practices in the twenty-first century.

A Morbid Taste for Bones? Reconciling Science and Ethics in Mortuary Archaeology

Dead bodies are a source of a range of extreme emotions in human societies past and present, from superstitious fear of the dangerous dead (burials at cross-roads in medieval Germany) to ancestor veneration and the curation and display of skeletal remains (catacombs in Portugal, Italy, and other areas of Europe). However, the expectation that the dead, once buried, will be allowed to rest in peace is a comforting fiction, as archaeologists working in CRM or heritage management know only too well. Most members of the public are unaware that the dead far outnumber the living, making their eventual disturbance due to human activity, such as urban sprawl or industrial development, and natural forces, such as coastal or riverine erosion, virtually assured. Archaeologists serve as one of the few buffers between the random and violent destruction of such remains, as often happened in the past, and their careful recovery and respectful analysis. Pat Richards has spent the better part of her professional career dealing with the tension between the public perception of mortuary archaeology and its practical reality. This paper will unpack the challenges of engaging in mortuary archaeology in an increasingly politically motivated anti-science ecosystem with global reach.

Arnold, Philip (Loyola University Chicago)**[216]***El juego de pelota y el juego político en Teotepac, el sur de Veracruz, México*

Aunque se considera un pilar del periodo clásico de Veracruz, el juego de pelota mesoamericano está poco documentado en la Sierra de los Tuxtlas del sur de Veracruz, México. Si bien se han identificado las canchas del juego, el conjunto de actividades que se organizan en esos lugares aún no se ha estudiado lo suficiente. Esta presentación informa sobre los juegos de pelota relacionados con el sitio de Teotepac, ubicado a las orillas del lago de Catemaco en el centro de Tuxtlas. Estos datos incluyen información sobre patrones de asentamiento dentro del sitio, prospección geofísica y el análisis de un contexto de banquete asociado con una cancha del juego. Esta última información proporciona una idea de las funciones políticas que pueden haber constituido parte de los rituales del juego de pelota. Específicamente, se argumenta que ciertos artefactos, como la cerámica policroma, ofrecieron un mecanismo mediante el cual los participantes de Teotepac afirmaron su identidad regional. En conjunto, estos diversos grupos de datos indican la importante función política, así como ideológica, del juego de pelota en el sur de Veracruz.

Arnott, Sigrid (Self-employed) and David Maki (Archaeo-Physics LLC)**[153]***Women's Portages: Colonial Encounters, Gender, and Indigenous Worldview in the Great Lakes*

Dakota and then Anishinaabeg women were central figures in water-based travel cycles in an annual round directed by plant, animal, and river relations within the Woodland Tradition. Portages, including Women's Portages, are material records of Indigenous women's labor before, during, and after the Fur Trade in the Great Lakes. The Northwest Trail and its environs, preserve a linkage of portages, poses, food sources, and waterways used by Indigenous travelers long before European contact. The trail was then shared with the colonial explorers and traders after contact. Recent research regarding gendered labor and Indigenous ontologies at this portage landscape reveal how colonial source materials and perspectives have biased archaeological interpretations of sites linked to portaging. Sources, including archaeology, show that, despite destructive changes wrought by these colonial forces, there is also ample evidence of Indigenous survivance.

Investigations carried out in recent years in various sectors of the Kaminaljuyu site have revealed relevant aspects of the use of local plants, their control, and distribution. Analysis of residues in ceramics allows us to know some data. Although the conservation of these remains is very precarious, it has been possible to find a

relevant corpus to discover novel uses of remains that had not appeared in the archaeological record of the past. There are some representations of plants in ceramics and in the iconography of the site that confirm the data of the organic remains recovered. Despite the problems with conservation, some of these resources are found in elite contexts, allowing us to know the interaction of the plant world with social groups of higher strata. Examples of various plants illustrating their uses in ritual contexts have also been identified. However, much remains to be known to systematically establish changes in the landscape over time. This is an initial and ongoing study that will offer a glimpse of the plants and vegetation of the ancient society of Kaminaljuyu.

How the Skeletal Remains of Romanian Reflect the Culture and Daily Life of the Medieval Period

Medieval Romania's history is riddled with gaps caused by destructive invasions against the Ottoman Empire, among others. With a fractured and understudied history, bioarchaeology emerges as a potent tool to unveil the concealed facets of this era, ranging from dietary habits and religious inclinations to vocational pursuits, physical traumas, and burial customs. Existing literature on Romanian excavations and osteological analysis indicates trends such as grain-rich diets, livelihoods in farming, blacksmithing, and craftsmanship, invasion-related trauma, and Christian Orthodox burial norms (such as heads facing west and feet toward the east), and social stature dictating burial proximity to churches. An analysis of a burial excavated at the site of Papdomb in Valeni, Romania reveals congruence with these anticipated religious burial practices. However, intriguingly, our excavations unveiled an unexpected facet: the prevalence of familial or multi-individual burials when single burials have been highlighted in the academic literature as the norm. This poster will examine the practice of multi-individual burials, and what this tradition reveals about life and death in Medieval Romania.

Short Reduction Sequences at the First European Peopling: An Example of Expedient Technology?

The early European peopling (about 1.5 Ma) is characterized by a low number of sites and lithic assemblages often consisting of a few hundred pieces. Despite these limitations, it is possible to define the technical behavior of these early Europeans with sufficient accuracy. The reduction sequences are always short and mainly aimed at the production of flakes that are very rarely retouched. Shaping is not always present, especially in cases in which the only raw material exploited is flint. In this context, the Pirro Nord site (Apricena, FG) represents an important example that provides interesting insights into early European lithic production.

Asch Sidell, Nancy and David Asch**[204]***Archaeobotany of the Lower Illinois Valley: The Legacy of Stuart Struever*

In 1960 Stuart Struever initiated an “Illinois Valley Archaeological Program” and devoted his research over the next decade to study of Middle Western Hopewell manifestations. He set out to test a hypothesis that the adoption of a simple mudflat agriculture conducted on raw soils of large-valley floodplains promoted more productive subsistence economies and contributed to population expansion and to emergence of Hopewell. Struever came to favor an alternative hypothesis that Intensive Harvest Collecting of multiple natural resources upgraded the Middle Woodland subsistence base. Whether or not seeds of floodplain pioneers were cultivated remained an open question. Outstanding among Struever’s accomplishments was his development of flotation as a practical method for recovering plant charcoal. By 1969 when excavations began at the Koster site, Struever was committed to collecting flotation samples from every provenience. Effectively, the CAA Archeobotanical Laboratory, which was established in 1970, studied flotation-recovered plant materials from 30 habitation components that were excavated from 1960 to 1980. These components span a time of hunter-gatherers entirely dependent on wild foods, a time when fires perhaps were employed to manage the landscape, and several millennia of developing plant cultivation and domestication.

Ashby, Emma**[202]***Understanding the Transition to Villages: A Comparison of Maize between Basketmaker III Sites and an Early Pueblo I Village*

Comparative morphological and other analysis on maize samples informs us of crucial nutritional changes in key Ancestral Puebloan cultural stages. The transition of the Basketmaker III (500–750 CE) period to the Pueblo I (750–950 CE) period in the southwestern Utah archaeological record is marked by distinct technological changes and larger, more densely populated and permanent villages. This increased population density necessitated the cultivation and growth of a stable food supply. Maize, a staple of Puebloan diet throughout both periods, is known for its genetic plasticity; thus allowing farmers to select for traits adaptive to their needs. In this study I compare burned maize from Basketmaker III sites in Montezuma Canyon to maize from an early Pueblo I village site (749–772 CE) located on the plateau above to ascertain if and in what ways maize changed as a part of this societal shift.

Ashley, Michael (Codifi LLC)**[293]***Reflections on 30 Years of Digital Archaeology: Where Do We Go from Here?*

Over the past three decades, archaeology has experienced a paradigm shift with the integration of digital recording and publishing methodologies. This “paper” critically examines whether, in our pursuit of technological advancements, we have remained true to the core principles of archaeological ethics. Are we on the brink of a digital dark age, or are we already in one? Through conversations with eminent scholars from the archaeological community, tech industry experts, and representatives from cultural memory institutions, we unravel the journey from a digitally focused archaeological approach to a more holistic practice. As we strategize for the upcoming 30 years, the emphasis is placed on the dual objectives of the discipline: ensuring the creation of a durable archaeological record that stands the test of time, while simultaneously harnessing the full

potential of modern technology. To assure our practices not only produce records that will benefit future generations but also leverage the capabilities of digital technology, this discussion serves as a clarion call to professional archaeologists, urging us to reflect, adapt, and innovate for a sustainable future in archaeology.

[25]

Horse Mandibles in the Paleolithic as Liminal Bodies

The deep bond between humans and horses is well reflected in the Paleolithic record from its earliest stages. The significant role of horses (*Equus*) in Paleolithic diet is evident from the presence of horse skeletal remains, and specifically mandibles and teeth, at multiple Lower Paleolithic sites worldwide—and for a good reason. Horse marrow has a unique nutritional profile superior to that of most other ungulates. Later, simultaneously with a sharp increase in the presence of horses at Upper Paleolithic European sites, it is the animal most commonly depicted. The horse head was given special focus, as were mandibles, tongue bones, and teeth. Among non-WEIRD societies, the responsibility to create “trust” and “reciprocity” often includes special treatment of prey remains, especially skulls. Moreover, mandibles and teeth specifically bear liminal qualities. Horses represent ideal shamanistic totems and liminal agents on account of their ability to travel distances, necessary for communicating with entities in other worlds. I argue that these Upper Paleolithic practices highlight the importance early humans attributed to horse skulls and mandibles as liminal bodies, a relationship whose roots lie in the Lower Paleolithic and perhaps in the unique nutritional role horse mandibles played in early human diet.

World War II Archaeology in the Galápagos Islands: The Soldiers and Convicts at the Wall of Tears (1940–1959)

During the early years of World War II, the US government began actions to protect one of its most important investments in America, the Panama Canal. During the late 1930s, the US Navy and Army built several military bases along the Pacific coast of Central and South America to defend the canal zone. The Galápagos Islands were selected to build a military base, considering the strategic position between Panama and the Gulf of Guayaquil. The Baltra Beta Base started operations in 1942 and radar was an important technology implemented in the Galápagos to detect possible air attacks from the west. Several radar stations were built in the archipelago, mainly on Isabela Island. After the war, the Cerro Orquilla radar station was abandoned and re-occupied by the government of Ecuador to hold a penal colony. Today, the remains of these institutions are a touristic place known as the Wall of Tears. In this talk, we present the results of the Summer 2023 archaeological survey of the site, which was focused on exploring the layouts of the institutions, the domestic activities, and the possible ecological impacts caused by the male population that occupied both the radar station and the penal colony.

Karanki Monuments of Northern Highland Ecuador: A Cultural History in Peril

The inter-Andean landscape of northern highlands Ecuador, including the western upper montaña region, is

dotted with clusters of large earthen mounds, many of monumental proportions that reach over 100 m on a side, 15 m in elevation, and have long ramps extending 150 m or more from their platforms. These sites are the legacy of the Karanki culture, which thrived between AD 1250 and about AD 1500. The Karankis met their demise with the Inka conquest, which soon after met its own demise with the arrival of the Spanish in 1534. Little is known from historical sources about the Karanki. In recent times, intensive archaeological studies have been carried out at several sites, but because of the monumental scale of these sites, this work can only be described as limited. This paper focuses on the sad fact that monumental Karanki sites, as extraordinary as they are, are rapidly disappearing from the landscape. In this sense, the Karanki culture is being steadily erased from history. What should be a proud reminder on the landscape of Ecuador's indigenous past is in danger of becoming but a footnote in Ecuador's cultural patrimony. This paper documents the ongoing destruction of Karanki monuments.

Taking Sides: Left and Right Concepts in the Enactment of Magic

Magic is essentially performative and heavily ritualized in its enactment whether wielded by specialized (e.g., shamans, cunning folk, alchemists) or lay practitioners. Each detail of the ritual performance not only works in tandem with all other aspects, but the details simultaneously connect with and draw on cosmic forces as the agentic energy that empowers the magic. Frequently, deeply embedded associations of directionality, especially left and right positioning and movement, are integral to the magical rite's efficacy. Using a specified hand with which to pick magical plants, to touch ailing or possessed patients, or to handle magical objects is often required as part of the ritual protocol as the left or right hands themselves are imbued with positive or negative energy. Movement throughout the ritual in clockwise (right-wise) or counterclockwise (left-wise) direction around features, elements, and subjects also allies the ritual with celestial cosmic movement. This paper will illustrate how crucial it is for archaeologists to understand the often invisible, but critically important, role left and right play in the physical enactment of magical rites and how we might endeavor to make the invisible, visible.

Tut on Tour: Thirty Years of Demand Creation through Exhibition

This study is a multidisciplinary investigation into factors that create, enhance, and normalize demand for collecting antiquities. Using the original blockbuster, *Treasures of Tutankhamun*, as the case study, this doctoral research investigates the correlating antiquities markets' reaction to Tut blockbusters by gathering, quantifying, and contextualizing 30 years of exhibition and antiquities market data. The market for illicit Egyptian antiquities is a demand-driven economic system predicated on collectors and museums acquiring antiquities; thus, we must understand what influences demand for antiquities. Drawing on primary sources

coupled with archaeological, economic, museological, and criminological theory, this research addresses the assumption that blockbuster exhibitions influence demand in the antiquities market. Anecdotal evidence cited in news articles and single-auction evidence in academic journals make up the totality of evidence for this assumption; thus, this research addresses a pivotal gap concerning causality between museums, the market, and the illicit trade. By identifying and understanding trends related to blockbuster exhibitions and collecting, the objective of this study is to introduce reliable data to the crucial debate concerning the relationship between museum blockbuster exhibitions, end-market demand, and the illicit antiquities trade. The results illustrate an instantaneous and intense demand for ancient Egyptian material on the market when tut tours.

Schismogenesis on the Scandinavian Peninsula during the Late Neolithic Transition

A pungent statement in *The Dawn of Everything* is that the enormous diversity in hunter-gatherer societies makes it impossible to talk about one transition to agriculture. There are several consequences to this statement. One is that hunter-gatherers did not wait for an inevitable revolution, and another is that the agricultural turn was all but one-sided. A theoretical premise used by the authors in several parts of their book to make sense of this is schismogenesis. The concept, originally framed by Gregory Bateson, is used to understand how groups have a tendency to identify themselves against others and adapt their own unique take on external elements. In this paper this concept of schismogenesis will be explored and adapted in a region on the edge of northern Europe to understand the agricultural turn. The change has been presented as a slow, drawn-out process until it suddenly changed around the turn to the Late Neolithic (ca. 2350 BCE). The archaeological evidence is here presented with the concept of schismogenesis in mind, arguing that resistance and adaptation created a unique agropastoral system that was highly impervious and dynamic to the local ecology.

Monumentality by Communities: Case Study of the Caribbean Coast of Nicaragua

Large stone and earth mounds of Cascal de Flor de Pino in the Caribbean of Nicaragua, which were built between 4 BC and AD 9, are unique in the region and have been suggested as a sign of social stratification and inequality. Indeed, reaching more than 30 m in diameter and 3 m in height, Cascal de Flor de Pino significantly differs from other sites in the region, which are marked by surface collections of ceramic and lithic, shell middens, and occasionally just a few decimeters high earthen mounds. To understand if these monumental structures represent social hierarchies, the access to resources such as ceramics, lithics, and foodways from monumental and non-monumental sites is analyzed. Based on the data, it is suggested that monumentality in the Caribbean of Nicaragua can rather be seen as a result of human interaction with the landscape than social stratification among human societies.

Light Comes from the East: The Archaeology of Belize in Historical Context

For more than a century, archaeological research in Belize has been at the vanguard of Maya Studies, contributing disproportionately to our knowledge of ancient Maya civilization. Yet, Belize's archaeological contributions to the field are often overlooked in many current synthetic statements on the ancient Maya. Research in Belize pioneered the application of settlement pattern studies and also witnessed the initial use of large-scale lidar, building on archaeological data that suggested the need for different organizational models for the past. In fact, Belizean lidar has undergirded new formulations and models concerning Mesoamerican settlements, urbanism, and landscape modification. Archaeological research in Belize has also led the way in studies focusing on Preceramic occupation, human ecology, the rise of cultural complexity, cave research, coastal adaptations, the Postclassic and Historic period Maya, aDNA, and climate change; this research has additionally shed new light on the transformation of ancient Maya civilization from the Classic to Postclassic periods. In this presentation, we discuss these considerable accomplishments and further highlight many other significant contributions that archaeological investigations in Belize have made to our understanding of the Maya past.

Disputes over Ancestors: Between Atacameño Discourse and Authorized Heritage

Since the nineteenth century, the inhabitants of the Atacama Desert have coexisted with collecting, heritage, and museum practices. Since the late twentieth century, Atacama communities have confronted archaeology and museums over the significance, ownership, and rights over the bodies of their ancestors that were taken to national and international museums. The Indigenous demands for a respectful treatment of human bodies in Chile show the need for a repatriation law and professional codes of ethics that integrate these populations. Likewise, conflicts over ancestors have reaffirmed differences between local knowledge and constructions and the authorized heritage discourse. We will present the progress of a research project focused on collecting, patrimonialization, and repatriation in the Atacameño territory.

Building a Case for Resilience: A Call to Action

South Florida contains a vast record of over 10,000 years of human occupation. The archaeological timeline of the area has the capability to demonstrate human adaptation to rapid climate change in the past during the transition from the Younger Dryas to the Holocene. As archaeologists, we have a professional imperative to highlight the long human history in South Florida and use it to address modern climate change. With each site threatened and then destroyed by development, climate change, or other causes, we lose our ability to share that narrative and inspire hope for modern Floridians. This paper will assess work completed in the area, why the threats from climate change cannot be ignored by archaeologists, and how we must engage in climate action to prepare for a better future.

Community-Based Ethnoarchaeology to Inform Experimental Archaeological Research: Learning from the Diasporic Tigrayan Community in Vancouver, British Columbia

Experimental archaeology is an extremely beneficial method of inquiry, as it centralizes the physical knowledge of material culture and sensory experiences. While experimental archaeology brings researchers closer to the realities of creating and using material culture, ethnoarchaeology reconnects researchers with people, reducing the distance between archaeologists and their subjects of study. Ethnoarchaeology also fosters connections between researchers and communities, improving research directions and questions, increasing relevancy to communities, and pushing results into more public spaces. The people of Tigray, Ethiopia are a culturally distinct ethnic group inhabiting the northern highlands. Despite deep temporal occupation, the area has recently been inaccessible to researchers due to ongoing political unrest in the region. However, Tigrayan communities in the diaspora maintain strong cultural ties and therefore valuable traditional knowledge. Using community-based ethnoarchaeology, the documentation of traditional knowledge guides experiments that aim to further our understanding of the use of indigenous African grains in traditional beer and brewing practices and aid their archaeological identification. Scientific experiments grounded by a firm foundation in the community contribute to the educational outreach of this research to the wider community while simultaneously benefiting archaeological investigations in the region.

Fish, Fishing, and Ecological Resilience along the Big Sur Coast of California

Along the Big Sur coastline, the Salinan and Esselen relied on a relatively consistent repertoire of small and medium-bodied fish species for at least 6,000 years. Decades of systematic excavations have identified the importance of fish, although we are still gathering data on temporal and spatial trends in varying ecological circumstances. Marine fish recovered from archaeological sites CA-MNT-1951 and CA-MNT-255, marine biology data, and intertidal foraging experiments contribute to our understanding of fish and fishing practices during the Early (5500–2600 cal BP) and Middle (2600–1000 cal BP) periods. Fish within four species dominate the collections: surfperches caught with nets, rockfish and cabezon amendable to individual hook and line capture, and pricklebacks by hand. These species dominate the archaeological record along the Big Sur and central California Coast. All represented fish could have been procured from the near shore waters of rocky intertidal, kelp forest, and tide pole habitats. The significant continuity in fish species caught through time—with no compelling evidence for depression of prehistoric fisheries or intensified fishing practices or technologies—reflects the abundance and resilience of fish in this productive marine ecosystem.

Azevedo, Terry**[274]***Discussant***Bacha, Henry****[37]***Chair***Bacha, Henry****[37]***Materializing Inka-Colla Interaction in the Colonial Viceroyalty of Peru*

This paper engages as its central problematic a recurrent iconographic motif—identified by scholars as depicting a ritualized drinking encounter between the Sapa Inka and his Colla (an ethnic polity of the Late Intermediate period Lake Titicaca basin) counterpart—painted on *keros* (Andean ceremonial drinking vessels) produced in the colonial Viceroyalty of Peru during the seventeenth and eighteenth centuries. This depiction of a peaceful interaction between the Inka sovereign and an evidently analogously powerful Colla monarch contrasts with historical accounts of Inka military conquests of a resistant altiplano; and archaeological evidence suggesting that the political landscape of the late pre-Inka Collao was characterized by fragmentation rather than by unification under a Colla state. Integrating iconographic analysis, ethnohistorical data from sixteenth- and seventeenth-century *crónicas* and *visitas*, and a synthesis of previous archaeological data from the historic Colla heartland, this paper interrogates the implications of such a depiction of Inka-Colla interaction in the early to mid-colonial Andes. Ultimately, it proposes that the iconographic motif served a performative function, alternately (and perhaps simultaneously) insisting on the equivalence of the historic Colla *señoríos* to the Inka in terms of sociopolitical sophistication complexity and asserting the essential benevolence of Inka rule and imperial expansion.

Bachir Bacha Llanos, Aïcha (EHESS, Mondes Américains)**[299]***Paracas Medio en el valle bajo de Ica, una perspectiva desde el sitio arqueológico Ánimas Bajas*

Poco sabemos sobre la vida de las entidades sociopolíticas que ocuparon el valle de Ica durante el Horizonte Temprano, en la época conocida como Paracas Medio (500-300 aC). Por ello, en esta conferencia se presentan y discuten los resultados del análisis de la cultura material hallada en Ánimas Bajas, sitio ubicado en la cuenca de Callango, valle bajo de Ica, en la costa sur del Perú. A partir de la reconstrucción de las etapas constructivas —con sus materiales culturales asociados— de un edificio cívico-ceremonial y de un contexto funerario que contenía fardos y cabezas ofrendas/trofeo, se pretende: (1) aprehender aspectos sociales, político-religiosos y económicos de las entidades que ocuparon el sitio; (2) entender el lugar que ocupaban los paracas del valle bajo de Ica en este periodo, tanto en la costa sur en particular, como en los Andes en general. Nos preguntamos si con estos nuevos datos aún se puede seguir calificando a la costa sur como un área retrasada en comparación con la esfera cultural de la costa norte y si era periférica a las dinámicas y el panorama de intensificación del intercambio y la migración que conoció los Andes en este periodo.

A Mound or Not a Mound? How Rasters and Point Clouds Can Help with False Positive Identification

This poster will discuss the benefits of using different combinations of rasters for large-scale survey and the functional usage of viewing problematic mounds in the point cloud to weed away the false positives. Maya sites around Mesoamerica have and will be scanned with lidar. Since the turn of the century, technology has improved and now the data collected is higher resolution but also more sensitive to smaller height changes. As a result, it has become both easier and harder to identify Maya mounds. Smaller mounds are more likely to be identifiable in the data, but extra features that look like mounds (false positives) will also be found which only ground truthing can weed out. Many interpretations of lidar have focused on various combinations of images and visualizations (raster images). On their own, these are limiting for verifying problematic mounds because they are dependent on the ground classification (input by the researcher/software). Instead, viewing the equivalent raw data, as the point cloud, rather than a generalized surface, provides greater clarity to check and differentiate between potential mounds and false positives, because there is less generalization.

The Río Bec Tradition in the Bajo el Laberinto Region: Preliminary Results

Located on the border between the central and northern lowlands, the Río Bec region developed a singular architecture and iconography from the sixth century. In the eighth century, the Central Lowlands underwent major sociopolitical transformations, such as the gradual fall of the Kaan dynasty and the loss of Calakmul's hegemony, resulting in increased mobility of populations and ideas. From the second half of the eighth century, some sites in the Bajo el Laberinto Region adopted architectural and iconographic features of the Río Bec tradition. Since 2020, a doctoral thesis, in correlation with the Río Bec 2 project, aims to reference and study these elements in order to contribute to a more precise definition of the Río Bec phenomenon, measure its influence in space and time and characterize its interregional relations. Bibliographical research, coupled with prospections and in situ analyses carried out during the 2022 and 2023 seasons, highlighted various themes and qualities of realization, suggesting different modes of transmission according to the sites. This presentation aims to present the preliminary results obtained at the sites of Calakmul, Olvidado, and Pared de los Reyes.

Archaeological Sites and Flooding in the Diquís Delta, Southeastern Costa Rica

The interaction between ancient societies and their natural environment was one of the topics discussed by Richard G. Cooke for southern Central America. We focus on the Diquís Delta, Costa Rica, an alluvial plain formed by the Térraba and Sierpe Rivers, with an annual rainfall ranging between 2,840 and 6,840 mm, subject to strong cyclical flooding, that have caused the deposit of sediments. Precolumbian occupations have been documented in the delta since at least 300 BC until the sixteenth century. Although the delta presented many environmental challenges, it also provided abundant cultivable land, an extensive mangrove swamp, proximity to various sources of raw materials, and a strategic position on communication routes. This led to the establishment of important population centers and the construction of various architectural clusters with units up to 1.4 m high that could serve as the basis for buildings of a public nature or residence of the leaders. These in turn could serve as shelter during floods. The results of archaeological investigations carried out at various sites located at 10 m asl and how these natural phenomena could affect village life, circulation of goods, places of memory, and generate settlements abandonment and reoccupation are presented.

Adapting Photogrammetry and 3D Modeling Beyond Archaeological Recordation for Use in Public Education

The expansion of digital technology has allowed archaeologists to quickly adopt new techniques and digital tools for use in the field. From the early days of analog recording and hand-drawn maps to contemporary tools like photogrammetry and 3D modeling, the rapid evolution of technology has led to greater accuracy and efficiency when collecting and processing data. For this reason, archaeology students today are expected to be familiar with digital technology and to refine their technical skills over the course of their studies. But with greater efficiency in the field also comes the responsibility to disseminate information effectively. Here, I present a case study of photogrammetry for public archaeology at the site of Xunantunich in western Belize. Using a tablet, DSLR camera, and a tripod, digital teaching models of 14 structures within the site core were created and designed primarily for use by local tour guides. The goal of this project was to open new avenues for public archaeology and better serve the local and Indigenous communities in which archaeologists work. This pilot project serves as evidence that by using digital techniques like 3D modeling and photogrammetry, archaeologists can simultaneously collect data while also preparing accessible learning materials for the public.

Bagwell, Elizabeth (Piñon Heritage Solutions)**[66]***Discussant***Bain, Allison (Université Laval, Québec, Canada)****[148]***Colonial Period Occupations and Historical Archaeology on Barbuda*

A variety of colonial period structures are scattered across the island of Barbuda. Spanning the seventeenth to nineteenth centuries, they include wells, lime kilns, a Martello Tower, as well as the remains of a dozen buildings at the Highland House site, among others. While many sites have been documented, excavations have been limited to only the Castle site located in Codrington Village and Highland House. The Castle site was initially a guarded storehouse and residence, while Highland House was a purpose-built retirement home and private game park, and later served as an administrative center. Whether scattered in the bush or on coastal roads, all of the island's colonial period heritage is facing the combined risks of encroaching development and climate change. This paper proposes an overview of the different phases of colonial period occupation and archaeology and highlights the necessity for further documentation.

Bain, Allison [148] see Richards-Rissetto, Heather

Bair, Andrew (Harvard University)**[91]***Medieval Archaeology as Historical Archaeology, or Why Anthropological Archaeologists Should Take the European Middle Ages Seriously*

Though by strict definition the study of any literate society might be considered “historical archaeology,” in practice American historical archaeologists largely focus on the centuries after 1492—in other words, the archaeology of the modern world. But modernity was not immaculately conceived; the themes, things, and questions that characterize historical archaeology find origins in the long and heterogenous European medieval period. This paper presents an argument for placing the Middle Ages within the framework of historical archaeology, the case here being the study of colonialism. While Europe would later become colonizer of the globe, it was the product first of its own internal and diverse varieties of medieval colonialism. In appreciating the complexity of colonial experience from the archaeology of medieval Ireland and Wales, Central and Northern Europe, Iberia, and the Levant, we can catch a glimpse at the genealogy of modern colonialism, better informing and contextualizing more contemporary material cultures and mentalités of great interest to historical archaeologists.

Baires, Sarah**[155]***Vibrancy of Place and Cahokia's Emergence*

The city of Cahokia sits in a landscape occupied by bodies of water, distinctive biota, and unique stone and mineral deposits. This flood plain landscape of the Mississippi River served for millennia as home to Indigenous peoples who lived in semi sedentary communities while participating in small-scale agriculture, hunting, and gathering. Cahokia and its sister boroughs of East St. Louis and St. Louis, along with farmsteads and villages located in the Richland Uplands to the east, emerged ca. AD 1050 taking shape rapidly marked by organized mounds, plazas, neighborhoods, and farming communities. In this paper I examine both the constructed and non-anthropogenic landscapes of Cahokia focusing on the intersection between the human and other-than-human realms that created this city. Particularly I emphasize the ways monumental places structured and integrated the neighborhoods and the surrounding environs into the city.

Baisan, Christopher [176] see Larrick, Dakota

Baisden, Rebecca**[269]***Small Sites and Big Assumptions: Questioning the Uncritical use of "Field House" to Classify Small Precontact Structures on South Cat Mesa of the Jemez Ranger District*

Small precontact structures throughout the Southwest that lie on the periphery of large village sites are often classified as "field houses", a term that carries with it the assumption that these structures were utilized seasonally, occupied for a short duration of time, and whose function is tied to agricultural practices. The uncritical and widespread use of this classification without consideration of the entire artifact assemblage may skew archaeological interpretations of land use, demography, and settlement patterns. This paper examines field houses on South Cat Mesa of the Jemez Ranger District to answer whether the broad and uncritical use of this term to describe small precontact structures assumes a singular function when they may have served more than one purpose. To test this idea attributes drawn from previous research were analyzed for 131 field house sites including method of construction, presence and frequency of extramural features, assemblage size, ceramic types present, and flaked and ground stone. This study shows that there is variability in sites classified as "field houses" on South Cat Mesa suggesting that some may have been used more intensively, occupied for longer periods of time, reoccupied repeatedly through time, or had other functions.

[20]*Exploring the Pleistocene-Holocene Transition Archaeological Record on the Colorado Plateau*

The Pleistocene-Holocene transition (PHT) archaeological record on the Colorado Plateau is notably sparse, especially when compared to the surrounding Great Basin, Rocky Mountain, and Plains regions. Whether this

dearth is due to low human populations in the region during the PHT, or due to insufficient fieldwork targeting PHT archaeological resources, is unclear. To address this uncertainty, we used a random forest model to determine which areas of southern Utah had high potential for PHT-aged archaeological sites based on the location of known PHT sites and several environmental variables. A cluster of high-potential areas in the San Rafael Desert, Emery County, UT, was selected for pedestrian survey during the 2023 and 2024 field seasons. We present the results of the 2023 field season, during which we encountered 12 sites, two of which contain lithic artifacts of ambiguous typology that may date to the PHT, as well as a handful of isolates, one of which may date to the PHT. We use GIS to analyze the distribution of archaeological materials in the environment and discuss future directions for PHT-focused fieldwork in the area.

[269]

USACE Tulsa District Wister Lake Site Preservation Project

In 1975, 41 sites surrounding the USACE Wister Lake, located in Latimer and LeFlore counties in Oklahoma, were designated as part of a National Register Historic District. Unfortunately, due to extreme local looting and fluvial action, less than 21 of these sites are still present today. USACE Tulsa District is beginning a site preservation project dedicated to protecting these sites and limiting the effects of looting and fluvial action in the future. This project consists of several segments: initial research through site files, physical site checks, targeted pedestrian survey, and the protection of sites through methods such as placing riprap or planting poison ivy. Once the most vulnerable sites have been protected, a historic properties management plan will be created in order to continue the best site preservation practices in perpetuity. Potential helpful programs, such as a public archaeology project or listing more sites on the NRHP, are being considered as future directions for this project after site preservation has begun. The purpose of this poster is to fuel discourse between the author and other archaeologists with experience in site protection and anti-looting practices.

The Question of Monumentality in the Sacred Spaces and Features of Ometepe Island, Nicaragua

Ometepe is the largest island in Lake Coçibolca (Lake Nicaragua), itself the largest body of freshwater between Lake Titicapa in South America and the Great Lakes of North America. Its topography is unique, composed of two volcanoes—one active (Concepción) and one ancient and dormant (Maderas). A vast array of petroglyphs on Maderas and statuary and clusters of mounds on both volcanoes comprise some of the unusual man-made features found on this distinctive island. Words like “monument” and “monumentality” elicit such connotations as extraordinary size, importance, commemoration, and ritual, all usually associated with human-built environments. Some natural features have, however, also been called monuments, usually because of some unique cultural and/or scientific importance and, often, impressive size. This paper will discuss how or whether Ometepe’s built constructions can in themselves be considered “monumental,” whether the intersection of unusual natural features with the ritual and ideology represented in the island’s man-made constructions more accurately define our notion of “monumentality,” and what these ideas and features signal regarding social complexity.

Issues of the Davit Gareji Monasteries’ Structure on the Background of the Early Byzantine Monasticism

In the south of the Kakheti region (Georgia), on the uninhabited vast territory, there is a monastic area known as Davit Gareji, which includes about 20 independent monastic complexes. According to the historical sources, the first Cristian monasteries were found here in the sixth century by the desert Fathers emerged from movement of the Syrian monasticism. The internal life continued incessantly including the High Middle Ages and subsequently, they underwent serious reconstruction along with the development. Since only a small part of the Davit Gareji complexes has been studied archaeologically to some extent, the determination

of their age of origin or their individual components is still in the initial phase. That applies also to the peculiarities of the worship service performed inside these complexes. In the recent years we conducted architectural and archaeological studies in order to correct this situation. Of course, we checked the correctness of the obtained results against the background of the early Byzantine monasticism in the neighboring foreign countries. It turned out that the vast majority of monasteries of Davit Gareji were arranged in the manner of the Laura in the sixth–ninth centuries.

Interdisciplinary Collaboration between Educators and Archaeologists

Archaeology contains fascinating subject matter that can provide the themes and content for many school subjects in K–12 education. Although there are many resources available for teachers, they are often difficult to find and/or only focus on the basic skills or tasks of archaeologists. What educators need is access to the rich and diverse research and knowledge possessed by archaeologists worldwide. Often more current or area/topic specific archaeological research is inaccessible due to paywalls and due to the complexity and structure of academic articles. Through collaborations between educators and archaeologists, rich resources and learning activities can be developed to mobilize knowledge and widen the scope of voices and narratives heard in school classrooms. This paper aims to share reflections on effective collaborations and make the case for future partnerships between the disciplines of education and archaeology.

Nuevas exploraciones en el asentamiento prehispánico de Dzibanché, Quintana Roo

El sitio prehispánico de Dzibanché tuvo una ocupación continua, desde el periodo del Preclásico Medio-Superior hasta el Clásico Tardío (300 aC-800 dC). Ocupación que continuó con una población menor hasta el periodo del Clásico Terminal-Posclásico (900-1500 dC). Fue el asiento de la dinastía Serpiente “Kaanu’l” en una de las primeras etapas de su historia, durante el periodo del Clásico Temprano Maya (250-650 dC). Dinastía que continuó viviendo en Dzibanché, aún después de dividirse y trasladarse al asentamiento de Calakmul, durante el periodo del Clásico Tardío (650-800 dC). Los datos epigráficos actuales, sugieren que el nombre de Dzibanché era Kaanu’l “lugar de serpientes” y sus gobernantes eran los ‘señores sagrados de Kaanu’l’ (Martin y Velásquez 2016). Recientes exploraciones (2023), en los complejos monumentales Tutil, Lamay y Kinichná, han documentado una uniformidad en los sistemas de enterramiento y variantes arquitectónicas relacionadas con el estilo local “Pilastras Pareadas”. Las investigaciones realizadas en los asentamientos prehispánicos de Dzibanché e Ichkabal, con el apoyo del análisis lidar, permiten confirmar que fueron entre los centros urbanos más extensos de las tierras bajas mayas en los periodos del Preclásico y Clásico (Balanzario y Estrada-Belli 2021).

Bridging Voices around a Circle of Dialogue between Tupi Guarani, Tuxá, and Eastern Pequot Peoples through an Activist and Social Latin American Archaeology

This paper presents the results of the first panel named “Indigenous Archaeologies, Territories, and Human Rights” as part of the seminar “Indigenous and Afro-descendant Peoples in the Americas: Collaboration, Archaeology, Repatriation, and Heritage,” an inter-institutional collaboration between the Interdisciplinary Research Laboratory on Evolution, Culture and Environment (MAE-University of São Paulo) and the Latin American Historical Archeology Lab (Department of Anthropology, University of Massachusetts, Boston). The seminar aims to ground intercultural exchanges on constructing political platforms that nurture strategic plans for Indigenous and African-descendant communities engaged in collaborative archaeological and heritage research. The first panel articulated the voices and agendas of Tupi Guarani, Tuxá (Brazil), and Eastern Pequot (USA) Indigenous peoples on dialogues around the topics of identities, recognition of their ancestral territories, decolonizing academia, linguistic revitalization, and politics of heritage. This conversation shed light on the shared history of colonization but, above all, on how the resistance of indigenous peoples has preserved their deep connections despite the weight of geopolitical and racial violence in the Americas. Their proposal for the future is based on strategies rooted in education and art expressions as tools in the struggle for civil rights.

What a Cache! Ritual Activities at the Medicinal Trail Community, a Small Rural Maya Site in Northwestern Belize
During the 2023 field season, excavations uncovered evidence for ritual activities at Group M of the Medicinal Trail Hinterland Community, an ancient Maya farming village in northwestern Belize, near the political center of La Milpa. Initial survey and brief excavations from the 2017 field season indicated the group was atypical of architectural groups from elsewhere in the community, not being residential or a work area associated with terraces. Excavations between the courtyard and Structure M-3, underneath a layer of construction fill, was a capstone supported by three upright stones, overlying a so-called Maya “God,” or “Face” pot. Within the pot was a sap-like residue and ash. At the same level and to the east, a concentration of large Early Classic Tzakol ceramic sherds were discovered that appeared to have been placed against a platform wall, suggesting the cache was part of a termination ritual. This finding, the presence of a stela, and others, indicates that Group M may have been a primarily ceremonial space. This discovery has implications for our understanding of Group M’s function and prehistoric ritual practices of the Maya at small rural communities.

Identifying Deeply Buried Sites: A Case Study from Site CA-SLO-16, Morro Bay, California

Archaeologists have historically studied the human-environment relationship through the lens of behavior, activity, and advancement. The study of past landscapes is focused on the human behavior response to these changes, not the effects these environmental changes have on archaeological sites. Geomorphological studies allow for understanding environmental change and the natural processes that alter the environment (global warming, flooding, sea-level rise, etc.). These environmental factors not only have an effect on the people of that time but also preservation and visibility of archaeological sites and later, the appropriate methods for identification of these resources. This case study highlights how landscape evolution, surface landform age mapping, buried site sensitivity modeling, and geoarchaeological identification methods can affect the

probability of identifying deeply buried archaeological sites. Additionally, this poster will provide geoarchaeological applications for future research.

Challenges on the Road from 9th Avenue to Professional Archaeology

While the recent uptick in the amount and frequency of contemporarily, socially relevant sessions and symposia held at SAA annual meetings can certainly be said to be commendable—truly, a much-needed and beneficial pursuit/meta-analysis—I think that a significant intersectional aspect that often gets overlooked when archaeologists engage in these sorts of discussions, regarding the structural barriers that exist to persons from historically disadvantaged backgrounds being able to go on to obtain success in the archaeological field, is the role that having an inner city upbringing can play in shaping a scholar’s experiences on the road to becoming a practicing archaeologist, and thereafter. Originating from South Central Los Angeles, and only being a second-year graduate student at the University of Arizona, this paper seeks to anecdotally draw from some of the numerous challenges that I have faced as a young Black man from the inner city to highlight some of the common struggles that persons from similar backgrounds and communities have to face in order to find success and make places for themselves in a field that can often make such persons feel the furthest away from social context(s) that they can most relate to.

Thirteenth- and Fourteenth-Century Redstone Pipes and Social Change on the Central Great Plains

Redstone elbow pipes, often made from catlinite from the Pipestone quarries in Minnesota, play essential roles in many Pawnee ceremonies, including the Hako ceremony, and in the calumet ceremony that was widespread in eastern North America. They appeared first during the thirteenth century in Central Plains tradition communities in eastern Nebraska. Excavations at 25BD1 in Boyd County, Nebraska, produced one finished and two unfinished redstone elbow pipes; local collectors showed us three additional finished pipes from the area. This paper describes the Boyd County examples and their significance in the context of late thirteenth-century social change on the central Plains, including evidence that Oneota-style disk pipes also appeared in eastern Nebraska at this time.

Banning, Edward (University of Toronto)**[116]***Changes in the Size and Organization of Storage in the Neolithic and Chalcolithic of the Southern Levant*

The size and spatial organization of facilities for the storage of cereals and pulses provide important clues to the socioeconomic organization and degree of inequality of households and communities. In the context of late prehistory in the southern Levant in the Middle East, we might expect changes in storage to result from the growing importance of agricultural economies as well as social changes in the scale and equitability of redistribution. Analysis of the volume and accessibility of storage facilities from the beginning of the Neolithic to the onset of the Early Bronze Age, despite a number of uncertainties, indicates that there was no monotonic change in storage and its management. Instead, the scale of storage in households and supra-household groups waxed and waned and probably also varied geographically, probably in response to differences in both social arrangements and local agricultural potentials.

Baquedano, Elizabeth (UCL Institute of Archaeology)**[21]***Mesoamerican Death Imagery Oversimplified*

The Aztecs and other Mesoamerican peoples were exceptionally aware and observant of their natural world and the cycles of nature, particularly the alternation of the seasons. Many of their representations were aptly identified with the dry or rainy seasons. Likewise, dead individuals were depicted in the natural death processes, such as rigor mortis, body skin decomposition (putrefaction), as well as with other death symbols: skulls, skeletons, or death joints (with skulls), normally described by Mesoamerican scholars as an alleged mortuary obsession of Aztec art and iconography. Rather than a “religious” obsession with death, Aztec art and iconography reflect a legitimate scientific interest in the natural world. I will show several examples from Codex Borgia using PCA graphs to see variables and their correlations in death imagery while offering new interpretations. Scholars have for decades described death imagery as terrifying demons, grotesque, crouching monsters, and “demon faces” adorning the elbows, knees, claws, and so on. These descriptions hardly do justice to the Aztecs’ close observation of the human body and their surrounding nature.

[25]*A Neanderthal Hunting Sanctuary in the Interior of the Iberian Peninsula (Pinilla de Valle, Madrid, España)*

In the Des-Cubierto Cave, in the Central System Range of the Iberian Peninsula, 35 crania of large herbivores (*Bison priscus*, *Bos primigenius*, *Cervus elaphus*, and *Stephanorhinus hemitoechus*) were recovered in an area where the main gallery widens and rounds off. Some of the crania are associated with small hearths. It seems that the heads had the mandibles removed outside the cave, and at least some maxillae inside the cave. Moreover, the brains were extracted from the crania by resting them on anvils and using large hammerstones found next to them. However, what is really exceptional is that postcranial bones are anecdotally represented. The introduction by Neanderthals of these skulls with percussion, cut, and fire marks has occurred on several occasions over time. The interpretation of the site with no apparent subsistence activity seems to be linked to some rite whose nature eludes us but is very probably related to the hunting activity of Neanderthal groups. One might think of celebration, initiation, passage, and propitiatory rites. The most parsimonious interpretation from the cognitive point of view, and without excluding other possible explanations, is that these crania were turned into hunting trophies. It has been proven that Neanderthals had symbolic capacity.

Bar, Shay (Haifa University)**[6]***Tel Esur: Summary of Fourteen Seasons of Excavations and a Long-Lasting Community Archaeology Project*

Tel Esur is situated in Israel's Sharon Plain, near Nahal 'Iron (Wadi 'Arah), 10 km southwest of Megiddo. I will present the results from the main excavation areas and insights into our community project: Area B: Middle Bronze Age (henceforth MBA) Ila fortification system with a 3 m thick city wall and a pyramidal tower. Abutting the wall were storage rooms and above them MBA strata of later unwallled settlements. Late Bronze Age (henceforth LBA) remains were also revealed, including a temple. Area BI: LBA (fourteenth century BCE) structure, with 80 complete vessels crushed on its floors, including vessels exhibiting Egyptian influence. A fifteenth-century BCE stratum found supports the identification of the place with Djefeti, mentioned in Thutmose III's Canaan campaign in 1457 BCE. Area D: ninth- to eighth-century BCE administrative buildings were found, an indication of the efforts of the Kings of Israel to enforce their jurisdiction over the coastal plain. A unique community excavation has been held at the site annually since 2010. Our team is comprised of students from local high schools. We promote cooperation between Jews and Muslims, coming from religious and nonreligious backgrounds. During the last 14 years, 6,000 children have worked with us.

[247]*Combining Strontium and Sulphur Isotope Analysis to Reconstruct Paleolithic Reindeer Mobility*

Understanding the movement patterns of past animals is key to unravelling Paleolithic hunter-gatherer mobility and landscape use. Strontium isotope analysis ($^{87}\text{Sr}/^{86}\text{Sr}$) has long been used as a proxy for provenance studies based on the high correlation between strontium values in faunal tissues and underlying lithology. However, interpreting $^{87}\text{Sr}/^{86}\text{Sr}$ results can prove challenging in areas with either homogenous or heterogenous lithologies. Sulphur isotopic analysis ($\delta^{34}\text{S}$) is becoming increasingly useful as a secondary indicator of provenance due to an increased understanding in sulfur variability in relation to coastlines/sea spray effects, changes in lithology and with climate. Thus, combining $^{87}\text{Sr}/^{86}\text{Sr}$ and $\delta^{34}\text{S}$ analyses offers the potential to improve reconstructions of individual movement histories and to infer species-specific spatial behaviors. Focusing on Late Pleistocene France, we present novel $^{87}\text{Sr}/^{86}\text{Sr}$ and $\delta^{34}\text{S}$ isotope data evidencing reindeer mobility patterns across the sedimentary basins of France. By comparing time-series $^{87}\text{Sr}/^{86}\text{Sr}$ data and bulk collagen $\delta^{34}\text{S}$, we generate a diachronic dataset including samples from Middle and Upper Paleolithic sites, allowing us to reconstruct seasonal movements from early-life and compare with later-life spatial data. This data further illuminates behavioral plasticity in Late Pleistocene reindeer, and the relationship between reindeer paleoecology to past climate change and human behaviors.

Barba, Luis (Universidad Nacional Autónoma de México)**[152]***The Tunnels in Teotihuacan: Geology and Technology to Extract Tezontle*

This paper aims to review how the Teotihuacanos took advantage of the available geological resources for the construction of the city. The study of the geological characteristics of the Teotihuacan Valley has revealed that what we presently observe is the consequence of the long-term volcanic activity produced in several steps. First, a high-pressure escape of magma shaped mounds of volcanic scoria that later were covered by a thick layer of yellowish tuff that made invisible the previous activity. To take advantage of the geological resources, Teotihuacanos developed a strategy that first used the soil layer. Then they excavated and passed through the tuff layer to reach the underlying scoria and made tunnels to extract and use this light but resistant material. Scoria (tezontle) was widely used to cover the main pyramids with large blocks, but also with middle-size blocks they raised the nucleus of the walls of the apartment compounds and finally, as

grinded tezontle was mixed with mud to prepare the mortar to plaster the walls and floors of the city buildings. The large quantities of materials used to build the city left behind deep scars in the terrain forming large depressions and many tunnels underground.

Which Stories for Which Storytelling? A Community-Based Approach to the Nineteenth- to Twentieth-Century Nunatsiavummiut Material Heritage

This presentation discusses archaeological research that is intended to create a space for the inhabitants to reconnect with their material heritage on the land. The project took place in the Nain region (Nunatsiavut, Labrador, Canada) in 2021 and 2022. It contributed to the Nunatsiavut Government policies by investigating Inuit material heritage facing conservation threat. This project seeks to step back from colonial perspectives by promoting narratives about the diversity of lifeways on the land. Rooted on a collaboration between Université Laval and the Archaeological Office of the Nunatsiavut Government, a community-based approach was adopted as a way to counter the helicopter research paradigm. A keystone was the anchoring on a local network of governmental institutions whose mandates are to defend Nain community interests. About 30 community members contributed in two ways: specialized services (guides, pilots) and nonspecialized contributions to excavations. The wage-earning policy aimed to shift from the specialization paradigm that relies on symbolic capital, to create spaces that entangle hiring with training for local workers. The gathering of perspectives from this diversity of actors fed the research with a need to refine research questions and root them in the complexity of local history.

Building and Breaking Primordial Space at the Río Viejo Acropolis

Formative period civic-ceremonial facilities like the Río Viejo acropolis in the lower Río Verde Valley on the coast of Oaxaca emerged from the combination a wide range of elements: conceptual, material, environmental, infrastructural, human, and divine. Built rapidly in the first centuries of the Common Era, the multiple monumental structures comprising the acropolis were not only the site of temporary human actions, but also an active repository enveloping the physicality of human relationships with the other animate entities with which ancient people shared their world. Drawing on multiple seasons of excavation on the Río Viejo acropolis, this paper traces the acts and materials through which human-divine relationships unfolded in monumental space. Analysis focuses particularly on processes of breaking down—through burning, consumption, smashing, and discard. Combining ceramic analysis with small-scale geospatial analyses and broader observations of architecture and features, we assert that the creation of primordial spaces at Río Viejo involved the juxtaposition of creative and destructive action. Evidence suggests that engagement with the divine at the acropolis often involved discomfort, disorder, and destruction.

Parasitism and Care in the Schoolyard: Archaeoparasitology of an Early Twentieth-Century School Latrine in New Orleans, USA

McDonough No. 5 School (1882–1930) was built in the historic Algiers neighborhood of New Orleans and was one of the first schools to educate Black children. But as the neighborhood turned Whiter and wealthier, the school was renovated, the Black children turned away and relocated, and the newly renovated school was given over to the White children of Algiers. In 2021, R. Christopher Goodwin & Associates Inc. conducted extensive excavation locating deposits and cultural features that were associated directly with the historic McDonough No. 5. School. Among them, a privy feature containing large quantities of school-related artifacts and rich in nightsoil was identified. Three samples consisting of two coprolites and a general soil subsample were submitted for parasitological examination. These analyses have recovered evidence of whipworm (*Trichuris trichiura*) and mawworm (*Ascaris lumbricoides*) signaling the presence of fecal-borne parasitic infections. Low parasitic rates and the finding of medicinal bottles, some of which were marked as vermifuge, suggest that care measures were put in place. As the first of its kind in Louisiana's historical archaeology, the present study contributes to a better understanding of the nature of parasitism and care among Black American communities at the turn of the twentieth century.

Paying the Price for Passion: Navigating Compensation Realities in US Academic Archaeology

This paper explores the complex realm of compensation realities encountered by academic archaeologists by examining the interplay between salary structures and regional cost of living variations. A hyper-competitive job market and the gradual decline of tenure track job availability have had profound effects on early-career scholars' prospects and institutional stability, with resulting burdens on contingent faculty straining academic quality, research output, and student mentorship. Furthermore, gendered and racial salary disparities persist across US academia, with broader cross-disciplinary studies revealing that women and BIPOC academics continue to earn less than their White male counterparts. In this study, we evaluate discrepancies in compensation across professional ranks and geographic locations within US academic archaeology, drawing on public salary databases and cost of living indices. We conclude with a discussion on how potential collaborative efforts, institutional reforms, and policy interventions might enhance future financial stability and equitable treatment for professionals across the spectrum of archaeological practice.

"We've never been allowed to fail before!" Undergraduate Experimental Archaeology Courses at the Crossroads of History and Archaeology

For five years, we have cotaught an undergraduate Introduction to Experimental Archaeology course under the auspices of the history department at a small university. In this paper, we examine the ways in which history and experimental archaeology share traditions of scholarship, learning objectives, and appeal to students. Yet, at the same time, differences between the two fields create opportunities for both. We highlight the ways in which experimental archaeology offers students the chance to play and to fail. In other words, students may try out skills, theories, or experiments in which outcomes are unknown. Our students have consistently remarked on and appreciated the freedom this offers them, especially as graduates of a school system based on No Child Left Behind. Historians, too, tend to be conservative about exploring data that will not support a suspected thesis. From a pedagogical standpoint, therefore, experimental archaeology offers advantages that go well beyond the material being taught. On the other hand, connections to a history department offers archaeologists access to a much larger student body and to broader historical narratives to which their research may be tied.

[25]

Fat, Potency, and Respect: The Holy Triad of Human-Animal Relationships in the Paleolithic

Animals played a major role in human subsistence, well-being, and relationship with the world around them since time immemorial. Humans were highly dependent on their animal counterparts for their successful survival and adaptation; however, this dependency was expressed in respect and appreciation toward these animals. I believe that the early archaeological record is consistent with such statements, and that fat, potency, and respect were major key-issues in human interaction with game animals in the Paleolithic. Case studies regarding the use of elephant, bird, and fallow deer body parts in archaeological contexts from the Levant and beyond will be used in order to implement these claims.

A Case for Digging (into Big Data)

A quick dive into regional databases can be invaluable in managing local resources. Updating regional contexts tends to be time consuming and expensive. However, obtaining general numbers of different site types, NRHP eligibility assessments, dates of use, and other basic information can be a quick exercise to guide future management. For example, basic regional data may show that NRHP eligibility is skewed too heavily toward considering a large number of sites NRHP eligible based on data potential, when actual research at all of those sites would be nearly impossible. These types of data can also help to determine types of sites that are less common and may require greater protection. Finally, a broad summary of available information can serve as a baseline for developing a detailed historic context with pragmatic temporal and geographic boundaries.

Classic Maya Wahys: What, Who, Where, and Why?

The Kerr cataloguing project at Dumbarton Oaks is creating opportunities to reexamine iconographic motifs and hieroglyphic texts on Maya pottery. One avenue in which this has been fruitful is the analysis of vessels depicting wahy creatures. In modern communities, wahys are powerful individuals with the ability to change shape at night, often for the purpose of causing harm or mischief. Classic Maya wahys were similarly linked to sorcery and have highly specific names and iconographic attributes aligning them with diseases and other misfortunes. In 1994, Grube and Nahm published their “census” of 55 such entities in Kerr’s *Maya Vase Book*. Today, after examining 186 scenes of cavorting wahy creatures, I have edited and expanded that list to 89. Glyphic captions frequently associate these entities with specific place-names, allowing me to analyze how they were distributed in space, and what they might mean politically.

Cross-Craft Interactions in the Central European Bronze Age

Archaeometric data obtained for various raw materials used by Central European communities in the Bronze Age (ca. 2300–800 BC) allow us to study technological interactions in the past realized mostly within usually small and densely settled sites. In this study, cross-craft contact zones between the selected activities are crucial. They are likely to reflect the social space of communication concerning the objects to be manufactured. For instance, the development of metallurgy required plenty of clay casting molds produced with the use of potting techniques. Were they manufactured according to traditional recipes and technological choices or did they have to meet some other, specific standards? How did the high temperatures used in metallurgy influence the quality of household pottery at the same sites? Why do we have so little evidence of the use of metal tools on Bronze Age bone and antler objects although they are more effective in processing animal hard tissues? How did the quality of bone tools affect their use in pottery making? My main objective is, therefore, to provide a comprehensive and coherent interpretative model of communication and knowledge transfer in various types of activities, both specialized and domestic.

The Presence of Potbelly Sculptures in the Lake Atitlán Basin, Guatemala

The sculptural style known as potbelly (“barrigón”) has been widely documented in archaeological sites in the southern Maya region, from Chiapas to El Salvador, with a few examples in the Lowlands and other areas of Mesoamerica. However, most of these monuments are concentrated in sites occupied during the Late Preclassic period on the Guatemalan Pacific coast and Piedmont, as well as in Kaminaljuyu. In this paper, data will be presented on the poorly documented, but significant presence of this sculptural style in various areas of the Lake Atitlan Basin, which includes two fortuitous finds made in the year 2022. The interpretation of the meaning of these sculptures is still a matter of debate among specialists, partly because their characteristics show variations between each region. Therefore, the specimens found to date in the Lake Atitlan Basin provide new data regarding their geographic distribution in the Maya Highlands, their anthropomorphic features, and symbolic and iconographic associations.

Plaza A, Plan de las Mesas, Copan, Honduras: The Sacred Center of an Early Classic Hilltop Fortress

The Plan de las Mesas archaeological site is a fortress built on top of a high hill, which dominates the Copan Pocket at its northern end. Plaza A, Group I, is the second highest area of the site and the most complex, containing the tallest pyramidal platform and a central altar to the south, an atypical pattern in the Copan area, but one extremely common at Teotihuacan. Other buildings at the plaza have shown architectural features also related to Teotihuacan as well as a high percentage of Pachuca obsidian. From Plaza A one can see not only the Copan Acropolis but also a wide extension of the valley floor, where most of the population was living during the Classic period. Also visible from this high scenic point are other mountain sanctuary sites such as the locations of Stelae 12 and 10, Los Sapos, La Laguna, and Cerro Chino. These sacred spaces may have also functioned as checkpoints to visually control both the local population as well as from which to spot any incursion from outsiders. Las Mesas was also an ideal location from which to watch the movement of celestial bodies in the night sky.

Archaeology during the Portuguese Dictatorship: The Role of Regional Institutions

Portugal's authoritarian regime, the conservative and nationalist Estado Novo (1933–1974), attempted to create a nationwide network of commissions dedicated to the supervision of archaeological, historical, and artistic monuments. The Municipal Commissions for Art and Archaeology (MCAAs, Comissões Municipais de

Arte e Arqueologia, in the original) were created as early as 1937, with some lasting until 1977, three years after the fall of the regime. This time frame, 1937–1977, makes the MCAAs exceptional case studies for understanding the context in which archaeological activities developed during and immediately after the dictatorship. In this paper I will briefly present some preliminary results of the MCAAs research project, which aims to determine what specific activities these MCAAs carried out in relation to archaeology and cultural heritage, whether they contributed to the strengthening of the regime at the local level, and whether there is any lasting influence of the MCAAs on the development of Portuguese archaeology since the end of the dictatorship.

Machine Learning for Chronology Building in Regional-Scale Synthesis

Chronological control is essential for regional-scale research in order to establish contemporaneity or temporal sequences among spatially distributed assemblages. Archaeology has benefited from advances in radiometric dating methods, as well as statistical protocols for combining dates to achieve greater precision age estimates. Yet the potential for applying these methods remains limited, requiring that samples of a narrow range of materials be recovered (often with special handling) from carefully excavated contexts. This leaves nearly all surface collections and many excavated assemblages undatable by these methods. Archaeologists also have long used artifact morphologies to estimate the age of assemblages. While widely applicable, this approach faces questions over subjectivity, replicability, and the causes of variation in artifact morphologies (and hence, their reliability for chronology). Fortunately, a suite of analytical methods, broadly termed machine learning, can combine these different dating approaches, allowing a much wider array of assemblages from many contexts—including surface assemblages—to be dated. We compare the accuracy and reliability of a suite of machine-learning algorithms for chronology building, widely accessible on normal desktop computers, using assemblages from dated, excavated contexts. We then illustrate their usefulness in regional synthesis by applying them to surface assemblages extending across eastern Spain.

Using Extant Photographs of Ceramic Collections for Geometric Morphometric Archaeological Research

Modern archaeology is constantly seeking innovative, nondestructive ways to learn new things about the past from existing collections. One powerful tool in the modern arsenal is Geometric Morphometrics (GMM), a method of quantitative shape analysis that can be applied to study technological style and communities of practice through material culture. 2D GMM requires only photographs, which museums already use to document their collections. If precise enough photographs of archaeological materials exist, then many new avenues of GMM analysis may be possible on collections that are difficult to access, or even that have already been repatriated. This paper compares the analytical effectiveness of profile photos of ceramic Roosevelt Red

Ware vessels from thirteenth- and fourteenth-century eastern Arizona that were taken previously, as part of museum documentation, to photos of the same vessels collected with the specific requirements of GMM in mind. This tests the ability to use preexisting photographs for Geometric Morphometrics research, offers insights for museum documentation practices, and investigates what information archaeologists are capable of learning from GMM on photos of ceramic vessels from the coalescent communities of the 1200s and 1300s Southwest.

The Neolithic Stone Beads of Nahal Hemar Cave, Israel

The Pre-Pottery Neolithic B (PPNB) site of Nahal Hemar Cave in the Judean Desert yielded, among others, many beads made of wood, plaster, shell and stone. The study of 35 stone beads recovered at the site highlights three main interrelated aspects: a broad range of raw materials used, the workmanship of bead production according to their types, and the fashioning of beads into types intended for a particular method of using them. Raw material identification was based on SEM-EDS and XRF analyses. Eleven minerals identified reveal a vast geographical range from which they were extracted. Typologically, they have mostly a round and lenticular transverse section. Experimentation indicated that the bead makers had an intimate acquaintance with the properties of the minerals. Microscopic wear analysis indicates the methods of abrasion and polishing, and selective methods of drilling and binding consistent with bead types. This is a technological approach that reflects careful planning and execution that contributes to the wider perspective of novel trends of the Neolithic period paralleling other developments associated with the establishment of village life and agriculture.

Challenges in Assisting Removal Tribes in the Reburial Stage of the NAGPRA Process

For over 100 years, large museums, universities, and institutions in the United States have amassed extensive collections of Native American remains and sacred objects from archaeological sites. The outcries of Native American communities who sought to protect their sacred sites and burial grounds from being repeatedly looted throughout the country were largely ignored. The passing of NAGPRA legislation in 1990 was crucial in transferring power back to Native communities to reclaim and rebury their ancestors. Despite this legislation, and efforts toward consultation and repatriation with institutions, communities struggle with the logistics regarding the reburial of their ancestors and sacred items. This is especially true for removal tribes who no longer have tribally owned land in the Midwestern states they were forcibly removed from and may not have access to the archaeological sites from which those ancestors were initially laid to rest. A key issue is protecting the reburial sites from future looters if a state prohibits unmarked cemeteries, and the logistics around safe reburial. This poster delineates the reburial laws in Ohio, Kentucky, Indiana, and Illinois and how these laws constrain removal tribes when trying to rebury ancestors in their homelands at the sites from which they were removed.

Reconstructing Mortuary Rites through Micro-CT Forensic Taphonomy at Ancient Aksum, Ethiopia (AD 50–400)

This paper uses micro-CT and funerary taphonomy to reconstruct ancient Aksumite burials (AD 50–400).

Aksum, in northern Ethiopia, was the capital of an ancient polity that spread across the northern Horn of Africa and became a major power in the Indian Ocean trade. The most notable remains of the ancient capital are its towering funerary stelae and monumental tomb complexes. This paper presents data analyzing previously excavated human remains from two stelae tombs in the central cemetery at Aksum. Data looking at element representation and patterning of cutmarks point to the postmortem processing of Aksumite remains. Micro-CT histology of bacterial bioerosion on 20 samples from the two tombs supports this conclusion. Differences in stable isotopes between tombs further suggest their family orientations. When contextualized with previous excavation data, it is possible to reconstruct a rough sequence of burial and postmortem steps and demonstrate their relevance in shaping Aksum's mortuary architecture. I also show that these mortuary rites fit with a larger Aksumite history as inventions of tradition that negotiated the rising cosmopolitanism in the Indian Ocean trade.

Jack's Backyard: Earth Oven Features on the Edge of Eagle Nest Canyon

The canyon edge around Eagle Nest Canyon contains the remains of numerous prehistoric earth oven features. It was also the property of Jack Skiles, who made a lifelong contribution to the study of archaeology. This paper will document the results of excavations conducted during a 2013 field school on the property of Jack Skiles, including along his driveway and by his pool. The results show that numerous types of wood resources were used in the features. The results also show that earth oven cooking was done in different areas of the canyon edge based on landscape morphology, such as bedrock depressions, and the availability of wood resources that appear to have shifted over time based on changing climate.

A Visual Analysis of Intersecting Identities: Nathan Harrison's Gender Performance in Southern California

Nathan Harrison, a formerly enslaved man from Kentucky, was adept at performing specific masculinities (and other identities) within different community groups. Through forced migration, Harrison traveled from Kentucky to California during the mid-1800s. After gaining his freedom, Harrison continued moving south until he settled in San Diego County. Archaeological excavations at his Palomar Mountain homestead uncovered an extensive artifact collection and archival work located abundant historical documents and oral narratives that detail Harrison's interactions with neighbors, friends, and tourists. Social network analysis will be used to determine how this personal community changed over time and space. A visual analysis will then be done on a selection of historical documents and oral narratives to understand how Harrison navigated social situations during a time of blatant racism and violence against African Americans.

Trees among the Cereal Fields: Arboriculture Reframed as Integral to the Food and Economic Systems of the Indus Civilization of South Asia ca. 3200–1500 BC

In this paper I synthesize a big picture of how people in the Bronze Age Indus Civilization of South Asia engaged with trees as a vital resource, and how there was no single conception of trees as “wild” versus “domesticated,” “orcharded” versus “stand-alone,” “exotic” versus “native,” and potentially “owned” versus “communal.” While wheat, barley, millets, and rice formed the staple food resource, in our desire to model

the underpinnings of urban-support systems—how the masses were fed—we have overlooked that the economy(s) and diets were more diverse and exciting than a daily dose of carbohydrates. The very first discoveries of plants in the Indus included dates, and since then a diversity of fruit remains have been found, alongside other datasets like wood, artistry, artifacts, and additional scientific data, that demonstrate that Indus systems of arboriculture enriched daily diets, complicated the economic system(s), and engaged with the mosaic environmental and cultural worlds that Indus peoples lived in. In this paper I play with notions of food, agriculture, trade, ritual, and ecological manipulation to explore how Indus peoples conceptualized trees within and without their spheres of daily life, pushing the boundaries of this oft-overlooked resource into new theoretical realms.

A Paleoethnobotanical Analysis of Ceramic Residues from Caches and Burials at the Lowland Maya Site of Holtun, Guatemala

Among the Maya, plant-based foods were not just important for sustenance but also had ritual meaning, especially emphasized when placed in graves and caches. Food offered during ritual performances created a reciprocal relationship between living individuals, their ancestors, and the gods. This paper presents the paleoethnobotanical results from the examination of seven ceramic sherds from the Preclassic through the Terminal Classic periods (800 BC–AD 900) associated with burial and cache offerings from the lowland Maya site of Holtun, Guatemala. Each whole vessel fragment was subjected to starch analysis, a method used to determine plant taxa on a microscopic level, as well as high-performance liquid chromatography and Raman spectroscopy to test for cacao residues. The identification of crops aside from the usual suspects like maize and cacao, such as manioc, yam, and malanga, suggests evidence of a complex ritual diet of the residues at Holtun. Although poor preservation can result from the environmental conditions of the Maya Lowlands, the results gathered from the preliminary starch and chemical residue analyses at Holtun indicate our ability to recover diverse plant remains from archaeological contexts and illuminates possible patterns of grave and offering types, social class, and variety in ritual diet.

[83]

The Cozumel Bee People, Social Ecology, and Landscape Management during the Late Maya Postclassic
Landscape management in Cozumel during the Late Postclassic resulted in a network of stone walls (*albarradas*) demarcating the entire island resembling the structure of a beehive. This paper presents a comparison of some features of the social ecology of Yucatec stingless bees and the structure of stonewalls demarcating Cozumel, looking at the social ecology of beekeeping and the agrarian production implemented by the Postclassic Maya in the island. The Postclassic Cozumel Maya population was referred to in the colonial books (known as the *Chilam Balam*) as the bee people.

The Claiborne site, located in Hancock County, Mississippi, has been dated using many different techniques since discovery in 1967. In order to create a tighter chronology and firmly place it into the timeline of the Poverty Point culture, chronometric hygiene protocols were used to dismiss dates that are not as accurate or precise as current AMS dates. New AMS radiocarbon dates were then added into the revised database, narrowing down the age of Claiborne, therefore connecting it to other Poverty Point sites in the region.

Baustian, Kathryn (Skidmore College), Clair Ralston (University of Nevada, Las Vegas), Debra Martin (University of Nevada, Las Vegas) and Maryann Hobbs (SNA International for DPAA)**[272]***Dynamic and Diverse Roles and Identities of Women in Ancient Southwest Systems of Violence*

The definition of violence is unique to all societies. Violent behavior is thus recognized in myriad ways and observing it in past societies demands consideration of many forms of evidence. Interpreting individual roles in systems of violence requires that we look beyond weaponry, site destruction, male warrior burials, and lethal injuries. Our perception and interpretation of females as actively engaged in violent interactions in the past is shaped by our own social conditioning, cultural frameworks, and lived experiences. We present examples of women's diverse roles and identities within systems of violence through a bioarchaeological analysis of skeletal remains from several Mogollon sites (Grasshopper, Turkey Creek, Point of Pines, and several Mimbres sites). Considering injuries, disease, and skeletal robusticity in relation to mortuary contexts and social structures, we interpret the agency of women in times of conflict and their roles as aggressors, defenders, or supporters of warfare and raiding in the precolonial American Southwest. (No images of human remains will be displayed.)

Bautista, Jessica**[67]***Forest Use at Te Zulay, an Ancient Community at the Mouth of the Pastaza River in the Upper Amazonia*

The use of plants of ancient Amazonian societies is currently heavily debated. Much of such it concerns the difficulty of finding good paleobotanic evidence in archaeological contexts. Lately, old plant use strategies have been reconstructed mainly based on phytoliths, starch, and pollen evidence. However, the present study is focused on charred wood samples from Te Zulay, a mounded site located on the banks of the Pastaza River on the Ecuadorian Upper Amazon. The anthracological results indicate Te Zulay inhabitants' preferences for certain types of trees during their period of occupation of the site.

Bautista, Stefanie (University of Rochester), Justin Jennings (University of Toronto) and Willy Yopez Alvarez (University of Toronto)**[175]***Survey and Mapping of Antimpampa, an Early Horizon Monumental Center in Southern Peru*

Globally, the earliest cultural ecumene are associated with monumental centers that spurred greater local

and interregional interaction. Antimpampa, located in the Arequipa region of Peru, is one such monumental center that has remained largely unstudied. This poster presents the preliminary results of our 2020 archaeological survey at Antimpampa, which spans 90 ha and is comprised of 13 platform mounds, associated plazas, standing stones, and a monumental enclosure wall. Surface mapping and artifact collection reveal a mound-plaza group organization distinguished by walls and elevation changes, as well as areas of residence, craft specialization, and ritual activities on and around the mounds. Our research also demonstrates that Antimpampa is the only known site in the Andes with artifacts that reflect the northern Chavín and southern Yaya-Mama/Pukara styles, the two great iconographic traditions of the Early Horizon (850–550 BCE). A third tradition at Antimpampa featuring large slabs of rock painted with zoomorphic and anthropomorphic animals may have emerged at this time. Antimpampa's rich assemblage of artifacts, combined with the excellent preservation of its activity areas, present an opportunity for future excavations to understand how Early Horizon centers worked as engines of integration, identity formation, and ritual practice.

[158]

Revisiting the Archaeology of a Small Harbor: Cananéia (São Paulo, Brazil), Nineteenth–Twentieth Centuries

The presentation discusses the results of the author's PhD dissertation on nineteenth- and twentieth-century harbor sites in Cananéia, São Paulo State, Brazil, a period when the capitalist economy was introduced in the region. From the mid-nineteenth century until 1950, the harbors experienced a subtle but significant transformation that expresses the economic and political changes derived from Brazil's modernization. These coastal and underwater archaeological contexts herein focus—one stone wharf, a wreck site of a paddlewheel steamship, and two shipyards—have been delimited with mapping, registering, and extensive surveying using an approximation to Westerdahl's methodology and the reflection of J. Herrera and M. Chapanoff. This approach is especially important because it includes not only the analysis of ruined, abandoned, and buried remains as archaeological resources but also meanings, beliefs, land/seascapes, structures, equipment, and buildings that are still present in the current social context as active elements. The result of the research was the understanding that two main changes have transformed the economic dynamics of the region: the transition from the boat building and commercial agriculture to industrial fishing and tourism, and the substitution of maritime transportation, first by multimodal river navigation and railroad, and then by road transportation.

3D Documentation of Grave Markers for the National Cemetery Administration

The United States Army Corp of Engineers, Engineer Research Development Center, Construction Engineering Research Laboratory (ERDC-CERL) is home to one of the largest cultural resources research teams in the DoD. In recent years our team has assisted the US Department of Veterans Affairs, National Cemetery Administration (NCA) with their duty to provide perpetual care to the graves of US service personnel and veterans. Using high-definition terrestrial laser scanning (TLS) and photogrammetry, 3D documentation of grave markers facilitates the repair, restoration and/or replacement of military grave markers in cemeteries formerly under private or municipal management that have fallen into disrepair or are threatened by a changing environment. This presentation will discuss how leveraging 3D data collection and visualization is enabling cultural resource managers to build resiliency against the ravages of time and climate change in maintaining historic properties.

Mogollon Murk: Ideas for Some New Ways Forward through Collections and Collaboration (and a Little Fieldwork)

Emily Haury wrote, “[Mogollon studies are] . . . a currently confused state of affairs. Perhaps in another half century [it] will have reached a state of broad acceptability and equilibrium” (1983:xix). Forty years into the prognostication, have we made inroads? This paper will explore the Denver Museum of Nature & Science’s efforts toward that end in the Mogollon highlands. From new ¹⁴C dates from Tularosa Cave, to reanalysis of WS Ranch, survey north of the Forestdale Valley, excavation of an endangered great kiva (and its repatriation and reburial alongside Zuni and Acoma advisors), to new and tantalizing sites out of reach but not out of mind, we hope to add to syntheses pioneered in the region by Martin and Rinaldo and riffed on a new generation of regional archaeologists looking to cast off the murk. New dates, new methods, and new thoughts to put into the hopper.

The Soils and Geoarchaeology of Aguada Fénix and the Middle Usumacinta Region

Three years of soil, water, and lidar analyses for the Middle Usumacinta Region indicate a diversity of soils, paleosols, and several areas of wetland rectilinear features that indicate a range of wetland farming and other uses. For the soils, we characterized soil profiles through excavations over more than 3 m depth, mapping stratigraphy, horizons, and paleosols. Our field and lab research on the soils aims to show soil formation, fertility, sediment sourcing, and broader geoarchaeology through geochemistry and stratigraphy in association with archaeological information. We analyzed soil texture, pH, magnetic susceptibility, XRF and ICP AES for elements, particle size analysis, LOI, C, N, P, S, and stable carbon isotopes. These analyses allow us to differentiate sediment sources, though the soils and sediments also reflect in situ weathering especially near the surfaces that have been exposed to the atmosphere for millennia. We present evidence of topsoils and paleosol Rendolls, Vertisols, and Oxisols buried under the largescale Middle Preclassic construction. We also consider the evidence for wetland fields and canals that are probably Classic period, using lidar visualization analyses and pattern comparisons with wetland fields demonstrated elsewhere for both the well-known Laguna de Términos field complex and other regional rectilinear canals systems.

The Impact of Belizean Archaeological Participation on Aspects of Cultural Identity and Cultural Heritage

Belize is a country rich in archaeological resources including Paleoindian, Archaic, the Ancient Maya, and colonial. Belize has been and continues to be the focus of archaeological research, largely conducted by foreign researchers that help facilitate archaeological field schools training primarily American, Canadian, and

English students. While many Belizeans are hired to work on these projects, they are not in a position to conduct investigations, analyses, nor produce/disseminate reports of their findings. Using ethnographic/qualitative methods, my dissertation research aims to investigate whether greater participation on an archaeological project has any impact on a young Belizean regarding (1) their sense of cultural identity, (2) their perception of a shared Belizean cultural heritage, and (3) their relation to the archaeological past. This paper outlines the proposed methodology, expected results, and why this form of community/collaborative research is essential for understanding the need of greater community/public components on foreign led archaeological projects in Belize.

Broader Impact of Archaeological Science Methods in Forensic Science Investigations

In 2009, the National Academy of Sciences report on “Strengthening Forensic Science in the United States” emphasized the importance of change needed in forensic science disciplines to ensure reliability, enforceable standards, and to promote best practices. Over the years many archaeologists and bioarchaeologists have assisted law enforcement with the recovery and analysis of human remains on an ad hoc basis with often little or no formal training in forensic anthropology. This presentation will review the value that archaeological science methods can contribute to forensic anthropology as an applied anthropology practice. In recent years, media coverage has highlighted cases where pseudoscience, unethical practices by unqualified individuals, and the unethical treatment of human remains had a negative impact to families, communities, and the discipline. The misidentification of animal remains as human because of a lack of qualifications or promoting the pseudoscience of dowsing rods to locate clandestine graves has lasting consequences in the public perception of what assistance trained forensic anthropologists can offer investigators. In this presentation, I argue that archaeologists who desire to assist in forensic investigations require a deeper understanding and ethical understanding of the broader impact their archaeological science methods have on the forensic anthropology community.

Systematic Data Recovery at Archaeological Sites in the McIntyre Creek Valley, Whitehorse, Yukon

This poster presents on the preliminary findings of systematic data recovery excavations at several archaeological sites within the city of Whitehorse, Yukon. These sites tentatively include JeUs-42, JeUs-43, and JeUs-96. Excavations were undertaken by Stantec during the 2023 field season; one site was partially excavated in 2010. Cultural materials recovered include microblade technology, bifacial technology, faunal remains as well as a thermal feature that likely predates the deposition of White River Tephra (~1500 YBP). Lithic material types include a variety of visually distinctive cherts, agate, and obsidian. Intrasite analyses are presented respectively. Intersite analyses and regional comparisons are also explored and are suggested to culturally correlate to a cluster of microblade sites located in the McIntyre Creek Valley, dating to the Early/Mid-Holocene. The distribution of these sites is presented. Findings suggest these sites may represent bison hunting and/or processing sites. The suite of sites explored in this poster further regional

understandings of the formation of cultural assemblages resulting from hunting activities within the Whitehorse subregion of SW Yukon.

Is It All Just Faience and Honey-Colored Gun Flints? Examining the Material Record of Eighteenth-Century French Culture in Multiregional Perspective

By the first quarter of the eighteenth century, the “blue crescent” of French land claims and settlement had spread across North America from the Acadian coast to southern Louisiana. While French colonial settlements existed contemporaneously throughout the middle of the continent, historians and archaeologists have tended to study these forts, trading posts, and communities either as isolated points or within regions that were defined by twentieth-century etic perspectives. While the environmental conditions of each community’s location played a role in the particular manifestation of French colonial society, there are commonalities across the continent. This paper compares the material record recovered from sites in the colony of Acadia located in the current state of Maine and one in the French colony of Louisiana in the current state of Arkansas to offer a line of evidence of a multiregional perspective of French colonial society.

Ritual y sacrificio de cocodrilos en la ofrenda constructiva del Juego de Pelota de Tlalixcoyan, Veracruz

Trabajos de investigación sobre arquitectura dañada del Juego de Pelota realizados en el Complejo Monumental de Tlalixcoyan, Centro de Veracruz, permitieron documentar ofrendas de dedicación y múltiples etapas constructivas durante el Clásico. En una de las etapas iniciales, los constructores del Juego de Pelota realizaron el depósito de cocodrilos junto a otros elementos que enfatizan aspectos acuáticos y ceremoniales. Las evidencias indican que al menos un cocodrilo fue enterrado vivo en la construcción. En esta ponencia se exploran las implicaciones de este contexto para nuestro conocimiento acerca de la cronología, los rituales y la participación colectiva en el Juego de Pelota de la Costa del Golfo. [Research work on the damaged architecture of the ballcourt at the Monumental Complex of Tlalixcoyan, in central Veracruz, documented dedication offerings and multiple construction stages during the Classic period. In one of the initial stages, the builders of the ballgame made the deposit of crocodiles along with other elements that emphasize aquatic and ceremonial aspects. Evidence indicates that at least one crocodile was buried alive in the construction. This paper explores the implications of this context for our understanding of the chronology, rituals, and collective participation in the Gulf Coast Ballgame.]

Big Data and the Berry Site: Colonial Archaeology in the Carolina Foothills

From December 1566 to March 1568, Captain Juan Pardo established a network of six small garrisons extending beyond the Atlantic Coast through modern-day North and South Carolina and across the Appalachian Mountains into eastern Tennessee. The first of these, Fort San Juan, was built in the Appalachian Foothills at a Native town named Joara and was intended to serve as the base of operations for Spain's imperial designs in the interior of northern La Florida. The subsequent destruction of all six forts during an Indigenous uprising brought these imperial ambitions to an unexpected end. Although short-lived, Pardo's forts constitute the earliest Spanish presidio system in the Western Hemisphere. More than two decades of archaeological research at the Berry site in North Carolina have revealed the location of Fort San Juan and the Indigenous context of its construction, use, and annihilation. Much of our work at Berry, and particularly our understanding of this Indigenous context, derives from Dave Anderson's pathbreaking work on the Savannah River chiefdoms, and indeed, we suggest that the people of Joara were descended from the upper Savannah's Late Mississippian populations.

Modern and Ancient Craftswomen in the Andes, from Tiwanaku (AD 500–1100) to Present in Bolivia and Peru

This research investigates skeletal evidence of labor (i.e., osteoarthritis and muscle enthesal changes), as performed by 525 females within the precontact Tiwanaku civilization (AD 500–1100) of the Bolivian and Peruvian Andes, and compares these labors to those performed by their modern-day indigenous Aymara descendants who live in the same region and perform many traditional tasks (i.e., non-mechanized farming, carrying goods on the back over varying elevations, weaving, pottery production). Using ethnographic evidence from 20 interviews and 3D computer-aided video motion capture (mocap) of traditional activities, data from these women were compared to prior published skeletal evidence of Tiwanaku tasks. Results show that many of the tools used in prehistory, such as a sharpened and smoothed llama bone, are the same as those used over a thousand years ago during Tiwanaku times, and that intense labors, such as farming or craft production begins in pre-teen years in both the past and present. Overall, focusing on laborers from the past and present can answer question about gendered labor and the importance of Indigenous expert knowledge.

Begel, Johann (UNAM, IIFL, Centro de Estudios Mayas) and Cédric Becquey (UNAM, IIFL, Centro de Estudios Mayas)**[32]***Stela and Altar Rituals: Caches, Inscriptions and Iconography in Tikal, Petén, Guatemala (AD 250–950)*

Mayan stelae and altars are a key epigraphic and iconographic source for understanding the political history of the Classic period (AD 250–900). Tikal produced a particularly large number of these monuments in a variety of architectural contexts: Twin Pyramids Groups, Plazas, Great Temples, residential groups, and even remote areas, probably corresponding to different events and ceremonies. To date, 70 caches have been discovered under 62 stelae and 5 altars, including 18 inscribed, 43 plain, and 6 removed in the ancient period. This corpus therefore lends itself particularly well to the study of the rituals associated with these monuments, which promoted the rulers' propaganda. The focus of this presentation will be on determining whether there were any caches specifically dedicated to the monuments. Epigraphy will shed some general light on the ceremonies surrounding the erection and dedication. Moreover, it will be interesting to determine whether a correlation exists between the messages put forward in the inscriptions, the text/image layout, the iconography, and the type of dedicatory cache. For all these approaches, it will also be important to evaluate the differences and variations depending on the architectural context and the event that led to the installation of these stelae and altars.

Beggen, Ian (University of Michigan)**[20]***Chair***Beggen, Ian (University of Michigan)****[20]***Utilizing Drone Modeling to Facilitate Targeted Pedestrian Survey in Central Western Patagonia*

Regional archaeological survey is notably difficult in continental Aysén, Chile. Many researchers mark the difficult terrain and dense vegetation of forest and forest-steppe biomes of this region of Central Western Patagonia as major factors limiting our ability to identify new archaeological sites. Thus far, most sites identified across the region are rockshelters, and this trend in survey results is likely due to our relative inability to identify open-air sites in hard to reach areas. Recently, methods such as remote sensing (i.e., magnetometry) have been utilized successfully to identify buried archaeological sites. However, regional magnetometry survey can be quite expensive. In this project, I utilize a less cost-prohibitive method to identify ideal landforms for subsurface archaeological testing. Using drone modeling of a 10 km² area of

forest-steppe ecotone adjacent to the Ibáñez River Valley (IRV), I employ a method of targeted subsurface survey to better identify buried archaeological sites. In this presentation I report the results of this survey and discuss possible outcomes for our understanding of this relatively-understudied area of Patagonia, particularly relating to settlement patterns, environmental marginality, and perceived chronological gaps.

Taking Their Water for New York City: Archaeology of Reservoir Communities

It took New York City more than 100 years to construct its system of 19 reservoirs and controlled lakes. Archaeological survey of city-owned lands around these artificial water bodies reveal the ruins of what once was. Collaborations with community members and partnerships with local libraries, historical societies, and community cemeteries help to make sense of the dramatically altered landscapes. Together we have built new understandings of the local impacts of water harvesting and redirection. Reservoir creation can be a violent act that displaces people, plants, and animals. It can also create new habitats and places of wonder.

A Tehuelche/Aonikenk Camp on the Northern Bank of the Middle Course of the Gallegos River (Santa Cruz Province, Patagonia, Argentina): Implications for the Use of Space in Historical Moments

The Mack Aike Canyon has been redundantly used by hunter-gatherer populations for at least 3300 years BP. The canyon provides protection, water, pastures, and fauna. Information corresponding to the Chorrillo Grande I site is presented, where lithic artifacts were found together with others made of glass (Venetian type beads and scrapers), metal—brass and iron—(ornaments, nails, and fragments), ceramic potsherds, and archaeofauna, mainly guanaco (*Lama guanicoe*) and horse (*Equus caballus*). The chronology obtained on remains of these fauna and potsherds goes back to the last 300 years BP. In addition, the distribution of the archaeological record follows a linear pattern that, together with the location in a canyon, conforms to the ethnographic information on the arrangement of toldos. The late artifactual signal has also been identified in other contexts of the canyon but at a very low frequency. The information allows us to interpret the site as a Tehuelche/Aonikenk camp and compare it with other sites in the extreme south of Patagonia with similar characteristics. Along with other sites in the Mack Aike Canyon, Chorrillo Grande I shows the persistent use of the locality and its role as an articulator of regional mobility until historical moments.

*Goosefoot Galore: Results from the Analysis of a Goosefoot (*Chenopodium berlandieri*) Cache in the American Bottom*

In precontact eastern North America, Indigenous peoples domesticated a unique crop system called the Eastern Agricultural Complex (EAC) before the arrival of maize (*Zea mays*). The EAC likely sustained past Indigenous populations beginning around 3900 BP, to approximately 600 BP. The EAC fell out of cultivation prior to European contact, so their domesticated forms only exist in the archaeological record. This poster focuses on one of these lost crops: goosefoot (*Chenopodium berlandieri*), a small-seeded, annual plant similar to quinoa (*Chenopodium quinoa*). Recent fieldwork at the Danny site (11S870), a multicomponent bluff-top settlement overlooking Silver Creek in the uplands east of the American Bottom, revealed a cache of approximately 275,000 charred seeds. We will conduct a morphological analysis of this seed cache focusing on seed diameter and testa (seed coat) thickness to explore the developmental plasticity present within this population. We will then compare our analysis to other goosefoot caches found across eastern North America. This study will contribute to recent goosefoot research that reframes its evolutionary history, and further illuminates the intricacies of past peoples' relationship with this crop.

Deep Stratigraphic Deposits: Pond Scum, Aircraft Wreckage, and Safety in Assam, India

Stratigraphy is an important part of understanding the history and land use of any archaeological site, but it is exceptionally important in understanding sites associated with US missing service personnel. Understanding the stratigraphy and pedogenic processes of a recovery site/scene allows the lead archaeologist to make informed decisions about the extent/depth of excavation as well as the direction of excavation. This understanding guides the excavations to the areas that appear to have the highest likelihood of recovering probative materials associated with missing US service members. An important aspect of the study of stratigraphy is to interpret the land-use history of these recovery scenes, including the original incident related archaeosediments and various taphonomic processes as well as natural and cultural depositional/ erosional sequences that are necessary to reconstruct the land use and modification of incident-related sequences. Examples from the recent (December 2022–January 2023) excavation in Assam, India, illustrate the compromise of excavating and interpretation regarding a large US aircraft crash site as well as maintaining safety protocols for deep excavations.

“Serpent Emperor” and “Serpent Co-ruler”: New Evidence on Kanul Hegemony under K’ahk’ Ti’ Ch’ich’

In 2017 previously unknown mid-sixth-century Kanul king K’ahk’ Ti’ Ch’ich’ Aj Saakil was identified in Classic Maya hieroglyphic inscriptions. He acceded as “high king” (*kalomte*) in AD 550 and was responsible for the defeat of Tikal in AD 562 and the expansion of Dzibanche hegemony through the Southern Lowlands. New reference to K’ahk’ Ti’ Ch’ich’ recently found at Chochkitam and dated to AD 568 as well as revision of the

inscription on Caracol Altar 21 show that his reign as high king continues longer than we believed, for about two decades, and that his successor “Sky Witness” for a decade could be a co-ruler. In the paper, we propose to reconsider the co-rulership model of the political organization of Kanul hegemonic polity. We also discuss the reference to K’ahk’ Ti’ Ch’ich’ as the overlord of the Tikal king and ceramic texts from the early Tepeu I phase (AD 550–600) that mention various lords claiming the title of “divine Mutul kings” in order to understand whether the Kanul ruler controlled Tikal and Tikal region after AD 562.

The Wari Occupation of the Site of Kaninkunka in the Cusco Region of Peru

The nature of Wari presence in the Cusco region of southern Peru during the Middle Horizon (600–1000 CE) is debated. In this area, the Wari state built large installations at Pikillaqta and in the neighboring Huarro Valley. Excavations in the Wari colony have demonstrated the strong Wari identity of its occupants along with their political ambitions, while excavations at sites outside the colony suggest that people living in villages further away were little affected by Wari presence. To further document the nature of Wari presence in Cusco and examine the relationships between Wari colonists and local communities, we excavated at Kaninkunka in the Huarro Valley. Unlike previous descriptions of the site as a Tiwanaku pyramid, our fieldwork revealed several Wari monumental structures, including a niched hall and a series of conjoined rooms. In addition, we uncovered many artifacts of Wari manufacture, such as Wamanga and Chakipampa pottery, large obsidian projectile points from the Quispisisa outcrop, turquoise-colored beads, and worked *Spondylus*. Results indicate that Kaninkunka was a Wari space used for non-domestic purposes. The small proportion of local material culture further suggests that its occupants sometimes interacted with local communities, albeit at a much smaller scale than those at Pikillaqta.

Mesoamerican Queens, Revisited

This paper builds on the author’s earlier research that documents previously unrecognized female rulers among the Aztec. Over the last 50 years, interest in elite women in other areas of Mesoamerica has grown, and the author presents the outcome of some of that research. Woman rulers from not only the Aztec area but also from the Valley of Oaxaca and the Mayan region are discussed. In addition, the author briefly relates her experiences as the only woman on a field crew doing settlement pattern work in 1968 in the Teotihuacan Valley as part of Bill Sanders’s larger Basin of Mexico project.

Potential Refugia in the Levant during the Pleistocene and Their Use by Hominins

Interest in the possibility that refugia have played an important role in human evolution has grown in recent years. A refugium is a relatively small area in which a population may be able to survive during a period of unfavorable conditions. Here, we report preliminary results of a study that is seeking to identify refugia in the Levant that were occupied by Pleistocene hominins. In the Levant, the main constraint on mammalian occupation has been, until recently, the availability of water. Hence, we focus on areas that likely had stable sources of water over long periods of time. We are reviewing geohydrological evidence to identify such

areas; to attach dates to the areas' refugial phases; and to correlate these phases with the global climate record. We are also examining archaeological evidence to ascertain when hominins occupied the areas in question. So far, we have identified over a dozen potential refugia across the Levant. The data indicate that the refugial phases are not always synchronous or correlated with global climate patterns. The data also indicate that some of the potential refugia are on the frontiers of the Levant, which raises the possibility that they could have facilitated hominin migration into Eurasia.

Dating Stylistic Change in Ancestral Pueblo Building Mural Traditions in the Southern Bears Ears and across the Northern Southwest

Mural decorations on buildings can be used to express shared identities and cosmologies at a variety of scales. Stylistic links between murals at sites can reveal connected networks of practice within and between regions. Most prior studies focused solely on murals from a single structure or site that are dated at a relative-scale using ceramic cross-dating. Additionally, few prior studies compare murals across large social landscapes over time. This study focuses on the development of spatial and temporal seriations of Ancestral Pueblo mural styles across the northern Southwest using newly developed methodologies for dating the creation and use of building decorations. Based on recently obtained and legacy dendrochronological data, and using the Cedar Mesa area of the Bears Ears National Monument as a case-study, I demonstrate the methods used to create mural-stylistic seriations at the site- and subregional-scales. Then, I apply similar methodologies to legacy data at the regional-scale to develop spatial and temporal stylistic seriations of murals for the larger San Juan River Drainage. Using these data, I revisit previous theoretical frameworks, combined with ethnohistoric accounts relating indigenous perspectives, to explain the role of building murals during the mid-Pueblo II (AD 1050–1150) and Pueblo III periods (AD 1150–1300).

Local or Exogenous? The Different Facets of Chert during the Gravettian at Vale Boi (Southwestern Portugal)
 Hunter-gatherers relied strongly on lithic raw materials, making them essential to characterize mobility and land-use, raw material provisioning, technology, social organization, exchange, and the functioning of social networks. As such, the characterization of hunter-gatherer lifeways is often the result of the combination of data obtained from autochthonous and allochthonous raw materials. Ongoing raw material studies at Vale Boi (an archaeological site located in southwestern Iberia) show local and exogenous chert raw materials for its Gravettian occupations. Identifying patterns of raw material use during this techno-complex, and especially the possible existence of social networks based on exogenous raw materials, may be a key aspect to understanding the Early Upper Paleolithic expansion in south Portugal, especially when previous works have suggested a possible ethnographic boundary between hunter-gatherer groups. This paper presents the chert raw material analysis results from the Gravettian levels of Vale Boi from the Terrace area. The archaeological chert artifacts were analyzed through a multi-layer approach (macroscopy, petrography, and geochemistry) and compared to a regional reference collection. Technological data was combined with the raw material results. This allowed us to better characterize the behaviors of chert obtainment, and their place within the technological or social organization of Gravettian hunter-gatherer communities.

If We Build It, Will They Come? A Community of Practice for Archaeological Repositories
 In 2021, caretakers and users of archaeological collections participated in a Wenner-Gren funded workshop that considered the social lives of archaeological repositories. The goal was to understand the repository as a site of social relations among and between stakeholders. Together, collections managers, curators, and archaeologists representing tribal, government, CRM, and academic sectors considered the fundamental roles of the repository for the stakeholders they serve. Workshop participants identified the elements that unite repositories beyond curating collections. One of the outcomes was to explore whether repositories and their stakeholders would benefit from a more collaborative system of information sharing through the establishment of a Community of Practice (CoP) or a Repository Collective. This paper considers the creation of a CoP for archaeological repositories, its benefits, and potential barriers to its formation. A CoP

could be a platform for interaction, a portal for best practices with an emphasis on sustainability, and a means to developing new solutions to common problems.

Humans Remain: Bioarchaeology and Community at the Historic First Baptist Church of Williamsburg

We present the results of osteological analysis of human remains excavated at the original site of the historic First Baptist Church of Williamsburg, Virginia. The goals and parameters of our analysis were defined through a process of public engagement evolved from the ethical framework of the New York African Burial Ground Project. Limited by poor preservation conditions, skeletal and particularly dental assessment nonetheless yielded information deemed vital by community members. We determined the ancestral remains of three excavated individuals to be those of a late teen of indeterminate sex, an adult male, and a probable adult male. The presence of dental caries, calculus and hypoplasia suggests overall poor dental health, and abnormal occlusal wear for one individual (Burial 13) indicates his possible occupational use of the dentition. Most importantly, our findings helped to confirm the African American descendant community's long-held claim to the site and rich legacy of one of the nation's oldest churches. This project demonstrates both the value and potential of publicly-engaged bioarchaeology as a means of community creation, engagement, and empowerment. ***This presentation will include images of human remains.

Recent Developments from the Submerged Cultural Landscape of Murujuga Sea Country, Northwest Shelf (Dampier Archipelago), Western Australia

In 2020 the Deep History of Sea Country project team published the discovery of two underwater archaeological sites in Murujuga Sea Country (Dampier Archipelago), Western Australia. Further lab analysis and field-based observations have been since undertaken, and these contribute to our understanding of the submerged sites within the broader setting within this rich cultural landscape. An update to our initial field observations will be provided with special reference to site formation and preservation on the submerged continental shelf. A brief discussion will be undertaken regarding heritage protection, as these sites represent a case study application for the protection of Indigenous underwater cultural heritage in Australia with wider implications for tropical environments around the Asia Pacific Region.

Bentley, Nicholas (Texas A&M University)**[316]***Late Quaternary Site Formation Processes and Archaeological Site Preservation Potential of the Lower Aucilla River, Florida*

For more than four decades the lower Aucilla River in northwest Florida has been recognized for its impressive late Pleistocene archaeological site preservation and its potential to further our understanding of Americas earliest indigenous inhabitants. Within the mid-channel collapse sinkholes of this river, dozens of late Pleistocene archaeological sites lie inundated in both surficial and buried contexts. However, only three of these sites have been thoroughly investigated, including the 14,550-year-old Page-Ladson site. While it has been demonstrated that dateable late Pleistocene deposits containing in situ archaeological material are present within the mid channel sinkholes of the Aucilla River, the extent of these deposits and the late Pleistocene site preservation potential for much of the lower Aucilla River still remains unknown. This paper discusses recent research focused on the geoarchaeological investigation of seven mid-channel sinkholes within the lower Aucilla River through sediment coring, geoarchaeological excavation, and high-precision radiocarbon dating.

Beramendi-Orosco, Laura (Instituto de Geología, UNAM) and Galia González-Hernández (Instituto de Geofísica, UNAM)**[152]***Chronology of the Post-Teotihuacan Occupations in the Teotihuacan Valley*

The moment of the collapse of Teotihuacan and the subsequent occupation of the area by other cultures are still subjects of debate concerning this important urban center in Mesoamerica. Understanding what happened after the collapse and dating the different reoccupations of Teotihuacan can be challenging due to different factors, including the reuse of building materials and looting during Postclassic and modern times that resulted in altered archaeological contexts or significantly mixed dates for the samples. A Bayesian approach integrating radiocarbon dates and detailed archaeological information can help to overcome these difficulties. In this contribution we will present the process of building a high-resolution chronology for the tunnels located to the east of the Pyramid of the Sun by the integration of 20 radiocarbon dates from “Cueva del Pirul” and “Cueva de las Varillas” with detailed archaeological information on the context for each dated sample, including ceramic styles. With the resulting chronology it is possible to distinguish the moment of the different occupations during the Epiclassic and Postclassic times, helping to refine chronologies based on ceramic styles and to understand the population dynamics in the area.

Building an Archaeological Record of Over Three Centuries of Turtle Use Across the Chesapeake Bay Region
Archaeological and historical data speak to the importance of turtles in the Chesapeake Bay region, which includes the eastern portions of Maryland and Virginia and which serves as a home to nearly 20 species of terrestrial, freshwater, and marine turtles. Despite the many roles that turtles played in pre- and post-contact communities in the area, there has been no systematic effort to examine long-term temporal and/or geographic variability in past human use of turtles in the Chesapeake Bay region. In this poster, we address this critical research gap using zooarchaeological and stable isotope data from turtle remains recovered from a number of archaeological sites in Maryland and Virginia that span the seventeenth through late nineteenth centuries. We highlight trends in the use of individual turtle species through time, including reliance on freshwater pond turtles across multiple time periods and the importance of brackish water diamondback terrapins, especially in nineteenth-century sites. We also discuss insights into turtle harvesting practices and historical ecology of turtles in this dynamic region. Ultimately, we highlight not only how turtles were used in the Chesapeake Bay region but also consider how best to approach archaeological turtle analysis more broadly.

The Sampling Was Done in the Field: JEA as Scholar and Mentor in Context

This paper examines and celebrates the scholarship of Jeanne Arnold within her life as a friend, colleague, and

mentor. Coming of age in a decidedly masculine and sometimes antagonistic era of California archaeology, Jeanne emerged as a leading and respected scholar in the study of complex hunter-gatherer-fishers. In this environment, and maybe in response to it, she approached data collection and analysis with methods that were extraordinarily careful, rigorous, and precise. In both mundane and profound ways, Jeanne personified these same qualities herself, applying similar levels of meticulousness and tenacity in her other roles as professor and mentor as she did to her fieldwork and analysis. In this paper, I consider the ways that Jeanne's methodological dispositions, personality, and personhood were intertwined, and I invite attendees to consider this exceptional archaeologist's influence on a more personal level. With this, I hope to promote a more holistic perspective on academic legacies and encourage an examination of the diverse lasting impacts each of us has on the field and on each other.

A Multiscalar Geospatial Study of Bronze Age Landscapes in the Trans-Urals

The Late Bronze Age (2100–1400 BCE) of the Ural-Tobol interfluvium saw the emergence and decline of proto-urban fortified settlements occupied by pastoralists and metallurgists. These sites have been interpreted as centers for military defense, ritual-political nodes, strategic centers to protect natural resources or avoid environmental hazards, and aggregations of metallurgists or other craftspeople. By 1700 BCE, communities began to abandon these sites and adopted a less-centralized settlement pattern. Archaeologists still have not determined the extent to which shifts in metallurgical production, ecological change, inter-settlement conflict, and internal social change influenced this process. To better understand the process of centralization and subsequent disaggregation, I present the early stages of a multiscalar geospatial study that traces the layouts of Bronze Age settlements, as well as landscape use 2100–1400 BCE. I will first discuss the fortified site of Kamysty, Kazakhstan, and the results of handheld lidar and GPR scanning in the summer of 2023. I then expand my scope to the entire Kamysty-Ayat River Valley, using satellite images to identify potential Bronze Age sites and ecological features. Finally, I discuss novel approaches to studying the broad settlement system of the Ural-Tobol interfluvium, utilizing a large satellite image dataset and cloud-computing technology.

Bernstein, Bruce (Tribal Historic Preservation Officer, Pueblo of Pojoaque) [167]

Historic Tewa Pottery 1600–1800 and Social Survivance

Pottery making over the long arch of Tewa history is episodic; social changes bringing small and large-scale modification and sometimes transformation to pottery forms and iconography. Pottery, or more precisely, its aesthetics and production are ritualistic, serving as a critical and material conceptual ideal of the Tewa world. And, significantly, pottery is a social tool, whether mediating Tewa people's settlement on new lands during the fourteenth century, adaptation to Spanish colonization, or to the onset of the cash economy and twentieth market for Pueblo art pottery. As Tewa people remind us, "Our history is recorded in pottery." Most Tewa pottery studies use stylistic analysis or typological studies, one pottery type instinctively leading to the next. This suggests an absence of sentience by the potters and sui generis basis for understanding Tewa culture. And, in particular, when approaching pottery this way we are more apt to input outsider knowledge over that of Tewa people's own sentience, a long habit of colonial powers and academic disciplines. Historic pottery is rarely studied and imperfectly understood, existing as archaeological sherds and whole pottery in museum collections. My discussion brings together disparate collections with fresh ethnographic inquiry

Tecapa: Segmentary Organization as Sociopolitical Technology in the Transitional Period (AD 800–1000)

The site of Tecapa represents one of the few major Transitional settlements on the North Coast. Its occupation (~AD 800–1000) spans the waning of Moche influence and the coalescence of Chimú and Lambayeque culture. In fact, the spatial organization of Tecapa shares important principles with Sicán and closely parallels the configuration of Chimú ciudadelas, even as urban growth at Chan Chan obscures its early years. The relationship of Tecapa to Huaca Colorada thus offers important insights into persistence and transformations of Moche practices and the emergence of coastal Late Intermediate period polities. At Tecapa, this transition reveals a gradual, though definitive break with Moche traditions rather than the “collapse” of Huaca Colorada as a major center. The planned grid of Tecapa indicates a conscious reorganization of social space. The segmentary structure of the site articulated relations between lineages and balanced highland settlers with coastal natives across a monumental plaza. Archaeological assemblages show how the new organizational paradigms may have balanced different political interests. Moreover, the incorporation and renovation of Huaca Colorada suggests its resignification as an ancestral location shared by highlanders and costeños. Ultimately, we argue that Tecapa presages the later segmentary ayllus and parcialidades of the coast.

Explaining Early Complex Society Development in Central America and Northern South America: Patterns, Variation, and Scales of Analysis

The early complex societies of Central America and northern South America were once widely recognized for their organizational and cultural diversity. Since that time, greater emphasis has been placed on their shared cultural traits, as revealed through genetic and linguistic data and patterns in material culture—the variation that was once so strongly lauded is now often seen as nothing more than regional manifestations of an overarching theme. But while research into these cultural affinities has enhanced our understanding of early complex societies in this part of the world, it has also led to unitary explanations of how those societies developed. Such explanations do not do justice to the rich organizational diversity that is evident in the archaeological record and obviates any opportunity to learn from what it can teach us about the processes of social change. Approaches are needed that account for this variation, and that distinguish between organizational and cultural processes, focus attention on the scales of analysis at which the processes of social change most strongly operate, and allow for a wider range of explanatory factors than what overarching, unitary explanations require.

Cottonwood Spring Pueblo (LA 175): A Multiethnic Community, Movement of People through Time and Place

In this paper we argue that Cottonwood Spring Pueblo was a multiethnic community similar to many other fourteenth-century village clusters in greater Pueblo World. Cottonwood Spring Pueblo (LA 175) consists of multiple pueblos and features grouped into Areas A–F along Cottonwood Wash on the western flanks of the San Andres Mountains. Variation in architecture, artifacts and site closure in these pueblos suggests they resulted from an aggregation of peoples from different places in the Jornada region. Room sizes, wall types and artifact patterns, in Areas A and B resembles those of pueblos to the northeast in the Sierra Blanca region. Several similar sites on the western flanks of the San Andres mountains (Horse Camp Draw, Fleck Draw, Cottonwood Wash) suggest a movement of these peoples into the area during the El Paso Phase. Other Pueblos in various loci of Area E on Cottonwood Wash, however, appear more similar to villages to the southeast like those clustered near Coe Lake. The Jornada Mogollon like that rest of the Pueblo World experienced dynamic changes during the fourteenth century and contributed to the variation in subsequent native communities of the historic era.

Embracing the Research Potential: Geochemical Sourcing of Rhyolite Artifacts from Antelope Valley Orphaned Collections

For over 40 years, the orphaned archaeological collections excavated by Antelope Valley College (AVC) have remained underutilized and underreported—an untapped resource and oversight to archaeological investigations in the western Mojave Desert. Orphaned collections can be revisited repeatedly with new paradigms and varied analytical methods. This research serves as a geochemical provenance study of rhyolite artifacts from three village sites excavated by AVC. Cottonwood Creek (CA-KER-303), Skelton Ranch (CA-LAN-488), and Totem Pole Ranch, located in different areas of the Antelope Valley, were seasonally occupied prior to or during the Late Prehistoric period. Sourcing rhyolite—a local lithic material from the area—can directly relate to the discussion of cultural boundaries and spheres of interaction that took place among semi-sedentary hunter-gatherers who occupied these villages. A previous geochemical study of rhyolite from the Antelope Valley suggested cultural affiliations and patterns of interaction between different ethnic groups dictated access and procurement of rhyolite from two known formations— Rosamond Hills, located in Rosamond, CA, and Fairmont Butte in Lancaster, CA. By employing LA-ICP-MS, micro-samples of rhyolite groundmass will be analyzed to expand on previous research and identify conveyance strategies that reflect the technically useful features of rhyolite and patterns of local-regional intergroup exchange.

Bertrando, Ethan (California Military Department)**[270]***Incorporating Multiple Data Sources to Identify Social Boundaries in a Prehistoric Landscape: A Case Study from the Nacimiento River, Camp Roberts, California*

Archaeologists have long looked to material culture to identify the presence and geographic extent of cultures in the past. Despite this long history, there remains significant challenges with this direction of research. In this case study, archaeological evidence ranging from subsistence remains to nonutilitarian goods is coupled with ethnographic data to plot the shifting settlement territories in an area occupied by various indigenous groups over the last 2,000 years including the Northern and Southern Salinan as well as the Northern Chumash. The results contribute to our understanding of how this approach may be applied and what its limitations are.

Besaw, Courtney and Tracie Mayfield (University of Southern California)**[267]***Colonoware alongside Imported Ceramics: Overview of Post-self-emancipation Local Pottery Production on Providencia Island, Colombia*

Colonowares are often recovered at colonial period sites in the Americas where peoples of African descent resided, and are low-fired, made from locally sourced clays and flux materials, and can be plain or decorated. Many archaeologists suggest that the practice of making this pottery is an African-based craft, however Indigenous influences (particularly in colonial contexts) cannot be overlooked. The presence of colonowares provides important information about the lifeways of enslaved people and Maroons because these wares were produced and traded outside of the colonial industrial complex. Recent excavations on Providencia recovered colonoware sherds that were coiled/hand molded and open air fired, much like those collected in other Caribbean contexts. These ceramics appear to be made with local clay and include red rock and quartz—a material linked to the Maroons of the island via oral history. On Providencia, methods for producing colonoware likely resulted from a combination of historical memory of peoples of African descent and methods learned from interactions with Indigenous people from coastal and inland sites. These findings are in line with Providencia's oral history which places residents of African, Miskito, and European descent on the island since the early 1600s.

Beshkani, Amir [93] see Nymark, Andreas

Bess, Jennifer (Goucher College)**[88]***Indigenous Knowledge: Scaling the Impact of Archaeological Research Up, Out, and Across*

Traditional Ecological Knowledge (TEK) or Indigenous Knowledge (IK)—evolved and evolving from hundreds or thousands of years of observation and interaction with specific environments—has answered questions posed by geomorphologists and archaeologists, among others, attempting to identify architectural remnants. In the 1990s, Hul'q'umi'num' and W̱SÁNEĆ Coast Salish communities aided Parks Canada and scientists investigating hundreds of stone walls along British Columbia's coast. The resulting study and revival of Coast Salish clam gardens and the creation of the Clam Garden Network exemplify the ways in which IK not only bridges gaps in archaeological research, but scales and diversifies the significance of that research into issues of cultural sovereignty, sustainability, and biodiversity. In the United States, continued labors to understand, revive, and advance clam garden IK for present-day purposes stand alongside projects such as the joint venture of Iñupiaq experts and Fish & Wildlife Service personnel in researching weirs constructed for whitefish harvesting in Kotzebue Sound, Alaska. Each example demonstrates that IK is not simply an alternative framework for understanding the past, but an epistemological alternative to (western) frameworks and disciplines that have created silos of expertise at odds with complex problem-solving.

Marine Shell from Burials in St. Henry's Cemetery (1866-1908), East St. Louis, IL (1866-1908)

In the nineteenth century, East St. Louis attracted immigrants to work in its centers of industry and was a hub for westward expansion. St. Henry's Cemetery in East St. Louis, Illinois was the prominent Catholic cemetery within the area, serving the community from 1866 to 1908. Supposedly relocated by 1926, the cemetery site was then developed into a National Guard Armory by 1952. Excavations in 2021/2022 revealed the presence of a large number of remaining burials in various states of interment, with over 75% of burials being intact. Of the 47 excavated features, a total of six were found to contain seemingly intentionally placed marine seashells. All features with shell were previously exhumed. This presentation examines the shells themselves, the burial status and possible demographic information for each of the interments found with marine shell and discusses possible hypotheses on why the shells were placed and by whom. Possible hypotheses involving ethnic heritage, religious associations, and symbolic transference of the soul are discussed with the latter being the most likely hypothesis in this case. Other examples of marine shell use in mortuary rituals are discussed. This presentation offers a glimpse into mortuary and cemetery relocation practices in Victorian East St. Louis.

Horses in Early Wichita Communities: New Evidence from the Little Deer Site

In North America, the southern Plains exchange system after 1600 CE was a complicated and fiercely competitive network of fluid alliances, rival interests, and conflict in the middle of overlapping Southeast and Southwest cultural, economic, and physical power bases. Within this system, the Wichita people occupied physical and social spaces between different environments, exchange networks, Indigenous groups, and eventually European colonies for generations, controlling the passage of goods, people, and knowledge through their territories. Horses played a critical role in these exchange systems. During the eighteenth century, Wichita villages served as major Indigenous-controlled centers of the horse trade in a region that lacked the establishment of official European posts or an extensive rendezvous system. However, much of what we know about horses in Wichita communities comes from accounts of Euro-American colonizers or from the perspective of their more mobile allies and trade partners, which often downplay the significance of horses to the Wichita, as well as undermine their antiquity. This paper presents the results of our reanalysis of faunal remains from a seventeenth-century Wichita village called Little Deer in west-central Oklahoma. This work provides new evidence that horses may have reached the Wichita earlier than previously believed.

Environment versus Technology: Weighing the Drivers of Western North American Holocene Intensification

Environment and technology are the independent “givens” of Julian Steward’s model of cultural ecology wherein different techno-environmental combinations favor different subsistence, settlement, and organizational responses. While all parties concede the importance of both, the thrust of much recent archaeological research echoes the contemporary media narrative in which environment—specifically climate change—is dominant, which is in keeping with a long-standing theoretical treatments of simpler societies, hunter-gatherers in particular. In this view, while technology can transform hunter-gatherers into something else (e.g., agriculturalists), technological variation among hunter-gatherers is mainly facultative, responding to local conditions, making technology a function of environment, and turning Steward’s cultural ecology into environmental determinism. This, and the correlative emphasis on climate as the major driver of hunter-gatherer behavioral change, is not in accord with the facts, specifically western North American hunter-gatherer demographic proxies showing a “hockey stick” trajectory at odds with climate records and sharply skewed to the very late Holocene, with an inflection point coinciding with the appearance of the bow and arrow at about AD 500, which favored social formations impossible with the atlatl (e.g., the family band), entraining a cascade of technical and social innovations that transformed western North American hunter-gatherer landscape.

Human-Shark Interactions in the Interior of North America: A Relational and Historical Perspective

In a previous article, Betts et al. (2012) explored the spiritual relationship between sharks and humans in the Atlantic Northeast. For peoples with relational ontologies, using, wearing, and trading shark teeth not only signaled a sacred relationship with the shark but also an identity embodied by this conspecific; namely, a way of life connected to the sea and its animals. However, for at least 2,500 years, extant and fossil shark teeth were traded from the Atlantic seaboard and Gulf of Maine into the interior of North America. The shark teeth occurred in Adena, Hopewell, and later Mississippian contexts from the Great Lakes to the Lower Mississippi and especially the Ohio Valley. Their trade and importance appear to have intensified over time, and they are especially prominent in Mississippian contexts, such as Cahokia, where effigies of the teeth may have also been created. What did these sharks and their teeth mean to people who had no direct relationship with the sea and its animals, and who had likely never seen a shark in their lives? This paper explores the meanings, social bonds, power, and histories embedded in shark teeth in interior North American contexts, from both relational and historical perspectives.

Unsung Heroes of Cahokian Cuisine: The Materials and Methods for Nixtamalization in the American Bottom

People who rely on corn for significant portions of their diets must process it to improve its nutritional quality, or risk severe malnutrition. A common method historically employed throughout Mesoamerica and North America consisted of soaking corn kernels in an alkaline solution created from wood ash or burned limestone, a technique referred to as nixtamalization. Recent research on pottery and limestone recovered from the East St. Louis site (11S706) by the Illinois State Archaeological Survey during an Illinois Department of Transportation project has yielded intriguing new data indicating nixtamalization was also practiced in the American Bottom of present-day Illinois as Cahokia grew to prominence as the first and largest Indigenous city north of Mesoamerica (ca. 900–1100 CE). The results of a pilot study indicate corn was nixtamalized using such seemingly mundane materials as locally available limestone and crude pottery utensils known as stumpware. Here I present the results of this research, focusing on portable X-ray fluorescence analyses, morphological variability, and depositional contexts of archaeological samples of stumpware, and experimental use of stumpware replicas. Examining how corn was processed in this way reveals information concerning culinary choice, the development of new foodways, and the formation of community identities.

Magical Treasure Hunting in Early Modern Wurttemberg: Spirits, Neurocognition, and Sociocultural Change

One of the most common forms of divination in early modern Europe was magical treasure hunting. In an era before banks, locks, and police were common, people often buried or hid valuables, and sometimes knowledge of the location was lost. Some people later stumbled upon these caches accidentally, but others sought them out. Some treasure hunters tried to use common sense to deduce their location, but far more employed magical implements and rituals to contact spirits thought to be connected with the treasure. The implements included dowsing instruments and ceremonial objects, while the rituals generally involved elaborate and protracted rites, and in a few cases inhaling smoke or powder. This paper will examine a series of treasure hunting episodes in the archives of the Duchy of Wurttemberg between 1600 and 1800, focusing particularly on those that involved ritual activities that appear to have induced in the participants altered states of consciousness in which they contacted spirits, and relating these activities and experiences to both the neuropsychology of ritual trance and the early modern duchy's evolving culture and society.

Pubertal Development among Prehispanic Moquegua Valley Populations (Southern Peru, 800–1500 CE)

As a temporally bounded bio-social process, puberty offers a compelling topic to explore the lived experiences of past people. The onset and pace of pubertal development are shaped by nutritional, environmental, and social factors that reflect long and short-term childhood experiences. We investigate puberty as a flexible process shaped by multiple factors; specifically, how in the late prehispanic Andes (800–1500 CE) adolescent growth and development interacted with childhood health and environmental conditions. We present data on 217 individuals, 5–30 years old, from three skeletal collections recovered in the Moquegua Valley (southern Peru): Omo M10, Chen Chen M1, and Estuquiña M6. We establish and compare pubertal growth/development curves across Andean and global samples and investigate the long-term effects of stress on the life course. This research combines traditional osteological methods for estimating age-at-death, sex, and stature with recent methodologies for assessing pubertal growth and determining juvenile sex. The scope of our analysis allows for the reconstruction and comparison of early life course histories, and the opportunity to evaluate how physical and psychosocial stress affected puberty in the prehispanic Andes.

Upstairs, Downstairs: Excavations of a Throne Room and Kitchen in the Kuche Palace, Kiuic, Yucatán

Beginning around AD 800 the Puuc region experienced a major construction boom of monumental architecture, including large palace complexes. At Kiuic, in the Bolonchen region of the Puuc, the early Yaxché Palace (AD 550–800) was replaced by a much larger complex of structures, still under construction at the time of the center's abandonment around AD 1000. This paper examines the results of several field seasons of excavation of two important buildings associated with the later Kuche Palace, the throne room and the kitchen. Although examining a number of aspects of the late palace, the paper focuses primarily on a functional analysis of these two structures. What does a detailed excavation tell us about the archaeological function and history of these two structures? Are the two buildings actually the throne room and kitchen; if so, are similar structures found at other important Puuc cities. The throne room underwent significant modification over this 200-year period, suggesting a dynamic period of sociocultural development. The results of these excavations are finally considered in relation to the larger complex of buildings and plazas that formed the Kuche Palace and what this tells us about palace life in the Late/Terminal Classic period at Kiuic.

Bhattacharyya, Tiyas (University of Oregon)**[289]***Fauna from Funan: An Examination of Human-Animal Relationships at Angkor Borei, Cambodia (500 BCE–500 CE)*

This talk will discuss the preliminary results from a study focusing on the analysis of select faunal remains from the Early Historic/Pre-Angkorian site of Angkor Borei, Cambodia. Angkor Borei is one of Southeast Asia's earliest urban centers, located in the Mekong Delta region of southern Cambodia. It was also a prominent trading center from the late first millennium BCE to the first millennium CE. I will present fauna from burial, residential, and industrial contexts that were excavated as part of the Lower Mekong Archaeological Project (LOMAP). Initial identification by previous scholars found both wild and domesticated fauna along with all major local taxa (e.g., water buffalo, pigs, cattle, chickens, crocodiles, various species of deer, rice rats, fresh and brackish water fish species, elephants, etc.). By examining the types and proportions of animals excavated and comparing the dataset from select contexts at Angkor Borei, I will discuss proposed shifts in human-animal-environment interactions, and how these may coincide with diachronic changes in sociopolitical organization, the subsistence economy, and religious practices.

Biagetti, Stefano**[151]***CAMP: A New Project for the Study of Pastoral Archaeological Sites*

Pastoralism is now recognized as a smart economy for food production in drylands, especially in the current scenario of climate change, where natural resource variability is increasing globally. Outdated stereotypes about the inefficiency and irrationality of pastoralism are being reevaluated, and there is a shift in the old paradigms regarding the study of contemporary pastoralism. Simultaneously, the archaeology of pastoralism is gaining renewed attention due to the long-lasting and sustainable nature of documented pastoralist practices. However, the archaeological record of pastoral sites remains challenging to study using current archaeological methods. The recently ERC-funded project "(Re)Constructing the Archaeology of Mobile Pastoralism (CAMP): Bringing the site level into long-term pastoral narratives" aims at developing a widely applicable methodology for the study of pastoral archaeological sites that can augment our knowledge on past livelihood in drylands.

Bianchi, Rachele (University of Toronto)**[315]***Time to Reconsider: A Critical Assessment of How Different Interpretations of Variation in Late Chalcolithic and Early Bronze Age Central Asia Influenced the Establishment of Chronological Frameworks*

Periodization and the establishment of chronological sequences are integral parts of archaeological discourse. Not only do we use them to diachronically investigate patterns and changes in material culture, but we rely on presumed contemporaneity to discuss interaction and exchange. However, archaeological reconstructions of the past and established chronological frameworks are heavily influenced by differential approaches to interpretation of variation. In this paper I discuss interpretative differences and underlying assumptions of Soviet and Western approaches to the establishment of chronological sequences for Late Chalcolithic and Early Bronze Age Central Asia. By comparing the approaches to Yamnaya and Namazga periodization, I highlight the interpretative ramifications of different mental constructs, ideologies, and theoretical conceptions of the past.

Biar, Alexandra (CNRS - UMR8096 ArchAm)**[154]***Dugout Canoe: A Solution for Bulk Transport in Mesoamerica*

In a cultural area where geography conspires against ease of exchange, Mesoamerican societies discovered technical answers adapted to their needs. At a time when the exchange of merchandise and goods relied mainly on human transport, some civilizations such as the Olmecs, Mayas, and Mexicas turned to accessible, high-performance waterways. Monoxylo canoes seem to have met all technical, economic, political, social, and ritual expectations. Based on ethnohistorical, archaeological, and ethnographic data, I propose to shed some light on the particular case of bulk transport, in which these monoxylo canoes played a primordial role.

Bicho, Nuno (Universidade do Algarve), João Cascalheira (ICArEHB, Universidade do Algarve), Jonathan Haws (University of Louisville) and Mussa Raja (Universidade Eduardo Mondlane)**[126]***Low-Cost Centripetal Technology in the LSA of Southern Mozambique*

Centripetal lithic technology, including various forms of Levallois technique, is very common in the African MSA. This technology is commonly identified by prepared core technology, where striking platforms are fully prepared to produce a variety of blanks. In Mozambique, both Levallois and prepared discoidal cores are very common throughout all MSA assemblages, and since there are very few excavated and dated sites, those cores are commonly used as type fossils. However, during survey and then testing of various sites across southern Mozambique, a simplified discoidal core was found associated only with LSA. These cores present a typical discoidal flaking surface, but they do not show any platform preparation and they seem preferentially made on smooth cortical pebbles and cobbles. The aim of this paper is to present the results of the study of these cores from the sites of Txina-Txina (Massingir, Limpopo basin) and of Zimuara (Save basin) and to understand the degree of expediency of this “fake” discoidal technology and to grasp the link, if any, between the traditional MSA centripetal technology and this LSA method.

Investigating Southeastern United States Early Pottery Uses through Lipid Residue Analysis

Recent archaeological evidence suggests that shell rings are not only potential origin points for pottery in North America, but also places where people lived and feasted. Techniques borrowed from analytical chemistry now allow archaeologists to test these hypotheses. Lipid analysis was conducted on 60 potsherds and 20 baked clay objects, the latter thought to have been used as boiling stones. These artifacts were uncovered at St. Catherines and McQueen, two well-known shell rings located on St. Catherines Island, off the coast of Georgia (USA), and occupied between approx. 4300 and 3800 years BP. Data obtained thus far suggest the presence of plant and animal-derived lipids in residues from both sites, but no contribution from aquatic resources. Also interesting are molecular signals from baked clay objects, which indicate they have been used for processing resources, a hypothesis so far untested by lipid analysis. These preliminary results allow for a better understanding of Late Archaic period foodways and early pottery uses in the southeastern United States.

Extended Temporal Overlaps of Atlatl and Bow Technologies in the Great Basin and Other Parts of North America

There is a large literature that discusses the prehistoric introduction of the bow and arrow into the various regions of North America. The dates of the introduction vary greatly. Erroneously, it is sometimes assumed that this “technological innovation” quickly replaced the atlatl and dart. However, there is a growing corpus of data that indicate, in some locations, that it took 1,500 years or more before the atlatl and dart were totally replaced. In most areas, the introduction of the new technology did not result in any immediate changes in technological tradition or economic practice. An examination of this transition in various cultural contexts provides insights into the factors that may have influenced the adoption of the bow and arrow.

Institutional Dimensions of Northern Iroquoian Confederacies and Implications for Contact Period Geopolitics

Confederacies have been under-theorized in the social sciences in comparison to discourses focused on state development as per socio-evolutionary paradigms. Confederacies do not serve to govern so much as to coordinate. This paper explores the practices, institutions, and ideologies utilized by late premodern Northern Iroquoian confederacies to coordinate collective action while preserving local autonomy. The Wendat confederacy originated as an alliance between two nations in the 1400s but expanded as other communities and nations were forced to relocate north due to conflict with the Haudenosaunee. The origins of the Haudenosaunee confederacy included highly formalized diplomatic protocols that facilitated mutual non-aggression and the raising up of sachems. While the historical development of each confederacy took place within an entirely Indigenous world-system, the variable network structures of each impacted how these large-scale collectives navigated the collision of Indigenous and European world-systems during early colonialism in sixteenth- and seventeenth-century northeastern North America, particularly with respect to the integration of newcomers and responses to European encroachment.

Proxies for the Agricultural Demographic Transition: How Well Do Radiocarbon Time-Series Track Crude Birth Rates?
Following the adoption of agriculture, societies frequently experience several hundred years of dramatic intrinsic population growth, followed by a population stabilization or decline; together these patterns are called the Agricultural Demographic Transition (ADT). These patterns result from increased birth rates, which can be tracked through Crude Birth Rates (CBRs), followed by increased mortality rates. However, estimating CBRs from sets of human remains requires huge amounts of individual-level data, which are rare in archaeology given preservation issues and ethical concerns. Radiocarbon data is the most spatially ubiquitous archaeological data across the world. Downey and colleagues (2014) compared summed radiocarbon probabilities (SPDs) to juvenility indices in Europe to find a significant correlation between long-term population trends and radiocarbon SPDs. We return to the European ADT with updated radiocarbon data (Bird et al. 2022) and slightly different methods. Then, we expand this analysis to two regions with well-characterized CBR patterns, the US Southwest (Kohler and Reese 2014), and the US Midwest (Milner and Boldsen 2023). This analysis will aid arguments for the ethical treatment of human remains in areas with a long history of colonialism (Thomas and Krupa 2021) and generate a more well-informed understanding of the radiocarbon dates-as-data approaches for the ADT.

Lines to the Mountains: Investigations of LIP and LH Carangas Settlement Patterns and Geoglyphs
The Carangas, primarily located in modern day Bolivia, were a Late Intermediate period (LIP) group often associated with highland pastoralism and broader LIP traditions. They are also known for a series of colored adobe chullpas in the Rio Lauca basin and a network of linear geoglyphs called the Sajama lines which cover over 20,000 km². They have been compared to groups in the Lake Titicaca Basin, the neighboring Pacajes, and other Aymara groups in terms of use of *pukaras* and chullpas. However, the Carangas have been understudied until relatively recently and these comparisons might not best reflect the emerging data. This poster presents preliminary data on the highland Carangas settlement patterns with a focus on *pukaras*. Using data collected during pedestrian survey and review of satellite imagery, we examine the use of 62 *pukara* sites by the Carangas to assess the variety of roles that these places would have fulfilled from defense to ritual. We also examine evidence of field systems, routes, Sajama lines, and outlying settlements to assess site hierarchy and the role of hilltop fortifications.

Investigating Interaction through Multilayer Material Culture Networks in the Western Pueblos
Comprehending the dynamics of regional interaction requires a holistic perspective. One artifact type falls short in capturing the richness of societal behavior, particularly when considering a sole attribute, such as paint style. Archaeologists are constrained by the availability of material culture and data, data quality, and methodological limitations; however, this situation is improving. This study synthesizes expansive datasets from the US Southwest, encompassing architecture, ceramics, and obsidian, to illuminate transformations within the period AD 1100–1500. Projectile point data is limited by typological problems and availability, but this is overcome through a novel analysis using geometric morphometrics. The study region spans from the

Hopi Mesas to Zuni and to Tonto Basin and areas in between (west-central Arizona and parts of neighboring New Mexico). Network analysis is ideal for this combined dataset due to its focus on identifying relations between sites. Multilayer networks allow each type of material culture to be analyzed as separate layers in a single analysis. By employing this comprehensive dataset and innovative methodology, this study advances new understandings of transformative processes within the specified era.

Archaeological Investigations of “Alaska” at Tule Lake Segregation Center in Northeastern California: Findings from Ground-Penetrating Radar

Tule Lake Segregation Center (TLSC) was a place of incarceration for over 18,000 Japanese Americans, yet it remains one of the most understudied incarceration sites of the Second World War. This presentation is an addition to the thesis research “Archaeological Investigations of ‘Alaska’ at Tule Lake Segregation Center in Northeastern California.” The following research reveals the results of ground-penetrating radar (GPR) conducted along Block 81 of TLSC within a portion of the site known as Alaska. This research was able to confirm the location of the barracks, latrines, and recreational halls that have since been bulldozed and removed post incarceration as well as identify several subsurface anomalies. These features are vital to understanding the life ways and experiences of Japanese Americans during wartime incarceration. Such knowledge validates the Japanese American experience, informs the narrative on incarceration, and acknowledges the true history of the United States. In addition, this fieldwork was made possible with the collaboration of multiple agencies, stakeholders, volunteers, and Japanese American descendants.

Animal Exploitation Choices in Worked Bones at a Portuguese Chalcolithic Village

Both hunting and agropastoralism were important to the Iberian Peninsular Chalcolithic subsistence economy. However, questions remain about the relative exploitation of wild and domestic fauna. Vila Nova de São Pedro (VNSP) is a Portuguese Chalcolithic village site, first excavated by Eugénio Jalhay and Afonso do Paço from 1936 to 1967 and by the VNSP3000 project from 2017 onward. Analysis of faunal remains from both periods of excavation by the VNSP3000 project has revealed the presence of both wild and domestic species. Wild taxa at VNSP represent a larger proportion of the faunal material and have greater species diversity than at other Chalcolithic sites in the area, including species such as beaver, lynx, and bear. This presentation will summarize the analysis of worked bone samples from VNSP using Zoology by Mass Spectrometry (ZooMS). There are many worked bone artifacts from VNSP, but most are not taxonomically identified because of their high degree of modification. This work will allow comparison between the diversity of taxa used for worked bone and that of the full assemblage of faunal remains and may reveal the use of rarer species. These findings reflect the material exploitation choices made by the Chalcolithic people at VNSP.

Shadowed Facts: How the Zooarchaeological Analysis of a Horse Skeleton within a University Teaching Collection Potentially Provides Insight into Early Chicago History and Equine Pathology

This presentation details a zooarchaeological analysis of a horse skeleton, stored unstudied for decades previous in a university teaching collection. Originating from an archaeological site outside of Chicago in

Cook County, Illinois, the skeleton displays notable pathologies and other osteological changes that potentially reflect its living use and conditions. While excavated from the site of the nineteenth-century Laughton Trading Post, the time and explanation for entering the archaeological record remains up for debate. Elaborating on skeletal and historical data, this study investigates multiple hypotheses regarding the horse's life history and potential significance within the context of the Laughton Trading Post and as a reflection of early Chicago history. This study also highlights the exploratory process utilized in connecting this specimen with its context as well as reinforcing the potential value in the reexamination of legacy collections.

Analysis of the Faunal Remains from Holtun, Guatemala

The site of Holtun is a civic-ceremonial center located in the Petén region of Guatemala, occupied from the Late Middle Preclassic to the Terminal Classic period (600 BCE–900 CE). Excavations conducted between 2010 and 2017 have resulted in a mid-size vertebrate faunal assemblage and a large archaeomalacological assemblage, including marine shell, freshwater shell, and modified shell objects. In particular, this includes a large amount of freshwater shell from a single Middle Preclassic deposit. This paper presents preliminary results from the ongoing analysis of faunal remains from Holtun, including an analysis of the distribution of faunal remains, and an examination of particular contexts and deposits that yield insights into the human-animal relationship at the site of Holtun.

Respecting the Past, Empowering the Present: NAGPRA, College Students, and Renewed Commitment to Indigenous Heritage

The archaeology lab at Auburn University at Montgomery (AUM) has seen several changes over the last year regarding updates to their policies, protocols, and practices associated with their Native American Graves Protection and Repatriation Act (NAGPRA) collections. Students were trained in a hands-on lab setting in both the legal details and the practical aspects of completing the NAGPRA process. The practices conducted by lab personnel focused on training undergraduate student assistants in the proper procedures for documenting NAGPRA collections, cultural sensitivity, and the decolonization of collections management practices. Involving students in NAGPRA initiatives is an important way to teach the next generation of archaeologists to be respectful and collaborative researchers. Our goal as a lab is to not only develop our own skills as NAGPRA professionals, but also to bring awareness to NAGPRA in the broader AUM community.

Information Transmission Rates in the Early Colonial Southeast: Estimating On-Foot Travel Time over Established Native American Trails across the Region

Among the myriad contributions David Anderson has made to American archaeology are his multiple collaborations with researchers using GIS (including myself) to extract new and useful data from multiscalar and multitemporal spatial datasets. As a graduate student of his, I learned that new and valuable information can often be wrestled from older sources. This paper presents the initial results of work inspired by—and directly influenced by—David Anderson's advice and interests. Myer's *Indian Trails of the Southeast* (1928) contains a map depicting the "trail system of the southeastern United States in the early colonial period." The

map, purportedly sourced by Myer from hundreds of reports, depicts an extensive network of trails connecting various modern and historic locations. After digitizing the trails into a GIS environment, I used cost-distance and travel-time functions to estimate travel times between various key locations. The results provide a realistic basis for estimating on-foot travel time across the US Southeast, and a perspective on the speed at which information and materials could have moved around the region.

Isotope Analysis of Macrobotanical Remains from Quilcapampa La Antigua, Arequipa, Peru

The Middle Horizon (600–1000 CE) was a period of increased mobility in the south-central Peruvian Andes. Research has demonstrated that the Wari Empire facilitated the movement of people and resources, many of which traveled great distances to reach the hands of both Wari-affiliated and local communities. This paper presents the results of isotope analysis of desiccated macrobotanical remains recovered from the site of Quilcapampa la Antigua, a small Wari outpost located in the Sihuas Valley, Arequipa, Peru. The results of our analysis speak to the possible ways plant resources demonstrate local and distant connections that knitted Andean communities together. Comparing our results to other lines of evidence, we are better equipped to address mobility during the Middle Horizon and the importance of plants in the creation and maintenance of social relationships.

Intentional Sustainability in Human Behavioral Ecology: Modeling Athabascan Caribou Predation

The paradigm of Human Behavioral Ecology (HBE) utilizes behavioral ecological models to understand the adaptive relationship between human behavior and the environment in which people reside. The introduction of intentional sustainability to HBE models benefits this paradigm by diversifying the factors that influence human behavior and developing a greater understanding of the relationships between people and their environments. Based on archaeological and modern information associated with Dene (Athabascan) predation of Alaskan caribou herds, an analytical model can be constructed to account for intentional sustainability as a contributing factor to forager behavior. The results of this model combined with the perspectives of modern stakeholders in caribou conservation, including Dene and non-Dene hunters, community sustainability organizations, and the US Fish and Wildlife Service, could be utilized to develop more effective modern caribou conservation that is informed by the archaeological record of the relationship between hunter gatherers and caribou.

Eagle Nest Canyon and the Ancient Southwest Texas Project

Eagle Nest Canyon joins the Rio Grande at Langtry, Texas, in the western Lower Pecos Canyonlands.

Despite its relatively short length, this storied box canyon contains a dense archaeological record representing at least 13 millennia of human activity and has seen intermittent archaeological investigation for almost a century. This paper introduces the canyon, its landowners, and its archaeological history. The authors are co-directors of the Ancient Southwest Texas Project (ASWT), an ongoing research program based at Texas State University. Since 2010, Texas State students and faculty have worked with colleagues, volunteers, and the landowners to carry out state-of-the-art archaeological investigation of rockshelter, terrace, and upland sites within and overlooking Eagle Nest Canyon. Key ASWT themes have been geoarchaeology, stratigraphic sampling, 3D photogrammetric documentation, archaeobotany, zooarchaeology, and earth ovens, following the motto “Low Impact, High Resolution.”

Machays, Tombs, and Burials: The Complex Mortuary Landscape of Late Intermediate Period Sondor

The site of Sondor in the south-central Peruvian Andes is famously known as an Inca ceremonial center in Andahuaylas, Peru. Prior to Inca presence, Sondor was occupied by cultures from the Formative period to the Late Intermediate period (LIP), with the largest occupation by the Chanka during the LIP (AD 1000–1400). Previous excavations targeting Inca structures discovered adults with fatal injuries and child sacrifices (*capacochas*). Additional excavations in the Chanka habitation sector uncovered *capacochas* on household floors. This project presents the results of the 2017 excavations with two units on the ceremonial hillside and one in the household sector. Each unit was unique in its mortuary style: one *machay* (rockshelter) in Unit 1, two cist tombs in Unit 2, and individuals buried outside and under the household floor in Unit 5. All units radiocarbon date to the late LIP with Chanka, Chanka-Inca, and Local Inca ceramics present. With the additional application of osteological, ancient DNA, and strontium and oxygen isotope analyses, the complexity of the late LIP Chanka only increases. We will discuss who the late LIP people were, if they were related, where they came from, and the style of their final resting place.

Should I Post This? A Discussion on Digital Archaeology and Ethics

Creating 3D models of cultural materials raises ethical concerns for how they are captured, stored, displayed, and utilized. Mainly, who is and who has the right to make these decisions? Professional societies and associations have established principles and codes of ethics related to best practices, but language pertaining to 3D models or digitally rendered objects is often vague or absent. These gaps leave the ethical and equitable decisions surrounding these “digital artifacts” up to individuals or institutions to determine. Making ethical decisions that do not center Indigenous or descendant communities when working with their collections is a disservice to those communities and the discipline by continuing to prioritize physical objects over human agency. With increasing access to and affordability of technology, questions pertaining to digital colonialism, data management, accessibility, language, and public engagement need to be addressed before normalizing the use of digital methodologies within the discipline. This paper aims to shine light on and discuss the ethics involved with the creation of digital artifacts.

The Glass Beads of San Vito de Valdobbadiene: Compositional Analysis of Glass Beads from a Sixteenth-Century CE Italian Factory

Despite being the center of European glass bead production during the sixteenth through eighteenth centuries CE, very few elemental analyses have ever been conducted on glass beads recovered from known production sites in Murano/Venice. Here we present LA-ICP-MS data on sixteenth-century Nueva Cadiz and seven-layer chevron beads recovered from the site of San Vito de Valdobbiadene, a bead finishing location where glass canes produced in Murano were finished by faceting, using the waterpower of the nearby Piave River. These data provide a new, comparative baseline for the composition of Venetian glass beads produced during the mid-sixteenth century.

Undergraduate Reflections on Archaeological Ceramics through Experimental Archaeology

Undergraduate ceramic archaeological instruction is built around the common, and often taken for granted, categories of raw materials, functional forms, and decorative characteristics. As students, we primarily study these categories to classify materials in field and laboratory settings with little time or reflection spent on the construction of the categories themselves. In our Experimental Ceramic Archaeology class at Lyon College, we were challenged to create a different relationship to archaeological ceramics through experiential learning. In this paper, we summarize our experiences in learning how to create archaeological ceramic reproductions using traditional techniques and compare this with other courses in our academic careers in order to provide insights for the integration of experimental archaeology in anthropology and ceramics classes. We also present a series of observations on our relationship to the material world that was shaped by a more detailed engagement with producing objects.

A Ritual Complex at Etzanoa

The National Park Service held its Remote Sensing Workshop at Etzanoa in May 2023, and Wichita State University followed with a field school in June. The results of both suggest that the area investigated was the site of a variety of ritual activities. Remote sensing there has included thermal imaging from a drone, magnetometry, resistivity, ground-penetrating radar, and magnetic susceptibility. These detected the structure of the underlying bedrock, variations in midden accumulation, a cluster of fire-related features, and a large number of storage pits. Excavation had previously revealed a series of bell-shaped storage pits on what was thought to be a natural knoll. That area, however, was buried under two layers of deep subsoil in a clearly purposeful fashion. All of the pits covered by these deposits were relatively empty of trash, and ceramics from them include a large proportion of Caddoan pottery. One proved to be a very large post pit with an insertion ramp. It and at least one of the bell-shaped pits contained broken grinding stones that may have marked a termination ritual.

Becoming Avian: Amazonian Featherworks from the John P. O'Neill Collection

In 1998, ornithologist John P. O'Neill donated a vast ethnographic collection of objects he was gifted from fellow researcher Charles Fugler or purchased from local persons in Pucallpa, Peru, during his time studying birds in the Peruvian Amazon. According to O'Neill, the cultures responsible for these items' creations are the Cashinahua, Aguaruna, Achual, and Arawak. Eighteen of these items are beautifully crafted arrangements of feathered clothing and objects. These items include five headdresses (Items #22059, #22060, #22071, #22072, and #22074), five bouquets (Items #22189, #22190, #22191, and #22193), a hat (Item #22180), a necklace (Item #22179), three tassels (Items #22142, #22143, and #22164), a backpack (Item #22147), a scarf (Item #22148, and a hair tie (Item #22274). In order to properly study these items within their original context from the perspective of Amerindian cosmology, a materialist perspective is necessary. By using this perspective, one observes the items' ability to act and transform. This transformation, which I refer to as "becoming bird" or "becoming animal," entails reciprocal vibrancies resulting from those interactions among the items, their materials, and humans.

Experimental Archaeology as a Vehicle for Interdisciplinary High School Pedagogy

Archaeological content in high schools appears in the social studies curriculum as historical narrative rather than as part of the process of active information production. Surveys of students indicated that they do not see value in archaeological content beyond the classroom and that they perceive their role in a social studies class to be reiteration of known information. They reported very little interest in archaeology in higher education. Cooperating with teachers in other subjects enabled me to reorient class content around archaeology labs designed to teach students to interpret data, generate information, and synthesize it with their peers' findings. Subsequent surveys tracking changes in student perception of archaeology showed increased interest in elective archaeology courses. Responses indicated that their understanding of archaeology expanded to include science content. Building content around knowledge production also personalized student learning outcomes and facilitated development of evaluative skills. The teamwork component of this skill instruction models upper level academic environments and exhibits the interdisciplinary strength of archaeology. Building content around knowledge production, presentation, and discourse also personalized student learning outcomes which improved engagement and facilitated development of more advanced evaluative skills than could otherwise be accessed.

Magic When It Matters the Most: Intensification of Tobacco Ritual during the Late Mississippian Period of the American Southeast

Religious traditions follow historical trajectories. Within the archaeological record, processes of cosmological reorientation may be signaled by patterned change in attendant ritual paraphernalia. This kind of evolutionary process may be tracked in the American Southeast among certain late prehistoric, Mississippian societies, specifically in relation to tobacco-oriented ritual. The case will be made for a trend of increasingly sectarian practice bolstered by a profusion of formalized, magico-religious invocations. This shift attends fundamental change in sociopolitical structure. The process of cosmological reformulation is empirically derived from examination of the numbers, attributes, and contexts of smoking pipe artifacts.

The Relationship between Human Subsistence Strategies and Late-Quaternary Paleoenvironmental Changes in the Northern Chihuahuan Desert of Southwest Texas

Previous studies of the northern Chihuahuan Desert and Trans-Pecos region of west Texas primarily used plant macrofossils from *Neotoma* sp. middens to reconstruct Holocene and late Pleistocene paleoenvironments, offering researchers a general understanding of bioclimatic change for the period of record. Given the paucity of recorded PaleoIndigenous archaeological sites in the region, some researchers considered the available paleoenvironmental data and suggested that the region was unfit for humans during the terminal Pleistocene and early Holocene because of increased aridity during that period. However, recent archaeological and geoarchaeological research at two stratified sites—the San Esteban rockshelter and GLD open-air site—has revealed evidence of human habitation during the Pleistocene-Holocene transition, challenging the idea that the region was unoccupied by humans at that time. Moreover, archaeological and paleoenvironmental data gleaned from the sites provide an opportunity to learn more about humans and the environment during that transitional period. In this paper, we present the results of our ongoing research at the San Esteban and GLD sites and use faunal and phytolith analyses to refine our understanding of the relationship between human subsistence strategies and paleoenvironmental changes primarily during the Pleistocene-Holocene transition, but also after that period in the northern Chihuahuan Desert.

An Important Cave Skeletal Assemblage Sees the Light of Day: A Reanalysis of Dos Pilas

The Petexbatun Regional Cave Survey, operating as a subproject of the Petexbatun Regional Archaeological Project from 1990–1993, was the largest Maya cave project ever conducted. Centered at the important site of Dos Pilas in the Department of Petén, Guatemala, the cave survey recovered a large and important human skeletal assemblage from six caves. The organization of the larger project featured many specialists in charge of analyzing particular aspects of the data, so the material was not controlled by the archaeologist who recovered it. As a result, the cave skeletal assemblage was never adequately analyzed. Fortunately, the greater part of the skeletal assemblage is now housed at California State University, Los Angeles, and is undergoing reanalysis. Each cave assemblage is being analyzed separately, reflecting the great variability in archaeological context and geomorphology. Preliminary reports on two of the caves will be presented in this session. While time does not permit the in-depth presentation of data here, we have already noted a good deal of information about the assemblage including skeletal pathology and the presence of juveniles across age categories. It is our goal that over the next few years, the entire assemblage will be analyzed and published.

The State of State Archaeological Site Files

The North Carolina Office of State Archaeology (NCOSA) has spent several years digitizing its archive of reports and site records to improve access for cultural resource managers and researchers. As we work

toward making those files available for professional archaeologists to search remotely, we have compiled data on how other states make their site files available. There appears to be a spectrum of accessibility, from those that have nothing digitized to states that have all records digitized and available remotely for free to Secretary of the Interior-qualified archaeologists. Most states fall somewhere between those options, with many (like the NCOSA) in the process of moving from one end of the spectrum to the other, depending on available staff and financial resources. This paper will present the data compiled on the state of state archaeological site files, along with illustrating some of the challenges faced by data managers in their efforts to increase the accessibility of archaeological information.

The Material Culture of Back-to-Africa: Object Reinvention in the Development of Africa's First Republic

Nineteenth-century Black American and Caribbean settlers of the Back-to-Africa movement to Liberia brought with them a wide variety of objects for building new lives and landscapes for their emancipatory and civilizing mission in West Africa. The migrants arrived to lands already inhabited by people long accustomed to European trading and possessing their own Indigenous material traditions. Recent excavations in Liberia by the Back-to-Africa Heritage and Archaeology Project have begun to untangle the complex assemblages of material culture on settlement era sites. These include Providence Island, the location of the temporary settlement of 1822 in Monrovia, to the town of Crozierville, settled by Barbadians in 1865. Here, we discuss artifacts with second lives: objects employed in new contexts, used and reused in strategic ways. From British refined earthenwares with extensive wear and modification, to locally made clay pots, migrants and Indigenous Liberians adapted their domestic toolkits as new lifestyles and identities were forged in Africa's first republic.

Double Headed: Becoming/Transforming in Early Formative Oaxaca

Figurines, as small, portable anthropomorphic and zoomorphic ceramic images, provide insights into a range of representational and symbolic concepts of the ancient Mesoamericans who created and interacted with them. Figurines have been interpreted as actively deployed in household rituals and social negotiations, as well as displays beyond those of the house. As the human body both tracks and is a medium of social processes and political change, changes in embodiment and aesthetics are recursively related to larger sociopolitical transformations during the Early Formative. At the highland site of Etlatongo, in the Mixteca Alta of Oaxaca, Mexico, recent excavations have explored later Early Formative (1400–1000 cal BCE) domestic and public space, recovering a large assemblage of figurines from these diverse contexts. While the corpus resembles some of the figural imagery from the contemporaneous Valley of Oaxaca, there are also substantial differences, especially in terms of rare “special type” figurines such as the physically impossible: two-headed figurines. I examine the range of these figurines' forms at Etlatongo, also exploring the contexts in which they were found. I interrogate both what they may represent as images of becoming/transforming, and the work they do in terms of the objects' animistic and dialogic nature.

The Cascade Phase at the Kelly Forks Work Center Site, Idaho: Exploring Regional Variability Across the Intermountain West

The Cascade Phase archaeological culture has been recognized across a broad region of the Intermountain West including the Northern Rocky Mountains, Columbia Plateau, and Great Basin. Cascade Phase sites typically date to the early to middle Holocene period and are identified by a suite of stone tool types including foliate Cascade projectile points and a variety of cobble tools thought to represent intensive food processing. While there are patterns in the archaeological record across the diverse range of ecological landscapes with Cascade Phase assemblages, there are outstanding questions about temporal and regional variability in settlement organization during the Cascade Phase. Exploring this variability can provide information on the process of settling into local ecological landscapes during the Holocene, and relationships with traditional land use practices of descendant communities living in these regions today. This poster reports on excavation of a Cascade Phase occupation at the Kelly Forks Work Center Site on the North Fork of the Clearwater River, Idaho. The Kelly Forks site is positioned in the Bitterroot Mountains in the traditional territory of the Nimíipuu (Nez Perce) Tribe, providing insight into Cascade Phase settlement and land use in this region and connections to traditional Nimíipuu subsistence practices.

Labor, Land Use, and Settlement at Hacienda del Rincón de Guadalupe, Apaxco, Mexico

Many have argued that the hacienda of colonial Mexico represents the emergence of commercial enterprise through privately owned landed estates. However, these estates were not strictly economic units, but comprised a diverse social and political institution engaged in a complex interplay with the broader cultural landscape, transforming local environments and drastically reshaping communities and relationships. Internally, haciendas featured their own hierarchical structures organized around class and racial boundaries often with a dominant landowner (hacendado) at the top and various workers comprising the rest, many of whom were fettered to the hacienda via coercive systems of debt. This poster examines these processes at Hacienda del Rincón de Guadalupe, a middle to late colonial mining hacienda located in the contemporary municipality of Apaxco, Mexico. Pulling on both the archival and archaeological record, we present data from an ongoing investigation, examining the interactions between land, labor, and community life at the colonial estate. We consider how the hacienda both shaped and was shaped by its constituent parts as well as responded to the broader social, political, and economic landscape.

Reconstructing Seasonality at the Burns Site (8BR85), Cape Canaveral, Florida, using $\delta^{18}\text{O}$ Stable Isotope and Zooarchaeological Analyses

Understanding patterns of localized environmental change in the past can provide valuable insight into modern environmental patterns, as well as comparative options for modern day environmental planning. This research analyzes *Donax variabilis* associated with the Burns Mound Site (900–1600 CE), located on Cape Canaveral Space Force Station along the Atlantic Coast of Central Florida. Samples were taken along growth lines of 12 *D. variabilis* shells from multiple levels of the site. Results show high $\delta^{18}\text{O}$ values, particularly in the terminal edge of shell growth, correlated with time of harvest. Increasing ratios ^{18}O to ^{16}O indicate colder, dryer conditions, which today are found during the months of October through March, in particular the winter months of January through March. This correlates with a site occupation of at least the fall and winter. Additionally, $\delta^{18}\text{O}$ values suggest surface water was on average cooler during site occupation than it is today. Further zooarchaeological analysis will contextualize the isotopic analysis and seasonality observations. Understanding how local environmental conditions differ between site occupation and present can help to inform conservation ideas and better explain cultural practices such as resource use and site habitation.

The Columbian Exchange in the Maya/Spanish Borderlands: A Zooarchaeological and Isotopic Tale of Resistance and Repurposing

The introduction of Eurasian domesticates in the Americas significantly changed the Maya domestic economy during the early colonial period (AD 1535–1700). However, this change was heterogenous in scale across the Maya world. While areas under Spanish control quickly adopted chickens and pigs, borderland communities were not so inclined. In this study, we present zooarchaeological, isotopic, and archival data from the Maya lowlands to showcase how Indigenous communities rejected or appropriated European domesticates on their terms. Our zooarchaeological data suggest that, after contact, borderland Maya communities continued to rely on local fauna and did not make pigs, chickens, and cows pillars of their domestic economy. Of the few Eurasian domesticates found at these sites, the isotope data reveal they were raised locally or regionally. In some contexts, the elite repurposed Eurasian animals for status display and ritual, continuing to imbue meaning specific to the Maya culture to animal resources. We compare our results to zooarchaeological studies in other peripheral regions, such as the American Southwest. Overall, this study provides critical insight into processes of resilience and resistance concerning animal resource exploitation in Indigenous spheres under Spanish colonialism.

Bolender, Douglas (University of Massachusetts, Boston) and Kathryn Catlin (Jacksonville State University)**[48]***"The Cottage," a Small Viking Age Dwelling in North Iceland*

This poster serves as an introduction and overview to a poster session on the archaeology of Kotið ("The Cottage"), a small dwelling established during the initial Viking Age settlement of Iceland in the late ninth century. Kotið represents a previously unknown and uninvestigated site type in the early Viking Age settlement of Iceland: a small dwelling that was located on marginal land despite the widespread availability of fertile farmland in the immediate region. The mix of agrarian and marine foraging resources point to a blend of ecological strategies and participation in supra-household production activities. The combined size, location, and integration of the household at Kotið raise the question of inequality and social control among larger and smaller households in the early settlement landscape of Iceland. Although domestic habitation at Kotið ceased in the mid-tenth century, the site had multiple phases of use and reuse through the medieval period, which points to the continued but evolving importance of marginal sites in the long-term sustainability of farming.

Boles, Steve, William Iseminger (Cahokia Mounds Assistant Site Manager [Retired]) and Lori Belknap (Cahokia Mounds Site Superintendent)**[154]***The 700-Year-Old Guth Dugout: From Arkansas to Cahokia*

The Guth dugout is named for the finder Matt Guth, who found the dugout on a sandbar in a meander portion of the St. Francois River in 2008. The dugout was exposed after floodwaters receded and due to the find location, Guth was determined to be the rightful owner. The dugout was over 6 m long and in remarkable shape given its age. In 2009, the ownership of the dugout was transferred to a group of concerned citizens and board members of the Illinois State Archaeological Society who in turn donated the craft to Cahokia Mounds. In this paper we provide highlights concerning the discovery, recovery, acquisition, transportation, preservation, and installation of the dugout into an exhibit in the museum. We also discuss evidence of manufacturing techniques and how the overall design affected the crafts maneuverability and speed on the water.

Boles, Steve [154] see Kinsella, Larry

Bolin, Annalisa (Aarhus University)**[258]***Heritage Pragmatics: Problems and Opportunities in Pursuing Decolonization*

"Decolonization is not a metaphor," Tuck and Yang remind us (2012). What does this call to action mean for heritage studies? This paper explores attempts at decolonizing cultural heritage management and research. First, tracing the ways coloniality has continued to influence management practices in Rwanda, the paper argues that decolonization in this context requires a practical approach to management change. Using this case study as a jumping-off point, this paper further argues for attention to the practical aspects of decolonizing heritage and heritage research: issues of management, as in the case study, but also research practices and funding. For example, the case study of research in Rwanda also raises the issue of navigating a thorny political context that complicates decolonial goals. In Rwanda and beyond, the paper also explores

how the expectations of funding bodies can be profoundly mismatched both with the practical realities of decolonial research and with what decolonization means to people on the ground rather than to scholars. These pragmatic considerations affect outcomes and impacts in ways too easily left out of academic approaches to heritage decolonization.

Reassembling an Assemblage to Examine the Origins of Race-Based Enslavement at Flowerdew Hundred Plantation
Flowerdew Hundred, a 1,000-acre plantation tract located on the south side of the James River in Virginia, was the focus of decades of excavations by the College of William and Mary and University of California, Berkeley. Three Flowerdew sites are among the earliest seventeenth-century settlements occupied by enslaved Africans, indentured laborers, and landowning elites in North America. By the time excavations had ceased in 2007, artifacts and field records were divided among multiple institutions. Since 2018, the Digital Archaeological Archive of Comparative Slavery (www.DAACS.org) has worked to reunite, catalogue, and digitize field records and artifacts from these sites. This case study comprehensively examines artifact distributions from all three sites to analyze household organization in the early seventeenth-century Chesapeake. We explore how resident ethnicity, social status, and daily activities shaped living arrangements. Linking these data to early eighteenth-century sites in DAACS demonstrates that understanding the longer trajectory of occupation and spatial arrangements provides important insights into the multicultural dynamics behind the emergence and establishment of race-based enslavement in Virginia. The results also demonstrate that before archaeologists can reach meaningful conclusions about human behavior from an archaeological assemblage, they must know how the assemblage was excavated and curated.

Maize and Meat over Millennia: Meta-analysis of Stable Carbon and Nitrogen Isotope Ratios from the Andean Pre-ceramic to the Colonial Period (7000 BCE–1600 CE)

Within the last 40 years, stable isotope analysis has revolutionized bioarchaeology, particularly in the study of human diets in the past. Thousands of studies have analyzed human and animal bone collagen and apatite, tooth enamel, dentin, and hair, but results have rarely been aggregated and studied at large scale. For this investigation, I will compile data reported in published human dietary studies in the Andes region of South America. Through a systematic review and meta-analysis of stable carbon and nitrogen isotope data in published literature, I will assess community diet in the Andes through both space and time (from 7000 BCE to CE 1600). These millennia subsume diverse local, regional, and imperial developments in cultural complexity, from the South American Pre-ceramic to the Inka and Spanish imperial expansions. I will examine specifically how diets have varied or remained stable throughout multiple phases of cultural development, particularly focusing on the ways in which expansive cultures and states impacted quotidian consumption on regional and local scales.

Unraveling Indigenous Histories in the Upper Itajai Valley (Santa Catarina State, Brazil): Insights from Archaeological Research at the Tobias Wagner Site

The Upper Itajai Valley, nestled within Santa Catarina, Brazil, has stood as the enduring homeland of the Laklãnõ-Xokleng people for centuries—a testament to their remarkable resilience despite persistent struggles for land and social rights. Against this backdrop, we present new archaeological findings from the

Tobias Wagner site, which comprises 18 pithouses and their immediate surroundings. Our presentation builds on data collected during the fall fieldwork season of 2023, examining three distinct pithouses and three external areas. Each of these areas unravels unique insights into the lives of past inhabitants. Through a comprehensive analysis of chronological, technological, and archaeobotanical data, we reveal the construction processes, patterns of use, and nuanced continuities and changes that span more than a millennium at the Tobias Wagner Site. This research represents a crucial stride toward constructing a comprehensive, long-term history of Indigenous presence in the region, transcending the European invasion of the Americas. These Indigenous Histories are intricately woven with material remains, oral traditions, and collective memory. Consequently, our investigation of the Tobias Wagner site deepens our understanding of pithouses and explores how the Laklãñō-Xokleng ontology may inform the interpretation of archaeological records, making a valuable contribution to the broader field of Southern Je Archaeology.

Between Research and Archéologie préventive: The State of/in the Field of Medieval Monastic Archaeology

Our paper will survey in critical fashion the last 20 years of medieval monastic archaeology in France. During that time, the new research directions of the late 1990s have confronted a changed landscape for archaeological work. The creation of INRAP has meant that fewer university-sponsored research programs have been proposed, approved and funded. Research questions have instead been increasingly tempered by the necessities of rescue archaeology. In this context, sites approved for excavation are often the result of new industrial construction, urban expansion or rehabilitation of older historic structures to new purposes. We will examine the data for patterns of archaeological priorities as these impinge on monastic sites, assessing where monastic sites have been explored, which monastic orders have been privileged, where female houses have been investigated, and where larger comparative questions of environment, technology and regionalism have been sought.

Approaches to Scale in Highly Commingled Contexts: A Case Study from Roncesvalles

Excavations at the ossuary of El Silo de Carlomagno, located in Roncesvalles (Navarre, Spain), have generated more than 680,000 human bones dating from the twelfth to the nineteenth centuries CE. The subject of ongoing archaeological research, the site represents one of the largest commingled assemblages ever studied, with a targeted approach to the inventory and collection of osteological data that has facilitated the interpretation of a range of mortuary practices employed throughout 800 years of continual usage as an ossuary, carnarium, and local cemetery. This presentation discusses some of the logistical challenges associated with such large-scale levels of commingling and the strategies employed in a highly fragmented context in which traditional MNI methodologies could not be readily applied. Conclusions from various aspects of the commingled analysis will be presented, specifically those from the demographic, taphonomy, and trauma analysis, all of which proved crucial in reconstructing mortuary patterns, identifying secondary deposits and specific episodes of conflict throughout the final phases of the ossuary's use. The dramatic scale, historical importance, and long-term usage of the ossuary make this a unique case study that highlights the enormous contribution to be made from the field of commingled remains.

Isotope Values Reveal “Canopy Effect” in Deer Territoriality and Maize Consumption for Dogs at Kentucky Archaeological Sites Dating to the Middle Woodland through Late Fort Ancient Time Periods

Our study aims to investigate the movement and territorial behaviors of white-tailed deer (*Odocoileus virginianus* Zimmermann) and dogs (*Canis familiaris* Linnaeus) over time, utilizing carbon, nitrogen, and oxygen isotope values derived from archaeological remains. An analysis of these isotope values extracted from tooth collagen and enamel was conducted for 20 deer teeth from 13 archaeological sites in Kentucky, spanning a period of approximately 1,500 years of human occupation. The “canopy effect” (grazing in deeply forested areas) in deer stable carbon isotope values was identified in the remains covering the Middle Woodland (200 BCE–CE 500) to Late Fort Ancient (CE 1400–1680). Additionally, tooth samples from nine dogs and one wolf (*Canis lupus* Linnaeus) were analyzed which revealed significant maize consumption in seven of the dog samples. These samples came from seven of the sites spanning the Early through Late Fort Ancient (CE 1400–1680) periods. Furthermore, we present carbon and nitrogen isotope values derived from deer bone collagen, analyzing nine samples from three of these sites dating to the Middle to Early Late Woodland (200 BCE–CE 800) periods. Hence, our study contributes to the growing database of isotope studies in the Eastern Woodlands.

The Role of Experimental Archaeology at the Range Creek Field Station, Utah

Ten years ago, the archaeological field school at the Range Creek Field Station explicitly embarked on a new direction of research. Students continue to receive training in excavation and survey techniques but actualistic experiments were added to the curriculum. The experiments are designed to calculate the costs and benefits associated with exploiting various wild resources, constructing simple surface irrigation systems to farm maize, and building prehistoric storage structures. Combined with techniques for quantifying various aspects of the environment, such as the distribution and seasonality of plant resources that were likely economically important to the prehistoric residents of the canyon, these data provide students and researchers with unique perspectives on past people’s behavior. The Range Creek Field Station offers an ideal setting for reconstructing paleoenvironmental variability and the response of farmers to that changing environment. Taken together, these studies contribute to a comprehensive database addressing the cost/benefits of conducting activities with simple technologies for living in Range Creek prehistorically. The results from each year inform the character of experiments in the following years. We believe that this approach to building an interpretive framework for exploring the archaeology in Range Creek Canyon will be productive and rewarding to student participants.

Worlds Prefigured: Settler-Colonialism, Anarchism, Indigeneity, and the Dawn of Everything

For many, *The Dawn of Everything* emerges as a watershed moment in their perception of a new history, how

that history impacts the present, and the implications these cast on the future. For others, it is a brazenly biased distortion of history. For still more, the book creates waves of revelation while simultaneously leaving them awash in confusion as they grapple with the scope of the watershed, which tributaries were embraced, and which were left out to dry. It is after all impossible to cite everyone, but because of the scope of impact of *Dawn of Everything* these choices wield the power of a political manifesto. This paper, anchored in Indigenous and anarchist theory and praxis, will navigate what worlds *Dawn of Everything* might be prefiguring through those choices.

Uncertainty Specialists: A Diversity of Late Upper Paleolithic Adaptations in the Dinaric Alps

This paper looks at the results of recent research at several late Upper Paleolithic sites in the area of the Dinaric Alps within the Eastern Adriatic catchment zone in present-day Montenegro and Herzegovina. For the first time in this region, a long-term persistence of the phenomenon of broad spectrum dietary strategy focused on the hunting of marmots has been recognized, with parallels in broadly contemporaneous sequences found in the Italian, French, and Swiss Alps. Apart from these likely seasonal hunting camps on marmots, it seems that longer-term aggregations, which might have represented “persistent places” on the landscape, can also be recognized as part of the regional settlement system. We have employed diverse methodologies in order to shed light on the examined sequences: radiocarbon dating, zooarchaeology by mass spectrometry (ZooMS), aDNA analyses, and use-wear analyses. Based on these different strands of data, we discuss the emerging picture of Late Pleistocene forager adaptations in this region, and to what extent these novel insights match the existing models of forager residential mobility during unpredictable environmental and climatic conditions. In doing this we evoke the memorable phrase “uncertainty specialists,” coined by Clive Gamble when discussing broadly contemporaneous foragers in the Epirus region of Greece.

Chair

Bossio, Laura (University of Michigan)**[130]***Introduction: Wetlands, Cultural Heritage, and the Power of Archaeology*

Archaeologists are well poised to investigate the past, discover what cannot be seen today, and bring that knowledge to the present in meaningful and effective ways. One important field of archaeological study is that of human relationships with wetlands; many wetlands have already been destroyed worldwide, yet these ecosystems are both culturally and ecologically vital. The archaeological case study of North America's Lake Erie will demonstrate this disconnect: today, it is notorious for high pollution and toxic waters, yet Indigenous life, community, and connection were built and sustained through millennia in this region. This represents just one example of modern ecological and public health catastrophes largely caused by the eradication of endemic wetlands. Furthermore, wetland destruction is here discussed as a dangerous means of cultural erasure. As the papers in this session will reveal, responsible and focused archaeological investigations can bring to light these human-wetland relationships and interactions of the past and rebuild lost cultural knowledge. In doing so, archaeologists can illustrate the need for protection and conservation of existing wetlands and also support motions for wetland reconstruction.

Boudreaux, Sarah, Matthew Helmer (Kisatchie National Forest), John Mayer (Kisatchie National Forest) and Rachel Feit (Acacia Heritage Consulting)**[189]***Variability in Site Usage: A Comparison of Sites 16RA1758 and 16RA1811 in Kisatchie National Forest, Louisiana*

In 2020, unauthorized excavations and Hurricanes Laura and Delta extensively damaged sites 16RA1758 and 16RA1811 on the Calcasieu Ranger District of Kisatchie National Forest, Louisiana. To address the adverse impacts and gain a deeper understanding of precontact lifeways, Kisatchie National Forest initiated comprehensive excavations at both sites. Situated approximately 150 m apart and separated by Valentine Creek, these sites provide a unique opportunity for fine-scale analysis of precontact human activities. Preliminary analysis of both artifact assemblages show that the sites were occupied from the Late Archaic to the Late Woodland periods. Site 16RA1758 has features suggesting permanent settlement that spans from the Late Archaic until the Late Woodland period. Features include multiple post molds and intact fire features. Artifacts include re-worked tools, utilized flakes, biface blanks, and ceramic sherds. Site 16RA1811 has a large accumulation of lithic debitage, no discernable features, few formal tools, and few ceramics. Here, we present a comparison of sites 16RA1758 and 16RA1811 and describe how the observed patterns indicate site-specific provisioning, intersite variability, and diachronic changes. This presentation will discuss the results of investigations, preliminary analysis for both sites, and the implications for socioeconomic choices and strategies of the precontact people of central Louisiana.

Boulanger, Matthew (Southern Methodist University) and Brandi MacDonald (University of Missouri)**[24]***Geochemical Analyses of Poverty Point Objects: Implications for Production and Exchange*

We present results of a geochemical study on baked-clay balls (Poverty Point Objects; PPOs) obtained from the Poverty Point archaeological site. We compare our data with PPOs obtained at other sites to evaluate the proposition that PPOs were traded or exchanged among Poverty Point-related cultures in the Southeast. We find no evidence to support this proposition. We explore statistically significant chemical differences within PPOs obtained from different areas at Poverty Point itself, and outline hypotheses concerning modes of production of these artifacts by the site's residents. Finally, we compare and contrast various analytical methodologies to provide brief comment on their suitability for further studies of PPOs.

Bluefish Caves I, II, III: Taphonomic Analysis of the Mammal and Bird Bone Assemblages

Following its discovery and excavation in the 1970s–1980s, the Bluefish Caves site (northern Yukon Territory, Canada) yielded a small number of stone artifacts and thousands of vertebrate remains buried in late Pleistocene loess. Preliminary taphonomic observations suggested that modern humans visited the caves about 30,000 years ago, raising considerable debate within the scientific community. More recently, a rigorous and systematic taphonomic analysis of the mammal bone assemblages from Bluefish Caves I and II showed that humans hunted horse and caribou as early as 23,500 cal BP. Here we extend the taphonomic analysis to the mammal bones from Cave III and to the bird remains from all three caves. Butchery marks were identified on a Snow Goose scapula from Cave II, and potential human bone modifications were observed on ptarmigan remains. We observed no sign of human activity in Cave III and hypothesize that it may have been ignored by humans in favor of the other two caves that offered better shelters and views of the adjacent lake. Compared with other late Pleistocene–early Holocene karstic sites in Alaska, we suggest that caves and rockshelters were only visited by humans on a sporadic, seasonal basis for hunting.

Urban Poverty in Historic New Orleans: Revisiting Magnolia / C. J. Peete

New Orleans experienced considerable social change between the mid-nineteenth and early twentieth centuries, with the economic participation of its residents varying widely according to race, gender, and immigrant status. In the two decades following Hurricane Katrina, federal aid disaster response and rebuilding efforts offered rare opportunities to perform archaeological data recovery in some of the more historically impoverished neighborhoods of the city. Current interpretations of assemblages obtained from such projects have largely focused on the transition toward mainstream American consumerism. In revisiting archaeological materials from the former Magnolia / C. J. Peete housing development, this research aims to move beyond these established tropes in search of additional, less visible themes related to the economic and social activities of marginalized residents in urban environments. What were the experiences of those households occupying the fringes of full societal membership, and what, if any, artifactual commonalities exist across them? This paper will explore the potential for such similarities to be transferable and thus also viewed as indices of socioeconomic standing when encountered in other contexts and locales.

Bouzon, Helen

[131]

Foodways as Agentive Response to Disaster in Colonial New Orleans

Disasters have plagued the City of New Orleans since its founding in 1718. The citizens of New Orleans have adapted and rebuilt in the wake of each catastrophe. Two fires destroyed significant parts of the colony in the eighteenth century. Little attention has been paid to the short or long-term effects of these disasters, other than the recognition of a shift in the architectural signature of the colony. These well-known but poorly understood events in New Orleans's history likely had a greater effect on the cultural milieu of the burgeoning colony than previously surmised. One way to elucidate potential cultural shifts in response to disaster is to examine foodways around the time of the fires. Food procurement, production, and presentation can illustrate “agency,” habits, and behaviors employed in daily life that are reflective of the choices of individuals within a social framework. In order to explore the concept of agentive response to

disaster, this research examines responses to eighteenth-century fires through an analysis of faunal and ceramic material from multiple sites in the French Quarter. The results are examined temporally to infer changes over time.

Perspectives, Policies, and Practices: How Thoughtful NAGPRA Implementation Can Change Everything

The Alabama Department of Archives and History has actively engaged in NAGPRA compliance work since 2018. In that time our NAGPRA and indigenous collections care policies have changed as our perspectives have grown and been shaped by consultation and relationship building with tribal partners and with participation in NAGPRA communities of practice. Our agency has undertaken a multifaceted reevaluation of its collections care and access policies with a scope that goes beyond Ancestral remains and objects subject to the law. This presentation details our institutional history of care for culturally sensitive materials, outlines our desired trajectory of long-term policy making and partnerships with tribal entities, and will also address how culturally respectful collections care has impacted our museum's interpretation of indigenous histories.

Deconstructing the Medieval Anchorhold

This paper will look at the religious phenomenon of anchoritism, popular in Western Europe during the medieval period and how we, in the twenty-first century can engage with it. The medieval anchorites (men) and anchoresses (women) lived in isolation in their anchorhold (cell) in order to live the life of a solitary recluse. The life within the anchorhold was lonely and tough, leading to possible negative impacts on the well-being of the anchorite or anchoress walled up inside us. This phenomenon may seem strange to us in the twenty-first century with our modern ideas and perceptions, however, there may be some comparisons between the isolation felt during the COVID-19 pandemic and well-being. and it is this which the presentation aims to investigate. This paper shall investigate how we can engage with medieval anchoritism through the lens of deconstructed landscape photography which focuses in on the details of a landscape or archaeological site rather than the wider landscape shot. This is a form of photography introduced by Scottish photographer by Niall Benvie and is a core part of my PhD research into engagement with archaeological landscapes.

[156]

Origins and Tenacity of Myth: Part II—Ethnography

Hunter-gatherer artists of the Lower Pecos Canyonlands of southwest Texas produced Pecos River style (PRS) rock art as early as 5,500 years ago. In 2016, Boyd identified patterns in PRS murals similar to the mythologies of the ancient Nahua (Aztec) and the present-day Huichol (Wixárika). She advanced the hypothesis that PRS murals are visual narratives containing evidence of an Archaic core of beliefs that has persisted across time and cultural, linguistic, and geographic boundaries. To test this hypothesis, Boyd and Dering traveled to the Huichol community of San Andres Cohamiata, Jalisco, Mexico, and met with seven shaman-elders, whose belief system closely reflects ancient Mesoamerican cosmological concepts. Conducting and recording open-ended interviews, they shared illustrated mural panoramas with the elders to determine the answers to two questions: Are PRS pictographic elements and patterns recognizable to present-day Huichol shamans? Can they offer insights into the image-making process of PRS pictography or the visual narratives they portray? In *Origins and Tenacity of Myth: Part II*, we share preliminary results of our analysis of these interviews and reveal deeply embedded core symbols and concepts in PRS rock art that endure today in the ancestral knowledge of Indigenous Native America.

A Proposition to Extend the Kings Crossing Phase in the Lower Mississippi Valley to 1200 CE

Ceramic data and radiocarbon dates from site 22Wr814, a newly recorded precontact lithic and ceramic artifact scatter along Mint Spring Bayou within Vicksburg National Military Park, show that the Kings Crossing phase (1000–1100 CE) extended to the end of the twelfth century CE in the loess uplands of the Lower Mississippi Valley (LMV). An analysis of the ceramic artifacts determined the ceramics are dominated by the Vicksburg set, the diagnostic set for the Kings Crossing phase. Shovel testing across the site identified a buried midden deposit with ceramics, lithics, faunal remains, fish scales, hickory nut shells, acorn shells, corn kernels, squash rinds, and floral remains. AMS dates on a hickory nutshell fragment and a corn kernel fragment provided a pooled mean of 905 ± 16 rcy BP, yielding a 2-sigma calibration range of 1050–1210 CE. These data along with other investigations in the LMV provide the context for proposing an extension of the Kings Crossing phase from 1100 CE to 1200 CE. By determining the actual termination of the Kings Crossing phase we can better understand culture change during the Coles Creek period in the LMV.

Bracken, Justin (University of Utah Press)**[110]***The Hydraulic Landscape of Muralla de León*

Premodern landscape modification at the northeast corner of Lake Macanché, surrounding the site of Muralla de León, predominantly consists of small hilltop settlements and hydraulic channels. These channels interact with the lake itself, as well as the *juleques* (pond-sized water-filled sinkholes) that cluster in the vicinity. Two prominent channels were mapped and excavated during dissertation fieldwork in 2018: first, an artificial continuation to the east of the inlet off the lake that marks the southern boundary of Muralla de León. This first channel then turns 90° to the north and continues to the southern shore of the *juleque* to the east of the site, connecting the *juleque* to the lake. The second channel is a modified natural drainage that runs on a WSW bearing into the northeast of that same *juleque*, across from the northeast corner of the site. It consists of a narrow channel cut into bedrock and a series of constructed pools incorporated into the alignment. The function and chronology of construction and use of these hydraulic features are considered here in conjunction with data from the Muralla de León site interior.

Brady, Arden and Corey Ragsdale**[80]***Paleodemography of a Late Medieval Cemetery in Poland*

Paleodemography is a useful way of learning about the lives of people in the past, while gaining insight into their cultural and environmental conditions. The Late Middle Ages in Poland saw several cultural and climatic changes. Historical documents provide context for the elites during this period throughout the realm, but information regarding the lives of common people remains mostly a mystery. The increased demands of labor throughout the feudal system during the time no doubt would have made the lives of non-elites increasingly difficult. The cemetery of Gać in Poland (fourteenth to sixteenth century) provides an excellent opportunity to examine the lives of common, rural people using mortality data. This study examined mortality rates for 189 burials recovered during a mortuary archaeological field school. Our results show an unbiased male-to-female ratio among the individuals for which sex estimations were possible. The cemetery at Gać has a notably high child mortality rate of more than half of all burials recovered, and a particularly high mortality rate of older children. Results also show a relatively high mortality rate among adolescents and young adults. Our mortality analysis reflects the hardship of the common people during the Late Middle Ages in Poland.

Brady, James (Cal State LA)**[221]***Chair***Brady, James (Cal State LA) and Ann Scott (Terracon Consultants Inc.)****[221]***Correcting Interpretive Miscues with the Cueva de Sangre*

The Petexbatun Regional Cave Survey, working for three seasons from 1990 to 1993, was the largest cave project ever conducted in the Maya area. While investigating 22 caves and 11 km of passage, the survey collected a large assemblage of human skeletal material that had the potential for clarifying the nature of human remains in caves. That potential was never realized. The Cal State LA Subterranean Bioarchaeology Project has initiated a program to rectify the situation by reanalyzing and reinterpreting the Petexbatun cave assemblages. This presentation begins the process with a consideration of the Cueva de Sangre, the largest and most complex of the Dos Pilas caves. A major flaw of the previous analysis is its lumping all the caves together, negating a consideration of the varied contexts of the individual caves. For example, a considerable stretch of passage from the main entrance in the Cueva de Sangre consists of a muddy, seasonally inundated trench filled with human bone, artifacts, and ceramics. Bone in lower passages were recovered from a flowing river. No attempt was made to relate the depositional pattern to known cases in the archaeological literature with Alberto Ruz never being consulted.

Meaningful Choices and Relational Networks: Analyzing Western Arnhem Land's Painted Hand Rock Art Style Using Chaîne Opératoire

A core feature of rock art studies concerns the characterization and analysis of motif styles to generate new insights into their function, meaning, and symbolism in the deep and recent past. Yet what is oftentimes overlooked is attention to the production sequence used to create motifs, and what this can reveal about the social and cultural behavior of artists. Where it is evident that a particular group of motifs contains a wide range of individual design conventions, questions about why and how these choices were made become points of enquiry that have the potential to develop new insights into their symbolic and relational character, and cultural significance. To address this challenge, we undertook an investigation of the rare and highly distinctive Painted Hand rock art style from western Arnhem Land (Northern Territory, Australia). Using a quantitative, systematic, style-based analysis, and an ethnographic exploration of a select group of distinctive design conventions, we show how the decisions made by artists to use specific design conventions were not random but instead were deeply implicated in, and shaped by, social processes acquired through learning or enculturation.

Pathways to Power for Classic Maya Sub-royal Elites

John Pohl's research is groundbreaking in its analysis of the supporting characters in Mesoamerican royal courts. Secondary elites (including the nobles, priests, merchants, and artisans of the court) vied for power using innovative tactics that worked outside the traditional systems of inherited authority. Pohl's work follows the creative political, social, and ritual strategies employed by those sub-royal elites to compete for power in Postclassic Mexico, but his findings are applicable to royal courts across Mesoamerica. This paper examines cases of Classic Maya secondary elites who sought power via similar unconventional pathways, and how their tactics appear in the archaeological record. At the site of El Zotz, in Guatemala, excavation data is combined with iconographic and material analyses to identify the political maneuvers of a possible merchant lineage group.

Project Management in Archaeology: How to Finish on Budget and ahead of Schedule while Meeting Expectations

Project management is an extremely important but critically underutilized body of knowledge in our discipline. Many of the activities that archaeologists engage in fit the definition of a project, that is a temporary effort that creates value through a unique product, service, or result. Despite that, many of us were never introduced to effective project management methods and only learned how to do it through trial and error. The goal of this poster is to provide an overview of project management as an effective tool that

can be employed by the SAA membership, including students, private and public sector professionals, and academics. Specific insights include 1) commonly used management frameworks that facilitate the responsible completion of research; 2) the roles and constraints of scope, schedule, and budget as they relate to archaeological projects; 3) what are common mechanisms to measure project success; and 4) common project management pitfalls which can result in inadequate preparation for research projects, degrade research integrity, and delay or prevent the dissemination of research.

Maya Obsidian Production and Exchange in the Southern Belize Region

Permanent occupation of inland southern Belize began at the dawn of the Classic period and continued into the Terminal Classic. Excavations at Pusilha, Lubaantun, and Nim li Punit have recovered more than 5,000 obsidian artifacts that date to these periods. These have all been sourced using portable XRF and subject to metric and attribute analyses. Although the Southern Belize Region is small and the major sites are close to each other, their access to material, procurement strategies, production and consumption patterns differ, supporting the notion that these communities had distinct external relations, were the center of their own bounded economies, and were distinct small polities.

Bone Collectors: Personhood and Appeal in Human Remains Sales on Facebook

The desire to own human skeletal remains has been prevalent for many years; in our modern technological age avenues for this market have exploded across the internet. This research focuses on Facebook groups dedicated to oddity sales and collecting. Purchasing human remains is illegal in Georgia, Louisiana, and Tennessee as well as prohibited by Facebook terms of service, but these sales persist. During 2021, 319 listings for human skeletal remains were recorded across six Facebook groups. Many elements are artistic in nature, something viewed as “Giving a second life” to the remains, as observed within these groups. To

understand the driving force behind this market requires cultural insight about the perception of human remains as well as the culture found within these groups. Kinship, friendship, and trust are all clearly expressed between buyers and sellers. Human skeletal remains often come from dubious origins, including that of grave robbing, exploitation, and co-opting of unclaimed remains. Despite this, the desire to own them is prevalent on Facebook. The view of personhood within these groups is clear: these skeletal remains are objects to be treated as such by individuals who purchase them.

Reused Timber and Woodland Management in Western Suffolk

This paper investigates the social context of timber reuse in late medieval and early modern timber-framed buildings. The data for this survey are centered around the town of Bury St. Edmunds, a market town in western Suffolk surrounded by rural farmsteads and villages. In the mid-sixteenth century there was a major shift in regional landownership due to the Dissolution of the Monasteries. The land, including woodlands went from being managed by the local abbey, a large institution, to multiple, smaller landlords. I examined 30 buildings from the rural and urban areas around Bury St. Edmunds, with construction phases dating from 1400 to 1700. Within these 30 buildings, there were 48 construction phases, and there was evidence of reused timber in 20 of them. However, the patterns of reuse observed in the survey do not necessarily relate to a lack of proximity to woodland. Historical documents indicate that timber was restricted by landlords throughout the period, both during and after the abbey's control of the land. Thus, this paper argues that the patterns of reuse observed in the survey indicate a long-standing building practice that developed in response to existing woodland management practices and subsequently intensified in later periods.

The Ethics and Outcomes of Using Archaeological Collections for Education

This paper discusses the ethical implications of using archaeological collections for education and outreach as well as the potential challenges that doing so poses to repositories and museums. We cover the benefits and burdens of accessioning donations, specifically discussing how to assess their potential value for teaching and research, and we compare the outcomes of using archaeological objects versus the rapidly growing body of alternatives, such as replicas, 3D-printed objects, and digital models. We conclude with how curators can make significant contributions toward education while upholding ethical standards. We use the Illinois State Archaeological Survey's work with its Illinois Department of Transportation collections as an example and highlight the relevance of this work in light of recent legislation that mandates Illinois public schools include past and present Native American culture and history in their curriculum beginning in the 2024–2025 academic year.

Ongoing Investigations into Late Woodland and Early Caddo Subsistence in the Bois d'Arc Creek Watershed, Northeast Texas

Bois d'Arc Creek is located at the western margin of the Caddo region, feeding into the Red River from northeastern Texas. In 2019–2021, AR Consultants Inc. excavated six sites in the Bois d'Arc Creek watershed, yielding archaeofaunas associated with Late Woodland and Early Caddo occupations. These sites tend to be located on terraces near the creek floodplain and situated within environments rich in plant and animal resources. Analysis of faunal remains from non-funerary features is complete for one site, and complementary datasets are currently being generated for two of the five remaining sites. The assemblages are dominated by deer and turtle, although they are characterized by an overall diverse suite of fauna. Further, generally good bone surface preservation has allowed for analyses of surface modifications including butchery marks, rodent gnawing, and carnivore activity. This talk presents the taxonomic composition, taphonomy, and animal butchery patterns observed in these assemblages, describes emerging trends within the project area, and compares these trends against what has been observed elsewhere in the Caddo world. Big, Bigger, Biggest: Investigating Aguadas 1–3 at Calakmul, Campeche, Mexico

Calakmul is known to be one of the largest ancient Maya urban centers in the Elevated Interior Region of the Maya Lowlands. Thus, it is not surprising that in this water-challenged environment, the population of Calakmul invested in some of the region's grandest reservoirs. While limited excavations were carried out in several of the site's reservoirs some three decades ago, the true scale and chronology of these features remained relatively hazy. Lidar imagery of Calakmul and excavations conducted in 2022 and 2023 have clarified knowledge of the city's water management system. We report here on excavations in three of the largest urban reservoirs known simply as Aguadas 1, 2, and 3. These massive tanks all had their origins in Preclassic times but were apparently modified in the Classic and continued to be used in the Postclassic.

Cuisine and Craft at Ancient Hualcayán: Exploring Ceremonial Production during the Chavín to Recuay Transition (900 BCE–1000 CE)

In this paper, we explore the production techniques, provenances, and uses of the pottery and foods important for different kinds of ceremonies throughout the Chavín to Recuay transition at Hualcayán, an ancient community located in the Callejón de Huaylas valley of highland Ancash, Peru. Ritual celebrations were a salient feature of social and political life at Hualcayán, where people fortified community ties through feasting, drink, and cooperative building projects over several millennia. Here, we combine analyses of ceramic paste technologies, the possible provenance of geomaterials used to make pottery, and the evidence for food production and procurement practices that were essential to these ceremonies. We conducted laser ablation–inductively coupled plasma–mass spectrometry (LA-ICP-MS) and thin section petrography on a preliminary sample of ceramics and performed macrobotanical, microbotanical, and faunal analysis of food remains recovered across ritual contexts and time periods at Hualcayán. By analyzing these datasets together, we aim to highlight the many sequences of practice involved in or indexed during these ritual events while exploring the changing social and material relationships that underlaid Chavín, Huarás, and Recuay communities between 900 BCE and 1000 CE.

Life and Death in Iron Age Wales: Results from Radiocarbon Dating, Histological, and Stable Isotope Analyses from Case Study Sites

The Iron Age in Wales is understudied compared to other regions in Britain largely due to the lack of osteological evidence. A study by Rowan Whimster in 1981 found only eight burial records in the entire country, leading to the assumption that Iron Age peoples in Wales conducted “archaeologically invisible” funerary rites, especially excarnation within hillforts. However, a recent reevaluation of Iron Age site excavations by Oliver Davis in 2017 has uncovered a larger burial corpus in Wales, offering an opportunity to assess funerary practices, mortality profiles, health, diets, and origins of the Iron Age population. This paper presents results from radiocarbon, histological, and multi-isotope analyses of two settlement sites with the largest assemblages of burial evidence: RAF St Athan in the Vale of Glamorgan and Dinorben in Conwy. Through this integrative study of isotopic and microtaphonomic analyses, the project aims to enhance our understanding of mortuary practices and provide new insights into the diets and origins of prehistoric populations in Wales, thus redressing long-held assumptions about life and death in the Iron Age.

St. Pius X Mission Boarding School: An Archaeological Investigation

The Pius X Mission School, founded in 1918 in Skagway, Alaska, lies at the center of the archaeological investigation discussed in this presentation. Researchers at the University of Arizona, Bureau of Applied Research in Anthropology aided in the assessment of cultural significance of the Pius X Mission Boarding School. Researchers collaborated directly with the Municipality of Skagway and the Skagway Tribal Council to conduct archaeological, ethnographical, and archival work to contribute to a more encompassing view of how St. Pius X Mission impacts the community of Skagway. This presentation will reflect on the importance of archaeological work, within the context of boarding schools, to highlight the lived experience of immersive

assimilation and systemic violence. Students at St. Pius X Mission, and within the boarding school system, experienced a genocidal philosophy toward Native Americans. Recognizing boarding schools as systems, such as St. Pius X, have caused intergenerational trauma among native communities will contribute to more thorough archaeological investigations. This project highlights a continued need for open collaboration between municipalities, universities, and Tribal councils to inform our understanding of the past and contribute to future management and development plans of these spaces.

“United with Them in Good Feeling and Friendship”? Material Insights into Seventeenth-Century Onöndowa'ga:' Hodinöhsö:ni' Incorporations

Onöndowa'ga:' (Seneca) Hodinöhsö:ni' (Six Nations Iroquois) communities in what we now call New York State incorporated a number of other Indigenous peoples, both individuals and large groups, throughout the seventeenth and eighteenth centuries. Other settler scholars have interpreted the status of these incorporatees as akin to enslavement—particularly for the Wendat (Huron) incorporated following their military defeat in 1649—yet little attention has been paid to the social, economic, and political dynamics of the communities following these incorporations, nor have many considered Hodinöhsö:ni' traditions and perspectives on this history. Employing legacy collections held in the Rochester Museum and Science Center, I utilize a relational activities-based lens to explore the experiences of incorporated peoples and their hosts. This paper forms one part of a three-generation study of Onöndowa'ga:' incorporations, focusing on the first generation of Wendat and other Iroquoian-speaking peoples incorporated in the mid-seventeenth century. Comparing material from two principal sites occupied directly following the Wendat defeat, Marsh and Dann, along with a contemporary satellite site purported to host the bulk of the incorporated group, Wheeler Station, I demonstrate the need for a more nuanced understanding of Hodinöhsö:ni' incorporations outside of the simplistic—and defeatist—interpretations of enslavement and erasure.

A Combined $^{87}\text{Sr}/^{86}\text{Sr}$ and $\delta^{18}\text{O}$ Isoscape of Minnesota for Estimating Geographic Origins: A Case Study

Strontium and oxygen isotopes preserved within plant and animal remains reflect the regional geology and environment where they originated. This approach relies on a regional map of baseline isotope values—or isoscape—to link values preserved in remains with a region of origin. Mechanistic models, which estimate baseline $^{87}\text{Sr}/^{86}\text{Sr}$ based on age and type of bedrock, can be used for geographic origin estimates if the primary driver of $^{87}\text{Sr}/^{86}\text{Sr}$ comes from weathered bedrock. In post glacial landscapes such as Minnesota, which are mostly covered by till, mechanistic models based on bedrock cannot be reliably used to estimate geographic origin. This project developed an $^{87}\text{Sr}/^{86}\text{Sr}$ isoscape of Minnesota through vegetation sampling and combined this data with preexisting $\delta^{18}\text{O}$ isoscapes. Variability in $\delta^{18}\text{O}$ is largely dependent on regional precipitation patterns, so the $\delta^{18}\text{O}$ preserved in organic materials can be used to constrain geographic origin estimates. The combined $^{87}\text{Sr}/^{86}\text{Sr}$ and $\delta^{18}\text{O}$ isoscape was evaluated on its ability to accurately estimate the geographic origin of archaeological faunal material of known provenance. This research demonstrates the necessity of developing regionalized isoscapes and outlines a protocol for doing so. It has produced a resource that has wide ranging applicability in archaeology and related fields.

Briggs, Rachel (University of North Carolina, Chapel Hill) and Heather Lapham (University of North Carolina, Chapel Hill)**[260]***Eating Colonialism: Consumption and Resistance in the Indigenous American South, Sixteenth through Early Nineteenth Centuries*

There is no one way that European domesticates were understood by Indigenous groups throughout North America. In the American Southeast, Spanish explorers and colonists introduced peaches, watermelons, and pigs during the sixteenth century, yet only peaches and watermelons were understood by most Native groups as food appropriate for Native bodies; pigs were rejected and considered unsuitable for Native bodies well into the eighteenth century. In this paper, we explore the symbolic qualities of pigs within southeastern Native cuisines from the sixteenth through early nineteenth century and propose that despite their culinary similarities to bear and bear oil within many Indigenous cuisines, the symbolic association between pigs, European bodies, and European colonial efforts led many Native groups to resist pork consumption as an act of sovereignty intended to keep Native bodies “Native.”

Brito Salvador, Mirko (Proyecto de Investigación Arqueológica—Región Pallasca) and George Lau (University of East Anglia, Norwich)**[81]***Prácticas textiles y complejidad social Recuay: Nuevas evidencias de Pashash (Ancash, Perú)*

Recientes investigaciones en Pashash revela nuevos datos para comprender la complejidad social de los grupos Recuay en la sierra norcentral, Perú (200-600 dC). Esta ponencia se enfoca en el material textil hallado junto a otros objetos en un contexto de ofrenda de elite. El análisis de hilos y restos textiles pone en evidencia la preocupación de los tejedores Recuay por la obtención de fibras locales y extranjeras, así como un especial énfasis en el proceso técnico para lograr refinados tejidos y cordones. Se indica una tendencia en la producción de bienes con tecnologías cada vez más sofisticadas de la mano del creciente prestigio de los liderazgos políticos locales. El escenario interpretativo sugiere que el renovado desarrollo de prácticas textiles y tecnologías afines se vincula con innovadoras dinámicas que contribuyeron en la formación y sostenimiento del tejido social y las relaciones políticas en Pashash.

Britt, Kelly (Brooklyn College)**[1]***Dismantling Inequities of Disaster: A Speculative Archaeology Approach*

When severe weather events strike, disaster ensues, leaving a catastrophic and at times an apocalyptic wake. This wake ripples through populations differently, generally preying on those already on the margins prior to the event and amplifying the structural inequities, whether they are economic, social, political, or physical. These events hit deeper and last longer. Most large-scale response and recovery efforts focus on getting “back to normal,” but “back to normal” for those at the margins generally means slipping further in this direction as existing inequalities are exacerbated by the effects of disaster. How can archaeology and heritage work inspire us to seek something beyond the normal that can build a better future for these marginalized communities? Building on my work from various sectors of the field, I turn to what I feel is archaeology’s greatest gift: storytelling. Using the speculative as informed by ethnography, heritage, and speculative fiction, how can we incorporate this mode of analysis and evidence-based conjecture to embody a present and imagine a future that dismantles these structural inequities?

Britton, Emma, John Welch (Archaeology Southwest), Brandi MacDonald (University of Missouri, MURR), Fred Nials (Archaeology Southwest) and April Oga (University of Missouri, MURR)**[236]***Multimethod Forensic Sedimentology to Address Heritage Crime*

As memories of World War II waned and the sixties swang, anthropologists developed a healthy distrust of State interests in our field. Relegated to the kids' table, anthropologists disengaged from the State for many decades. Among the consequences of our broad professional disdain for officialdom is an inattention to cultural heritage crime. Here, we present initial results from a proof-of-concept study for forensic sedimentology in upland Arizona, a region of high heritage crime activity. Our forensics sedimentology team has re-invited archaeologists to the table, bringing robust analytic methods, courtroom-ready evidence, and the view that forensic archaeology involves more than dead bodies. We are complementing a context-specific focus on dirt (which is ubiquitous), with geomorphology, microscopy, petrography, and trace element analysis to assess and validate sediment provenience attributions. Petrography, for example, is providing information regarding specimen mineralogy, and may illuminate distinctive context attributes, such as snowmelt, and episodes, including flash floods. Multi-method sedimentology is an effective tool for linking objects or persons of interest to crime scenes. When these lines of evidence are synthesized and interpreted, a compelling case can be made for their efficacy in curbing and solving cultural heritage crimes.

Britton, Kate (University of Aberdeen)**[247]***North of the Wall: Archaeo-ecological Approaches to Scotland's Elusive Paleolithic Past*

For more than a century, Paleolithic Scotland was missing from the textbooks, presumed nonexistent. A low-density of archaeological finds was compounded by a research tradition that persistently excluded the possibility of human settlement at the extreme edge of northwest Europe prior to the Holocene, a situation at odds with decades of paleoenvironmental research. Recent discoveries of unequivocal Late Upper Paleolithic (LUP) sites have provided indisputable evidence for human activity in Late Pleistocene Scotland, yet research continues to be held back by both a lack of investigation and a lack of conventional finds. With specific reference to the Paleolithic archaeology of Scotland, this talk will explore the perceptual barriers that can inhibit research, as well as the challenges of understanding the human past where little conventional archaeological evidence belies an undoubted human presence. PAIaEoScot (People, Animals, Landscapes and Environments of Late Glacial Scotland) will be introduced, a new research initiative from the University of Aberdeen which centers on the use of archaeo-ecological and multispecies approaches to explore the low visibility archaeology of LUP Scotland. The first results will be presented, including new radiocarbon dates and isotopic analyses of paleontological materials, illuminating the chronological and ecological context of postglacial recolonization in Scotland.

Brock, Daniel (Tennessee Division of Archaeology)**[206]***An Archaeological Study of Pit Cellars in Tennessee*

This presentation discusses the regional and ethnic identity of pit cellars in Tennessee. Pit cellars are pits dug into the ground within or around historic buildings that were typically used for the storage of food or personal items. They come in multiple forms and were used by many different groups in North America. Archaeologists prize them for the valuable information they provide about the past and the people who used them. Previous archaeological excavations in Tennessee have revealed hundreds of these features at a variety of sites inhabited by African Americans, Euro-Americans, and Indigenous Americans. Using previously reported data, a survey of pit cellars was conducted in Tennessee's three grand divisions to study the various types of pits, people, and places they occurred over time. The synthesis of this information is used to understand if pit cellars were a regional phenomenon or a manifestation of ethnic identity.

Brock Morales, Amanda (University of Florida)**[172]***Palabras Andantes: Collaborative Story Mapping of Community Memories Using QField at Chupacoto in Huaylas, Peru*

In 1970 a 7.9 magnitude earthquake destroyed many towns in the Callejón de Huaylas and displaced many families. Following the earthquake, elevated monumental archaeological sites in the region, such as Chupacoto in Huaylas, were occupied by families who continue living there today. As a result of these occurrences, tensions between various stakeholders arise. However, while Chupacoto appears to be a remnant of the past, it is a vibrant and active part of the Huaylas landscape today. In 2022, I documented memories and interpretations of Chupacoto with local community members using the QField phone application. QField allowed me to walk around Chupacoto with participants to map stories and memories in place around the archaeological site. The mapping was coupled with sit-down interviews with participants and highlighted Chupacoto as a place in the making with value and vitality in the present. After documenting stories using QField, the Kawsay Pacha team conducted archaeological excavations at Chupacoto in 2023 to understand the relationship between architectural changes to the site and the broader landscape. Ultimately, this project intends to braid present-day local knowledge and memories of Chupacoto with archaeological and scientific findings about Chupacoto's role as a ceremonial center in an environmentally active landscape.

Brockwell, Sally (Australian National University) and Colin Pardoe (Australian National University)**[130]***Residential Patterning around Highly Variable Wetlands in Australia*

We compare residential patterning of hunter-gatherer/forager populations along wetlands on the coastal plains of the Top End of the Northern Territory of Australia and the Riverine Plain of the Murray Darling River Basin, New South Wales. Although climates are very different in these regions, people needed to adapt to the variability, as well as the specific ecologies of these evolving environments. Mapping of earth mounds associated with these wetlands provides an indicator of settlement patterns relating directly to local hydrology. This is also a distillation of roughly 4,000 years of individual and group decision-making about the best places to live. We provide examples of how this traditional knowledge can be used as an environmental proxy, or indicator of where we should concentrate our conservation efforts. Constraints on water availability, introduced animals and plants, tourism, water-level change, and sea-level rise are all in play. The archaeological record may or may not survive these impacts, but our eyes must be firmly set on trying to keep some animals and plants alive. If the environment survives, so does the archaeology have a better chance.

Brody, Rachel (Boston College)**[22]***Opening Up a Can of Worms: Putting Archaeological Evidence for Intestinal Parasites in Conversation with Early Medieval Medical Manuscripts*

In what ways did early medieval people of the Atlantic Archipelago encounter parasitic worms within and about their bodies, and how did these gutsy matters affect their daily lived experiences? To begin answering these questions, we should consider, alongside environmental archaeological data, textual sources in the form of early medieval medical manuscripts. Therefore, I will first present examples of *Trichuris trichiura* and *Ascaris lumbricoides* eggs preserved in human coprolites from excavated sites dating between 800 and 1000 CE. The sites I will discuss are Coppergate—the Anglo-Scandinavian urban deposits—in York, England, and Fishergate Street, an Hiberno-Norse urban conurbation located in Dublin, Ireland. Next, I will consider this evidence together with *Medicinale Anglicum* (Royal MS 12 D XVII) and the *Lacnunga* (BL, Harley 585)—two texts compiled in the ninth century—which show that medieval people were very much aware of their uninvited parasitic guests and were knowledgeable about plant-based cures to help dispel them. Intestinal parasites, especially in urban settings, were likely ubiquitous in the day-to-day lives of early medieval people. We can begin to unpack these nonhuman entanglements through text and archaeology to understand how people coped and understood their bodies and navigated their local ecologies to find herbal remedies.

Broodbank, Cyprian (University of Cambridge)

[18]

Continental Dynamics and the Shaping of Island Societies

Island archaeologists have tended to underplay the significance of continents and their social dynamics in influencing the temporal and spatial patterning witnessed among island societies at a regional and comparative level. When continents are considered, it is largely as staging posts for initial peopling, or as recipients of island trade, with much of the emphasis on generic continental factors encouraging early insular settlement, for example in the context of broader farming expansions. This paper argues that later continental dynamics involving the emergence of major polities, their networks, and associated technocomplexes played a far more crucial role in shaping the pattern of island lives in later prehistory than is currently appreciated, despite the uncontested importance of such factors over the last 500–600 years. It suggests, moreover, that specific contexts can be identified that help to explain quite precisely the historical timing of many major episodes of change in island life, including a fundamental reshaping of Cypriot society in the mid-third millennium BC, the earliest human activity on many of the circum-African island groups, and the chronology of sail-borne expansion into Island Southeast Asia, and across the North Atlantic.

Interpreting Prospect Bluff

In the nineteenth century, a fort and independent settlement of enslavement escapees and their descendants emerged along the Apalachicola River. Prospect Bluff, which eventually became to be known as “Negro Fort,” was a place where Maroons resisted the institutions of slavery. Prospect Bluff hosted a vibrant community of Maroons. At its peak it was home to Native Americans as well as Black men, women, and children from varying cultures including Spanish, British, and French Caribbean. The fort, though heavily armed, was eventually destroyed by the US Navy because it was marked as a threat to the emerging presence of US imperialism. The construction of communities like the one at Prospect Bluff, are a materialized reality of the consciousness and extent to which African descendant people in the Americas physically and intellectually fought for their freedom. Archaeological surveys at Prospect Bluff and along the Apalachicola River will

hopefully reveal data to interpret these Maroons' stories and provide valuable historical information to the communities throughout the Apalachicola region.

Pittsburgh's Chinatown: A Study of Chinese Diaspora Archaeology in Pittsburgh, Pennsylvania

During the nineteenth century, there was a dramatic increase in emigration out of southern China, with many moving to the United States. With the move of Chinese immigrants into the United States, Chinatowns also began to develop in urban centers throughout the country. Chinese diaspora archaeology studies these communities, with a majority of the work done in the western United States where the communities were often most concentrated. However, after the end of the Gold Rush and the Transcontinental Railroad, Chinese diaspora communities began to spread east, with a community settling in Pittsburgh, Pennsylvania in the 1870s. This Chinatown, much like other East Coast Chinatowns, has had very little research done on the community that lived there. This thesis focuses on Pittsburgh's Chinatown through historical research, geospatial analysis, public outreach, and geophysical survey to explore the size, layout, and impact of the Boulevard of the Allies on the Chinatown. The goal of this research is to both gain an understanding of the community that lived there, as well as the true extent of the Chinatown in its prime to show how the expansion of roads near the Chinatown contributed to its decline.

The Effect of Gender Imbalances in Mesoamerican Lithic Studies

While more women than men are getting PhDs in archaeology today, female lithicists continue to be outnumbered by their male counterparts. This is in part a result of outdated gendered conceptions about who can do certain types of archaeological field and laboratory work and also related to deeply seated Western notions of male versus female tasks and domains. In Mesoamerica, lithic studies align with these outdated gendered conceptions and, we argue, the lack of diversity among lithicists has impacted the types of research questions asked, the analyses conducted, and the interpretations made, effectively leaving many stones unturned, or under-investigated. We chronicle the contributions of female lithicists working in Mesoamerica in the last half century, paying close attention to the impact of regional differences in approaches to lithic studies in Mesoamerica. We conclude by recommending avenues by which lithic studies can become more inclusive and collaborative and how the subfield can be more equitably encouraged among budding archaeologists.

Ancient and Medieval Agricultural Terraces in Italy: Chronology, Geoarchaeology, and sedaDNA

Agricultural terraces are ubiquitous in the Mediterranean. The pan-European TerrACE Project has been using new methods to deepen our understanding of the chronology and cultural ecology of terraces. The terraces investigated in Italy span later-prehistory to the post-medieval period. We have applied portable luminescence (pOSL/pIRSL), luminescence dating (OSL), and ^{14}C for dating with a combination of pXRF and

thin-section micromorphology for soil history, as well as phytoliths and sedimentary ancient DNA (sedaDNA), to determine crops and livestock. The sedaDNA of these terraces proved to be better preserved than expected and this will be one focus of the paper. Although these methods have met with variable success, between them they have allowed chronology, history, and crop use to be determined for most sites. Some terraces at Soave are prehistoric but most represent medieval agricultural intensification associated with changes in urban fabric and control. The Sicilian site was constructed in the eleventh century AD and was reconstructed in the post-medieval period. SedaDNA and phytoliths reveal a wide variety of fully Mediterranean crops and fodder-plants from vines to figs. Collectively the sites reveal how cultivation terraces are archives of both macro and molecular evidence of agricultural, landscape, and cultural history.

A Tenuous Prize: Archaeology of the Inka Conquest of Northern Highland Ecuador

The numerous Inka forts in northern highland Ecuador, more than reported from most other imperial provinces, suggest preoccupations with the region and its inhabitants. The Barbacoan-speaking locals were indeed powerful and a potentially difficult conquest, as attested to by their gigantic earthen platform mounds and extensive raised fields that could support a large population. After a tough battle between Tupaq Inka and the Quitos, the Inka prevailed but ongoing concerns led to the construction of the massive Inka military installation at Pambamarca, one of the largest and most complex military installations in the prehispanic New World. With nearby mitmakuna from Inka-controlled Cañar, the Quinchuajas fortresses would stand as a bulwark at the northeastern corner of the empire for years, perhaps until the rebellion of the local Cochasquí and Caranqui peoples brought Tupaq's son Wayna Qhapaq back north to build more forts. After costly losses he at last prevailed, and fortunately, architectural differences between forts built by father and son offer an archaeological approach to understanding Inka strategies of conquest and acculturation within the framework of two different and distinctive imperial periods. Ultimately, while the historical context of the conquests varied, both emperors struggled despite their massive armies and sophisticated tactics.

The Deep-Site Excavation Strategy at the Koster Site

By 1972 the exposure of deeply buried occupation surfaces was a novelty in the Midwest. In Illinois, deep-site excavation experience was limited to the Modoc Rock Shelter exploration. Koster offered a new opportunity for a deep-site exposure, but one that raised significant engineering challenges. The requisite broad exposures had to be achieved in a stepwise fashion. For the Koster site, that goal was achieved by excavating

a step six feet across for every six feet the work proceeded downward. This procedure was dictated by the discovery that the site's loess sediments were undermined by a slow seepage of water from its surroundings. The result was an unparalleled view of an Early Archaic occupation although the excavation that had the appearance of an open-pit mine instead of series of isolated squares into deeply buried layers.

Mortuary Practices at the Precolumbian Site of Indian Creek, Antigua: Preliminary Results

This paper discusses the preliminary results from recent excavations at Indian Creek, Antigua, that have helped identify, document, and recover four late period Saladoid burials. Despite this being the longest continuously inhabited site on Antigua, and one of the longest continuously inhabited sites in the Caribbean, only one other complete burial has been recovered from this site. These excavations offer a glimpse into the mortuary practices of late Saladoid people with regard to burial position and geographic location within the site in addition to cultural practices such as cranial modification and artifact and ecofact inclusion. This research marks the first systematic excavations used to explore areas outside of the deeply stratified middens surrounding the site with the goal of gaining a better understanding of mortuary practices and how space was utilized during this period on Antigua. We also look to compare our results with other precolumbian burial sites in the Caribbean. Lastly, we will discuss some of some ongoing and future research related to isotopic dietary reconstruction and identifying genetic relationships between these individuals using aDNA.

Unraveling the Political and Economic Complexities of Late Formative (600 BCE–CE 200) Cusco: A View from Muyumoqo

Despite the archaeological significance of the Cusco region, research on societies that preceded the Inka in their heartland have lagged behind other areas. In particular the Late Formative (600 BCE–CE 200) presents a time of increasing social complexity, increased participation in interregional trade networks, and potential political competition between rival polities. Existing survey and excavation data indicates the rise and fall of several potential polities. Despite this insight, our understanding of the processes behind how these polities grew and what their relations were with one another as well as other regions outside of Cusco remains unclear. This paper focuses on one hypothesized center, Muyumoqo, and evaluates earlier hypotheses about the site's occupational history, relationship with neighboring sites, and its role in the wider Cusco region. In addition to focusing on Muyumoqo as a case study, this paper reevaluates survey and previous excavation data from sites in other regions of Cusco to better understand the socioeconomic, political landscape, and daily life during the Late Formative.

Brown, Nicholas (Yale University)**[81]***Monumental Afterlives of Chavín Mountains at Chawin Punta and Kunturay in Pasco, Peru*

The breakdown of Chavín interregional networks at the end of the Early Horizon had variable outcomes for high-altitude ceremonial centers in the Central Andes of Pasco, Peru. Within the Chaupihuaranga Canyon, neighboring mountaintop monuments have distinct sociohistorical trajectories that complicate temporal arguments about the post-Chavín abandonment and resettlement of sites at the end of the Early Horizon and beginning of the Early Intermediate period. This paper employs a novel chronological framework of “monumental eras” to track the periodic shifts in how past people engaged with the already ancient stone heritage atop canyon ridges. In light of the vitality and agency of stone in Andean ontologies, this paper recounts the long lives of monumental mountaintops to illustrate how their changing relationships with humans forged new social organizations during the late first millennium BCE and early first millennium CE. Excavations at Kunturay reveal that its platform building episodes continued during the late first millennium BCE long after monumental construction had ceased at Chawin Punta. By the second century CE, people had resettled Chawin Punta and built houses atop its sunken circular plaza, marking a major change in humanity’s relationship with mountain worship at this sacred site.

Bruhns, Karen (Fundacion Nacional de Arqueologia de El Salvador)**[157]***The Ceramics of Cihuatan, El Salvador: Between Two Worlds*

Cihuatan, El Salvador, appears to have been the southeasternmost Maya city. Dating to the Early Postclassic, it shows clearly the internationalizing tendencies of the time period in its ceramics. Although most are local versions of widespread Early Postclassic Mesoamerican types (or actually imported as in the case of Tohil Plumbate), a certain number of styles hark to lower Central America, suggesting that although mainstream Mesoamerica was a strong influence, the southern neighbors were known and their ceramic arts appreciated.

What Is CRM’s Origin Story: How Did We Get to the System We Have Now and What Does It Say about Our Future?

How did the current regulatory archaeology system form? What lessons can we learn from how the system was set up? What do these past accounts say about the future of cultural resource management? As part of a historical review stemming from the SAA Government Affairs Committee's survey regarding the Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation, we look at the past to understand what it says about how we got where we are and the future of cultural resource management.

Considerations for Your Stewardship Journey: The Indigenous Collections Care Guide as a Resource

Museums and academic institutions are beginning to reexamine their collections stewardship and daily practice by inviting Indigenous voices and perspectives into the conversation. This is becoming particularly relevant with the proposed addition of duty of care to the NAGPRA regulations. However, knowing where and how to start can be overwhelming—especially while advocating for change within your institution. With funding and partnership from IMLS and the School for Advanced Research Indian Arts and Research Center, the Indigenous Collections Care (ICC) Working Group is creating a guide, which will be a reference tool for institutions that interact regularly with Indigenous collections. The guide will not teach museums how to specifically care for each item, since these vary among each community. It will instead offer achievable considerations and templates for implementation, advocacy, and creation of policies and procedures. This guide does not replace consultation or the repatriation process—instead, it is meant to help guide those conversations and provide a framework. This presentation will discuss the development of the guide and how it can be a tool for stewarding sensitive cultural heritage.

Architectural and Technological Analyses from a Pueblo III Slab-lined Pit Structure in Northeastern Arizona

Teaming with the Navajo Division of Transportation, Dibble Engineering, and the Navajo Nation Heritage & Historic Preservation Department, Logan Simpson recently completed data recovery for the Dennehotso Loop Road Improvement Project on the Navajo Nation in northeastern Arizona. Within the area of potential effects data recovery resolved adverse effects to the southeast portion of a large pre contact habitation, locally known as “Many Homes,” inhabited from the Basketmaker III to Pueblo III periods (ca. AD 600–1300). Feature 58, an idiosyncratic slab-lined pit structure, was one of 18 features within the APE and contained a diverse assemblage of ceramics, lithics, worked faunal bone, and various artiodactyls, turkey, and small game animal remains. Maize cob fragments from the floor fill date the structure to 1028–1162 cal AD, while ceramics provide a mean ceramic date of AD 1117. Upright tabular sandstone construction of the structure includes an east wall with pecking possibly representing astronomical patterns. In this presentation, we discuss the material remains and architecture to elucidate activities within the structure.

Ritual Transformation in Formative Period Oaxaca: A Comparative Analysis of Deity Impersonation, Nagualism, and Hybrid Beings

A hallmark of ancient Mesoamerican art and religion is the ability of powerful ritual practitioners, sometimes referred to as “shamans,” to transform themselves. The Olmec were-jaguar is probably the best-known example of the phenomenon. However, artifacts from different regions of Mesoamerica demonstrate that this was a diverse set of beliefs and practices involving a variety of animal and spiritual entities and a generally permeable boundary between humans and other beings. In this paper, we trace the archaeology of ritual transformation in Formative period (2000 BCE–250 CE) Oaxaca, Mexico, from a comparative and diachronic perspective. The Formative period witnessed the elaboration of the concept of transformation, whereby people gained access to metaphysical powers and negotiated a range of societal roles by transforming their bodies. As links between the physical world and other dimensions, altered bodies may reflect negotiated relationships among people, animals, ancestors, deities, landforms, and many more other-than-human beings. We examine archaeological and iconographic evidence from highland and coastal Oaxaca, including indications of masked deity impersonation, nagualism, and divination. By taking an explicitly relational approach, we consider the affective energies of these occurrences as distinct ways of knowing the world, engaging and modifying the senses, and acquiring knowledge.

Climate Change and Environment in Cahokia's History

Archaeologists, particularly in the Southeast, have often looked to the environment and climate change to understand the evolution of past societies. Droughts, floods, and environmental degradation have been implicated in the rise and fall of societies, especially Mississippian period societies like the city of Cahokia. Despite calls to provide more holistic interpretations of places like Cahokia, agency, history, and practice are frequently relegated to the background and environmental processes are elevated as primary causal factors precipitating culture change. In this presentation, we consider environment and climate change at Cahokia from a relational perspective, drawing from Indigenous philosophies of locality, place-thought, kinship, and reciprocity, to provide an avenue for more nuanced understanding of how people negotiated their relationships with the inhabited world—including how climate change might have been interpreted as embedded within and stemming from those relationships. Climate, while important, cannot necessarily be considered a primary driver, as environments and their inhabitants were among many significant relationships that factor into the choices and histories of past (and present) people.

Lead Isotopes as a Tool for Identifying Human Mobility in Central Mexico

Lead isotopes have successfully been used in archaeology to trace artifact provenance and, more recently, to study human paleomobility through skeletal remains in regions with traditionally temperate climates, such as Europe. However, very few environmental lead isotope baseline studies have been conducted for the

Americas, where anthropogenic lead contamination in the environment tends to be high, and even fewer studies have tested the feasibility of analyzing lead isotopes in human enamel in this region, where skeletal preservation tends to be poor. The study presented here investigates the use of lead isotopes for paleomobility research at the site of Teotihuacan in central Mexico (AD 1–550). Preliminary results are provided for lead isotope baseline development in the Basin of Mexico using rock and soil samples. The labile fractions of the soils were extracted and analyzed to determine if modern-day lead contamination in the environment affects the natural lead isotopic signatures of these soils. The initial results of lead isotope analyses in human enamel will also be presented.

Combining Proteomic Sex Determination of Archaeological Remains with Isotopic Analyses for Understanding the Development of Animal Husbandry

Proteomic techniques are being increasingly used in bioarchaeological applications to improve understanding of the human past. However, few studies have focused on the study of tooth enamel for sexing in archaeofaunal remains despite initial studies over a decade ago looking at human teeth. Here we use of LC-orbitrap-MS/MS for identifying the sex of archaeological cattle and sheep remains in comparison to humans from a range of sites across Europe. Through combination with carbon, nitrogen, and oxygen isotopes, these biomolecular techniques have the potential to better understand the evolution and development of animal husbandry practices. However, with proteomic sex identification being still in its infancy, there are several key limitations that need to be further investigated, largely relating to the unconventional methods utilized. These limitations and the extent to which they differ relating to the taxon being investigated will be discussed, as well as latest advances in improving these methods.

A River Runs through It: Placing Vicksburg in Context through an Analysis of Late Coles Creek Culture (1000–1200 CE) Land Use in the Lower Mississippi Valley

HDR's recent investigations in Vicksburg National Military Park (VNMP) identified multiple precontact sites composed of extensive ceramic scatters. A typological analysis of nearly 300 sherds suggests these occupations are associated with the transitional Coles Creek culture of the Late Woodland/Early Mississippian period, specifically the redefined Kings Crossing phase (1000–1200 CE). Coles Creek culture is notable for growing social complexity and intensifying landscape modification, trends which occur alongside increasing population densities during a period of climate stability and greater effective moisture throughout the Lower Mississippi Valley (LMV). Within VNMP, the newly identified Kings Crossing phase sites are interpreted to represent outlying settlements of Kings Crossing (22Wr537), the multi-mound, monumental center type site for this phase. To better contextualize the precontact occupation of VNMP, this study employs an eco-cultural niche modeling approach to address questions surrounding Late Coles Creek culture settlement organization, monumentality, and land use in the greater LMV. The results of the analysis have the potential to yield new insights into Terminal Woodland occupation of VNMP, the adoption of Mississippian ideas by an essentially Woodland society, how that society perceived and constructed landscapes in the LMV, and the role of outlying settlements in shaping these landscapes.

Exploring Early Historic Human-Canid Relationships in the Intermountain West: A Case Study from Seventeenth-Century Blacks Fork, WY

Between the sixteenth and seventeenth centuries, Indigenous cultures of North America began utilizing domestic animals brought to the Americas by Spanish colonists, creating profound social, cultural, and ecological change. In the northern Rocky Mountains, domestic horses provided new opportunities for transport and travel—but our understanding of how new human-horse relationships articulated with preexisting human-animal relationships is still limited. Blacks Fork, WY, is uniquely suited to provide more archaeological insight, as it features the seventeenth-century deposition of an Indigenous domestic horse skeleton with three, morphologically ambiguous, canid skulls. To explore human-canid relationships at Blacks Fork, and their possible associations with human-horse relationships, we used mitochondrial DNA extraction and analysis, craniometric examination, and paleopathological examination to identify species, age, health, and relevant trauma for each of the canid specimens. Our results suggest that the Blacks Fork canids were likely three healthy, young adult, wild coyotes or coyote-dog hybrids, which people hunted, killed, and disarticulated for ritual deposition at Blacks Fork. Our findings provide archaeological evidence for the antiquity of human-coyote relationship in the Rockies and reveal information about the shifting roles of wild and domestic animals during a time of rapid transformation in the North American west.

Let's Shed Some Light: Computed Tomography and GIS in Bioarchaeological Analysis of Funerary Urns from Los Tamarindos Cemetery, Tierra Caliente, Michoacán

Spatial distribution and relations between the osteological material and grave and/or pyre goods within cremation funerary urns are crucial aspects of the bioarchaeological analysis of cremation burials. Through meticulous examination of material distribution, valuable insights can be gleaned regarding the behavior of mourners—shedding light not only on how the remains were collected and placed into the grave but also on postdepositional processes that significantly influence the preservation of archaeological and osteological material. In recent years, noninvasive documentation methods such as computed tomography (CT) have gained prominence in the study of cremation burial practices. Despite the great potential of this method, we note limitations that do not allow us to fully understand the cremation burial rite without exploration of the

funerary urns. We studied cremation burials from the Los Tamarindos cemetery, Tierra Caliente, Michoacán, documenting the spatial distribution of the material via CT images. In this presentation, we propose integrating geographic information systems (GIS) to enhance imaging and spatial analysis, offering transparent results and precise data presentation.

The Susiana Legacy: A Discussion on the Ceramic Petrographic Analysis of Legacy Collections from Iran's Susiana Plain

The Susiana Plain of southwestern Iran has a long history of archaeological investigation, perhaps most notably at sites such as Chogha Mish and Susa. Scholars have demonstrated the Susiana Plain as a place of interregional connection and distinctive material tradition. However, though interest in the broader region surrounding Susiana persists, the intensity of study has slowed considerably, and much of the material recovered from excavations in decades past remains largely untouched in museum storage. This paper specifically uses the archaeological material of previous excavations, now housed in museum storage, to assess the attributes of fifth and fourth millennium BCE pottery. Methods of ceramic petrography are used to examine and compare technological characteristics between sites and over time. This analysis aims to bring the Susiana communities into conversations of contemporaneous pottery practices in neighboring regions; furthermore, this paper offers discussion on the challenges, and rewards, regarding the use and study of legacy collections.

People on the Move: Early Peopling of Central Brazilian Plateau, Eastern South America

The aim of this presentation is to discuss the peopling process of the Central Brazilian Plateau through the study of archaeological sites located in the Middle Valley of the Tocantins River. The Central Brazilian Plateau is the region where there are the earliest dates available for the occupation of eastern South America; therefore, it is a crucial area for discussions on the Initial Peopling of South America. The sites selected for the present research present evidence of being occupied since the end of the Pleistocene, and thus, they have an enormous potential for discussing the age and dynamics of the occupation of the inner South American continent. The case of the Middle Tocantins area draws attention to the need for a contextual approach to studying the dynamics of interaction between human behavior and environmental variations and the need for a complex look at the articulation arrangements between the archaeological record and the behavioral interpretation. We expect to contribute to a wider discussion about the dynamic involved in the occupation process of uninhabited or poorly inhabited areas, as well as on the interactions between human behavior and environmental variations. Therefore, we will work with key concepts such as technology, mobility, territory, and territoriality.

In the Beginning: Stuart Struever and the Lower Illinois River Valley (LIV)

This introductory paper for the symposium recognizing and celebrating the seminal contributions of Stuart

Struever to Midcontinental archaeology begins with his earliest regional project at the Kamp Mound Group. Legend has it that Struever became lost traveling to St. Louis. On highway 100, north of Kampsville, he saw a landowner bulldozing a portion of the Kamp Mound Group, paused, and asked if he could conduct an archaeological excavation instead. Thus, the 1958 and 1959 field seasons began a 26-year regional archaeological program directed by Struever, centered in Kampsville. The Kamp excavations anchored 65+ years of productive LIV bioarchaeology. Following the Kamp Mound analysis, his MA thesis at Northwestern University, Struever pivoted to village sites and regional surveys during the 1960s. Flotation developed, and with it the transformative paleobotanical and paleofaunal studies that helped define the Eastern North American Agricultural Complex (EAC) and the significant role of freshwater resources. The profoundly interdisciplinary Koster site excavations dominated the period between 1969 and 1979, with geoarchaeology assuming an increasingly prominent role. Struever's contributions to ceramic analysis and chronology were also foundational, as was the west-central Illinois Contract Archaeology Program. As Struever's concept for archaeological research expanded, the LIV's role diminished, ending in 1984.

Collaborative Approaches to Ancestral Remains Protection, Recovery, and Repatriation in Oregon

The sale, trade, and otherwise mistreatment of human remains is an issue impacting a diverse institutions and entities, from sovereign Tribal nations, to universities, to law enforcement. This unethical and illegal behavior can be found in a wide range of digital and analogue venues, often making it difficult to trace the origins of both the seller and the individual whose remains are being sold. In the state of Oregon, a collaborative approach between Tribes, state agencies, and law enforcement is being used to target human remains sales and trafficking. Strategies include the creation of new positions, the development and dissemination of educational materials, and phased outreach to individuals engaged in sales. The core of this collaboration is constant, committed engagement and communication between state, federal, and Tribal partners. Information and resource sharing allows every organization to be more effective in this effort than if each were to stand alone. While many of the initiatives in Oregon are still new or being developed, they show promise in their ability to recover human remains. It is our hope that these approaches can help develop similar programs beyond Oregon.

Molecular and Isotopic Analysis Indicates Variable Uses for Early Pottery from Northwest Alaska

Ceramic technology was adopted approximately 2,800 to 2,500 years ago in Alaska, coinciding with a transition toward an economy increasingly focused on marine resource use. Despite expectations for marine resource use in early northern pottery, an initial pilot study found strong evidence for freshwater aquatic and/or mixed terrestrial/aquatic resource processing in a small sample of early sherds. The current study investigated this trend in greater depth using lipid and isotope analysis to detect the past uses of more than 120 early pottery sherds from coastal and interior/riverine contexts in northwestern Alaska. The dominant character of the residue was compared to results from isotope mixing models and the osteofaunal record to assess cooking practices with regard to patterns of resource use. Results indicate that pottery was used to cook or render oil from primarily marine and freshwater/brackish resources, however caribou processing appears to have been more common in pottery than previously recognized and anadromous fish were less represented than expected, possibly because they tended to be cooked in different ways.

Stand by the Gray Stone: GIS and Spatial-Temporal Applications at the Milwaukee County Poor Farm Cemetery
 I am immensely grateful to have had Dr. Patricia B. Richards as a professor, supervisor, and mentor throughout my academic pursuits. Her long and distinguished career has been exemplified by a fierce and unwavering focus to provide her students with the tools needed to successfully apply advanced archaeological methods and research schemes to a variety of topics. Her innovative approach has always accepted new techniques and practices that continue to drive a scientific approach to Midwestern archaeological studies. This paper will highlight some of the ways in which Dr. Richards has successfully applied GIS spatial technologies to the study of historic cemeteries. Spatial-temporal studies at the Milwaukee County Poor Farm Cemetery (MCPFC) have been applied to numerous collaborative research projects. Understanding space and place follow an intellectual legacy that began early in her graduate school career at University of Wisconsin, Milwaukee and has been continually adopted in strategic ways by her students and colleagues.

Archaeological Immersion and the Rhythmanalysis of Place: Experimental Virtual Reality Spatial Analysis at Jatanca (Je-1023), Peru

The phenomenon of place as it is rhythmically embodied, akin to a fabric that is collectively worn and interwoven over successive generations, unfolds at the center of our presentation. We explore the intricate meshwork of place-making, applying an immersive VR reconstruction of the Late Formative period site of Jatanca (Je-1023) as our methodological lens to examine the subtleties of spatial perception, locomotion, and the profound interconnections between embodiment and divergent rhythms in the fabric of Jatanca's everyday life. Through immersive analyses of pre- and post-plug alterations to Jatanca's monumental architecture, we broaden archaeological interpretations to imagine agrarian ceremonial place-making, emphasizing the corporeal, sensorial, and temporal dimensions of its taskscapes. The uncanny virtual realism to navigate in immersive VR reconstructions demands attentional awareness, thus complementing phenomenological insights and enriching the scope of the archaeological imaginary.

The Water Is Not Wasted: Tailwater Ponds, Habitat Conservation, and the Perpetuation of Akimel O'odham Water Culture

Akimel O'odham are river people. During testing investigations for a roadway improvement project in Scottsdale, Arizona, sponsored by the Federal Highways Administration (FHWA) and Salt River Pima-Maricopa Indian Community (SRP-MIC), a historical water feature was identified. Geomorphological and archival research determined that the feature represented historical tailwater deposits, possibly associated with a historic SRP-MIC irrigation system waste ditch. Evidence for a twentieth-century tailwater pond

presented seemingly limited archaeological information potential. And yet tribal interest prompted additional ethnographic and archival research to explore the cultural significance of riparian micro-environments associated with tailwater ponds that once sustained Native Traditional Use plants (crucifixion thorn, arrowweed, etc.) and shade trees (cottonwood and mesquite). The role of these places in Community memory—for example, as *vapchki* (reservoirs)—is investigated in regard to the elimination of traditional riverine settlement by the allotment system and the introduction of large-scale irrigation and farming, traditional “water culture” (*shuudag himdag*), and as places for social gathering.

Micaceous Mindsets: Chemical Characterization of Classic Period Utility Wares at Multiple Sites Along the Rio Grande

Micaceous utility wares are commonly found at Ancestral Pueblo villages along the Rio Grande and adjacent areas, yet they have received comparatively little attention relative to the contemporary well-studied glaze wares. Compositional studies show that glaze ware vessels and their ingredients were often transported across the landscape, driven by a mix of ritualistic and economic factors, but utility wares were also a common component of daily Pueblo activities and are shown to have been involved in complex exchange schemes. Neutron activation analysis is used to chemically characterize micaceous utility sherds from seven Classic period (1300–1600 CE) sites located along the Rio Puerco and Rio Grande between the modern towns of Santa Fe and Socorro, New Mexico. Five micaceous ware distribution patterns are recognized based on the spatial patterns of compositional groups present within and shared between sites. These indicate procurement and/or manufacturing similarities between the Rio Puerco and Albuquerque areas and differences to the north on the Pajarito Plateau and to the south along the Rio Abajo.

[206]

The First Bite: Archaeological Traces of Early Spanish Colonial Carpentry from Quarai and Pecos Pueblos

Primary sources attest to the training of Indigenous carpenters in early colonial New Mexican woodworking. By the 1620s, Spanish craftsmen began introducing techniques based in the widespread Iberoamerican Mudéjar carpentry vernacular, which Pueblo artisans learned and used in constructing Franciscan missions. These accounts have received little study nor testing, however, based in the presumption that the 1680 Pueblo Revolt destroyed almost all early carpentry in New Mexico. In fact, scattered archaeological traces and remnants permit a partial reconstruction of early New Mexican carpentry and processes of cultural negotiation through the medium of woodcarving. Combining the contextualizing methods of archaeology with analysis of museum collections, this paper uses the earliest known archaeological remnants of colonial woodwork to explore the transmission and significance of pre-Revolt carpentry. It relies on remnant artifacts from Quarai (ca. 1623–1628 CE) and Pecos (ca. 1620–1630s CE), now in the collections of the Maxwell Museum of Anthropology, the Center for New Mexico Archaeology, and the Pecos NHP. Surviving amid carbonized fragments and architectural remnants, the “bite” of chisels and gouges characteristic of these early carpenters speak to their technical faculty but also processes of intercultural negotiation, meaning making, and violence amid the entanglements of colonial New Mexico.

Questioning “Centralization”: Ritual, Minor Temple Complexes, and Social Integration at Ceibal, Guatemala

The Maya site of Ceibal, Guatemala, became a preeminent center in the Pasión Region of the southern lowlands over the Preclassic period (ca. 950 BCE–350 CE). During the latter centuries of this period, minor temple complexes were built at regular intervals within the Ceibal urban center and across the rolling Ceibal horst. Although the presence of minor centers has often been linked to increased political centralization and the establishment of regional settlement hierarchies, systematic excavations in outlying

areas of Ceibal have complicated our understanding of core-periphery dynamics. The data have revealed the temples were built at different times with variable construction techniques and materials, and populations settled around them following their construction. The evidence suggests local groups built their own ceremonial precincts as they settled in new areas around Ceibal. Rituals resembling those performed in the ceremonial epicenter were also conducted regularly at the temples, revealing some people in outlying areas had access to specialized ritual knowledge from the epicenter. These outlying communities appeared to be largely autonomous yet integrated into a larger Ceibal society. This paper draws from collective action and generative planning theory to question notions of centralization and explore heterarchical sociopolitical complexity and integration.

Shell, Trade, and Systems of Value at the Dawn of Agriculture in the Tucson Basin

Current studies on nacreous shell jewelry, those with an iridescent inner layer, during the Early Agricultural period (2100 BC–150 AD) (Vint 2017) have chiefly examined how the material was brought into the Tucson Basin without much consideration for if its presence in the region was purely due to chance or if it was specifically chosen. Central to that question is understanding how nacreous shell artifacts were valued in the region and if that differed from non-nacreous artifacts. To address this gap in our knowledge, a series of chi-square and Fisher's exact tests were conducted on the various shell assemblages recorded from 17 sites dated to the Early Agricultural period. These tests compared nacreous and non-nacreous shells across eight types of contexts and 26 stylistic forms in order to see if either shell material was found more or less frequently in any particular context or fashioned into any particular form. The results from these tests suggest that nacreous shell material was used and valued independently, with clear connections to mortuary practices. Additionally, these results reaffirm previous hypotheses on the origin of nacreous shell in the Tucson Basin and suggest regional differences in shell use across the study area.

How Houses Become Haunted: Folklore Traditions as Archaeological Context

Anthropology and archaeology strive not only to reconstruct the physical characteristics of the past world but to understand how past people thought about the world around them. The way people think gets encoded in magical frameworks in both physical objects like monuments and dwellings, as well as in less permanent expressions, like music, foodways, and folklore. Folklore, and especially storytelling, acts as a transmission system between listener and audience in which story elements become cultural shorthand. As a

part of folkloric traditions, ghost stories are not just superstitious entertainment pieces, but often have educational or moralistic value for the listeners. Even if the teller or their audience does not believe in the factual truth of the story, the pieces of the story emerge from a cultural lexicon of understanding. Ghost stories, especially when describing places, people, and things in the real world, indicate legitimate cultural relationships among those things. This paper explores a set of ghost stories from Missouri by modeling recurring story elements in relation to place and archaeological/historical sites to indicate how folklore informs understandings of culture and belief.

Using Geophysical Survey to Relocate Missing World War II–Era American Graves and a Large Postwar Unmarked Cemetery near Stalag Luft VI, a German POW Camp in Macikai, Lithuania

In 1944, on separate occasions, three US military airman died while interned at the Stalag Luft VI German prisoner-of-war camp in what is now the Village of Macikai, Lithuania. All three were interred in a small burial area, along with at least one other (a Canadian airman), located outside the camp perimeter fence. While accounts of this burial area's location, along with ground-based photographs, are readily available, its exact location has been lost since the war. In 2019, in partnership with the Defense POW/MIA Accounting Agency, Ohio Valley Archaeology Inc. was tasked with locating the American burials by conducting geophysical surveys on three areas selected based on burial detail accounts. Ground-penetrating radar and magnetic gradiometry were used to survey all three areas (2.8 ha). Probable and possible graves were detected in three locations, including in a small area consistent with the burial accounts and a large triangular area with at least 1,000 previously unknown graves. Subsequent excavations have (1) confirmed the presence of graves, (2) resulted in the recovery of the three Americans, and (3) confirmed the presence of a large, previously unknown postwar cemetery associated with the Russian gulag that repurposed Stalag Luft VI.

Mapping the Historic Baptist Tabernacle in Oak Bluffs, Massachusetts

In August 2023, an archaeologist from Michigan State University and participants living and vacationing on Martha's Vineyard, an island off the coast of Massachusetts, documented and mapped the remnants of a nineteenth-century Baptist Camp Meeting site in Oak Bluffs. Utilized by Baptist groups for weeklong revivals from 1875 until ca. 1930. The Baptist Temple Park site is important to the recent history of Oak Bluff. Today the Baptist Temple and the revivals held there are seen as part of the story of why many families first moved to the area and as one of the core reasons there is now, and has historically been, a strong history of African American homeownership in the Highlands and East Chop regions. Our investigation in Baptist Temple Park mapped the remnants of the temple structure and the walking paths throughout the park. Preserving the location of these remnants and describing them in detail will help us better understand the location of the Tabernacle, its construction, and its physical and historical orientation to the neighborhoods around it. The investigation also serves as an entry point for introducing archaeology as a tool for investigating and preserving the past in Oak Bluffs.

Burnett, Paul (SWCA Environmental Consultants), Kristin Barker (Beyond Yellowstone Program) and Lawrence Todd (University of Wyoming)**[171]***Elk and Archaeological Models in the Shoshone National Forest*

Since 2009, we have been modeling archaeological probability in the Shoshone National Forest. These have been continually refined as new data become available. Now, using newly available elk collar data, we compare patterns in the archaeological record with those of elk movements to evaluate correlations. We compare elk locations with archaeological probability and model elk probability using the same suite of environmental parameters. The elk probability models identify their potential past occupation or migration areas, and the archaeology near these areas may signify past procurement locations that have since been abandoned. We will present these models for further consideration in relating migration corridors to the archaeological record.

Busby, Ashley (Shumla Archaeological Research & Education Center)**[282]***Painting Methods and Process: A Compositional Analysis of Pecos River–Style Murals*

A compositional analysis of pictographs of the Lower Pecos (LP) Canyonlands, located in Southwest Texas and Northern Mexico is presented. The complex systems utilized by LP artists in their painting process are examined, including symmetrical organization of forms and intentional arrangements of figures in a scene (typically a portion of the site). A dimensional analysis of the paintings include on-site measurements and experimental reproductions of common mark-making techniques. An analysis of the formal elements of shape, line, space, and diversity of mark-making in these paintings demonstrates the ways in which LP artists built expressive, visual narratives.

Bussiere, Lauren (Texas Archeological Research Laboratory, University of Texas, Austin)**[305]***It's Our Mess Now: Changing Values, Problematic Legacies, and Visioning Change in Archaeological Collections Management*

In recent years, many leadership positions at archaeological repositories and museums have been filled by a new generation of archaeologists, collections managers, and curators. These early- and mid-career professionals' education and training has taken place since the enactment of NAGPRA, and our lived experiences have been marked by the growth of the digital world, climate change, and acute awareness of structural inequalities. As such, many of us bring to our work a value system that is often at odds with the principles and practices that have historically governed our institutions. As we step into these roles, we struggle to implement meaningful change within institutions burdened by insufficient resources and constrained by bureaucratic policies. We are tasked with rebuilding relationships and providing excellent collections care after decades of damaging colonial practice. This presentation explores the ways that new

leaders in this field are grappling with the problematic legacies of their institutions and presents an actionable framework to plan for and enact structural change.

A Study of the Materiality of Codex Tonindeye: Some Preliminary Results

The Codex Tonindeye, also known as the Codex Zouche-Nuttall, is one of the most striking examples of prehispanic Mixtec historiography and artistry. Brought from Mexico to Italy, it was preserved for centuries in the Dominican convent of San Marco, Florence, until the middle of the nineteenth century, when it was sold to England. Since 1867, it has been held at the British Museum. A new multidisciplinary research project organized by the Santo Domingo Centre of Excellence for Latin American Research (British Museum) and the MOLAB mobile laboratory is currently studying the materiality of Codex Tonindeye. The close inspection of the manuscript provided new insights on its painting process, revealing the existence of deletions and repaintings, some of them never seen before. Hyperspectral imaging spectroscopy (HIS), UV-vis-NIR Fiber Optics Reflectance Spectroscopy (FORS), and External Reflection Fourier Transform Infrared Spectroscopy (ER FTIR) provided information to chemically characterize the painting materials while further techniques (XRF, Raman, RTI, microscopic imaging, etc.) will be applied in the near future. The paper presents the preliminary results thus far, both in terms of the painting materials and the painters' working method, providing a fascinating glimpse on "Mixtec historiography in the making."

The Ust'-Menza 14 (Lagernaya) Site and Its Place in the Middle Upper Paleolithic of Southern Siberia

With implications affecting numerous anthropological debates, Paleolithic discoveries in Siberia are important to understand how humans initially spread across Eurasia and into the Americas. Here we introduce Lagernaya, a middle Upper Paleolithic site in the Transbaikalian Region of southern Siberia. Three ¹⁴C dates from the site's oldest cultural layer indicate a possible age >30,000 cal BP. Its stone tool assemblage is characterized by large, informal tools made on local river gravel, and smaller, more formal tools using high-quality, exotic raw material. While there are small, amorphous flake and bladelet cores, no evidence of formal wedge-shaped microblade technology exists. Given its elevation above the modern channel, and other geological and pedogenic evidence, the site was believed to be associated with the Menza River's second terrace, but it now seems that the oldest material is in a buried part of an older Chikoi River terrace. Furthermore, most, if not all, of the artifacts and features may be in a secondary context, displaced from their original location by erosional flooding. Despite these shortcomings, research at Lagernaya has the potential to

yield valuable information about the Siberian Upper Paleolithic just before, or possibly during, the Last Glacial Maximum.

Multi-Plied Research Methods: Choctaw Traditional Textiles and Collaborative Research on Southeast Fibers, Cordage, and Garments

Since 2018, the Choctaw Nation of Oklahoma Historic Preservation department has worked to reawaken pre-European contact knowledge of fiber technologies. Drawing on archaeological and ethnographic sources, this applied archaeology work is approached through both collaborative models of research and experimentation and community engagement. This presentation will discuss ways that communities, in this case the Choctaw Traditional Textile group, can engage with past perishable technologies through the act of making and studying extant materials alongside others in both hands-on and virtual engagements (i.e., Zoom). The Choctaw Nation Cultural Center, opened in 2021, provided an opportunity for Choctaw makers to learn and apply textile techniques including cordage production and twining to contribute to diorama exhibits. Through an iterative process, the Choctaw Traditional Textiles group has continued to refine material processing and cordage preparation techniques by engaging with extant collections and experimentation with fiber sources. This process has expanded our ability to represent and educate on the textile traditions of ancestral makers while empowering Choctaw artists and rebuilding connections to Choctaw homelands through engagement with native fibers. Finally, this applied work informs broader academic and museum archaeology fields through the presenter's dissertation research design and data collection on extant cordage and textile materials.

Soil Micromorphology Applied to Ceramics from Chupícuaro: The Search of Raw Materials in Volcanic Contexts

Regional geology affects the mineralogical and geochemical footprints of ceramics components, yet in relative homogeneous areas, the first approximations of ceramic petrogroups can be difficult to define. One approach

is to apply concepts derived from soil micromorphology, regarding stable elements or pedorelicts that may be preserved despite the complex history of the artifact. During the Chupícuaro occupation phases consider the dominance of sand fraction components derived from local geology (this includes the presence of volcanic glass, with some variants, as well some ignimbrite textures) including a general affectation by hydrothermalism. Particularly, in the Chupícuaro phase, ceramics with fine sand fraction components present mica group minerals and reworked clay illuviation pedofeatures. The subsequent Mixtlan phase present a minor contribution of Fe-Mg minerals and volcanic glass. A contrasting aspect is the optical activity of the clay matrices between the two occupation phases, particularly from the Mixtlan phase where it is possible to observe striated fabrics associated with manufacture traces related to the ductile-brittle state of the paste. This last technical aspect needs more detail in its characterization and comparison with the “natural” conditions of clay mineral genesis in the local soil prospection as raw materials.

Life and Death: How Infant Burial Practices in Buen Suceso Reflect Social Practices, Status, and Community
Infant burials during the Ecuadorian Formative (3800–1450 BC) took several forms, including as offering deposits at ritual locations, as burials accompanying adults, and as primary burials in cemetery contexts. This variation may reflect important differences in the status of these infants, their life experiences, and/or how Formative peoples viewed infancy. In this poster, we present infant burials from Buen Suceso, a Formative site on the central Ecuadorian coast. Here, infants were buried in public spaces, in domestic/utilitarian structures, and in a formal cemetery. We compare mortuary goods, burial style and examine skeletal evidence of pathology and trauma for these individuals. Different burial locations and styles may reflect emergent ranked status, based on the distribution of pathological lesions. However, infants buried in the cemetery were more likely to be associated with ceramics, figurines, and shells, items that held significance for the Buen Suceso community. Thus, the connections between early life experiences of health, special grave goods, and burial location do not clearly depict emergent ascribed status. In this poster, we showcase how infant remains can reflect nuances in community structure and may have also been treated differently from adults as part of a larger ritual practice.

Visualizing the Vergennes Archaic: Using 3D Imaging to Highlight the Importance of Vermont's Ketcham's Island Site
The Ketcham's Island (KI) site in Brandon, VT, provides an important window into the lifeways of Vermont's native peoples in the Late Archaic period, including residential structures, extensive toolkits, and subsistence strategies. Despite the significance of Ketcham's Island to local history, though, few Vermonters are aware of the site and detailed information about the site is not easily accessible to either academic researchers or members of the general public; artifact collections are dispersed and the site itself is not easily visited. In this poster, we present efforts to bring information about the Ketcham's Island site both to a general audience and the broader academic community. These initiatives include airborne photogrammetry to bring the past environment to life, as well as 3D scanning and printing of Ketcham's Island artifacts from around the state. Artifact models are now united digitally, provided easier access to researchers, while 3D printed replicas are being used in community outreach events. Together, these efforts have produced data for more in-depth academic research and helped make the early history of Vermont come alive for members of the general public.

Cabrera, Kevin**[246]***An Osteobiography of Tomb Op. 42, Ent. 5 from Copan, Honduras*

This research constructs an osteobiological narrative of two females and a male from Copan, Honduras, who were placed together within a Classic period (AD 600–822) tomb in the residential group Salamar (8L-10) Op. 42. Utilizing mortuary and isotopic data, this case study emphasizes aspects of personhood reflective of perceived sex, gender, and identity within the culturally diverse Copan society. Aspects of personhood, including gender roles, are embodied on the skeleton, enabling researchers to identify life history events and reconstruct daily practices. An osteobiographical approach best explores the personal journey of each individual by providing highly specific context reflecting individual social and environmental experiences. This case study examines the lives of these three individuals, hypothesizing how they became entangled in their death and how these stories fit into Copan society as a whole.

Cabrero-Miret, Ferran**[62]***“Tola Boayacu Puyu” (Upper Pastaza, Ecuador) in the Understanding of the Amazonian Urbanism and Food Consumption*

In the last 50 years, from Amazonian archaeology there has been a remarkable and growing debate about the origin and dispersion of the cultures of the area, their carrying capacity, population number and density, political structure, and links with the adjacent geographical areas, as the Andes to its western border. More recently, carrying capacity and paleobotanical analysis have added complexity to interpretations, yielding unpublished data for the region. This report presents survey and excavation results from the site “Tola Boayacu Puyu,” located in the city of Puyo, Ecuador, and shows ceramics from the Regional Development period (500 BC–AD 500) to the Integration period (AD 500–1500). Analysis of carrying capacity and the biocultural remains are especially presented, including results in paleodiet and macronutrients showing an important variety of foods. Jointly with other archaeological sites in the Upper Pastaza (e.g., Río Chico, Té Zulay), “Tola Boayacu Puyu” is an example of a certain type of Amazonian urbanism and an opportunity to compare different settlement patterns nearby, like those of the Upano River.

Tropical forests have often been synonymous with “wilderness” in popular discourse. However, the last couple of decades of research in archaeological, paleoecological and historical ecology have revealed that these ecosystems have actually been intensively managed by our species from at least 45,000 years ago. This necessitates reevaluation of traditional ecological and conservation approaches across the tropics. Here, we highlight how the key constituents of tropical forests, trees, can constitute a “living archaeology,” with their rings, growth patterns, and chemistry recording long-term human-environment interactions. Focusing on the

case study of pre- and postcolonial forest management in the Amazon Basin, we discuss how combined application of stable isotope analysis, dendrochronology, ancient plant genetics, and geographic information systems techniques are providing new insights into the lasting legacies of changing human land use and socioecological changes. We argue that this method holds much potential across the tropics and emphasizes the significance of tropical trees from the perspective of cultural as well as natural heritage.

Reconstructing Ancient Mesoamerican Cuisine through Innovative Imaging Techniques of Amorphous Carbonized Objects

Archaeobotanists (paleoethnobotanists) often come across small, amorphous carbonized objects (ACO) in their flotation samples. However, identifying ACO's is often difficult, and as such, they mostly remain unidentified. New ways are therefore necessary to study these objects, which, we hypothesize are in some cases the remains of complex food preparations. One way is using nondestructive SR X-ray microtomography (μ CT), a key technique to consider for the imaging of archaeological materials. For the very first time, phase-contrast SR μ CT was applied to putative food remains from Mesoamerica and to experimentally prepared foods. In this paper we present the methods and preliminary results of the study of ACO's from Mesoamerican contexts. These data provide novel information on the ingredients used and the ways in which foods were prepared by Classic period (AD 250–900) populations living at Teotihuacan in Central Mexico but also in the Lowland Maya region.

Individual and Collective Insights Lost through Commingling

Commingling of skeletal remains is largely acknowledged to occur in response to taphonomic factors in situ or secondary practices post-interment. However, data is frequently lost from commingling in museum collections due to curatorial practices. Here, commingling through curation and its ramifications are explored in an Egyptian legacy skeletal collection, Lisht. Skeletal remains from Lisht were excavated beginning in 1906 and, starting in 1908, were curated by the National Museum of Natural History. This skeletal collection represents one of the first collections Dr. Hrdlička curated as the Physical Anthropology curator and exemplifies the ramifications of commingling through his curatorial practices. A comparison between archival and osteological datasets from Lisht shows that while information is lost at the excavation and documentation stage of fieldwork, there is precipitous data loss at the curation stage. A minimum of 585 individuals were identified; however, postcranial elements were associated with only 51 individuals. During curation, skeletal elements were separated by bone type, removing the potential for analyzing distributions of an individual's features. These ramifications are compounded by the loss of associated mortuary contexts, for which 48% of tombs recovered with skeletal remains have lost skeletal data, further limiting narratives on mortuary experiences.

Cajigas, Rachel (University of Alabama)**[75]***The Agricultural Landscape at La Playa*

The La Playa site is a compelling example of large-scale anthropogenic modification within a landscape of change through deep time. The development of irrigation technology and agricultural intensification in the Sonoran Desert was deeply entwined with changing climatic and geomorphic conditions. As the largest identified Early Agricultural period site in the southwest United States/northwest Mexico, La Playa is a key case study in understanding the development of early agricultural technology in a dynamic region. At least 3 km² of the site is a vast agricultural landscape that includes earthen canals, field grids, and water diversion features constructed on the silty floodplain of the Boquillas River, all in various stages of destruction or threat of destruction due to rapid erosion of the relict floodplain. Following the end of the Early Agricultural period, geomorphically unstable conditions on the floodplain led to the abandonment of the irrigation system. Although there is no evidence of intensive agricultural practices after this time, people continue to occupy La Playa in the following centuries, creating new earthen canals and possibly reusing and expanding the ancient canals.

Callaghan, Michael (University of Central Florida)**[122]***Chair***Callaghan, Michael (University of Central Florida) and Brigitte Kovacevich (University of Central Florida)****[122]***Ritual and Cultural Process in the E-Group Complex at Holtun, Guatemala*

In this paper we present data from investigations of Group F, or the E-group complex at Holtun, Guatemala. Named for the group at Uaxactun where this specific architectural compound was first identified, the Holtun E-group contains a large pyramidal structure to the west and a range structure to the east. First believed to be celestial observatories, E-groups are now known to have functioned in many ways involving gatherings of large groups of people, including agricultural and other rituals, possible markets, and royal ascension ceremonies. Here we combine various lines of evidence to show that E-group ritual activity reflected significant events in the history of Holtun, including its founding as a sacred site during the Middle Preclassic period, the possible establishment of kingship by the Late Preclassic period, warfare and abandonment at the close of the Terminal Preclassic period, and repopulation and renaissance during the Late Classic period. While the Holtun E-group demonstrates connection with a larger tradition of lowland Maya ritual practices, it also displays local innovation. This leads us to argue that the study of Maya E-groups must focus on differences as much as similarities, in an effort to reveal important regional cultural manifestations of larger interregional ritual practices.

Callaway, Graham (College of William and Mary)**[303]***Patterns of Ecological Succession and the Archaeology of Living Trees*

Human activities have a strong influence on the species makeup of wooded landscapes. This means that the species present in a wooded area can be a useful line of evidence for understanding past land use. However, patterns of ecological succession are complex and influenced by many factors, including the types of plants and animals present, growing conditions, and ongoing human activities. This paper explores how wooded landscapes can be understood in terms of past successional patterns, visible to us through the living plants on the landscape. Most wooded areas can be productively understood as a co-creation of humans, other living things, and ecological conditions, and understanding these patterns can provide new insights about archaeological landscapes. A case study will be presented from Mecklenburg County, Virginia, USA.

Callaway, Taylor (College of William and Mary)**[325]***Chair***Callaway, Taylor (College of William and Mary)****[325]***The Afterlife of Feasts: Feasting and Ritualized Deposition in the Middle Woodland Tidewater*

In this paper, I consider the Middle Woodland period (500 BC–AD 900), a time in which forager-fishers moved across the central Atlantic seaboard in seasonal rounds, regularly returning to particular locales for large-scale feasting events. By analyzing the ceramic characteristics and feature distributions at a prominent Middle Woodland gathering place known as the Maycock's Point site, I discuss the ways ritualized deposition was integral to Algonquian commensalism. While feasting remains are often treated as simple byproducts of commensal events, the recent theoretical return to depositional practice allows us to reframe such deposits as purposefully curated assemblages with significance that far exceeds the feast itself.

Calongos Curotto, Manuel (University of Pittsburgh)**[193]***Chair***Calongos Curotto, Manuel (University of Pittsburgh)****[193]***Between Lunahuanas and Incas: Imperial Landscape in the Middle Cañete Valley, Peru*

The Cañete Valley was of great economic importance to the Inca Empire. The presence of sites like Huacones/Vilcahuasi in the lower section of the valley or Incahuasi in the middle section, both of them having various sets of storage facilities, shows the significance of the intensive agricultural production of the valley. However, we still do not understand how local communities accepted and/or negotiated Inca presence in their homeland. This presentation focuses on how different features on the territory were used or built to create an imperial landscape in which local identities and practices were contested with imposed Inca practices in the middle section of the Cañete Valley. I will present data about three different types of settlements: cemeteries, shrines, and control stations. In the first two types of settlements, we have cases in which different traditions merge in the same place, while in others, there is a clear differentiation between them. Control stations along the Inca Road, which usually present walls, function as a way to control the movement of people, but also as possible boundaries among different types of territories. I proposed these settlements were essential elements in the strategies of control of the Inca Empire.

Calvo Trias, Manuel (University of Balearic Islands)**[18]**

About Islands and Islanders: Mobility, Connectivity, and Identity in the Balearic Islands (Mediterranean Sea) during the Bronze Age

During the Bronze Age, the archaeological record of the Balearic Islands in the Mediterranean Sea reveals a conspicuous prevalence of similarities across all the islands within the archipelago. To elucidate the mechanisms underlying this convergence phenomenon within the archaeological record, we developed a study centered on the analysis of mobility and connectivity dynamics. This project generated an expansive theoretical, methodological, and analytical framework. This framework encompassed a diverse array of methodologies, including the examination of ceramic production through archaeometry and technological assessments, investigations into metal production, isotopic analyses, and the application of isotopic techniques to analyze the mobility patterns of domesticated animals. Furthermore, we conducted a study of maritime seafaring strategies between the islands employing geographic information systems (GIS) analysis, coupled with an examination of meteorological maritime conditions. Through the compilation and analysis of these datasets, we have garnered valuable information about the mobility and connectivity strategies employed by the Bronze Age island societies of the Balearic Islands. Additionally, our research has afforded us the opportunity to think how these dynamic processes actively contribute to the configuration of identity among island communities, both on individual islands and across the entirety of the archipelago.

Mobility, Foodways, and Ancient Statecraft in the Gobi-Steppe of Mongolia

From the appearance of monumental traditions in the Late Bronze Age (ca. 1500–1000 BC) through the emergence of the Xiongnu state (ca. 250 BC–AD 150), populations of the semiarid Gobi-steppe of Mongolia underwent a series of dramatic transitions. These changing dynamics altered how people interacted with and moved within the landscape, transformed subsistence and habitation practices, and spurred the development of inter- and intraregional political complexity. Investigation of shifting mobility patterns and foodways provides concomitant throughlines for these transitions, linking local and regional changes in community-level organization to better understand the position of Gobi-steppe populations in the rise of the first nomadic state in eastern Eurasia. This paper integrates several lines of novel biomolecular evidence (stable and radiogenic isotopes, lipid residue analysis, proteomics) from the Gobi-steppe of southeastern Mongolia to chart diachronic changes in human and livestock movement and subsistence during the Late Bronze Age, the Early Iron Age (ca. 1000–400 BC), and the Xiongnu period. These data are discussed in relation to what is currently known about the development of cultural and political complexity in Mongolia, with specific focus on what regional changes in mobility and foodways can tell us about the formation and structure of the broader Xiongnu state.

Campbell, Rod (Institute for the Study of the Ancient World, NYU)**[56]***A Commons Approach to Violence and Inequity: Public Goods, Enchaining, and the Reconstitution of the Shang Kingdom under Wu Ding*

In Chinese archaeology the question of how large-scale political collectives came into being is usually understood under the rubric of “state formation.” In addition to the issue of the potential reification of an anachronism in the state concept, early complex polities are generally imagined in terms of political and

economic centralization with the focus on first occurrences. The implicit assumption is that once “states” have formed, a new era has dawned and the rest is just politics. This perspective tends to obscure the fact that every polity is both a novel experiment and a continuation of historical precedent and that inflection points and structure changing events occur at multiple scales and temporalities. I will focus on the Shang kingdom centered at Anyang during the reign of king Wu Ding (ca. 1250–1200 BCE). I will analyze Wu Ding’s institutional innovations as a set of solutions to the problem of establishing and maintaining a hierarchical political community against a backdrop of diverse elite and non-elite interests. It will be argued that a commons perspective enables an understanding of how prestige practices were re-coded as public goods allowing both for their expansion and redeployment in the service of enhanced inequity.

Building Back Past Diné Communities: Ricos, Pobres, and Naat’aanii Status in Pericolonial New Mexico

In the mid-1900s, American anthropologists characterized Diné society as a four-tiered social organizational structure with “natural communities” at the highest level. Often referred to as regional “bands,” these geographically defined, economically self-sufficient, multifamily social entities were loosely organized under the nominal leadership of local *naat’aanii* (“headmen”). The unifying structure of these otherwise dispersed communities would have been shaped by repeated marriages among localized lineages that in turn served to structure traditional farming and herding-focused land use practices mediated by traditional *k’ée* kinship ties (i.e., *k’ée*). This concept has been most thoroughly developed in the intensively pastoral context of Reservation-era Diné society (AD 1860–present; Kelley and Francis 2019); however, questions abound regarding the structure of Diné land tenure in earlier centuries. In the spirit of improving our knowledge about early Diné social organization, this paper endeavors to extend the tenets of the *k’ée* system into the seventeenth and eighteenth centuries, where Spanish records hint at the enigmatic sociopolitical and economic roles of Diné “capitanes” on the colonial New Mexican frontier. How can a Diné-focused archaeology help us to better understand Diné organizational logics in a world where numerous changes, including widespread fortress building and apparent pastoral growth, were well under way?

The Importance of Different Ontologies for Heritage Conservation in the Maya Area

Heritage conservation has as one of its main objectives the recovery of specific values defined on many occasions by restorers and trained professionals. However, these values might not be the same for everyone. How can restorers incorporate the different ontologies regarding heritage in their conservation treatments and policies? Through a case study of a Maya indigenous community in the state of Chiapas, the meanings and values of two different kinds of heritage are studied. The community of Francisco Sarabia worships on the one hand, a Catholic canvas painting from the eighteenth century depicting the “Virgen Corazón de María”; on the other hand, the Postclassic archaeological site of Tenam Puente gets intertwined with the Catholic religion and their Maya cosmivision, playing a relevant role in the agricultural cycle, being the Acropolis of the archaeological site the destination of a pilgrimage carried out once a year by the community to honor the “Virgen.” Through an ethnographic approach, the different ontologies related to this patrimony are unveiled, serving as a starting point to better understand the role of the restoration processes and the possibility of creating more inclusive conservation policies.

Campos-Hernandez, Cinthia (Binghamton University)**[256]***A Comparative Analysis of Trincheras Tradition and Hohokam Subsistence Practices from ~400 to 1450 CE*

For nearly a century, archaeologists have debated the subsistence adaptation of the Trincheras Tradition of Sonora, México. Nineteenth-century scholars hypothesized that they were foragers until the arrival of the Hohokam around 1300 CE. Having recently excavated Snaketown in the Phoenix basin, archaeologists had characterized the Hohokam by their extensive crop irrigation canals along the Salt and Gila Rivers. After failing to observe similar features to those of the Phoenix basin Hohokam, the Trincheras were interpreted as bands of “desert Hohokam” who had adapted to the marginal environment as hunters and gatherers. Although archaeologists often generalize the Hohokam as a whole, research has revealed micro-traditions that share similarities and differences in settlement and subsistence patterns. Nineteenth-century archaeologists referenced the Papaguerían Hohokam, whose southernmost extension is the town of Caborca, east of the Magdalena Valley, part of the Trincheras’ heartland. Recent research has allowed us to reevaluate and test these early hypotheses regarding regional subsistence adaptations and micro-traditions. This study presents archaeological and macrobotanical results from all excavated Trincheras sites to compare their subsistence patterns to that of the three Hohokam micro-traditions through time. This study challenges the notion of Hohokam and Trincheras as monolithic and contrasting neighboring cultures.

Campos Martinez, Miriam (UC Merced)**[114]***Chair***Campos Martinez, Miriam (UC Merced), Manuel Duenas-Garcia (UC Merced) and Guillermo Aguilar Martinez (Universidad de Guanajuato)****[114]***Chemical Analyses and Activity Areas at Cerro de en Medio: A Multidisciplinary Approach*

This interdisciplinary archaeological study centers on Cerro de en Medio (CDEM), an ancient site in the northern reaches of Mesoamerica during the late Classic period (600–900 CE). Advanced chemical analyses of occupation floors provide insights into CDEM’s activities, revealing its intricate social dynamics. The research combines this chemical analysis with artifact examination and architectural layout studies, fostering a comprehensive understanding of enduring activities at CDEM. CDEM is located in Aguascalientes, in the central-northern region of the country, atop a 2,100 m (6,890-foot) hill. It is encircled by rhyolite ravines and horizontal tuff layers. The rocks’ erosion resistance shaped the stepped hill landscape, influencing the daily lives of ancient inhabitants by providing essential lithic raw materials and impacting tool-making practices. Our study identifies distinct activity areas in CDEM: lithic tool production (including arrow points and scrapers), storage, and service ceramics. Chemical floor analysis delineates specific areas—food preparation, consumption, storage facilities, and a dedicated nixtamal preparation area. This understanding is vital in an area where agriculture is challenging. CDEM’s households provide insight into subsistence strategies complemented by the site’s unique characteristics.

Campos Quintero, Lina (Archaeologist of the Gold Museum), Luis Carlos Choperena-Tous (Independent Archaeologist), Julián Gamboa-Mendoza (Sacyr), Marcos Martín-Torres (University of Cambridge) and Agnese Benzonelli (University of Cambridge)**[118]***Changing and Exchanging Social Values of Metals: The Integration of Tumbaga and Iron Objects in Indigenous Graves in the Colombia’s Caribbean Region*

Although the colonial order between the sixteenth and eighteenth centuries transformed the use and trading of metal objects employed in indigenous funerary practices in Colombia’s Caribbean region, it also enabled local goldwork traditions to continue. Particularly, in the lower-Magdalena River region, the “Malibú” buried

their dead with typical tumbaga objects from a long-lasting regional tradition, along with iron tools traded and worked by either Spanish or African enslaved people. Here, I suggest how, even though the colonial institutions tried to reduce the mobility of indigenous people by making villages and encomiendas, the great mobility of the “Malibú” along the river could have had an impact on the intraregional trading networks for metallic objects. Stylistic and compositional analyses of tumbaga and iron objects at two archaeological sites, San Felipe and La Pasión, enabled the coexistence and integration of metal technologies of different origins to be described. On the one hand, performing chemical analyses of the tumbaga objects allowed the lost-wax casting and depletion gilding techniques, which indigenous goldsmiths before the Spanish conquest were experts at, to be characterized. On the other, stylistic and compositional analyses of iron provide a first chemical approach in Colombia to suggest origins of the metal.

Chinese Mining in the Snake River Canyon of Southern Idaho

In the autumn of 1870 Euro-American miners in the Snake River Canyon lifted their prohibition of “Chinese emigration” enacted the previous May at the Shoshone Falls. Historic accounts suggest the easily accessible river bar deposits were playing out, and as one miner noted, “The Chinese are better adapted to this sort of mining.” While most Chinese initially worked as laborers, claims were eventually being “bargained and sold.” One claim in particular was transferred from Relf Bledsoe to Ah Mon Mong and Tung Tock Tong in November 1871. The influx of Chinese during this time coincided with the completion of the Transcontinental Railroad. In the fall of 2023, Cannon Heritage Consultants received a grant from the Twin Falls Historic Preservation Commission to begin survey work in the Canyon toward developing a National Register District Nomination. This paper will discuss the results of the initial phase of the survey in the context of the Chinese diaspora.

Adaptive Water Management in the American West: Utah Case Studies in Technological Innovations and Community Cooperation

The western United States has experienced dramatic population growth for the past century and a half and fluctuating water resources even longer. For example, there is increasing evidence that people began diverting water from Utah’s streams and rivers during the Fremont period (ca. AD 1–1300). As early as 2,000 years ago, the Ancestral Puebloans did the same in central and southern Utah. Research within the broader Four Corners Region shows that the introduction of maize agriculture was accompanied by various irrigation techniques at least 3,000 years ago. Still, also that variable water resources impacted settlement patterns and migration for centuries. Though few historical or archaeological studies of Utah’s water management, the evidence suggests that residents have long harvested water, developed adaptive water management strategies, and created technological innovations to ensure access to water sources. Drawing on case studies that preserve past irrigation systems, we examine the changing use and construction of water infrastructure over time that inform on community-water dynamics. Within this comparative approach, we identify salient components of ancient and historic water infrastructures that enabled sustainable water management in arid regions.

Before the Aurora of Hegemony: How the La Corona Community Brooked the Kaanul Dynasty

By examining archaeological and epigraphic evidence from the northwestern Petén during the Classic period, we can gain valuable insights into the strategies used by the Kaanul dynasts to establish and maintain a unique regional hegemony in the Maya Lowlands. We focus on the site of La Corona where we have integrated archaeological and epigraphic data to examine the significance of the early rulers in this particular geographical area. Looking at architectural construction, ceramic affiliation, epigraphy, and settlement, we investigate the changes in the nature and organization of the La Corona community in the AD fifth and sixth centuries. Based on the available data, we suggest that the northwestern Petén region held significant strategic importance, serving as a crucial location for both the initial expansion of the Kaanul dynasty in the early AD sixth century and the subsequent transformation and maintenance of its dominant control during the AD seventh and eighth centuries. We, therefore, aim to model in what ways the changes in the Kaanul dynasty regime impacted this community and set it on the course to become its long-standing subordinate ally.

Finding the Everyday: Coles Creek Non-Mound Spaces in the Natchez Bluffs

There has been a long-standing interest in the Coles Creek (AD 700–1000) mound centers of the Natchez Bluffs region in the Lower Mississippi Valley (LMV), however, work focused on non-mound spaces is lacking. Few Coles Creek structures that are unassociated with mounds have been excavated, which makes answering questions about everyday life and settlement patterns difficult. Over the summer of 2023, I conducted archival work and preliminary survey to locate previously recorded non-mound Coles Creek sites in the Natchez Bluffs. Here, I present results from this work and propose a methodology for future survey and analysis to identify additional non-mound spaces and everyday activities carried out within those spaces. This study will provide a better understanding of the daily lived experiences of Coles Creek peoples outside of monumental mound centers and the role of the home in the Natchez Bluffs landscape.

Exploring the Underwater Zooarchaeological Record of Lake Titicaca

Lake Titicaca is one of the centers of early cultural development in the ancient Andes. Because of its sensitivity to climate change, the surface of the lake has fluctuated considerably over time, which in turn has influenced the development of ecological systems and cultural development. This paper focuses on the archaeofaunal remains recovered in the context of recent underwater archaeological explorations in Lake Titicaca. Specifically, we describe and compare the zooarchaeological assemblages of two sites, Ojjelaya and Khoa. Ojjelaya was a residential village inhabited during the Late Formative period (400–500 CE) and likely abandoned due to flooding. Khoa was an offering shrine during Tiwanaku (800–1000 CE) times. The faunal remains from Ojjelaya comprise heavily fragmented and incomplete camelid remains, confirming they were deposited as a result of domestic activities. In contrast, the faunal assemblage of Khoa consists of mostly complete elements of juvenile llamas, likely sacrificed in situ. At both sites, an abundance of fish and frog remains as well as additional indicators suggest a taphonomic background dominated by aquatic taxa and verifies that both ecological processes and human behavior contributed to the formation of the complex zooarchaeological record preserved in Lake Titicaca.

“We Used to Always Burn That”: Anthropogenic Fire Regimes and Cultural Resilience at túl'mən'

On September 7, 2020, the Cold Springs Fire ignited on the Colville Indian Reservation during a significant wind event, with flames racing southward 50 miles overnight, crossing the Columbia River and igniting the Pearl Hill Fire. These fires eventually charred a combined 413,673 acres, including some of the last vestiges of Washington's fragile shrub steppe ecosystem. Not unexpectedly, the obliteration of both invasive and disproportionately dense stands of native vegetation allowed the return of countless plant species of cultural significance to the Moses Columbia Tribe and the Confederated Tribes of the Colville Reservation of whom they are a member. The subsequent resurgence of subsistence gathering within, and the recollection of ancestral anthropogenic burning practices and teachings specific to, this area speak to the regenerative qualities of fire in landscapes long managed through its controlled use. As climate change related wildfire events become more frequent and more devastating, the recovery of knowledge related to the management of the shrub steppe through the anthropogenic use of fire becomes ever more critical. How might archaeological and historical inquiry support Indigenous efforts to reinstitute anthropogenic burning regimes in support of cultural resurgence and ecosystem resilience?

A Failure of Imagination: North Coast Peruvian Irrigation under Spanish Colonial Rule

Ethnohistoric documents describe the north coast as a verdant, irrigated landscape at the time of Spanish conquest; yet, only a few decades later, colonial archives are filled with legal disputes over water rights, water shortages, and the desertification of farmland. Cataclysmic demographic collapse caused by the introduction of European diseases accounts for some system degradation in those early years. However, archaeological and ethnohistoric evidence suggests that a failure of imagination might also be to blame. Failure is defined as a mismatch between intended outcome and actual outcome, and it often occurs due to a misunderstanding of the nature of the problem being addressed. This paper argues that a fundamental misreading of the north coast environment underlies the many “small-f” failures that plagued the Spanish colonial farming system (many of which persist, even today). It presents three examples that exemplify this misreading: (1) a prehispanic canal “designed to fail,” (2) a prehispanic dam feature designed to leak, and (3) a twentieth-century account of a canal branch designed to be flooded. These cases demonstrate that prehispanic and autochthonous, modern-era water management infrastructure targeted elements of the north coast environment ignored or misunderstood by colonial farmers.

Interdisciplinary Investigations in Teotihuacan’s Tlajinga District: Disentangling Public and Private Uses of Space

Since the project’s beginnings in 2012, Luis Barba has been a codirector of the Proyecto Arqueológico Tlajinga Teotihuacan (PATT), helping to bring an interdisciplinary research program to studying neighborhood organization and domestic life on the southern periphery of this early Mexican metropolis. After first investigating apartment compounds and the southern extension of the Street of the Dead, the project has recently focused on understanding the construction history and uses of elevated platform complexes in Tlajinga’s southern neighborhood center. Compared with the apartment compounds of the district, these complexes were more elaborately made and decorated. Their larger courtyards and patios served some ceremonial functions but the complexes may have also served as residences for intermediate elites. Elucidating the nature of more public versus more private activities in the complexes requires interdisciplinary research combining excavation and artifact analysis with geophysical prospection and floor and artifact chemistry.

What Happens in the Ivory Tower: The Academic Trade of Archaeological Human Remains

While much of the recent discussion around the trafficking and illicit trade of human remains focuses on the black market and sales utilizing sites such as eBay or various social media platforms, we examine the historical practice of sending (or trading) human remains within academia. Historically, scholars from academic institutions throughout North America were well known for moving partial or complete collections of human remains between institutions for use in comparative collections or to facilitate specialized analyses. Such trades or loans were often based on what are widely described as “handshake agreements,” where no paperwork exists to document these transfers. Through this “sharing of resources,” human remains were often separated from important contextual information, as well as associated cultural materials and human remains. In this paper, we describe the historical practice of undocumented collections transfers between faculty and institutions and explore the ethical ramifications, including complications for curation, research, and repatriation.

Bappir: The Ancient Mesopotamian Brewer's Best Friend

Bappir (Sumerian: “beer bread”) was a ubiquitous ingredient in ancient Mesopotamian beer brewing for millennia. However, little is known about exactly what *bappir* was or how it was used. Nevertheless, the scant evidence available from contemporary texts, such as the second-millennium BCE “Hymn to Ninkasi,” have led some researchers to interpret *bappir* as a dried sourdough loaf. Unknowingly or otherwise, ancient brewers used these loaves to inoculate their brews with the *Saccharomyces cerevisiae* (yeast) cells necessary for fermentation. Previous experimental archaeology has proved the plausibility of this interpretation, as carefully baked sourdough loaves can retain sufficient viable yeast cells to function as a starter for beer brewing. No data exists, however, on the “shelf-life” of *bappir*. To address this, experimental archaeology was employed to investigate the viability of yeast cells for beer production during prolonged dry storage in *bappir* loaves. *Bappir* loaves were prepared and stored for six months (26 weeks), with samples taken each week to test the yeast cell viability (survivability) and vitality (healthy activity). Understanding how long *bappir* can be stored while remaining viable for beer production can reveal insight into the frequency with which household brewers, typically women, were required to make these loaves.

Ceramics and Social Process at Holtun, Guatemala

In this paper we present data from 13 years of pottery research at the Maya site of Holtun, Guatemala. Using results from type: variety classification, attribute studies of paste and form, and chemical composition analysis, we outline the sequence at Holtun and relate it to important events in the history of the site and region. Beginning with the site’s founding in the early Middle Preclassic period we identify signs of incipient specialization of Mamom sphere wares, as well as long-distance exchange of Mars Orange Paste Ware. This robust ceramic economy flourishes in the Late and Terminal Preclassic periods, but abruptly ceases when the site experiences a collapse in the Early Classic period. The collapse does not last, and the ceramic economy experiences a second and final florescence in the Late Classic period marked by types and forms of the Tepeu sphere made from local, yet distinct, paste recipes in comparison to the Preclassic period. We conclude that the pottery sequence at Holtun reflects important local innovation of regional trends, as well as engagement and estrangement from interregional sociopolitical processes.

Zooarchaeological Remains from the Roman Harbor Vada Volaterrana

The ancient Roman harbor of Vada Volaterrana was supported by a network of structures immediately surrounding the port at Vada's San Gaetano site. A 2015 GPR survey identified a series of rectangular buildings of unknown purpose in the southern sector of this site whose subsequent excavation produced several botanical and faunal remains. In 2019, a collaborative project between the University of Pisa and Troy University was initiated to address cultural activity at San Gaetano's buildings I, L, and M using these assemblages. This poster presents data and interpretations from Vada's 2017 to 2022 bone and shell samples. Paired with architectural, artifactual, and botanical data, our zooarchaeological results help uncover shifts in both subsistence patterns and cultural enterprises at this building complex.

Five Thousand Years of Kalispel Food Security: A Multiproxy Approach to Food Processing, Preference, and Access in the Past

Food security is fundamental to strong, resilient food systems, and healthy communities. It exists when all people have consistent access to nutritious and culturally appropriate foods, gathered and distributed in socially acceptable ways. Archaeology offers a means of documenting and understanding deep time histories and legacies of food security, highlighting millennia of subsistence solutions across climatic and social conditions. In this paper, we explore the archaeology of food security and resilience of the Pend Orielle Valley of the Northwest plateau, in partnership with the Kalispel Tribe. We thoughtfully examine interdisciplinary approaches to food security, justice, and sovereignty before examining the archaeological record of plant food availability, access, preference, and sustainability over the last 5,000 years. We specifically look to macrobotanical, geoarchaeological, and fire-cracked rock data lines from communal food processing and consumption features within nine sites located in ancestral Kalispel lands. As we continue to work together, we share these records of food security and provisioning with the Tribe so they can continue to define their own contemporary food system that honors and acknowledges these culinary traditions and histories of resilience.

Sowing the Seeds of Empire: Early Statecraft and the Emergence of Indigenous Agriculture on the Mongolian Steppe (ca. 250 BC–AD 150)

The end of the first millennium BC (ca. 250 BC–AD 150) marks the genesis of Xiongnu, eastern Eurasia’s first nomadic state, which emerged from central Mongolia to successfully integrate one of the largest-scale political configurations in prehistory. This transformative period also marks the appearance of Mongolia’s earliest direct agricultural evidence. Though long assumed to be a “purely pastoral” state, scholars have recently considered connections between these phenomena. Growing evidence suggests a political culture that may have deployed novel foodways in statecraft; namely, the development of flexible indigenous agropastoral systems that integrated or intensified production of foreign cereals. Evaluation of this perspective, however, has been hindered by a historical lack of systematic archaeobotanical analysis. Here we present an overview of current evidence for eastern steppe populations’ relationships to agricultural practices and products during the first millennium BC. We then report results of the first and earliest formal macrobotanical and isotopic analyses ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$, $^{87}\text{Sr}/^{86}\text{Sr}$) of a set of locally produced crop assemblages from Iron Age northern Mongolia, including the earliest direct evidence for the presence of oats and broomcorn millet. Results are drawn together to situate agricultural trajectories in the Mongolian steppe within the broader prehistory of the trans-Eurasian crop exchange.

Shall We Gather at the River: 13,000 Years of Adaptation in the Sonoran Desert at La Playa (SON F:10:3)

Our research at the extraordinary La Playa Site (SON F:10:3) is now entering its twenty-third year. This site is located at the Boquillas Valley about 10 km north of Estación Trincheras and some 27 km west of Santa Ana, Sonora. The La Playa site presents an archaeological landscape revealing evidence of continuous human use since the Paleoindian period (ca. 13,000 years ago). Its most intensive use was during the Early Agricultural period (3700–2050 cal BP or 2100–150 CE); after this period, the occupation of the Boquillas Valley greatly diminished, but the site was continuously occupied by the Trincheras tradition people, Piman groups, French goat herders, and even a hotel and restaurant was in operation there during the 1950s. Countless thousands of *hornos* (roasting features), several hundred human inhumation and cremation burials, numerous dog burials, shell ornament production and lithic reduction activity areas, caches of manos and tabular “lap stone” slabs, and a schist quarry are the predominant features associated with the Early Agricultural period. This lecture presents a cultural-historical account of the *longue durée* of these human occupations and their varied adaptations represented in the archaeological record.

Exploring the Function and Evolution of Intensive Stream Modifications in the Southern Escarpment of Calakmul
Investigations over the past decades have shown that the Classic Maya conducted monumental landscape modifications in order to both avoid inundations of settlement areas and to capture and store rainfall. In the initial stages, these modifications involved the sealing of reservoirs, which maximized the amount of stored water. In situations of increasing demographic pressure, the Maya also increased the catchment areas of their reservoirs by sealing the surrounding areas and the construction of influx canals. Frequently, these public building programs involved the modifications of larger landscape areas, including the alteration of natural seasonal streambeds. In our contribution, we present the results of our recent investigations within the PABAL project, realized in three streams located in the southern escarpment of Calakmul (Arroyos 5 and 6 and Arroyo Zapote). The features documented in these drainages revealed sophisticated solutions of hydraulic engineering indicating a highly integrated modification of the settlement landscape, which both protected and created cultivation areas, and prevented the loss of surface runoff into the adjacent bajo areas. Our contribution will explore the function and evolution of these landscape alterations in the specific case of Calakmul, and in comparison with other Lowland Maya sites.

All that Sprouts Is Not Maize: Phytogenic Imagery in Mesoamerican Art and Narrative
Interpretations of sprouting imagery and phytomorphic deities in Mesoamerican iconography have often

turned to maize. Although maize informs Maya art and is personified as the Maya Maize God, imagery from elsewhere in Mesoamerica is often less specific and draws from a variety of sources to construct its deities visually. This fact complicates explanations that posit a direct correspondence between maize and specific deities. A review of the iconographic, archaeological, ethnographic, and ethnobotanical sources demonstrate that cycads, aroids, palms, and various trees, among other plants and animals contributed to the symbolism of Mesoamerican fertility deities and ecological representations. By bringing these lines of information together this paper suggests that such imagery, rather than being representations of specific taxa often depicted systems or ecologies. Therefore, this paper counters studies that assume a one-to-one iconic or isomorphic relationship between the image and its referent. This assumption fails to account for the processes that these hybrid depictions often imply, leaving emic categories underexplored. From this perspective a system for analyzing Indigenous ecological knowledge through the art historical record is elaborated with a specific focus on sprouting, growth, and transformation.

Pastoralism and Landscape Sustainability: A Mediterranean Perspective

The contraction of traditional pastoral practices in the last century has prompted a rapid transformation of those landscapes whose character had been shaped by pastoral mobility. A transformation that is accentuated by the consequences of climate change. This process is particularly relevant in Mediterranean landscapes, where vertical and horizontal transhumance have been practiced for millennia and are currently in rapid decline. To understand what might happen to these pastoral landscapes in the future we have to investigate their long-term evolution. Reconstructing the processes that led to the transformation of vegetation, soil and landforms under the pressure of mobile herders, provides us with precious insights to anticipate future changes. The PLAS research program (Pastoralism and Landscape Sustainability) combines methods from mathematical, natural and human sciences to investigate the consequences of the long-term interaction between pastoralists and environments, focusing on different regions of the old continent. In this paper, the first results from two case studies in the Mediterranean will be presented. The analysis of prehistoric transhumance in the Alps and modern agropastoralism in Aspromonte have revealed that animal farming is responsible for the development of the current character of these mountain landscapes.

Synthesizing Multiscalar Remote Sensing Data for Archaeological Prospection

Established terrestrial remote sensing tools like ground-penetrating radar (GPR), magnetometry, and electrical resistivity and conductivity have been used with great success for nondestructive archaeological prospection. Similarly, recent technological advancements have made remotely sensed data collected from airborne and space platforms both affordable and accessible to archaeologists. How well these datasets complement each other at a variety of spatial and temporal scales remains uncertain. This discussion recounts the benefits and challenges of synthesizing multiscalar datasets for cultural resource management (CRM) on public lands located in south-central Michigan.

Microfossil Analysis of a Grinding Stone from the Etzanoa Archaeological Site

Microfossil and residue analysis can provide valuable information about past dietary practices and environments. Etzanoa (14CO3) or the Arkansas City Country Club site, is an Ancestral Wichita site attributed to the Lower Walnut Focus of the Great Bend Aspect. This site is situated on the Walnut River at its confluence with the Arkansas River and is dated to roughly 1450–1715 CE. During the 2021 field season, a grinding stone was recovered, and samples were taken from both surfaces. To better understand the foodways and the environment of the Ancestral Wichita, microfossil and residue analysis was conducted. Observed microfossils include pollen, fungal spores, plant tissue, and possible helminth eggs. This poster presents the findings of the study.

Shark Interactions in Early Times: A Comparison of Some Sites from Colombia and Panama

The data obtained from the zooarchaeological remains of some Panamanian Pacific sites and Colombian Caribbean Sites allowed for unprecedented discussions about the role of sharks in the lifestyle of precolumbian inhabitants on the intermediate area. People captured and processed sharks, using their body parts both as a food source and for ornaments. These data also provide a window for reflecting on the use of the different habitats.

Reconstructing Climate and Environment in Paleolithic Western Iberia: A Stable Isotopic Study of Organic Remains at Lapa do Picareiro

Portuguese Estremadura (central Portugal), is an understudied region in Paleolithic research with several key Middle and Upper Paleolithic sites that have provided important information on human lifeways in westernmost Europe during the Late Pleistocene. One of these is Lapa do Picareiro, a rare type of site on the Iberian Peninsula, with end-dates for the Middle Paleolithic (~45–42 ka cal BP) and Upper Paleolithic deposits containing evidence of early Aurignacian (~41–38 ka cal BP), Gravettian, Solutrean and Magdalenian occupations. Picareiro

offers the opportunity to assess Neanderthal and modern human paleoecology in a stratified and well-dated site with a growing number of paleoenvironmental records. Here, we present new stable isotopic data (carbon and oxygen) derived from organic materials associated with Middle and Upper Paleolithic deposits of Picareiro, elaborating on one of a handful of existing zooarchaeologically based stable isotope environmental records in Paleolithic Portugal. We reconstruct the ecology of Paleolithic humans using these data and combine this with the results of existing environmental records obtained from organic and sedimentary sources at the site.

Remote Sensing of Archaeological Landscapes at Picuris Pueblo

In 2022, our team conducted experimental surveys at Picuris Pueblo using a new, drone-deployed lidar sensor alongside aerial thermal and color imaging to successfully map extensive remains of ancestral agricultural terraces and related archaeological features. This paper presents results of our 2023 efforts to expand on our initial results, extending lidar survey to cover 10+ km² of forested landscapes both on Picuris Pueblo and nearby federal lands, revealing vast areas of previously undocumented agricultural fields, water management features, and settlement sites. In addition, we conducted ground-penetrating radar, magnetic gradiometry, and thermal imaging at the historic center of Picuris Pueblo and several nearby sites, offering new insights into the location and preservation of subsurface archaeological features. Collectively, our results demonstrate how this suite of noninvasive and nondestructive remote sensing methods can be efficient and powerful tools for discovery, documentation, and interpretation of the rich archaeological landscape of Picuris Pueblo.

FINISTERRA: Population Trajectories and Cultural Dynamics of Late Neanderthals in Far Western Eurasia

In recent years, knowledge of the processes involved in the disappearance of the Neanderthals and the successful expansion of our species across Eurasia has substantially increased. Still, the spatiotemporal variability of the presumed mechanisms behind Neanderthals' demise makes evaluating the replacement at a continental scale very challenging. Iberia, due to its cul-de-sac position and the role of its southern regions as one of the last refugia for the Neanderthals, represents an ideal natural setting for testing models of cultural and demographic trajectories leading to the disappearance of those populations. This poster introduces FINISTERRA, a project that seeks to expand this framework by implementing an integrative, interdisciplinary,

multi-scale approach to the archaeological and paleoenvironmental records of late Neanderthals in southwestern Iberia. Combining geoarchaeological, chronological, and paleoecological evidence, FINISTERRA will (1) provide a detailed characterization of late Neanderthal adaptive systems, presenting high-resolution data on the timeline of events leading to their disappearance; (2) investigate the presence of the so-called early warning signals of Neanderthals' demise through the use of cutting-edge quantitative analyses; (3) explore alternative hypotheses of a gradual or sudden loss of Neanderthals' resilience by considering the impacts of climate change and the spread of modern humans into western Eurasia.

Characterization of Chupícuaro and Cuicuilco Ceramics Technical Traditions: Preliminary Results

For the last decades, the existence of stylistic similarities between Chupícuaro ceramics and those found in some Preclassic sites in the Basin of Mexico has raised questions on the nature of the interactions between these two regions. In this paper, we will present the preliminary results of the reconstruction of the *chaînes opératoires* of ceramic material from collections from Chupícuaro sites TR6 and JR24, as well as some ceramic collections from Cuicuilco. We propose that applying a study of *chaînes opératoires* of ceramic materials, which we view as an alternative method to the typology approach, will allow us to characterize the technical traditions of the pottery communities of the sites we researched. Their comparison will allow us first to characterize the know-how involved in the ceramic production of both societies, and secondly to evaluate the presence or absence of a social affiliation between the Chupícuaro potters and those of the Basin of Mexico.

Patterned Pictographs: The Rock Imagery of Eagle Nest Canyon in a Regional Context

The rock imagery of Eagle Nest Canyon (ENC) is well known to many archaeologists and canyon visitors, especially at three sites: Eagle Cave, Kelley Cave, and Skiles Shelter. However, six additional rock imagery sites within ENC and adjacent tributaries are infrequently visited but still provide important contributions to the overall corpus of pictographs in the ENC vicinity. This paper provides a brief summary of nine rock imagery sites stewarded by the Skiles family using data collected during Shumla's Alexandria Project. Second, we discuss the research potential of comparing prominent iconographic elements from ENC sites to the larger regional Alexandria dataset. Our analysis uses iconographic observations and panel imagery from the Alexandria database to explore the attributes of speech-breath, rabbit-ear headdresses, and antlered anthropomorphs. This data synthesis demonstrates not only iconographic connections between ENC rock imagery sites and other Lower Pecos Canyonland (LPC) sites, but it also shows that some ENC sites have unique graphic expressions of certain elements. This paper demonstrates the diversity and importance of the painted imagery within Eagle Nest Canyon as well as the utility of the Alexandria Project database for future regional rock imagery studies.

Interaction and Exchange between Tingambato and the Central Michoacan Area in West Mexico

Long-distance interactions and exchange of goods should leave marks in the material record. Because of the movement of objects or goods, such exchange will be reflected in the presence of foreign objects or technologies. Interactions are themselves a communication process in which ideas and knowledge are transmitted. This is reflected in the expansion of stylistic elements and cultural syncretism, through the adoption, resignification, reproduction, and transmission of ideas, styles, or cultural elements. This presentation aims to address the development of and changes in interactions and mechanisms of exchange between Tingambato, the Michoacán Lake region, and the frontier with Tierra Caliente during the Classic and Epiclassic periods (AD 1–800) as reflected in ceramics and obsidian. The study applies archaeometry techniques such as optical mineralogy and petrographic analysis in thin sections and Electron-Probe Microanalysis (EPMA).

Vegeculture Agriculture in the Ethiopian Highlands: The Archaeobotany of Enset

Although Ethiopia is remembered for famines in recent decades, the zone of vegicultural agriculture in the

southwest has largely avoided food insecurity. Here agricultural systems are usually centered on *Ensete ventricosum*, a tree-like vegetative starch crop, an endemic staple food for 20 million people. Our current research combines archaeobotanical work with genetics and ethnographic work with colleagues from Royal Botanic Gardens Kew and at UCL Institute of Archaeology. This paper provides the first results of an archaeobotanical methodology to identify *Ensete* and infer its domestication and evolution through a focus on phytoliths. Fifty enset leaf samples, including wild and cultivated landraces, have been processed to compare phytolith extraction methodologies, phytolith variation, and morphometric traits, offering new criteria for separating *Ensete* and recognizing variation related to plant part, growth environment, and domestication.

Glass in Colonial and Early Independent Mexico: Investigating Its Context of Use and Symbolic Value

After arriving in Mexico in the sixteenth century, glass, and the technology to make it, slowly found their way into the everyday life of colonial populations in Mexico City, Puebla, and other areas of New Spain. While glass routinely appears in archaeological excavations of colonial and nineteenth-century contexts in Mexico, it is not as deeply studied as other colonial materials such as ceramics. Understanding how it was represented in art can offer us insights into its context of use and symbolic value, which can help us place the material in its social context and consider it in relation to other elements of material culture. By looking at representations of glass objects in colonial and nineteenth-century paintings, historical documents, and glass from Mexican museums and archaeological collections, this paper explores the place glass occupied in colonial and nineteenth-century Mexican society.

Constructing Perspectives for the Application of Wood Charcoal Analysis in Kiuic, Yucatán, Mexico

Archaeological investigations in the Bolonchen district have as one of their goals the understanding of the variation of the natural resource exploitation by the ancient settlers in the region. An approach that has been a relevant for reconstruction of the landscape and prehispanic forest management is provided by the archaeobotanical data, and specifically the analysis of wood charcoal preserved in archaeological contexts (anthracology). In the north of Yucatán there are still few anthracological research studies, due to both the excavation strategies and preservation conditions of carbon. The lack of carbon research in the northern Maya Lowlands compared to central Maya Lowlands could have an effect in the interpretation of forest management in the Puuc region. In this sense, it was proposed to conduct an anthracological analysis for the site of Kiuic. The methodology consists in the construction of a data base of recovered carbon fragments from soil samples collected during the 20 years of excavations in Kiuic and the definition and selection of contexts with carbon fragments with optimal conditions of preservation for taxonomical identification. This presentation discusses the contexts with good carbon fragments that was recovered so far, and the sociocultural implications for past forest management reconstruction.

Castleberry, Crystal (Colonial Williamsburg Foundation)**[16]***A Complicated Healing Process: Community Engagement at the First Baptist Church and Powder Magazine Burial Grounds*

As an institution that has contributed to the Black community's historical erasure, Colonial Williamsburg is still working to rebuild trust and right many wrongs. Few projects have made that more apparent than the First Baptist Church excavation and the rediscovery of its burial ground. With the discovery of Confederate burials at the Magazine the following year, we are balancing rebuilding that trust alongside the respectful treatment of those who fought for the subjugation of free and enslaved Black individuals. This paper offers a look at two very different burial grounds and the thoughtful consideration of whose voices should be brought to the table. Further, it discusses the complications that arise when working with a community of known descendants and engaging with stakeholders representing people for whom no clear descendant community exists under other circumstances.

We present a discriminant metric study of stone projectile points ($n = 422$) from 21 archaeological sites in the Andes of South America (16–37°S). We make a critical use of comparative datasets, which suggest that darts may have been smaller than previously thought. We assess the use life of each point and tie them to reliable chronological sequences, in order to increase the reliability of our data. Our results show that in the Lake Titicaca Basin and northwestern Argentina, bows had replaced spear-throwers by ~1780–950 cal BP, prior to the development of complex societies such as Wari and Tiwanaku. South of 29°S, the results suggest that bow technology was transmitted from north to south, since the earliest arrow-sized points at 29°S date to 3000 cal BP and at 37°S, 1800–1000 cal BP. North of 34°S, the continental limit of domesticated plants and animals, there is a gradual abandonment of the spear-thrower. South of 34°S in northern Patagonia, both weapon systems coexisted. We suggest that bow and arrow technology was not an independent invention in the southern Andes, but instead, it appeared in new groups via macroregional technological borrowing among Andean herders.

The Role of Small Dwellings in the Viking Age Settlement of Iceland

Historical accounts of the Viking Age settlement of Iceland largely focus on the lives of elite colonists and landowners. Although these texts are clear that non-elite and enslaved individuals were present and played a critical role in the settlement of the island, archaeological researchers have struggled to identify these people in the material record. This is, in part, due to the singular space of Norse farmsteads, in which household members, from landowner to enslaved, generally lived and worked together. We discuss new research from Hegrans, North Iceland that has revealed the presence of small dwellings in the early phases of settlement that hold the promise of revealing the lives of the non-elite. The small dwellings are located on marginal land and exhibit economic and subsistence strategies as well as architectural features that distinguish them from other excavated farmsteads. They had short occupations and do not appear as a site type after the Viking Age. These observations suggest a social and ecological role in the settlement that is unknown from later historical and ethnographic texts. We present new excavation data from the site of Kotið, a small dwelling located on marginal land that dates from the earliest phase of settlement.

Patterns of a Life and Death through Machine Learning: Archives of the Bois Marchand Cemetery in Mauritius

The Bois Marchand cemetery in Mauritius was established in 1867, during the malaria epidemic, as the largest in the Indian Ocean and the third largest in the world. The Bois Marchand Cemetery Archive (1867–to date) holds a near-complete set of burial records of individuals interred in this cemetery. The records contain personal information of the deceased, from their names, sex, and place of birth to their date, place, and cause of death, and the date and type of burial, and provide a unique repository of demographic and disease data. We are making this information computationally usable with Handwritten Text Recognition (HTR) technology. AI technologies, such as machine learning, are transforming how archival data is processed and analyzed. Machine-learning algorithms can be trained to recognize patterns and make predictions based on the given data. This paper will present our work and some of these patterns.

Settlement Pattern Transition from the Middle Formative to the Classic in Southern Mesoamerica and the Establishment of Veracruz and Maya Spheres through the Analysis of Low-Resolution Lidar

This paper examines the settlement patterns transition from the Middle Formative to the Classic period through a low-resolution lidar analysis in Southern Mesoamerica, over a 25 km² area. Based on previous lidar research carried out by the Middle Usumacinta Archaeological Project (MUAP), in 2022 I did a low-

resolution lidar analysis with a dataset from the Instituto Nacional de Estadística y Geografía (INEGI), an open-access resource from the Mexican government. The initial goal was to find the total extent of early ceremonial complexes outside the Maya and Olmec regions and understand the social dynamics. However, the lack of early ceremonial complexes in Central Veracruz and Oaxaca showed that the distribution was probably restricted to the Isthmian interaction sphere (Gulf Coast, Central Chiapas, and southern Pacific coast). Furthermore, the results from my analysis demonstrate that in the transition between periods the settlement pattern changed with the establishment of Veracruz and Maya spheres. We argue that intensive interregional interactions and cultural and ecological factors might have played a role in this transition.

Heat Alteration of Red Munsungun Chert

Red chert from the Munsungun Lake formation in northern Maine is found in late Pleistocene Fluted-Point period archaeological sites across northeastern North America. Despite its prevalence, there is no literature detailing the effects of heat alteration on red Munsungun chert. Here we report the effects of experimental heat alteration on red Munsungun chert. We conducted a controlled heat experiment in which flakes of chert were heated to specific temperature steps in a furnace. A campfire heat-alteration experiment was also conducted to determine how Munsungun chert reacts to open flame. We report that red Munsungun chert responds to heat at temperatures beyond 500°C. We also observed that some blackening occurs in flakes that are in close proximity to open flame. Interestingly, we observed in both the campfire and furnace experiments that red Munsungun chert breaks apart into two or more pieces in response to temperatures over 500°C. These results have many implications for the study of Pleistocene Fluted-Point period archaeological sites in northeastern North America. In particular, these results will help identify hearth-centered activity areas in the absence of preserved hearth features.

MITLA 3D: A Digital Reconstruction of the Most Important Postclassic Zapotec City

Illustrating the past in a faithful and immersive way requires finding the right balance between the available archaeological data and the imagination that fills in the many blanks. This presentation is about such an experience, from a background in architecture and digital arts. The Zapotecs are one of the most fascinating cultures of the Americas, and after Monte Albán, Mitla is definitely their most famous city, often compared to a “Vatican” for the map of Postclassic Mesoamerica. In spite of its importance, until 2018, Mitla had never been reconstructed in 3D, and was rarely depicted in color. The work presented here, self-funded, the sum of a full year of modeling on Blender, is an attempt at offering our eyes the spectacular aspect of Mitla-Lyobaa in its golden age. The 3D here allows one to grasp the city at all scales, in the vast natural landscape, in urban districts, and in intimate corners of the architecture. This work is also a positive story of meeting with today’s Mitla, creating faithful images to celebrate the locals’ amazing ancestry, contributing to their pride of an inspiring past.

Cercone, Ashley (University at Buffalo)**[255]***Thinking Locally: A Glimpse at Ceramic Production at Külliöba, Turkey, during the Early Bronze Age*

After the birth of the Turkish Republic, German archaeologists fled to Turkey in search of new beginnings and freedom. These archaeologists would soon head the first archaeology departments in Istanbul and Ankara, shaping how budding archaeologists would complete their training and research for the next 90 years. Traditionally, ceramic research has been focused on creating chronologies, publishing catalogues, and making visual cross-comparisons between pots to argue for large-scale trade. However, in the last 20 years, scientific methods, like neutron activation analysis and residue analysis, have slowly infused into Anatolian archaeology, primarily due to interdisciplinary departments and international collaborations. Over the past few years, scholars at the archaeological site of Külliöba, located in inland Western Anatolia, have been using various methodologies to reexamine resource acquisition, craft production, pyrotechnology, and trade. This paper will discuss past and present trends in ceramic studies in Turkey and provide insight into ceramic production and “trade” at Külliöba during the Early Bronze Age (3000–2000 BCE) through the interpretation of thin sections. Contrary to current belief, the settlement was more often producing pottery locally and interacting with nearby neighbors.

Cerezo-Román, Jessica (University of Oklahoma), Megan Walsh (University of Oklahoma) and Jane Buikstra (Arizona State University)**[241]***Cremation Mortuary Practices at Phaleron during the Archaic Period*

In this paper, we reconstruct cremation mortuary practices from the Archaic site of Phaleron (ca. 750–480 BCE) located in Athens, Greece. We build on performance theory and issues of identities to answer two main research questions: (1) How was the identity(ies) of the cremated individuals portrayed in the cremation burial custom and how does that relate to the biological profile? and (2) What are the different stages of cremation rituals at Phaleron and what are the possible cultural significance? We do this by reconstructing the biological profile of individuals, examining thermal alterations, burial construction, and broader archaeological information from the site. Preliminary results highlight the variation in cremation rituals between different individuals. Some individuals were highly burned while others were not, suggesting diverse levels of pyrotechnological efficiency and/or resource accessibility. Additionally, the necropolis of Phaleron was an active space where people buried and memorialized their dead in many ways. This research project emphasizes the benefits of exploring cremation rituals within a holistic view, considering the decedent and how their mourners and community treated the individual at death.

Este sitio mixteco del Formativo tardío (300-100 aC) fue explorado por el equipo de Alfonso Caso y Jorge Acosta entre los años 1936 y 1940. Es sobre esta base, en el marco del Proyecto Arqueológico Monte Negro 2023 que esta investigación se enfocó en profundizar en aspectos arquitectónicos por medio de técnicas fotogramétricas implementadas en los templos T y X. En particular, el *Reflectance Transformation Imaging* (RTI) que permite examinar las superficies de interés de una manera detallada, encontrando aspectos difíciles de identificar a simple vista y la fotogrametría 3D, la cual brinda modelos digitales que pueden ser analizados, al mismo tiempo de ser una excelente forma de registro y exposición. Con estos modelos, se logró identificar las modificaciones que han sufrido los petrograbados que se encuentran en bloques que conforman las escalinatas, esto teniendo como referencias las fotografías tomadas por Caso. Finalmente, se sugiere una interpretación iconográfica y se brinda un panorama más amplio de la interacción de la población actual con el sitio arqueológico, junto con las condiciones de conservación en las que se encuentra, aspectos que se desarrollan en este trabajo.

Chai Andrade, Travis (Princeton University) and Emma Ljung (Princeton University)**[98]***Undoing Aesthetics: Remediating Problems in the AP History Curriculum through Indigenous Artifacts in University Museums*

In 2022, 34.6% of US high schoolers took an AP test, US History being among the most popular subjects. Yet, despite heightened sensitivity toward Indigenous cultures and their material remains, the AP history curriculum still displays visible shortcomings in this regard. Moreover, in college, many students encounter Indigenous cultures through one discipline only: art history. Within this discipline, introductory courses often treat artifacts as aesthetic objects whose stylistic contents merit study even when original context, use, and provenance are unknown. To the student, the museum becomes an indisputable “last home,” the culture isolated in the past. But those aesthetic and stylistic contents only illuminate a brief, temporal fragment of larger, longer stories. In effectively halting museum study and thus the aestheticizing approach to objects as the introduction to Native American cultures, the COVID-19 pandemic offered an opportunity to rethink how Indigenous artifacts tell multiple stories, stories not only of the past but of the present. In shifting the conversation to the present, those artifacts can fill important learning gaps inherited from the AP curriculum.

This paper uses an Alaskan harpoon socket at the Princeton University Art Museum to demonstrate how actively de-aestheticizing research assignments can generate productive learning outcomes.

[156]

An Animist Shamanism: The World behind San Rock Art

Hunter-gatherer cosmology in southern Africa is very clearly multinatural; persons human and nonhuman working to behave intelligibly to each other so that relations are brokered and maintained. Until recently, however, rock art interpretations have implied a physical division between realms animal and human, spiritual and mundane. Ironically, the dominant paradigm was founded on the principle that the images did not represent everyday life. The New Animisms have offered up a palette of colors with which to paint a new picture of San rock art, one which emphasizes negotiation-as-navigation, social topographies and the ontological consequences of place, position, and perspective. Instead of showcasing shamans' power, it transpires that images were rather made to broker "proper" relations between entities on a shared landscape.

Settlement Patterns, Water Accessibility, and Circulation in the Azraq Watershed during the Neolithic Colonization (Seventh–Sixth Millennium BCE)

The end of the neolithization process (seventh–sixth millennium cal BCE) was a period of settlement peak in the arid margins of the Fertile Crescent. In northeastern Jordan, the combination of a long sequence of Neolithic occupation and several decades of field investigation provide the opportunity of an in-depth study of this phenomenon through a regional perspective. This presentation will focus on the Azraq watershed with a particular emphasis on the Black Desert plateau, also known as Harra, which drains the northeastern part of the catchment basin. Based on the results of past and present field programs, including unpublished data from the Western Harra Survey project, it intends to propose a comprehensive overview of the colonization of the region during the PPNB and the Late Neolithic. It will question settlement patterns and their evolution over two millennia through the lens of water availability, in quality (type of water source), space (proximity and accessibility), and time (short-term water seasonality vs. long-term wet/dry climatic periods). Beyond subsistence and given the circulation difficulties in the Harra, the potential role of watercourses as corridors between Azraq, the Black Desert, and beyond will also be assessed.

[209]

Archaeology's Empire of Sectarianism

Social historians demonstrate the historical contingency of sectarianism, which may be defined as a process and discourse that entwines religious sects and identities with political ones, on the ground and in state arrangements (Makdisi 2000). Despite this contingency, academic, government, and public circles doggedly reify sectarianism as "the" principle of the Middle East—i.e., social worlds are transhistorically segregated and explained by sect (Makdisi 2017, 2019). Using bioarchaeological and archival evidence, I trace the shifting coordinates of sectarianism and its entwinements with other processes, revealing tensions between life and death on the ground, Ottoman and Euro-colonial imperial knowledge-making, and archaeology's politics of knowledge. I argue that archaeology is among circles that inappropriately—and subtly—reify sectarianism as "the" principle of the Middle East, and this reification is related to imperial practices. I thus call for a revision of the subtle workings of archaeology's knowledge, as well as the power and identity politics and milieus that sustain it. Taking sectarianist truths as objects of inquiry is an effort to attend to subtle reconfigurations of violence in multiple registers. It is to engage sectarianism's agility as "imperial duress" (Stoler 2016) that shapes (inter)state structures and landscapes, violently enfolding lives, deaths, and relations.

Chamoun, Tony (Syracuse University)**[209]***Chair***Chan, Ching Yi (Mavis), Norman Easton and Robert Sattler****[49]***Archaeological Sites of the Southern Yukon-Alaska Borderlands: Distribution, Chronology, and Dineh Place Names*

This poster will map out selected archaeological sites of the SY-AB and provide a table of associated radiocarbon dates calibrated to the most recent IntCal 20. Human occupation of what was then extreme southeastern Beringia begins in the Allerød interstadial (ca. 14.2–12.9 Kya) demonstrated at Little John and Britannia Creek in Yukon and Linda's Point and Nateł Na' in Alaska. The SY-AB also contains a continuous history of Holocene occupations (Moose Lake, Little John, the Tok and Deadman Lake site complexes) and a rich record of Late Prehistoric and postcontact Amerindian-European interaction (Nataełde/Batzulnetas, Nabesna/Northway, Chisana, and Scottie Creek site complexes). Archaeological site distribution is complemented by an extensive Ahtna and Upper Tanana native place-names corpus and associated ethnohistories, which map onto many of the archaeological sites or places we can reasonably expect to find archaeological deposits.

Chan, Ching Yi (Mavis) [49] see Hutchinson, Vance

Chan, Evelyn (Itza Project), Timothy Pugh (Queens College; Graduate Center, CUNY) and Kevin Schwarz (ASC Group Inc.)**[110]***"Domesticated Waterscapes" in the Petén Lakes Region, Petén, Guatemala*

A recent lidar survey of the Petén Lakes in Petén, Guatemala, has confirmed landscape modifications suggested by previous research and revealed new evidence of water management and settlement placement. Influenced by Joel Palka's recent work among the Lacandon Maya, we consider domesticated waterscape features such as canals and settlement drainage systems. We also consider the selection of living spaces. Canals connect some lakes and would have allowed canoe traffic; however, some are disappearing due to modern construction. Many settlements were designed with drainage systems that would have alleviated standing water and, in some cases, continue to do so. The locations of some settlements appeared to have been selected so that they are bounded on two sides by water. While our primary focus is the Middle to Late Preclassic period, many of the features discerned by the lidar survey are yet to be dated.

Chang, Claudia (ISAW New York University)**[215]***Discussant***[17]***Chair***Chang, Claudia (ISAW New York University), Sergey Ivanov (Kyrgyz National University) and Perry Tourtellotte (Independent Researcher)****[17]***On the Periphery of the Iron Age World System: "Animal Style Art" in Southeastern Kazakhstan*

The commodification of aesthetic traditions in the Eurasian steppe world may be explored as a method for tracing the economic and political spheres of the larger Eurasian World System in the first millennium BCE. This paper will address the question of whether Scythian "animal style art" was part of a circulatory system manipulated by peripheral "nomadic" groups to perpetuate sociopolitical interests and territorial claims. The

case study from the Talgar region of southeastern Kazakhstan examines objects found at settlement sites and in funerary contexts of the Saka culture. A carnelian bead, a bronze amulet, and a carved bone disk found at Iron Age settlements suggest long-distance commodity trade across a proto-Silk road. In the nearby Issyk burial mound of Golden Warrior, the splendid gold foil, plaques, and headdresses convey notions of political and status emulation for a nomadic elite within a larger political arena of competitive nomadic groups. Traditionally, discussions of Eurasian animal style art have been the intellectual domain of art historians and archaeologists. This paper extends the discussion of “animal-style art” to include a world-systems approach. The bigger question is whether a visual trope—an aesthetic tradition—can be examined through the lens of world-systems analysis.

Charting Science Communication with Geoarchaeology

Science communication can be a daunting task for researchers who seek public engagement, especially through multimedia formats. Building from your knowledge, experience, and research will make developing multimedia skills more approachable. Creatively including scientific principles to develop aspects like storytelling and in-media citations helps to legitimize your work and drives engagement. Recording equipment and software may be accessible through your organization, lowering initial costs and can be inexpensive for at home production. Open-source software is also available, sometimes for free or trial periods. With thoughtful planning, you can develop high-quality projects, and major science outlets host workshops year-round to help develop media and writing skills. Most major platforms provide engagement metrics and analytic tools, with exportable data, that provide insight into audience demographics. Ultimately, science communication can be a rewarding endeavor that drives awareness and engagement with your research and organization while also providing opportunities for networking and collaboration.

Analysis of Radiocarbon Dates on Terminal Pleistocene Horses from North America Shows Synchronous Local Extirpation and Overlap with Paleoindian Technocomplexes

Absolute dating in archaeology is dominated by radiocarbon dating, a method that is frequently conducted on zooarchaeological material, creating a large and diverse global dataset that is readily accessible. Though radiocarbon dates are certainly valuable on their own, their value extends beyond their original contexts. When aggregated, radiocarbon dates can also contribute to answering big archaeological questions—for example, debates over North American Pleistocene extinctions. In this paper, I use data from published works and the Canadian Radiocarbon Database to show that there is good evidence that Pleistocene horses and recognized Paleoindian peoples shared the landscape in North America for a substantial period of time. This has considerable implications for our understanding of regional megafaunal extinctions, Paleoindian diet breadth, and horse evolutionary history. By using data produced by multidisciplinary communities and focusing on one taxon, this project uses a complex zooarchaeological dataset to address questions that have permeated generations of researchers. The radiocarbon date modeling used here is an example of how researchers can employ previously published data in addition to new dates to generate aggregations and answer novel questions.

“A Name Comes First and the Story Follows”: Archaeology, Story Maps, and the Milwaukee County Poor Farm Cemetery Project

Throughout her career, Patricia Richards conveyed experience and knowledge through storytelling. Impassioned and insightful, these stories often reveal episodes forgotten by written history. As one example, the Milwaukee County Poor Farm Cemetery (MCPFC) represents thousands of stories, generated through a humanistic approach that integrates individuals with their contexts, archaeological and historical. Recent adoption of ESRI Story Maps leverages state-of-the-art mapping and multimodal storytelling technology to connect the MCPFC to the greater Milwaukee community. One goal of this effort is to make transparent the archaeological and osteological methods that led to the provisional identification of four nonadults through associated “affective objects.” The Story Map promotes transparency in archaeological research by detailing both the process of making interpretations (the how we know) and the products of collaborative research (what we know). Whereas the placemaking of a sprawling regional medical campus is quite legible, the previous (and ongoing) land use as a burial site for marginalized members of Milwaukee society has remained relatively invisible. The Story Map endeavor puts narratives from the MCPFC “on the map,” creating a durable record that renders the events of the past and the research of the present legible and accessible.

Cities on the Cutting Edge: Urban Research in Belizean Archaeology

Archaeologists’ views of the breadth and depth of precolumbian Maya urbanism, and Mesoamerican urbanism more broadly, have been repeatedly revolutionized by archaeological researchers in Belize. The first National Science Foundation funding for Maya archaeology centered on determining how the ancient Maya modified the Belize landscape, eventually providing a path for refuting the then-current vacant ceremonial center city model. Modern urban models and methods to study Maya sites as cities have helped demonstrate the social complexity underlying Maya urbanism. The inception of tropical lidar research (that has unleashed a geospatial revolution) also occurred in Belize, providing a wealth of data for comparative urban research. The range of cutting-edge research into the ancient Maya cities of the eastern lowlands echoes the geographic and environmental diversity of Belize. Belize’s coastal, riverine, and upland settlements showcase the full variability of Maya cities and exhibit unique site plans, urban forms, and historical trajectories. At the same time, local differences do not obscure larger patterns and processes relevant to urbanism, both ancient and modern. In short, the ancient Maya cities in Belize (and generations of scholarship) have greatly contributed to our understanding of urbanism—and continue to do so.

From Marginalized to Impactful: Belizean Archaeology and the Classic Period Maya

The impact of Belizean centers and settlement on ancient Maya civilization of the Classic period (CE 250–900) has been recognized in the last 50 years of research. Before 1975 Belize was seen as being on the fringes of the Maya world and portrayed as a backwater. Most archaeological syntheses focused on the core area of the southern lowlands where the art and architecture of the ancient Maya were replete with hieroglyphic texts on beautifully carved stone monuments. Carved monuments with extended hieroglyphic histories occurred only at limited centers (Caracol, Pusilha) in the country of Belize, making it difficult to contextually place Belizean sites into broader Maya prehistory. Yet, over the last five decades, interpretations concerning Belize's role in the ancient Maya world has changed substantially. Classic-era Belize was actively engaged in the broader Maya world. Belizean coastal sites were significantly involved in the inland salt trade. Altun Ha likely controlled the flow of trade goods emanating from the Atlantic. Caracol rivaled Tikal and Calakmul in global politics relative to the southern Maya region during the Classic era. Half a century of archaeological data has made once marginalized Belizean archaeological remains central for understanding the Classic period Maya florescence.

The Shadow Realm: How Belizean Archaeology Has Illuminated the Maya Postclassic Era

Without Belizean archaeological data, we would know very little about the Maya Postclassic period (CE 950–1530). While viewed as a period of lesser cultural development by earlier researchers, Postclassic archaeological research in Belize was published as early as 1898 but generated little further interest in this important era. Carnegie Institution of Washington research in the early 1920s focused on the Postclassic site of Tayasal, Guatemala, but had trouble defining associated archaeological remains pertaining to this time period. The Carnegie excavations in the early 1950s at the Postclassic city of Mayapán, Mexico, did little to improve the overall portrayal of this important era because of bias and poor moral on the part of the excavators. Postclassic remains excavated in the Belize Valley in the 1950s were not fully analyzed until 1976. However, beginning in the 1970s, three long-term archaeological projects in Belize focused specifically on the Postclassic period at Lamanai, Santa Rita Corozal, and Laguna de On. This research demonstrated the artistic vibrancy of the late Maya and the continued presence of sizeable populations that extended into the contact period. The concentrated focus on the Postclassic period in Belize has laid the modern foundation for understanding of this maligned era.

Chavez, Hannah and Teresa Rodrigues**[88]***Archaeology and TCPs*

Perceptions of the past are culturally bound, which can inhibit research objectives and our interpretations. Taking a reflective approach in archaeology encourages researchers to consider the social and political ramifications of their work and how it may affect the communities that they serve (e.g., academia, cultural resource management, descendant groups, public). Cultural resource management (CRM) plays a pivotal role in maintaining and illuminating historical narratives through Section 106 of the National Historic Preservation Act (NHPA) by the recommendations deemed eligible to the National Register of Historic Places (NRHP). For instance, traditional cultural properties (TCPs) may be eligible for the National Register of Historic Places but are seldom adequately evaluated during preliminary cultural resource inventories and surveys. The lack of TCPs on the NRHP can be attributed to several factors, including groups' attitudes toward the NRHP, privacy concerns, and inadequate methods for collaboration and documentation. This paper examines the relationship between archaeology and TCPs within the framework of the NRHP, the benefits of documenting TCPs, the challenges of documenting TCPs, and possible solutions for collaborators to consider when working with TCPs.

Chavez, Rene (UNAM), Maria Encarnacion Camara (Universidad Politécnica de Madrid), Andrés Tejero Andrade (UNAM), Luis Barba (UNAM) and Linda Manzanilla (UNAM)**[152]***Geophysical Prospecting of the Teotihuacan Subsoil*

A geophysical study was carried out on the eastern flank of the Pyramid of the Sun to define the continuation of a tunnel discovered in 1974 under the western entrance of the pyramid. The investigation was carried out in the vicinity of Las Varillas cave, a structure excavated by settlers to obtain construction materials employed to build the city. Total magnetic field and vertical gradient surveys allowed to estimate a 3.3 m thick of alluvial sediment over the basaltic flow. The high-frequency magnetic gradient defined the geometry of Las Varillas Cave and the Euler deconvolution method specified the depth to the top of a tunnel (3–6 m). Two nearly parallel GPR profiles (separated 10 m) surveyed in a NW-SE direction (one passing over the known tunnel), detected the tunnel roof at a depth of 4 m. The second profile depicted a more complex morphology for the pyroclastic horizon. The anomalies associated with the basaltic flow or eruptive centers are clearly depicted. An electrical tomography profile was performed along the first GPR profile. The image showed a region of high values (1000 Ohm m), consistent with the presence of a tunnel at a depth of 4 m. Pastoralist Spacetimes and Political Life in the Past: Exploring the Value of Living and Dead Animals Archaeologically

Anthropological approaches to value assert that creating and contesting value is at the heart of politics. Herd animals offer a complex window into this basic theoretical insight—they are simultaneously producers of and objects of value and their value cannot be easily reduced to the categories of economic or symbolic value. Analyzing archaeological data from pastoralist societies in the Late Bronze Age (1500–1100 BCE) South Caucasus, this paper considers how the different kinds of value-in-action made possible by living and dead animals shaped political authority. The value of living animals emerges from their potential for future reproductive labor and the affective connections forged through interaction. In contrast, the complex value of dead animals enables other kinds of spatiotemporal transformations. Dead animals weave together the

semiotic potential of wholeness and fragmentation, memory, and the complex temporal rhythms and the unstable futurities of consumption as a social practice. This analysis highlights how living with, working alongside, and killing and eating herd animals has the potential to generate different kinds of relations between humans and animals, shaping intersubjective spacetimes within more-than-human worlds.

Contribution to Rock Art Interpretation with New Decipherments of Hand Prints

The discovery during the 1990s of an unexpected large rock art field in East Kalimantan, East Borneo, containing more than 2,000 negative hand prints, has led to a different approach of the possible function(s) of this materialization of specific procedures. It has permitted researchers to look for practical interpretations of decipherment of sex gender on these panels. A preliminary computer program had been elaborated yielding interesting results, followed recently by a more precise program deciphering men's and women's presence in numerous caves or shelters of the world. We present here the results, including from South America, of hundreds of significant decipherments completing the previous results and publications.

Landscapes of Insecurity in Huancavelica, Peru: Infrastructure, Emplacement, and Quotidian Life in Volatile Surroundings

The Late Intermediate period (1000–1400 CE) in the Central Andean highlands is characterized by balkanization and warfare, a pattern that is materialized through the construction of hilltop forts (*pukaras*) and skeletal trauma observed from Ancash to the Titicaca Basin. After a decades-long hiatus in academic research in Huancavelica, Peru, which was prompted by the propagation of guerrilla warfare carried out by Sendero Luminoso (Shining Path), recent surveys have finally begun to shed light on this understudied region through the identification of previously unrecorded sites. Fortified settlements, lookout stations, tombs, and other infrastructural features are strategically positioned across montane ravines to mitigate violent encounters. These sites embody a “landscape of insecurity,” reflective of the fractured political and social dynamics of the Late Intermediate period. Through this lens, we can begin to recognize the Huancavelica highlands as a landscape that has been forged by both prehispanic and modern violence, while also exploring the practices through which communities create stable space in otherwise tumultuous conditions and emplace themselves within hostile landscapes.

The Emergence of Pottery Use and its Interpretation: A Case Study from Huaca Negra, Virú Valley, Peru

“Why did people begin to use pottery vessels?” is one of the most compelling questions to archaeologists. As

a site witnesses the transition from the Late Preceramic to the Initial period occupation in the Virú Valley, north coast of Peru, Huaca Negra constitutes an ideal case study to investigate the utilitarian function, cultural traits, and possible social meanings of the first-generation pottery. By putting ceramic remains into the reconstructed spatiotemporal context, the attribute analysis illustrates a clear utilitarian function of this assemblage and its diachronic changes. Both pottery decoration and the petrographic analysis suggest that, although not pursuing consistent or standardized products, ancient potters shared basic ideas of pottery-making, and the shared experience might have facilitated building a sense of community. Investigating “the emergence of pottery use” at Huaca Negra from both economic and social aspects makes the contextualized interpretation possible.

Ground Stones in Ritual Contexts in the Central China Neolithic: Use-Wear Analysis and Residue Analysis of Artifacts in Burials

Burial practices provide important evidence for understanding the social and symbolic connections between the dead and the living. The presentation of artifacts in burials and their functions can provide crucial information of meanings in ritual practices. In this study, I apply use-wear analysis and residue analysis to a sample of grinding stones, sickles, and stone adzes from the early Neolithic burials of the Peiligang site (8000 BP) in North China. The results show that grinding stones were multi-functional tools, used for grinding hard materials and for processing multiple types of plants. Grinding stones recovered from residential refuse pits were used extensively for grinding *Panicoidae* grass, acorns, and tubers. Grinding stones from burials were less extensively used and are more intact, preserving all four feet. Stone sickles are mostly related to harvesting activities, and stone adzes are associated with soil working. Combined with evidence from previous residue analyses of pottery from burials, that show that red rice alcohol was served, this research suggests that tools related specifically to acquisition and processing of plants may have had special symbolic and ritual significance in this early Neolithic context.

Exploring Ancient Foodways: Starch Grain Analysis of Ceramic Residue in Wansan, Yilan County, Taiwan

This research examines starch residues on food related pottery vessels in order to investigate the utilization of various plant foods in the late Neolithic Wansan society. Based on preliminary identifications, most of the residue starch belongs to *Panicoidae*, with definite identification of foxtail millet and Job's tears. No taro or yam have been identified; despite arguably being an important part of early Austronesian horticulture as supported by linguistic reconstructions. The absence of rice starch from Wansan is also perplexing as it has been broadly reported in Taiwanese neolithic sites in various periods and regions. However, more lines of evidence need to be gathered before the lack of rice, taro or yam can be interpreted; their absence in the archaeological record may reflect a real pattern of activity in the past, or could result from either differential preservation, or these species being subjected to alternative ways of processing, cooking or consumption that differ from other plant foods.

Prehistoric Hohokam Gridded Fields in the Lower Salt River Valley

Archaeologists working in west Phoenix discovered a complex of prehistoric Hohokam agricultural features consisting of a lateral canal and associated turnouts, sluice gates, field canals, and agricultural field cells in the southeastern portion of AZ T:12:206(ASM) (Site 206). The field cells appear to have dated mainly to the Sacaton phase (AD 950–1150). These are some of the only Hohokam fields ever discovered. A “perfect storm” of preservation had taken place in which flood deposits from the Salt River capped a portion of the field cells and thereby protected and preserved them, burying them deeply enough to avoid the rippers and plows of modern agriculture. This is much like the conditions that led to the preservation of pre-Hohokam, Early Agricultural period (1200 BC–AD 50) fields along the Santa Cruz River in the Tucson Basin. Our focus in this study is on determining how the irrigation system operated and what had been grown in the field cells. The discovery of fields at Site 206 has given archaeologists a glimpse into Hohokam farming practices along the lower Salt River and shown many centuries of continuity in prehistoric farming practices in southern Arizona.

Clay from the Coast: Petrographic Investigations of Xiajiaoshan’s Coastal Hunter-Gatherer Pottery Production in Southern China

Despite extensive research on ceramic production in agricultural societies, ceramic traditions of coastal hunter-fisher-gatherer groups in southern China have been comparatively overlooked. The middle Neolithic site Xiajiaoshan, said to belong to the Xiantouling Culture (dated to 7000 BP), excavated in recent years has yielded abundant intact pottery vessels, offering a unique opportunity to glean the production, distribution, and use of pottery wares by prehistoric coastal communities. Through typological and petrographic analysis, this study compares Xiajiaoshan with other sites in the coastal landscape, investigating Xiajiaoshan occupants’ ceramic production techniques and clay sourcing. By comparing pottery petrographic data across multiple coastal sites, we reconstruct interaction networks among coastal communities and their understanding of the landscape for clay-sourcing. This research illuminates the pottery production capabilities of coastal hunter-fisher-gatherers, enhancing our understanding of prehistoric pottery technology in southern China. More broadly, it could possibly inform interpretations of sociocultural practices and landscape perceptions of other prehistoric coastal communities.

Theoretical Frameworks for Isotope Data Collection and Interpretation

This presentation describes the theoretical frameworks for isotope data collection and interpretation that will help archaeological scientists ensure their contributions to forensic investigations are scientifically sound and legally defensible. Archaeological science is now commonly used in forensic settings to reconstruct an unknown individual’s life history. One particularly useful technique is stable isotope ratio analysis, which measures the isotopic signatures of human tissues. These signatures reflect variations in diet and drinking water and their interpretation can provide information on the likely origin of an individual since food and water sources are typically geographically linked. However, for the technique to aid investigators, it is essential that the quality and surety of the isotope test results is sufficient to guarantee their reliability for forensic interpretations. This presentation will highlight good practice overlap between archaeological and forensic applications of stable isotope ratio analysis. Topics discussed include quality control metrics for sample preparation and analysis; assessment of meaningful differences when comparing and compiling isotope data; and minimum requirements for reporting isotope test results.

Sustainable Futures in Southern Calabria: Vibrant Communities, Farming Heritage, and Loving the Rural Life
 Small rural towns throughout Italy struggle with declining populations, and many sell houses for extraordinarily little money to lure people to become residents and invest in these communities. The Bova Marina Archaeological Project knows that paying people to move to a hilltop town will not be sufficient to revitalize a community. In our architectural survey of the San Pasquale Valley, a rural community near the town of Bova Marina, we learned that residency provides only one element of a sustainable future. Building sustainable communities requires four key components: (1) making a reliable living to support families; (2) maintaining residency to support a vibrant community; (3) supporting policies and policy makers to provide residents with material and labor resources to protect and manage their local built and natural environments; and (4) some people of the younger generations embracing rural life and seeing a future for themselves in these areas. Our project seeks to contribute toward revitalization efforts in rural Bovese communities by offering our expertise to create heritage tools and nuanced knowledge bases that can empower local residents in their efforts to build a future for themselves and future generations.

Connecting the Past and the Present: The Kaviyangan Ancestral Pottery Project
 The story begins on September 13, 2015, with a unique and unconventional wedding. This wedding was initiated by an object, the ancestral post, that had been preserved in the National Taiwan University Anthropology Museum for over 80 years. The protagonists of this wedding were the National Taiwan University and the source community of the ancestral post, the Kaviyangan community of the Paiwan tribe. Through this unique wedding, National Taiwan University and the Kaviyangan community established a new relationship. It is their hope that through the establishment of this relationship, they can transform the conundrum created by the colonial history. This marital relationship has now approached its sixth year. Both the Kaviyangan community and National Taiwan University have maintained, strengthened, and transformed this relationship through various activities. This article introduces how archaeology is used to organize and understand the ancestral pottery collected from the chief's house of the old Kaviyangan community. It also delves into how the tribe contemplates the placement of these ancestral "objects" within contemporary contexts, seeking possibilities for their organic continuity in the present. This process further stimulates our deeper research into the "objects" themselves, laying the foundation for sharing more stories about the ancestors.

Chicoine, David (Louisiana State University)**[81]***Chair***Chicoine, David (Louisiana State University)****[81]***Huanca Stone and Ancestor Veneration at Cerro San Isidro, Middle Nepeña Valley, Peru*

In the Moro region of the middle Nepeña Valley, on the western slopes of the north-central Peruvian Andes, the fifth century BCE marked a major social crisis, perhaps best seen in endemic armed conflicts, unfinished monumental buildings, and the demise of Chavín-related artistic programs. In this balkanized political landscape, Cerro San Isidro, with its strategic location at the center of the circumscribed Moro Pocket, emerged as one of the most populous and important human centers. This paper summarizes the stratigraphic, radiocarbon, and material evidence recovered at Cerro San Isidro between 2019 and 2022, outlining the broad lines of post-Chavín human occupation and their implications for our understanding of changing forms of social and political arrangements. The site is organized as series of anthropogenic platforms where co-resident groups lived in close proximity. Here, I focus on one of those platforms where our team uncovered and documented a *huanca* stone within an elite residential complex. I interpret this context in light of ancestor veneration practices, emerging social arrangements, and shifting political strategies. More broadly, I explore the cosmological implications of the *huanca*, especially in light of enduring ties with the adjacent highlands.

Chilcote-Fricker, Celise (University of Kentucky)**[157]***Death Knows No Boundaries: Mortuary Patterns and Cross-Cultural Relations of Preconquest Central America*

The characteristics and roles of the preconquest cultures that once existed in Central America have long been the subject of debate, the main focus of which revolves around the nature of their relationships to the surrounding Mesoamerican and Chibchan cultural areas. Largely accepted that no central complex society dominated this area, it has been suggested that there existed multiple “minor” cultures that reflected regional trends and participated in widespread trade networks. Due to the very nature of the universality of death and its prevalence within the archaeological record, patterns in mortuary practices provide an invaluable approach to inferring sociocultural attributes and interpreting cross-cultural relations. A survey of general mortuary patterns from preconquest El Salvador, Honduras, Nicaragua, Costa Rica, and northern Panama are used to delineate regional and temporal patterns for Central America, as well as reflect on areas of interaction, exchange, and influence with the surrounding Mesoamerican and Chibchan cultural areas.

Childs, S. Terry (Retired, Department of the Interior)**[40]***Discussant***Childs, S. Terry (Retired, Department of the Interior)****[297]***Archaeological Collections and Volunteerism*

How are managing and preserving archaeological collections and volunteerism related? I have known Dr. Majewski for about 25 years. Almost all of that time has been when she volunteered to be on various Society for American Archaeology committees that I was also on, wrote articles for journal theme issues I edited, and other activities, all related to improving the curation of collections. Dr. Majewski has been the backbone of educating archaeologists about how and why CRM does what it does with archaeological collections. In the time I've known her, she has enlightened us on how contracting works related to funding collections;

CRM field practices related to no-collection methods; preservation of associated records, both hard copy and digital; orphan collections; and many other issues. This paper will discuss Dr. Majewski's broad expertise on collections as related to her commitment to volunteering, both of which she has impressively demonstrated over her career.

Tz'ite and Sib'aq: The Wrong Materials to Create People in the Popol Wuj

Many species of plants are named in the mythical narratives of the Popol Wuj. The sixteenth-century text from the K'iche' of highland Guatemala describes how the gods and the first people used wild and cultivated plants and plant-derived materials in many ways. These narratives convey the cultural significance of plants in rich detail, effectively complementing archaeobotanical data. This includes plants that preserve poorly and are seldom recovered in archaeological contexts but were likely employed widely in ancient Mesoamerican communities. But the interpretation of the poetic K'iche' text is far from straightforward. The writers employed literary images and polysemous words that lend themselves to variable interpretations. In this paper, I examine the meanings associated with the wood of the tz'ite tree (*Erythrina berteroana*) and the fibers obtained from the tul sedge (*Cyperus canus*), known in highland Guatemala as *sib'aq* and by the hispanicized term *cibaque*. A reassessment of the well-known passage of the Popol Wuj, where the gods used these materials to fashion people in a former era, yields potentially significant cultural meanings for these plant-derived materials.

Mapping Heat: Pinpointing Early Human Interactions with Chili Pepper in Mexico

Our project investigates the origins and domestication pathways of the Mesoamerican chili pepper (*Capsicum annuum* var. *annuum* L.). Undertaken by an interdisciplinary team and relying on a tripartite methodological framework, this study employs morphometric analyses of extant and archaeological *Capsicum* seeds, ecological niche modeling across a temporal span of 20,000 years, and diachronic geospatial analyses of archaeological sites in contemporary Mexico. These methodologies converge to assist in the identification of potential loci of initial human interaction with the wild progenitor, *C. annuum* var. *glabriusculum* L. The results of this work contribute to the broader discourse on early human-plant interactions, colonization of novel ecosystems, and the complex processes underpinning plant domestication. Moreover, our research approach underscores not only the importance of archaeobotanical analyses but also the utility of integrating diverse skillsets to elucidate the intricate relationship between cultural practices and environmental adaptation.

Complete and Commingled Juveniles: Comparison and Interpretation

Throughout much of bioarchaeology's history, the remains of juveniles (nonadults) have seen a lack of study. Reasoning ranged from their perceived lack of importance in ancient societies, the complexities of growth and development, and the more fragile nature of their bones. Similarly, commingled remains are less often studied than their more complete counterparts. While it is now widely acknowledged that both juvenile remains and commingled collections have much to contribute to our understanding of the past, studies of commingled juveniles present unique challenges that have led to some hesitancy to pursue them. Using three Byzantine sites from the southern Levant, this paper discusses the importance of commingled juvenile burials for studies of ancient lifeways, particularly personhood, status, and religion. Further, we examine the methodology for incorporating juveniles into more general studies of commingled burials and the limitations and strengths of doing so. We especially focus on facilitating direct comparison between commingled and complete juvenile burials to gain a well-rounded understanding of juvenile life in the past.

Plant Use at Cinnamon Bay, St. John, USVI: A Window into Taíno Ecology and Ritual

This paper presents the analysis of paleoethnobotanical data from excavations at a Classic Taíno site (1000 CE–1490 CE) at Cinnamon Bay, a shoreline ritual site located on St. John in the United States Virgin Islands (USVI). Excavations began in 1992 when it was determined that the site was at risk of being lost to erosion. Until now, there has been no analysis of the paleoethnobotanical samples taken from the site. In the Caribbean, limited macrobotanical studies have been conducted due to concerns about the level of preservation, but previous analyses of soil samples from Taíno habitation sites including Trunk Bay on St. John and the Tutu Village site have provided baseline evidence for what comprised the Taíno diet. Although those analyses are important to our understanding of Taíno domestic economy, there has been a lack of analysis of ritual sites. This paper provides insights into ritualistic plant use by the Taíno that have previously been uninvestigated. We explore potential overlap with dietary resources from domestic habitation sites, including forest resources and agricultural staples, but pay particular attention to how plant use activities were connected with the ceremonial life of the ancient occupants of Cinnamon Bay.

Investigating Ceramic Standardization at Bombon Church, Philippines

This poster presents a preliminary report on the investigation of ceramic standardization at Bombon Church in Camarines Sur, Philippines, spanning different time periods. Bicol is recognized as one of the few regions in the Philippines where year-round extensive wet-rice agriculture was practiced even before the prehispanic era. While agricultural intensification is acknowledged as a key factor driving craft specialization in other parts of the Philippines, various case studies have indicated that foreign contact and colonial pressures can have varying impacts on the organization of ceramic manufacturing and, consequently, standardization. Using ceramic standardization as a proxy indicator of craft specialization, this poster presentation delves into the possibility of identifying changes in standardization over time among the ceramics found at Bombon Church, Camarines Sur. Additionally, it seeks to determine whether these trends indicate shifts in craft production practices. To assess the degree of morphological standardization of earthenware ceramics at Bombon Church, we carefully selected ceramic rim sherds from the site's assemblage for thorough morphological analysis. Subsequently, we utilized statistical analysis to examine measurements related to the physical characteristics of these sherds, aiming to pinpoint changes in the level of standardization within the assemblage across different time periods.

A Reevaluation of Cribra Orbitalia at Early Bronze Age Bab adh-Dhra'

Individuals at Early Bronze Age Bab adh-Dhra' (located in modern Jordan) lived in densely populated, walled towns, which led to increased physiological stress. Cribra orbitalia, likely resulting from nutritional deficiency, was used as a measure of such stress. A new method of assessing cribra orbitalia using a Bone Porous Lesion Evaluation (BoPLE) form categorizes severity and healing scales, lesion area, and pits present in a 1 cm² area. Other pathological lesions like cranial depressed fractures are prevalent on Bab adh-Dhra' individuals, representing a time period of increased interpersonal violence. A comparative study of both cribra orbitalia and cranial depressed fractures could identify a correlation between those experiencing malnutrition and those experiencing violence. This study reevaluates cribra orbitalia on complete crania of Bab adh-Dhra' individuals, to assess how this new standard might enhance studies of stress and violence at Bab adh-Dhra'.

Planning for the Inevitable: Climate Change, Cultural Resources, and Coastal Cities in the American Southeast

Risks of flooding and damage associated with climate change can be extensive and devastating, with potential impacts covering multiple domains (health/safety, infrastructure, economic, natural and cultural resources) and extending over substantial areas. Mitigation efforts are complex, costly, and may be controversial. Historic coastal cities, with substantial cultural resources located above and below ground, face unique challenges in planning for a seemingly inevitable scenario with few options. In that sense, large-scale projects that aim to develop strategies for the mitigation of such risks may present opportunities for the long-term preservation of cultural resources in such settings. Challenges faced, lessons learned and future approaches are presented for two southeastern American coastal cities: Charleston, South Carolina, and St. Augustine, Florida.

“These, therefore, are our roots, our existence”: *Ancestral Roots as the Embodiment of Identity in K’iche’ Maya Society*
In the *Title of Totonicapán*, a sixteenth-century K’iche’ Maya text, the authors declare that the founders of their royal lineage were the “roots” from which they grew and were nourished, as a maize plant draws its sustenance from its roots: “These, therefore, are our roots, our existence” (Christenson 2022:87). In this passage, roots are not merely the source of their bloodline, but of their very existence. When migrating from one locale to another, the text notes that they “brought the roots of trees and the roots of bushes” (Christenson 2022:97). These “roots” serve as a metaphor for the people themselves. In early highland Maya texts, founding ancestors are consistently described as roots, an essential part of a plant that cannot be severed away from the living plant without destroying it. As a Tz’utujil Maya colleague once told me: “As the old people say, when the Spaniards came, they broke off the branches of our world. They even burned the trunk. But the roots remain and they can never reach the roots. We will never die because the roots have power. We draw strength from our ancestors.”

Reconsidering the Role of Archaeology in Shaping “Affective Places”: *Case Scenarios from Hawai’i and Yucatán*

Western-trained scholars like to take for granted that the discipline of archaeology plays a foundational role in providing data from ancient sites from which scientists reconstruct histories, social organization, and what drew people to such places. Government institutions use such information to assign values to cultural places in the context of heritage management, which typically translate into eligibility for preservation funding. I will present two case scenarios of potent ancient sites with material vestiges which Indigenous people have reconstructed on multiple levels and with whom they practice active agentive relationships. Archaeology plays a minimal role or is not wanted. One is the famous chiefly birthplace Kukaniloko on O’ahu island, Hawai’i, and the other are the many muul or stone mounds in the Yucatec Maya landscape. Although local histories and cultural issues are completely different, both question the need for archaeology. I open discussions of how Indigenous and Western ways of knowing (archaeology) might come together so that we learn how to apply lessons from both systems to help shape a regenerative future.

Student Mentorship and Reflections of Service on DPAA Recovery Projects

Archaeological recovery of missing service personnel on conflict landscapes have increased since 2015 through strategic partnerships between the Defense POW/MIA Accounting Agency (DPAA) and volunteer organizations, heritage and cultural resource management (CRM) businesses, and universities. Such partnerships result in the sharing of methodologies and innovative technologies that are adapted and implemented at incident-related sites. Team members with varying levels of experience in field recoveries are offered opportunities to train in specific archaeological methods related to the DPAA. Partnership projects operating as academic field schools or commercial-style projects expose early career archaeologists, as well as veterans or other volunteers, to different learning opportunities through adaptive and strategic

cooperation while on site. As a result, supervisors and assistants collaborate to teach archaeological field methods, discuss recovery challenges, and receive crucial mentorship throughout the project from experienced professionals. Collaboration between project participants from multiple countries increases the social value and educational potential of DPAA projects and fosters invaluable cross-cultural experiences for foreign students, volunteers, and professionals engaged in US-funded and directed projects. In addition, such collaborations may result in the establishment of similar organizations in foreign countries focused on the recovery of their own unaccounted MIA service members.

Post Molds in the Forest: A Preliminary Report on Site 16VN3504

Data recovery excavations were conducted in the summer of 2023 at two sites in Vernon Parish, Louisiana, as part of hurricane recovery efforts in the Calcasieu Ranger District of Kisatchie National Forest. This poster presents preliminary results from 16VN3504, a multicomponent site along Drakes Creek. Excavation of Test Pit I revealed five possible post molds and associated cultural features. These post molds may represent one of the first archaeologically recorded permanent or semipermanent precontact structures in the region, potentially modifying long-held interpretations of precontact Native American lifeways in this part of western Louisiana. Information is presented on the dimensions and physical characteristics of these post molds and features, along with interpretations of their age, archaeological integrity, disturbances, and associated artifacts. Diagnostic artifacts from Test Pit I include a San Patrice point and whiteware ceramics. The dating of the structural feature requires an interpretation of disturbances.

The Nunalleq Project: Yup'ik Heritage and Community-Based Archaeology in Quinhagak, Alaska

The Nunalleq Project was initiated by the leaders of Qanirtuuq Inc., the ANCSA Village Corporation representing the Yup'ik village of Quinhagak, Alaska. The project was intended to address two locally identified needs: to recover as many artifacts as possible from a rapidly eroding archaeological site and to reconnect young people to Yup'ik traditions. The Nunalleq Project has just completed its fourteenth year with results and impact that have far exceeded any of our early expectations. This paper describes how this long-term collaboration has evolved and continues to benefit both local and outside stakeholders.

Resilience and Vulnerability of Small African Islands

While often forgotten, there are small African islands that played a crucial role in modern history and have often forgotten stories to tell about the impact of colonialism and the diaspora of enslaved and indentured workers. Their role emerged with the emergence of epidemic diseases and the need to manage the health

risks involving thousands of people forcibly or voluntarily moved around the continent. This paper highlights some case studies of small islands used as quarantine stations, leper colonies, and prisons between the eighteenth and the twentieth centuries on the east coast of Africa, i.e., the Indian Ocean. In their small size, these sites encapsulate the drastic environmental change undergone by previously uninhabited islands and, archaeologically, are exemplars of the built landscape created by colonizers for sanitary purposes. The history of these sites, though chronologically short, has profoundly marked the experience of thousands of migrants and marginalized communities and played a role in shaping new sea routes and interconnections with the mainland. In addition, some of these sites have recently been reconfigured as nature reserves for some endangered species, questioning our ability to reconcile archaeological research and environmental protection.

Assimilation, Acculturation, and Individual Agency in a Coastal Gabrielino Village

Ethnohistoric accounts suggest that the Gabrielino were a complex hunter-gatherer society similar to their Chumash neighbors. They had a rich and elaborate material culture and a ranked society with a chiefly class. Building on previous research on Chumash burial grounds, we report the results of an intensive multiyear study of a Gabrielino village and burial ground that was utilized for hundreds of years in west Los Angeles. An examination of changing mortuary treatments and associated artifacts reveals that high-status social classes or roles developed in coastal Gabrielino society in the late Mission period with little evidence for social differentiation prior to that time. We argue that the emergence of status and role differentiation is one of several responses by the Gabrielino to both the adverse conditions and opportunities presented by colonial contact with Spanish missionaries and ranchers, and the environmental changes they wrought.

“An Acre of Land to Plant or A Stick of Wood to Make a Fence or Fire”: A Heritage of Mohegan Allotment
Allotment was a world-changing institution that forever altered the course of North American history; through this process, Indigenous lands were broken up into lots, “owned” by individuals and families rather than collectively held. Allotment placed an unprecedented amount of stress on Indigenous traditions of subsistence, social relations, political organization, and more. A strikingly limited amount of archaeological attention has been placed on studying histories of allotment and their aftermaths, nor are these subjects traditionally discussed in terms of heritage. In this paper we take a pragmatic view, thinking through the differences that a “heritage of allotment” makes in the wider world. We consider allotment of Mohegan lands in southeastern Connecticut (USA). An archaeology of Mohegan allotment speaks to an enduring and long-term Indigenous presence, to the challenges faced and overcome by Mohegan peoples living through, and with, settler colonialism, and to the nuances of Indigenous-colonial archaeological records. The paper emphasizes the importance of Indigenous and collaborative archaeologies for shedding new light on these challenging but important archaeological traces, while also exploring how a heritage of allotment pushes back against the Eurocentric and colonial vantages through which Indigenous history is often framed.

Reenvisioning “Zero Waste Archaeology”

As archaeologists, we have a heightened awareness that the objects we discard in our daily lives persist and tell a story about contemporary society. But do we give enough consideration to the items we discard through the process of archaeological research? In 2012, an article published in the SAA Archaeological Record titled “Zero Waste Archaeology” pointed out various ways that archaeologists could reduce the negative ecological impact of their research. Over a decade later, many of these suggestions have become common practice for most as sustainability has increased in importance and necessity in our personal and professional lives. Practices of present interest, including the reduction of fossil fuel consumption, avoidance of single-use plastics, and participation in the circular economy, are given brief, if any consideration. In this poster, I revisit the idea of “zero waste archaeology” for this decade, in light of current sustainability research and trends.

“Us the Hunters”: Evaluating Shifting Gender Dynamics of North American Paleolithic Researchers and Scholarship

The number of women in Paleolithic archaeology has increased over the last 30 years, following the trend in the field in general. In the United States and Canada, the number of men and women in tenure track positions is nearly equivalent, yet this equality masks considerable imbalance when considering the seniority of these professors. Male professors are more likely to be in positions of power in their institutions but are also more likely to be seen as leaders in the field and to be perceived as the voices of Paleolithic archaeology. This last point is starkly expressed when viewing the representation of human origins “experts” in the public media. As a result, the way that gender roles and dynamics are interpreted in the Paleolithic archaeological record is often perceived through an androcentric bias. In this paper, we evaluate the changing demographics of Paleolithic archaeology researchers, assessing whether these changes impact how Paleolithic gender is interpreted in scholarship and by the public.

Public Archaeology and Geophysical Survey of a Cemetery in North Dakota

The State Historical Society of North Dakota (SHSND) recently acquired a suite of geophysical survey equipment in preparation for collaboration with the Turtle Mountain Band of Chippewa and Spirit Lake Nation. At the same time, a small community cemetery contacted the SHSND for information on locating unmarked burials, as the descendant community research indicated that the Logan Center Cemetery in Grand Forks County, North Dakota, contained numerous unmarked graves. Partnering with the cemetery caretakers, the Society’s Department of Archaeology and Historic Preservation conducted a multisensor remote sensing survey, including GPR, electric resistivity, and color and infrared drone surveys. Field crews included SHSND staff, local community members, and Turtle Mountain Band of Chippewa staff. The project garnered immense interest from family members who traveled to observe the fieldwork, including some

driving from multiple states away to learn about and see the process. This presentation discusses the public aspect and the geophysical findings of this survey.

Shades of Confinement: Collaborative Study of a Historic Treescape at Amache National Historic Site

Trees—whether planted, pruned, or left to grow in their natural setting—can provide detailed evidence about intention, expertise, and aesthetics of the people who planted or lived among them. This paper overviews the methodologies employed and research findings of scholars studying the trees of Amache, Colorado's World War II-era Japanese American incarceration camp. A primary strategy for making their prisonscape more habitable, incarcerated prisoners planted thousands of trees at Amache and many still exist on-site. High-resolution drone imagery has made mapping these trees much more streamlined and reveals important neighborhood-level patterning. At Amache this broader scale data has been combined with GPR, excavations, and analysis of individual trees deepened through engagement with community members, including experts in traditional plant care. This holistic approach provides a fine-grained view of these critical, often living, heritage resources.

Ethnoarchaeological Pottery Traditions in North Wollo, Ethiopia

This paper will review the ethnoarchaeological context of ceramic production in North Wollo, Ethiopia, and trace changes to ceramic traditions influenced by sociopolitical factors, with implications for archaeological reconnaissance and research. This research is a part of the broader Solomonic-Zagwe Encounters Project and its ongoing efforts to, in part, reevaluate pottery from the post-Askumite period. Much of the pottery analyses from northern Ethiopia have followed a simple typological model of vessel form and color. Often, this has been a descriptive exercise with little interpretation of broader archaeological significance. Ethnographic research of contemporary pottery production, almost exclusively in the Tigray region, however, has been more robust, correlating attributes like temper to geographical origins and technical and social factors. This paper presents complimentary research from Gannata Maryam in the Zagwe Dynasty heartland. The research highlights how twentieth-century politics influenced pottery production with implications for current field surveying, how local potters view technical choices like temper, and describes rarely recognized potting techniques. All these aspects contribute to more meaningfully engaging with pottery as an archaeological resource in post-Aksumite Ethiopia.

Detecting the Path: The Usefulness of Lidar in the Upper Central Tombigbee River Valley

Over the past few decades, lidar has been used to reveal the extent and complexity of cultural landscapes in different world areas. The Mississippi period (AD 1000–1550) is poorly understood in the Upper Central Tombigbee River Valley, especially as a broader Mississippian understanding of these settlement data come from Tennessee-Tombigbee Waterway surveys and excavations of the 1970s. This paper compares the ability

and limitations of lidar in the Upper Central Tombigbee Valley, first by testing against reported Mississippian sites in the region, then by considering the possibility to pair lidar with Indigenous knowledges in north-central Mississippi. By braiding together new settlement data, Indigenous knowledges, and current technology, we can detect the paths of the past, contextualizing a multidimensional landscape through a variety of lenses.

SPD Analysis Sheds Light on North Spanish Mesolithic Demography

Summed probability distributions of radiocarbon dates (SPD curves) have become an increasingly popular tool with which to reconstruct prehistoric population dynamics. They are used here to test models of demographic change using Mesolithic data from Cantabria and the middle Ebro valley. Local, regional, and global models are compared. Results show a consistency of pattern, regardless of scale and the shape of the null model, when the Ebro dates are compared with those of Cantabria. In each comparison there is an inverse relationship between central Cantabria and the Middle Ebro. As Cantabria loses population, the Middle Ebro gains it. Cantabria shows a significant increase in population that peaks at 7.7–7.8 ka cal BP, followed by a decline that continues well into the early Neolithic. The middle Ebro shows a long negative deviation between ca. 12–10 ka cal BP, suggesting the region was unoccupied until the late Upper Paleolithic. This is followed by a long positive trend that attains statistical significance at ca. 7.4 ka cal BP, with maximum population density at 7.1–7.0 ka cal BP, some 700–800 years after the Cantabrian peak, perhaps explaining the near abandonment of Cantabria following the Mesolithic.

Why Do Pictures Speak? Orality in Maya Hieroglyphic Writing

This paper investigates the relationship between Classic Maya text, imagery, and genre when quoted speech is introduced. Quotes can be attributed to speakers through “speech scrolls,” the quotative evidential particle, or the verb meaning “say.” When the latter two are used, they are followed by the name of the speaker and sometimes the addressee. These kinds of attributions appear more commonly on ceramics than on monuments, and when these attributions do occur on monuments, they rarely appear as the speech verb. The usage of the speech verb primarily on ceramics, especially those portraying mythohistorical narratives, suggests that its appearance may be generically bound. Texts that include the speech verb are often thematically related and temporally and regionally limited. They are connected to a few historical actors—owners and scribes—named in rim texts. The way scribes represented speech in these narrative contexts was likely meant to foster a greater connection between their patrons and the mythohistorical heroes of their stories for a significant political aim. By creating these connections and even claiming to know the spoken words of supernaturals, historical actors could impress their esoteric knowledge upon their subjects by boasting access to an oral tradition passed down from the supernatural world.

Real Roads and Imaginary Borders: Exploring Northern and Central Andean Cultural Trajectories and Interactions from the Perspective of the Ceja de Selva during the First Millennium BCE

The border between Peru and Ecuador has often been viewed heuristically as a boundary between the cultures of the Northern and Central Andes, particularly by the second of half of the first millennium BCE when the historical trajectory of the two culture areas appears to diverge into two separate paths. Nevertheless, recent research from the ceja de selva of the eastern half of the Transitional Zone between the Northern and Central Andes indicates a considerably more complicated picture, one that is suggestive of both shifting cultural boundaries as well as continued cultural interactions. In this paper, I use recent evidence from the site of Huayurco to argue that cultures living in Peru's northern ceja de selva actually strengthened their relationship with societies living in Ecuador during the latter half of the first millennium BCE, a trend that would continue into the subsequent first millennium AD, likely in order to maintain access to certain types of products used for ritual paraphernalia. The evidence from this paper reinforces the idea that the Northern and Central Andes were not separated by a hard border but rather shifting cultural frontiers that contributed to the cultural trajectories of both regions.

Basement Curation: Adopting an Orphaned Collection from Montserrat

The Galways Plantation collection, consisting of 28 boxes of artifacts excavated on Montserrat during the 1980s, was temporarily on loan in the United States when the Soufrière Hills Volcano erupted in July 1995. This catastrophic event led to the creation of an exclusion zone covering two-thirds of the island that remains officially unoccupied to this day. In addition to the loss of life, land, and livelihoods, the disaster destroyed archaeological sites—including Galways—and threw the cultural heritage administration into chaos. The Galways collection has now been off-island for over 25 years because, notwithstanding the aftermath of the eruption, the island does not currently have the capacity to curate the collection, which is a systemic issue throughout the Caribbean. Climate change, political instability, and lack of resources mean that many archaeological collections eventually find homes far from their sites and communities of origin. In fall 2023, the Galways materials will move from New Jersey to Central Connecticut State University in New Britain, CT, where they will be digitized into DAACS and used for teaching. Unpacking these boxes, and their history, will involve accounting for their past and present storage conditions as entangled sites of curation.

Claypatch, Hunter (Binghamton University; Desert Archaeology)**[75]***Understanding La Playa through 2,000 Years of Ceramic Production and Exchange*

Ceramics blanket La Playa's vast landscape and include some of the earliest pottery produced in the Southwest/Northwest. Despite its high frequency and value for reconstructing occupational histories, there has been no synthetic discussion of La Playa's ceramics. This presentation chronologically frames the site's 2,000 years ceramic presence by exploring questions of nascent pottery production, distribution of trade wares, and regional precolonial ceramic variability. The value of La Playa's ceramics is particularly important for reconstructing Trincheras tradition chronology (~400–1450 CE) and has recently contributed to the first seriation of its ceramics. This seriation demonstrates that a locally produced ceramic type, La Playa Purple-on-brown, was among the earliest decorated ceramics produced in the Southwest/Northwest and served as a progenitor for over eight centuries of local decorated pottery production.

Clayton, Sarah (University of Wisconsin, Madison)**[11]***Discussant***Clayton, Sarah (University of Wisconsin, Madison) and Angela Huster (PaleoWest)****[214]***Ritual, Material Culture, and Interaction in the Epiclassic Basin of Mexico: Contextualizing a Temple Assemblage from Chicoloapan*

Central Mexico's Epiclassic period (550–850 CE) was a time of significant social change, marked by the breakdown of the Teotihuacan state, political fragmentation, the migration of large numbers of people, and the adoption of new practices and institutions. In the Basin of Mexico, macroscale shifts in regional settlement are well documented, including the formation and growth of settlements that persisted for multiple centuries. Less is known, however, about the everyday lives, changing practices, and interactions among people living across the region during this time. In this paper, we examine community-scale ritual and associated material culture at Chicoloapan, a large settlement in the southern Basin that flourished after Teotihuacan's decline. We present an analysis of artifacts and features associated with a temple complex at Chicoloapan and consider the activities that took place in civic-ceremonial spaces among Epiclassic communities in this area. The assemblage includes diverse objects, from censers to musical instruments, that represent the material traces of events and interactions that shaped social relations, power structures, and concepts of identity among residents. This research sheds light on the internal dynamics of an Epiclassic community and examines shifting local practices and material culture within the broader context of regional sociopolitical change.

Cleary Moungey, Megan**[181]***Discussant***Clinker, Susannah****[168]***Sewing Hope: Embracing Traditional Knowledge and Crafts through Gut Sewing*

Gut-sewing technology was utilized by Inuit communities until the early twentieth century. Despite gut-sewing being a successful and advantageous technology for thousands of years, it is scarcely practiced today. This is in part due to the availability of synthetic materials but also because these kinds of traditional practices have been lost over generations due to the forced displacement of Indigenous people, Residential school systems, and federal laws restricting traditional hunting practices. In recent years, however, many Indigenous communities have attempted to reestablish and renew these kinds of cultural practices and traditional

techniques, including gut sewing. This is typically done by bringing together Elders and knowledge holders with members of the community and the general public. For example, the Smithsonian Arctic Studies Center in Alaska brought together three Indigenous artists in 2014: Mary Tunuchuk (Yup'ik), Elaine Kingeekuk (St. Lawrence Island Yupik), and Sonya Kelliher-Combs (Iñupiaq-Athabaskan) to study historic gutskin objects and to teach community members this traditional skill. This presentation will outline my experience trying gut-sewing and will reflect on how community-based projects that teach these kinds of traditional skills can be valuable experiences for archaeologists to immerse themselves into the social aspects of the technological process alongside community members.

[7]

Lift Every Voice: Ethical Imperatives in Community-Led Bioarchaeology

This presentation focuses on redefining ethical frameworks in bioarchaeology and anthropological genetics, particularly when working with African American communities. Utilizing a “shared authority” approach, the talk argues for the community’s role as not merely subjects but active collaborators and decision-makers. Case studies from the historic New York African Burial Ground and other unidentified sites in North Carolina, and South Carolina serve to advocate for an ethical paradigm shift toward community-centric research. This shift aims to create mutual benefits: empowerment and ownership for communities over their ancestral narratives and a more nuanced understanding for researchers. The goals are twofold: to decolonize bioarchaeological practices by authentically incorporating African American perspectives and to advance restorative justice by recalibrating how knowledge is generated and shared. This community-focused approach fosters empowerment and ownership within African American communities over their past. By doing so, it creates a more ethical and equitable landscape for research, celebrating African American heritage. Finally, we call for an ethical reevaluation in academic practices, offering a blueprint for a more respectful, inclusive, and responsible future in bioarchaeological and anthropological genetic research.

A Model Melting Pot? Interrogating Hybridity and Ethnogenesis in Colonial Ceramic Production at Comanche Springs, New Mexico

Located in the foothills of the Manzano Mountains in southeastern New Mexico, the site of Comanche Springs has been an object of research and excavation spanning five decades. However, the social fabric of the people who once occupied this seventeenth-century colonial settlement remain unclear. Was this relatively isolated population an exemplary “hybrid” community foreshadowing the unique melting pot of contemporary New Mexico? To answer this question, I conducted an in-depth analysis of the Comanche Springs ceramic assemblage according to type, form, temper, design, and firing process. This research elucidated the involvement and influences of both Spanish and Indigenous residents in the production processes and eventual use of ceramic vessels. Characteristics of hybridity and ethnogenesis present in the assemblage indicate that Spanish settlers at Comanche Springs were clearly intertwined with—and perhaps even dependent on—local Indigenous populations for knowledge and survival on the colonial frontier.

Capturing Time: 3D Preservation of California Central Valley Rock Art for Future Generations

The preservation of cultural heritage through advanced technology allows us to understand and protect the past for future generations. This poster presents the Rock Art Heritage Preservation Project, a project aimed at digitally conserving the legacy of California Central Valley's rock art with the Southern Sierra Miwuk Nation. California's landscape harbors invaluable cultural heritage, such as rock art sites, many of which remain undocumented due to limited accessibility and private ownership. These petroglyphs and pictographs reflect Indigenous artistic expression and culture; however, these sites are at risk of natural erosion and vandalism, highlighting the urgency of their preservation. The project, centered in Merced and Mariposa counties, uses recording techniques like lidar, photogrammetry, and structured light scanning. This initiative not only encourages the digital documentation of these culturally significant sites but also increases their accessibility for both researchers and Indigenous groups. By employing these advanced methods, the Rock Art Heritage Preservation Project strives to offer an immersive experience that bridges the past and present. This undertaking emphasizes the integration of technology and cultural stewardship, ensuring that rock art sites endure as a testament to Indigenous creativity and culture.

The Transformative Power of Learning Assemblages, Relational Pedagogies, and Universal Design for Learning in Archaeology

In our collaborative work, Karina Croucher and I have developed a pedagogy that we have called an inclusive learning assemblage approach (Cobb and Croucher 2020). We have argued that archaeology is powerfully placed to deliver teaching and learning that foregrounds the lived experiences of our students and their relationships with humans and nonhumans alike, bringing these into conversation with the past, present, and future. In contrast to banking, instrumentalist, or “chalk and talk” models of teaching and learning; our approach follows hooks (1994) in advocating methods that teach to transgress, and in turn this has the potential to transform the archaeologies that our students will produce in the future. But what does this look like in practice when we are constrained by the day-to-day requirements of our universities? How can we resist and challenge these while foregrounding our student’s diversity? In this paper I turn to the concept of Universal Design for Learning, which aims to accommodate the needs of all learners, in order to work through how principles of inclusive learning assemblages can be realized in assessment practices and beyond.

Neanderthal and Carnivore Interplay at Escoural Cave: Preliminary Evidence from the Archaeofaunal and Spatial Analysis of Two New Test Pits

The Escoural Cave (Portugal) represents a key window into Neanderthal-carnivore interactions during the Middle Paleolithic. Excavations in the 1960s and 1990s unearthed abundant archaeological findings, including

Neolithic burial grounds, cave art and Upper and Middle Paleolithic remains. The Middle Paleolithic layers are characterized by abundant quartz industries and faunal remains. U-Th dating suggests an age of approximately 48 ka. This research presents the results of a zooarchaeological and taphonomic analysis of the fauna recovered from two recently excavated test pits—outside and inside the cave. Additionally, spatial analysis on the vertical axis was employed to discern Neanderthal and carnivore occupations. Preliminary findings suggest that both Neanderthals and carnivores contributed to the accumulation of remains, but that Neanderthal visits were sporadic. While human and carnivore alterations seem intermixed in the vertical section, there is no current evidence indicating overlap or scavenging events between the two. The complexity of the cave system, site formation processes, and the unknown connection between external and internal cave sediments challenge our understanding of the interactions between Neanderthals and carnivores, underscoring the importance of reexamining previous finds and undertaking new excavations. This study sets the foundation for future research, anticipating deeper insights into prehistoric dynamics.

Continental Connections: Development of the Yayoi People

The Korean Peninsula and Japanese Archipelago have been intimately connected in many ways since the beginning of the peopling of both regions. However, the Mumun (Bronze age) period of the Korean Peninsula witnessed the most impactful interactions between the two groups. During this period the Jomon people of Japan and Samhan people of Korea started exchanging more than simple trade goods. This is evident in the archaeological materials found in both regions. This paper will look specifically at the exchange of material culture and ideas such as Bronze AFOs and ceramics coming into the Japanese archipelago. In addition, it will discuss the development of burial mounds and how continental connections helped to develop this custom. It will detail the significant role that the Mumun pottery and bronze dagger traditions played on the developing Japanese culture. It will also question the idea that the cultural exchange occurred only in one direction as some scholars have suggested.

Creating Machine-Learning Models Using Historical Maps to Identify the Places In-Between

Historical archaeology lies at the intersection of the written word, the spoken word, and material things. We extend and enhance that purview by incorporating machine-learning algorithms to create more dynamic assessments of places documented on historical maps, thus engaging more deeply with sociocultural and environmental perspectives embedded in a multiscalar historical past. By creating hybridized data sources to create more dynamic collections of information, we are able to take advantage of inherent “unknowns” in traditionally utilized data sources to identify probable locations of past human activity. Embedding the in-between spaces in our model of historic coastal plantation spaces allows us to more fully engage with theory building of liminal, disenfranchised spaces and places using a broader synthesis of the processual culture history building inherent in southeastern archaeology while also engaging with the so-called “ontological turn.” Ultimately, we propose that by identifying the locations of places ignored or unknown by archaeologists, as well as highlighting the areas within which many community-building activities took place, we can create a system to identify and protect important cultural heritage resources that are at risk due to the climate emergency.

Paleo Core: A Conceptual Framework for Integrating Paleontological, Archaeological, and Geological Data

Data sharing, integration, and synthesis remain elusive goals for paleoanthropological and archaeological research into human biological and cultural origins, which relies on fossils, artifacts, and geological specimens collected by diverse, independent research teams. Integrating find data across these efforts is an acknowledged but as yet unachieved goal. Part of the challenge is the heterogeneous nature of the collected data as well as the lack of shared conceptual frameworks and standards for sharing information. A shared framework supports integration and synthesis of primary data across sites and teams by specifying the relationships between notional entities fundamental to paleoanthropological and archaeological research. Here, we present a modular, extensible conceptual framework for recording and sharing paleoanthropological and archaeological data, developed from an assessment of existing data dictionaries from a diverse set of projects. We also provide concrete examples of data standard implementation in paleoanthropology and archaeology to demonstrate the benefits of adopting such a framework.

Identification of Avian Bone and Eggshell to Reveal Seasonal Foods from Ancient Wetlands

Wetlands provide a huge abundance and diversity of foods from aquatic plants and animals, many of which don't survive archaeologically. Those that do, such as the bones and eggs of aquatic birds, are often underutilized in archaeological interpretations due to the difficulty of their recovery and taxonomic identification. Yet avifaunal remains from aquatic species can provide a wealth of information on wetland health and productivity, presence of co-occurring organisms and harvesting of food items, alongside contextual information about seasonally available foods. Recent research has demonstrated the utility of proteomic techniques for identifying fragmentary avifauna from archaeological sites, including proteins within the mineral matrix of eggshells which can survive far longer than proteins can survive within animal bones. We present new research from the ArchaeoBiomics laboratory at the University of Turin, Italy, where we are refining the methodologies to extract proteins from eggshells and expanding reference libraries to improve the taxonomic resolution for identification of both avian bone and eggs. We also consider whether protein degradation can be used to identify markers of cooking in eggshells and apply these techniques to examine seasonal wetland exploitation and cooking within the context of a late Pleistocene to Holocene transitional site in Southwest Asia.

When Walls Talk: Rodent-Cached Botanical and Ceramic Assemblages from a Nineteenth-Century Charleston Kitchen House

This poster focuses on the context of urban enslavement in the South Carolina Lowcountry, examining botanical and ceramic assemblages as mechanisms to create visibility for populations often who lived in close proximity with and are thus materially rendered less visible by their enslavers. The rodent-cached botanical

and ceramic assemblage of the Nathaniel Russell House Kitchen House provides archaeologists with new data to draw out the lived experiences of the urban enslaved through networks of formal and informal exchange that encompassed both urban and plantation loci. Rodent caches inherently save materials that would otherwise be consumed, planted, or discarded in household middens. By focusing on rodent-cached materials in an urban context, this poster continues the research program of the archaeology of urban enslaved lifeways through a comparative examination of botanical and material assemblages that have not been preserved in similar contexts. The results of the first phase of this study are presented, along with potential future avenues of exploration as this project continues.

The Effects of Carnivore Diversity on Scavenging Opportunities and Hominin Range Expansion during Out of Africa I
 Numerous extrinsic hypotheses explaining Out of Africa I, like faunal turnover and hominins following fauna, have been rejected based on paleoecological models. Others have explored the importance of the hominin intrusion into the carnivore guild. Here, I build on this hypothesis by proposing a complementary hypothesis; the scavenging corridor hypothesis (SCH). In East Africa, carnivore richness peaked around 3 Ma and declined gradually until shortly after 2 Ma. This timeline coincides with the development of early lithic technologies and initial evidence of the butchery of large mammals; thus implying that increased hominin carnivory impacted endemic carnivore diversity through the transition from passive to confrontational scavenging. The SCH posits that the relatively stable carnivore diversity and richness in Eurasia permitted hominin range expansion into Eurasian habitats after 2 Ma due to scavenging opportunities along continuously overlapping carnivore ranges. This study tests the SCH by examining carnivore diversity at African and Eurasian sites covering intervals before, during, and after initial Out of Africa I dispersals. This study builds on previous hypotheses about the role of carnivore guilds in hominin dispersals while tying in theoretical models on modes of early hominin carnivory and actualistic research on scavenging opportunities resulting from carnivore guild composition.

Laws that Continue Depriving Indigenous Peoples of Their Cultural Heritage in Guatemala: Lesson for Archaeologists
 In Guatemala, the Law for the Protection of the Cultural Heritage of the Nation establishes that archaeological sites are the property of the nation and are under the exclusive protection of the state. From the point of view of Indigenous Peoples, this law is racist, exclusionary, and violates their rights since it legalizes the dispossession of Indigenous Peoples over their cultural heritage. In 2022, Bill 5923, called "Rescue of Prehispanic Heritage," was proposed with the objective of rescuing the prehispanic cultural heritage and promoting its conservation and restoration. The regulation of these tasks would be in charge of a National Council for the Rescue of Prehispanic Heritage formed by state entities with private and public financing. Once again, Indigenous peoples were not consulted about this bill, and their participation was not included in the so-called National Council despite the fact that this initiative directly affects their rights over their cultural heritage. The rejection of this bill provides with important lessons about the Indigenous

peoples' valorization of their cultural heritage, especially on sacred sites (archaeological sites). This case offers archaeologists reflections on the efforts Indigenous peoples have made to recover their past despite the legal and structural violence in Guatemala.

Specters and Spectators: Paranormal Tourism and Historic Sites of Confinement in the American South

In this paper, authors Cayla Colclasure (she/her) and Zoe Schwandt (they/she) consider the phenomenon of paranormal tourism and related media as one way various publics engage with historic sites of confinement in the American South and attempt to bridge the epistemological divide between these forms of engagement with the past and the discipline of historical archaeology. We focus on historic sites of confinement such as prisons, jails, convict leasing camps, asylums, and sanatoriums as loci of difficult histories which have received widespread attention in the form of paranormal tourism and media. Through site visits, media analysis, and archaeology of digital spaces, we explore how the paranormal (mal)functions as a lens for education and learning about difficult histories, consider the implicit carcerality of haunting, and contemplate the afterlives of historic sites of confinement from an abolitionist perspective. Ultimately, the authors relate this discussion to their work on incarcerated labor, institutional life, and the multitemporal politics of confinement.

Paleozoological Baselines Inform Climate Change and Help to Restore Indigenous Socioecological Systems: A Case Study from the Bear River Basin, UT

As human impacts on ecosystems accelerate, there is a growing emphasis in conservation planning toward maximizing the capacity of ecosystems to respond to anticipated changes in the near future. Doing so requires understanding how ecosystems responded to past changes (e.g., human impacts, altered climates) that occurred over timescales exceeding those of direct human observation. Paleozoological data provides such a record and documents baselines of animal communities that can be used to evaluate historic anthropogenic change and attest to the responses of species to ecosystem changes over geological timescales. This study uses paleoclimate and paleozoological data from a high-elevation cave deposit in the Bear River Basin, straddling modern-day Utah, Idaho, and Wyoming, to establish an independent record of faunal abundance for the region, capturing a greater range of potential species representation than historic observations. We then compare the paleorecord to modern zoological survey data and climate records to evaluate whether anthropogenic climate change has contributed to local range shifts or extirpations, as has been predicted for the region's montane mammals. Then, we discuss how our findings will contribute to an ongoing interdisciplinary project led by the Northwestern Band of the Shoshone Nation to restore Indigenous socioecological systems in the region.

Recent Manifestations of Belief in Embodied Spiritual Power in the Western World

When considering the claim that it has long been common for people to attribute spiritual power to certain body parts and bodily substances of humans and nonhuman animals and incorporate them into their religious beliefs and practices, there is a tendency for us, modern Westerners, to exoticize the phenomenon. We are liable to view it as something done by non-Western societies and ancient cultures rather than something we do. In the present paper, we hope to show that this is a mistaken framing. By highlighting both instances from the last few hundred years of Western history and contemporary examples, we will try to demonstrate that the belief that certain body parts and bodily substances of humans and nonhuman animals possess spiritual power has very much been part of the conceptual repertoire of the West in the modern period and still is for many Westerners. “Embodied spiritual power” is neither an alien belief nor an extinct one. It is one of our civilization’s collection of ideas and it is still very much alive.

Archaeological Data Reuse in Action: Three FAIR Examples in tDAR

The FAIR Principles for Data Stewardship asserts that data should be Findable, Accessible, and Reusable. Only by digitally preserving, efficiently curating, and ethically sharing data and information can we better understand the complex convergence of forces acting on humans and their societies across time and space. To this end, the Center for Digital Antiquity (CDA) advocates for the FAIR Principles to be implemented as the “industry standard” guiding all archaeological data management and reuse efforts. This poster highlights how CDA applies the FAIR Principles in its digital repository, The Digital Archaeological Record (tDAR), focusing on the reuse strategies, statistics, and successes of three exemplary collections: the Department of the Air Force (DAF), the Colorado Projectile Point Database, and the Digital Archive of Huhugam Archaeology (DAHA).

What Makes a Better Surface Elevation Model: On-the-Ground Total Station or Low-Altitude Lidar?

Recent excavations on two small precontact archaeological sites in southeast Iowa provided an opportunity to conduct drone-mounted low-altitude aerial lidar in addition to the standard total station methodology to develop ground surface elevations and contours. The drone used for the projects was the industrial grade mapping inspection drone, DJI Matrice 300 RTK with base station. It was equipped with the DJI Zenmuse L1 lidar + RGB survey camera. With minimal leaf cover during the early spring of 2023, the lidar instrument provided highly detailed ground point data. This poster will compare the results gathered from the two technologies when analyzed independently as well as combined to determine which one reigns supreme.

Tracing Health Outcomes of Africans Who Were Enslaved in North Florida, Pre- and Post-emancipation

Florida stands as a unique case study due to being one of the few states to include Africans who were enslaved in the mortality schedules during the 1800s. The historical backdrop of Northern Florida’s settlement and its deep rooted ties to the institution of slavery sets the stage for a rich examination of pre- and post-emancipation treatment of non-White residents. This study provides a cursory analysis of health outcomes in North Florida, focusing on the difference between Africans who were enslaved and their White

contemporaries from the period surrounding the Civil War. Using the mortality schedules obtained from the Florida State Archives, this research explores historical data trends in order to illuminate the health trends surrounding the abolition of slavery in the region. This study approaches the available data with a critical perspective, understanding that challenges and biases inherent historical recordkeeping must be considered. Additional research into newspaper articles and other historical sources are used to provide context for the individuals under study. By cross-referencing these records with other documented proof of death, I aim to construct a comprehensive picture of pre and post-emancipation health outcomes, highlighting the enduring impacts of slavery on the well-being of African Americans in North Florida.

A Preliminary Recontextualization of Lithic and Exchange Chronology of Coxcatlan Cave within the Tehuacan Valley, Mexico

In recent years, Coxcatlan Cave has drawn renewed attention for its early regional chronology and centralized location as a nexus point for interregional exchange. However, its importance for understanding shifting patterns of exchange and resource acquisition within the Valley of Tehuacan has yet to be explored. This research draws on the data gathered by the Tehuacan Archaeological-Botanical Project, directed by Richard S. MacNeish in the 1960s, to understand how exchange networks in Mesoamerica formed and transformed in conjunction with the development of urban society. MacNeish and colleagues collected over 3,000 obsidian artifacts from multiple caves and terrestrial surveys throughout the Tehuacan Valley—including Coxcatlan Cave. A total of 114 diagnostic obsidian projectile points from MacNeish's collection, currently in the Robert S. Peabody Institute of Archaeology at Phillips Academy in Andover, Massachusetts, were subjected to nondestructive X-ray fluorescence (XRF) analysis with a Bruker Tracer 5i analyzer and evaluated for this research. While the existing collection is an incomplete sample, the data produced from this analysis hint at a correlation between shifting point chronology, obsidian sourcing, and cave occupation over time, most pronounced in Coxcatlan Cave. This research is a crucial first step in recontextualizing early lithic exchange and resource use in Mexico.

Confluences: Canals, Wetlands, and Agroecosystems of the Ancient Maya in Northwestern Belize

Wetlands played a crucial role in the subsistence methods of early complex polities, including the ancient Maya. The scale of canal development in the Birds of Paradise wetland field complex reflect the status, technological power, and agronomic wealth that wetlands provided to the ancient Maya in this region during the Maya Late Preclassic to the Postclassic. These elaborate systems persisted through the Terminal Classic droughts well into the Postclassic. New findings from our field excavation at a specific canal confluence in summer of 2023 have revealed significant changes in the built environment that further support evidence for extensive and persistent water management practices. This site in Northwest Belize is a complex system of canals and fields within the Programme for Belize Rio Bravo Conservation and Management Area, roughly 5 km² wetland forest (with an additional 7 km² nearby) within the coastal plain of the Rio Bravo watershed. Further remote sensing and multiproxy geochemical analysis will provide greater understanding of wetland ecosystems and indigenous water management strategies at this site and may indicate adaptive strategies across extensive periods of climate variability against the changing tapestry of shifting polities.

Interior Chumash Faunal Exploitation: The View from SBA-2464

Late prehistoric– and early contact–era Chumash society included wide-ranging exchange and social networks that integrated people among a diversity of ecological zones. Several of these models suggest three of the major ecological zones were the Northern Channel Islands, the nearby mainland coast, and the upper Santa Ynez River Valley (SYRV). While the coastal zone and the islands have received considerable attention from archaeologists in part due to exceptional preservation on the islands and modern development on the mainland, interior regions are not as well documented. The interior was also less densely populated and there were fewer sites than in the other two zones. This presentation includes faunal data from the late prehistoric and early historic site of SBA-2464 in the SYRV and compares those data to sites in the other two ecological zones.

The Justin Kerr Maya Vase Database and Its Contribution to the Study of Maya Iconography

It is hard to overstate the rich intellectual benefits that iconographers and epigraphers have been given through the lens of Justin Kerr's remarkable Maya Vase Database. It not only brought to light a world of gods, rulers, courts, and vivid bestiary but also revealed complex narratives that are now only beginning to be understood. Part of the contribution, aside from the game-changing roll-out photography, is accessibility. The publication of *Maya Vase Book* provided a key resource until the era of the internet ushered in a platform to move online. It is now easier than ever to access the wonderful world of Maya art. Online archives are becoming more popular as is the need for clear, concise, and accurate searchable systems. Visual literacies are key. The preservation, expansion, and accessibility of this archive are immensely important for current and future researchers. The current work being undertaken at Dumbarton Oaks brings a renewed sense of order with its searchable lexicon, thus providing inspiration for similar endeavors that in the spirit of Justin Kerr's generosity, are creating a more global and accessible dissemination of Maya art and iconography.

Squaring the Circle: Public Architecture of Fort Center and the Resiliency of Community

Within the southern Florida interior, Fort Center is most widely known for its monumental architecture and 2,000-plus years of occupation within a dynamic, and at times unpredictable, landscape. In this paper I discuss how peoples' early investment in communal architecture played a role in establishing and maintaining resiliency for successive generations. The architecture in question, an enclosed plaza, serves as a highly accessible communal space and was constructed with the expectation of cyclical environmental shifts. Although there are several other ditched encloses in the region, the persistence of Fort Center as a regional hub showcases how people recognized the value of connectivity regardless of perceived distance from one another. This is especially true now, when faced with ongoing and exacerbating environmental pressures.

Comer, Anne**[141]***Universal Access to Archaeological Parks and Sites: A State of the Question Part II*

For whom does “access” address and do current laws, nationally based, regarding accessible design foster enough guidance for effective site updates—if not, what can we as heritage professionals do to foster a more inclusive visitor experience, and how can we support archaeological park managers to create more inclusive programming? This session explores case studies highlighting the intricacies and vast interpretations of “access” and continues the conversation of an international working group formed under the auspices of ICOMOS/ICAHM to produce international guidelines for an accessible programming and management for open air UNESCO World Heritage archaeological sites. As the members of the working group approach the publication of our guidelines, we invite you to join us for a wider discussion on accessibility with our archaeology colleagues working in all forms of archaeological parks. Please join us in discussing how to make archaeology more inclusive for all.

[311]*Using DNA to Connect Living People to Enslaved Ironworkers at Catoctin Furnace*

In 2023, “The Genetic Legacy of African Americans from Catoctin Furnace” was published in *Science*, demonstrating that it is possible to wed the power of massive direct-to-consumer ancestry databases with ancient DNA technology. Using the first reliable approach for identifying identical-by-descent (IBD) connections between present-day and historical people, we compared the DNA of 27 African Americans who labored at Catoctin Furnace, Maryland, during the late eighteenth to early nineteenth centuries to that of more than nine million research participants in the 23andMe genetic database. Key findings are 1) we identify 41,799 modern relatives. Of these, 2,975 are extremely close and include likely direct descendants. 2) We trace enslaved peoples’ origins in Africa. By sampling DNA from historical people with closer ties to Africa, we show that the enslaved workers at Catoctin derive from a small number of African groups, particularly the Wolof of West Africa and the Kongo of Central Africa. 3) We restore personal stories. Within the Catoctin African American cemetery, we identify five genetic families, primarily composed of mothers, children, and siblings who were buried close together. 4) We offer methods for communicating with descendants. We developed protocols to inform descendants and provide critical information and support.

[263]*Current and Potential Applications of Satellite-Borne Lidar to Archaeological Research and Conservation*

With the advent of certain satellite-borne lidar instruments, the availability of free and extensive lidar data suitable for archaeological applications has become plausible. Here we use an airborne lidar dataset collected over the island of Pohnpei, in the Federated States of Micronesia, as a reference to test the utility of two satellite-borne lidar datasets, being collected by NASA’s Global Ecosystem Dynamics Investigation (GEDI) and Ice, Cloud, and Land Elevation Satellite-2 (ICESat-2) missions, for identifying and characterizing archaeological landscapes and features. Though these tasks are currently challenging, we offer observations on how satellite altimetry data products could become more readily applicable to archaeological research and conservation in the future.

Comer, Margaret (University College London)**[141]***Dark Heritage in Tallinn: Dissonant Narratives of Mass Violence*

This presentation will examine several museums and heritage initiatives connected to Nazi and/or Soviet violence in and around Tallinn, Estonia, through the lens of “dark” and “contested” heritage, as well as “competitive victimhood” and “securitization of the past.” It will analyze the narratives of victimhood, perpetration, and suffering that are communicated at these sites, “memorial” or not, and their interpretive mechanisms and lenses, in order to discuss patterns in the country’s overall interpretation and memory of repression. It will particularly focus on how regional and international “memorial forms” related to repression, death, and suffering are adopted and adapted for local use. It will also focus on how interpretations have changed in the aftermath of the intensification of the Russian war of aggression in Ukraine. Case studies include Vabamu and the KGB Prison Cells, Patarei Prison, the Estonian War Museum, and the Estonian Jewish Museum.

Compton-Gore, Kate (Northern Arizona University)**[8]***Addressing NAGPRA, Contamination, and Policy in Museums*

Under NAGPRA, a museum must inform recipients of repatriation of any known contaminants such as preservatives, pesticides, or other treatments that may present a potential hazard to the persons handling the item. However, NAGPRA does not require museums to test for contaminants, and historically museums did not regularly keep records of treatment. Very little is known about how museums inform about contaminants, or how it affects Native American communities who are waiting to receive ancestors and cultural items. Historical curatorial procedures involved treatment with pesticides made with heavy metals (such as arsenic and mercuric salts) and synthetic pesticides (such as DDT) to prevent biodeterioration or destruction by insects and other pests. Although the use of these contaminants ended by the 1980s, the harmful legacy on human health remains. This paper discusses preliminary results of a rapid policy evaluation on how contemporary museums are approaching the continuing issue of contaminated items, and how policy is developed and implemented to facilitate repatriation in instances where contamination is a concern.

Comstock, Aaron (University of Louisville) and Robert Cook (Ohio State University)**[101]***“General Diggings”: Where Did Harvard Dig? Determining the Actual Layout of the Turpin Site*

Over the span of a few winter months in the mid-1880s, Harvard University conducted excavations on the property of Philip Turpin in Hamilton County, Ohio. Under the direction of Charles Metz, a local physician, a small team excavated areas throughout the terrace on which a Late Woodland (ca. AD 400–1000) and Late Precontact (ca. AD 1000–1300) settlement, now known as the Turpin site, was located. Metz and his team excavated and recorded coarse information on dozens of refuse pits, hearths, houses, and ancestral burials. They made some cryptic notes about where features were located but made no site map and recorded no datum locations that they used to locate these features. This leaves us with the massive problem of hundreds of features with no provenience. We are attempting to solve this puzzle by working back-and-forth with excavation blocks we made based on the limited spatial data in the archived field notes with geophysical data and other results from our fieldwork at the site to try to best guess where Harvard excavated. Here, we detail the entire process we are following with initial findings about the actual layout of the Turpin site.

Conard, Nicholas (University of Tübingen)**[58]***Chair***Conard, Nicholas (University of Tübingen)****[58]***Recent Excavations and Research on Lithic Technology of the Swabian Aurignacian*

The study of the Swabian Aurignacian goes back to fieldwork in the 1880s in Bockstein Cave in the Lone Valley. Subsequent generations of archaeologists have excavated well-known sites including Hohlenstein-Stadel and Vogelherd in the Lone Valley and Geißenklösterle, Hohle Fels, and Sirgenstein in the Ach Valley. Over the last three decades, yearly excavations by the University of Tübingen in the Ach and Lone valleys have greatly improved our understanding of the cultural and chronostratigraphy of the Swabian Aurignacian. In addition to the famous discoveries of numerous figurative artworks, personal ornaments and musical instruments, this fieldwork has greatly expanded the size and improved the context of the lithic assemblages from this period dating between ca. 42 and 35 ka BP. In 2017, based primarily on the importance of the Swabian Aurignacian, UNESCO granted the caves of the Ach and Lone valleys World Cultural Heritage status. This paper reviews the history of research on the region's Aurignacian lithic technology and summarizes where research stands today, while highlighting the unique importance of the Swabian record of technological innovation at the beginning of the Upper Paleolithic in the Upper Danube drainage.

Conger, Megan (University of Georgia), Sam Olvey (University of Georgia), Leonardo Umberger (University of Georgia), Carla Hadden (Center for Applied Isotope Studies) and Amanda Roberts Thompson (Laboratory of Archaeology, University of Georgia)**[176]***Rehabilitating the Radiocarbon Sample Archive at the Center for Applied Isotope Studies, University of Georgia, Athens, Georgia*

Since at least 1972, the Center for Applied Isotope Studies (CAIS) at the University of Georgia (UGA) has maintained an archive of the pretreated and unpretreated remnants of samples sent for radiocarbon dating and stable isotope analysis. This growing archive now contains over 15,000 archaeological and geological specimens. In August 2022, CAIS initiated a project to rehabilitate this collection by cataloguing and rehousing the entire archive according to UGA Laboratory of Archaeology and 36CFR79 standards. We discuss our process and detail some challenges unique to radiocarbon and other scientific sample archives. Drawing from our experience, we suggest some best practices for other institutions with similar collections. These include establishing complete and thorough informational control over collections and associated records, developing collections policies, and ensuring compliance with laws, such as NAGPRA (the Native American Graves Protection and Repatriation Act), which governs archaeological collections.

Conkey, Margaret (UC-Berkeley)**[156]***Rock Art and Slow Science: What's the Connection?*

In this paper, I will suggest that rock art research is an excellent example of how we can advance many of the goals of the slow science movement, despite continued practices by some rock art researchers that promote "the scoop" and other problems that slow science advocates are trying to work against. As rock art research

has been developing over the past several decades, there are important lessons for the enactment of more cautious, humane and even heart centered approaches in archaeology that celebrate ambiguity and the interconnectedness of knowledge and knowledge production. A few examples will be presented as to how rock art research has begun to be a prime domain for moving forward a more “slow science.”

Turtles All the Way Down: Tracing Long-Term Genetic Change in Southern Caribbean Green Turtle (Chelonia mydas) Populations and Applications to Modern Conservation

Caribbean sea turtle histories are deeply intertwined with past human activities. While modern DNA offers insight into impacts of recent stressors, to fully support sea turtle recovery we must account for activities acting on populations prior to modern baselines. Ancient DNA (aDNA) research offers a novel method for identifying timing and rate of change to reveal past genetic events (e.g., bottlenecks, admixture) that may have altered sea turtles' biodiversity. We apply aDNA methodologies to 80 archaeological green turtle (*Chelonia mydas*) bones from Archaic (3400 BC–AD 500/800), Ceramic Age (AD 500/800–AD 1499) and colonial (AD 1499–1954) sites across Bonaire and Curaçao to identify long-term genetic change. Samples from our local partner institution, NAAM, underwent amplification of the mitochondria's control region (D-Loop) in Simon Fraser University's dedicated aDNA lab identifying the presence/absence of haplotypes and haplogroups. Results are interpreted with respect to Curaçao and Bonaire's archaeology and past human resource exploitation, and the applied relevance to conservation biology priorities. Archaeological data will eventually be paired with modern DNA results to showcase archaeology's potential to support species conservation by offering long-term genetic and environmental data that can enrich current conservation management strategies supporting the restoration and maintenance of green sea turtle biodiversity in the southern Caribbean.

The Upland Agricultural Revolution of the Fourteenth Century

This paper reports preliminary results from intensive surface mapping and test excavations of precolonial agricultural systems at Picuris Pueblo. Our work alongside collaborators from Picuris has uncovered one of the largest continuous agricultural systems in the northern Rio Grande region. After five field seasons of mapping we have documented a kilometers-long terraformed landscape designed to capture and control the flow of rainfall in a high-altitude, low-precipitation upland environment. Carbon dates from test excavations place the oldest parts of the systems in the tenth century, with more recent modifications occurring through the early colonial period. The most extensive landscape alterations appear to have occurred during the fourteenth century, at the onset of major economic change: namely, the development of the Plains-Pueblo macroeconomy. The people of Picuris, through their strategic location and long-standing relationships with Plains groups, were positioned to be key players in this new economic regime. Here, we build from an assessment of the morphology and hydrology of the Picuris field systems to reevaluate late precolonial economic systems, paying special attention to questions of labor organization, land tenure, and ecological stewardship.

The Archaeology of Wetlands, Weirs, and Waterways in the Kawartha Lakes Region, Ontario

I provide an overview of the relationship between Archaic through Middle Woodland peoples and the ecologically heterogeneous wetlands and waterways of the Kawartha Lakes region of south-central Ontario. I focus on our research group's survey of submerged shorelines which has revealed a substantial underwater archaeological record that demonstrates a longer history of waterway and wetland use than the terrestrial record alone provides. Paleoecological reconstruction provides evidence for the importance of shallow water taxa, including wild rice, for strategic positioning decisions; and this in turn has strengthened our working proposition that areas of localized abundance emerged as drivers for long-term habitation histories, ritual investment, and social interaction that were the nodal places in the wider territorial landscape of this hydrologically complex landscape.

What's the Point? Contextualizing the Significance of the Turpin Lithic Assemblage

A long-standing point of contention has been the degree of continuity and change between the Middle Woodland (ending AD 500) and Fort Ancient periods (beginning about AD 1000). The intermediate Late Woodland period has become a placeholder but is clearly of great interest as it was a time during which peoples transitioned into corn-farming villagers. Here, we address this issue by focusing on diagnostic projectile points from a legacy collection from the Middle Woodland Turner site and the Late Woodland/Fort Ancient Turpin site housed at the Peabody Museum of Archaeology and Ethnology at Harvard University. The assemblage is relatively large but unfortunately, given the poor quality of the expedition, most of the points are without intrasite provenience. To combat this, we have revisited the site and systematically excavated many different areas within the site with which we can more accurately examine the significance of this important transitional site.

A Characterization of Archaeological Sites in the State of São Paulo: Some Notes

In the Brazilian state of São Paulo, different pottery producers are described ethnohistorically, and the most expansive is the Tupiguarani Tradition. However, pre-European population relationships between the Tupiguarani and other groups are unclear. This paper applies phylogenetic methods to the Tupiguarani and related ceramics based on their morphological, decorative, and technological aspects. Our analysis covers four important regions in the state: the north coast, the south coast, the central region represented by the Tietê River Valley, and the southern Paranapanema Valley. Our results reveal new patterns of cultural transmission in São Paulo state and highlight the interactions between Indigenous groups before European arrival. Our results also demonstrate the applicability of cultural transmission theory to generate testable hypotheses concerning teaching and learning mechanisms in the past.

Identifying the Gaps: Prospects and Limitations of Using Pottery Collections as Archaeobotanical Data in Korea's Neolithic

The Neolithic (ca. 6000–1500 BCE) is a formative period of Korea's prehistory that sees the beginning of plant cultivation. Although archaeobotanical research on Korea's Neolithic began more than two decades ago, rapid development coupled with an almost total reliance on rushed rescue excavations has resulted in major gaps in the archaeobotanical record. While nearly 1,000 sites associated with the Neolithic are known, only a small number of these (<20) have been systematically sampled for archaeobotanical remains. As a result, very little is known about (1) the timing of the arrival of foxtail millet and broomcorn millet, (2) the spatial scope of their cultivation and use, and (3) what other domesticated and wild plants were cultivated and/or used alongside millets. While the collection of archaeobotanical samples from sites excavated in the future will be crucial to gain a better understanding of plant use throughout the period, the use of legacy materials housed in museums provides one potential means of selectively sampling sites for archaeobotanical analyses. This paper will briefly discuss some of the prospects and limitations of using internal and external pottery impressions as a means of retroactively collecting archaeobotanical data from Korea's Neolithic.

[33]

Assessing Inter-Site Variability in Southwestern Idaho Pottery Sites

The ethnographic record for southern Idaho indicates that pottery was primarily utilized for camas processing in the uplands and occasionally as stewpots. However, recent investigations reveal that Late Archaic ceramics occur beyond just riverine and upland locations, suggesting a broader use of pottery. This study aims to delve deeper into these findings by examining the assemblage variability in southwestern Idaho pottery sites. The data used in this study is a culmination of published research and survey data from southwestern Idaho. Artifact diversity and environmental setting will be used as a proxy for inter-site variability. Gaining this insight will enrich our understanding of pottery's role in seasonal resource procurement and its influence on mobility patterns. This study emphasizes the necessity of testing ethnographic analogies and reevaluating previous research in light of new data.

Searching for the Domestic at Chavín: Integrating 20-Plus years of Archaeology in La Banda

Even after more than a century of research at Chavín de Huántar, two key questions remain about who the ceremonial center was built for and who it was built by. As research attention has largely focused on pilgrims, priests, and peer polities, the labor force and craft specialists whose activities were fundamental to the site's success have remained backgrounded. Excavations outside of the monumental core, beginning in the 1970s, have attempted to address this elephant in the room, but salvage excavations associated with the 2003 construction of a new road on the east side of the Río Mosna were the first to produce any broad areal exposure of Chavín architecture outside the monumental core. In this paper we use "rescue photogrammetry" from photos and total station data produced by two decades of investigations in La Banda to consider the extent and character of that architecture. Integrating these data makes it possible to consider whether densely packed small-scale structures are necessarily proto-urban or even urban, whether non-monumental Chavín is necessarily domestic, and whether activity in La Banda was integral or marginal to Chavín's function as a ceremonial center.

Virtual Anthropology in Fieldwork, Conservation, and Education in Mexico: Lessons Learned, Challenges, and Future Perspectives

The development of novel digital technologies has consistently expanded the capacities to explore and approach existing anthropological and archaeological research questions. Virtual Anthropology stands as a relatively new interdisciplinary approach that further expands our resolution to study ancient and recent human remains, cultural contexts, and artifacts. The six tenets of Virtual Anthropology (digitize, expose, compare, reconstruct, materialize, and share), which allow the creation of digital replicas of human remains or cultural artifacts, have a great potential to expand research, education, and conservation in Mexico, but its consistent use and application that can translate into benefits is still on the horizon. Based on the experiences of preliminary fieldwork conducted in Mexico during the summer of 2023, we present an overview of the benefits that scanning and generating high-definition 3D models of objects can have in the context of teaching, research, and conservation of the enormous and rich collections housed and curated by the National Institute of Anthropology and History. Furthermore, we explore the challenges of this approach in the context of the asymmetries between the Global North and South by paying special attention to how the newly generated data could be handled in an ethical and legal manner.

Household and Community Scales of Post-Famine Demographic Change in Western Ireland

The national demographic ramifications of the Irish potato famine in the late nineteenth century are well documented; however, there is an absence of full understanding of the continuum of its social and psychological impacts. One way to access these impacts is through examination of specific persons; specifically, individual family histories. Individual family histories reveal the private rational(s) for splitting or relocating families, yet these are not necessarily generalizable to the population level; conversely, population-level studies alone cannot reveal the complex personal context of migration. Considering these together, however, allows us to more comprehensively and richly describe how changes in environment and social identity likely informed individual decision-making. Using a combination of evidence provided by historical documentation, excavation, and oral histories collected from Inishark and Inishbofin, Co. Galway, this project analyzes the complex reasoning for migration, the particularities of relocation, and the complex changes which impact the lives of both the transplanted migrants and those left at home. Examining this phenomenon on the microscale assists in drawing broader implications concerning the decision-making processes of both willing and unwilling participants in the Irish diaspora.

A Spatial Analysis of Precontact Sites Containing Ceramics in Relation to Natural Resources and Landforms of Eastern Idaho

When comparing the volume of studies conducted concerning precontact ceramics in the eastern Snake River Plain of Idaho to its neighboring regions, it is evident that the underwhelming amount of information is

due to the lack of samples and the provincial reliability of the samples. Many past studies have been limited to garnering research data from donated samples originating from regional collectors. This study focuses on the distribution of a robust sample set of precontact sites containing ceramics situated in an 890-square-mile contiguous block of the land that has been closed to the public for approximately 75 years. It assesses the spatial distribution of these sites in relation to natural landforms and the water, obsidian, clay, plant, and animal resources within the eastern Snake River Plain and surrounding regions.

Picking Up the Pieces of Harvard's Colonialist Archaeology: The Turpin Site in Social, Historical, and Archaeological Context

As with many archaeological sites, the Turpin site has factored into various social, historical, and archaeological narratives ranging from the good to the bad and ugly. Here we begin by situating Harvard's archaeology project at Turpin within the social context of the mid-1880s when fieldwork was conducted at the dawn of professional archaeology in the United States. Then, we examine later investigations regarding how and why the site was excavated and how it factored into local identity and an understanding of precontact history. We review the usual issues of looting and "othering" of the site's original inhabitants, but also surprising examples of stewardship and respect for the site demonstrated by one of the first Euroamerican residents, the Turpin family. The Turpin family was connected to Thomas Jefferson by marriage and the lands on which the site is located were one of many land grants given to American Revolutionary War veterans. In short, our aim is to contextualize the history of fieldwork at the Turpin with hope that this case study can help inform decolonization of other precontact legacy collections through targeted fieldwork.

Theory at the Waterline: Advances in Submerged Precontact Landscape Archaeology

The southeastern United States encompasses the greatest extent of submerged continental shelf in North America along with the greatest abundance of documented submerged precontact sites. It also includes some of the earliest documented precontact sites in North America, some of which are also submerged today. A substantial component of the early archaeological record in this region, and North America broadly, lies submerged offshore. Documented submerged site abundance moreover indicates high potential for offshore site preservation. While site identification remains a significant challenge, the efforts needed to meet this challenge are justified by the contribution of such sites to our overall understanding of the archaeological record. In this paper, we will review advances in theory and methodology designed to assist in this search. These advances are chosen to both assist in submerged precontact site identification, and more importantly, to articulate these sites with the onshore archaeological record.

New Insights on Avifauna from Picuris Pueblo

The avifauna collection of Picuris Pueblo is fertile ground for understanding human-environmental relationships in the Northern Rio Grande. Migratory birds like geese (*Branta* sp.) illustrate the seasonality and adaptivity of past peoples, staples such as turkey (*Meleagris gallopavo*) show domestication strategies, and wild species such as doves (*Zenaida* sp.) convey how management shifted with the needs of the community. The ancestral pueblo was extensively excavated by Herbert Dick in the 1960s, but many of the faunal remains (mammalian) were lost and/or reburied and therefore unavailable for further study. However, the avifauna remains are intact and well-provenienced. The collection, curated by Hargrave and Emslie, demonstrates a unique archive of the past from the faunal record. Using taxon identifications from Emslie and new taphonomic data from the author, this paper reveals how birds and humans were using the planned and managed landscapes surrounding the Pueblo. Examining butcher practices, flock management, and animal behavior, this paper seeks to contextualize the avifauna's place in Picuris ancestral pueblo. This research is part of an ongoing look at how Picuris managed animal species in both formal and informal strategies to cooperate with the larger environment and changing geopolitical realities.

Exploring Temporal and Geographical Aspects of Chumash Mortuary Practice and Ceremonial Integration

Ethnographic and ethnohistoric evidence indicate that certain ceremonial objects were exclusively associated with 'Antap ritual specialists and were used in multi-community Chumash religious ceremonies. Analyses of the evolution of the form of these artifacts through time identified significant developments in ceremonial aspects of Chumash society. The timing of these changes is compared with transitions in other aspects of Chumash society. The evidence suggests that significant changes in artifact form correlated with increasing levels of ceremonial integration in Chumash society and supports the hypothesis that ritual elaboration and ceremonial integration were important sources of cultural change in Chumash society. This paper also addresses ethnic and cultural continuity through analyses of geographical and temporal patterns of mortuary practice in the Chumash region. Systematic analyses of mortuary assemblages provide substantial evidence for ethnic and cultural continuity rather than for population migrations and replacement. In general, mortuary practice was more strongly influenced by geography than by temporality. The most salient change in burial practice occurred approximately 2,000 years ago. There was also a convergence on a normative treatment approximately 1,000 years ago. I also examine both material and nonmaterial aspects of Chumash mortuary practice and assess the articulation between these two systems.

Cordell, Ann (Florida Museum of Natural History) and Neill Wallis (Florida Museum of Natural History)**[287]***Using Petrography to Fine-Tune Temper and Fabric Recognition of Indigenous Pottery in Florida*

Petrographic studies of archaeological pottery from Florida have contributed to our understanding of the range of variability in pottery tempers (prominent aplastics that may have been intentionally added to clay in pottery-making) and fabrics (characteristics of clay resources themselves). From the many studies carried out in the Florida Museum of Natural History's Ceramic Technology Lab over the years, we have identified/specified over 10 gross temper categories and seven petro-fabrics. Characteristics of each are illustrated here with clues for their recognition through standard and petrography microscopy. The time frame represented ranges from the Late Archaic to the early colonial period.

Cordell, Ann [287] see Rutkoski, Ashley

Cordero-Fernández, Rosario (Universidad Alberto Hurtado)**[112]***Hand Imprints in the Middle Ibañez River (Central Chilean Patagonia): Social Cohesion and Human-Nature Relations*

It seems that the primary function of painted hand imprints on rockshelters in the Middle Ibañez River Valley (Chile) may have been to assist in promoting social cohesion within and between hunter-gatherer groups. Hand imprints possess the quality of replicating the hand that created them, thus becoming a personal statement. These imprints have been associated with cultural significance and are intimately linked to the identity of their creator. Hand imprints should be seen as acts that record self-recognition in relation to the environment, with an awareness of the impact this has on the world. Moreover, the presence of small hands suggests that the occupations in the area were significant symbolic spaces for hunter-gatherers moving as whole family units, comprising both sexes and different generations. By expressing themselves using hand imprints on rocks, individuals and groups confer a specific meaning on the spaces they utilize and inhabit, as well as the way they perceive these locations. Following Troncoso (1998), it is likely that this action of expressing cultural concepts in space embodies an important ideological function: by embedding symbols in nature, they attain chronological permanence, implying a conception of time that extends beyond everyday life (Bradley 1993; Criado 1991).

Cormier, Aviva (Davidson College)**[241]***Chair***Cormier, Aviva (Davidson College) and Jane Buikstra (Arizona State University)****[241]***Distinctive Burials of the Phaleron Cemetery, Archaic Greece: Marginalized in Life and Death*

The Phaleron cemetery is most well known for the archaic burials of 79 young men who had been shackled, probably violently executed, and interred in three trenches. However, there are 80 additional individuals whose mortuary contexts fall outside expected forms, now categorized as "distinctive," which includes additional mass grave contexts or those positioned prone or tightly flexed in single graves. For the individuals buried in distinctive single burial contexts (N = 43), 40% were most likely bound, as suggested by limb positioning and/or the presence of metal shackles. Others are considered distinctive based solely on body positioning that fall outside expected forms, which cannot be directly correlated to a violent death. Nearly all of those in the mass grave contexts were bound at the time of interment. We examine patterns in the demographics, pathology, trauma, and isotope analyses to consider how experiences of physical and structural violence may have impacted their identity construction, physical well-being, and resulting mortuary treatment. This paper presents

the contextualized life histories of those buried in distinctive graves, exploring the connections between marginalization and violence during life and the distinctive burial forms representing their death.

How Indigenous Museology and Archaeology Can Contribute to the Well-Being of the Comcaac Community

The history and everyday lives of the Comcaac (Seri) people are intrinsically linked to their ancestral landscape on the central coast of the Sonoran Desert and the Gulf of California. The community's powerful and complex oral tradition, language, and the continuous occupancy of their originally nomadic territories, ties them directly and undeniably to the archaeological record. The Comcaac Museum, located at the tourist town of Kino Bay, was founded by the state government to "recognize and promote the legacy of the Comcaac." Most of the archaeological collection still await official classification by INAH, and the museum has operated with little consultation from the Comcaac. During the last decade, some families have showcased and sold crafts, or have performed their traditional songs and dances during museum events. Nevertheless, museums are obligated to build stronger partnerships, this paper presents a new participatory research initiative led by a group of Comcaac women to address some of the community's ethical dilemmas around museum practices and policy, biocultural conservation and indigenous tourism in their communal lands. A community-led heritage interpretation methodology is being implemented in a collaborative effort to include the cultural and ecological traditional knowledge of the Comcaac to advance Indigenous Museology and Archaeology.

The Effects of the Colonial Introduction of European Domestic Fauna in Some Localities of Southern Mexico

The introduction of European domestic fauna during the Spanish conquest represents a major change in the cultural use of animals, influencing both how they acquired and processed. Although this point has been recognized, in fact it has been poorly documented. This work, based on the common protocol for archaeozoological studies, analyzes a collection of five localities from the state of Morelos, Mexico. They are chronologically located between the Postclassic and mid-colonial periods, some of them showing one or more occupational stages. The initial hypothesis proposes that the introduction of European domestic animals caused a reduction of faunal diversity in the human settlements compared to prehispanic practices. Thus, the faunal contents of the sites were measured and compared by means of diversity index, looking for the differential impact in a regional perspective on the cultural use of animals. The preliminary results of the sites suggest a faunal use pattern where the most radical change was the introduction of European domestic

fauna, mainly cattle, sheep, and, to a lesser extent, poultry; while persistence is represented by local resources, probably from occasional milpa hunting.

Ancient DNA: Investigating Maya Domesticated Waterscapes

Environmental DNA (eDNA), or the genetic material obtained from sediments, ice, or water, is a relatively new and untapped methodology in archaeology. This technique provides important insight into the biodiversity of different plant, animal, and microbial communities, positioning archaeologists to understand human-landscape interactions of the past better. More specifically, eDNA is a powerful tool for reconstructing ancient Maya environments, shedding light on both domesticated and wild vegetation growth around artificial bodies of water (Lentz et al., 2021). This study builds on previous work by examining plant DNA extracted from canal and reservoir sediments at the Late Preclassic Maya site (ca. 200 BCE–200 CE) Mensabäk in Chiapas, Mexico. By detailing our methodology and discussing the implications of eDNA analysis, we hope to understand better the construction and use of domesticated waterscapes and, more broadly, resource and water management in the Maya region.

[285]

Ceramic Variability at Alkali Ridge Site 13

Alkali Ridge Site 13 is a large ancestral Pueblo village in southeastern Utah dating to the late AD 700s. Ceramics from the site consist almost entirely of small gray ware jars and decorated red ware vessels in a variety of forms. Extensive excavations by Harvard at the site in the 1930s recovered more than 100 whole or reconstructible vessels, which provide data on the range of vessel forms and sizes at the site. Analysis of rim sherds from recent excavations by Brigham Young University in 2012 and 2013 demonstrate variability in raw material choices and measurable vessel properties such as porosity. Notably, potters used a narrow range of clays, which oxidize red, to make red ware vessels. Some gray ware vessels are made with clays similar to those used for red ware, but potters also used a wide range of other clays to make gray wares, using firing methods to control the final color. We combine data from sherd and whole vessel analyses to explore the relationship among vessel form, size, raw material selection, and the technological properties of vessels at the site.

Monumentality in Sites with Stone Spheres, Diquis Delta, Southern Central America

Several sites in the Diquis delta, an extensive alluvial plain in southeastern Costa Rica, present architectural ensembles consisting of artificial mounds up to 30 m diameter and a height between 1.1 and 1.4 m with cobblestone walls and ramp accesses, with stone spheres of a similar diameter (1.2 m in average) in their corners. This would be a context of “composite monumentality” including spheres and structures that would have reinforced the importance of those who lived in or used such structures and spaces. Sites such as Finca 4, Finca 6 and Antigua Finca 7 due to its location within the alluvial plain and complexity better withstand the periodic flooding of the delta. The presence of elevated structures and a slightly higher elevation (10 m asl) could favor population concentration and the generation of material stratification expressions. In Finca 6 and Antigua Finca 7 there have been findings of complete and fragmented zoomorphic and anthropomorphic sculptures associated to the access ramps that contribute to their composite monumentality. These statuary objects are local in nature and of circulation restricted to the delta. They can be considered as inalienable possessions whose retention serves to legitimize the status of individuals or groups.

Paleoindian Sites and Their Cultural Diversity in Southeast, Brazil: A Case Study from São Paulo State

The archaeological record for the early Holocene in Brazil shows great cultural diversity, suggesting the coexistence of different groups. Recently, we have noticed that São Paulo State does not behave differently. These distinct groups inhabited shelters, open-air areas, and fluvial shell mounds, leaving a very diverse lithic industry characterized by assemblages with points, slugs, retouched flakes, or simple flake products, ranging from very dense industries to those with less evidence. Some of these sites still show a long-term occupation with a possible cultural continuity evidenced by stone tools. In this presentation, we will discuss how those dated sites and their lithic industries have been used to understand human dispersal in the area and how they can be related to the surrounding finds.

Pottery Offerings and Ritual Gestures in Sutar Conti, a Ceremonial Site on the Processional Pathway of the Licancabur Pampa, San Pedro de Atacama, Chile

Inter-nodal archaeological studies show how pottery, among other functions, is part of the offerings found in ceremonial contexts associated with journeys through the Atacama Desert. Focusing on ethnohistorically recognized processional pathways, with the Licancabur volcano as a ceremonial node, our investigation centers on Sutar Conti, a site renowned for its material and structural remains. Our research explores the role of pottery documented at this site, which spans from the Early Formative period (ca. 3000 BP) to posthispanic times. Notably, two ceramic types exhibit high frequencies: the locally polished black or gray Séquitor (1900–1600 BP) and the foreign Yavi style (1100–500 BP) from Talina, Potosí, indicating connections between the northeastern puna of Jujuy and southern Bolivia. Most sherds can be assigned to individual vessels. Through detailed spatial analysis, we discern distinct patterns of deposition and breakage associated with structures, the pathway, and the landscape. We interpret these differential patterns as distinct ritual gestures, following Nielsen et al. (2017), offering insights into both chronological and identity-related aspects of these journeys.

Paracosmic Play Areas in Western Plains Boarding and Day Schools

Childhood play areas represent a complete departure from the landscapes that archaeologists often examine in that they physically exist within adult domestic, logistic, and/or sacred spaces yet simultaneously outside of any of these spatial ideals. The difficulty in analyzing these areas is further compounded when the implications of Indigenous ontologies are considered, especially those of children who may or may not fully engage with larger cultural systems, and even more so when considering the intersection of children's understandings of the intersection between their belief and colonial policies. In this paper I briefly present the methodology that I use to identify where children played in boarding and day schools in the western Plains, based on evidence from the historic and archaeological records, and discuss the micro-paracosmic nature of these play areas drawing from traditional Native understandings of childhood. Finally, I take a closer look at the phenomenological "reality" of these spaces and argue that, at least when occupied by playing children, these areas require an expanded understanding of contemporary archaeological approaches, an understanding that draws from the unique lens of the children themselves.

Revisiting the Submerged Shell Midden at Sabine Pass: Preliminary Core Results from the NOAA Exploration Mission: Paleolandscapes and the ca. 8000 BP Shoreline on the Gulf of Mexico Outer Continental Shelf

Over 40 years ago Coastal Environments Inc. pioneered a phased approach to identify prehistoric occupations on the now submerged outer continental shelf of the Gulf of Mexico. This work homed in on a target in the Paleo-Sabine Valley and identified one of the first in situ, submerged prehistoric sites known in the Americas. The Sabine Pass Block 6 (SP6) site is 8 miles offshore the Texas-Louisiana border under 40 feet of water. The site consists of a possible shell midden and burned bone dating to 8000–8500 BP. Although unsettled, this discovery was thought to be more like archaeological than natural deposits. In June 2020, new cores were recovered from SP6 as part of a NOAA funded expedition to investigate the Late Quaternary paleolandscapes and peoples of the submerged continental shelf. Preliminary data on core 109 from SP6 provides a more detailed picture of the SP6 "midden."

Costin, Cathy (California State University, Northridge)**[146]***Discussant***Costin, Cathy (California State University, Northridge)****[333]***Iconographic Evidence for Altered States of Consciousness in Andean Cupisnique Visual Culture*

Although a shamanic component has long been recognized in Andean Formative cultures, recent research on Cupisnique (ca. 1200–900 BCE) ceramic iconography yields evidence for more varied, more prevalent, and much more far-reaching use of therapeutic and entheogenic substances during the early phases of Andean prehistory than has been previously reported. The imagery on special purpose ceramics forms—especially the iconic stirrup-spout bottle—includes depictions of psychoactive flora and fauna, the presumed production and consumption of neuroactive brews, and the bodily sensations, altered states of consciousness, and visions they produced. Other imagery includes animals closely associated with shamanic practice in the past and the present, a practice rooted in the deployment of altered states of consciousness to divine, counsel, and heal. Even images of seemingly mundane or prosaic plants, animals, and objects bear esoteric markings that link them to altered states of consciousness. The low visibility of many of these esoteric markings suggests that some information about ASCs was meant to be kept secret and available only to a few privileged individuals during therapeutic and divinatory rituals and performances.

Coughlan, Michael (University of Oregon), Kelly Derr (University of Oregon), David Lewis (Oregon State University), James Johnston (Oregon State University) and Bart Johnson (University of Oregon)**[133]***Ready, Aim, Fire: Darts, Arrows, and Precontact Era Fire Use in the Western Cascades*

In Oregon, Indigenous oral histories and ethnohistories document the use of fire as an important part of the Indigenous subsistence system. Fire was used for plant tending, harvesting, and collecting, but also in hunting. Transitions in hunting technologies are often associated with significant changes in entire subsistence systems. For instance, the transition from atlatl and dart to bow and arrow in western North America as evidenced by morphological changes in lithic projectile points is hypothesized to have been associated with shifts in social organization, settlement, and resource use dynamics. Further, the timing of the dart-arrow transition is hypothesized to have varied geographically, with some groups retaining the atlatl longer than others. In this paper, we test a late dart-arrow transition hypothesis and explore how this transition may have differentially affected patterns of Indigenous fire use for a watershed in Oregon's western Cascades. We integrate multiple lines of evidence, including radiocarbon dates, obsidian sourcing and hydration, cross-dated fire histories, ecological site interpretation, and ethnohistory to refine chronological analysis of the dart-arrow transition and its implications for local fire ecology.

Covell-Murthy, Amy**[39]***Discussant***Coverdale, Julia (Binghamton University)****[171]***What's with Exterior Corrugation on Bowls? Using Spatial Analysis in GIS to Track Ceramic Deposition*

Corrugated exterior white wares in the Ancestral Puebloan world are often thought of as a rarity. While these ceramics are not as common as gray ware corrugated or regular black-on-white ceramics, they are an

important blending of pottery manufacture. Corrugated whiteware ceramics can also help us begin to understand symbolism and meaning of corrugation itself. By using geographic information systems (GIS), significant patterns of deposition of these ceramics can be identified. In this poster, I will discuss spatial and temporal analysis of corrugated whiteware in the Northern and Middle San Juan Basin during the Pueblo II period (CE 900–1150). Through this spatial and temporal analysis and Great House site data from the region, I hypothesize that corrugated whitewares are associated with the Chaco Phenomenon.

Lake Superior's Relict Shorelines: Geochronological Dating of Archaic Sites in the Northern Lake Superior Basin
 Since the end of the last major glaciation over 10,000 years ago, lake levels in the Lake Superior Basin have varied considerably. This variation caused the formation of relict shorelines that were left behind as water levels dropped. At around 6,600 years ago, the lake level began to rise in an event that took place over the next 700 years. This event marks the beginning of the Nipissing phase which varied over the next 2,000 years, reaching its peak between 4,500 and 5,000 years ago. The tight geochronological component of these relict shorelines provides a unique opportunity to target and date archaeological sites found along their shores. This project works to reconstruct the Nipissing relict shoreline in the Thunder Bay region of Ontario, Canada by mapping strandlines and elevation estimates associated with the time frame using digital elevation models derived from the Ontario Classified Point Cloud data. The results of this mapping are then compared to the locations of suspected Archaic sites in the region to identify if these sites correlate to the Nipissing relict shoreline and test the potential use of this model for identifying archaeological targets for further investigation.

Humanizing Archaeology

Teresita Majewski has influenced archaeology and heritage management in extensive and diverse ways. To my mind, her contributions all have one idea in common: humanizing the field. Here I present three examples of her influence on my own work, especially regarding ceramic analysis and work with stakeholders, research partners, and students. First, I present a case study of archaeology at the St. Mary's Hospital site in Virginia City, Nevada, where outreach to a related Catholic organization led to important conversations about meaning and ideology in ceramics found at the site. Second, I discuss collaborative archaeology and humanizing relationships in conducting research "by, with, and for" Native communities at the Stewart Indian School site in Nevada. Finally, Terry's mentorship deserves comment, as we know that she always mentored the whole person, and this has been impactful in how we pay it forward.

The Art and Light of Paint Rock, Texas

The archaeological site of Paint Rock, Texas (41CC1) at over 300 m in length is the largest continuous rock art site in Texas. Many of its older pictographs have been scheduled to spectacularly interact with the sun on the equinoxes and solstices and apparently also on the cross-quarter days. The older rock art at Paint Rock shows strong connections with the rock art of the Lower Pecos and with Mesoamerican ideology.

Crabtree, Pam (New York University)**[234]***Moderator***[10]***Discussant***Crabtree, Pam (New York University)****[22]***Feeding Medieval Towns: The Zooarchaeological Evidence*

Provisioning played a critical role in the establishment of early medieval towns in northwestern Europe from the eighth through the tenth centuries CE. Zooarchaeology can reveal how the inhabitants of early medieval towns obtained meat and other animal products. Recent zooarchaeological research has revealed how the sites of Ipswich (seventh–twelfth centuries CE) and Antwerp (eighth–tenth centuries CE) obtained animal products. This paper will compare the zooarchaeological evidence from early medieval Ipswich (UK) and Antwerp (BE) with the evidence for urban provisioning at other eighth- to tenth-century towns in northwestern Europe.

Crabtree, Stefani (Santa Fe Institute; Utah State University)**[303]***The Centrality of Saplings: Trees and Archaeoecological Analysis*

Often when we examine past ecologies we focus on food webs—what people ate, and how people were connected to larger trophic entanglements. However, by analyzing the networks that form around the myriad uses beyond food of other biota we can see how humans embed themselves in and structure ecologies worldwide. As part of the archaeoecology project we have analyzed seven cultures around the world and noticed that one thing is in common—each of these places have trees as a central position in the network of taxa that humans use. In this paper we leverage network analysis to understand the central position of tree species around the world and discuss the implications that this had both for the cultures using those trees and for the ecologies more broadly. When exploiting a tree species often that species is removed which can convert forest spaces to grasslands. A network approach can help us understand these trade-offs and help us to examine the central place that trees held for multiple cultures worldwide.

Cramb, Justin (University of Alaska, Fairbanks)**[301]***Property Regimes, Resource Protection, and Sustainability in the Remote Pacific*

The tradition of resource-use prohibition known as *rahui* is found throughout the Pacific Islands. *Rahui* typically involves placing certain resources or areas of the land and sea under the protection of a central authority. For *rahui* to exist the concept of collective resource exploitation must also exist. This appears antithetical to the traditional and current land tenure practices on many islands where individuals and families hold control of traditional territories. However, concepts of centralized authority and *rahui* appear to supersede concepts of individual or lineage-based resource control. The ubiquity of *rahui* and similar practices in East Polynesia suggests a long antiquity perhaps stretching back to the first colonization of uninhabited islands by Polynesian voyagers. Through archaeological, ethnohistoric, and ethnographic data from the Northern Cook Islands I demonstrate how past concepts of *rahui* interact with property regimes and the development of sustainable resource use practices as well as how *rahui* is conceptualized, enacted, and viewed today. I argue that the tradition of *rahui* may have influenced, and strengthened, the development of flexible political institutions that promote centralized authority and population sustainability above individual or lineage-based control.

Changes in Obsidian Procurement and Use from the Preclassic to the Classic Periods at Holtun, Guatemala

Imported obsidian is often representative of regional trade patterns in Mesoamerica. Such patterns for the Central Lowland Maya have been documented and allow for comparisons between sites and between periods within a single site. In this paper we compare the procurement and use patterns of obsidian between the Preclassic and Classic periods at Holtun. While excavations at Holtun uncovered less obsidian than other, larger nearby sites, such as Tikal and Yaxha, the presence of obsidian throughout the site's occupation allowed for the analysis of intrasite spatial and temporal patterns. Sourcing and use studies of Holtun's obsidian indicate a shift not only in procurement from the Preclassic period to the Classic period but a change in how and to what extent obsidian blades were used over time. Like many other lowland Maya sites, Holtun experienced a shift from emphasizing San Martín Jilotepeque obsidian in the Preclassic to El Chayal obsidian in the Classic period, though usage patterns during both periods suggest that El Chayal was often conserved at higher rates regardless of its overall availability.

When Studying Landscapes . . . What Actually Does “-scape” Mean?

This paper is an appeal for a structural archaeology, analogous to what used to be called structural anthropology. Or at least an appeal for a structural archaeology of landscape. Landscapes are active, performative, changing, temporal, moving, contingent, situated . . . but they are also the result of a design, whether intentional or embedded, from above or from below. They embody a pattern. The pattern becomes regular. Regularity becomes structure. The structure points to an inner model. The inner model is realized in the landscape. Landscape archaeology is an inverse engineering of all these processes. The sociocultural processes behind the landscape can be deconstructed if, among other things, it is accepted that there is structure in the landscape shape. As far as we are talking about the 5Es+A model of the mind (the paper will also deal with this conceptualization), we can talk about the 5Es+A landscape. This paper is part of the ERC Synergy XSCAPE project on Material Minds. Enactive, engaged, embedded, embodied, extended + affects and emotions.

The Structural Archaeology of a Middle Fort Ancient Village: Recent Investigations at the State Line Site

This presentation provides an overview of recent discoveries and excavations at the State Line site on the Ohio-Indiana border near Cincinnati, Ohio. The State Line Site is primarily a Middle Fort Ancient Anderson Phase village (ca. AD 1050–1275), with earlier components. ASC Group Inc. has led ongoing investigations at this site as part of a Section 106 compliance project for an intersection improvement project. A brief overview of field and laboratory research will be presented with a focus on identified Fort Ancient period structures. Terminology, approaches, and insights from recently published research on ancient architecture of the Ohio Valley will be integrated with new data from the State Line site. Specifically discussed will be the discovery and documentation of a large, unique wall trench structure believed to be a community structure.

Ceramic Pastes: Refining Epiclassic and Early Postclassic Basin of Mexico Typologies and Interactions Close to Home

The interplay of compositional, stylistic, and technological variation of pottery from the Basin provides the framework to assess shifting patterns of regional interaction. The Epiclassic is characterized by Coyotlatelco pottery, although this pottery was locally made and used with minor amounts of exchange with neighbors. Also, unique ceramic complexes within parts of the Basin and Mexico (and neighboring Tula) developed early in the Epiclassic—especially in the southern Basin and north in Hidalgo. Transitioning from the Epiclassic to the Early Postclassic, regional patterns of interaction begin to shift as evidenced by adoption of new ceramic types and changing settlement patterns. In order to further understand how ceramic production can provide

new insights into interactions between neighboring communities, I am implementing a macroscopic study of ceramic pastes (binocular microscope) that helps to refine ceramic typologies and classify large groups of sherds according to their observable mineral components and texture. Paste groups are assessed from samples that have undergone chemical source characterization (INAA) and have been classified according to regional pottery complexes. A selection of cases are highlighted that provide new resolution of ceramic production and implications for interaction among neighboring communities of Central Mexico.

Frontier Fundamentals: An Analysis of Artifacts from Historic Fort Gibson Military Site

Located in Eastern Oklahoma, Fort Gibson acted as the starting gate for America's military expansion into the West. Founded in 1824, Fort Gibson played a role in mediating encounters between the Osage and Cherokee until 1857. The Fort reopened at the start of the American Civil War and operated until 1890. Fort Gibson serves as an excellent archaeological resource for uncovering the everyday lives of frontier soldiers and those around them. This poster presents the preliminary results of my analysis of ceramics, glass, and small metal artifacts recovered from excavations near the fort's reconstructed barracks and original stockade in 2017 and 2018. This research suggests that even small samples of recovered artifacts can be useful in understanding how enlisted men and others lived at Fort Gibson.

Reconstructing Early Settlement in the Northern Lesser Antilles while Honestly Accounting for Site Loss

Significant site loss due to sea-level rise and modern development significantly impacts the known and potentially present inventory of archaeological sites attributable to the initial peopling of small islands in the northern Lesser Antilles. Coastlines available for occupation during periods of early settlement are presently submerged portions of vast shallow offshore banks. Increased development associated with tourism and population growth over the last several decades further limits the sampling universe in which we might discover new evidence of early settlement. We face this reality with a handful of sites and a comfortable amount of speculation.

Generationally-Linked Archaeology: "Living-Off-the-Land" for 4,000 Years on the Salish Sea

Ed Carriere, Suquamish Elder and Master Basketmaker, and I published on how ancient Salish Sea basketry styles statistically linked through 4,000+ years in style to the basketry Ed learned from his great-grandmother

Julia Jacobs (born 1874) who raised him from infancy. Ed helped me analyze 2,000-year-old wet archaeological basketry from his traditional territory, and we were able to replicate these styles from 100 generations back, demonstrating a continuity of styles through statistics and his current basketry. We called this a Generationally-Linked Archaeology approach. If this worked with ancient basketry, then it should work with other cultural practices of his early life. Since he was raised by Julia and they had little but their shoreline Indian Allotment land the first half of his life, they essentially “lived-off-the-land” using all the native resources to support themselves: shellfish, fish, ducks, mammals, and berry crops. We are comparing their practices with the archaeological fauna/flora analyses within 20 miles of his allotment land for 4,000+ years. The initial results show a trend supporting Generationally-Linked Archaeology, with similar resource occurrences and frequencies through time. Also information not preserved archaeologically is presented: resource behaviors, capture techniques, preparation procedures, cooking, taste, and storage practices.

Keeping the Dead Close

This paper explores the use of anatomical body parts—namely, skulls and crania—in the Neolithic of southwest Asia. It is clear that for many, the dead were kept close to the living, with their remains physically used by the living. Discussing plastered skull, the paper explores potential beliefs around practices where the remains of the dead are retained; in particular, arguing that there may have been a desire for the dead to maintain a place in their communities beyond the grave. This debate is set in a broader context of theories of grief and loss, suggesting a desire to maintain “continuing bonds” with the deceased.

Transformations in Professional Archaeology

Most professionals in archaeology emerge from educational centers hosted within departments of anthropology, where the four-field approach has dominated training. Market forces and preference for the STEM fields are now constraining educational opportunities for the humanities and social sciences. Declines in postsecondary enrollment, programs unable or unwilling to adapt, or outright closures are at play. Higher-education decision-makers are questioning the value of degrees in archaeology and anthropology at the same moment work is expanding within review and compliance, heritage preservation, user experience design, artificial intelligence—fields where social scientists are uniquely positioned to make relevant and immediate contributions. In the last several years, a number of grassroots movements, partnerships, nonprofits, and for-profit providers have formed to fill training gaps and disrupt traditional educational frameworks. Tactical skill-building and experiential learning in service of applied—not pure research—work settings are emphasized. How has the historical shift toward cultural resource management informed these new training paradigms within our sister fields of anthropology? And how are current discussions of professional, practicing and applied work impacting the way future archaeologists will be educated? Case studies from personal and professional engagements across fields and sectors will illustrate this discussion.

Crowley, Suanna (SWCA)**[325]***Discussant***Crowley-Champoux, Erin (University College Dublin)****[234]***Discussant***Crowther, Alison (University of Queensland), Chantal Radimilahy (University of Antananarivo, Madagascar), Tabibou Ali Tabibou (CNDRS, Comoros), Mark Horton (Royal Agricultural University, UK) and Nicole Boivin (Max Planck Institute for Geoanthropology, Germany)****[217]***Transported Landscapes and Globalized Foodways in the Settlement of Western Indian Ocean Islands*

Food is often used as a marker of social and cultural identity, reflecting deeply embedded traditions of taste, technology, and social relations. Crops that moved as part of migration and resettlement processes thereby often played more than an economic role, being central to the creation and negotiation of memory and identity in new social contexts. This paper uses archaeobotanical evidence from the islands of Madagascar and the Comoros in the western Indian Ocean to explore the region's dynamic history of settlement, trade, and cross-cultural interaction involving peoples from Africa to southeastern Asia. Waves of migration and exchange saw the introduction not only of new crops to the region, but methods of cultivation and social practices that formed important "bundles of knowledge" that also moved with the plants. In-progress research aimed at investigating complementary evidence of ceramic production and consumption, as well as broader landscape-level transformations resulting from the introduction of transported landscapes to these islands, is also outlined.

Crumley, Carole (University of North Carolina, Chapel Hill)**[298]***Discussant***Cruz, Patrick (University of Colorado)****[331]***Landscapes, Memory, and the Pueblo World*

Landscapes are entangled with social meaning. Societies that live on a landscape imbue it with both cultural meaning and use them as mnemonic devices in order to preserve their histories. In turn, these culturally constructed meanings and mnemonics act in a feedback loop as both formulation and preservation of culture. This is true for Indigenous societies around the world. In the Pueblo Southwest, shared landscapes continue to tie existent communities to those of the past. The Northern Tewa region of New Mexico with its highly varied topography of hills, valleys, and mountains, provide a perfect template for cultural landscapes of meaning and memory. Tewa people have been living on this landscape for at least 700 years and with such deep histories come rich cultural and mnemonic entanglements with that landscape and its viewsheds. Here I examine ancestral places of the Northern Tewa region within the context of their shared landscapes with those of living communities. I suggest that these shared landscapes can provide for long continuity of cultural meanings and memory that can inform about ancestral spaces.

Cruz-Gil, Rafael (Cornell University)**[248]***Measuring Urban Mobility and Accessibility in a Mesoamerican Context*

While spatial analysis has become commonplace in archaeology, the social implications of mobility and

accessibility in urban contexts remain an aspect that can be studied in much more depth. Drawing theories and methodologies from urban design has long been a staple for understanding the lived built environment, and while the lack of direct observation and the fragmentary nature of the data are challenging, they also present opportunities. Teotihuacan, extensively and accurately mapped since the 1970s, presents an ideal occasion for such analyses. Research along these lines, using methodologies such as Space Syntax, has already been carried out, but recent projects have produced lidar data that could be used for a precise understanding of spatial contexts that include the vertical aspects of the city, which have traditionally been hard to map and analyze even in modern environments. By bringing techniques and theories from contemporary Urban Studies, the understanding of how areas within a city compare to one another in regard to mobility and accessibility, a deeper understanding of social differentiation within Teotihuacan can emerge. I will propose how building on previous work could be accomplished using newer technologies.

Arqueología y geofísica en Chicoloapan, México: Estudios colaborativos de la vida cotidiana y la organización comunitaria después de Teotihuacan

Se presenta una investigación colaborativa que examina la organización espacial y dinámica sociopolítica de Chicoloapan, un asentamiento en la Cuenca de México, que creció durante el periodo Epiclásico (550-850 dC), después del declive de Teotihuacan. Este proyecto combina métodos arqueológicos y geofísicos para investigar una comunidad post-colapso y las prácticas cotidianas de sus habitantes. Nos centramos en el entorno edificado, considerando las formas en las que la arquitectura cívica y residencial condicionó las interacciones entre los residentes. Los estudios geofísicos realizados por Luis Barba y su equipo enriquecen nuestra comprensión de la configuración espacial del sitio, al permitir estimar las dimensiones de las estructuras y su proximidad a otras características físicas del paisaje. La arqueología combinada con la prospección magnética ha llevado a la identificación de diversas formas de arquitectura, incluidos templos, casas, además de una plaza cerrada y hundida que es la primera que se documenta en esta área. Sostenemos que un enfoque colaborativo y multidisciplinario que integre un conjunto de métodos geofísicos y arqueológicos es indispensable en la investigación de los asentamientos arqueológicos.

Modern Migration Theory and Their Applicability to Prehispanic Mesoamerican Populations

Modern migration theories are based on a capitalistic view of economic forces for people (mostly males) to migrate in search of better economic conditions. However, the dynamics that characterize modern times are hardly applicable to prehispanic societies. Trade between and within regions was an important force driving human mobility, so economic reasons cannot be ruled out a priori because they did represent a factor also present in ancient times. Yet, the direct analysis of individual mobility based on strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) isotopes in dental enamel provides many possible reasons behind individuals' mobility. In the prehispanic northern Maya lowlands, when nonlocal people are analyzed by sex, age at death, social status, funerary attire, and burial location, the emerging picture encompasses multiple factors. This paper argues that the equal representation of males and females and the presence of infants and children speaks in favor of families moving according to kinship networks. Nonlocal elite females suggest marriages to strengthen political networks. The presence of royals also indicates the development of outposts and the expansion of political domains. Finally, the lack of specific mortuary settings and locations for nonlocals suggests that they had been integrated into the local society regardless of their origin.

Alcohol in Complex Society in Northwest China: A Case Study from the Mogou Site (1800–1200 BC)

Research in recent years has substantiated the prevalent presence and utilization of cereal-based fermented beverages in prehistoric China. In this study, residue analysis was applied to pottery artifacts excavated from the Mogou site, which dates to approximately between 1800 BC and 1200 BC in Gansu Province, northwest China. By comparing these ancient residues with modern reference samples, we established the existence of rice beer. Through an examination of starch content, our investigation unveiled that the recipe for this alcohol primarily employed red mold qu starter as the fermenting agent, with rice serving as the principal ingredient, and possibly root plants as supplementary components. Moreover, our findings divulged the sustained consumption of rice beer over a substantial period at the Mogou site, even in the face of changing pottery styles. It is highly plausible that this rice beer held a pivotal role in both daily routines and ritualistic practices, evolving into a tradition that persisted through different eras.

Radiocarbon Dating a Paraffin Contaminated Moccasin: Detection and Removal of Paraffin from Skin-Based Samples

As part of an ongoing collaboration dating ethnographic collections, the University of Oregon sent a piece of a leather moccasin to the PSU Radiocarbon Lab for dating. The moccasin was recovered in 1938 from a near-surface deposit of Roaring Springs Cave, Oregon. Another moccasin from this context produced an anomalously old radiocarbon age— 7670 ± 35 BP—and contamination from museum conservation was suspected. Ongoing research into accurately radiocarbon dating skin-based samples has resolved issues inherent in the complex chemistry of leather manufacturing (Davis et al., in press), but did not address the effects of curation practices. Conservants, insecticides, or modern material for mechanical repair can introduce additional contamination that confounds attempts to accurately radiocarbon date skin-based samples. Here we present work to identify one contaminant, paraffin, using Fourier-Transform Infrared Spectroscopy (FTIR) and to develop pretreatment methods for its removal using organic solvents and XAD purification. A set of known-age leather samples were purposefully contaminated with paraffin and the efficacy of pretreatments was evaluated with comparisons of FTIR spectra, C:N ratios, and ^{14}C content. This experiment aimed to develop a method for detecting and removing radiocarbon-dead paraffin so paraffin contaminated skin-based samples like this moccasin can be accurately radiocarbon dated.

The Prevalence of Pseudoarchaeology on TikTok

The popularity of pseudoarchaeological content on the internet reveals an issue in the way academics

approach the public. To measure how quickly an individual with an interest in archaeology can be influenced by pseudoarchaeology, I conducted a preliminary study on the app TikTok. The content that is presented to the users of the app is determined by a complex algorithm which uses this information to curate ones “For You Page.” Several new accounts were created and to train the algorithm I “liked” the first 100 videos in the archaeology “hashtag.” Most of the content in this phase was well researched but there was some pseudoarchaeological content. After, I recorded and liked the first 100 archaeology related videos on the app’s For You Page. The first few videos were well researched but there was a rather immediate switch to pseudoarchaeological content. This content included topics like ancient aliens, inaccurate biblical archaeology, and giants. The data collected clearly shows the ease with which a member of the public can be persuaded by pseudoarchaeological content on apps like TikTok. For this reason, more archaeologists need to be engaging with the public in more accessible forums such as social media.

So Many Disks, So Little Research: The Intersectionality of Modified Ceramic Sherds

Scattered evidence across North America points to the use of a common piece of refuse and a common human desire: broken pottery and playing games. A small sherd can be transformed with minimal effort into a circular disk which can be used as game pieces, counters, or toys. They were used in indigenous sports, European colonist gambling, and as playthings by enslaved children, among many other contexts. Investigation of two likely disks found at a multicomponent archaeological site in Somerset, Massachusetts yielded few relevant results; as such, their varied origins and transformations over time may be richer and more complex than is currently understood. This paper explores the untapped research potential of these enigmatic artifacts, especially in New England. With further study into the use and prevalence of modified sherds such as these, we can broaden our understanding of material interactions with cultural dynamics. Class, race, and gender show up in every area of life—even the small, broken pieces.

3D Skeletal Digitization as a Tool for Collaborative Artistic Commemoration

Facial approximation is a salient tool in archaeology that aims to estimate the likeness of past peoples based on historic, anatomical, and artistic evidence. This project used an iterative and community-oriented approach to 2D manual facial approximation for three decedents buried at Rupert’s Valley Burial Ground in St. Helena. Rupert’s Valley is a nineteenth-century enslavement era archaeological site containing the burials of formerly enslaved “Liberated Africans.” This project was conducted in collaboration with St. Helena community partners and artists to create commemorative images for the site following its reburial in 2022. In preliminary planning sessions, an adult man, adult woman, and child from the site were selected for approximation. Based on community feedback, several portraits were created for each decedent to embrace the interpretive nature of the project. The decedents’ skull fragments were 3D surface scanned, and then virtually reconstructed and layered with facial muscles and tissue depth markers in 3D Slicer. These files, historical context images, and a reconstruction guide were shared with the artists to guide their portrait creation. The iterative process of portrait creation has provoked artists and community members to reflect on the sobering nature of the site and its importance as a cultural landmark.

Praxis Makes Perfect? The Archaeological Correlates of Social Failure in Minoan Crete

In a 2017 paper on architectural failures in Minoan Crete I suggested that these reflected a greater focus on

signification than on engineering. Still failures, as drains that need refitting and paving that needs replacing cannot be seen otherwise; but a deeper, more nuanced understanding of the underlying purpose of these projects provides insight into sociocultural and political conditions. Likewise, ceramic failures—overproduction, malformed and misfired vessels, breakdowns in assembly—suggest the real “product” was not simply a sufficient supply of functional and aesthetically pleasing storage, cooking and table wares. Through the lens of Social Entanglement theory (Cunningham 2023) it becomes clear that these outcomes reflect the needs of the polity to entangle its constituents and prevent fissioning; economic production thus becomes social reproduction. A polity such as Minoan Crete, that depends on entanglement for its survival, will also require social leveling to finesse status inequalities. For example, destroyed and/or abandoned buildings might also reflect punishment for transgression; and ritual abasement, lamentation, and atonement, as reflected in the iconography, may demonstrate the need for elites to publicly process social transgressions or failures of office, real or potential.

When Isn't a Va'aki? Additional New Perspectives on Ancestral O'odham Ceremonial Architecture

Scholars of the Hohokam archaeological culture area have worked for decades to build a more comprehensive explanatory framework regarding the interpretation of *vapaki*, or ancestral O'odham ceremonial houses. In 2023, an edited volume of the same name was published and represents a step forward in that effort. That volume explores the archaeology of platform mounds in Arizona, the role of O'odham oral history and continuity with their *huhugam* (ancestors). We contribute to this ongoing effort by combining archaeological data recovered from a structure known as Feature 7 at AZ U:9:165(ASM) in downtown Tempe, Arizona, with ethnographic research on contemporary O'odham concepts of ceremonial architecture. Our analysis focuses on Feature 7's internal architecture, the surrounding O'odham landscape and the interrelationship of architectural characteristics with O'odham worldview and ceremony. Our results reinforce previous findings while examining the primordial aspects of ceremonial architecture that help transcend cultural historical frameworks and emphasizes historical continuity and the role of O'odham perspectives in archaeological interpretation.

Searching for Archaeological Evidence of Roque Madrid's 1705 Campaign and Navajo Resistance in Northwest New Mexico

In 1705, Spanish commander Roque Madrid led a group of soldiers and Pueblo allies on a 20-day excursion through the traditional Navajo homeland in northwest New Mexico. The goal of this excursion was to burn Navajo cornfields and resources as punishment for raiding and general resistance. Madrid kept a campaign journal during these days, describing the route traveled as well as different skirmishes with Navajo fighters. This journal was translated and published in 1996 by Rick Hendricks and John P. Wilson. The location of one violent encounter between Madrid's army and Navajo resistance is described to be at the confluence of Tapicito Creek and Cañon Largo. This confluence is, in part, currently on land managed by the New Mexico State Land Office (NMSLO). This presentation will describe the investigation of the location and the attempt by NMSLO archaeologists to locate any remaining material evidence of this battle. Methods include a complete archaeological survey of the area in question and subsurface testing.

Pastoralism and Nomadism: An Archaeological Bifurcation

Despite great advances in the archaeology of nomadism, in Eastern Europe, medieval nomads are still associated archaeologically with burials in prehistoric barrows, along with horses or parts of the horse body. Huns, Avars, and Magyars are all labeled “nomads,” but the actual conditions for nomadism in the Carpathian Basin are quite restrictive. Meanwhile, great advances in zooarchaeology have changed the terms of the discussion, with a greater emphasis on pastoralism. Nonetheless, the archaeology of medieval transhumant pastoralism in the Balkans is still in its infancy. A major point of bifurcation is slowly, but steadily taking shape in the research on medieval nomads and pastoralists.

[81]

Cultural Continuity and Ritual Significance: Apu Illaorco (Iscoconga) and Apu Rumitiana (Santa Apolonia) in Focus

This presentation unveils the findings of more than eight years of research in the Cajamarca Valley, focusing on two distinct Caxamarca sites from the Early Intermediate and Middle Horizon periods. Iscoconga or Apu Illaorco, investigated since 2017, served as a center for pottery production and pastoralism. The site boasts an abundance of pottery that defined the Caxamarca economy and local identity. Simultaneously, the presence of camelids underscores their significance in site development, as they served as vital contributors to both the production of raw materials and transportation, thereby fortifying the economy and supporting the local population. In contrast, recent archaeological excavations at Santa Apolonia Hill, Apu Rumitiana, shed light on a public/ceremonial Caxamarca center. It comprises plaza spaces with evidence of pilgrims, food and textile production areas, and funerary contexts. A multidisciplinary approach has allowed for the comparison of activities at both sites, offering insights into the social and economic processes of each. This contributes significantly to our comprehension of Caxamarca society in the Cajamarca Valley during these periods.

Monte Lima, a Tallán Community in Late Intermediate Period Chira Valley, Peru

Monte Lima is one of five large Late Intermediate sites in the lower Chira Valley described by Richardson et al. (1990) as representing a surge in local complexity resulting from Sicán and Chimú expansion to the far north coast. In 2023, we conducted preliminary excavations across this multicomponent site to establish chronology, better understand stratigraphy and preservation, and begin to explore the roles of state

conquest and interregional exchange in shaping local social and political organization. Fieldwork and visits to local community museums revealed that local Tallán ceramics and architectural elements were abundant at Monte Lima. Most of what we know about the Tallán culture comes from colonial period records of their language, their interactions with Pizarro's invading forces, and their politically powerful women, called *capullanas*. Little archaeological literature so far has explicitly addressed the Tallán. In this paper, we report on our first steps toward recognizing Tallán presence at Monte Lima and characterizing local interactions with the powerful states and trade networks of the Late Intermediate period Andes.

Beyond Kinship Trees: Capturing the Social Tapestry in European Prehistory

While kinship studies based on ancient DNA (aDNA) data have been instrumental in reconstructing biological relationships in European prehistory, they often overlook the complex web of social interactions that shaped prehistoric communities. This interdisciplinary investigation delves into the rich tapestry of social dynamics that characterized European prehistoric societies. Drawing from archaeological, sociocultural anthropological, and archaeogenetic data, the project aims at unveiling a multifaceted approach to deciphering social organization. It emphasizes the significance of non-kin relationships, such as alliances, friendships, and hierarchies, which have been underrepresented in previous studies. Following a mixed method approach, the project sheds light on the intricacies of interpersonal connections, economic exchanges, and ideological affiliations within and between communities. The project showcases the importance of moving beyond simplistic kinship tree models to unravel the intricate social fabric in current aDNA studies in European prehistory. By embracing a holistic perspective, by integrating qualitative ethnographic data and quantitative data, the project highlights the importance of understanding how these societies created and broke social relations beyond those created by blood.

Investigating Human Subsistence Strategies in Panama during the Late Holocene

Subsistence strategies and foodways were at the heart of Richard Cooke's and colleagues' pioneering work in Panama. Early work found that shifting resource reliance (terrestrial and marine) had impacts on the evolution of these early peoples' cultures and potentially the surrounding ecosystems. Therefore, subsistence in this region has important historical and ecological implications, such as agricultural plants being transported during their domestication process, and marine resources changing with regional productivity. However, to date it has been difficult to separate these different foodways given analytical limitations. We examine the evolution of human diets ($n > 60$) across the Panamanian Isthmus over the last 6,000 years using classic $\delta^{15}\text{N}$ and $\delta^{13}\text{C}$ values of bulk isotopes of collagen coupled with cutting-edge compound-specific isotope analysis of amino acids, which can identify the main protein and energy sources, and trophic position of people. Regardless of site, bulk and amino acid $\delta^{13}\text{C}$ values showed a clear sex divergence, with males consuming more maize. Interestingly, $\delta^{15}\text{N}$ values vary by site and temporal period, suggesting differing subsistence strategies and reliance on coastal resources. This work improves our ability to distinguish terrestrial and marine diets, better enabling us to unravel the interplay between human subsistence practices and the environment.

Cyr, Howard (GeoArch Solutions LLC)**[336]***Discussant***Czaplinska, Tina (University of Montana) and Meradeth Snow (University of Montana)****[68]***Nondestructive DNA Sampling Method of Human Teeth*

DNA acquisition from skeletal remains reveals a wealth of information that observational analysis alone does not offer. Researchers can glean an individual's ancestry, lineage, and biological sex and review genetic diversity. However, most current methods require some form of destruction to extract genetic material, which can dissuade entities (museum curators, living and descendant communities) from allowing this research to occur. The damage caused by destructive extraction methods can also limit additional DNA research. This study has developed and refined a nondestructive method for extracting DNA from human teeth to address these concerns and encourage future genetic research. Using nontoxic materials, the resulting tooth will also remain nontoxic, unlike in many other protocols. This project will build on the nondestructive DNA extraction method established by Essel et al. (2021, 2023) using sodium phosphate buffer (0.5M), amicon ultra-4 centrifugal filter (with ultracel-3 membrane), and a purification step to obtain a single-stranded extract. However, the application and utility of this method on human remains and the resultant ability to obtain usable genetic material have not been completed, and the methods have been adapted to typical anthropological genetics downstream applications. The results have implications for forensic and ancient genetic contexts.

Czére, Orsolya (University of Aberdeen), Baukje de Roos (Rowett Institute, University of Aberdeen), Eléa Gutierrez (University of Aberdeen), Gary Duncan (Rowett Institute, University of Aberdeen) and Kate Britton (University of Aberdeen)**[334]***Integrating Isotope Analysis with Empirical Measures of Vitamin D Status: New Directions in the Study of Diet and Deficiency*

Stable isotope analytical techniques are increasingly employed alongside other innovative methods to gain a fuller understanding of past life-histories. Recent developments in biomedical sciences have offered noninvasive means of quantifying vitamin D status in individuals through the determination of 25(OH)D₃ content in hair. Vitamin D deficiency is linked to a wide range of adverse health effects, the risk of which is increased at latitudinal extremes where limitations are placed on the dermal synthesis of vitamin D₃ due to insufficient sunlight, particularly during winter. The consumption of food sources with high vitamin D content can mediate this risk, including salmon, marine fish, and marine mammals. Where hair is preserved in the archaeological record, these novel methodologies may not only allow an empirical indication of vitamin D status but also reveal the relationship between diet and vitamin D health. Here, we present novel intra-strand 25(OH)D₃ data from modern individuals and the first archaeological applications. The detection of seasonal variability ($\delta^{18}\text{O}$) of 25(OH)D₃ content in incremental samples of hair, in tandem with the analysis of dietary ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$) indicators, provides evidence of the links between ancient (seasonal) diet and vitamin D status for the first time.

This paper presents the results of isotopic analysis of ceramic sherds and locally sourced soils that contribute to our understanding of the origin of ancient Sardis's ceramic corpus and help clarify the site's role within the larger interaction network of western Anatolia. A previous study employing neutron activation analysis (NAA) of ceramic sherds from the site identified 10 discrete compositional groups; however, the origins of

some sherds remained unclear. The current study employed strontium isotopic analysis of sherds from one of the ambiguous types, Asia Minor Light-Colored, to determine whether the specimens represented local or nonlocal wares. Additional analyses incorporating strontium and lead isotopic analysis of the same selection of sherds in addition to local soils are presented as a method for relating the ceramic specimens to their geological source of origin.

Predicting Water Availability from Phytolith Assemblages of Finger Millet, Pearl Millet, and Sorghum

The interpretation of water management practices and the use of irrigation for agricultural intensification has been central to the archaeological debate. Until now no direct method has been presented for the discrimination of water availability for C₄ cultivated crops, representing the main components of the agricultural package in drylands. In this study, phytoliths are suggested as possible proxies to overcome the methodological issue. Experimental cultivations of traditional landraces of sorghum, pearl millet, and finger millet have been conducted, simulating irrigated and rainfed fields in drylands. Morphotypes concentration and ratios in relation to water availability have been investigated from different plant tissues and a prediction model was tested on the basis of the results obtained. The model built on phytolith composition has been applied to four different archaeological deposits of the Mature phase of the Indus Civilization: Harappa, Kanmer, Shikarpur, and Alamgirpur with the aim of formulating new hypothesis on the land use strategies. Additionally, the same model has been used to test the potential extent of finger millet and sorghum agriculture in the northern Horn of Africa region during the Aksumite Kingdom; that is, the period when finger millet and sorghum are first documented in the macro- and microbotanical record.

Apophatic Archaeology: The Materiality, Phenomenology, and Textuality of Caves in Early Medieval Britain

Although most discussions surrounding humans and caves in Britain begin in prehistory and end with the Roman period, archaeologists have uncovered evidence for early medieval activity across the island. Still, early medieval historians face a methodological problem in which—compared to the preceding eras—the quantity of archaeological evidence for cave presence declines substantially, just as the textual record increases and begins to flourish with underground references. At once, this paper seeks to address this evidentiary quandary from a jointly archaeological and historical perspective. First, I draw on established frameworks such as the archaeology of atmosphere, phenomenology, and the archaeology of darkness to argue for an “apophatic archaeology” that acknowledges absences in the underground material record as meaningful. Deploying this experimental framework with reference to British cave sites, I propose that the “imagined” underground, as uncovered in early medieval texts, must be read with and against the “real”

underground, evidenced by both archaeological discoveries and present-day phenomenological encounters with caves. Above all else, this paper aims to bridge the disciplines of archaeology, literature, and history in order to further scholarly exploration of underground encounters in the early medieval British milieu.

Methods, Models, and Movement: Examining Multiple Trace Element Dataset to Explore Past Land-Use Dynamics

Differential use of obsidian sources by precontact peoples has been used to infer mobility patterns and occupations in the Absaroka mountains, Wyoming. Identifying sources of obsidian involves measuring the relative abundances of trace elements using eXRF and analyzing clusters to differentiate sources. Using a large dataset of 1,842 obsidian artifacts, assembled by the GRSLE project, sourced using eXRF coupled with pXRF scans we assembled a logistic Bayesian model for predicting obsidian sources using just the results from pXRF. The model can identify samples from Obsidian Cliff in Yellowstone National Park with a better than 0.99 confidence. Using this modeling method and pXRF data greatly increases the feasibility in sourcing large assemblages of obsidian and provides a baseline for expanding our regional record.

Yucatecan and Mesoamerican Influences on Taino Ceremonial Iconography

The iconographic corpus of the Taino cultures has been the focus of recent scholarship, yet as a whole remains understudied within Caribbean archaeology. Scholars in the past attempted to demonstrably link the Taino to the Late Postclassic Maya with limited success. However, Yucatecan influences are evident within the spatial layout of Taino ceremonial architecture of batey ballcourts, as well as from the presence of certain objects observed on Taino archaeological sites, such as stone yokes and jadeite celts. Through examinations of the Maya “muyal” glyph and similar motifs expressed in post-Saladoid Taino media, such as Cohoba snuffing tools, elite regalia, rock art, and zemis, this research suggests there exists a correlative meaning imbued within these symbols that allowed the religious actors who ritually utilized them to sequester preternatural powers to access ancestral realms. It is without question that the particular meaning inscribed in Taino motifs represents components of a unique and distinctive religious system that developed within the Greater Antilles. However, these symbols may have carried a prescribed meaning derivative from Late Postclassic, and by extension earlier Maya and Olmec cosmological ideology, which diffused through a bilateral regional interaction sphere based on long-distance maritime trade.

Urban Organization and Agricultural Practices at Las Huacas, Chincha Valley (AD 1100–1570)

In modern times the Chincha Valley is one of the most productive agricultural valleys of Peru, and its offshore islands were rich in guano—bird excrement that is a potent fertilizer—that was exploited by foreigners from the Colonial into the Republican periods (AD 1523–1879). While the importance of the valley’s agriculture and resources is well known throughout history, how agriculture was practiced in the valley during prehistory is not well understood. Historic accounts state that the Chincha were an important province under the Inca and that groups lived in specialized settlements of fisherman and farmers, but there is no detail

on how land use was organized under the Inca (AD 1400–1532) and during the preceding Late Intermediate period (AD 1100–1400). Furthermore, exactly when and how residents began using guano as a fertilizer has not been addressed. This poster presents new excavation data from the site of Las Huacas (a 100 ha agricultural center) that provides insight on the sequence of occupation at the site and site organization. This data is then paired with isotopic data from plant, animal, and human remains from previous excavations that can shed light on the use of guano.

The Reality of Commercial Archaeology for Early Career Archaeologists

This paper will present the outcomes of a second survey of European and world archaeologists intended to understand and explore the realities of early career archaeologists in commercial settings. The first survey conducted by the European Association of Archaeologists Early Careers Archaeologists Community focused only on academic archaeologists while this survey is exploring all non-academic archaeologists. Preliminary findings show concerning trends in the US, UK, and across Europe for early career archaeologists. Major findings including increasing levels of education requirements with multiple degrees at the same level (i.e., two or more master’s degrees), large periods of prolonged unemployment and chronic underemployment leading to large numbers of archaeologists becoming reliant on non-archaeological part-time jobs, and an unsettlingly high number of archaeologists completing professional work that is unpaid. Additional preliminary findings suggest that almost half of those surveyed have felt disadvantaged because of their personal background or attributes while another half of archaeologists surveyed reported being advantaged because of those same traits, e.g., gender, sexuality, ethnicity, or economic background. These are difficult findings and trends to examine, and this paper will break down these trends and other findings from the survey once it has come to a conclusion.

Visualizing Mayapán's Outlying Centers and Regional Distribution

We present the identification and analysis of the outlying minor centers surrounding the Postclassic city of Mayapán in the 44 km² area of the 2013 Mayapán lidar Survey. The centers were identified in the airborne laser scanning (ALS) data, and all were ground-checked. In this presentation, we display the major architectural and environmental features and their spatial arrangement for each minor center. Most previous research in the area focused on the two centers within the urban core, but we seek to build a better understanding of the diverse manifestation of minor centers distributed in the rural area surrounding the city. We evaluate the form and organization of each center to characterize their variation using systematic procedures to identify the fundamental structures and environmental features in each and identify key similarities and differences among them. We explore the minor centers' potential relationships within the broader polity to gain a greater understanding of political and economic activities in the Mayapán region. We use this analysis to enhance our understanding of regional interconnections and shift the focus of analysis from the isolated city to the broader relationships connecting people at multiple settlement levels and to support further research in and around Mayapán.

The Bow That Wasn't: On the Absence of the Bow in Aboriginal Australia

The nearly worldwide diffusion of the bow is often interpreted in terms of its superiority over other weapon systems. There is, however, at least one exception to this diffusion: Australia, where this weapon was never locally invented, and never spread from neighboring regions, although Aboriginal Australians near the Torres Strait were in contact with populations that used this weapon. Based on ethnographic literature and the comparative assessment of weapon systems, this presentation investigates the reasons for this situation. We suggest that, in the local conditions where Aboriginal Australians witnessed the use of the bow, this weapon did not present significant advantages over the spear-thrower, precluding its adoption and even triggering a reverse movement (spread of the spear-thrower among Torres Strait Islanders previously using the bow). In other parts of Australia, where the use of the bow might have proved advantageous, its non-invention might illustrate the rule that invention events for this weapon (vs. adoption through diffusion) are globally rare, if not unique. The evolution of weapon systems must be approached through local scenarios encompassing conditions of use and the history of techniques, rather than viewed as a reflection of cognitive capacities or of the intrinsic parameters of each weapon.

The Turbulent Archaeological History of Relations between Chupícuaro and Cuicuilco Revisited through Ceramics: An Overview

The study of interregional social relations is a subject that has been explored extensively by Mesoamerican archaeology and has traditionally relied on similarities between their respective material productions, especially pottery. During the twentieth century, stylistic analogies concerning ceramic materials between

Chupícuaro in the Lerma valley (Guanajuato) and Cuicuilco in the Basin of Mexico, led to diverse interpretations involving population movements, commercial interactions, and ideological influences, which often granted Chupícuaro a primal position as a possible area of emigration or as a prominent ceramic production center disseminating its beautiful products over long distances. After a brief overview of these different interpretations, we present the issues and challenges of the CHUPICERAM project that seeks to renew our understanding of these relations by fully exploiting the information potential of the ceramic production processes, from the raw materials acquisition strategy to the finished product.

The Production of Blackware Pottery at Pachacamac and the Lurín Valley, Peru, during the Late Horizon: A Multi-method Approach

While pottery made to look black has existed in many regions in the Andes and through many time periods, the style sees widespread distribution and use during the Late Horizon, particularly in Inka contexts. Often made through firing in a reducing environment, blackware was a style common to the Chimú Empire (located on Peru's north coast), which was subjugated by the Inkas. Ethnohistorical and bioarchaeological evidence has also shown the forced resettlement of Chimú potters to other subject territories under Inka rule, working in these new locations to produce pottery in imperial decorative styles. Simultaneously, local potters in subject territories paid tribute to the Inka empire through the production of Inka styles of pottery, emulating the forms and designs but using their traditional technologies for production. In this study, we examine the production of blackware pottery using thin section petrography, neutron activation analysis, and raman spectroscopy to address several questions: where was this pottery produced, and what techniques were used to produce it (and how do these relate to other styles of pottery local to the region)? And how was the polished black finish of the pottery achieved?

Usulután Pottery in the Southern Maya Region: Paste Composition and Potting Communities

Usulután is a type of resist-decorated pottery which was a prominent component of the ceramic assemblage for many Late Formative archaeological sites in the Southern Maya Region. Originating in Western El Salvador, this resist decoration is found on serving wares across Mesoamerica. This paper presents the results of compositional analyses of Usulután pottery in the Southern Maya Region and theorizes on the relationships between potters and potting communities that facilitated the spread of this pottery style. Integrating INAA and PXRF data with discussions of style and form, this paper will discuss the possible relationships between potting communities in the Southern Maya Region.

Traditional Subsistence Economies on Southwest Madagascar Have Long-Term Impacts on Ecological Productivity

The environmental impacts of human societies are generally assumed to correlate with factors such as population size, whether they are industrialized, and the intensity of their landscape modifications (e.g., agriculture, urban development, etc.). As a result, small-scale communities with subsistence economies are often not the focus of long-term studies of environmental impact. Having a clear understanding of the ways different communities at different scales interact with and shape the environment can help us effectively support communities co-designing and maintaining sustainable relationships with their environments today. On Madagascar, ecological and cultural diversity provide a unique case study to examine the role of diverse socioeconomic practices (e.g., fishing, foraging, and herding) on long-term ecological (in)stability. In this study, we use high-resolution remote sensing datasets and machine learning to compare long-term ecological impacts of different human livelihood strategies in SW Madagascar. Our results indicate that while human-environmental dynamics between different socioeconomic communities are similar, but these strategies can be identified in geophysical data using machine-learning classifiers. Furthermore, we find that traditional ecological practices have become integrated into the very fabric of ecological systems in SW Madagascar and help serve roles in environmental resilience.

Sourcing Surface Treatments on Whiteware Ceramics from Southeast Utah Great House Communities

Previous elemental research on ceramics from Chacoan Great Houses in southeast Utah produced unexpected results. Whereas painted whiteware serving bowls are traditionally thought more likely to be traded or procured from further away than grayware cooking pots, neutron activation analysis (NAA) of the ceramic pastes of whiteware and grayware sherds from these communities found the opposite. This poster presents the results of a follow-up 2018 laser ablation-inductively coupled plasma-mass spectrometry (LA-ICP-MS) analysis of surface treatments (slips and paints) of a subset of the same whiteware sherds. The goal

of the study was to determine if the source areas and procurement groups suggested by chemical signatures of the surface treatments (slips and paints) corresponded with those previously determined for the paste of the sherds. The results indicated there was no grouping of slip clays into distinct source-area groups and that paints could not be grouped beyond carbon/mineral distinction, suggesting less distinction and less grouped variation in slip and paint recipes than in paste recipes. Understanding the composition and sourcing of surface treatments provides insights about the nature of pottery production and trade in the ancient Southwest, including revealing differences in procurement networks for different components of pottery production.

Exploring Potential Connections between Pleistocene Bifacial Projectile Designs in Japan and North America: A First View

While paleogenetic studies indicate that the majority of the genomic heredity of indigenous peoples of the Americas can be traced to late Pleistocene human populations in far eastern Asia, we do not yet understand whether a cultural connection exists between this region and the Americas. To study this issue, we began a project to characterize and compare key cultural markers found in the design and modes of manufacture in lithic technology presented in the artifacts from late Pleistocene sites of Japan and North America. Here, we present a first view of our work on studying bifacial lithic projectile point technology from the Shirataki Valley region of Hokkaido. We discuss the use of digital 3D scanning methods and geometric morphometric approaches to elucidate design and manufacturing elements encoded in bifacial projectile points and explore next steps for research.

Davis-King, Shelly (Davis-King & Associates)**[87]***Climate Change and Other Effects to Aboriginal Medicine*

America's first people have been extremely knowledgeable about animals, plants, and fungi they ingest and/or breathe in for medicinal purposes. Medicine, from a Native perspective, is something honored, taken in for healing and well-being, to be used with respect and knowledge, with spiritual reverence and recognition of cultural continuity. Recent changes in climate have affected medicine pollinators, habitat, cross-species interaction, and traditional access while medicinal species degradation and eradication of species considered "pests" or "invasive" has affected the health and even survival of Native American communities. A decrease in the natural quantity of the species due to climate change is further exacerbated by cultural appropriation and poaching of species glorified through social media. Medicine locales often go unnoticed by the archaeological surveyor and thus become even more threatened.

Davis-Robinson, Lachlan [256] see Pugliese, Melanie

Dawson, Emily (University of Texas, Austin)**[256]***Party on the Plaza: Risk and Resilience in Seventeenth- and Eighteenth-Century New Mexico*

Spanish colonial efforts in New Mexico began in 1598 with the establishment of a capital in Santa Fe, as well as missions, ranches, and farms. Documents from the early colonial period (AD 1598–1680) are rife with colonists' concerns about the New Mexican environment, indicating struggles at the household scale to establish European-style agriculture in New Mexico. Eventually, mismanagement of the colony and cruel treatment of the local Pueblo peoples led to the 1680 Pueblo Revolt and the first colony's abandonment. In 1692, the Spanish Crown recolonized New Mexico. Returning colonists faced major disruptions in the form of the rise of the Comancheria. However, in spite of these challenges, the second New Mexican colony proved more resilient. I examine plant microremains (phytoliths), macrobotanical remains, and ceramics from two sites, a LA20,000 (a seventeenth-century ranch) and the Plaza del Embudo (an eighteenth-century settlement) in order to reconstruct risk-management practices among the colonists. I explore the ways that seventeenth-century Spanish colonial risk management strategies differed from those of the eighteenth century and suggest that the colonists second colonial was more successful because of their greater knowledge of the local environment and stronger community ties.

Dawson, Peter (University of Calgary), Remi Mereuze (University of Calgary) and Max Friesen (University of Toronto)**[168]***Laser Scanning and Preservation of House A3H5 at Kuukpak: A Study of Excavation and Archaeological Monitoring in an Arctic Environment*

Archaeological research at the Kuukpak site in the Mackenzie Delta represents a compelling case study in the face of climate change-induced coastal erosion. We offer an in-depth analysis of the innovative use of laser scanning technology in the excavation and preservation of the Kuukpak A3H5 semi-subterranean house. Our study focuses on the comparison of laser scans taken at the end of the excavation season in 2014 and the subsequent reopening in 2016. The primary objective is to examine how the permafrost environment impacts wood preservation and decay dynamics. By analyzing high-resolution laser scans, we scrutinize changes in the wood elements and analyze them with information recorded during the excavations. This taphonomic analysis allows us to discern the extent of wood decay, identify potential preservation challenges, and gain insights into the complex interplay of the multiple factors contributing to degradation. Our findings offer critical implications for understanding wood deterioration in permafrost regions, advancing our knowledge of preservation and long-term excavation strategies, and informing future research at similar archaeological sites. Furthermore, our study underscores the invaluable role of laser scanning as a tool for documenting, monitoring, and safeguarding the cultural heritage of vulnerable sites in the face of climate change.

Following the Path of Dead in Chichen Itza through a Unique Modified Skull

During the Terminal Classic and Postclassic periods, Chichen Itza became an important pilgrimage center. People from all over Mesoamerica came to the Maya Lowlands to make special offerings to Chichen Itza's sacred well. Paleoclimate studies indicate that a severe drought occurred during that period of time. This may have lasted a decade or more. During that time, offerings of all kinds to the Sacred Cenote increased. Many different kinds of objects such as ceramic objects, jade, turquoise, and especially human sacrifices were offered to Chac the rain god. After analyzing the human remains from the bone collection situated at Mexico City's Museum of Anthropology, we explored several more cenotes. In one of them, situated at the west of the City of the Itza, we documented an interesting modified human skull. I will describe in this session the documenting of such a rare and important object.

The Role of Fire-Processed Limestone at the Shivwits Plateau, Arizona

This study explores the role of limestone as a potential element in hide working among the Virgin Puebloan Branch people who inhabited the Shivwits Plateau, Arizona, in precontact times (~300 BC–AD 1200). Hide working is generally a female related activity that is lacking research in archaeology. This study demonstrates the importance of researching women-related activities to understand better the myriad of ways in which materials such as limestone could have been used in precontact times. To accomplish this goal, (1) this study reports on archaeological evidence of fire processed limestone at the Shivwits Plateau, (2) provides an overview of some of the ancient and modern uses of limestone associated with hide processing, and (3) presents an experimental study to test the effects of fire-process limestone on hide working. The results show that using limestone expedites the depilation of hides and provides antimicrobial properties. Furthermore, this study makes the case that fire-processed limestone could have been used by the Virgin Puebloan Branch people for hide working.

Past Transgressions, Future Reconciliations: Ethical Engagement with Legacy Collections

This presentation examines the history and creation of legacy collections, with a specific focus on the Hamann-Todd, Terry, and Cobb anatomical collections. These anatomical series, like many around the world, were amassed due to anatomical legislation that targeted marginalized communities. To better understand how to ethically engage with legacy collections, we must understand the past and sociopolitical context in which they were created. We must also better understand who the individuals are that comprise these collections. What narratives do they provide that allow us to bridge the past to the present and truly center descendants? This presentation will discuss how to ethically engage with these collections in an inclusive way that addresses the importance of not only locating but including descendants in conversations involving their disappeared ancestors.

De La Garza, Mary**[207]***Comparing and Contrasting Data from Drone-Based Lidar with Other Remote Sensing Technologies*

The use of aerial remote sensing technology to detect, collect, and investigate archaeological data is an increasingly popular component of archaeological research. Data from drone-based lidar collected below 400 feet allows archaeologists to construct detailed 3D images of the ground surface. During 2023, the University of Iowa Office of the State Archaeologist (OSA) collected drone-based lidar data from three midwestern archaeological sites using a DJI Matrice 300 RTK with base station, equipped with the DJI Zenmuse L1 lidar + RGB survey camera. The data was processed using Pix4D applications. This paper compares and contrasts the drone-based lidar data with existing datasets from each site that were generated from ground-penetrating radar, total stations, and lidar by aircraft. By overlaying the datasets, we examine similarities and differences between landscape and archaeological features. Insights gained through these comparisons will assist archaeologists in detecting new archaeological features at future projects that integrate drone technology.

[162]*Of Pigments and Tools: Lithic and Ochre Raw Material Procurement Strategies during MIS 5 at Mwulu's Cave (Limpopo, South Africa)*

The Middle Stone Age was a period of important innovations for *Homo sapiens*, including but not restricted to heat-treatment of silcrete, hafting adhesive, symbolic behaviors such as engravings, or exploitation of ochre. Though southern African Middle Stone Age lithics and ochre are commonly studied, combined studies of their provenance remain scarce. While each of them bears the potential to document the mobility and trade networks of past societies, combining them could increase our understanding of past cultural behaviors and social networks. Here we present results of lithics and ochre provenance studies for the MIS 5 site of Mwulu's Cave in Limpopo, South Africa. Using a naturalistic approach—the analyses of archaeological and geological raw materials by petrography, pXRF, PIXE and ICP-MS—we question the local provenance of the lithics and ochre retrieved at Mwulu's Cave. Our results highlight the existence of nuanced procurement strategies with local provenance for lithic raw material and a combination of local and nonlocal provenance for ochre materials. We question this interaction between exotic and local materials in terms of population mobility as well as their social-symbolic meanings.

[229]*Climate-Induced Hurricane Risks and Heritage Preservation in Southwest Florida: A Case Study of Hurricane Ian's Impact on Pineland Archaeological Site Complex*

Climate change is intensifying hurricanes, posing increased disaster risks. These risks encompass various factors, from physical to attitudinal, magnifying their impact. Hurricane Ian's impact on Southwest Florida in September 2022 underlines these challenges, particularly for archaeological mounds. Southwest Florida hosts numerous archaeological mounds, which are one of the most important resources for studying past groups in South Florida and past adaptations to a changing climate, placing them at climate-related risk. One notable site is the Pineland Archaeological Site Complex in Bokeelia, FL, which carries importance as a major town of the native Calusa people, characterized by extensive shell mound complexes and water features. To safeguard sites like Pineland from natural hazards, Disaster Risk Management (DRM) plans not only aim to protect heritage but also enhance resilience and reduce disaster risks. This paper briefly discusses Hurricane Ian's impact on Southwest Florida's archaeological sites and the Florida Public Archaeology Network's post-hurricane assessments. We use the Pineland case study to illustrate the development of a DRM draft plan,

underlining the critical significance of preparedness and risk reduction strategies to safeguard our heritage in the context of climate-induced challenges.

Erasure, Disappearance, and Accountability: Rethinking Taphonomy and Site Formation Processes in the Sonoran Desert

In 1994, the US Border Patrol formalized a boundary enforcement strategy known as “Prevention Through Deterrence” (PTD) that employs the natural environment as a weapon to impede the movement of undocumented border crossers. PTD has subsequently been linked to the death and disappearance of thousands of migrants in Arizona, Texas, and California. Since 2009, the Undocumented Migration Project has employed a combination of archaeological, forensic, and ethnographic approaches to document and understand the violent social milieu created by PTD in regions such as the Sonoran Desert, as well as the material footprint of clandestine migration. In this paper, we highlight the important (and often hidden) role that PTD plays in both the formation of archaeological sites and the taphonomic erasure of human remains. Drawing inspiration from Jeanne Arnold’s work on the California Channel Islands, we discuss how micro-debitage analysis has been used to help explicate the experiences of people crossing the US-Mexico border while also improving our understanding of the complicated politics of site formation processes.

Local Materials, Global Ideas: The Lithic and Symbolic Record from NW Iberia

The NW of the Iberian Peninsula is defined by the scarcity of flint and the predominance of acid soils that prevent the preservation of organic remains. These are the main handicaps affecting Paleolithic research. The lithic assemblages of the Galician Upper Paleolithic sites are defined by the hegemonic use of local and immediate resources, especially quartz. Only at the Valverde site has flint coming from the Cantabrian coast been identified. Based solely on the materiality of the lithic records from the NW Iberia, a process of economic and cultural regionalization could be alluded to, with little relation to the dynamics observed on the Cantabrian coast. However, in the last decade, in the sites where portable or rock art has been found, this interpretation has clearly changed. The scarce examples of portable art show clear parallels with the Cantabrian coast and the western Pyrenees. In contrast, the rock art from Cova Eirós finds its stylistic and technical affinities with open-air stations, and sites from inland Iberia. Consequently, interpretations of the economic and cultural spheres of the UP groups are strongly conditioned by the quality of the archaeological record.

Exploring 10,000 Years of Variation in Weapon Technologies: A Diachronic Analysis of Lithic Projectile Points in the Puna de Atacama (Northern Chile)

We present an analysis of the functional design of a collection of 353 projectile points from archaeological sites in the Puna de Atacama (21.9°–24.7° S) that belong to the cultural sequence dating from 12,500 to 2400 years BP, which ranges from the earliest groups to inhabit the area to the emergence of the first agropastoralist societies. The results obtained reveal significant changes in projectile or weapon technologies throughout the sequence. This begins with the predominance of the spear-thrower and dart system during the Early Archaic, followed by the diversification and specialization of these technologies during the Middle Archaic, with a significant increase in the use of throwing and thrusting spears. In the Late Archaic, we contend that the bow and arrow became the prevailing technology for the first time, although older technologies remained in use. However, the debate is ongoing, as it is also possible that the artifacts studied are actually smaller dart points that reflect new designs in projectile technology. Lastly, in the Early Formative period, bow and arrow technology became undeniably widespread, while the prevalence of older technologies was low, and often associated with social legitimation practices and rituals.

Search for the Federal Retreat Route at the Battle of Oak Hills at Wilson's Creek National Battlefield in Southern Missouri

On August 10, 1861, Federal forces under Brigadier General Nathaniel Lyon and Confederate forces under Brigadier General Ben McCulloch and Major General Sterling Price were engaged in a six-hour fight on the rolling hills surrounding Willson's Creek in Greene and Christian Counties in southern Missouri. Following the death of their leader, with the ammunition and water running low, Federal troops retreated along the Wire Road to Little York Road on their way back to Springfield. Magnetic and metal detector investigations in a 32 ha (80-acre) hayfield southwest of the main battle yielded several bullets, buttons, and horseshoes associated with the skirmish along the retreat route near the Guinn farm site.

A Reexamination of Hurricane Hill Macrobotanicals

Early Caddo ethnobotany is understudied compared to later periods due to a variety of factors, including preservation and sample size issues. The Hurricane Hill Site (41HP106) is an Early Caddo site with carbonized plant materials previously examined by Gary Crites and Eileen Goldborer. This study analyzed a subsample of Hurricane Hill macrobotanicals stored at the Texas Archeological Research Laboratory at the University of Texas to determine whether their contents were consistent with those examined previously. In general, the results are consistent with past family and genus identifications, as well as the low density of carbonized materials noted previously. These findings emphasize the difficulty in studying macrobotanicals from this period and region and the importance of large sample sizes in Early Caddo macrobotanical analysis.

Hammer on Vampires: Reconceptualization of So-Called Deviant Funerary Practices of Early Medieval Slavs

Slavic “deviant” funerary practices and dealings with certain dead—including decapitations, mutilations, or crushing cadavers with stones—have been of interest for mortuary archaeologists for many years. The explanation that researchers turned to most often was the one describing these practices as apotropaic in nature, as means of subduing the evil dead (most of the time identified as a “vampire”) and, subsequently, protecting the living community. However, given the broad sociocultural context of early medieval Slavdom, interpreting local atypical burials as “vampirical” calls for much thought. Lack of written sources supporting the narrative of existence of vampire folklore, matched with the linguistic, cultural, and historical spheres of the period most notably form an argument that equating atypical funerary practices with vampirism is at best dubious and hard to defend. With that in mind, objectives of the paper are, firstly, an evaluation of existing interpretations regarding Slavic deviant burials; secondly, contesting these interpretations with sources; and finally, proposing an alternative view on early medieval Slavic deviant burials and their origin and place within sociocultural structures.

The Power of Blade Stones in Postclassic Mesoamerica

In the present discussion, I will focus on mutually constitutive relationships between people and the material world, specifically on gestational dynamics, suggesting that by stone flaking and stone chipping, children (of stone) were fabricated. From the womb of the earth, which is very much a stony essence, they are chipped and flaked from the ancestors’ bodies. Some of these “metapersons” were “child blade stones” who personified warriors and fed themselves with sacrificial victims or depicted as tongues in the open mouths of deities, securing sustenance for the hungry gods. I argue that the birth of these stone warriors should be integrated into a major mythological theme, namely the Child Hero and the Old Adoptive Mother. The emphasis will be on Central Mexico but complemented with essential data from other parts of Postclassic Mesoamerica.

Climate Adaptations in Persistent Places: Relational Solutions in Yucatán, Mexico

This paper focuses on the past 500 years of nearly continual human presence on the lands held today by residents of Tahcabo, Yucatán, Mexico. Previous work addressed why town residents continued to persist in this area despite the violence of colonialism. One answer pointed to significant human relationships with other-than-human beings and things. Drawing on new data—pollen and soil carbon isotope studies from sinkholes in this area—we examine trends in climate, cultivation, and biodiversity, comparing them to the results of previous studies of climate-linked carbonate oxygen isotopes and archival records. Preliminary results from lidar data analysis and groundtruthing contribute to assessment of how people moved across the landscape in response to periods of drought and other pressures from the colonial period (ca. 1540–1821) to the present day. A consistent challenge in explaining past human and other-than-human responses to climate

has been to weigh the influences of environmental context, political regimes, technology, and other factors in landscape and livelihood changes. By considering the more recent past in a well-studied area, potential exists to track cause and effect and deepen understandings of how people persisted amid changing climates and politics through their relationships to plants, other nonhuman entities, and landscapes.

Life's a Ditch: The Role of Ditches, Canals, and Waterways for Animal Waste in Historical New Orleans

Since its founding, New Orleans has required infrastructure to collect and move water from its below-sea-level terrain. The urban development of the city required drainage ditches and canals that connected to bayous, the Mississippi River, or Lake Pontchartrain. Although there was trash collection in the city, the inhabitants of New Orleans used these various waterways for trash disposal, and the city also disposed of collected trash directly into the Mississippi up until the end of the eighteenth century. One category of trash that created significant health and aesthetic concerns was the slaughter of animals for market consumption and the disposal of animal carcasses and offal into the city's varied waterways. Trash disposal in waterways made trash invisible and thus created the illusion of order. As shown in this presentation, animal disposal created economic and sanitary concerns that eventually prompted the implementation of animal slaughter policies and new infrastructure that was built downriver and away from the urban core of the city. I use faunal remains from a late eighteenth- and early nineteenth-century urban ditch and the history of the urban slaughterhouse located in the Lower Garden District as examples.

Recent Search and Recovery Efforts: Honoring Missing US Service Personnel through Forensic Archaeology

The Defense POW/MIA Accounting Agency (DPAA) is dedicated to identifying and honoring missing US service personnel, particularly from World War II and other conflicts. Recent search and recovery efforts conducted by Alta Archaeological Consulting (ALTA), through the DPAA Partnerships and Innovations program, focused on excavations of US bombers crash sites in Germany and Poland. Utilizing forensic archaeology methodologies, these efforts aimed to carefully recover and document remains and artifacts. The objective is to bring closure to families by identifying and repatriating the missing service personnel. The collaboration between DPAA and ALTA underscores the significance of honoring fallen heroes and ensuring that their sacrifices are remembered and acknowledged.

The North Plaza Marketplace at Chan Chich, Belize

During the Late Classic period (600–850 CE), the ancient Maya had a robust market economy that connected people with goods through long-distance and local exchange networks. Marketplaces were an important institution serving a primary economic function while also stimulating social and political interaction. Recent research has argued for a network of marketplaces at centers across the Maya lowlands, with implications for the commercialization and integration of the Late Classic economy. Some of the challenges for archaeologists are understanding how marketplace activities aligned and varied at different centers, the extent of regional integration, and when these institutions emerged. This paper reviews the results of multiple seasons of investigations of the Late Classic North Plaza marketplace at Chan Chich, Belize, a large ceremonial center in the eastern Three Rivers region. Excavations in the North Plaza, one of two public plazas in the site core, demonstrate spatially discrete craft specialization that includes late-stage biface manufacture, obsidian blade production, and textile working. We further investigate the sources of nonlocal raw material to understand site-wide and regional procurement patterns and possible trade routes. Finally, we consider the development of the Late Classic marketplace alongside other contemporaneous changes in Chan Chich's urban space.

Human Impact on an Inhospitable Plain: New Insights into the Hydraulic System of the Rio Huaycho (Lake Titicaca, Bolivia)

The ALTI-plano research project (Archaeological Lake Titicaca Inventory-Mapping) aims, in particular, to provide a complete map of archaeological sites along the eastern shores of Lake Titicaca. Our focus lies primarily on refining our grasp of local chronologies, human settlement patterns, and the environmental change effects on agropastoral activities in this less explored area. The study and mapping of archaeological sites in a portion of this region, located between the municipalities of Titali (Peru) and Puerto Acosta (Bolivia), were particularly undertaken. Remote sensing enabled preliminary mapping of a 35 km² hydraulic system in the Huaycho plain (Bolivia), highlighting channels flowing south-southwest to north-northeast toward the river to the east. Some structures indicate direct flow into the lake to the west. Despite the presence of natural features, human activity significantly shaped the landscape. Our results suggest the ancient communities exploited local water tables, qochas, and river meanderings to develop an expansive irrigation system for this semiarid plain. On-site investigation of these channels has highlighted the region's anthropization, provided chronological insights, and revealed usage patterns. This communication presents the results of integrating data collected both by remote sensing and by a six-week pedestrian survey conducted in the region in 2023.

Bringing the Creed to the Classroom: Assassin's Creed as a Pedagogical Tool

Starting with the release of the titular game in 2007, creators of the *Assassin's Creed* franchise have been showcasing the historical and archaeological record, bringing the past into our living and dorm rooms.

Although criticism of the franchise focuses on the pseudoarchaeological connecting storyline, the franchise does include a highly organized, detail-oriented presentation of the past. Beginning in 2017, game developers, working with archaeologists, have implemented educational modes to guide student learners. This paper will not focus on the larger issues of the franchise that have been discussed elsewhere, but rather on the multitude of ways these video games can be introduced to the classroom to create truly novel learning experiences suitable for multiple learning styles and modalities. The *Assassin's Creed* franchise is unique with its supplemental content, far exceeding any other game design, and has adaptable resources that many game franchises do not. Material from each of these for those teaching an Introduction to Archaeology, World Prehistory, or even Biological Anthropology. Elements of the game, including NPC (non-player characters), can help frame concepts and controversies in ways that allow students to make meaning of the material within a video game context in which they are familiar.

New Evidence of the Northern Manteño Frontier: The Land of the Pasaos before the Spanish Encounter

Early chronicles indicate that the Manteño groups organized themselves along the coast into complex trading chiefdoms: these regional polities, controlled ports, and navigation equipment such as balsa rafts. In addition, maize agriculture combined with seafood products conformed their subsistence economy. Echoing early chronicles, some scholars indicate the existence of two well-differentiated groups, the Manteno at the north and the Guancavilca at the Peninsula de Santa Elena. Others believe there is only one group with minimal regional variations. Most of the studies so far have concentrated at the center of the Manteño or Manteño-Guancavilca cultural region, where it is challenging to observe regional differences. This study aims to contribute to discussing presented evidence obtained at the northern Manteno frontier. More specifically, this work presents data obtained in the region of Cabo Pasao, which, according to the chronicles, was the land of the Pasaos part of the Manteño chiefdoms.

Inclusion of Indigenous Knowledge and Perspective in Cultural Resource Management: A Laboratory Perspective

Indigenous history has been told through the lens of outsiders claiming authority on the subjects with little credibility given to traditional knowledge of the descendant communities who remain (Bernardini et al. 2021). There is an abundance of Indigenous Knowledge communities can share with archaeologists to help insert Indigenous voices that are currently overlooked. While efforts have been made to change the ways in which archaeology has been conducted historically, there are still many areas in need of improvements; specifically, within the laboratory setting where short-term stewardship, analyses, and curation preparations occur. Using tenants of decolonizing archaeology, the field can transform perspectives, methodologies, guidelines, and practices away from Eurocentric/colonial perspectives, which can at times harm Indigenous communities, instead of strengthening them. Cultural resource management has an opportunity to center Indigenous voices, knowledge, and perspectives in archaeological research and practice and create an integrated community working toward the same goals: preservation and perseverance of cultural identities. This poster will highlight the research we have conducted on repository guidelines and respectful language in analysis,

reporting, and documentation and the ways in which Chronicle Heritage is working toward centering Indigenous communities on the work we are conducting.

The Arch Street Project in the Classroom: The Multifaceted Benefits to the Student

It has become clear that current students thrive with a hands-on approach to learning. This type of engagement leads to an increase in achievement and interest among students (Erickson et al. 2020), as well as an increase of knowledge. The human remains that were unearthed as part of the Arch Street Project provided students with an invaluable resource to study and learn about the human skeleton, human variation, and human history; none of which can be examined completely independently of the others. Examining historic remains from a nearby region enriched the students' experience by creating a connection to the skeletal material. The idea that skeletons are the way they are due to their individualized histories helps students to identify the idea of skeletal holism—everything that occurs over an individual's lifetime will help to transform their skeleton. This can also help them to understand human variation. Knowing the rich history of this site also helped students to recognize the ethical issues of studying human remains and the importance of incorporating respect and professionalism when examining them. Having access to the Arch Street material proved invaluable for students.

Of Pigs and People in Colonial Guatemala: A Zooarchaeological Historical Approach

Among all the Eurasian domesticates that were introduced consequently to the arrival of the Europeans in the Americas, pigs hold a singular place. Unlike larger ungulates such as horses and cattle, their rearing does not require large resources which makes them easily adaptable to a variety of situations, including urban contexts. In the Spanish colonial sphere of influence, their remains are quite pervasive in archaeological sites located in cities and towns, places that were gathering culturally highly diverse populations including Europeans, Natives, and Africans. Besides providing an abundant meat supply, they were also a source of other byproducts, such as fat, that were vital to reproducing the European material culture in the Americas. Based on the zooarchaeological analysis of 11 sites in Antigua Guatemala and historical studies, this paper aims at highlighting the specific contributions of pigs to the postcolumbian diet as well as exploring the process of their adoption and integration in the native Maya communities of the Guatemala central highlands.

Game Save Data Is Missing or Cannot Be Read: A Twenty-First-Century Crisis of Digital Archaeological Site Loss

In 2023, the first study of its kind by the Video Game History Foundation determined that 87% of video games made before 2010 are critically endangered. What was once considered a fun but silly form of entertainment has grown into a multibillion-dollar global industry spawning competitive scholastic and professional e-sporting events and spurring popular film and television adaptations. It is undeniable that video games exert an influence on our culture. However, for every *Super Mario Bros.* or *The Last of Us*, there are dozens of games that have not attained that level of notoriety to avoid becoming endangered. In this paper, I argue that video games are no different from ancient games and are worthy of consideration for research by

archaeologists and anthropologists. Video games can encapsulate cultural, political, and economic moments in time, as with the creation of the ESRB after the release of *Mortal Kombat*. Video games can also present different or unfamiliar ontologies, as with the game *Perception*. Echoing the archaeological crisis of the 1970s, this paper outlines how archaeologists can use their knowledge of materials preservation, cultural resource management, and legislative efforts to be proactive in protecting video games from digital oblivion.

Slave Ships of the Viking Age

Viking ships were slave ships. Between 750 and 1100 CE, clinker-built vessels were used across Northern Europe on raids for collecting captives and transporting them on routes that linked the North Atlantic to Central Asia. We have extensive knowledge about these ships through a unique combination of textual evidence, material remains, and experimental archaeology. Yet this evidence has not been interrogated as a trace of slaving activity. This paper investigates these intersections of slaving and sailing through the material culture of the Viking Age, proposing new models for understanding early medieval slavery and developing frameworks that allow a reappraisal of more recent slave ships as well.

More Hands Make Light Work: A Collaborative Leadership Approach for Successful Public Archaeology Field Schools

In today's climate of budget cuts and decreasing enrollments, the importance of publicly engaged projects cannot be understated as they demonstrate our value to the public in a tangible way. Archaeological field schools represent obvious opportunities for public engagement and increased visibility for both archaeology programs and their host institutions. However, in many instances a single archaeologist is responsible for managing all aspects of a field school (research design, student supervision, records management, etc.). Juggling these various duties often leaves little time or opportunity to properly engage with the public. This paper summarizes the activities of the West Virginia State University's 2023 field school in Malden, West Virginia, and outlines a system of collaborative leadership used to conduct a successful public archaeology field school. Through defined leadership roles for each team member, we were able to engage the public in a more impactful way. This system of shared leadership serves as a blueprint that should be used in developing a model for more effective public and community outreach for archaeological projects.

Water Access and World-Systems: Aquarian versus Terrestrially Oriented Polities

The primary focus of world-systems analysis (WSA) is the impact of systemic-level interaction on long-term sociopolitical and economic stasis and change. Differentiation (not equalization) among polities is one of its predicted outcomes. WSA is methodologically transdisciplinary. Traditional academic disciplines play a role in the advancement of knowledge but eventually form barriers to understanding as our silos retard the ability to link important phenomena. In this paper we adopt a long-term process model of social change from the comparative world-systems perspective (Inoue and Chase-Dunn 2019). Using archaeological, historical, geographic, political, and social evidence, we identify differences between largely terrestrial and largely aquarian human interaction networks in 12 important linked social processes. The impact of access proves significant, and primarily positive, in 11 of those processes. Advances in maritime archaeology (especially the ability to find both submerged port areas and new wrecks) and metallurgy (the ability to track the origins of metals found on shipwrecks) suggest significant future advances in these regards. Understanding the differences between terrestrial and aquarian systems will allow us to better comprehend social formations and acquire a firmer foundation for the study of polity differentiation and systemic social change.

Mongol Trappings: Analysis of Archaeological Leather from Northern Mongolia

In this study, we examined leather excavated from the Mongol period (1206–1368) cemetery of Dood Tsakhir located in Khuvsgul province, Mongolia. This cemetery had been looted in the recent past, yet there was quite good preservation. Leather fragments from clothing, footwear, and tools were recovered and analyzed using ZooMS (zooarchaeology by mass spectrometry). Due to their condition (small, fragile fragments), this technique is preferable to traditional morphological analyses used to identify leather to species. Accurately identifying the species of each sample is crucial for our understanding of the site and the kinds of resources that were available in the region. We identify the diversity of species that were used to make leather, and whether there was a preference for leather from particular animals to make certain types of accessories or clothing. Ultimately, the goal of this project is to determine whether wild or domestic species were preferable and whether other properties of the animal hide were factors in selecting it for leather making.

Differences in Procurement of Arctic Fox in the Inuvialuit Settlement Region (NWT, Canada) Revealed through Stable Isotope Analysis

Despite their prevalence in zooarchaeological assemblages across Inuit Nunangat (the Inuit homeland), there is a

paucity of information in the ethnographic and zooarchaeological literature about Inuit and Paleo-Inuit relationships with arctic fox (*Vulpes lagopus*). Furthermore, the information that is published has typically focused on the economic value of fox pelts. Stable isotope analysis is well suited for exploring the dynamic interactions between people and arctic fox in the past. We analyzed stable carbon and nitrogen isotopes in the bone and dentine collagen of arctic fox from archaeological sites in the Inuvialuit Settlement Region (NWT, Canada) to explore their foraging ecology and human hunting/trapping. Arctic fox from sites in the Mackenzie River Delta showed greater individual variation in diet than foxes from sites on Banks Island. We interpreted the differences in fox diets between the two regions as indicative of both different fox foraging and human procurement strategies. This study is part of a larger project that seeks to use stable isotope analysis to explore the dynamic relationships between Paleo-/Neo-Inuit and arctic fox in the archaeological past.

Migration and Dental Nonmetric Variation in Medieval and Early Modern Hungary

Throughout history, the Carpathian Basin has been a natural crossroads for populations migrating between Europe and the rest of Eurasia. During the medieval and early modern periods, three major migrations shaped the demography of the basin: 1) the migration of the Avars; 2) the conquest of the Magyars; and 3) the invasion of the Ottomans. While the cultural impact of these migrations is well understood, their impact on biological variation is not. This study uses biodistance analysis and trait frequency comparisons to explore dental variation in medieval and early modern Hungary. Using ASUDAS, 27 dental nonmetric traits were scored on bioarchaeological collections housed at the Hungarian Natural History Museum and Szeged University (Avar = 139, Carolingian = 226, Post-Magyar Conquest Medieval = 481, Ottoman = 381). The collapse of the Avar empire is associated with the greatest shift in dental variation with subsequent transitions resulting in comparatively subtle fluctuations. After the Avars, Hungarian dental nonmetric variation stayed relatively consistent, even with major demographic and cultural changes. Expanding the available dental nonmetric data from this region promises to further refine these interpretations and expand our understanding of diversity and variability in medieval Eurasia. ***Presentation may include images of human remains.

Early Paleoindian Mountain Use: Initial Reports from Ongoing Investigations at High-Elevation Clovis Sites in the Beartooth Mountains, Montana

The use of high-elevation ecosystems by Early Paleoindian cultures using a Clovis-Techno complex has been known for decades. The earliest uses of North American mountain ecosystems have been hypothesized as transient forays by small groups focused on raw material acquisition and limited supplemental hunting. Between 2021 and 2023, the BEAAR Project discovered three Late Pleistocene-Early Holocene occupation areas

associated with the Clovis Culture at ~10,000 feet in elevation. These localities present a new facet of Early Paleoindian adaptations in North America, depicting the first instances of high-elevation habitation sites associated with the Clovis Culture. These sites exhibit evidence of predation, hide working, blade manufacture, point manufacture, and domestic behaviors, in addition to exhibiting shared lithic raw material acquisition behaviors with other regional Clovis localities. These sites represent the highest-known Clovis localities.

Learning to Navigate Cultural Resource Management through a Simulated Tabletop Game

While the use of simulations in educational contexts for archaeology is not new, the ways in which this approach have been employed have not fully explored the higher-level educational benefits possible. Many simulations focus on the general concepts of archaeology, rather than viewing them as genuine professional training opportunities. Given that the overwhelming majority of employed archaeologists in the United States work in some facet of cultural resource management, providing a simulated training opportunity for students to manage projects, encounter and resolve crises, wrestle with ethical dilemmas, and address public relations problems can be of great value. Even the best traditional archaeological field schools will not necessarily prepare graduates for the wide range of possible scenarios, and many are thus thrust into decision-making roles without having had the “opportunity to fail” in a low-stakes setting. Additionally, while digital simulations may be more immersive in some sense, the discussions, debates, and healthy competition involved in a face-to-face tabletop setting may prepare students more fully for real-world settings that they will encounter “on the job.” The inclusion of random events, problems that need collective solutions, critical thinking, improvisation, and choices that have permanent consequences create valuable learning opportunities in the classroom.

The Great House and the Old Plate: Planter Household Archaeology

Archaeological interpretations of household organization have long recognized its role in the construction of social identities and in the furtherance of social goals. While much of the historical archaeology of Jamaica, and indeed the Caribbean more broadly, has focused on exploring spatial and consumption choices of enslaved Africans and African descendants, application of these kinds of analysis at the household level for planters is less widely applied. Yet, as archaeologies of Whiteness are beginning to demonstrate, White identities are equally constructed within this same milieu and demand to be interrogated and deconstructed. We might expect this to be particularly true during the period historians have termed the “fall of the planter class” in the late eighteenth and early nineteenth century, when both the physical and political security of the planter class was under pressure. Thus, by analyzing the spatial and consumptive patterns of planters, we may be able to mark their deployment of material strategies furtherance of their own social goals. This paper describes evidence recovered from Stewart Castle, a Jamaican sugar plantation great house occupied in the closing decades of the eighteenth century and the opening of the nineteenth century.

A Late Pleistocene Paleoenvironmental Record for Northern Namaqualand, South Africa: Geoarchaeology, Geochronology, and Stable Isotopes from Spitzkloof A Rockshelter

Excavations at Spitzkloof A Rockshelter, northern Namaqualand, South Africa, identified a deep stratified sequence with pulsed occupation dating to the Last Glacial Maximum (23–17 kcal BP) and Marine Isotope Stage 3 (>51 ka BP), while the lowest layers are candidates for U-series dating. Importantly, this period encompasses a time of marked climate change, with fluctuating environmental responses within Africa likely requiring human innovations and adaptive plasticity. Abundant ostrich eggshell throughout the deposit (including the undated layers) includes beads and flasks, presumably reflecting social and technological innovations allowing people to forage in the southern margins of the Namib Desert. High-resolution records of climate change in Namaqualand are sparse, yet reconstructing paleoenvironments is fundamental to understanding how people engaged with the landscape. Large grazers in the LGM deposits suggest wetter environments, while arid-adapted specialists imply drier landscapes in MIS 3. To test these interpretations, we present new geoarchaeological, geochronological, and stable isotope results on ostrich eggshell (C, O, and N) to assess the paleoenvironmental context and confirm that the LGM deposits reflect wetter environments than exist today. Ongoing analysis will extend to material from the MIS 3 and older deposits to verify the arid signal.

Migrant Health in the Past: Assessment of Differential Growth Conditions between Locals and Nonlocals to Medieval London

Previous bioarchaeological work in medieval London (ca. 1000–1540) has produced evidence of higher survivorship and lower hazards of mortality and, by inference, better health in adults with nonlocal isotopic (lead and strontium) signatures compared to those with local signatures. This may be a medieval example of “migrant selectivity” (i.e., the “healthy migrant effect”), a phenomenon observed in living populations and a limited number of recent historical populations whereby migrants experience better health on average compared to people in both their regions of origin and receiving populations. There are several possible mechanisms underlying the healthy migrant effect, including differences between locals and migrants in childhood growth conditions that produce long-term consequences for adult health (i.e., developmental origins of health and disease, DoHAD). This study assesses the developmental origins mechanism for the healthy migrant effect in medieval London by comparing adult stature (a marker of developmental stress, or lack thereof) between locals and migrants to the city. Preliminary findings suggest that migrants were, on average, taller than London locals and thus experienced superior childhood growth conditions prior to migrating.

The Stratigraphy of American Archaeology: Gender, Academia, Authorship, and the Need to Go “Beyond the Critique”

This presentation will deconstruct American archaeology’s past to understand modern sociopolitics of gender distributions within the discipline and how these proportions shape archaeological theory, practice, and authority. By connecting the foundations of American archaeology with what they coin the “boys club of

archaeological knowledge and authority,” the author describes these strata and, with them, unearths American archaeology’s problematic tendencies, including the binary bind and the marginalization of feminist epistemologies. Together these layers create heteronormativity and androcentrism, where biases and stereotypes exist. Feminist archaeologists know this and have been critiquing archaeology and its problems these past three decades, resulting in discussions with little change, indicating it is time for American feminist archaeologists to move beyond the critique. By arguing for the inclusion of queer theory, intersectionality, and other feminist epistemologies, the author demonstrates how archaeologists mitigate these problems by using these frameworks, forcing cultural relativism on the researcher, thereby creating a more holistic, inclusive interpretation of the past. The author highlights successful applications of feminist epistemologies in recent years. Together, these case studies demonstrate the benefits of feminist theory and apply it to American archaeology.

Crafting Bones: An Analysis of a Worked Bone Assemblage from a Mississippian Ceremonial Complex in Northeast Florida

Bone has been used as a medium for crafting both tools and decorative items since our earliest ancestors; however, this important component of material culture has often been overlooked, with the few published studies focusing on assemblages from either a utilitarian or burial context. The Mill Cove Complex, located along the St. Johns River near Jacksonville, Florida, would have served as a locus for ritual activity among the St. Johns II communities in the area. The analysis of the worked bone assemblage recovered from the excavations of a special activity midden (Kinzey’s Knoll) has the potential to provide insights into the role of worked bone within this unique ritual context. This study will create a typology using a multi-analytical approach to highlight the relationships between form and function supported by use-wear and macro fracture analysis to provide insights into the manufacturing, use, and discard of worked bone artifacts recovered from the site. The data gathered from this study will contribute to a better understanding of the role of worked bone within a unique ritual context among the precontact communities along Florida’s Northeast coast.

[223]

Investigating Camelid Herding Strategies in the South-Central Andes Using Stable Isotope Analysis

Pastoral practices shape the responses of herders to environmental and sociopolitical changes. This paper uses stable isotope analysis to examine camelid herding strategies from pastoral settlements in the south-central Andes during a period characterized by climatic and political changes (eighth–fifteenth centuries CE). Samples from archaeological sites in Peru and Bolivia—Ayawiri (Puno); Los Batanes (Sama); Omo M10 (Moquegua); and Wila Pucara, ACH-10, Pokotia, Konto Konto, and San Antonio (Bolivia)—provide an altitudinally and temporally diverse perspective on herding strategies. We used oxygen and carbon isotope compositions from sequentially sampled tooth enamel to reconstruct seasonal camelid diet and mobility during animals’ early life stages. We also conducted carbon and nitrogen isotope analysis of camelid bone collagen to reconstruct dietary inputs. These data are interpreted within the specific context of each site environment. We compared the results of published and modern datasets to identify different management practices, such as transhumance across altitudinal gradients. The results will reveal access to pastures composed of plant communities with distinct isotopic signatures reflective of different ecological and

anthropogenically modified environments. These multiple lines of evidence enable insights into the variability of herding practices that are often overlooked using a single line of evidence.

Isotopes and Texts: Animal Management Strategies in Ancient Greece

Integrating textual sources, a largely qualitative dataset, with archaeological science, a largely quantitative dataset, is no easy task for archaeologists and historians. This paper reflects on the challenges and opportunities of integrating the textual and biochemical evidence for animal management in the ancient Greek world. Over the last several decades, archaeologists and historians have argued over the topic of animal husbandry in the ancient Greek world. Some scholars have marshaled ethnographic and historical evidence for mobile herds moving seasonally between uplands and lowlands to argue that ancient Greek animals were managed similarly. Other scholars have argued, also on the basis of ethnographic and historical evidence, that animals were reared in smaller herds and largely tied to agricultural land that produced fodder and grazing. Here, we present isotope evidence from ancient Crete relevant to the question at hand: a multi-isotope sequential series that examines seasonal diet and mobility in sheep and goats. Instead of either model, there is a large amount of variability in the ways in which animals were reared. Here, we examine quantitative and qualitative approaches to comparing the isotope evidence with textual sources.

[123]

Elemental Analysis of Archaeological Hair Compared to Soil Composition: A Case Study of a Child and Adult Female

This case study focused on two individuals, a child (G-009) and an adult female (G-033), recovered with intact hair masses from the former First Baptist Church of Philadelphia (FBCP) cemetery. Hair samples from both individuals were studied visually using light microscopy and chemically using inductively coupled plasma optical emission spectroscopy (ICP-OES) and mass spectrometry (ICP-MS) multi-elemental analyses. ICP-OES analysis focused on the parts per million (ppm) level of 14 elements, including major and trace elements found in hair and soil (Ca, Cr, Cu, Fe, K, Mg, Mn, Na, Ni, P, Zn) and three heavy metal toxins (As, Cd, Pb). Periodic table semiquantitative heatmap analysis via ICP-MS was also conducted. Elemental analysis revealed the G-009 and G-033 hair samples were chemically distinct from each other and from the soil samples collected at the excavation site. The heatmap results suggest that while burial has a significant effect on the mineral content of hair, hair retains elemental distributions unique to the individual even after centuries of direct soil exposure. Therefore, the mineral composition of both the hair and soil in archaeological contexts should be analyzed to provide insight into the types of environmental exposure experienced by individuals ante- and postmortem.

Household Craft Production at San Gabriel Mission, California

Over a decade of research, archaeologists working at San Gabriel Mission (active from 1771 to 1834) explored contexts outside of the mission quadrangle that revealed evidence of the numerous ways in which native

residents navigated their colonial world, including areas of agricultural production, Native American ceremony, and Catholic ritual. Unique among these is an unusually well-preserved Native American house floor feature that contained evidence of domestic consumption and craft production, including fiber processing using ceramic spindle whorls. Set apart from the large-scale adobe housing blocks, communal kitchens, and collective production areas that were primary foci of the Franciscan missionary efforts, this small tule reed hut appears to have been a locus of more autonomous crafting, cooking, and dining. This paper compares the San Gabriel Mission household crafting assemblage to contemporary collections at California missions and native rancherías (villages), assessing the role each productive unit played in local economic systems.

People and Food: Investigating the Diet through Isotopic Analysis in a Precolonial Group from Piaçaguera Shell Mound (Sambaqui), Brazil

In this study, we aim to present new evidence on the diet of precolonial individuals excavated in the Piaçaguera *sambaqui* (7151–5668 years cal BP), one of the oldest shell mound found on the Brazilian coast. Previous isotopic analysis has shown that, although there is a general preference for consuming marine fish, there are regional variations in the diet of the groups excavated in *sambaquis* along the Brazilian coast during the Holocene. We conducted isotopic analyses of ^{13}C and $\delta^{15}\text{N}$ on collagen extracted from human (bone and dentine) and fauna (bone) remains from Piaçaguera. The dentin was divided into horizontal mini-slices (both in permanent and deciduous teeth), allowing for the evaluation of diet at various stages of childhood. The results indicate that at Piaçaguera, individuals had a preference for consuming marine fish but also consumed terrestrial animals to a significant extent. Additionally, there is a slight variation in diet when separating the individuals into two groups based on the site's planistratigraphy. During childhood, the study found no significant variations in weaning ages, which typically occur around four years old; the post-weaning diet is similar to that of adults, and some individuals may experience periods of catabolic stress during prepubertal ages.

Payang (Pangium edule) Pengolahan (Processing): Using Experimental Archaeology to Understand the Archaeobotanical Record at Liang Jon, East Kalimantan, Borneo

Liang Jon is a limestone rockshelter situated within the Batu Gergaji range located in Sangkulirang-Mangkalihat karst. In 2019, excavations revealed a rich archaeological sequence with a wide range of macrobotanical remains, including *Pangium edule* Reinw. (payang) endocarps. Payang is an important botanical resource to indigenous groups across Island South East Asia and is extremely toxic due to high concentrations of cyanogenetic glycosides. While historic accounts establish poison leaching techniques, these lack detail around the processing sequence helpful for archaeobotanical inquiry. In collaboration with Dayak Kenyah man Stepanus Gung we developed the Payang Proyek to document step-by-step use of payang; from locating trees, plant collection, through to processing, and consumption, as well as uses for medicine, poison extraction, and other plant-based technologies. Comparison of experimental remains with archaeological fragments recovered from Liang Jon suggest that archaeological remains can be attributed to particular stages in the processing sequence. Our findings demonstrate that payang collection and processing was an important socioeconomic activity carried out at Liang Jon over at least the past 10,000 years with ecological knowledge and techniques maintained and practiced by indigenous communities today.

Dillian, Carolyn (Coastal Carolina University)**[150]***Discussant***Dillian, Carolyn (Coastal Carolina University), Katie Stringer Clary (Coastal Carolina University), Cheryl Cail (Waccamaw Indian People) and Harold Hatcher (Waccamaw Indian People)****[303]***Sharing Traditional Ecological Knowledge (TEK) in an Outdoor Exhibit with the Waccamaw Indian People*

The Waccamaw Indian People (WIP) are a close-knit community that shares knowledge of the relationships, culture, and Traditional Ecological Knowledge (TEK) of their ancestors. Working collaboratively, we have created an outdoor exhibit and interpretive trail that embraces TEK as a means for the public to learn about Indigenous management of the longleaf pine forests and wetlands that make up Waccamaw traditional territory. The exhibit materials highlight the heritage, forests, and ecosystems of the WIP by showing how the lands were maintained in traditional Indigenous ways, and how this environmental heritage persists within the Tribal Grounds and surrounding region. In addition to providing a self-guided exhibit for the public to explore, the project creates green infrastructure using TEK to maintain and restore natural hydrology, wetlands, and longleaf pine forest species, and connects university students with tribal members and the community.

Dine, Harper (Brown University)**[256]***People-Plant Negotiations in Two Rejolladas at Yaxuna and Joya, Yucatán*

Rejolladas have long been identified as sites of specialized agricultural and ritual practice across the northern Maya lowlands. However, archaeological investigations of these cavernous, soil-rich features have been sporadic until relatively recently, and there is still much to be understood about the way people engaged and built relationships with them, especially at the local level. This paper presents an overview of microbotanical and macrobotanical methodologies and preliminary findings from archaeological fieldwork carried out within two *rejolladas* at the ancient Maya sites of Yaxuna and Joya, which are located within the present-day ejido of Yaxunah in central Yucatán. These contrasting case studies build on insights regarding the various ways that Maya people and plants negotiated contours of the landscape they shared.

Discamps, Emmanuel [247] see Barakat, Sarah

Diserens Morgan, Kasey (University of Pennsylvania)**[254]***Heritage Making with a Side of Archaeology: A Community-Led Project and Practice in Tihosuco, Mexico*

The process of heritage preservation and the production of knowledge in indigenous communities regularly seem at odds in terms of their overarching goals and outcomes. Relationships to the study and use of heritage are often fraught and can become political quickly. This paper outlines the practical and methodological aspects of conducting a community-led heritage preservation and development project. It addresses some of the pitfalls and processes that have been used as a part of the Tihosuco Heritage Preservation and Development Project, located in Quintana Roo, Mexico. Additionally, it will focus on the paradox that seems inherent in heritage preservation practice today, that of the focus on materiality versus the focus on the people and the narrative about heritage. I argue for an updated version of community-led heritage making practice that moves beyond the focus on the past to instead center the present and future of heritage assets and heritage narratives for use by local communities.

Feasting and Gift Giving in Precontact and Spanish Colonial Saipan, Northern Mariana Islands of Micronesia

Feasting and gift-giving in the ethnography, history, and archaeology of native peoples in Southeast Asia and its islands in the Western Pacific are often given primacy in accounts of academic fieldwork. Some ethnohistoric accounts on the precontact and Spanish colonial Chamorro people indigenous to Guam and the Northern Mariana Islands of Micronesia also mention similar behavior during the early Spanish contact and ensuing 300 years of colonial rule until 1898. Archaeological fieldwork and analyses of the Pre-Latte and Latte periods in the archipelago, however, pay scant attention to recognizing evidence of such events in the material record. This study presents measures for evaluating aspects of feasting and gift-giving at two prehistoric sites on Saipan in the Marianas archipelago between approximately 1500 BC and AD 1668.

Origin of Northwest Coast Microblade Tradition: Insights from Shuká Káa Cave (SKKC)

Two hypotheses for the origins of the Northwest Coast Microblade tradition (NWCMT) predominate: (1) it derives from the first human dispersal to the NWC from interior eastern Beringia; (2) it results from westward movement to the coast from interior regions of British Columbia (BC), Canada. The oldest NWCMT radiocarbon date from SKKC is ca. 10,700 cal BP, and the sum probability for all early ¹⁴C dates associated with the NWCMT at SKKC is ca. 10,360 cal BP. SKKC and other early NWCMT assemblages lack tools made from lithic sources and artifact types associated with contemporaneous and older microblade sites in eastern Beringia, while obsidian originating from Mt. Edziza occurs in early NWCMT assemblages. This indicates the NWCMT developed following LGM deglaciation ca. 12,500–10,700 cal BP and results from contact between people on the NWC and the Stikine Plateau, BC, likely between ca. 11,000 and 10,500 years ago. The morphological and functional variability of NWCMT technology suggests experimental application to new tasks and environmental circumstances. These data indicate the NWCMT originates from an early postglacial adaptation incorporating both non-coastal (terrestrial) microblades into a preexisting maritime technological system characterized by stemmed bifaces and a generalized lithic technology emphasizing production of organic artifacts.

Imperial Tokens: Mirrors in Roman and Qin-Han Empires

The Roman Empire and Qin-Han China were two of the most significant and powerful states and empires in antiquity. Building on recent research findings and drawing inspiration from numerous archaeological discoveries of mirrors in the both empires, this proposed paper aims to demonstrate how contemporary scholars can utilize specific archaeological artifacts, such as mirrors, to enhance understanding of social archaeology and gain insights into the ideas and concepts of the ancient world. The primary objective of this presentation is to conduct a comparative study of mirrors in the Roman Empire and Qin-Han China. The central concept chosen as the foundation of this research is “reflection,” accompanied by sub-concepts: (1) soul/spirit; (2) social identity; (3) empire; and (4) beauty. By employing archaeological remains, findings, and ancient written sources, the study aims to utilize the concept of reflection as a means to connect mirrors within the context of social archaeology. This encompasses the understanding of mirrors as personal items associated with the concepts of soul and spirit, the role of dream and fantasy in mirror usage, and the use of mirrors as artifacts for propagating the ideas and roles of empires as political structures during the Qin-Han and Roman Empires.

Dockter, Abigail (Logan Simpson)**[149]***Oral Histories of Southwestern Paleoethnobotanists: A Karen Adams and Vorsila Bohrer Appreciation*

Paleoethnobotany, the study of past relationships between people and plants, rapidly developed new methods and priorities in examining plant remains from archaeological contexts during the late twentieth and early twenty-first centuries. Oral histories from two paleoethnobotanical researchers, Dr. Karen Adams and her mentor Dr. Vorsila Bohrer (1931–2021), document this development of the field over the course of their influential careers in the US Southwest. In February 2017, Willow Powers and Mollie Toll interviewed Bohrer about her experiences as a paleoethnobotanist, and in 2017 and 2018, Abigail Dockter conducted similar interviews with Adams. These interviews form a small archive of women's histories in this field. The interview material covers topics of methodology, education, and encouragement of young analysts, and the two researchers' perspectives on their field as well as entertaining personal stories that emerged from the pursuit of that work. Such interview projects provide insight into knowledge creation in the field of archaeology as well as an appreciation of the practitioners who have devoted their intellectual lives to this research.

Dodd, Lynn (USC)**[141]***Chair***Dodd, Lynn (USC), Sabina Zonno (Huntington Library, Art Museum, and Botanical Gardens) and Lauren Malkoun (Università degli Studi di Roma “La Sapienza”)****[141]***Making and Made: Time and Virtual Material Action as Empowerment of Cultural Heritage Curation Institutions*

Cultural repositories struggle with competing missions of wide access and preservation. To release this tension, we created the Virtual Reality Global Library (VRGL), a shareable, immersive VR headset experience that provokes presence through real-time virtual reading of ancient manuscripts with parchment simulation. Informed by experts and experimental archaeology, we focus on de-aging strategies that prompt awareness of the use life and biographies of ancient, fragile objects. Conservators and curators both urged us forward and toward caution. Thus, we emphasize transparency in constitutive exclusions of de-aging and renewing parchment. These prompt renewed awareness of the socio-material entanglements of use and ageing, of people touching, kissing, crying, and smearing, or reading the manuscript by candlelight. This use cost by devoted adherents to the Christian faith is accessible to us, bridging divides of time, space, and experience in a virtual realm. We argue that enhanced transparency results for those who use this project when practitioners engage this work personally by yielding insights about material change, materiality, and concepts lively in discourses of New Materialism. We offer concrete examples of multidirectional intra-action and discuss interjections of decision-making, and hence of subjectivities, in gestural and procedural work as 2D images transform into 3D parchment simulations.

Dodd, Walter (California State University, Fresno)**[33]***Street Code: Working Out How Symbolic Artifacts and Features Are Used to Traffic Drugs*

Sixteen years of ethnoarchaeological observation and collection has resulted in the creation of a massive dataset relating to ongoing drug sales in an urban context. Hundreds of thousands of “trash” items have been gathered for study. They display strong repetitive patterning in their content and testify to the organized complexity of everyday dealing. A diverse array of warranted evidence from material culture inventories, slang words and phrases, subcultural behaviors, and rehab interviews is advanced to construct a preliminary model of trafficking dynamics.

Dodge, Robyn (University of Texas, Arlington)**[213]***Ancient Maya Marketplace Investigations at Hun Tun*

This paper discusses preliminary data related to a potential ancient Maya marketplace at the Late Classic site Hun Tun. The Hun Tun Archaeology Project operates under the larger Programme for Belize Archaeological Project and within the modern geographic boundaries of the Rio Bravo Conservation Area. It was determined that Hun Tun Group B fit the established criteria of known marketplaces within the region and was included in this investigation. The coordinated support and collaboration of the larger marketplace study provided the opportunity to gain a regional perspective of Late Classic Maya economy. Marketplace interactions between larger sites, such as La Milpa, and the surrounding hinterland settlements provide insight into the regional mobility of goods. Current marketplace research is the first of its kind at Hun Tun. Marketplace research methodology at Hun Tun was consistent with other sites included in this study and consisted of the following: soil testing of marketplace plazas, trench excavations of plaza courtyards, investigations of associated features, and identification of tree species. Group A served as a control or “non-marketplace” courtyard. Archaeological matrix and tree species were also evaluated in Group A at Hun Tun.

Dodson, Timothy (US Army Corps of Engineers)**[317]***Discussant***[317]***Chair***Dodson, Timothy (US Army Corps of Engineers)****[317]***Smoke and Weirs: The Historic Use and Archaeological Documentation of Fish Weirs in Eastern Tennessee*

The use of fish weirs/traps and dams by both Native American Tribes and Euro-American communities in eastern Tennessee is considered to be common knowledge but has only received modest and sporadic attention by archaeologists/historians. The shapes, sizes, and construction materials vary depending on the environment, biodiversity and size of community that constructed these structures. Whether constructed of wood, stone, or a combination of both, weirs vary in complexity, size, shape, and location. This paper will highlight the ongoing work in documenting fish weirs in eastern Tennessee.

Doelle, William (Archaeology Southwest), Skylar Begay (Archaeology Southwest), Ashleigh Thompson (Archaeology Southwest) and Shannon Cowell (Archaeology Southwest)**[88]***Transforming Archaeological Institutions: The Path toward Tribal Collaboration*

Archaeology Southwest has elevated “Collaboration with Tribes” to the highest priority in our strategic plan. That is easy to do on paper, but we have found that multiple transformations at the organizational and staff levels are needed to implement this goal. It’s a process that Archaeology Southwest has embarked on, but the path toward this goal is neither simple nor straightforward. We provide a historical overview of our trajectory over our 35 years as an institution. Our primary focus is on the past decade, where research, advocacy, landscape-scale preservation, public outreach, and even fundraising are part of this strategic imperative. A key step in our process has been diversifying our staff and board—an effort that is ongoing. Another step is the development of a Tribal Collaboration Model, by a team led by two Indigenous staff members and now accessible on our website. We have begun to implement the model using a simple form that compels staff to carefully consider four Indigenous kinship values (relationship, responsibility, reciprocity, and redistribution) at the outset of a new project to define specific collaborative elements and actions. The goal of this paper is to provide practical approaches to this important process of institutional transformation.

[20]

Considering the Role of Mammoth and Other Megafauna in Food Systems across North America

Archaeologists agree that proboscideans and other megafauna played a role in lifeways of the first Americans. From eastern Beringia to central America, the evidence is unequivocal: humans hunted mammoths. But what role did these animals play in the food systems of the first Americans? New research at several archaeological sites seeks to go beyond the kill site to the campsite. Investigating domestic areas associated with proboscidean remains can help us to better understand how people used this resource as food, their importance to past lifeways, and what changed when they disappeared from the landscape. From Swan Point to La Prele and Colby, this paper considers how researchers are reinvestigating terminal Pleistocene occupations to better understand the relationship between foragers and their environment.

Sharpening Archaeological Approaches to Linear “Tool Grooves”

“Tool grooves,” “incised lines,” and “axe-sharpening marks” are some of the varying names used to describe linear rock modifications found across western North America. Previous ethnoarchaeological research has examined methods and motivations surrounding the creation of such markings, but consideration of their individual landscape contexts remains limited. Further, the use of technique-oriented terminology to describe linear forms encourages the oversimplification of a large variety of rock art images into a single analytical category. This poster examines the utility of taking a landscape and iconographic approach to the analysis of linear “tool grooves.” Through a case study of over 1,300 incised linear icons located in the Colorado Gunnison River Basin, I examine the diverse forms these images can take, and the trends that emerge from their placement within specific topographic and vegetational surroundings. This poster illustrates the need for more detailed study of linear “tool grooves” that promote better contextualized interpretations of their role in cultural landscapes and Indigenous histories.

Cove Creek Clovis? Exploring Fluted-Point Assemblages in the Eastern Great Basin

Despite its prominence in Paleoindian archaeology throughout much of North America, Clovis has long been overshadowed in the Great Basin by the potentially contemporary, and locally more prolific, Western Stemmed Tradition. Despite decades of research, the relationship between the two distinct techno-complexes remains unclear. Largely due to difficulties related to dating and the general rarity of buried sites, the nature of Clovis in the region is particularly poorly understood. In 2021 and 2022, a reinvestigation was conducted in Cove Creek, Utah, at a rare concentration of sites (42MD1341, 42MD1404, 42MD2502, 42MD2535, 42MD2604, 42MD2645, and 42MD3117), where original investigators reported surficial Clovis and/or Western Stemmed diagnostic materials and noted the potential for buried deposits. Over two years, approximately 3,000 artifacts were collected from surface surveys at six sites and an additional 100 from test pits excavated at three sites. Here, the preliminary results of the surface surveys, test excavations, and material analyses are reported.

Bickering over Bison Bones: Radiocarbon and Stable Isotope Analysis to Determine Number of Individuals at the Haynie Site (5MT1905)

The Haynie site (5MT1905) is an ancestral Pueblo village that was intermittently occupied from approximately AD 700 to 1280. The formation of this village is extremely complex, as it includes multiple occupations and significant modern disturbance. The Crow Canyon Archaeological Center has conducted research at Haynie since 2017, focusing on reconstructing its occupational history, connections to local and regional networks, its role as a community center through time, and human-environment interactions. Excavations in two pit structures likely dating to the tenth and eleventh centuries yielded bison (*Bison bison*) remains, which are rare for the Colorado Plateau. These remains are found in a few different horizontal and vertical depositional contexts. However, when the skeletal elements are considered together, the Minimum Number of Individuals (MNI) equals one. Are there multiple bison individuals represented in these pit structures or a single individual? We use high-precision AMS radiocarbon dating—providing stable carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) isotope values—on multiple bison specimens to answer this question. Our analysis provides insights into the extent of depositional mixing at Haynie, whether people were intentionally placing bison remains in the same location over time, and whether these bison were locally procured or not.

Making the Dream Work: Overcoming Challenges to Respectful Return through Collaboration

A significant challenge to successful repatriation is an inability for federal agencies and museums to identify who has stewardship and compliance responsibility for collections. This occurs for various reasons: universities and CRM agencies may have conducted contract work for federal agencies, maintaining collections at their facilities post-project; records may have been lost, or were not sufficiently documented in the first place; students or researchers may have removed collections and never returned them; or collections may have been moved from their original repository without sufficient transfer paperwork produced. For these reasons and others, institutions may be hampered in their efforts to return ancestors and their belongings in an expeditious and respectful manner. With the changes to the implementing regulation, it is more important than ever to ensure that institutions are able to work cooperatively to find a path forward for repatriation. This paper provides suggestions for museums and federal agencies seeking to establish collaborative relationships and overcome challenges to respectful return.

The Mesoamerican Knife Handles at the Museo delle Civiltà (Rome): A Cultural Biography

The Museo delle Civiltà (Rome) holds two famous Late Postclassic Mesoamerican knife-handles, sculpted in wood and encrusted with a mosaic of turquoise, malachite, lignite, *Spondylus*, *Strombus*, mother-of-pearl, and gold. Both represent crouching figures—one anthropomorphic and the other zoomorphic—facing toward the now-missing blades. The two artifacts were most probably brought to Bologna in 1533 by the Dominican friar Domingo de Betanzos, together with other mosaics, featherworks, and codices. In Bologna, they ended up in the collection of Ferdinando Cospi (1606–1686) and, subsequently, in other local public collections until

1875, when they were transferred to Rome by Luigi Pigorini. The paper investigates the long cultural biography of the two handles, reconstructing their collection history and focusing on the visual reproductions and textual descriptions produced by a host of scholars over the centuries. Part of the paper will deal with the most recent phase of their biography, that is, a recent multidisciplinary research project—also including scientific analyses and 3D modeling—which explored the handles' iconography, technology, function, and cultural attribution.

The Underestimated Utilization of Aquatic Resources in Neolithic Northern China: Evidence from Stable Isotopes

There is no doubt that millet farming and pig husbandry were the dominant subsistence practices in late Neolithic northern China. However, wild resources, such as foraged fruits and nuts, shells, and hunted wild animals, also contributed substantially to people's diet at this time. Wild resources, especially aquatic resources, are sometimes overlooked by archaeologists due to limited preservation. A recent excavation at the Jiaojia site, a late Neolithic regional center in the lower Yellow River Valley, yielded many shells and fish remains, in addition to mammals and other terrestrial animal remains. We carried out carbon, nitrogen, and sulfur isotope analysis on human and fauna remains, including fish remains at Jiaojia, to evaluate the possible contributions of different resources. Sulphur isotope values, in particular, suggest that most individuals have consumed noticeable amount of aquatic resources. This finding provides important insight on how people utilized different kinds of resources at Jiaojia. More importantly, it reminds us that aquatic resources are probably important elements of people's diet, in addition to crops, raised animals, and other terrestrial resources during the Neolithic, even in northern China; more investigations are needed to fully understand the spectrum of subsistence practices.

Following in El Maestro's Footsteps: Historical Ecology and Panamanian Capacity Building in Darién

In 2012, Richard Cooke described the study of so-called Gran Darién as one of the most urgent concerns in Panamanian archaeology. Years later, that mandate resonated with us, and in 2019 we joined efforts beginning to fill in one of the greatest gaps in the archaeology of Latin America. Cooke's mentorship not only delineated our geographical path, but also marked our theoretical, methodological, and ethical approaches to archaeological practice in Panama. The Darién Profundo project aims to carry on Cooke's legacy by applying a historical ecological approach to the Gulf of San Miguel, building on his work in the Las Perlas archipelago, and carrying out research entirely in Spanish, facilitating both local community collaboration and the education of younger generations of Panamanian archaeologists. In this paper, we summarize the results of

the project since its foundation in 2019, including the first chronology of Darién based on radiocarbon dates. We then feature a selection of Darién's archaeological sites, including monumental stone sculpture and architecture. Finally, we share the project's future directions featuring Richard's perspectives, which were discussed in our last conversations with him from the field in 2023.

Cows, Clorox, and Canning: Early Twentieth-Century Consumption and Consumerism in Rural Alabama

The McFall Site (1LU528) in Northwest Alabama provides a case study for the archaeology of rural consumption and consumerism during the first half of the twentieth century. The site and the surrounding land have been maintained as a farmstead by the Holland (1870–1945) and the McFall (1945–present) families, who faced numerous challenges stemming from dramatic global, national, and local events. Material evidence, historical research, and oral histories gathered through a cultural resource management (CRM) mitigation were used to better understand how these families participated in an expanding consumer culture. Available evidence suggests the two families used a variety of strategies, such as flexible agribusiness practices and government programs, to obtain necessities and luxuries as they experienced economic depressions and world wars.

Gendered Publishing Patterns and Occupational Trends, Oceania Archaeology 2005–2020

My research examines ongoing issues of gender disparity in male-dominated academic professions like archaeology. Here, I investigate the link between gender and publishing of archaeological research in Oceania among a broad cross-section of archaeologists. Similar research conducted on North American archaeologists has found significant gender imbalances between female and male publishing rates. To determine if similar trends exist among archaeologists working in Oceania, I created a database to log the number of female first-authored and male first-authored research articles in both regional and international journals, as well as edited volumes. I also recorded the occupational affiliation of the first authors to compare gendered publishing rates and job type. To launch my study of gender disparities, I collected 16 years of data (2005–2020) for nine peer-reviewed regional journals and eight peer-reviewed international journals. My current study investigates the possible causes of gender disparities in publishing, including gender of journal editors, female preference for nonacademic jobs that do not require publications for advancement (as with CRM), instances of gender exclusion and harassment at research field sites, or limited undergraduate mentorship opportunities for prospective female archaeologists.

With the Best in the House: Ceramic Analysis of a Nineteenth-Century Irish-American Household

The Anthony Farmstead (SOM.HA.4) in Somerset, Bristol County, Massachusetts, was established in 1757 and passed father-to-son through multiple generations of a prosperous New England Yankee family until the mid-nineteenth century, when the property was rented out to tenants. The longest tenant occupation of the property was by a young Irish immigrant couple and their American-born children. Previous research has broadly examined the site's archaeological assemblage and documentary record to articulate the immigrant family with commonly practiced behaviors within the larger nineteenth-century Irish diaspora culture, and to consider how the family engaged in identity formation simultaneously as Irish and as new Americans. The current research takes a more intensive look specifically at the ceramic assemblage, employing varied

analytical approaches in an attempt to develop a more emic understanding of material choices; identity formation and expression; and local, regional, and global economics.

Industry Challenges for Cultural Heritage Consulting Firms in North America

A main challenge confronting archaeologists today is the uncertainty surrounding the availability, viability, and sustainability of careers. As such, this paper provides an economic overview of the cultural heritage consulting (CRM/HRM) industry, the largest employment sector for archaeologists, in the United States and Canada. The industry and its challenges are discussed through a labor economics perspective. The US industry is comprised approximately of 1,400 firms in 2,000 offices, has annual revenue of \$1.1 billion, and employs 9,100 archaeologists augmented by a pool of approximately 3,700 project-hire field technicians. Despite the currently high demand for compliance consulting services, partially fueled by large but temporary federal legislation, the industry has been shrinking with 10-year mean annual growth of -0.5%. Industry firms are having difficulty finding enough employees to meet the demand, yet there are over 10,000 new graduates on the job market every year. The CRM/HRM industry has plenty of jobs but few careers, and graduates are choosing to work in other industries with more stability, benefits, better pay, easier work, and a home base. Thus, both employees and companies are struggling. How can firms be financially sustainable and still provide career paths for junior employees?

A Tale of Two Mounds: New Chronologies of Mississippian Movements and Mound Building in Southwestern Virginia, USA

Mississippian expansions through the Cumberland Gap into the region has been explained as the seeking of new opportunities for elite lineages with roots to the west, particularly through the development and control of craft production and related exchange relationships on either side of the Appalachian Mountains. However, new chronologies for two primary Mississippian sites and new excavations at one, the Ely site, suggests that Mississippian movements into and out of this region were punctuated and driven more by historical context and contingent motivations among migrant groups. Here, we report the results of new radiocarbon dating and chronological modeling for Ely. With new high-resolution temporal data we present a new narrative of Mississippian movements in southwestern Virginia and outline necessary future directions for research.

Doucette, Dianna (The Public Archaeology Laboratory [PAL])**[187]***Chair***Doucette, Dianna (The Public Archaeology Laboratory [PAL])****[187]***Life on the Edge: How Can the Archaeological Assessment of the Physical and Cultural Landscape of Today Be Applied to Native American Settlement Choices Thousands of Years Ago?*

Several large-scale cultural resource management surveys conducted ahead of utility line construction in Massachusetts have shed new light on the history of Native American subsistence procurement practices and settlement patterning along two of the most significant river drainages in southern New England: the Charles and Taunton Rivers. Regulated archaeological survey along the traditional waterways and homelands of the Wampanoag and Nipmuck Tribal Nations coupled with their involvement, helped fill in the gaps along the rivers' edges. This paper considers the predictability of Native American settlement choices along the Charles and Taunton Rivers and their many tributaries in eastern Massachusetts during the precontact period and draws from numerous surveys conducted by the Public Archaeology Laboratory Inc. (PAL) and other professionals over the past five decades.

Dougherty, Haley (University of Nevada, Las Vegas)**[103]***Understanding Ecological and Social Diversity in the Virgin Branch Puebloan Region*

The Virgin Branch Puebloan (VBP) region is pronounced by its ecological and social diversity much like other areas of the US Southwest, including Puebloan "core" areas like Mesa Verde and Chaco Canyon regions. This research will examine archaeological materials from Moapa Valley (a lowland area of the VBP region, located in the Virgin Valleys of southern Nevada) and the southern end of the Shivwits Plateau (or the upland regions, located on the westernmost edge of the Colorado Plateaus in northwestern Arizona) during the Pueblo II and III periods. Specifically, ceramics from these regions are analyzed to examine whether the geographical and environmental differences between the lowland and upland regions resulted in differences in (1) food storage methods, (2) food preparation techniques, and (3) social signaling and creation of strong in-group ties.

Douglas, Diane (Initiative for Sustainable Development in Africa), Jeffrey Altschul (Center for Collaborative Synthesis in Archaeology), Gerry Wait (Initiative for Sustainable Development in Africa) and Ibrahima Thiaw (Cheikh Anta Diop University of Dakar, Senegal)**[267]***A Pathway to Attain Sustainable Development in Africa*

The Initiative for Sustainable Development in Africa (ISDAf) was conceived in 2020 to raise awareness of the need to engage local indigenous and descendant (LID) communities as equal partners in Strategic Environmental and Social Assessments (SESA) and Environmental and Social Impact Assessments (ESIAs) for development and conservation projects at the national and local level. The UNDP's (2019) report on international migration explores the driving forces behind many Africans making the dangerous journey to Europe via smugglers. The study found that 90% of immigrants would take the same risks again given the chance to create a life in Europe; 77% said the primary reason they left their homes was because they had no opportunity to participate in their country's government. The failure to adequately engage with LID communities often results in people being displaced and losing access to traditional medicines and foods when they do not have access to doctors, hospitals, or grocery stores. They also lose access to traditional sacred sites, burial grounds, and other cultural sites important to the community, leading to a loss of their self-identity and community cohesion. ISDAf's initiatives in Africa illustrate the potential positive outcomes of working with LID communities as equal partners.

Doyle, Emily, Marina Ugarkovic (Institute of Archaeology, Zagreb, Croatia), Goran Durn (Croatian Academy of Sciences and Arts) and Branimir Šegvic (Texas Tech University)**[255]***Interconnectivity between Seclusive Iron Age Communities and Burgeoning Greek Colonies in the Eastern Adriatic Illustrated through Analysis of Ceramic Material Culture*

The Eastern Adriatic region is historically an ingress into the Mediterranean and its wider cultural sphere, serving as a crossroads of cultural exchange and influence. Many seclusive communities have made their homes here since the Neolithic Age, though the Iron Age saw the arrival of numerous Greek settlements as many city-states sought to expand westward. The island of Hvar and the surrounding mainland settlements serve as a microcosm within which the influence of these different communities on one another may be explored. This exploration was undertaken via multiple spectroscopic and chemical methods, with a special focus on an innovative geochemical technique that uses in situ spot analysis over a homogenized approach. These methods include X-ray powder diffractometry (XRD), optical petrography, scanning electron microscopy and energy dispersive spectroscopy (SEM-EDS), and laser ablation–inductively coupled plasma–mass spectrometry (LA-ICP-MS). Preliminary results suggest firstly that native pottery was fired likely at higher temperatures than once assumed, and secondly that the clay paste preparation possibly changed after Greek arrival. These early results indicate that the native communities possessed greater technological acumen than previously ascribed to them and that they likely had greater interaction with the Greek settlers.

Doyle, James (Penn State University)**[90]***Rollout / Not Rollout: Maya Plate Painting and the Kerr Archive*

While Justin Kerr might be best known for pioneering the rollout photographic technique specific to 3D drinking cups and serving vessels, some of his still photographs of painted plates also proved pivotal to the understanding of Classic Maya religion and history. Plates contain artists' visions of creation narratives, courtly scenes, dancing deities, decapitated beings, animal shenanigans, and important textual records. This presentation reviews the corpus of plates in the Kerr archive and analyzes both the graphic strategies of plate painters and the iconographic content on these relatively flat earthenware canvases. Specific case studies of individual masterpieces and potential schools of plate painting reveal the undeniable value of the record that Justin and Barbara Kerr have created, especially with a new generation of the archive at Dumbarton Oaks, in continuing to push forward the fields of Maya archaeology, epigraphy, and art history.

Disconnects in Archaeology Higher Education: Insights from SAA Faculty, Professionals, and Students

The impending growth of the cultural resource management field (Altschul and Klein 2022) has brought the demand for well-trained archaeology graduates in the United States into sharp focus. In this qualitative study, we explored the relationships and disconnects between archaeology practitioners' stated needs and desires in new graduates to the resources and priorities of instructors in higher education. While practitioners desired practical skills and stronger connections with indigenous and professional communities, faculty members reported low institutional support and difficulty convincing students of the viability of archaeology as a career path. Interviewed students also reported confusion on professional pathways and frustration in graduate school mentorship. This disconnect in archaeological training implies a crisis in both the cultural resource management field and higher education if not addressed.

Caught Starch and Managed Hearths: Minimally Invasive and Restorative Methods in Gallina Paleoethnobotany

Concerns around sampling methodology, size, and adequacy endure in archaeobotany, centered on one persistent question—how much is enough? At the same time, archaeologists in many areas have become increasingly interested in minimally invasive and minimally destructive methods in response to ethical, community, and other research design constraints. How might these preoccupations work together? This paper explores what minimally invasive, less invasive, and restorative field archaeobotany might be, and what these “impact-scaled” methods might be able to say. In other words, how much (and what) are the data gathered using these methods is enough? Taking previous work in survey-based macrobotanical collection as a starting point, I present a pilot effort in incorporating paleoethnobotanical analysis into a broader project in the American Southwest. Focusing on the Gallina region of the Ancestral Pueblo world, I present a catch-and-release survey starch extraction project. Articulated with archival research and macrobotanical samples from both disturbed and intact contexts of a looted site, I consider how these variously invasive collection practices, each suited to specific community and landscape contexts, might work together toward greater archaeobotanical understanding of a relatively understudied area within a data-rich region.

“Interesting Characters Find Graves in the Potter’s Field”: The Value of Storytelling in Historical Bioarchaeology
 Dr. Patricia Richards had an indelible impact on these married authors’ time as UWM doctoral candidates. Her support as the former’s dissertation advisor was unflinching, and she provided a useful anthropological perspective for the latter’s English creative writing committee. In this paper, her multifaceted contributions and our academic worlds collide as we explore the value of humanistic and data-driven narratives in archaeology. Guided by Dr. Richards’s passion for revealing personal stories forgotten by written history and influenced by scholars known for their storytelling—including Deetz, Praetzelis, and particularly Spector and her seminal publication, “What this Awl Means”—we first introduce what we know from archival and archaeological data about the unusual life, death, and burial of 24-year-old James Jones. The inevitable research gaps are then filled through a fictive narrative meant to enrich our understanding of the complex agents and sociocultural factors that resulted in his pauper’s grave. While guided by data, this narrative is also the product of imagination. As Deetz argued, archaeologists are storytellers; it is our responsibility to communicate beyond the ivory tower not only our often tedious data, but the significance of unknown and unknowable individuals whose lives form the foundations of our work.

America’s Most Studied Battle: Twenty Years of Systematic Metal Detector Surveys at Pea Ridge National Military Park, Arkansas

Pea Ridge National Military Park commemorates the March of 1862 battle that was the most important engagement fought west of the Mississippi River. Since the early 2000s, archaeologists from the National Park Service, Arkansas Archeological Survey, the Arkansas Archeological Society, and the NPS Volunteers in Parks program have studied the battlefield through numerous means, all heavily employing geophysical approaches. Using remote sensing techniques to identify isolated battle-related finds, plan for shovel testing surveys, and to guide open block excavations, we have studied significant portions of the park and made Pea Ridge one of the most thoroughly-studied conflict landscapes in the country. This research has led to refinements in the way the battle is interpreted to the public and has created unique stories about the event lost beneath the dirt long ago. This poster details those impacts and shows how geophysics-led, collaborative projects can be used to great effect.

Working Like a Dog: Stable Carbon and Nitrogen Isotope Analysis of Canids from the Canadian Arctic

To better understand the social and economic relationships between humans and dogs in the Canadian Arctic, stable carbon and nitrogen isotope analyses were performed on canids (dogs and wolves) from a number of archaeological sites. These data provide a record of an individual’s dietary habits and the environments in which they lived. Additionally, the potential of dogs serving as dietary proxies for human subsistence in Arctic contexts (the Canine Surrogacy Approach) was explored. The isotopic compositions of the canid bone and dentine collagen (primarily dog) suggested they had highly variable diets regardless of time

or place, and even throughout their lives. This variation may be indicative of a variety of provisioning strategies and the dynamic, highly contextual nature of human-dog relationships in modern and ancient Arctic societies. At the Silumiut site (Northwestern Hudson's Bay, Nunavut), comparisons of dogs and humans revealed differences in both stable carbon and nitrogen values, implying that dogs are not suitable as direct dietary analogues for humans in this region but do provide an additional, indirect line of evidence for human subsistence practices more broadly.

Druggan, Patrick (Penn State University)

[94]

A Bayesian Approach to the Emergence and Decline of Cahokia

The emergence and decline of Cahokia, the largest Indigenous settlement north of Mexico, have long captivated archaeologists. Population reconstructions are a major line of evidence for unraveling the story of Cahokia. Current models hinge on reconstructions derived from architectural data which estimate population by tracking the quantity of observed dwellings per phase. It has been proposed that the emergence of Cahokia was rapid and marked by significant population increase, perhaps related to the introduction of maize, and the decline of Cahokia appears to have coincided with hydroclimate variation. Our understanding of Cahokia, however, is hindered by a continued reliance on culture-historic units of analysis grounded in informally constructed chronologies. The propagation of error from chronology to population must be addressed for the crafting of robust archaeological narratives. I synthesize the available radiocarbon record of the American Bottom and recently collected architectural data from the East St. Louis Precinct as well as legacy data from Cahokia to provide an updated population reconstruction of Greater Cahokia through a combination of Bayesian chronological modeling and Monte Carlo simulation. I then present these estimates in the context of regional demography, maize introduction, and hydroclimate variation to evaluate existing models of Cahokia.

Building a Selection-Based Model to Explain the Spatial and Temporal Distribution of Obsidian Artifacts in the Northern Great Basin

Over 20 archaeologically identified obsidian sources occur as inter-bedded surface exposures and stream-transported alluvial deposits within and along the margins of Idaho's Snake River Plain. Previous research has documented the differential frequency of source use through time and variation in material transport distance for southern Idaho obsidians, implying preferential, but as yet unidentified choice criteria were used by toolmakers. The temporal and spatial variability of obsidian use and the observation of discrete, performance-linked material properties meets expectations for a selection-based model framework to explain this distribution. In particular, we find that use-linked performance attributes such as predictability of cleavage/fracture pattern, fractal function, and intra-source coefficient of variation support selection-driven explanations of material choice and use. As prehistoric identification and cataloguing of the source universe increased, obsidians were preferentially chosen for material properties like predictability, and variance reduction in manufacture and use costs, over notional characteristics like material hardness, luster or "workability." Distribution of "high-use" obsidian suggests a selection-based "inertia" existed for these materials, and that the trend of archaeological obsidian utilization supports the observed temporal reduction

of source variability and greater spatial distribution in sources predicted to have high inertia, measured by material properties and performance characteristics.

Understanding Livestock in Political Economies in West Africa: Archaeological Insights Inspired by the Legacy of Richard Redding

Among his many intellectual contributions, Richard Redding was a leading scholar in the use of zooarchaeology, specifically the production, distribution, redistribution, and consumption of animal products, to understand political economies. Through systemic approaches, Redding was able to explore the daily lives of different segments of society that are often overlooked in the past. In this paper I explore the role of livestock in the political economies of central West Africa, focusing on the Mouhoun Bend of western Burkina Faso. Here, livestock played a central role in the forging of connections among early farming communities, the later development of inequalities, and the subsequent rejections of inequalities and construction of horizontal forms of complexity. The dynamic political histories of different social segments can be reconstructed through systematic analyses of ritualized depositions of animal remains within archaeological tells that yield insights into animal production, distribution, redistribution, and consumption.

Molding Community: Compositional Insights into the Organization of Mississippian Pottery Production on the Central Gulf Coast of Florida, USA

Technological innovations can have profound social consequences. Alterations to a given potting network change the pacing and tempo of interactions between experts and apprentices, effectively restructuring intergenerational relationships within a community. For this reason, experienced potters may intentionally resist new technologies to keep active the social bonds that depend on a specific organization of production. This study mobilizes technological and compositional analyses to investigate the social implications of shifting from coiled to molded pottery production during the Mississippian transition in Tampa Bay, Florida. The primary empirical observations of this research are 1) the presence of chromium-enriched clays in domestic pottery after AD 1050 signaled increasing reliance on a restricted range of clay resources, and 2) certain optical patterns in thin section identify a form of pottery production predicated on the use of concave molds. We argue that molding was a comparatively expedient technique that broadened participation in domestic potting and eliminated certain steps in the socialization process. Ultimately, patterns gleaned from this work suggest that the expansion of molded pottery paralleled the development of kinship systems predicated on the vertical transmission of property, fundamentally reorganizing relationships between generations of potters and communities in this segment of the Mississippian world.

The Trackway Site: Human Footprints at the Pleistocene-Holocene Transition in the Great Salt Lake Desert
In 2022, human footprints were discovered on the Old River Bed delta, a large terminal Pleistocene to early Holocene distributary wetland in western Utah's Great Salt Lake Desert. The site also sits within the boundaries of the US Air Force's Utah Test and Training Range. The prints' preservation and context showed the unshod feet of adults and children infilled with stream sand from wading in waters that disappeared about 10,000 years ago. Their stratigraphic position suggested an age as early as the terminal Pleistocene alongside similarly preserved Haskett-associated archaeology in the vicinity, ca. 12,500–12,100 cal BP. In 2023, in consultation with affiliated Native American tribes, the site was excavated to determine the age and geomorphic sensitivity of the footprints. Documentation included using ground-penetrating radar (GPR) and 3D scanning technologies to minimize invasive impacts, examine preservation, and create digital products. In this presentation, we share new results on the age and significance of the footprints and discuss next steps in managing the Trackway site through further preservation-based archaeology and ongoing Tribal involvement.

Reciprocal Feasting and Access to Foodstuffs at Huaca Colorada
Feasting has long been acknowledged as a central element in Andean social and economic life. Crucial to this emphasis on feasting during the Late Moche period (AD 600–850) is the need for tribute and the redistribution of the goods brought in by tribute through conspicuous consumption. This is not an instantaneous process, but one that requires planning, organization, and time for it to come to fruition in the great feasts for which the Moche were known. These social processes did not simply happen but were the product of the organized accumulation of food, drink, and various implements with which to serve and consume them. These goods were both local and foreign in origin and were accumulated as part of the reciprocal tribute system postulated for this region at this point in time. This system required administrators, dedicated space for collection and redistribution, and both the time and labor to convert these goods into consumable materials. Utilizing architectural, ceramic, paleobotanical, and zooarchaeological evidence, we identify the functional spaces at Huaca Colorada where the activities of collection, redistribution, food production, and consumption took place and discuss the social processes entailed in maintaining this system.

“... this distant and isolated post”: Fort Tombeché and Frontier Community

The French established Fort Tombeché in present-day Alabama in 1736 to secure their alliance with the Choctaws and to more firmly establish their presence in a region vulnerable to English takeover. During the following 27 years, hundreds of Choctaws visited the fort to trade and confer, and they eventually established a town nearby. Historic documents and archaeology suggest that Fort Tombeché and its surrounding landscape were a nexus for multiple ethnic groups and nations, a place for negotiating colonial and Native

identities. While traditionally studied as reactionary pawns of political decisions and events occurring hundreds and thousands of miles distant, Tombecebé's inhabitants and neighbors conducted daily lives as responses to the demands of basic survival and local alliances.

Dynamic Coasts and Landscapes of Resilience: Archaeological and Environmental Hotspot Modeling on the Swahili Coast (Sixth–Nineteenth Century CE)

With over 40% of the global population residing within 100 km of a coastline, coastal regions stand at the forefront of the climate breakdown. This paper adopts a diachronic approach to investigate how Swahili coastal communities, who inhabited the northern Tanzanian coasts from the late sixth to the nineteenth centuries CE, adapted to a spectrum of climatic and environmental stressors. Situated in tropical East Africa, this region has weathered a complex history of severe droughts, floods, storm surges, and other extreme natural phenomena. Our research leverages environmental data and incorporates known archaeological site locations as training data to develop an Archaeological Predictive Model (APM). This APM will simulate areas of high archaeological potential and validate the significance of environmental hotspots in shaping the coastal settlement network. This model will center on the coastal hinterland of Pangani Bay (5° 25' 60" S, 39° 0' 0" E), a region with tremendous potential to illuminate the interconnected factors at the climate-environment-society nexus that shaped settlement patterns and impacted subsistence strategies, food security, infrastructural adaptations, and governance frameworks across time.

"La Cisterna": An Analysis of Ceramic Materials from a Manteño Phase Hilltop Water Cistern in Dos Mangas, Ecuador

A Manteño phase (AD 750–1530) settlement located in the present-day community of Dos Mangas, on the coast of Ecuador, is the site of a rare hilltop water cistern, which was previously excavated by Sarah Rowe in 2009. Archaeologist Jorge Marcos first described the presence of hilltop water cisterns utilized during the Manteño phase, which collected mist from coastal fog that was then distributed to agricultural terraces via irrigation canals. Due to the rare occurrence of these water features in the archaeological record, little is known about additional associated activities. The 2009 excavation of this Manteño phase hilltop cistern was the first of such a feature. It yielded no evidence of irrigation canals; however, leveled terraces can be observed on the hillside leading to the cistern site, suggesting previous agricultural terracing at the site. A recent analysis of materials from the 2009 excavation suggests potential ritual use of the site, attributable to the presence of a large quantity of burnt and fineware ceramics, indicative of feasting and ritually significant practices, in addition to utilitarian vessels likely used for crop storage. Other significant materials include mother of pearl shells, and canine remains, which also suggest ritual use of the site.

Historical Bodies and the Marketplace: Ethical Engagement

Commerce and trade in human remains involves a panoply of thorny ethical questions surrounding rights of the dead and the authority of the living to speak for them. Trafficking of human remains may be defined as unauthorized, exploitative, or obscene commerce involving human bodies. Interest in a particular set of human remains is frequently heightened by a connection to larger narratives in public imagination. Criminality, royalty, relics, and superlative qualities frequently drive public interest. “Forensic” biohistory refers to the use of scientific methods to ascertain the identity or characterize the circumstances surrounding the lives and deaths in such cases. Here we examine the broad landscape of biohistory to identify and explore ethical challenges that anthropologists face to advocate for the dead while simultaneously avoiding and combating exploitation and trafficking of human remains. Specifically, we consider justification of exhumation, who (if anyone) owns remains legally or morally, and arbitration of competing narratives surrounding historical bodies in examples such as Francisco Franco, Richard III, Beethoven, Pedro de Corpa, and Charles Byrne. Anthropologists’ roles in studying such historical bodies is potentially fraught but presents opportunities to shape public debate about history and experience greater impact outside of the academy.

The Meaning, Value, and Purpose of Things: The Evolving Idea of the Archaeological Museum Collection

In addition to being tangible heritage and a material cultural record of the archaeological past, archaeological museum collections are products of archaeological and curation practice during and after the time of their collection. Likewise, the laws, rules, and procedures that shape archaeological collection in the field and the accessioning of materials into museums and repositories are products of ideals of (or at least ideas about) archaeological practice at particular points in time. Past conceptions of the meaning, purpose, and value of archaeological collections therefore continue to shape our interactions with museum collections in the present. Unpacking these historical and evolving ideas is a valuable step in becoming better stewards of the material in our care. Collections at the Arizona State Museum—an institution with over a century of collections history as well as an active repository and a long-standing regulatory role in Arizona archaeology—serve as a case study.

Fire History and Red Pine: Ojibwe Cultural Burning in Northern Minnesota

This presentation highlights the work of our fire history partnership on the Chippewa National Forest and Leech Lake Band of Ojibwe Reservation in northern Minnesota. The research is a collaborative effort involving the Leech Lake Band of Ojibwe, Leech Lake Tribal College, the USDA Forest Service, and the University of Minnesota that is exploring the role of human behavior in shaping the iconic red pine forests of northern Minnesota. Part of this effort includes compiling fire histories and we have established tree-ring chronologies that extend into the 1670s in various parts of the forest. The data suggests that the fire history pattern observed in parts of the forest were formed and maintained over time by the Ojibwe prior to the establishment of the national forest. This presentation will provide an overview of our current understanding of the fire history in our shared landscape as well as how our partnership is creating opportunities for interdisciplinary cooperation between various disciplines and stakeholders regarding cultural burning and Indigenous land stewardship.

Behemoths of the Bajo el Laberinto: The Development of Urban Reservoirs at Yaxnocah and Calakmul, Campeche, Mexico

The Elevated Interior Region of the Maya Lowlands, including the area surrounding the sprawling Bajo el Laberinto, faced acute water availability issues that necessitated the annual capture and storage of rain water to support urbanization. Two large urban areas dominate ancient Maya settlement around Bajo Laberinto: Yaxnocah, an extensive Preclassic center on the bajo's southern flank, and Calakmul, the eventual Late Classic seat of the powerful Kaanul dynasty, on its northern rim. Unsurprisingly, urban development at these two centers was accompanied by the development of an elaborate system of reservoirs constructed on a wide range of scales. In this presentation we summarize evidence for the development of their water capture and storage systems beginning in the Middle Preclassic and continuing well into the Postclassic. Among other findings is evidence for some of the earliest and some of the largest urban reservoirs known in the Maya Lowlands. However, in addition to massive civic projects, water management also took place at the household level.

The "On Colors" Chapter in the Historia General de Sahagún: Its Structure, Contents, and Contribution to the Knowledge of Technology and Artistic Practices in Ancient Nahua Society

This paper revisits the structure and contents of the greatest source—the only one of its kind—concerning the knowledge of color technology and, consequently, artistic practices of the ancient Nahua: the chapter on colors in Sahagún's *Historia General de las Cosas de Nueva España*, which contains a description in Nahuatl of the origins and uses of coloring materials used since prehispanic times, accompanied by illustrations and Spanish descriptions. Although the version of this chapter included in the Florentine Codex has caused much ink to flow, this research aims to address other important aspects, not yet studied, to refine our reconstruction of the prehispanic and colonial knowledge about materials for rendering colors, their categorization, and cultural appreciation. Based on a comparative study of two variants of the text and an analysis of the illustrations in the Florentine Codex, this study aims, on the one hand, to clarify the content of the largest amount of data available on Nahua coloring materials, and on the other hand, to better define when, where, by whom, and in what context this information could have been provided, so that we can make a more thorough and conscientious use of it.

Isotope and Elemental Analyses Using Portable Laser Ablation at the Elemental Analysis Facility: A Progress Report

The study of archaeological artifacts often needs to be undertaken with no or very limited damage to the objects. It is with this constraint in mind that the Elemental Analysis Facility at the Field Museum was established. The choice of laser ablation–inductively coupled plasma–mass spectrometry (LA-ICP-MS) was ideal in this respect as the damage to the artifacts is invisible to the naked eye; however, objects must fit into the laser chamber (10 × 10 × 1.8 cm with our current laser). This is a major limitation for larger objects, inducing sample selection bias. With portable laser, a relatively novel sampling technique, micro sampling is possible virtually anywhere and on any type of objects without limitation of size. Aerosols produced via ablation are pumped in air and deposited onto a Teflon filter. The ablated material can then be directly analyzed for elemental composition via LA-ICP-MS but can also be subjected, after dissolution, to isotope analysis. We are exploring the capabilities of this approach for the elemental analysis of ceramic and copper artifacts and the isotope analysis of lead in copper, silver, and ceramic; of iron in iron-based objects; and of strontium in glass and bones.

Interconnections between Indigenous Women and Traditional Fire Practices in the Far North

Women within hunter-gatherer societies have had deep interactions with fire through their cultural and gender roles for thousands of years. I aim to explore the intersections among Indigenous women of Dene speakers, fire, and material culture throughout the recent and more distant past. My focus is centered around women's/girls' interactions with their environment and specifically fire from both natural and human-made sources. In order to achieve a more holistic perspective, I will apply a four-field anthropological approach that compares data from Indigenous oral histories, Indigenous language

dictionaries, material culture from multiple Interior Alaskan archaeological sites, and publications ranging from multiple disciplines.

The Migration Panel: Rethinking Acoma's History in SE Utah

Near the summit of Comb Ridge, an imposing monocline that rises above the dry landscape of southeastern Utah, is a great series of petroglyphs that archaeologists call the Procession Panel. The panel depicts four lines of anthropomorphic figures converging on a central double circle. Dating to Basketmaker III/Pueblo I transition (ca. AD 650–800), the panel was created at a time when dispersed households were coming together to create a new kind of Pueblo village social life. Archaeologists propose that these petroglyphs commemorate coalescence event(s). We agree that this rock imagery records epic histories. Nonetheless, our paper complicates the archaeological narrative by incorporating the beliefs and experiences of Acoma Pueblo colleagues. Over the past three years, our team, consisting of Acoma tribal members, preservation advocates, and archaeologists, has built a partnership based on collaborative site visits and discussions. Our Acoma colleagues believe that the movement of people depicted in the panel is one of migration and records their Pueblo's story of emergence in Utah and subsequent movement south to their present home in New Mexico. We seek to show how centering Indigenous beliefs and viewpoints can expand archaeological interpretation while simultaneously reestablishing and strengthening claims of tribal sovereignty.

The Dark Arts: Mississippian Dramatic Delusions and Theatrical Illusions

Demonstrating one's spiritual power through dramatic theatrics, based on deceptions and illusions, has long been the purview of ritual practitioners in their efforts to gain, legitimize, and maintain political and social advantages. Exclusive and secretive ritual sodalities, which often form the institutional framework for corporate-based magical practice, is evident throughout Indigenous North America—sharing many similarities, especially miraculous performances that defy the laws of nature. Magical practice as a way for ruling elites to garner authority and wealth has been overlooked by scholars investigating the Mississippian world. In this paper I focus attention on Mississippian Hero Twins imagery, mound portals, and symbolic weaponry to argue ritual theatrics bolstered aristocratic privilege through awe and fear. Magical practice, including conjuration, legerdemain, and prognostication, has deep roots into the ancient past as revealed in the archaeological record, ethnohistoric accounts, and iconographic images.

When Survey Is Not an Option: Comprehensive Archaeological Monitoring Standards in Texas

Archaeological monitoring is generally considered a secondary investigative methodology, to be used when necessary after proactive archaeological work has already occurred. However, monitoring is increasingly relied on as a primary form of investigation within archaeological compliance, particularly in highly urban settings where proactive work is logistically challenging and cost prohibitive. Consequently, monitoring has become a kind of wild west in archaeological compliance, lacking standardization between consulting firms,

governmental bodies, and regulatory agencies. In 2022, the Council of Texas Archeologists Standards and Guidelines Committee formed an ad-hoc subcommittee to address this issue, on which both authors serve. In the paper, we discuss some of the unique challenges posed by archaeological monitoring and the solutions we are proposing in Texas to help mitigate or minimize these challenges.

Sowing the Seeds for a Relational Archaeology: Building Relationships in Queer Inuit Communities as a Settler Archaeologist

Relationships form the foundation of every community archaeology project. By establishing relationships with communities whose cultural heritage is intertwined with the archaeological record, archaeologists not only ensure that their work is meaningful to all connected parties but also adhere to the ethical principles of accountability and public outreach outlined by the Society for American Archaeology. With the rise of heart-based practices, there has been an increased effort to analyze the effects that these relationships have on our research methods and our interpretations of the past. Yet, relationships between communities and researchers are often reflected on after a project has finished rather than analyzed throughout the research process. In my work with the Queer Inuit Pasts and Futures Archaeology Project in Nunatsiavut (Canadian Arctic), I have found that the relationships I have built with my community partners are not just an essential precursor to our research but are an ongoing component of our attempts to build connections between contemporary queer Inuit and the material culture created by their ancestors. Therefore, I will argue that, in a relational archaeology, there is no “relationship building” phase but a continued analysis of the connections that are formed between participants, researchers, ancestors, and descendants.

Chemehuevi Sites in the Western Mojave Desert in the Late Nineteenth Century: Continuation of Desert Adaptations by Chemehuevi Migrants in the Ranching Era

This presentation will discuss several sites in the southern Antelope Valley (western Mojave Desert) that were occupied in the late nineteenth century by Chemehuevi family groups. At one of these sites, a traditional circular structure—dwelling—dating from that era was photographed in the 1920s and salvaged in 1966. Recent research on the site and its environs has expanded our understanding of this occupation. These Chemehuevi family groups, following a traditional economic adaptation rather than attaching themselves to local ranching communities, were part of a many-decades-long movement of Chemehuevi/Southern Paiute from the Nevada-California border region southwestward across the Mojave and Colorado Deserts. The traditional ability of the Chemehuevi and Southern Paiute groups to successfully cope with extremely xeric conditions on the southern margin of the Great Basin made this remarkable historic-era migration possible. This remarkable adaptation to extreme desert conditions, among the most xeric in western North America, and the persistence of this adaptation near the end of the nineteenth century among migrant groups in the western Mojave Desert and the Antelope Valley is discussed.

Tombs as Evidence for Religious Diversity in the Late Prehispanic Sacred Valley, Peru (ca. 1000–1532 CE)

This paper articulates a novel approach to prehispanic Andean funerary architecture that interprets differences in materiality and temporality as evidence for distinct religious traditions. I analyze a sample of 845 tombs throughout the Sacred Valley, Peru, and adjacent tributary valleys, built and used during the Late Intermediate and Inka periods (ca. 1000–1532 CE). This sample, combining primary and published datasets, includes a wide variety of tomb structures that would have variably facilitated or impeded particular interactions and relationships between the living, the dead, and nonhuman agents. To understand this diversity, I develop a typology comprising seven tomb types, which display overlapping distribution at local and regional scales. In

contrast to studies that assumed general homogeneity and commonality in Indigenous Andean mortuary practices, this dataset attests to considerable diversity in belief and value systems over a 500-year period. As such, this study presents new interpretations of late prehispanic interment styles and funerary structures, considering that Indigenous Andeans across time and space have held divergent beliefs about life and death.

Vessels at War: The Kerr Archive and the Study of Classic Maya Violence

Rollout images of Maya vases and the database developed by Justin and Barbara Kerr allowed unfettered access to Classic Maya depictions of tribute, palace life, and mythic history. The Kerr Archive also brought into focus marching warriors and captured enemies, some of them sacrificed in polychronic detail. In this paper I examine how the Kerr Archive has enabled a better understanding of violent imagery through the lens of painted vases. I consider the iconography, style, and embodied experience of scenes of warfare, including its preparation and aftermath. I argue that painted scenes of warfare prioritize relational networks, complementing archaeological and sculptural approaches to the study of Maya war. Where possible, I consider the context of vessels depicting violent scenes, exploring how painted ceramics intersected with other forms of painting and sculpture to convey political, economic, and cultural narratives.

Surveillance and Intelligence Gathering in the Urartian and Assyrian Empires

By the Middle Bronze Age (ca. 2000–1600 BCE), two distinct fortified landscape styles had developed in western Asia: fortifications surrounding grand urban complexes and the “fortified regional network” (FRN), a rural, regional system comprising fortresses, forts, towers, and other structures situated along roads and river crossings. FRNs performed diverse roles including military communication via fire beacons, rest stops, route protection, and garrison housing. In the early first millennium BCE, surveillance and intelligence gathering were critical components of Urartian and Assyrian imperialism. The research investigates the Urartian Empire’s surveillance infrastructure, employing geographic information system (GIS) analysis to map and interpret archaeological features like watchtowers and fortifications. Mobilizing comparative material from Assyrian textual records and archaeological evidence, the paper sheds light on administrative structures, espionage practices, and the roles of surveillance and intelligence in maintaining order and empire building. Ultimately, the Neo-Assyrian Empire expanded on the FRN model, using fortified villages and towns—rather than forts—as hubs in their networks. Meanwhile, the Urartian Empire, located in mountainous terrain, employed FRNs for route control, information transmission, and traveler monitoring.

Necromagikon: Comparing Egyptian and Casas Grandes Archaeology

Death exists at the cornerstone of every culture. Each culture has death rituals through which humans seek to control the unknown. These rituals may focus on the event of dying and “crossing over” as dictated by each culture, but also include the role the dead might play even after their bodily death. Archaeologists have focused on mortuary ritual, but the magical practices surrounding death and the dead are less heavily studied. We have coined the term necromagikon, meaning death magic, to refer to magic practices involving death,

and the dead. This term brings into focus the ways the living can interact with the dead with sacra that include associated myths, magic, and artifacts to complete specific rituals. Our categories include the intent of the practitioner (e.g., controlling demons with magic wands, reanimating human remains to help the recently deceased) and subcategories that include the desired effects of these rituals (e.g., allowing the dead to pass on). We present two case studies from Middle Kingdom Egypt (2055–1650 BC) and the Medio period (AD 1200–1450) Casas Grandes of the Greater Southwest to illustrate the utility of our model.

Radiocarbon Dates and a Proposed Cultural Chronology for Little John (KdVo-6), a Multicomponent Site in Eastern Beringia, Yukon Territory, Canada

The Little John site (Borden #KdVo-6) holds a sequential record of human occupation from the Allerød through to the present day, including early and later expressions of the Chindadn complex, the Denali complex, the Northern Archaic tradition, the Late Prehistoric/Dene, the Contact Transitional of the nineteenth and early twentieth centuries, and the more recent post-Alaska Highway historic periods. The earliest Occupation period (East Lobe LJ OP I-a, ca. 14.5–13.8 Kya) is chronologically equivalent to Holme's Swan Point Diuktai but technologically ambiguous, dominated by expedient retouched split pebbles, flakes, and flake cores, undiagnostic biface fragments, split cobble choppers, hammerstones, and debitage. East Lobe LJ OP I-b (ca. 13.4– is definitively of the Chindadn Complex, based on directly associated dates to three Chindadn points. Additional undated Chindadn bifaces and associated lithics of the deflated West Lobe basal loess stratum are either formed tools exclusive to OP I-b (Hypothesis 1) or perhaps a mixed Allerød assemblage related to both OP I-a and OP I-b (Hypothesis 2). This poster will present accumulated raw and calibrated radiocarbon dates, stratigraphic and areal distribution across the site, and correlation with other regional sites on the Yukon-Alaska borderlands.

Rising from the East: The Preclassic Foundations of Lowland Maya Societies in Belize

The Preclassic period (1200/1100 BC–AD 300) represents one of the most significant cultural transitions for lowland Maya societies. Over the course of ~1,500 years, communities settled permanently on the landscape, committed to agriculture, and began building monumental constructions. By the end of this era, most people

lived in highly stratified societies, and large cities dominated the social and political landscape. Though evidence for Preclassic occupation is rare in the Maya lowlands, over a century of archaeological research in Belize has provided one of the richest records of the Preclassic Maya and their lifeways. Research in western and northern Belize was among the first to document pre-Mamón occupation in the lowlands, confirmed by robust programs of ceramic analyses and radiocarbon dating. Pioneering studies on the production of chert, obsidian, greenstone, and marine shell craft production have also illuminated our understanding of Preclassic interregional economic interaction. Extensive excavations across Belize also illustrate the precocious use of Preclassic architecture by emergent elites, with subsequent monumental buildings reflecting the rise of divine kingship and importance of ancestor veneration. We review these important contributions, which allow us to compare Preclassic cultural development across Belize and to understand these developments elsewhere in the Preclassic Maya world.

Nineteenth-Century New Orleans in the Lower Mid-City Neighborhood

TRC, on behalf of the Louisiana Office of Facility Planning and Control, recently completed the Section 106 consultation associated with the multiyear investigations of the new Medical Center of Louisiana at New Orleans. This new hospital project, which was a FEMA-funded recovery project resulting from damage to the old Charity Hospital during Hurricane Katrina, led to the archaeological examination of 14 city squares in the Lower Mid-City neighborhood of New Orleans. While TRC did not complete the excavations, we were responsible for limited data analysis and report writing. This paper will summarize those efforts and examine nineteenth and early twentieth-century lifeways in this once vibrant neighborhood.

Espacios subterráneos en Yaxchilán: Las cuevas como elementos modeladores del paisaje constructivo

A lo largo de tres temporadas de campo el “Proyecto Investigación Arqueológica en Yaxchilán y su entorno. Área del Meandro en el Usumacinta”, se ha centrado en realizar el reconocimiento de superficie de toda el meandro sobre la que se asienta Yaxchilán. Como parte de este proyecto, se detectaron alrededor de 20 pequeñas cuevas con materiales arqueológicos. Varias de éstas tienen asociados algunos de los conjuntos arquitectónicos más relevantes del sitio, tal como la Pequeña Acrópolis o la Acrópolis Sur. El propósito de la presente ponencia es mostrar la ubicación de dichos parajes, sus características y evidencias arqueológicas asociadas, así como su relación con los monumentos arquitectónicos de Yaxchilán y algunas canteras. Es así que podremos comenzar a delinear algunas hipótesis sobre la configuración del paisaje construido y en el papel activo de dichos espacios subterráneos dentro de la actividad ritual del sitio, en vista de que las cuevas con evidencia de actividad humana se ha detectado más allá del área monumental. Todo ello teniendo en cuenta las asociaciones simbólicas de dichas cavidades las cuales forman parte importante del paisaje ritual como portales al inframundo.

No Source, No Problem: Evaluating Connectedness from Geochemical Analysis of Pottery with a New Python Tool

Compositional analysis techniques, such as laser ablation–inductively coupled plasma–mass spectrometry (LA-

ICP-MS) in combination with petrographic analysis, have been used to generate high-resolution comparison of clay sources, pottery, and pottery manufacture sites. Studies that utilize these methods provide strong evidence for intrasite interactions. This paper aims to lower the barrier to entry for researchers interested in the network analysis possibilities of chemical analysis. We present a new tool in Python called ArchyConnect that aids in the rapid analysis of compositional data and ease of collaboration. We also focus on a type of network analysis, connectedness, that simultaneously provides strong inferences about past interactions and is a more feasible supplement to provenance studies. Connectedness allows us to see useful information from pottery assemblages even when the geographic location of the source of clay or temper is unknown. It also provides a strong framework for diachronic network analysis across sites. We believe that these two innovations vastly expand both the amount of useful ceramic data available to archaeologists, and the number of archaeologists who can contribute.

Diaguita Pottery, Technological Traditions, and Changes during the Late Intermediate and Late Periods: A Petrographical and Chemical Approach

Studies of Diaguita pottery have advanced toward the definition of decorative styles. In this regard, new studies and radiocarbon dating from the El Olivar archaeological site have significantly contributed to a new understanding of pottery traditions and chronological assignments of ceramic styles. The purpose of this work is to explore pottery traditions and their changes from a technological perspective that allows us to delve into the relationship between production practices and the formation of cultural entities. Specifically, we seek to approach technological traditions and their possible changes through the study of technological choices, especially the selection of raw materials and the formulation of paste recipes, using an archaeometric perspective. In this work, we combine petrographic analysis with neutron activation analysis of ceramics from the El Olivar site in Coquimbo, Chile. The results indicate that raw materials were acquired locally and pottery production occurred under two different technological traditions characterized by the temper selection (diorites and volcanic rocks respectively). Additionally, the chemical results show some variability, which may imply the use of different clay sources, possibly indicating different production groups.

El cacicazgo en la experiencia de los Caranquis-Cayambis en la Sierra y en Daule, costa del Ecuador: Una aproximación desde la etnohistoria y la arqueología

En la sierra norte del Ecuador, la cosmovisión andina, la geografía con su mosaico de nichos ecológicos, diversidad de recursos, y la necesidad de una seguridad social y alimentaria, exigió un sistema de gobierno práctico y muy visible, para resolver los problemas ecológicos y de adaptación y lograr que la población se prolongue en el tiempo. Para entender este proceso es oportuno plantearse una serie de interrogantes: ¿cómo se logró mantener el derecho de pertenencia al grupo y cuáles fueron los medios empleados para indicar afiliación o exclusión? ¿Cuáles fueron las funciones desempeñadas por los sacerdotes o chamanes? ¿Las fiestas colectivas fueron una manera social de ratificar la pertenencia a un determinado cacicazgo? Desde la interacción “con los de afuera”, ¿qué rol jugaron las sociedades vecinas y diversas, al respetar las identidades diversas? ¿El cacicazgo fue hereditario? ¿Los cacicazgos fueron formas de gobierno despótico, aceptados libremente por una población que se acostumbró a obedecer bajo un simple cálculo de costo-beneficio? ¿Esta forma de gobierno fue una construcción propia o hay influencia de las poblaciones barbaocas que llegaron al territorio de lo que hoy es Ecuador?

Petrographic and Lead-Isotope Analysis of Pottery from Goat Spring Pueblo, New Mexico

Research at Goat Spring Pueblo, a village located in the Rio Abajo region of south-central New Mexico, examines cultural continuity and transformation in the late Ancestral Pueblo period (AD 1300–1680). This poster reports data concerning local versus nonlocal pottery production and vessel exchange at Goat Spring Pueblo, which was located at the border between Zuni and Piro lands. These analyses demonstrate that the clay used to make both undecorated and decorated pottery originated from rhyolite rock outcrops in the area. Not surprisingly, given the village's location along a trail that connected Western and Eastern Pueblo villages, nonlocal pottery recovered at the village was produced at contemporary Pueblo villages in a variety of other regions. In addition, the lead used to make paint on local glaze-painted wares was not coming from the sources near Goat Spring Pueblo but rather from over 100 miles away to the east. Overall, our results show that potters at Goat Spring Pueblo who were actively making vessels for a variety of functions, and that residents of Goat Spring Pueblo were participating in broader Rio Grande exchange networks through time, in part to gain access to some resources required to produce glaze paint.

Made in Vermont: Highlighting the Rich and Complex History of the Vermont Marble Company through 3D Imaging
Vermont has a rich and deep historical connection to the marble industry of the nineteenth and twentieth centuries. Virtually synonymous with this legacy is the Vermont Marble Company (VMC), headquartered in Proctor Vermont. As one of the largest producers of marble in the world, VMC marble was used in constructing the United States Supreme Court building in Washington, DC, and master sculptors and quarry workers from around the world moved to Vermont to work for the company. In this poster we share the use of 3D imaging by the Vermont State University-Castleton Innovation lab to help bring the history of the VMC to life. A variety of significant artifacts and items representing the history of the company have been scanned, including the tools and models used by artisan carvers, as well as the billy clubs used by strikers and strike breakers during periods of labor unrest. Through the use of 3D imaging technology, the detailed history of the Vermont Marble Company can be better preserved and shared with the general public, allowing for a broader visibility and a renewed appreciation for the rich and complex history of the marble industry in Vermont.

Updated Demographic Profile of a Commingled Assemblage from Durango, Mexico

The cave site EDR 9-7 is located in the Rio Zape Valley of Durango, Mexico, within a transitional region between Mesoamerica and the American Southwest. EDR 9-7 can answer questions about environmental variation and cultural resiliency due to its initial use as a mortuary feature during a period of environmental stress, as well as its long-term repeated occupational history by the Loma San Gabriel (AD 600–1450). Previous research at this site has focused on intentional nonadult burials with evidence of stress and malnutrition and implications of ritualized sacrifice. The commingled assemblage associated with these burials has never been analyzed and has the potential to offer new insights into the community that repeatedly

returned to the cave. Analysis of the minimum number of individuals (MNI) reveals that individuals were deposited in the cave after the initial ritual event regardless of age or sex. The commingled assemblage also shows evidence of malnutrition and infection, indicating continued physiological stress in the region. The demographic profile based on the MNI identifies those who were most at risk for physiological stressors during times of environmental variability as well as who was included in this sacred mortuary space.

[265]

A Phylogenetic Approach to Analyzing Lithic Stone Tool Morphology in Southern British Columbia

As one of the most significant hydrological systems in British Columbia, the Fraser River drainage basin holds sociocultural and economic significance both presently and in the past. Archaeologically, sites located within the vicinity of the Fraser River exhibit evidence of extensive trade and social networks between cultural groups from as far north as present-day Prince George where the river flows south through the center of the province before eventually reaching the present-day coastline of Vancouver. Can the history of lithic technological variation along this route be detected using a phylogenetic analysis? Given the abundance of archaeological evidence for trade and social networks in this area, a macroevolutionary approach to understanding artifact assemblages should give indication of the timing and process of cultural transmissions. Using phylogenetic methods, this study will test three hypotheses regarding the evolutionary history of tool morphologies in consideration of the geographic distribution of sites and the timing and nature of stylistic changes along the southern portion of the Fraser River watershed.

From McLoughlin and Mills to Ikanum and Inclusion: Broadening the Understanding of tumwata (Oregon City) History through Indigenous Historiography

Emergent Indigenous place theories are developing effective “gaps analyses” of archaeological and historical datasets caused by the social contexts in which existing dominant culture narratives have been written, interpreted, and projected. Archaeological and historical methodologies for researching and re-centering the stories of historically excluded communities are less well developed. In this paper, we present a decolonizing approach and application to historical and archaeological data as developed by the Tribal Historic Preservation Office of the Confederated Tribes of Grand Ronde. Grand Ronde’s understanding of significant places is necessarily “verbed”—that is, centered in practices that are continuously enacted by people of/in that place since time immemorial. Ikanum (traditional stories) and oral histories are the framework for understanding these relationships, both during the millennia of indigenous lifeways and during the last two centuries of Euro-American encroachment and colonization. Using tumwata (Oregon City) as a case study, we outline changes and continuities in practices such as working, meeting, hosting, and exchanging across different periods of history. Emphasizing practice helps amplify and center narratives of those people and communities “hidden in plain sight,” resulting in expanded narratives, richer contexts, and more complete and accurate understanding of place in a manner accessible to all.

Foraging for Answers: A Preliminary Analysis of Contemporary Central African Forest Forager Diets via Stable Isotopic Analysis

Stable isotopic analysis is commonly used to assess dietary patterns among prehistoric hunter-gatherers. However, although the use of this method is prolific in archaeological contexts, its application in contemporary settings is minimal. In addition, an approach that can provide more accurate assessment of what individuals actually consume, such as stable isotopic analysis, is warranted. An ongoing ethnoarchaeological project among contemporary Central African forest foragers aims to fill this gap in the literature and provide critical insight into their dietary patterns via stable isotopic analysis of carbon, nitrogen, and sulfur from hair—a quantitative, independent measure of diet. This project presents an initial look of Bofi and Aka forest forager women, men, and children's diets reflecting dry season consumption behavior. The results of this project provides critical insight into Bofi and Aka forager dietary patterns across the entire population, allowing us to understand their dry season isotopic signature patterns for future comparison against wet season data, as well as an initial evaluation into whether significant dietary differences exist between different portions of the population (i.e., women vs. men). These results also provide an important reference to better understand prehistoric forager dietary patterns.

Houses to Villages: Exploring Late Precontact Communities in the Great Lakes Region

Structures, especially houses, are focal locations, acting as a venue for a myriad of social actions. Analyzing the size, shape, orientation, and context of houses individually and as a group allows for multiscale interpretations of past communities. This paper explores variation and organization of structures at a series of Late Precontact (ca. AD 1100–1400) village sites in the western Great Lakes region. Specifically, the paper will investigate variation within and among village sites to explore its implications for function, village organization, and community dynamics.

Bronze and Iron Age Urban Ecology in the Galilee

Micromammal remains have proven to be successful proxies for conducting zooarchaeological research and reconstructing paleoenvironmental conditions in the Levant. Their success as a paleoecological proxy is due to their sensitivity to climatic change, specific ecological niche, and low rate of human interaction. While there is abundant research on micromammals from prehistoric periods of the Levant, little research has been done using micromammals as environmental proxies in historical periods which are most often represented by urban environments. These areas are crucial for understanding human social organization and humanity's impact on local ecosystems. To address these gaps, we sourced micromammal remains of individuals weighing less than 3 kg primarily from Bronze and Iron age sites located in northern Galilee. Using community structure, biogeochemistry, geometric morphometrics, and taphonomy, we reconstructed the ecology of the historic urban environment and the level and impact of human occupation on the local micromammal ecosystems.

Eeckhout, Peter and Lawrence Owens (University of Winchester, UK)**[212]***Sacrifices, Retainers, or Disposal? The Social Roles of Ychsma Children from Funeral Contexts at the Site of Pachacamac*

The excavation of numerous subadult burials from late prehispanic contexts at Pachacamac led us to question the archaeological and anthropological criteria used to identify human sacrifice. Identifying this practice requires a robust conceptual framework and analytical approach, and this is particularly necessary when dealing with subadults. The frequent association of subadults with adult burials or in unusual locations or positions raises the question of retainer burials, as well as the manner in which nonnormative subadult interments should be perceived: namely, differentiating between reverence, pragmatism, and indifference. These questions are addressed by drawing on a corpus of several hundred individuals from Pachacamac, Peruvian Central Coast, spanning five centuries of occupation at the site.

Food is more than simply fuel; it is one of the most significant ways in which humans connect with each other, within and across communities, and to their environments and homelands. This research is grounded at t̄əmt̄ə́míx̄w̄t̄ə́n, a large ancestral village site in what is now known as Burrard Inlet, British Columbia, Canada, in the traditional, ancestral, and unceded territory of Tsleil-Waututh Nation. We draw on the archaeological record, Tsleil-Waututh oral histories and testimony, fisheries ecology, and historical records to build an estimated ancestral diet. We estimate the maximum carrying capacity of Burrard Inlet before European contact, meaning the number of people the Inlet could sustain over generations without causing environmental or species degradation. Based on prior work, we assume a high protein diet that is primarily (90%–100%) from marine and intertidal sources. We consider the caloric needs of adults, children, elders, and those who are pregnant or lactating. Finally, we consider the variation in the edible yield from different animal species, and their relationships in the food web. We use a precontact model of the Inlet, built using fisheries modeling software Ecopath (EwE), to test the diet and determine if it would have been sustainable over the long term. Egan, Rachel, Shaun Rose and Jared Orsi (Colorado State University)**[206]***The Home and the Hearth: Reconstructing Race and Ethnicity at the Starkville Mine and Town*

The southern coalfield in Colorado played a significant role in the growth of the American steel industry in the late nineteenth and early twentieth centuries. With the availability of bituminous coal, which can be refined into coke, the region became a key producer of high-grade coal, with Starkville Mine emerging as a major player. The mine and its associated town were instrumental in shaping the social and cultural fabric of the coal-mining industry in the American West, thanks to the Colorado Fuel and Iron Company's (CF&I) Sociological Department. This department implemented various programs to promote unity and downplay racial and ethnic differences while bringing in a diverse and cheap workforce. However, despite the efforts to standardize their way of living, the people of Starkville demonstrated remarkable agency, asserting their own decisions and influencing their own lives, as best illustrated continued of traditional Mexicano practices in the

home and the hearth. This paper explores the complex interplay between dominant forces and individual agency in the coal-mining industry of the American West

Settlement Persistence in Northwestern Mongolia: Archaeological and Paleoenvironmental Insights from the Long-Term Occupation Site ZK513

The Mongolian Bronze Age (2500–700 BCE) was a period of greater social interaction and important transformations (e.g., the adoption of domestic livestock herding and intensification to widespread mobile, mounted pastoralism) that prompted social inequality and the formation of the first nomadic states. What is known today from past Mongolian pastoral societies comes primarily from studying highly visible features such as funerary monuments and rock art. However, little is known about the archaeological evidence preserved in their daily contexts. Recently, the excavations at ZK513 winter campsite in Uvs aimag have revealed clear-cut stratigraphic layers originating from recurrent use of the locality for over 4,000 years, with new excavated combustion features and burnt layers containing organic remains such as herbivore dung and bones. Through a multiproxy approach that includes soil micromorphology, zooarchaeology, and lipid biomarkers analyses, we retrieved the micro, macro, and biomolecular signatures left in ZK513 by the recurrent occupation of nomadic pastoralists and their livestock. The integration of distinct but complementary proxies allows us to investigate shifting environmental conditions, anthropic activities, as well as continuities and discontinuities in the occupation. We finally discuss how our combined approach could be applied to other mobile pastoral archaeological contexts in Mongolia and elsewhere.

x^{wiq}wix^{walq}wu? - Coast Salish Community-Based Participatory Archaeology in Practice

The *x^{wiq}wix^{walq}wu?* project is a partnership between the Stillaguamish Tribe Cultural Resources Department and the Department of Anthropology at Western Washington University designed to reorient archaeological practice to address the concerns of Indigenous communities. Implementing a community-based participatory framework, the program seeks to decenter Western academic interests and create a meaningful connection between the Coast Salish past and present that foregrounds the knowledge, experiences, and values of community members. Instead of academic research questions, the goals of the first phase of this program focused on relationship-building and generation of more inclusive pathways to participation in archaeological practice. This presentation outlines the successes and challenges we encountered during the first two field seasons of the program, as well as areas of emphasis for future collaboration. Further, this paper identifies structures within academia that serve as impediments to institutional change and potential pathways to overcome these challenges.

[23]

Exploring Bronze Age Mongolian Monuments with Geophysical Methodologies

For mobile pastoralists, monuments are places of permanence and stability in a landscape inhabited and perceived through movement. It is within these monumental spaces that dispersed peoples gather as a community, and through secular and ritual activities, organize and reaffirm social bonds and institutions, and maintain wider community connections. These dynamics have been an important scholarly focus within anthropological archaeology in many regions of the world. In recent years, there has been an increasing interest and debate in the connection between complex monument construction and deep structural shifts in the social organization of pastoral nomads in Mongolia during the Bronze Age (1800–800 BCE). This presentation will investigate this through the implementation of multiple complimentary geophysical techniques, including fluxgate gradiometry and magnetic susceptibility, at two khirigsuur monumental complexes in Tarvagatai Valley in north-central Mongolia. This innovative research design utilizes novel field methodologies that are nonintrusive and allow archaeologists to analyze the spatial patterning of these spaces in finer detail at a larger scale. This analysis of these spaces creates a more nuanced understanding of the deep relationships between these culturally anchored landscapes and their intrinsically linked communities as we recover further evidence for the locationality of past activities.

Heritage Management in Nunatsiavut: Policy in Action

The heritage landscape in Nunatsiavut, and in the north more generally, is changing rapidly and in ways that demand changes in how we approach heritage management. Nunatsiavut holds 7,000 years of human history, and the importance of protecting and promoting this history is attested to in the Labrador Inuit Land Claims Agreement, which confers considerable authority, but also considerable flexibility, over archaeological and cultural resources. The Nunatsiavut Government is relatively young, and heritage policy is still being written. Recent developments and significant changes in the fields of archaeology, collections management, and repatriation have been guiding our recent policy work. We discuss how we are striving to build heritage policies that are robust enough to encompass the full breadth of the Nunatsiavut Government's legislated authority, but also flexible and resilient enough to respond to the logistical challenges common to many remote northern communities.

Cast Your Nets: The Island Economy and Ecology of Gotland within the Larger Viking World

In recent decades, more archaeological scholarships have been dedicated to understanding the types of exchanges that were occurring in the Viking world in the early Medieval period. Particularly, Gotland remains one of the key trading centers regarding smithed exported silver. Looking broadly at Gotland and its relations to other periphery sites, such as Grobina in present-day Latvia and Salme in present-day Estonia, how was Gotland's trade influenced by its island geography and ecology? My research aims to look at the ways Gotland's success in the Viking network derived from maintaining larger trading networks to other periphery sites, by comparing it to other island economies within the period.

[89]

The Making of the 1928 Hurricane Victims 1 and 2: Excavating Identity in an Unknowable Legacy Collection

In traditional bioarchaeological practice, the first scientific identities fixed to skeletal remains are the labels given to them when they are excavated. From there, the basic information about the remains is built from those first identifying features associated with the site. But what happens if the remains are encountered for the first time long after that process, when the meaning of those first identifiers is lost? How can we rectify an identity that is absent any context, yet permanently inked on cardboard? This case study will examine the two commingled skeletal individuals labeled 1928 Hurricane Victims 1 and 2 Belle Glade, first encountered in the storage space at Florida Atlantic University by the presenter in 2016. There is no paper trail for these individuals, and skeletal preservation is extremely poor. Thus, the only way of “knowing” these individuals is through the markings on the Motts Apple Cider boxes in which they were found. How do our research projects change when these assumed, but unprovable, identities drive the questions that are being asked? The 1928 Hurricane Victims 1 and 2 illustrate both the limits of bioarchaeology and also the power of scientific naming processes to structure entire programs of research.

Transforming Policy and Museum Practices: Decolonizing Frameworks and UNDRIP in Canada

The Canadian Museum of History, a national collecting institution dating back to the mid-1980s, has undergone many transformations throughout its history, including to its name, mandate, and location. This presentation will outline how community collaboration and collections access has transformed in response to changing ethical, legal and policy frameworks at Museum and in Canada. While the Museum has a 50-year history of collaboration with communities and repatriation, it continues to grapple with the implications of its 150-year legacy and the colonialism embedded in its collecting practices. Recent policy transformations will be shared to show how the museum is working to incorporate decolonizing frameworks into its day-to-day operations. This work goes beyond a repatriation policy and legal obligations, to a reconsideration of the way that research, collections access, collections management, and programming is developed. It will show how the interconnected work of policy, strategic direction, and changes in the national governance of Indigenous cultural heritage (Bill C-15, UNDRIP and the Truth and Reconciliation Commission) are shaping museum practices in the present and for the future.

Trajectories of Zooarchaeological Research across Central America: The Influences and Interests of Richard Cooke
 Archaeological research in Central America is often seen as quite disparate between the northern regions of Mesoamerica (primarily Mexico, Guatemala, Belize, and northwestern portions of Honduras and El Salvador) and the more southerly Intermediate Area (including Honduras, El Salvador, Nicaragua, Costa Rica, and Panama). Zooarchaeology, however, has taken a slightly different path. Through researchers like Dr. Richard Cooke with his wide-ranging interests and international network of colleagues, particularly across the Americas, zooarchaeologists have had considerable success collaborating and sharing ideas between research zones. In this paper we use publications and archival records from the Smithsonian Tropical Research Institute (Panama) and Florida Museum of Natural History at the University of Florida, as well as our own personal history of zooarchaeological research with Richard in the various regions of Central America, to explore the issues of mutual interest across the broad region. We include perspectives on fish, turkeys, macaws, dogs, deer, and examine the use of animals as food, artifacts, symbols, and the impacts of humans on animals through landscape modification, exploitation, and husbandry.

Analyzing Stone Fish Net Sinkers in the North Coast of Peru: Inquiring its Functional and Symbolic Aspects
 Maritime communities flourished along the northern coast of Peru for thousands of years due to the abundance of marine life, which inspired these communities to create specialized tools to aid in the fishing process. One of these tools was cotton fishing nets of which the attached stone sinkers are more commonly found in midden deposits. This study analyzes the variability of the fish net sinkers from two sites in Huanchaco, Peru: Pampa La Cruz, and Jose Olaya, Iglesia Colonial. Additionally, this study will compare the differences in stone net sinkers between cultural occupations spanning over centuries starting with the earliest of the Salinar occupation (400–200 BC), the Virú (BC 100–AD 450/500), and the Moche (AD 450/500–800/850). By analyzing the similarities and differences between the fishnet sinkers, one can infer the types of fishing nets used by maritime communities and their subsistence and social implications. In addition, fishnet sinkers found in ceremonial contexts had evidence of being intentionally broken in half, showing that they were possibly part of elaborate rituals. Studying these lithics gives insight into the integral nature of fishing in people's daily lives and the ceremonial practices that occurred in these Andean maritime communities.

Engelbert, Lynne**[329]***Approaching Extensive Damage at Historic Cemeteries Using Canine Detectors*

Historic cemeteries do not “age” well. Many factors contribute to the degradation of cemeteries. The constant shifting of soil, rodents, vegetation, vandalism, and now we are facing an even bigger threat with climate change, including floods, fires earthquakes, mud slides, hurricanes, etc. How do we approach burials that have been lost or damaged over time? The specially trained dogs with the Institute for Canine Forensics (ICF) are one of the few ways to locate lost burials in a noninvasive manner. For close to 25 years, ICF has been working with archaeologists, tribal entities, state and federal park services, and cultural resource management to help locate historic and precontact burials so they can be protected. ICF’s dogs bring another “layer” to archaeology. Dogs can access sites that cannot be explored by other means. They are the only “tool” that can locate the scent of human remains. A recent project at the Vicksburg National Cemetery is a case-in-point. A landslide obliterated a section of the cemetery. Remediation couldn’t begin until the number of graves impacted could be determined. Bring in the dogs! The National Park Service did that and the results allowed successful remediation to begin.

Ennahid, Said (Al Akhawayn University) and Néjat Brahmi (École Normale Supérieure)**[95]***Sharifian Letters: Conducting Archaeology in Pre-Protectorate Morocco (1884–1891)*

One of the recurrent themes of French colonial period discourse on conducting archaeology in Morocco was the belief that the state and the people had little or no interest in their pre-Islamic past or its material correlates. To explore and deconstruct this theme, we will examine a set of never-before-published archives consisting of eight firmans (also called Sharifian Letters), which were royal authorizations from Sultan Moulay Hassan I allowing Henry Poisson de la Martinière to conduct his scientific expedition to Morocco (1884–1891). This paper will consist of (1) a close analysis of these Sharifian Letters in terms of content (e.g., the terms used for archaeology, excavation, artifacts, to mention a few) and form, and (2) a close analysis of Henry de la Martinière’s correspondence with his contemporaries as they viewed themselves as the rightful heirs to Rome. As Ennahid stated elsewhere, “Archaeology was to serve as a powerful tool to establish a material connection between the old colonizer and the new one, and, consequently, to legitimize the Protectorate’s appropriation of Morocco’s classical heritage.” Preliminary analysis of the firmans’ language shows a genuine concern, within the royal court of Morocco, for the preservation of the country’s archaeological heritage.

Enriquez, Alejandro (Illinois State University)**[21]***Human Sacrifice or Blood Libel: Accusations of the Ritual Killing of Maya Children in 1562 Yucatán*

This presentation examines the 1562 confessions of Maya ritual murder (“Procesos contra los indios idólatras de Sotuta, . . .” [“Processes against the idolatrous Indians of Sotuta, . . .”]) obtained during the Idolatry Trials led by Friar Diego de Landa in colonial Yucatán. Through an analysis of their context of production, their constitutive elements, and their comparison to other European, Christian anti-Semitic tales, I argue that the confessions of Maya blasphemous crucifixion and human sacrifice are better understood as Franciscan blood libel and ritual murder propaganda against the Maya elites. As someone trained in medieval and early modern literature and cultural studies, I am interested in engaging in cross-disciplinary conversations about the evidence of Maya human sacrifice after the conquest and suggest how interdisciplinarity can be mutually enriching, particularly when dealing with the serious suggestion that the Maya sacrificed their most vulnerable (orphaned or kidnapped youth) to offend the absent friar and the church he represented.

Eppich, Keith (TJC- The College of East Texas)**[314]***Modeling the Social Demography of a Classic Maya City-State, the Case of El Perú-Waka’, Guatemala*

This paper attempts to model Classic Maya society and social dynamics, as expressed at the ancient city-state of El Perú-Waka, Guatemala. Large-scale ceramic analysis, combined with traditional excavation and an ambitious test-pitting program, allow for novel perspectives on the internal functioning of this complex Native American society. The urban society there is characterized by social heterogeneity, with different kinds of social units operating at the time period. These units include noble houses, patrilineages, wealthy commoners, and still others, all present on a socially diverse landscape. Yet, these units changed over time, as shifting historical circumstances favored some modes of social organization over others. This becomes apparent in the archaeological record, especially with newly developed ceramic seriation techniques, which allow for close chronological control of such changes. The composition of the ancient society changed over time, and the ceramics allow for the partial documentation of such change. Thus, at least partially, they allow for the modeling of the social demography of this Classic Maya city-state.

Understanding Animal-Human Interactions during the LIP in the Central Coast of Peru

In recent decades, zooarchaeological studies have been increasing in South America. Nevertheless, combining the methods used to understand some questions related to animal and human interactions in ancient Peru seems crucial. In this paper, we will present the first results of an ongoing multidisciplinary project focused on the central coast of Peru during the Late Intermediate period. A study of the faunal material found at Pachacamac by the Ychsma Project (ULB) shows a distinct use of domestic and wild animals in diet and ritual. The disciplines (archaeology, zooarchaeology, ethnohistory) used so far are insufficient to understand this in greater depth. Hence, iconography and myths are useful in approaching discoveries from new points of view. In the first case, we analyzed the animals represented, their frequency and any associations with other animals/elements. Initial results from the iconography of textiles show that wild animals are more frequently represented. In the case of the myths, we also found a greater presence of wild animals as the main protagonists. Finally, we feel it is necessary to provide a theoretical framework for this research to detach ourselves from a modern European vision and consider the multiple visions/practices of interactions between animals and humans.

Precious Objects and Kingship: A Closer Look at Precolumbian Classic Period Maya Artifacts, Located at the Godwin Ternbach Museum

Throughout thousands of years, various civilizations and groups have depicted their beliefs on objects and architecture. Maya rulers are an example in how architecture, extravagant costumes, jewelry, weaponry, and ceramics were used to emphasize their title as *ajaw*. *Ajaw*, the title for a ruler that represents the king's massive authority for their people and their relationship to bridge the supernatural and natural world together. The Godwin Ternbach museum, located within the Queens College campus, consists of various precolumbian Maya artifacts such as jade pectorals, jade beads, a ceramic vessel, eccentric flints, and a piercing tool. These artifacts depict various Maya mythologies, dynamics of kingship, and their form of storytelling. The project focuses on answering various questions (such as how? When? What? Why?) in regard to the artifacts while gaining experience in 3D scanning. 3D scanning has begun to advance and become affordable, where archaeologists can use their cellphones to retrieve their data. The scans also can be shared online, where the public and researchers can access without the requirement of visiting the artifacts in person. The paper discusses my findings, trial and errors, and solutions to 3D lidar and photogrammetry scanning apps. I hope to share my experience and provide guidance.

Erftenebeck, Hanna (University of Notre Dame)**[169]***Daily Food Practices and the Materiality of the Early Bronze Age Kitchen in the Southern Levant*

The Early Bronze Age (EB IB-III, 3300–2500 BCE) in the southern Levant is marked by significant social, political, and economic changes, as people aggregated into large, often fortified settlements for the first time in the region. These new sites differ in size, environmental setting, and in the degree of social differentiation and political organization. But were these differences reflected in the material record of people's day-to-day practices? Food production, storage, processing, and preparation were central parts of EB daily life, and many of these food-related practices took place within residential spaces. Using evidence from EB houses excavated at Numayra, Jordan and comparing those to residential contexts from other EB settlements in the Southern Levant, this paper investigates the "EB kitchen." I argue that, despite differences in size and social, political, and economic organization, the tools, installations, vessels, and features used for food related practices remained markedly similar in residential spaces at both large and smaller EB sites, suggesting that EB people shared a food habitus throughout the Southern Levant.

Erter, Isabella (Ohio State University), Robert Cook (Ohio State University) and Emiley Gottwald (Ohio State University)**[101]***Seeing is Believing: Re-creating the Past at Turpin with Virtual Reality*

Archaeologists are often good at communicating with each other, but not usually at conveying our findings to wider audiences. This seems particularly true in the US Midwest, where visibility of the remains of ancient sites is low, in contrast to places like the US Southwest. We address this problem by using Virtual Reality (VR) to share information about the precontact component of the Turpin site in southwest Ohio. Specifically, we are creating an immersive reconstruction of the site including the archaeological grid and a variety of maps, photos, and 3D objects that can be examined in their discovery context. This technology can make visible what the site contains with no damage to the resource and can also facilitate remote access to the site.

Escalante, Kirsty (Tulane University)**[226]***Repatriations of Maya Antiquities to Guatemala: Successes, Pitfalls, and Significant Factors*

While scholars have been concerned since the 1960s about the widespread looting of Maya sites to supply the international antiquities market, countless objects have been illicitly exported over the decades from Guatemala and surrounding countries. The repatriation of looted antiquities to their countries of origin has received increased attention as source countries request the return of their archaeological heritage and more objects are repatriated as a result. In addition, Memoranda of Understanding, international treaties, and changes to museum ethical codes and acquisition policies have led institutions and collectors to be more cautious about owning ancient art. Nevertheless, the return of illicit Maya antiquities to their source countries is a relatively recent phenomenon compared to the long history of looting in the area and has varying rates of success depending on an object's individual circumstances. As a result, minimal research exists regarding the variety of repatriation cases and the factors contributing to successful outcomes. By analyzing the return of looted Maya antiquities to the Guatemalan government and the mechanisms through which repatriations have been achieved, this paper aims to outline factors that may lead to successful returns of looted Maya objects in the future.

Eschbach, Krista (University of Mississippi)**[297]***Contrasting Commensality in Colonial Mesoamerica and the Borderlands East*

Native groups developed great diversity in food recipes, preparation techniques, and approaches to commensality. In some regions, such as in the Borderlands East, commensality tended toward communal-style serving vessels and related eating practices. Those practices contrasted with individual-style plates,

bowls, and cups that were used in regions of Mesoamerica. The arrival of European colonizers further added to and transformed regional vessel forms with their use of tables in the practice of commensality. The regional differences in Native traditions likely contributed to the varied adoption of Native serving vessels for the colonial table. I contrast major variations in traditions of commensality in colonial Mesoamerica and the Borderlands East. I then investigate those differences through the distribution of European-style tableware and Native serving vessels recovered from two distinct colonial contexts: the Port of Veracruz and the Presidios of northwest Florida.

Anthropologist in Exile: Navigating Loss and Pursuing Justice

Making space for us to love archaeology in its prismatic wholeness is John Pohl's greatest contribution to the field. We first met when I was an undergraduate taking his course on precolumbian art and archaeology of Mexico. He was my only college professor who encouraged me to connect archaeology with my own family history, and who created academic opportunities for me to interrogate how and why such a project mattered today. He supported my applications to graduate school and offered solidarity as I witnessed and endured gendered violence, racism, betrayal, apathy, complicity, and injustice while pursuing my PhD. Although I earned my degree, I honored my trauma and left after graduation to become a lawyer. For the past 17 years, Professor Pohl has been a consistent presence in my memory when I recall what I love most about anthropological archaeology. This paper is in honor of those of us who will always be anthropologists but who love and engage with anthropology from afar: as anthropologists in exile, pursuing justice within the profession as only the forgotten can.

Taiy Tsadlh (Six Mile Hill) Site Evaluations

Taiy Tsadlh or Six Mile Hill has been used since prehistoric times for a variety of activities, ranging from recreation, a military fuel terminal, ceremony, subsistence, and game spotting. Archaeological investigations have revealed six extensive prehistoric sites further documenting the rich history of the area. Lithic artifacts and tools, as well as faunal remains, have expanded our understanding of prehistoric hunting and gathering subsistence activities. Data derived from these sites regarding lithic raw material acquisition and trade, as well as lithic tool creation, maintenance, and use have contributed to broader patterns of landscape use in the area.

Weaving with Wichuñas in the Coastal Tiwanaku Diaspora: New Insights into Camelid Bone Tool Production from Los Batanes (Sama, Peru)

Textile production was a major economic sector in the prehispanic Tiwanaku state, for which weavers transformed camelid (llamas, alpacas) fibers and bones into utilitarian and decorative objects. As Tiwanaku pastoral communities dispersed in the wake of state collapse, they relocated to arid coastal regions where

their textile industry demonstrates continuity in textile traditions and technological innovations. Excavations of domestic middens at the coastal site of Los Batanes (Sama, Peru), occupied by Tiwanaku descendants in the twelfth century CE, revealed finished and unfinished camelid bone artifacts with morphological similarities to present-day weaving tools. These objects and their broader context provide insight into pastoral, bone tool, and textile production strategies of coastal camelid herders. Here, we present the results of macroscopic and microscopic analyses of the camelid bone tool assemblage from Los Batanes. The sitewide age-at-death profile of the camelid assemblage sets a baseline for evaluating culling practices related to fiber production and preferred ages for tool production. Fracture patterns from unfinished tools are indicators of production sequences, and use-wear patterns compared to ethnoarchaeological studies and bone tools recovered at the highland site of Tiwanaku will determine the artifacts' uses in textile production.

Section 106 and Fish Weirs: Recent Examples

A recent resurgence in fish weir research has revealed limitations in the NRHP evaluation of such sites. With few weirs having been directly dated, and with a general lack of excavation of associated processing sites, it is often difficult to define the chronological context needed for a proper evaluation. In addition, as Section 106 areas of potential effect generally stop at the river's edge, there are few professionally recorded fish weirs for comparative purposes. Examples from recent projects in North Carolina and Maryland are discussed.

Inspiration from Beyond the Border or Innovation from Within? Reconsidering the Paracas-Nasca Transition on the Peruvian South Coast

During the final centuries of the Early Horizon (~300–100 BCE), independent Paracas communities across multiple valleys on the Peruvian south coast began an extended process of social, cultural, political, and religious transformation. These changes ultimately culminated with the development of the Nasca cult centered at Cahuachi. The profound changes associated with the Paracas-Nasca transition have often been attributed, at least in part, to the influence of the Topará tradition, long understood as a foreign group which intruded into the Paracas heartland from the north. We present excavation and radiocarbon dating of Jahuay, the earliest accepted Topará site, which contradict this long-held theory and invite us to reconsider how this period of major social transformation unfolded. Instead of looking for answers beyond the boundaries of Paracas communities, we propose turning our gaze inward to consider how competition between the supporters of emergent traditions across and within south coast valleys spurred innovation and transformation.

Changes and Continuities on Recent Past Human Occupations in Continental Southern Patagonia

Human occupation of the last centuries in continental southern Patagonia has been described as a stage in which a great variability of processes stand out, such as the arrival of allochthonous groups, the introduction of new resources such as horses, sheep and industrialized products, the emergence of stable settlements, along with the division of the landscape into livestock production units. All these changes and processes triggered organizational and technological adaptations in the local hunting populations, as well as forms of cattle occupation suitable to each environment. This stage has been approached archaeologically taking into account basins as spatial unit, describing the particularities of the changes and continuities in different locations. In this context, it is especially important to address the research on a larger spatial scale, which

considers global historical processes while highlighting local particularities. Thus, it is proposed to compare the current regions of middle west Santa Cruz (Argentina) and Aysén (Chile), with the aim of describing and understanding their historical trajectories and the current scenario.

Sobre “actores sociales”, “comunidad” y otros términos esquivos: Reflexiones desde el complejo arqueológico Mateo Salado, Lima, Perú

“Actores sociales”, “comunidad”, “arqueología comunitaria”, “patrimonio arqueológico” y otros términos que se aplican en la gestión de los sitios arqueológicos muchas veces fluctúan entre la ambigüedad o la relativización, o entre el esencialismo y el paternalismo. Las críticas que se les han hecho se han enfocado en cómo enmascaran o legitiman discursos de un poder ejercido verticalmente desde un sistema hegemónico. Pero se ha visto menos cómo su uso soslaya relaciones sociales contemporáneas diversas, cambiantes y contradictorias, las cuales son activadas por el objeto arqueológico. La ponencia plantea una discusión y reflexiones sobre estos términos desde la práctica, es decir desde la experiencia de gestión en Mateo Salado, un gran complejo arqueológico ubicado en medio de la actual ciudad de Lima, capital del Perú.

TULAR: Transculturality and Social Innovation in Proto-Etruscan Areas of Pre-Roman Italy

Human mobility has played a vital role in shaping societies, both in the past and present. From the circulation of people to the biocultural integration of individuals, these population dynamics have triggered fundamental transitions in our sociopolitical landscape. The early first millennium BC in Italy was marked by significant geopolitical changes involving extensive population nucleation, recognized as early forms of urbanization and traditionally associated with large movements of people. The TULAR (Etruscan for border) project delves into the question of how changes in human networks influenced the diverse cultural, social, and economic adaptations of ancient communities during the formative period of the Etruscan civilization. TULAR investigates the sites of Pontecagnano, Sala Consilina (Campania region), and Vulci (Latium region), integrating archaeological, osteological, and multi-isotope analysis. This paper compares the first set of data from previous research (Tarquinia, ninth century BC; Fermo, ninth–fifth centuries BC) with ongoing studies on human mobility and discusses them considering their archaeological contexts. ⁸⁷Sr/⁸⁶Sr results on human remains show a high proportion of nonlocal individuals. Future works will help us to unravel these population dynamics, providing a compelling reworking of our understanding of the European Iron Age and revising the traditional narrative of the Etruscan civilization.

Classic Maya Urbanism at Dzibanche Revealed by Airborne Lidar Mapping

Lidar survey of the city of Dzibanche reveals the city's settlement to be more extensive and populous than previously thought and consistent with its political reach as a hegemonic state. A closer look at the organization of public spaces within its center reveals architectural arrangements that appear to share many characteristics with Preclassic and Early Classic Petén centers. An extraordinarily well-developed system of causeways radiates out of the monumental zone to peripheral plaza groups revealing a vast network of political nodes and associated settlements forming a coherent and well-organized urban landscape interspersed with agricultural fields. The spatial organization and interconnectedness of these elite nodes and associated settlement suggests a concern with optimal flow of goods and people across a dense urban and peri-urban landscape seen only at a few other Maya centers. Lidar images also reveal the largest extensions of wetland agricultural fields ever recorded in the Maya Lowlands suggesting a portentous economic potential for Dzibanche, which may account for its ascent as political and economic superpower during the Classic period and its longevity as a settlement well into the Late Postclassic period.

Investigating Precontact Resource Conservation of Deer Populations in the San Francisco Bay Area

Mule deer were important resources for the Ancestral Ohlone populations in the California San Francisco Bay area. Researchers typically use artiodactyl abundance information derived from archaeological assemblages to understand past hunting and land use behavior. Building on previous models (diet breadth, costly signaling, climate change, and resource intensification) which use a single explanatory cause to explain the artiodactyl abundance, my research investigates how Ancestral Ohlone peoples hunted deer through the analysis of teeth collected from several sites mitigated through cultural resource management practices. Teeth provide a snapshot of each individual by recording information which is accessible through archaeometric methods: proteomics (estimate animal sex), wear patterns (estimate animal age), stable isotopes (e.g., diet, environment, life history, migration patterns, local or nonlocal), and dental cementum increment analysis (estimate animal age and season of death). I expect conservation, or the increase of deer remains to be represented by the differential culling of younger males, which would allow females to successfully reach maturity and produce offspring. The results of this study have potential wide-ranging implications for understanding prehistoric hunting, land-use practices, forensics, and has relevance to modern habitat restoration and species conservation studies by biologists and ecologists.

Geophysical Investigations of Submerged Landscapes: Results from the Northwestern Gulf of Mexico

The authors acquired parametric subbottom and conventional chirp subbottom data over potential submerged and buried landscapes features in the Northwestern Gulf of Mexico. The purpose of the study was twofold: to map out potential preserved features for geotechnical sampling and also to directly compare the efficacy of the two different technologies for subsurface mapping. This paper will summarize the methods used in developing the survey grids and present the results of the landscape mapping. The interpreted landscapes and seismic horizons, as presented in this paper, were used to select locations for sediment cores taken in the next stage of the project. The authors will also discuss the results of the comparison between the two sensors.

Forest Regrowth and the End of Upland Farming at Picuris: Evidence from Tree Rings

Kilometers of terraced rock alignments characterize the upland slopes of the Picuris Pueblo watershed, capturing rainfall runoff in a water-efficient method of irrigation to combat the aridity of the Southwest. The terraces' effective use of runoff rainfall and space supported the Pueblo's population growth and Plains-Pueblo trade during the fourteenth and fifteenth centuries. After agricultural production in the upland slopes ended, the terraces have supported the growth of dense juniper, pinon, and ponderosa forests. Through dendrochronological analysis of tree ring samples taken in the regrowth forests of the Picuris agricultural fields, we are studying the historical and climate impacts of the field systems. The end-date of upland farming, whether aligned with climate crisis or historical event, will shed light on the changing agricultural practices of Picuris Pueblo. Furthermore, climate and streamflow reconstructions using the tree-ring samples will quantify the positive impact of Picuris land management on the preservation and health of forests in an arid climate.

Doctrines of Discard in the Ịjẹ̀bù Kingdom: Social Stratigraphies of Refuse Mound Deposition in Southern Nigeria, AD 1400–1900

The Ịjẹ̀bù Kingdom (southern Nigeria) was for centuries involved in far-reaching trade networks—with the inland and coastal Yorùbá ílú (city-states), European merchants from various nations, and eventually the British Lagos Colony following its establishment in 1862. During this period, the Ịjẹ̀bù cultivated a reputation for insularity and isolationism, implementing policies restricting entry to the kingdom which relegated foreign merchants to hinterland market towns. Those entering the polity followed roads that were tightly regulated by tollgates and associated shrines to specific òrìṣà (deities), around which prosperous settlements would develop. This paper discusses archaeological research conducted at one such Ịjẹ̀bù tollgate village—Eredo (Lagos State)—that lay on an important trade road running from the coast to the Ịjẹ̀bù capital; and behind the 100-mile-long earthwork of Sungbo's Eredo. Through analysis of the stratigraphy of large discard mounds, it explores what the archaeological record informs us about Ịjẹ̀bù philosophies pertaining to accumulation, prestige, and ancestral continuity, and how these were materialized through practices of discard deposition. Moving away from ethnocentric understandings of discard as worthless refuse, it especially considers the relationships between discard amalgamation, land rights, ancestral power, and prosperity underpinning Ịjẹ̀bù society from the fifteenth to nineteenth centuries.

Legacies of the Códice de Cholula: An Ethnoarchaeology of the Valley of Puebla's Indigenous Landscape

Ethnoarchaeology is a critical methodology for analyzing prehispanic and early colonial codices. Drawing on the foundational work of John Pohl and Bruce Byland's *In the Realm of 8 Deer*, I discuss how ethnography can help decipher, contextualize, and bring to life Indigenous pictographic documents. My ethnoarchaeological fieldwork in Puebla, Mexico, has produced new insights into the sixteenth-century Códice de Cholula. Through interviews and participation in pilgrimages, I have located previously obscure locations, as well as elucidated the layout and cultural importance of the mountains, ravines, caves, and boundaries of the kingdom of Cholula. Importantly, ethnoarchaeology provides information on the continuity of Indigenous culture, such as the persisting social ties that pueblós still have to Cholula throughout the region. In

particular, the mountains mentioned on the Códice de Cholula remain crucial monuments for constructing ethnic identity and affiliation. I focus on two prominent hills, Ehecatepetl of San Jerónimo Caleras and Cerro Montero of San Antonio Mihaucán. These hills have been the sites of Indigenous agendas to assert their autonomy in the face of expropriation and privatization. Through ethnoarchaeology, I present a panoramic of the Cholultecan landscape as a space of resistance and resilience.

Geoarchaeological Approach to Resolving the Origins of Bison Bone Beds at Bonfire Shelter, 41VV218, Val Verde County, Texas

Bonfire Shelter is a large prehistoric rockshelter site situated at the northern end of Mile Canyon in southwest Texas. Early investigators determined the site to be the location of multiple bison jump events; however subsequent investigations have disputed this interpretation. My research focuses on answering the questions of whether the Paleoindian bone bed represents a bison jump event and if so, does it represent one or multiple events. Geoarchaeological methods including particle size analysis, magnetic susceptibility, and loss-on-ignition are providing insights in the formation processes of the site and as a result, insights into the origin and number of events represented within the Paleoindian bison bone bed. To date, research of this type has not been conducted to analyze the Paleoindian bone bed at Bonfire Shelter. This presentation will provide the completed results of my thesis research as well as the final interpretations of Bone Bed 2 at Bonfire Shelter.

Using ZooMS to Understand Hunting and Fishing in the Roman Mediterranean

Large-scale fishing of small fish in the Scombrid and Clupeid families as well as hunting of tunas was part of the economy in the Roman empire through the production of fermented fish sauces (including garum), pastes, and other fish products. These products were produced in various grades at large factories on the Mediterranean and exported throughout the Roman empire with the best garum fetching high prices. Much information is known on fish sauce production and use through texts and cookbooks including the commonly used fishes. In addition, the remains of garum factories and amphorae containing fish remains provide evidence of production and trade. While morphology can provide some information about species, the fermentation process often digests the bones creating morphological ambiguity which is complicated because most element of some species (such as the tunas) are morphologically indistinguishable. We developed markers for zooarchaeology by mass spectrometry (ZooMS) that distinguish to species level the most commonly used Mediterranean species in the Scombrid and Clupeid families and then used them to determine the species exploited at different fish processing plants in Iberia including both small whole fish used in garum and larger species of tuna identified at the garum production sites.

Fachard, Sylvian (University of Lausanne)**[26]***Territorial and Border Surveillance in the Greek World*

The Greek world formed a giant mosaic of city-states and leagues stretching over the entire Mediterranean and delimited by political borders. Like today, crossing a border was not innocuous, as states imposed their rule of law and enforced strict surveillance over their territories. This paper examines archaeological and textual evidence to argue that three forms of surveillance were commonly found in the Classical Greek world (fifth–third centuries BCE). First, a form of “natural surveillance” was innate to the occupation of the countryside, endorsed by social groups and citizen militia that lived in a continuous network of secondary settlements found in the territories of Greek city-states. Second, “institutional surveillance” was implemented by state personnel, as scouts, forest rangers, watchmen, and mountain and border patrols were regularly set up to watch the borderlands. The third form of surveillance, more infrastructural and military in nature, sees wealthier states increasingly investing energy and resources to support large-scale surveillance strategies by building towers, forts, fortresses, signal stations, linear barriers, and roads. These forms of surveillance, which operate jointly or separately at different levels, attest to the importance of territorial security and protection for the Greek city-states.

Fairbairn, Cannon (University of Birmingham)**[115]***Relationships and Connections through Breast Milk: An Examination of Ancient Egyptian Perspectives on Breastfeeding*

To understand the usage of breastfeeding in ancient Egyptian art and ritual it is necessary to examine and

explore the ancient perspectives and beliefs which contextualized their creation. This includes the role of breastfeeding in a child's upbringing and growth as well as the relationship between a child and its nurse (whether mother or wet-nurse) with my interest being focused especially on the latter. This paper examines the role of breastfeeding and breastfeeders in ancient Egyptian society and how an understanding of everyday breastfeeding influences our understanding of its usage in ritual and political settings, or "high-status" settings. I will also examine what may be learned regarding everyday breastfeeding from images of nursing goddesses. As a common aspect of motherhood, the topic of breastfeeding offers a means by which to examine the way mothers were understood by their societies and the ways mothers may have understood their own roles. The usage of breastfeeding's image in society also offers an opportunity to examine the influence of motherhood on ritual, political, and social practices and beliefs.

Assessing Predictability of Dam Effects at Archaeological Sites Using Long-Term Repeat Lidar Surveys

Repeat lidar surveys conducted over multiple years are a means of monitoring physical changes at archaeological sites with methods that are objective, replicable, accurate, and relatively low impact. These monitoring data can also be useful for testing assumptions about how archaeological site condition may change in response to changes in upstream dam operations and consequent alterations in the downstream environment. Using topographic change data collected with terrestrial lidar over the past decade at 29 sites along the Colorado River in Grand Canyon, Arizona, we assessed predictability of a conceptual model in terms of whether sites are likely to aggrade or degrade in response to ongoing operation of Glen Canyon Dam located upstream from the study area. Initial analysis of the lidar-based monitoring data demonstrates that effects of dam operations on archaeological sites are generally predictable when geomorphic setting, local sediment supply, weather conditions, and dam-induced riparian vegetation expansion are considered. While we developed the conceptual model and monitoring methods as a means of assessing dam effects on downstream archaeological sites, the approach is broadly transferable to other contexts and for other research purposes, such as assessing influences of a changing climate on cultural resources.

Expedient Technological Behavior in the Aurignacian of Southern Italy

The role of expedient behaviors in the Upper Paleolithic has often been overshadowed by the study of more elaborate technologies to produce bladelets. This disparity in research focus is particularly evident in the Aurignacian context. Little discussion exists surrounding the use of cost-effective methods to produce stone tools with nonstandardized characteristics from low-quality raw materials. However, archaeological and ethnographic data indicate that expedient technologies are frequent throughout human history, with changes in their significance often linked to the higher focus of archaeologists on high-cost technologies. This presentation aims to illuminate the significance of expedient technological behavior in the southern Italian Aurignacian, which emerged around 41,000 years ago, replacing the Uluzzian. The latter is often associated with minimal technological investment in stone tool production, mostly relying on bipolar knapping to produce a limited range of formal tools. However, bipolar technology remains well-attested in the southern Italian Aurignacian. During this presentation, we will thus explore questions such as, to what extent is bipolar technology associated with expedient behavior? How does the availability and quality of raw materials influence this context? Is there a correlation between reduction intensity and core

technological investment? Are there commonalities in expedient technologies throughout the early Upper Paleolithic?

Climate, Vulcanism, and Agricultural Terrace Construction in Late Bronze Age Crete

Environmental change during the Bronze Age (3000–1100 BC) on Crete had a strong impact on the viability of agriculture and subsequent development of land-management technologies. In particular the development of terraced agricultural systems increased the capacity of slope agriculture, allowing cultivation to keep pace with population growth. In particular, the 4.2 ky climate event (2200 BC) and the volcanic eruption of the island of Thera (mid-sixteenth century BC) appear to have resulted in flooding and soil loss which would have been a challenge to cultivation. This paper presents results from geoarchaeological and geochronological research at two Bronze Age terrace sites in eastern Crete, Anavlochos and Choiromandres. Portable X-ray fluorescence (pXRF), portable optically stimulated luminescence (pOSL), and archaeological thin section micromorphology were integrated to reconstruct the history of land use and soil loss at the sites. Results confirm the use of terraces for agriculture in the Bronze and Iron Age and suggest that increased erosion affected slopes in Crete ca. 4.2 ky (2200 BC) and 3.6 ky (1600 BC). The causes for these erosive events, such as the eruption of Thera, are discussed, as well as the motivations for terrace construction in the Aegean during this period.

A Geochemical and Petrographic Analysis of Ceramics from the Estero Island Site in SW Florida

The Estero Island site (8LL4) is located on a shell ridge in what is now Fort Myers Beach in southwestern Florida. A portion of the site, Mound House, consists of a historic house built on top of a Calusa shell mound that was occupied from ca. AD 500–1000. Conservation efforts at Mound House to preserve exposed Calusa archaeological deposits led to the excavation of five 1 × 1 units previously used as educational exhibits. This presentation reports an exploratory analysis of ceramics from one of the five units at Mound House to establish geochemical (LA-ICP-MS) and petrographic composition. Previous work at the site has discussed the importance of future work to help link the local communities at Estero to the broader Calusa kingdom and other indigenous cultures of southwest Florida. This analysis provides ceramic compositional signatures that can be used to compare to local and regional potting communities of practice and infer interaction through the movement of people, clays and/or ceramics. The project also adds significantly to the limited corpus of pottery compositional data in the south Florida region.

Fargher, Lane (PAST Foundation / Ohio State University) and Robert Cook (Ohio State University)**[248]***Decolonizing the Concept of Urbanism: Early Formative Mesoamerica and Native North America in Comparative Perspective*

The colonialist academic project has long obliterated complexity in the precontact Americas. From the nineteenth to the mid-twentieth century, the complexity of Mesoamerican societies was erased; for example, the massive cities encountered by Cortés were deconstructed as simple villages/towns inhabited by tribes. Not until the second half of the twentieth century did Western scholars venture to argue that cities existed prior to Spanish colonialization. More recently, scholars have come to accept prehispanic urbanism in the Andes. However, most colonialist academics continue to expunge the urban history of Native North America. Accordingly, we use a comparative perspective to dive into the emergence of urbanism in Mesoamerica during the Early-Middle Formative as a backdrop for exploring settlement complexity in Mississippian, Fort Ancient, and Puebloan sites in North America. The goal of this work is twofold: to expand scholar understanding of non-Western urbanism and, thereby, challenge the colonialist project.

Farmer, Andrea (US Army Corps of Engineers, Savannah District)**[4]***Unexpected Discoveries and Partnerships: A Revolutionary War Discovery in Coastal Georgia*

In 1779, several British vessels were scuttled in the Savannah River, successfully stopping the advance of the French fleet off the coast of Georgia. The Savannah Harbor Expansion Project, the largest Civil Works project in the US Army Corps of Engineers, Savannah District's history, provided a unique opportunity to investigate this incident in the city's submerged history. Between 2021 and 2022, 19 cannon were retrieved from the Cannon Cluster Site (9CH1552), which allowed for the development of new partnerships and outreach opportunities. This paper will focus on the results of the underwater remote sensing surveys, diver investigations, recovery efforts, and conservation measures to better understand this unexpected discovery and Savannah's maritime history.

Farmer, Reid**[94]***Chair***Farmer, Reid, Jon Kent (Cherokee Ranch Science Institute), Caitlin Calvert and Kayla Bellipanni****[94]***Archaeological Excavation and Survey at Cherokee Ranch, Douglas County, Colorado*

In cooperation with the Cherokee Ranch and Castle Foundation, Metropolitan State University–Denver has conducted excavation and survey on the Foundation's property near Sedalia, CO, since 2014. Excavations have taken place at the Cherokee Mountain Rock Shelter (5DA1001) that was previously partly excavated in the 1970s. Artifacts and radiocarbon assays indicate a seasonal occupation primarily during Late Prehistoric period, though recent work indicates probable Archaic components. Survey has covered circa 780 acres with

recording of 31 prehistoric sites and 74 isolated finds. Three of these show intensive use: another rockshelter, a lithic quarry, and a large occupation site. The remainder appears to represent frequent but short term occupations for various resource extraction activities. They show occupations dating from 7500 BP to the Protohistoric. Lithic materials and ceramic types show inhabitants had trading/cultural ties with groups up to hundreds of miles away. All together these data paint a portrait of prehistoric use of this area of the Colorado Piedmont throughout the Holocene.

Wetlands and Grasslands: Habitat Choice of Hunters and Herders across the Transition to Mobile Pastoralism in Mongolia's Desert-Steppe

Paleoclimate studies across northeast Asia document a pronounced drying and cooling trend across desert and desert-steppe environments around 6,000 years ago, intensifying between 4500 and 4000 BP. While conditions led to the deterioration of lake and wetland habitats, past archaeological research based on museum collections and a limited number of excavated sites suggests that Neolithic (ca. 8000–5500 BP) foraging communities intensified use of remaining wetland environments through high residential mobility, a trend that continued into the Bronze Age as herding practices were first introduced (ca. 4500 BP). The continuation of wetland focused settlement strategies during the early stages of pastoralism is thought to signal the gradual, in situ development of herding, however, recent multiscale research in Mongolia's desert-steppe has identified subtle shifts in mobility and land use that signal a more abrupt change in habitat choice, including prioritization of upland grasslands and productive winter vegetation at the expense of lowland wetlands. We propose that the resulting population consolidation increased levels of unpredictability as people vied for scarce resources and contended with increasing rates of social interaction, patterns that fostered adaptations that came to define Eurasian mobile pastoralism including high residential mobility, long distance connections, and social differentiation.

Shark Teeth Research Opportunities Broadened by Innovations in Materials Science

The study of sharks in the archaeological record provides plentiful research opportunities within the lenses of social zooarchaeology and materials science. The convergence of these two themes when analyzing artifact shark teeth presents unique advantages and challenges to understanding how past people perceived sharks and made use of their physical remains. Advanced methods in materials science (scanning electron microscopy and X-ray diffraction) as well as potential avenues for future investigations are outlined by summarizing an analysis of 107 shark teeth from 16 archaeological sites across Florida.

Experimental Granary Construction in Range Creek Canyon, Utah

Food storage is a key component of many human subsistence patterns and has been a topic of interest for decades. In arid environments, agricultural surplus can be critical to survival. Having stored surplus available when needed is a benefit likely well worth the costs. In Range Creek Canyon (RCC), prehistoric maize farmers appear to have invested considerable effort into creating secure food storage facilities in the form of aboveground granaries and semi-subterranean cists. There is, however, significant variation in how these facilities were constructed and where they are located. Experimental reconstructions will help explain this variation by providing estimates of construction costs associated with different types of granaries, as well as any differential benefits conferred by those methods of construction. Students at the Range Creek Archaeological Field School participate in this experiment by building their own experimental reconstructions and recording their time costs. Students are free to experiment with different techniques and are not micromanaged to make every granary identical. This contributes to their learning and formation of potential research questions and refines the experiment with new information. Additionally, students gain skills that help them in recording similar features that they see at the field station or in later careers.

Shellfish Perspectives: Marine Resource Exploitation and Maritimism in Zanzibar

The Zanzibar Archipelago experienced dramatic socioeconomic and socioecological changes over the last 2,000 years in line with the rest of the Swahili Coast. The onset of Iron Age transformations linked to foraging and farming economies, connections via the broader Indian Ocean trade network, through the colonial period and into the present day, together mark significant shifts in the way that people have engaged with the coast and marine resources. Although under debate, investigations of occupation and economic social structures throughout this period have also led to discussions about the timing and nature of “maritimism” in the region. The sea and its resources have been, and continue to be, of high importance to the people of the Zanzibar Archipelago, with an increasing body of socioecological literature emphasizing the economic, ecological, and social factors that drive the nature of fishing and shellfish foraging through time and space. Here, I explore how the exploitation of marine resources—especially shellfish—serves as evidence of maritime worldviews, requiring intense knowledge of maritime landscapes and what they offer. Using ethnographic and archaeological evidence, I show that significant engagement with the ocean began fairly early in the occupation sequence of Zanzibar and continues to the present.

How to Avoid Getting Stuck: Hierarchy, Heterarchy, and Anarchy in Southern California

Precolonial California was home to some of the highest degrees of linguistic and cultural diversity seen in human history. This rich variability provides an excellent example for scholars to compare historical trajectories to understand how different societies developed along different political and economic pathways. In *The Dawn of Everything*, Graeber and Wengrow compare between highly dissimilar political strategies employed in the Pacific Northwest and northern California, suggesting that some of the differences between these regions can be explained through the concept of schismogenesis. In this paper I extend this analysis to southern California. I will argue that different coastal and interior regions, while maintaining intense contact between each other, chose very divergent political pathways. While some developed hierarchical and pyramidal political structures, others chose much more heterarchical and anarchic pathways. In this paper I explore how insights from the Graeber and Wengrow's provocative contribution can help us understand the different political and economic choices made by different ancient societies in southern California.

Trials and Tribulations: Navigating Instruction of Archaeology Courses for Rising Scholars in a Post-pandemic Educational Environment

On October 6, 2021, California's Governor Newsom signed in law AB 417 - Rising Scholars Network: Justice-Involved Students. The purpose of this bill was to expand higher educational opportunities for and reduce equity gaps among Rising Scholars (students who have formerly experienced incarceration or are currently incarcerated). At Palo Verde College, where 12–15 anthropology courses are offered to Rising Scholars students each semester, the need for ensuring Rising Scholars students are provided with a robust educational experience is crucial. Yet, given the obstacles confronted by Rising Scholars students, anthropology instructors have struggled to provide Rising Scholars with a robust archaeological curriculum. These obstacles include, but are not limited to, the following: slow-moving correspondence with students, students' limited access to the internet, difficulty in accessing library tools, and students' limitations related to on-campus resources. In this paper, I will examine the challenges confronted by anthropology instructors who teach Rising Scholars students in an effort to explore the skills needed to successfully apply effective archaeological pedagogy to correspondence-based archaeology courses.

Reconstrucción de rutas acuáticas en Nueva España a través del análisis geográfico de textos

En esta ponencia se presentará la metodología refinada del análisis geográfico de textos que permite relacionar nociones espaciales concretas con expresiones lingüísticas con distintos niveles de precisión. En particular, me concentraré en el problema de las rutas acuáticas que aparecen dispersas en numerosas fuentes escritas del virreinato. Para esto presentaré una sistematización metodológica que pretende facilitar la extracción de la información que a su vez permitirá la reconstrucción de rutas acuáticas en las que tecnologías de navegación locales indígenas permitieron el movimiento en distintos cuerpos de agua. Estas rutas acuáticas son integradas a un SIG histórico que a su vez se compara con los resultados de un modelo de análisis espacial que permite detectar el potencial de navegabilidad de los cuerpos de agua en tierra firme.

Ancient Maya Agriculture: The Intersection of Archaeology, Soil Science, Ethnobotany, and Traditional Ecological Knowledge

One enduring mystery of the ancient Maya is how they managed to feed large populations in a tropical environment and land resources that have long been characterized as hostile and challenging for agriculture. The traditional academic and popular perception of Maya agriculture, both ancient and modern, was based on the cultivation of maize, beans, and squash, using a land-extensive slash-and-burn cultivation system across a relatively uniform landscape. In this study we model the suitability of varied land resources for a variety of crops beyond the maize-beans-squash trilogy. We are developing a model of how the ancient Maya may have tailored their cultivation practices to match a variety of food plants to the most suitable soils for particular species. Our study area is El Pilar Bi-national Park which straddles the Belize-Guatemala border and surrounds the ancient Maya civic-ceremonial center of El Pilar. Lidar imagery and full ground truthing has been used to map all ancient settlement within the park. Soils have also been mapped at a scale of 1:10,000. We critically evaluate the application of the FAO suitability classification for specific crops, while comparing the results to crop suitability evaluated by Maya master gardeners well versed with traditional ecological knowledge.

Rekindling Ancestral Choctaw Cuisine: A Collaborative Application of Archaeology for Community Consumption

The Pine Hills of Mississippi is an understudied research area in archaeology with even less work done in collaboration with Indigenous descendant communities (both resident and removed). The current project was undertaken in collaboration with the Choctaw Nation of Oklahoma to better understand earth-oven technology in the archaeological record of their homeland with the goal of rekindling cooking techniques and traditions for their community. The approach presented here incorporates information from the tribe, both past and present, including oral traditions, ethnohistorical documents, and place-names. From an archaeological perspective, clay sandstone features that may represent cooking facilities, associated artifact assemblages, and lithic debris from a representative archaeological site in the ancestral Southern District will be examined through the lens of Choctaw culture. In developing this type of research collaboration, the theme of decolonization and Indigenous ontologies emerged, which adds value to the methods, analysis, and broader impacts of the work itself for both archaeologists and descendant communities. Specifically, this project demonstrates the application of Community-Based Participatory Research (CBPR) principles in archaeology can inform cultural revitalization of a living people.

Deep Learning and Pollen Detection in the Open World

Pollen-based paleoecological reconstructions rely on visual identifications that can be automated using computer vision. To date, most automated approaches have focused on taxonomic classification of pollen in cropped images. There are fewer protocols for pollen detection (i.e., localization) in whole-slide images. New samples potentially introduce rare and novel taxa, making pollen detection in the open world—a world where we constantly encounter new diversity—challenging. We explored pollen detection in the open world by focusing on three significant challenges. We first addressed taxonomic bias—missed detections of smaller, rarer pollen types. We fused an expert model trained on this minority class with our general pollen detector. We next addressed domain gaps—differences in image magnification and resolution across microscopes—by fine-tuning our detector on images from a new imaging domain. Lastly, we developed continual learning workflows that integrated expert feedback and allowed detectors to improve over time. Effective pollen detectors enable higher and more reproducible pollen counts that could improve the accuracy of diversity estimates and accelerate the creation of long-term, high-resolution paleoecological records. Our methods can be applied to other visually diverse biological data, including algae, fungal spores, and phytoliths.

Glass Provenance Studies Using Isotopes and the Nuances of Geological Inputs and Influences

Advances in both analytical techniques used to examine archaeological materials and in our understanding of various isotope systems have led to an efflorescence of research that applies isotopic analyses to questions of provenance in ancient glass materials. While initial isotopic studies of ancient glasses began with lead isotope work by Robert Brill and colleagues (late 1960s), advances in precision and accuracy, and, more importantly, the sensitivity of more recent instrumentation have opened new isotopic systems for exploration. This led to the use of the strontium (early 2000s) and neodymium (later 2000s) systems, which was followed by extensive exploration of the applicability of other isotope systems, such as antimony, boron, copper, and more, leading to many new and exciting provenance interpretations. Work with these isotope systems also has led to large-scale characterization of raw material resources used in ancient glass production. However, this growth in glass provenance studies using isotopic analyses comes with a growing concern over properly understanding the role and influence of natural (and human) processes that can significantly impact our abilities to interpret those results correctly. This paper outlines

recent issues, successes, and challenges in generating and interpreting radiogenic isotope data for provenance studies of ancient glass.

The Heritage Glossary Project

Heritage is a multidisciplinary field. Students of heritage come to the subject from a broad array of backgrounds, nationalities, and languages. The word heritage has many meanings depending on context and understanding the multiple meanings of the word itself is the first “translation” I task students with in the classroom when the semester begins. The Heritage Glossary Project grew out of this classroom exercise. The aim of the project is to produce a resource to support heritage education for students who do not have English as their first language, or who do not have a disciplinary background in heritage or archaeology. The project is UK-based. The first stage of the project has been to learn from student experience of heritage education and compile a glossary for their practical use, drawing on student feedback and engagement. This paper will account for the first stage of the project, and future steps toward developing inclusive resources for heritage education.

Combining Trade Good and Radiocarbon Dates across a Calibration Curve Inversion: Middle Grant Creek

Precise dating of archaeological sites created during the last millennium often benefit from chronological information provided by trade goods but may be hampered by inversions in the radiocarbon calibration curve. Middle Grant Creek is one such site. It is a protohistoric Native American site near present-day Chicago which has yielded a number of European trade goods and for which a series of radiocarbon dates span a large calibration inversion. We created a series of OxCal models that start with the radiocarbon data and progressively incorporate stratigraphic and trade good chronological data. The results provide insight into how OxCal modeling responds as more information is added—particularly with respect to boundary conditions—as well as a better understanding of Middle Grant Creek’s chronology.

Raw Material Selection and Technological Expediency in the Iberian Middle-Upper Paleolithic Transition

Expediency, in the sense of applying low-cost, informal technological solutions, characterizes a great deal of hominin technological behavior over time. The degree to which expedient technological behaviors are culturally laden versus culturally void remains an open question—one with important implications for our interpretation of hominin evolution. In Iberia, for example, lithic assemblages are widely categorized as Mousterian if they (1) appear expedient in nature (especially if made on materials such as quartzite or quartz) and lack UP fossils directeurs, (2) have centripetal methods, and c) date to periods when it is known or assumed Neanderthals lived. However, such inferences become problematic when applied to Iberia’s Middle-Upper Paleolithic transition. Since the process and chronology of Neanderthals’ replacement by modern humans remain to be clarified, drawing links between technological expediency and Neanderthal authorship here risks confusing the conclusion for a premise. Toward informing this debate, this paper reviews the role of raw material selection on expedient lithic production during the Iberian MP. Data are presented from Lapa

do Picareiro layer FF—an expedient assemblage overlying early Aurignacian deposits—to illustrate the impact of raw materials, and how our own framing of technological expediency shapes interpretations of this key transitional period.

Comparing Plane-Based and Drone-Based Lidar to Pedestrian Surveys in the American Southwest

Lidar surveys have revealed vast areas of ancient human settlement in parts of the world that are poorly known due to dense vegetative cover, but the use of lidar as a survey tool has not been fully explored in regions like the American Southwest that feature minimal vegetation and generally good surface visibility. Our research program in the Lion Mountain area of west-central New Mexico seeks, in part, to understand Pueblo period settlement over vast areas in the Gallinas Mountains, but pedestrian survey is slow and labor-intensive. UAV-based lidar shows great promise in both revealing previously unknown sites and illuminating details on known sites. We have implemented UAV-based lidar with large spatial coverage, and direct comparisons are now possible between full-coverage pedestrian survey, lower-resolution plane-based lidar, and higher-resolution UAV lidar. Direct comparison is also made between visual data inspection and trained deep learning models for site detection. While UAV-based lidar cannot fully replace pedestrian survey for compliance purposes, it can greatly enhance the identification of surface features and regional settlement patterns.

Farming and Importing Food: Colonial Racial Capitalism and Food Sovereignty in the US Territory of Puerto Rico from 1919 to the Present

The purpose of this research is to trace food practices in the US territory of Puerto Rico for the last century (1919–2018) and relate them to the processes of colonial racial capitalism. Since the mid-twentieth century,

Puerto Rico went from being a mostly agricultural archipelago to an archipelago where there is barely any agriculture and that imports 85% of the food it consumes. This transformation was led by the development strategies that were initiated in 1947, under the political banner of bringing a better quality of life to the archipelago. However, there is a lack of specific knowledge of how agriculture was abandoned, and political narratives tend to put the blame on individuals who did not want to continue farming. Thus, here I will use archival data to explore food practice changes and how they relate to political and economic decision-making. I will use agricultural censuses to trace farming and landscape changes within Puerto Rico throughout time, and I will then visualize these changes in GIS maps. Moreover, I will look at importation and exportation records to graph food importation changes throughout time. Lastly, I will suggest possible avenues for change and the growing food sovereignty movement in the archipelago.

Haciendo camino al andar: Hacia una arqueología colaborativa en Cañete (Cañete)

El sitio arqueológico Cerro de Oro (Cañete), al igual que miles de sitios en Perú, fue considerado por la comunidad que lo rodea como un espacio abandonado. Fue huaqueado, usado como vivienda, espacio agrícola, y sus paredes y restos afectados por diferentes tipos de actividades. En el 2012, el Proyecto Arqueológico Cerro de Oro inicia como un pequeño proyecto de investigación. A lo largo de los años, y luego de interactuar con los vecinos que viven sobre el sitio, con gobiernos distritales, provinciales y regionales, colectivos culturales, instituciones educativas, etc.; el enfoque del proyecto ha cambiado hacia una propuesta de arqueología colaborativa. Esta propuesta ha ido creciendo de manera orgánica a través de distintas iniciativas que nos han llevado a trabajar de la mano de la universidad local, de los colegios nacionales, colectivos culturales y en particular con los vecinos que viven sobre el sitio. Esta ponencia presentará los retos de establecer y mantener una iniciativa de arqueología sostenible con un enfoque colaborativo y voluntario.

More than a "Bones Player": Community-Led Reinterpretation of the Brewster-Mount Site in Setauket, New York

The Brewster-Mount home (ca. 1800) was razed in the 1960s and excavated in 1982. An extensive assemblage of artifacts was recovered that ranged from construction materials, domestic ware, faunal remains, and more personal items. Recently, a new public history has highlighted the plurality of this home's history as a site of African enslavement and labor exploitation. Notably, nineteenth-century genre and landscape artist William Sidney Mount had not only painted the homestead, but three of the Black residents of this home who sat for portraits were notably depicted in Mount's *The Bones Player*. Of these, Andrew Brewster and another resident were enslaved. This rare occurrence allows us to see the artistic interpretation of what the occupants looked like. However, their likeness (through art) is still framed within the "White male gaze" of their painter, Mount. Recently, descendants of the enslaved occupants of the Brewster-Mount home have partnered with the Three Village Historical Society to reinterpret and exhibit this assemblage, exploring themes of identity, race, and agency. This poster will highlight the reinterpretation of this site and recent developments for this project.

Ferras Deletré, Mélanie (Lettres Sorbonne Université)**[27]***The Offerings to the Ceremonial Center of Chavín de Huántar: New Perspectives from the Explanada Canals*

The ceremonial center of Chavín de Huántar (1200–500 BCE) stands out for its extensive network of hydraulic canals. The excavations carried out by the Chavín de Huántar Archaeological and Conservation Research Program in the Explanada sector allowed these subterranean structures to be investigated. Their excavations provide an important variety of data that covers both construction techniques and selections of materials and objects deposited. Indeed, the hydraulic functions of the canals not only had a wastewater role but also a ritual part, being part of the dynamics of material offerings to the ceremonial center. The analysis of the material registered during the excavations of the canals demonstrates a careful selection of the artifacts offered. This choice to select valuable pieces is particularly emphasized in the Explanada Canal 7, where a set of articulated bone pins was deposited.

Ferris, Neal (University of Western Ontario)**[331]***Fluid Persistence: The Heritage Matters and Watery Wellness of the Bath Spring and Stream, Nevis*

The volcanic waters of the Bath Spring on Nevis flow downstream and enter Gallows Bay in the Caribbean Sea, a fluid persistence that has shaped and been shaped by the differently lived archaeologies along its waterscape before and through local becomings of Western colonialism, imperialism, and capitalism. Their ascribed curative qualities have shaped the heritage of these waters to that of a shared tradition of health and wellness. Today this watery heritage continues to enmesh Nevisians and visitors alike who daily come to the hot springs to cure ailments, restore vitality, and participate in the social custom of bathing and being Nevisian. But these waters are also continually transforming, as differing vibrancies of this watery wellness are prioritized by distinct assemblages of colonizer, enslaved, emancipated, and disenfranchised Nevisians, foreigners and tourists, all contesting and remaking the why and what for of this place. How the Bath waters have been differently lived and understood reveals much about the fluid persistence to this heritage, especially given ongoing efforts by the St. Kitts Nevis government to articulate an Outstanding Universal Value for these waters as part of their effort in securing a World Heritage inscription.

The Becoming of Far View House

More than a century ago, Jesse W. Fewkes excavated Far View House, a large mesa-top pueblo in Mesa Verde National Park. Despite a long history of research, interpretation, stabilization, and maintenance since its initial excavation in 1916, a complete construction history of Far View House has never been produced. New research at Far View, including architectural, tree-ring, and archival analysis, has enabled a detailed reconstruction of the formation and development of Far View House. These results illustrate a complex building history including at least five major phases of construction, which began sometime in the mid-to-late ninth century and possibly earlier, with a rectangular, single-story, 18-room pueblo. Over the next four centuries, Far View was transformed into a multi-story, 57-room pueblo with four enclosed kivas and a large, bisected plaza. This architectural reconstruction of Far View House illustrates the growing complexity of the building and the Far View community during the Chaco Era.

Geochemical Soil Analysis of Sequential Public and Private Plaster Floor Surfaces from the Maya Site of Holtun

In this paper we present the results of an exploratory program aimed at providing multicomponent soil sampling and analysis of plaster floor surfaces at the Maya site of Holtun, Guatemala. Our research sampled three different plaza settings at the site: the monumental E-Group plaza, an elite residential patio adjacent to the E-Group monumental core, and an elite residential patio distant from the E-Group. Sequential floors within these open spaces spanned from the Middle Preclassic through the Late Classic periods. Our research identified the chemical signatures for activities related to food production and consumption in sequential plaza floors across all sampled contexts and suggests the locations of some of these activities changed over time. Importantly, our results suggest different activities took place in public as opposed to private spaces within the site, offering new avenues for future research in similar settings.

Our Ancestor's Hands Made These Ceramics: A Comparative Ceramic Analysis in the Coca-Nahua Community of Mezcala, Jalisco, Mexico

The Lago de Chapala region during the Postclassic period (900–1520 CE) was a borderland where the P'urhépecha Empire in Michoacán expanded into the territories of the smaller, but resistant Coca, Tecuexe, and Cazcan kingdoms, and nomadic Chichimeca groups in Jalisco, Mexico. Archaeologists from the United States excavated in this region from about 1950 to 1970, filling in gaps in the archaeological timeline, but left with more questions than answers. After a 50-year period of stagnant research in the region, my interest in learning more about my ancestors led me to work with the neighboring community of Mezcala, which is experiencing a resurgence in Coca identity reclamation and interest in its own cultural heritage. My master's thesis research aids these community interests by analyzing ceramics from the town and island of Mezcala and comparing them to ceramic assemblages from across Jalisco and Michoacán. My results point to strong regional similarities in the production of ollas and bowls, which I hypothesize indicates a shared regional identity separate from P'urhépecha influence. This project is an example of how Indigenous Archaeology is allowing local communities to reclaim, rediscover, and write their own history.

Figueroa Beltran, Carlos (San Diego State University)**[96]***The Peninsula of Baja California, a Terra Ignota Before and Now*

The colonization process in the Baja California Peninsula began with the arrival of Hernán Cortés in Bahía de la Santa Cruz in 1535. Then, the peninsula was called Terra Ignota, a Latin term used in cartography for regions that have not been mapped or documented. Its geographical isolation from the rest of New Spain made it a territory wrapped in fantasy and mystery for those first explorers and missionaries. Paradoxically, the peninsula remains Terra Ignota after almost 500 years of European contact. However, its geographical isolation has allowed it to be considered by many scientists as an archaeological, biological, and geological laboratory. The accelerated impact caused by the colonization led the native communities to their total extinction from the Los Cabos region to El Rosario, northwest of the peninsula, leaving only a handful of ethnohistorical records on their cultural and religious practices. For this reason, the Cochimi, who occupied almost half of the peninsular territory in its middle part, were a cultural group that we know little about but left abundant material records of their way of life, funerary practices, and religiosity. Here, we present the results of three archaeological expeditions in different geographic settings of the Cochimi Desert.

Finley, Judson (Utah State University), Erick Robinson (Native Environment Solutions LLC) and R. Justin DeRose (Utah State University)**[107]***Hydroclimatic Constraints on Population Growth in Dryland Foraging-Farming Communities*

Developing a unified theory of human population growth requires a multiscale perspective on the evolution of human social-ecological systems over space and time. This requires iteration between macro-level theory and microscale events captured in the archaeological record. This poster begins to develop theory for the microscale. It does so by focusing on the hydroclimatic constraints on population growth in dryland foraging-farming communities. We develop high-precision models for settlement persistence of Fremont communities on the northern Colorado Plateau and eastern Great Basin. These communities were some of the shortest-lived agricultural communities on earth. We integrate high-precision site-based models for community growth and decline with (1) an annual streamflow model derived from a 3,000-plus-year-old tree-ring record, and (2) high-precision alluvial geochronology models. We propose that the hydroclimatic contexts of these communities were too dynamic and sensitive to major disturbances to support settlement persistence over the long term. This lack of settlement persistence limited the knowledge transmission networks required for innovations to grow and ultimately sustain these populations.

Fiore, Matthew (Hamilton College), Hannah Lau (Hamilton College), Lara Fabian (University of California, Los Angeles), Jeyhun Eminli (Azerbaijan National Academy of Science [AMEA]) and Susannah Fishman**[42]***Examining Origins of Ceramic Production in Lerik, Azerbaijan (Late Iron Age to Late Antique Period): Insights from Ceramic Petrographic Analysis*

This research examines manufacturing technology and origin of production of ceramics from the necropolis at Piboz Tepe and site at Yoladoy Bin in the Lerik region of Azerbaijan through utilization of ceramic petrography and surface treatment analysis. Data obtained through petrography analysis indicates whether ceramics were locally produced or imported from elsewhere, in correlation with regional geological data. The research investigates choices made by dwellers in this highland region, whose mortuary assemblages suggest a relationship with their imperial neighbors—extending previous research to learn more about the role of these dwellers within the larger sociopolitical system. The data come from the Lerik Azerbaijan-America Project (LAAP), which considers living communities contemporaneous with the creators the necropolis at Piboz and its landscape to better understand local cultures and practices from the Late Iron Age to the Late Antique period (ca. 500 BCE–500 CE). The methodology provides a lens through which to center lesser-known contributions

to the success of dominant empires, based on proximity or other factors. Further analysis will help to reconstruct aspects of production, social organization, and exchange for the living population using data from mortuary contexts and provide a baseline against which to compare to other excavated contexts.

Refining Ideal Free Distribution Predictions Using Paleoenvironmental and Zooarchaeological Data on California's Northern Channel Islands

I examine the potential for using higher resolution environmental records to expand on existing ideal free distribution (IFD) model applications on California's Northern Channel Islands. In this project, I take advantage of recent advances in paleoenvironmental research and higher resolution proxy methods (e.g., sclerochronology) since previous applications and consider how IFD model applications within archaeology have been applied in the last decade. I then apply patterns in dietary diversity and settlement chronology in the context of multiproxy environmental data, which can be used to refine patterns in site suitability beyond what broader climate records in previous applications allowed. Informing climatic data is a synthesized set of proxy records (e.g., speleothem and coral records) using data archives sourced from Climate Data Online, PANGEA, and outside publications. Sclerochronology samples are sourced from two sites on Santa Rosa Island—namely, CA-SRI-19 and -138, two trans-Holocene dated sites. Faunal data is sourced and compiled from outside publications, supplementing CA-SRI-19 and -138. To ensure internal consistency of datasets for comparability, I review data for inconsistencies (e.g., nonunique primary identifiers) and differences in resolution (e.g., differing organization/ schema) prior to application within models. Results of this analysis provide important information about the continued calibration of IFD.

Karen Adams: Scholar, Collaborator, and Friend

Karen Adams richly deserves recognition as a premier, foundational Southwest archaeobotanist, a status personally and professionally celebrated by the organizers of today's session in her honor and by her past term as President of the Society of Ethnobiology. Few other researchers in the field approach her qualifications, breadth of knowledge, experience, and pioneering scholarly accomplishments. She is remarkable for the most fine-grained and rigorous of studies as well as broadly interpretive works that draw on an encyclopedic command of related disciplines. Karen is further unique for her far-reaching professional networks, cooperative spirit, generosity, and mentoring of upcoming scholars. I will touch on recurring interests that Karen has continued to build on in multiple directions and at multiple scales throughout her career. Perhaps the most exemplary of these ongoing interests is the accurate characterization of corn and its role in the unfolding histories of regional traditions. I will comment on several opportunities to coauthor timely syntheses of plant-focused archaeological research with Karen. They were unforgettable encounters with her deep scholarship and keen insights.

Ethnohistorical Approaches to Panamanian Archaeology: Toward an Enhanced Conversation

A significant, yet not fully recognized contribution of Richard Cooke's to the understanding of Panamanian archaeology were his erudite analyses of contact time chronicles and documentation. Through systematic contrast and comparison of documents, landscapes, linguistic and archaeological evidence, particularly concerning environmental transformations, resource use, and sociopolitical change, Cooke was able not only to assess geo-demographic and social complexity issues relevant to archaeological research but also vindicate the ancestral ties of Panama's indigenous populations to their territories and contest colonial narratives. In this paper we will review Cooke's ethnohistorical approach and evaluate methodological and theoretical issues concerning the interpretation of diversity and change in the archaeological record. Of particular concern will be the recent genetic evidence about the relationships between extant and ancient Panamanian populations and the growing trend toward a more informed understanding about intra- and interregional contacts as evidenced (or not) in the archaeological and ethnohistorical records.

Rock Art and Archaeology in the Mongolian Altai, Part I

Petroglyph research and archaeology provide different avenues into the past. Commonly viewed as distinct disciplines, they have looked ill-suited to integration (Jacobson 2023). This specific task, however, was a focus of a National Endowment for the Humanities-supported field project conducted by East Tennessee State University and the Smithsonian Institution in Western Mongolia's Altai Mountains. Khoton Lake is ideally suited for this study because its glacially polished surfaces produced a suitable lithology for image-making dating from the Upper Paleolithic to the present. Carvings are often associated physically with mortuary monuments and other ritual or ceremonial features. This paper demonstrates how the combined study of rock art and dirt archaeology broadens understandings derived from each field independently. Here we discuss (1) direct links comprised of pictorial elements engraved on archaeological monuments and features; (2) dating methods that facilitate the identification of petroglyphs and petroglyph-types with archaeological periods or cultures; and (3) how our understanding of Central Asian culture history can be advanced by combining art historical and scientific approaches.

Forced Labor versus "Slavery": European Ideas and Indigenous Realities in Mesoamerica (CE 600–1521)

This presentation reconsiders what has conventionally been described as Mesoamerican "slavery." Slavery is but one form of forced labor within various informal and institutionalized practices. Thus far, the majority of Mesoamerican forced labor has been studied using colonial sources written or edited by Spanish writers. While useful, these writers brought with them unfamiliar terms and concepts, which were then translated through cultures and back in time to precolumbian Mesoamerican societies. I present the impact of the terms "slave" and "slavery," their import from European vernacular, and thus their influence on new concepts of forced labor. I contextualize my discussion with descriptions and examples of various coercive labor practices defined based on legal, social, and cultural circumstances. Forced labor can take the form of slavery, debt bondage, penal labor, and *corvée* (labor taxation). Much of the forced labor discussed is a consequence of downward social mobility. Those who fall down the social ladder are those most likely to be exploited by those at the top of the social ladder. This presentation examines how these coercive labor practices are used and presented in a series of written, pictorial, and material sources.

FitzPatrick, Mackinley (Harvard University)**[37]***The Andean Khipu and a Precolumbian Computer System: A Postcolonial Perspective*

For decades, researchers have strived to “elevate” *khipus*—Andean knotted cords—to the status of a writing system. However, this discourse is rooted in colonial frameworks for assessing cultural sophistication, which neglect the uniqueness of non-Western systems and obscure the richness of *khipus*. This paper challenges the conventional debate surrounding *khipus* and urges scholars to consider *khipus* as part of a computational system rather than a written one. While *khipus* have been compared to the binary encoding of computers, this analogy was used to show their potential to contain writing. Here the khipu system is directly compared to modern computers, arguing that they exist on a historical continuum of computational progress. This continuum has reduced the extent of human interaction required to store data, fulfill tasks, and make predictions; its culmination may soon be realized with the development of artificial intelligence, capable of functioning without any human input. This paper presents a novel perspective that *khipus* formed part of a malleable and modular computer system, inviting scholars to explore *khipus* as sophisticated tools for data processing and communication in Andean society. This framework fosters a more inclusive understanding of indigenous knowledge systems and challenges Eurocentric biases that have historically influenced archaeological discourse.

Fitzpatrick, Scott (University of Oregon)**[18]***Chair***Fitzpatrick, Scott (University of Oregon)****[18]***Exploration of Diminutive Spaces: The Connected Isolation of Micronesian Islands*

More than 3,000 years ago peoples ventured into Remote Oceania using a combination of sophisticated watercraft, wayfinding techniques—including a celestial compass—and sailing strategies passed down orally through rote learning across generations. Over the course of 2,000+ years, different groups settled islands in Melanesia, Polynesia, and Micronesia, representing the most rapid and expansive diaspora in human history. The latter region stands out as exemplary in terms of how and when smaller islands were settled. In this paper I discuss the historical contingencies that have led to cases of relative isolation on some islands in Micronesia through time while in others extensive exchange systems developed to help ensure survival, biological diversity, and the acquisition of desired or needed resources. The settlement of Micronesia represents environmental adaptation par excellence; however, years of colonial rule and globalization—coupled with climate change—have in some ways led to a greater degree of marginalization, disconnections from traditional lifeways, challenges to conducting archaeological research, and prospects of eventual island abandonment.

Despite women receiving the majority of archaeology PhD degrees for decades, issues with gender representation continue within the discipline, such as the well-documented underrepresentation of women in prestigious academic positions. It follows that the majority of archaeological museum collections stem from projects led by male archaeologists, yet the care of these collections is largely undertaken by museum professionals, a field that has been and continues to trend predominantly female. In this paper, we compare female representation in the traditional academic archaeology with female representation in archaeological museum spaces. Often categorized as a “pink collar” career, we consider the ways archaeology conducted within museums has been classified as “care work” and thus impacted by gender devaluation. We argue the framework of “care” associated with museum work leads to the negation of individual scholarship (or agency) associated with similar research, collaboration, and outreach efforts in more traditional academic settings. As ethical changes in our discipline spur increasing utilization of museum collections, the intersections of gender, care, prestige, and valuation will require further attention.

Flammang, Amandine (Université libre de Bruxelles)**[185]***From the Dead to the Living: An Interdisciplinary Analysis of Late Period Open Sepulchers, Upper Nepeña Drainage, Ancash, Peru*

The ubiquity of open sepulcher type funerary contexts in the Andean highlands is a salient fact. Previous work and new surveys in the Pamparomás and Chaclancayo valleys of the Upper Nepeña Drainage have identified more than 60 such funerary contexts. Over the past two years, systematic excavations of selected sites coupled with a landscape approach has allowed us to better understand these structures and their significance within late prehispanic society. Here, the author reviews current knowledge on late period (AD 600–1532) funerary practices in the Peruvian highlands and contrasts this with the recent results from the

Upper Nepeña Drainage. Using archaeology, bioarchaeology, and a landscape approach permits us to explore variations in typology, chronology, function, and placement of these monuments. The methodological challenges related to these contexts—including their highly disturbed nature, consequence of several looting episodes during colonial and modern times will also be addressed. This study shows that an interdisciplinary approach provides a holistic understanding of these contexts, the funerary practices associated with them, and the populations living in the region at the time, despite the many looting episodes to which they were subjected to.

A Supplemental Approach: The Influence of Ann Stahl's Interdisciplinarity to African Archaeology

There is a long history of interdisciplinary research on the precolonial African past, with historians, archaeologists, and historical linguists seeking out and drawing on insights from their allied disciplines. These scholars often seek to integrate different types of data or use one type of data (like archaeology) as support for others (oral traditions/histories, linguistics). What Stahl's work in Ghana has offered, however, is a theoretical approach to thinking about way that different types of data must be understood as distinct forms of knowledge. One important result of this is a critical engagement with the way that scholars attempt to triangulate between these data fields, without privileging one over the other. In this paper, I explore these aspects of Stahl's work and show how it has impacted the way that I have worked to re-conceive the relationship between archaeology and historical linguistics, in the context of my own research in Zambia.

Historic Genome from the First Baptist Church on Nassau Street: Reflections on Process and Product

Community members, stakeholders, and congregation members expressed interest in pursuing DNA testing of the Ancestral Individuals from the Historic First Baptist Church. In collaboration with the Let Freedom Ring! Foundation, successive community engagement meetings were held to explain the process of ancient DNA testing and answer questions from the community. The descendant community elected to uncover three burials for osteological analysis and DNA testing. Preservation of the bone was variable, and DNA was successfully extracted, indexed, and whole genome enriched for one Ancestral Individual at the University of Connecticut. The enriched DNA library was sequenced on an Illumina HiSeq. Results showed typical patterns damage and low amount of exogenous mitochondrial contamination. The Ancestral Individual was affiliated with African reference populations and displayed a R1b Y chromosome haplogroup and L3d mitochondrial

DNA haplogroup. The results were shared with the community by explaining the testing process and outcomes. The community elected to not continue DNA testing, as the harm of destructive testing outweighed the likelihood of successful results. In summation, a stepwise community engagement model centered the descendant community as the decision-makers in the direction and duration of the study.

Digitizing Handwritten Field Notebooks: The Impacts of Image Preprocessing on OCR Text Extraction

Although field notebooks are created as a resource for future archaeologists to reference in their research, the labor required to digitize handwritten notes presents a barrier to their incorporation in state-of-the-art computational analyses. In this research, I explore if image pre-processing can improve the accuracy of text extracted from handwritten field notebooks by Optical Character Recognition. I apply image pre-processing to scans of handwritten field notebooks from the 1970s excavations of the Gulkana site, a precontact Northern Dene site in Alaska's Copper River Basin. These documents contain important data regarding native copper innovation that occurred at the Gulkana site, but the lack of digital spatial data hinders analysis and public interpretation.

Ritual Landscapes of the Lower Mississippi Valley: The Marksville Archaeological Project

The Lower Mississippi Valley (LMV) has a long history of monumentality, with early examples of monumental earthworks confidently dated to the Middle Archaic (6000–3000 BC) and Late Archaic (3000–1000 BC) periods, and other mounds dating to Woodland (after 1000 BC) and Mississippi (after AD 1200) periods. The Middle Woodland period Marksville mound site (AD 1–350), located in central Louisiana, is associated with the Hopewell Interaction Sphere, connecting Marksville to Hopewell ceremonial centers in the Ohio Valley and elsewhere in eastern North America. This paper will provide a comparative site layout analysis of Marksville to the earlier monumental site of Poverty Point (16WC5) and the Marksville period site of McGuffee (16CT17), along with comparisons to Hopewell “core” sites of the Hopewell Mound Group (33RO27) and High Banks Works (33RO24). This extensive comparative analysis provides an opportunity for examining the manifestation of long-distance communication and exchange from the perspective a site within a particular historical trajectory of monumental construction. This will contribute to the understanding of the degree of influence of Hopewell ceremonialism on the design and construction of the Marksville site within the context of the long history and presence of monumental constructions within the LMV.

All along the Watch Tower: Surveillance, Survivance, and the Making of a Christianized Landscape in the Mangareva Islands, French Polynesia

The transformation of island environments and settlement patterns resulting from missionization and Christian conversion is a well-developed theme in the historical archaeology of Oceania. The Mangareva

Islands in French Polynesia provide an exemplary case study, featuring dozens of stone structures built by the Catholic Pères des Sacrés Cœurs beginning in the 1830s. These include a massive cathedral in Rikitea, stone churches on each of the main inhabited islands from the colonial era, boys' and girls' schools and associated infrastructure, triumphal arches, a royal palace complex for the high chief Maputeoa, and multiple watch towers built to monitor the comings and goings of ships and canoes. On closer inspection, however, a simple story of colonial dominance resulting in new settlement patterns is insufficient to explain the development of the landscapes in the Mangareva Islands. Maputeoa and other high ranking Mangarevans such as his uncle, Matua, had their own political agenda in their interactions with the more historically prominent missionaries. As with any landscape containing elements of "surveillance," the buildings themselves simultaneously provided the social spaces for resistance. An analysis of the settlement patterns of colonial Mangareva undermines the colonial narrative and demonstrates the Polynesian shaping of mission life.

A Multi-instrument Geophysical Survey Comparing the Effects of Plowing on the Geophysical Signatures of a Precontact Earthwork in Perry County, Ohio

Ohio is home to a significant number of precontact period earthworks—mounds and enclosures—many of which have been affected by plowing to various degrees. While magnetometer surveys have produced remarkable images of earthwork ditches and embankments in the Middle Ohio Valley, few other instrument types have been employed. For this study, magnetometry, ground-penetrating radar (GPR), and electromagnetic induction (EM) were used to survey a small ditch-and-embankment enclosure bisected by a fence line. Plowing has flattened the ditch and filled the embankment to one side of the fence, while on the other the earthwork is readily visible. The earthwork ditch was most notable in the radar data from the plowed area, but the conductivity component of the EM results produced the most consistent indications of the earthwork in both plowed and minimally plowed contexts. Most surprisingly, the earthwork was near invisible in the magnetic data. These results highlight the importance of using multi-instrument surveys for detecting the remains of large earthen constructions, even in a region known for its excellent magnetic survey results. The results also show the importance of geology and soils in determining the outcome of magnetometer surveys.

Did Archery Technology Precipitate Complexity in the Titicaca Basin? A Metric Analysis of Projectile Points, 11–1 ka

The origins of Andean archery technology and its impact on social organization remain unclear. This analysis uses metric data from 1,179 projectile points from the Lake Titicaca Basin, 11–1 ka, to identify the timing of archery technology and its potential social consequences. Our data reveal a dramatic decrease in projectile point size at 5 ka, spanning the Late/Terminal Archaic period boundary, signaling that archery technology likely emerged during the Terminal Archaic period, 5–3.5 ka. This technological transition coincided with the growth of settlements, a surge in the use of exotic goods like obsidian, low intergroup violence, and incipient agropastoralism, all of which intensified during the subsequent Formative period

when monumental ceremonial centers emerged. These findings suggest that archery technology did not incite violence but rather contributed to emerging cooperative dynamics that expanded regional exchange networks and community aggregation. We hypothesize that archery technology may have expanded economic opportunities or raised the cost of violent interaction, thereby facilitating new cooperative norms.

Aguadas of the Bajo el Laberinto Region: Form, Distribution, and Biocultural Importance

Aguadas are permanent or temporary water reservoirs distributed throughout the Elevated Interior Region (EIR). These wetlands have formed complex ecosystems that are essential for the survival of many species and are sometimes the only source of fresh water for animal and human communities in the region.

Archaeological research has shown that most of the *aguadas* were built by the ancient Maya as part of their water management strategies, which they adapted and developed over the centuries. This paper presents the results of the documentation of the *aguadas* in the Bajo el Laberinto region, which was carried out using remote sensing techniques (lidar and satellite imagery) and field verification of selected examples. The results of this process allow us to know the morphological characteristics of the *aguadas*, such as their shape, area, estimated capacity, and distribution, essential information to come closer to understanding the importance they had for the development and maintenance of the prehispanic population of the region, as well as their current relevance as wetland ecosystems.

Beyond the Kaanul: Setting Some Questions and Initial Thoughts on the Urban Layouts of Calakmul and Its Region

The ancient city of Calakmul was the locus of important human developments throughout a period of no less than 15 centuries, during which various social groups, ruling houses and urban palimpsests followed one another, and sometimes coexisted, until its definitive abandonment. Nowadays, lidar technology provides the most detailed and accurate type of documentation that can be generated about the remains of an ancient landscape. This allows an understanding of the details of a built environment on an unprecedented scale; something to which settlement archaeology aspired from its very beginnings. Parallel to the initial classification of a large amount of data that the new relief models provide, identifying the imprint of the different construction projects, as well as establishing their approximate chronology and development, becomes a fundamental task. Some architectural and spatial patterns seem to emerge not only from the analysis per se that we have made of these models but also from their comparison with other contemporary centers of the Maya Lowlands. In this paper we propose that these potential urban projects could be representative of certain sociopolitical systems during specific times, and a testimony of their materialization, as well as the canvas for their gradual change to new ones.

Landscape and Settlements in Cuscatlán, El Salvador

Several explorations were carried out in Cuscatlán (Amaroli 1986; Amaroli 1992; Velázquez and Hermes 1995; Barrera 2018; Arevalo 2018), where the Metropolitan Area of San Salvador (AMSS), El Salvador, now

stands, including explorations resulting from archaeological rescues and projects based on the model of preventive archaeology (Bozoki-Ernyey 2007) along with the recording of various fortuitous findings in the area, southeast of the magnificent San Salvador Volcanic Complex (SSVC) (Ferres et al 2011). In the current study, the data has been organized using geographic information systems (GIS) to analyze the cultural change before and after the diverse volcanic eruptions that affected prehispanic populations, including the Maar Plan de la Laguna (Amaroli and Dull 1998) and Ilopango Caldera (Dull et al. 2019) from the Middle Preclassic period to the present. This research aims to provide a perspective on the cultural change forced by volcanic and tectonic dynamics, as well as the complexity and archaeological richness in Cuscatlán.

Daily Life Rhythms of the Mexican Mountains: Narrating Milpa and Coffee Landscapes in Baxtla and Mixtla de Altamirano

Within the Mesoamerican worldview, maize is synonymous with the body and represents the primary food of the human being, accompanied by a complex planting system known as milpa. Said system, we believe, celebrates the interrelation between the diversity of species, serving, in this way, as a metaphor to understand our social construction. In this metaphor, there is an interrelationship between human beings and the landscape in a chain of changes manifested in daily life; that is to say, the changes are visible by exploring inhabiting, how we produce, and how our environment produces us. Through the rescue of this interrelation exploring the narration of daily life in Baxtla, and Mixtla de Altamirano, this presentation aims to blur the fine lines that separate the milpa and the coffee plantations and the many ways in which this traditional agroforestry systems have changed.

Early Plant Food Use and Processing: Insights from Madjedbebe Rockshelter, Northern Australia

A broad spectrum diet, including the exploitation of a variety of wild plant foods, has historically been considered a precursor to the origins of agriculture. However, increasing evidence globally points to the use of a range of plant foods, including seeds and underground storage organs, by Pleistocene humans and their closest ancestors. At Madjedbebe, a rockshelter in northern Australia, early occupation by ~65 kya is associated with the use of a diverse range of plants, including evidence for intensive processing and associated technologies. This presentation considers this early diet and its change over time in response to changing environment and demography. This included a broadening of the diet during drier glacial stages, as well as changes in the seasonal round and incorporation of new foods with the formation of freshwater wetlands following sea-level rise in the late Holocene. The foundations of the economy evidenced at Madjedbebe, including seasonal mobility, a broad diet, and requisite plant processing and grinding technologies, were, however, maintained through time. Broad spectrum foraging is, therefore, a significantly older practice than

once hypothesized and a key component of the resilient economic system evidenced at Madjedbebe, allowing for cultural continuity in the face of pronounced environmental change.

The Oldest Dates from the Ocean State: New Data for Late Paleoindian Habitation in Rhode Island

Two of the earliest radiocarbon dates in Rhode Island have been obtained from two different archaeological sites that help connect isolated Paleoindian artifacts found in the state to the larger historic narrative of Native American habitation in the Northeast. The excavation of these sites, discovered during a CRM survey, were conducted within the Section 106 consultation process that dictated the extent and focus of the excavations. Charcoal recovered from intact cultural features provided valuable information about Paleoindian settlement patterns. The dates further suggest that Late Paleoindian people in southern New England had a generalized mode of subsistence rather than following a specialized model, in which a highly mobile group focused on exploitation of large, now extinct animal species. The Pine Swamp and Crossroads sites add to the growing body of evidence supporting Paleoindian period occupation in southern New England in a variety of micro-environments.

Producing and Stretching Identity: Earspools and Childhood in the Maya Area

Iconographic sources indicate that the wearing of earspools by ancient Maya peoples was so ubiquitous that it was an essential part of personhood, a status put into jeopardy when earspools were removed and replaced with paper in scenes of almost naked captives or of warriors. Previous studies of archaeological examples of jade and shell earspools have largely focused on high-status adults, while few studies have considered their importance among children. This paper examines the act of piercing infants' ears as a key rite of passage in the making of social persons in the Maya area. It examines, in particular, Classic period ceramic figurines, sculpted works, and painted representations of children and their developmental stages and contextualizes these images with ethnohistoric and ethnographic literature on children. Although ear piercing was a key rite of passage, this paper also underscores the stretching of the ear over time, making this ritual a long-winded process where social identity was constantly reworked.

Sea-Level Rise and Settlement at Ta'ab Nuk Na, Belize: Analyses of Marine Sediment from the I-line, 4m Transect

The ancient Maya created a culture with writing, religion, and vast trade networks. These trade networks are evident on the southern coast of Belize, where archaeologists have found sites dedicated to salt making. This paper will discuss Ta'ab Nuk Na, one of these sites. Sediment and charcoal samples were collected by the Underwater Maya Research Group led by Heather McKillop and E. Cory Sills. I subjected these samples and components within them to loss-on ignition, radiometric dating, and microscopic analysis. Loss-on ignition was used to ascertain organic material percentage by burning sediment at high temperatures to burn off organic components that are weighed and compared to unburned sediment. Microscopic analysis was used to determine the organic makeup of the sediment across the excavation. Radiometric dating was used to determine dates for site occupation and sea-level rise. Loss-on ignition and microscopic analysis helped

accurately determine areas of the excavation associated with human activity. Radiometric dating shows when the site was abandoned due to sea-level rise. This paper sheds light on when the site was occupied, when sea-level rose and how this affected the ancient Maya, and the organic material levels within the site.

Rethinking Site Survey: An Interdisciplinary Approach to Site Modeling and Prediction in a Hazardous Environment
 Hazardous and difficult-to-navigate terrain often impedes investigation and recovery of missing individuals in forensic archaeological contexts. Here we discuss novel solutions at one such site, a 1,750 m high sheer limestone cliff in Southeast Asia. In addition to the difficult terrain, investigation and recovery is hampered by the scale of the geological feature, which includes a 700 m near-vertical drop, portions of which are covered with dense subtropical vegetation, which makes identifying and accessing potential recovery sites exceptionally challenging. We used an interdisciplinary team to employ remote sensing technologies, artificial intelligence-based computer modeling and analysis, light detection and ranging (lidar), 3D mapping, geospatial analysis, and anomaly detection algorithms on drone video footage to target locations for investigation. Here, we present the outcome of this study, carried out between 2020 and 2023. The result is a focused, systematic approach that limits the time investigation and recovery personnel spend in hazardous conditions—thus ameliorating risks while maximizing recovery potential. The project combines novel approaches and exemplifies interdisciplinary approaches to an anthropological problem.

#Land Back! Tribal Land Exchanges and the New Mexico State Land Office (NMSLO)
 There are over nine million acres of trust land across the state of New Mexico. This land is not public land; rather, it is land held in trust by NMSLO for the benefit of its beneficiaries (e.g., public schools, hospitals, colleges, and other public institutions). Revenues are raised through the leasing of lands to the mining, renewable energy, and oil and gas industries. The mission of the NMSLO, then, is to manage the land for maximum economic yield. This is where land exchanges fit in. Land exchanges are a tool designed to increase returns for the beneficiaries by acquiring land that is of equal value or of greater value to the State. And sometimes, that means NMSLO is interested in giving land back to Tribes in exchange for land that can generate revenue for its beneficiaries. Although it is not quite “land back” per se, it is a win-win situation for state beneficiaries and for Indigenous Nations. This poster will discuss the history of NMSLO land exchanges, our learnings on the process of tribal consultation, how programmatic agreements create greater tribal engagement in the exchange process, and the unique issues that hinder Tribes from acquiring state land.

Sugar, Alcohol, and Toys: Uses and Changes in Pottery Following the Spanish Conquest of Comitán, Chiapas, Mexico
 Following the work presented at SAA 2023 about identifying specialized potters in the Comitán Valley of Chiapas, a study of change brought by the Spanish conquerors is presented. The local potters had to innovate as their work was integrated into sugar cane processing via the molds, or “*pilónes*,” used to crystalize sugar as well as water-carrying jars used in distillation processes of liquor. Archaeological, historical, and ethnographic data is presented to understand how tracking these changes helps to get a broader understanding of the acculturation of local pottery traditions as a historical development. Ethnographic work tells the story of how the use of pottery in sugar making was abruptly stopped for political reasons as an example of the way material culture is impacted by sociopolitical phenomena.

Learning the Ropes: Cordage, Knots, and Lashings, Their Purposes and Their Meanings in Olmec Art

While only small fragments of actual cordage have been recovered in Gulf Coast Olmec excavations, depictions of cordage figure prominently in Olmec and Olmec-related art. Reliefs of string, rope, and knots appear as costume components on Colossal Heads, on figures in the round, and in relief images on thrones and stelae, as well as in depictions of rope used as an instrument to connect, secure, or bind objects or people. The meanings behind these rope-based costume elements and paraphernalia have proven elusive, however. While some scholars suggest that depictions of rope symbolize captivity and subordination, others suggest that this imagery refers to familial connections or even symbolizes umbilical cords, and still others suggest that depictions of rope indicate control, power, and status. This project closely examines depictions of cordage to identify the types of knots and lashings used in Gulf Coast Olmec depictions. The resulting identifications help to reveal the purposes of the different types of ropework and bring new understanding to the nature of what is portrayed in this sculpture. Further comparisons of Olmec depictions of rope with associated objects and closely related motifs shed additional light on the meanings and symbolism of Olmec cordage imagery.

Inter-site Relationships on the Madaba Plain: Surveys around the Ancient Town of Nebo (Khirbat al-Mukhayyat, Jordan)

Khirbat al-Mukhayyat is located approximately 6 km northwest of the city of Madaba and has long been associated with the ancient town of Nebo. The Khirbat al-Mukhayyat Archaeological Project (KMAP) was established to investigate the economic and ritual importance of the site across multiple periods and its connection to contemporary sites in the region. Building on the work of the Tell Madaba Archaeological Project (TMAP), KMAP continued the tradition of investigating the role of presumed urban centers and their relationship to other sites within a regional settlement network. This poster will present the results of KMAP's four survey seasons (2017–2023) as well as two surveys conducted by TMAP at the nearby sites of Libb and Ma'in. This survey work has investigated a number of Late Neolithic, Chalcolithic, and Early Bronze Age sites around Mukhayyat. A series of Iron Age hill forts and villages has also been identified in the region. In addition, a number of burial caves, likely dating to the Byzantine period, have been identified in the wadi west of the site. The evidence produced by these surveys clearly illustrates the importance of this region throughout antiquity.

Reflections on Career Choices: Alliance Building in Archaeology

It was the writing and award of NSF Women in Science grant that brought to the fore for me the issues of women in archaeology. Motivated to build on my associations, I sought speakers in archaeology that could represent the world of possibilities. In that search, I was able to meet many women in the field and learn of existing informal gatherings that were essentially network support groups, something that should be formalized for our national meetings. These encounters revealed the different paths that women in archaeology choose to fulfill their academic aspirations as well as personal commitments. As I reflect on my own path, I can see that alliances and networks are at the foundation of a fulfilling career.

Material Transformations and Vegetal Ontologies in the Postclassic and Colonial Mesoamerican Flower Worlds
 Prehispanic visual sources and colonial alphabetic texts provide rich descriptions of what scholars have termed “the Flower World” in Mesoamerica. This idealized celestial realm was filled not just with flowers, but an array of other precious substances, ranging from gemstones to precious metals, to bird feathers and butterflies. An interesting feature of prehispanic iconography is that some of these distinct substances are represented with identical motifs. What accounted for such visual conflations? These materials ostensibly did not transform into one another in a fashion akin to alchemy; instead, evidence suggests they were all linked by being seen as in states of constant transformation and growth, exhibiting ontologies akin to flowers and other plants. I argue that it was this fluidity and ever-changing nature of these substances that allowed other materials introduced from Europe to be absorbed into the Flower World during the colonial period; namely, silk. By adopting silk textiles and other liturgical vestments, and folding them into these same Indigenous ontologies, it became possible for a new vision of this Mesoamerican celestial realm to be materialized in early Catholic churches.

Teotihuacan and Its Interregional Interactions during the Epiclassic Period: New Data from the Suburban Neighborhood of Hacienda Metepec
 Interregional relations are widely documented for Classic period Teotihuacan (AD 1–600), where a rich and extensive network of goods, people, and ideas connected the ancient city with the rest of Mesoamerica. After its political collapse at about AD 550/600, Teotihuacan remained a large population center during the subsequent Epiclassic period (AD 600–800). The degree of integration of these post-collapse Teotihuacan households into broader regional or interregional networks, however, remains poorly understood. In this paper, we present recent data obtained from Hacienda Metepec, a peripheral neighborhood of Teotihuacan that was occupied before and after the collapse. Based on the study of artifacts obtained during two seasons of field excavations (obsidian, ceramics, figurines), we infer that residents of Hacienda Metepec were primarily engaged in local exchange networks, having limited interactions with communities beyond the Valley of Teotihuacan. Nonetheless, the Epiclassic residents also participated in broader conventions of making and decorating ceramics and figurines and engaged in ritual practices shared with communities across highland Mesoamerica. This case study demonstrates that while ideas and customs were still exchanged at interregional scales after the collapse of Teotihuacan, the economic network had been much reduced in scale.

[179]

From Terrace to Tray: Agriculture and Foodways at a Thirteenth-Century Alqueria
 The preparation of a meal begins with the acquisition of ingredients—and for much of our human past, this has meant growing or gathering. Thus, food production through farming is a natural starting point for investigating foodways, especially for communities that are self-sufficient or have limited access to markets, such as agricultural peasant communities or island communities. One such community is the medieval Muslim

population of the Balearic Islands, who inhabited part of Muslim Iberia (al-Andalus) from the tenth through thirteenth centuries CE. In this paper we bring together botanical, faunal, ceramic, and spatial data from the *alqueria* (farming village) at the site of Torre d'en Galmés, Menorca, along with contemporary textual evidence (cookbooks, estate inventories, tax treaties) to investigate how the inhabitants of this settlement fed themselves, from agricultural terrace to tray. More specifically, we investigate (1) what aspects of farming and foodways practices can we reconstruct at Torre d'en Galmés?; (2) how can we use remains of meals to reconstruct cultivation practices?; and (3) how does this information compare to the mainland; i.e., are there any differences between this rural island settlement and mainland rural settlements?

Follow the Pictorial Path: Assessing Rock Imagery and Human Movement at Chaco Canyon

A core principle of professional archaeology is the preservation and consideration of context. For studies of rock imagery, this necessitates documenting the context of panels in relationship to the larger cultural landscape. Using landscape theory, I assess the placement of petroglyphs and pictographs at Chaco Canyon, NM, in relation to known and suspected corridors of pilgrimage movement. A central theme built into Chaco is sacralized human movement, with systems of public architecture, roadways, and shrines designed to profoundly shape people's experience of moving through the canyon. Chaco is popularly interpreted as a regional ceremonial center and pilgrimage destination, in keeping with sacralized movement being an integral aspect of the rituals and ontologies of historic and contemporary Puebloan communities. I assess this model of Chacoan social organization through identifying the spatial relationship of rock imagery to access points and formal routes through Chaco. Rock imagery is ethnographically documented as an integral feature of pilgrimage journeys and cosmographically defining ceremonial spaces in the American Southwest, but the relationship of Chaco's landscape iconography to formalized movement and ceremonial performance remains largely unassessed. My dissertation research demonstrates the integral role rock imagery played in ritual performance on the topographic stage of Chaco Canyon.

Sea-Level Rise and Settlement at Ek Way Nal: Coring the Past

Excavations in the spring and summer of 2022 were carried out at the underwater ancient Maya salt work of Ek Way Nal in Punta Ycacos Lagoon in Paynes Creek National Park, Belize. Ek Way Nal provided salt to the ancient Maya during the Late and Terminal Classic periods (600–900 CE). In addition to excavations in buildings at the site, a 1 × 2 m unit was excavated to extract a sediment column for examining the relationship between the ancient Maya settlement at Ek Way Nal and sea-level rise. In this presentation, the excavations, extraction of the sediment column, and processing it for laboratory analyses are described. Field observations are discussed. Fine red mangrove root (*Rhizophora mangle*) and charcoal samples were extracted from the sediment column for radiocarbon dating. The results from the datum core excavation indicate that sea-level rise occurred before, during, and after the ancient Maya occupation at Ek Way Nal.

Experimental Archaeology in Maize Farming at Range Creek Field Station, Utah

Archaeological evidence in Range Creek Canyon, Utah, shows a heavy reliance on maize farming during the

Fremont occupation, 900–1200 CE. Evidence includes numerous corn cobs, ground stone tools, and food storage sites. Since 2013, researchers at the field station have used actualistic maize farming experiments to provide a unique perspective on the difficulties of farming in arid environments with simple prehistoric technology. The maize farming experiments have been ongoing each year with the help of staff, students, and volunteers. The experiments are designed to produce quantitative data on the costs and benefits of irrigation as well as how to conduct other farming activities such as planting, weeding, and harvesting maize using only tools available 1,000 years ago. The experiments show that Fremont farmers would have relied on surface irrigation from Range Creek, a perennial stream, to improve maize yields. Students participate in every stage, from clearing fields in the spring to harvesting the maize and analyzing it in the lab during fall semester. Our experiments not only provide a truer experience of what prehistoric farming was like in the canyon, but also teaches students how to design and implement experimental research to supplement the archaeological record.

Comparative Analysis of Food Production, Waste, and Socioeconomic Dynamics in Red Light Districts and Brothel Sites across Three Port Cities during the American Industrial Revolution

In this paper, I present a comparative analysis of brothel sites and red-light districts in three major port cities during or around the period of the American Industrial Revolution. With a focus on Storyville in New Orleans, Louisiana, I will use Five Points in Manhattan, New York, and Hell's Half Acre in Los Angeles, California, as sites for comparison. This analysis examines faunal data to provide insight into food production, waste, economic factors, and socioeconomic dimensions at these sites. The selection of these three cities as case studies is motivated by their geographical locations as bustling port cities. This allows for an examination of the transportation networks of food commodities within the United States and from international sources through these port facilities. Utilizing a comparative approach, this analysis seeks to discern commonalities and distinctive characteristics among these red-light districts situated in diverse locales. In particular, I aim to uncover the relationships between urban sex trade, food consumption, and broader societal contexts. In addition to highlighting food distribution and sourcing and the potential implications of racial prejudice on food waste practices, this research also seeks to illuminate the resilience, adaptability, and perseverance of sex workers in the face of challenging circumstances.

Who Died Prematurely? A Demographic Profile of Middle and Late Period San Francisco Bay Area Juveniles

This study explores the demographic profile of a Middle and Late period juvenile burial assemblage from a San Francisco Bay Area site, CA-ALA-329 (bearing the Muwekma Ohlone name of Mánni Muwékma Kúksú Hóowok Yatiš Túnnešte-tka, or Place Where the People of the Kúksú (Bighead) Pendants are Buried). Sex-ratio was established using a proteomics method of sex identification. Stress was evaluated based on presence/absence of skeletal indicators. Social status and distribution of wealth were ascertained based on the quantity/type of associated grave goods. The sex-ratio is about equal. Skeletal indicators consistent with nutritional deficiency, disease, and/or metabolic disorder are present, particularly among infants. There is a correlation between age-at-death and quantity and type of artifact, as infants were frequently buried with the elaborate grave goods. Distribution of wealth appears more equal in the Late period. Each phase of this project was designed with full support of living descendants of Ohlone peoples, to contribute to the scientific record of Bay Area Peoples over thousands of years. Ultimately, we aim to support Ohlone traditional knowledge of cultural continuity in the Bay Area and aid in federal recognition. This study focuses on childhood in the Bay Area, thereby expanding our picture of the past.

Deep History of the Picuris Watershed

Provocative new evidence from research on tribal lands suggests that Picuris was already a demographic center of the Eastern Pueblo world at the start of the tenth century CE. In this paper, we report on recent surveys and excavations at the Eagle Pile Site, home to a large Developmental period (850–1150 CE) village. We summarize what is currently known about the hundreds of pit houses that likely composed the village; we draw on a growing radiocarbon dataset to chronologically situate the village within the region's deeper Holocene history; and we undertake compositional analyses of on-site Red Mesa Black-on-White and Kwahe'e Black-on-White pottery to explore exchange networks, particularly Picuris's early connections to the emerging regional system based in Chaco Canyon.

aDNA Analysis of Prehistoric Salmon Remains at Housepit54

Salmon were a critical resource in the Indigenous economies of the Pacific Northwest. There are five Pacific Salmon species that spawn within the Fraser River and its tributaries: sockeye (*Oncorhynchus nerka*), Chinook (*Oncorhynchus tshawytscha*), coho (*Oncorhynchus kisutch*), pink (*Oncorhynchus gorbuscha*) and chum (*Oncorhynchus keta*). Since each species exhibits different spawning behaviors, determining which species were consumed helps archaeologists better understand ancient socioeconomic strategies. This project utilizes ancient DNA (aDNA) to identify salmon species variation to test alternative hypotheses about the economics and social impacts of fishing behavior at Housepit54, Bridge River site located in British Columbia. aDNA analysis is conducted on samples of thoracic and atlas vertebrae taken from the sequence of 15 stratigraphic floors, which can be segregated by two occupational periods represented as Bridger River 2 (1600–1300 cal BP) and Bridge River 3 (1300–1000 cal BP).

Participation, Choice, and Institutional Change across the Eurasian Bronze Age

Theories of “complex social organization” have long linked institutional formations to increased concentrations

of power, centralization, and inequality. However, for more than a decade, novel models of “non-uniform complexity”—wherein economic, social, ritual, and practical institutions reflect divergent geographic networks from those underpinning political power—have been useful for explaining the rapid and regionally expansive connectivity and innovation that linked urban communities and mobile pastoralists of Inner Asia throughout the Bronze Age. This paper reexamines this model in light of *The Dawn of Everything*, ultimately situating non-uniform complexity within a wider theoretical movement that promotes alternative views of complexity and an archaeological contribution beyond “habitus” and “practice” to link human choices and institutional participation to the formation of complex and extensive connectivity among pre-state populations of Eurasia.

Establishing Longitudinal Regional Origins in East Coast North America Using a Modern Strontium and Sulfur Isoscape in Deer Bones from Virginia

Establishing geographical provenance and life histories of North American colonial individuals is critical for understanding early population movements related to urbanization, immigration, and the changing demographics of an emerging nation. In East Coast North American archaeological studies, oxygen stable isotopes are the primary proxy for regional origin, yet this isotope system is generally limited to latitudinal variation. This study examines bioavailable sulfur and strontium isotopes in Virginia, the source of which is the north-south striking geologic formations in this region. Weathering releases sulfur and strontium into the soil which then propagates up the food chain, a process which functions similarly in both colonial and modern ecosystems. Over 200 modern deer across a 300 km distance are analyzed for sulfur and strontium isotopes in bone collagen and bioapatite, respectively. Preliminary sulfur isotope data shows a 5% shift from coastal to mountainous regions. Pending strontium data will enhance this isoscape and generate a dual-isotope matrix with more nuanced discernment of longitudinal origins and east-west movement. This will be the most comprehensive set of bioavailable sulfur and strontium isotope data for this region. Combined with oxygen isotopes, these new data can provide a more powerful assignment of geographic origins for past individuals.

Pueblos, Hogans, and Lidar on the Fireline

Fire archaeologists in the US Southwest are at a challenging intersection of increased wildfire severity with dense fuels, high site densities, and often limited cultural resource inventory. The archaeological sites most vulnerable to wildfire effects are those that are unknown and undocumented. This presentation details the applicability of lidar data to identify archaeological resources in time-sensitive emergency response situations. The 2023 Kane Fire on the Kaibab National Forest in northern Arizona provided the opportunity to field-test

the technology amid the fast-paced environment, grueling conditions, and multiple logistical challenges of wildfire incidents.

Small Stemmed Projectile Points, Bow and Arrow, and the Presence of New Human Populations in the Final Late Holocene of South Patagonia

During the Late Holocene, a variety of stemmed projectile points have been recorded in the Atlantic side of central-south Patagonia. Although some of the so-called Fell IV stemmed projectile points may have been part of a bow and arrow weapon system, this is probably not the explanation for the thick so-called Fell IV projectile points. The situation is not so clear for other varieties of these stemmed points. These varieties may have coexisted in some places, like the Magellan Strait. However, in the upper Santa Cruz River Basin there are chronological differences for the deposition of the Fell IV and the smallest varieties of Fell V projectile points. The latter were recorded at the end of the Late Holocene, when other changes in the archaeological landscape were also identified. Genetic information points to the presence of new human populations in the area, suggesting that this is the reason for the introduction of the smallest variety of stemmed projectile points, and the related bow and arrow weapon system.

Aligning Previous Research with New Methods: Photogrammetry and 3D Artifact Analysis of Tabun Cave, Israel
Tabun Cave, Israel is an iconic Paleolithic site known for its long cultural sequence and its rich and variable artifact assemblages. Historically, Tabun has been studied for nearly a century in many different ways, but we endeavor to apply newer methods to bring our current understanding of the site into alignment with contemporary questions about hominin toolmaking. Here, we report on methods and preliminary results which explore trends in stone tool manufacture and artifact form during the late Lower Paleolithic (LP) Acheulo-Yabrudian (AY) and Middle Paleolithic (MP) Levantine Mousterian (LM) at Tabun. The AY and LM technological systems co-evolved with human behavior and biology over the course of hundreds of thousands of years from the LP to MP. The key to understanding this complex relationship lies in determining which aspects of Paleolithic technology played dynamic roles in large-scale evolutionary patterns, how they interacted, and why.

[267]

Heritage Management and Wildland Fire: A Story of Success on the Comanche Fire

In June of 2023 the Comanche Wildfire began by a lightning strike on the El Rito District of the Carson National Forest in northern New Mexico. Due to the rains and cool temperatures this fire was burning low to moderate allowing the Forest to use the fire beneficially; however, this posed a problem for cultural resources. Cultural resource management during fires is often triage, picking which sites you have time to protect; however, as this fire was burning slowly archaeologists had more time to protect sites. Thanks to preventative fire mitigations, a

prehistoric habitation site and a historic spring box site came out unscathed by fire. Additionally, through the hard work after the fire by wildland fire fighters the site is even more protected from natural events and other impacts in the future. This is a success story for cultural resource management in a wildfire.

A Simple Model of Long-Term Population Expansion and Recession

Over the last 12,000 years human populations have expanded and transformed critical earth systems. Yet, a key unresolved question in the environmental and social sciences remains: Why did human populations grow and, sometimes, decline in the first place? Our research builds on 20 years of intense archaeological research studying the deep time dynamics of human populations to propose an explanation for the long-term growth and stability of human populations. Innovations in the productive capacity of populations fuels exponential-like growth over thousands of years; however, innovations saturate over time and, often, may leave populations vulnerable to large recessions in their well-being and population density. Empirically, we find a trade-off between changes in land use that increase the production and consumption of carbohydrates that may drive repeated waves of population growth over thousands of years and the susceptibility of populations to large recessions due to delays in the manifestation of competition for resources. These results shed light on the long-term drivers of human population growth and decline.

Slave Trade and Colonialism in African Islands from the Atlantic and the Indian Oceans

One key period of history involved the forced migration of millions of people due to slavery. Information on the origins of the enslaved individuals has been reconstructed from historical records and, more recently, through the use of paleogenomic techniques. However, all these ancient DNA studies have been performed on mainland Americas and the Caribbean, leaving other geographical regions understudied. In this project, we explore the history of slavery and the impact of colonialism in Mauritius and the Canary Islands, where enslaved people were brought during colonial times through the Indian Ocean and the transatlantic slave trade, respectively. For that, we use next-generation sequencing of ancient DNA to estimate the genome-wide ancestries of individuals sampled in the cemeteries of Albion ($n = 8$) and Le Morne ($n = 26$) in Mauritius, and Finca Clavijo ($n =$) and Juan Rejón ($n = 1$) in the Canary Islands. Ancestry inference indicates that individuals from Mauritius had ancestries related to not only mainland Africa and Madagascar but also from Europe and South Asia. For the Canary Islands, enslaved individuals had sub-Saharan African, North African, Middle Eastern, European, and Canarian indigenous ancestries. Our results provide insight into the complex demographic history of Mauritius and the Canary Islands.

Interpreting Burned Commingled Ancestral Remains in the American Southwest

Highly fragmented ancestral remains are found throughout the Ancestral Puebloan region of the American Southwest (AD 800–1700). These human remains are often cut, burned, broken, disarticulated, and commingled. For the last 20 years, the narrative has been that these collections were burned to be eaten (anthropophagy/cannibalism). This narrative fails to include Puebloan ethnography, which discusses fire as a tool of transformation and purification. Burning and ashes serve a critical role in many Pueblo ceremonies and curing rites. There are accounts of fire being used as a purifying act to ritualistically destroy villages and to annihilate the bodies of those accused of witchcraft. This research project embraces the complicated relationship between the victims and those individuals who handled their bodies after death. Violence is never an isolated or meaningless act but intentional, communicative, and culturally meaningful. The act of burning these bodies held a greater cultural meaning than simply burning for consumption. This project brings together bioarchaeological data, ethnographic, and archival resources to reconstruct and contextualize these ancestral remains. Using social theory about body transformation and body agency, a reinterpretation is offered about the nuance of how these commingled bodies were handled.

Magic Soul Containers of the Classic Maya in Archaeological Context

Classic Maya (CE 250–800) texts include a phrase *k'a'ay u sak nikte'*, faded his white flower, as a reference to the ending of the sweet breath of rulers and as a metaphor of their death. The breath—allegory of white flower—is evidently an allusion to soul force. Scholars identified on Tikal Stela 5 a reference for a White Flower Soul Container, which is believed to be a lidded jar used as a receptacle for containing the breath soul. Excavations at the ancient Maya site of Waka' have unveiled white stone and black and brown lidded ceramic jars placed in the tombs of rulers, likely soul containers. At Tikal, two lidded jade mosaic encrusted cylinders found in royal tombs are also identified by the authors of this work as soul containers, and additionally as receptacles for patron maize gods conjured by rulers

Genomic and Isotopic Migration and Kinship among the Classic Maya of Belize

Emerging genomic and isotopic approaches have opened new doors to reconstructing diet, mobility, kinship, demography, and identity in the past and have the potential to transform our understanding of the ancient Maya world. These methods offer ways to reconstruct where people lived, who they were related to, how they organized their communities, what they ate, how they moved around the landscape, and how these dynamics changed over time. However, relatively few studies in Mesoamerica have combined genomic and isotopic approaches and grounded the collective interpretation of these data in archaeological contexts. What if we let archaeology drive what we learn from these emerging data, with collaboration of local communities, and combine all the tools and relationships at our disposal to understand ancient social worlds? We discuss the ongoing state of genomic and isotopic research in the eastern Maya lowlands in Belize and show how community engagement, cutting edge scientific approaches, and traditional archaeological data can enhance one another and contribute to the creation of anthropological models using examples from projects across Belize—from Classic period Caracol in the Vaca Plateau to polities in the Belize Valley such as Lower Dover and Postclassic Santa Rita (Chactemal) in northern Belize.

Pagan-Christian Interactions Eleventh to Thirteenth Centuries CE: The Isotope Evidence

The Balts are generally recognized as the longest persisting pagan-dominated community in temperate Europe, widely practicing until the fourteenth century CE. Historical research documents that trading, raiding, and crusading often brought the Balts into direct contact with Christians in the centuries leading up to their ultimate conversion. This paper presents $^{87}\text{Sr}/^{86}\text{Sr}$, $\delta^{18}\text{O}$, $\delta^{13}\text{C}$, and $\delta^{34}\text{S}$ results demonstrating direct evidence for mobility of pagan groups existing within or economically entwined with their Christian neighbors between the eleventh and thirteenth centuries CE. Horses sacrificed in Balt cemeteries excavated in modern Kaliningrad and Lithuania were sourced across the Baltic Sea from Christian trade partners. Additionally, Kyivan Rus accommodated Baltic migrants buried in a pagan style. These findings establish diverse socioeconomic intermingling not previously documented between pagan and Christian groups at the end of the Long Iron Age.

Analysis of the Fenley Hunter Obsidian Flake from the Tule Springs Archaeological Site, Las Vegas, NV

This poster concerns the Tule Springs Archaeological Site (79001461/26CK4) in Clark County, Nevada, and new analyses of the obsidian flake discovered there in 1933. The importance of the flake rests in its then-postulated association with the fossil remains of extinct Pleistocene megafauna and the long-term research endeavors that have happened since. Although a direct association with megafauna could never be demonstrated, the flake was found within terminal Pleistocene sediments. Using X-ray fluorescence (XRF) spectrometry, we show that the artifact originated from the Airfield Canyon obsidian outcrops associated with the Obsidian Butte geochemical source in southwestern Nevada, roughly 230 km north of Tule Springs. By contextualizing the current results within the broader spatial patterning of Great Basin toolstone conveyance at the time, we reintroduce Tule Springs as a key site in the study of the earliest occupations of the Desert West.

Occupational History and Site Function at Two Sites within Montezuma Castle National Monument

Arizona's Verde Valley represents a significant archaeological resource and was a prehistoric cultural crossroads. Despite this, the region has been relatively understudied. Archaeological interest and excavation has historically focused on the large pueblos in the region, while smaller habitation and resource processing sites have only received cursory investigations. The last archaeological excavation in the Montezuma Well Unit of Montezuma Castle National Monument was conducted by the National Park Service in the early 1960s. Recent archaeological testing at two sites near Montezuma Well represented a rare opportunity to explore Southern Sinagua occupation and use of the Verde Valley and Montezuma Well area, in particular. The resulting analysis of recovered cultural materials offers a challenge to the previously established occupational history of the area and identifies site functions that have had only limited consideration.

Keeping Up Productivity: Persistence of "Lost" Crops in the Trans-Mississippi South

Most crops in the Eastern Agricultural Complex were no longer members of Native American farming systems when Europeans first took note. Reasons usually proposed for the fall-off entail advantages of maize over the pre-maize cultigens, with heightened defensibility of close, compact fields being another possible factor. Similar to the variability in timing of initial dependency on maize across subregions of eastern North America, later agricultural trajectories differed from subregion to subregion. At sites in the Trans-Mississippi South, evidence exists for continued production of sumpweed and goosefoot—along with sunflower, eastern squash, and of course maize and beans—well into the final decades of pre-European contact and probably later. I discuss possible causes for the persistence of agrobiodiversity in this particular area, where densely populated Native towns were few and sustained European contact was late. This paper salutes the ongoing productivity of Dr. Karen Adams and her contributions to the study of underappreciated crops, maize, and diverse Indigenous food production systems.

Childhood Diet, Mobility, and Weaning in the Early Medieval Kingdom of Lindissi

Lindissi is an early medieval kingdom that encompassed the majority of North Lincolnshire, UK. It was independently ruled until roughly the early seventh century when it underwent many years of sociopolitical change before finally being absorbed by Mercia. Here we examine bulk tooth enamel $\delta^{13}\text{C}$ and $\delta^{18}\text{O}$ isotopic signatures from six sites in the region to explore dietary and weaning patterns as well as childhood mobility during this turbulent period. Permanent first (0–3 yrs.) and third molars (7–16 yrs.) from 26 adult individuals across sexes that date to between the fourth and eighth centuries were sampled. By comparing and contrasting data from both tooth types, we are able to create snapshots of child life history from early to later childhood. Macpherson (2005) examined enamel from a further four sites in North Lincolnshire which date to between the eighth and twelfth centuries. Comparing our data with their data shows long-term trends in weaning habits across the entirety of the medieval period. Finally, we are able to contrast these data to previously reported bone collagen $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ data for our sample to discuss the complex nature of inter-tissue comparisons and show trends throughout the life-course.

Activating Heritage: Introductory Remarks on Substantive and Pragmatic Archaeologies

Drawing on the session co-organizers' experiences, this paper offers reflections on the state of heritage research being conducted by archaeologists, its current limitations, and its potential for greater social impact. Leaning into the notion that heritage does important work in the world, we offer thoughts on how archaeologists can engage in more substantive heritage practices—ones that aim to dismantle systems of oppression and actualize a more just future.

Frykholm, Soren (University of Michigan)**[160]***Engaging and Building Community through Archaeology at Monte Negro, Oaxaca*

Since the 1930s, the community of Monte Negro has played an integral role in the research projects carried out at its namesake archaeological site. Beyond participating in the investigations of visiting scholars, community members have themselves initiated projects to collect and disseminate local knowledge pertaining to their heritage, sought resources for the continued preservation of their archaeological site, and promoted the community as a model for sustainable Indigenous tourism. During a productive conversation with local leadership in 2022, I was able to discuss how a more traditional archaeological research program might intersect with local needs and ambitions. After formalizing a partnership agreement, we began developing initiatives that included developing a children's theater group, petitioning INAH to allow the community to retain archaeological artifacts, enhancing tourism infrastructure, and more. Later, and after several rejected attempts, I secured funding from a public scholarship grant that allowed us to make these aspirations a reality. In this presentation, I will talk about the collaborative relationship and initiatives I have developed with the people of Monte Negro and what implications it might have for foreign archaeologists like me who have a passion for Oaxaca archaeology.

Zanthoxylum bungeanum, a vital component of ancient Chinese culinary life, has been unearthed from many tombs associated with the Chu state. As a prominent funerary offering, it is presumed to hold distinct roles and functions within the burial context. The presence of *Zanthoxylum bungeanum* alongside various fruit remains underscores its multifaceted significance as a food item, serving functions in cooking, seasoning, and alcoholic beverage production. When found in conjunction with cinnabar, it likely played a significant role in shamanistic ritual ceremonies. On one hand, it contributed to the warding off malevolent forces, while on the other hand, it bore connections to the Chu state's religious beliefs regarding soul guidance and convergence. The fragrant aroma of *Zanthoxylum bungeanum* had the capacity to invoke spirits, thus its inclusion in burials could facilitate communication with divine entities. *Zanthoxylum bungeanum*, within Chu culture, served as both a delectable ingredient and an essential element in rituals and beliefs, with its functions and symbolic meanings permeating various facets of ancient Chu civilization, reflecting the profound understanding and reverence of the natural world and the spiritual realm by the Chu people.

Growth in cultural and environmental compliance industries highlights a need to train early career professionals in collaborative approaches to heritage management that consider both the interrelatedness of cultural and natural resources across diverse habitats, and the expressed interests and goals of the communities who maintain long-standing connections to managed lands. Here, we present ongoing research as part of a field school in the Okanogan Highlands of north-central Washington state, in the homeland of the Okanogan people, that was developed to address this need. The field school is aimed at exploring the continuity of culture and place and connections between community, landscapes, and ancestral foods in upland environments through time. It was developed in partnership with the Confederated Tribes of the Colville Reservation, Bureau of Land Management, and academic institutions and provides a unique opportunity to train early career professionals in collaborative heritage management practices in diverse upland ecologies. The field school was designed to improve accessibility to field training opportunities and teaches field methods applicable to careers in CRM and related industries. Specialized analytical techniques (aDNA, paleoethnobotany, zooarchaeology, drone/lidar, pXRF) are used to explore enduring connections to the land and how they articulate with food sovereignty and community health.

Using Social Annotation to Improve Student's Transferable Skills in an Online Archaeology Course

Many universities are interested in developing students' transferable skills—those focused on the ability to do something (e.g., think critically), as opposed to content-based or discipline-specific knowledge. In a world where the average person changes careers 5–7 times, transferable skills are becoming increasingly important to help leverage career options. However, transferable skill development has become more difficult in the post pandemic world in part due to decreased student engagement. Incorporating social annotation into coursework is one way of not only increasing student engagement, but also developing transferable skills—some of the top qualities today's employers seek in new hires. Social annotation takes the traditionally solitary activity of reading texts, viewing videos, and examining course material and transforms it into a collaborative activity, usually in an online space. Students highlight, comment, and discuss questions about course material while learning from (and with) each other. This study explores transferable skills within the

context of social annotation by analyzing data from a large enrollment (140+ students) asynchronous online, undergraduate, general education introductory archaeology course. I compare sections that incorporated social annotation into coursework with those that did not. I investigate student perceptions about their own skills and examine assessment data measuring these skills.

Politics and Possibilities in Prehistoric Europe: An Alternative View on Power and Wealth

An overarching idea of *The Dawn of Everything* is that archaeologists should be encouraged to explore the past as a world of possibilities, not the least with regard to social and political organization. Taking up this call, this paper will reexamine two of the main conceptual premises underlying most models of social organization and evolution in prehistory: current Western notions of Power and Wealth. These are fundamentally skewed toward an individualist, exclusive, competitive, and confrontative view of what is considered as “human nature” and thus create an unjustified Eurocentric bias toward such kinds of motivations and forms of behavior, downplaying and neglecting collective, cooperative, and caring practices. As anthropological work has shown that coercive force is largely to be considered as absent in non-state societies, reevaluating power and property relations as mainly collective, consensus-based forces, and differentiating different forms of wealth, it is argued that these concepts mainly work from the bottom up, downplaying the dominant focus on top-down, leadership-based agency. This new conceptual framework enables us to understand the seemingly contradictory evidence in European prehistory, where inequality in relational wealth is often found in burials but is not matched by inequality showing up in the domestic sphere.

Wooden Posts and an Ontology of “Treeneess”

Wooden posts have been a critical element of Andean architecture within the Jequetepeque valley on the north coast of Peru, particularly in the Moche site of Huaca Colorada (AD 650–850). However, wooden posts have frequently been interpreted in the archaeological canon as architectural features with little connection to ritual procedures except in their inclusion as an inert element of ritual architecture. Utilizing new analyses of wooden posts made from the algarrobo tree (*Prosopis pallida*), this paper identifies trends in the use and recycling of wooden posts at Huaca Colorada during the Middle Horizon, shedding light on the role of the algarrobo tree as more than a simple resource by examining how the algarrobo tree may have participated in the ritual, political, and social structures at Huaca Colorada as distinct persons within the local ontology. This paper explores the use and perception of algarrobo trees within the complex of Huaca Colorada and the role of trees in establishing or promoting culturally specific perceptions of place, ancestry, and memory.

Inka Dynamics in the Cochabamba Valley

After expansion from Cuzco, the Inca introduced a statecraft model based principally on the mobilization of numerous population groups across longer and shorter distances. In this sense, the Inca Empire can be conceptualized as a “mobile state” that was to last for only 80–100 years (AD 1445–1538). Inca influence in the area of Bolivia was moderate until the reign of Huayna Capac (AD 1491–1527), when it experienced massive population replacements through the colonization of 14,000 mitimaes to work on the Inca state fields in Cochabamba. The original population groups were sent to the eastern borders. The principal interest

of the state was the fertile valley bottom and the production of surplus and staple food for further conquests. The valley played a highly important role in the organization of the empire. The role of the productive and reproductive reorganization of the Cochabamba valley, the implementation of new forms of production and its techniques as well as transformations in land ownership and dependency have not yet been thoroughly studied. The project uses interdisciplinary methods (GIS, surveys combined with ethnohistorical research) to elucidate Inca production methods and mobilization as a governmental strategy with its different forms of dependency.

Toward a Social Geoarchaeology of Aegean Burial and Ritual at Eleon, Greece

In recent years, geoarchaeological and soil micromorphological analyses have aided in reconstructing the complex histories of funerary burial and ritual in the Mediterranean. For the Eastern Boeotia Archaeological Project in Greece, geoarchaeological work has investigated a burial complex at the site of Eleon dating to the late Middle Helladic to Late Helladic I period (ca. 1600–1450 BCE). Investigations targeted areas within a large chamber tomb and a low tumulus that monumentalized an extensive burial complex. Soil micromorphology made known building materials and techniques and episodes in the construction and multigenerational use of the tombs and tumulus and the taphonomic and pedogenic processes that altered their preservation. Further analyses comparing the burial monument with constructions of the surrounding settlement reveal a long tradition of building skills and knowledge of material properties and their variable applications to create new types of monuments. Only a few studies in geoarchaeology have been conducted on tumuli and related mound-type structures, and most have concerned contexts in the Americas. Therefore, this work at Eleon provides methodological advancements in applications of geoarchaeology and soil micromorphology in a new context and comparative material for understanding sociocultural processes of monumental and multigenerational burial and ritual across time and space.

Mirrors, a Mean to Look into Cultures

No matter what material they were made of, stone, metal, or crystal, or if it was cheap or expensive (gold, silver, copper, bronze, obsidian, or pyrite), mirrors are one of the most fascinating artifacts made by artisans in the past. The users of these items were normally high-class members of society (political figures, high military members, merchants, holy men, or priests), and due to their complex manufacture, they were not easy or cheap to get their hands on them. Mirrors were considered a high-status item and used as a commodity for commercial, ceremonial, and even political performances. Mirror studies have gained a lot of attention lately in order to understand how they were made, who used them, how they used them, and/or what they mean for holders.

Marine Species and Sea-Related Representations in Ninth- to Fourteenth-Century Casma Iconography on the North-Central Coast of Peru

Recent archaeological work has revealed that the north-central coastal region of Peru had been the territory of a cultural entity that we recognize today as “Casma” between the ninth and fourteenth centuries AD. Some aspects of this culture remain largely unknown and require further investigation, particularly its iconography. It appears mainly on molded ceramics, ornamented by anthropomorphic and zoomorphic motifs, as well as scenes that can also occur on painted textiles. As in other coastal cultures, this abundant iconographic repertoire includes notably representations related to the sea and the coastal environment. Various animals such as seabirds, fish (including rays), and other marine species are sometimes depicted alone, sometimes in maritime scenes like navigation and/or fishing, but also in other compositions—especially featuring a front-facing anthropomorphic character generally considered as the main Casma deity. Identifying the recurring figures, their features, and occurrences in scenes allows us to better understand the importance of sea-related representations in Casma ideology, and more broadly the interactions of this coastal culture with its environment.

Re-dissecting an Old Friend: Looking Back at the Evidence of Kiuic's First Court

From 2007 to 2016, a team of archaeologists under the direction of George J. Bey III excavated Structure NI065E1025, a pyramid temple dated to the Terminal Classic period and located at the Yaxché group in the heart of the archaeological site of Kiuic, Yucatán. The structure had a complex construction history that started around 800 BC and concluded at about AD 900 when the site was periodically depopulated. NI065E1025 underwent significant renovations and changes over a thousand years. In the Late Classic period, the Yaxché group served as the location of Kiuic's court at its most expansive configuration. During the Terminal Classic period, NI065E1025 was transformed into a towering temple that stood at a height of 12 m with a masonry room and a stone bench on its top. Our previous papers discussed how the Yaxché group exemplifies the traditional Puuc Courts, defined by their religious, administrative, and residential spaces. In this paper, I revisit the evidence and critically assess how it aligns with our current understanding of Royal Courts in the Puuc region and the origins of the Late Terminal Classic authority of its urban centers.

Landa's Auto de Fe and the Destruction of the "Idols" of Mani: Petrographic and Chemical Analysis from Mani, Mexico

In 2015, an archaeological rescue program was carried out in Mani, Yucatán, related to improvements in the main square with the aim of designating Mani as a "magical town." The excavations produced 568 fragments of the "idols" destroyed during the so-called auto de fe organized by Diego de Landa in Mani (1562), punishing the Maya population for continued pagan practices. This presentation offers details of this uniquely important historical event and provides an analysis for the first time of the archaeological evidence of what happened at Mani. Landa gathered the idols from the entire region (Yucatán); in fact, Scholes and Adams noted (1938) that he gathered both local idols and those from as far away as the Cobá region. The incensarios identified in the excavations are of the Late Postclassic and contact period type (AD 1000–1500) classified as Chen Mul modeled. Forty Chen Mul fragments were analyzed by INAA and petrographic analysis and the different chemical groups were compared to similar Postclassic pottery and clays from Mayapán, Santa Rita Corozal, Laguna de On, and the Petén Lakes region to determine the place of origin of the destroyed incensarios. The petrographic analysis will help test the historical hypothesis regarding the various incensarios collected.

Labor Coercion, Land Access, and Free Markets after Emancipation in the American Southeast and Caribbean

The use of theory and related models that explicitly lay out the causal processes that we hypothesize operated in the past to generate patterns archaeological data is a rarity in historical archaeology. It is especially hard to find examples of research that create or use models that are then tested using archaeological data. The Digital Archaeological Archive of Comparative Slavery (DAACS) works to encourage the application of theory to the dozens of archaeological sites and millions of artifacts from sites of enslavement across North America and Caribbean that are freely available through DAACS. Here we use a model of coercive labor and open markets to understand settlement patterns of newly freed enslaved laborers in the American Southeast after 1865, and on the islands of Dominica, Jamaica, Nevis, and Barbados after 1834. We track the use and discard of material culture throughout the nineteenth century in both

regions. The results demonstrate that access to abundant and fertile land and free markets away from “home” plantations afforded greater opportunities and higher wages to newly freed laborers than those with restricted access to environmental resources.

La Tortuga: The Last Texas-Built Laguna Madre Scow Sloop

Since first appearing on sixteenth-century Spanish exploration maps, Texas’s 5,405.8 km coastline was famous for difficult navigation. The coast’s low-lying, monotonous nature, shallow lagoons, changing river mouths, and shifting sandbars made it treacherous, especially for deep drafted vessels. Spain’s focus on internal infrastructure and mercantilism meant that by the time Texas was annexed as a state the coast remained undeveloped. By the nineteenth century, the people of Texas adapted to this challenging littoral zone by constructing two types of working vessels well-suited to the environment: the Laguna Madre Scow Sloop and the Gulf Scow Schooner. While Gulf Scow Schooners were abundant west of New Orleans and throughout the coast of the Gulf of Mexico, Laguna Madre Scow Sloops were unique to the southern Texas coast. We focus on the last remaining Laguna Madre Scow Sloop (*La Tortuga*) and its construction process to give insight into the assembly of one of the most prolific nineteenth- to mid-twentieth-century south Texas fishing vessels. This construction process was replicated utilizing historical images, conversations with individuals associated with vessels maintenance, and several physical investigations of the vessel and resulted updated ship construction plans.

Middle Preclassic Constructed Landscape in the Puuc Region, Yucatán

In the last decade, lidar-supported surveys and excavations at different sites within the Puuc region in Yucatán revealed an intense and complex early occupation driven by highly productive soils and attested to by a dense network of monumental construction. Our ongoing research indicates that monumental construction began as early as the Middle Preclassic period and that these architectural spaces were the foci for some of the first public gatherings in the Puuc area. The similarity of these buildings suggests a regional tradition of civic architecture differing from monumental construction elsewhere in northern Yucatan; one possible interpretation is that they served as regional equivalents to E-groups elsewhere. Notably, several Middle Preclassic sites of different sizes have been identified. Even though we haven’t recognized a clear hierarchy of settlement organization during this time, this information leads us to question the social and political implications of the existence of these distinctions. In this paper, we present an archaeological overview of the Middle Preclassic constructed landscape, comprising sites within the Santa Elena Valley and the Bolonchen District. Our findings offer an opportunity to explore the early social and political networks of the Puuc region and its interaction with the remainder of the Northern Maya Lowlands.

The Practice of Pottery Production and Trade in Prehistoric Communities from Northern Hokkaido, Japan

This research is framed as a counter to settler-colonial narratives that treat indigenous communities as passive recipients of capitalist commodities expansion. Instead, I emphasize the agency of Indigenous people to resist and the unique colonial configurations that resulted from these acts of resistance. This research focuses on the prehistoric ancestors of the Ainu, Japan's northern Indigenous peoples. Current discourse draws stark lines between the historic period and the prehistoric period, denying the continuity and sovereignty of the Ainu people. I argue that the earlier prehistoric processes studied here shaped later entanglements between Ainu and Japanese colonial powers. Such a perspective more accurately reflects the broader regional history of trade and interconnectedness, and the Hokkaido Ainu's own narrative of the past. Drawing on the concepts of practice, resilience, and risk-mitigation, I examine the relationship between the initial introduction of commodities trade and culture change in precolonial foraging societies on in Northern Hokkaido, Japan. I analyze geochemical and morphological data of ceramic sherds to interpret the social aspects of pottery production in prehistoric communities, illuminating how communities become intertwined with broader world systems by transitioning from local subsistence-based economies to interconnected political economies and distant trade networks.

The Case for Shipwreck Material Culture Studies: Identifying Sixteenth-Century Spanish Provisioning Patterns Using Ceramic Analysis from the Emanuel Point II Shipwreck

Archaeological research related to Tristán de Luna's 1559–1561 colonization attempt has produced new insights into early colonial Spanish culture as well as broader realizations applicable to the whole field. One such avenue of research focuses on the analysis of material culture pertaining to both the terrestrial settlement and also, the shipwrecks associated with the expedition. Shipwreck-based material culture studies are integral into understanding the nature of the life and culture aboard transatlantic vessels in the sixteenth century. This paper discusses the results of a detailed analysis of the ceramic material culture recovered from the Emanuel Point II (EPII) shipwreck, specifically how it pertains to the provisioning of galley equipment on oceanic voyages. Additionally, it argues that shipboard galley equipment represents a wide range of functional vessel types, including wooden, metal, and ceramic containers.

The Maya Mountain Altars of Northwestern Guatemala

Among the Maya of northwestern Guatemala, modern populations continue to use the mountains found in their territories as places of worship. Often altars are located directly on the peaks of hills and mountains, while in other cases they are found on pilgrimage routes in or around these high sacred points, such as on the mountains from which corn appears in different myths or on those where other supernatural events took place. In some cases, these spaces are marked by archaeological sites that crown the hills, which at times appear to be defensive constructions that can be dated to the Postclassic period (1000–1550 CE). This paper will present a system of classifications and characteristics of these ritual centers, which represent the living traditions of contemporary Maya, particularly among the Jakaltekos, Akatekos, Q'anjob'ales, and Chuj from the department of Huehuetenango, in Guatemala.

The Origins of Amazonian Cuisine: Archaeobotanical Study of Hunter-Gatherer Subsistence Systems in Limoncillos, Colombia

Previously, it was thought that Amazonian Rainforests presented a barrier for the early colonists of the South American continent. Moreover, these environments were regarded as having few sources of calories and were not inhabited until food production systems were established by humans elsewhere. Recent archaeobotanical studies within NW SA have demonstrated that palms (Aceraceae family) played a central role in hunter-gatherer subsistence systems during the Pleistocene-Holocene transition. Palm resources within Amazonian contexts in Colombia seem to persist well into the late Holocene. Therefore, the present paper presents new archaeobotanical findings from the site of Limoncillos in San Jose del Guaviare, Colombia. The site spans the arrival of humans to the Colombian Amazon up to the very recent past. Palm resources dominate the assemblage early on, but there is a shift toward diverse forest environments toward the mid to late Holocene. scanning electron microscopy analysis on charred multicomponent plant aggregates from the site attests to some of the earliest meal preparations to be studied so far in the Amazonian part of Colombia. Lastly, observations of contemporary hunter-gatherer groups from the Colombian Amazon allowed to identify from the archaeological record what possibly enabled humans to colonize these spaces with a palm-centric subsistence system.

Under the Lens: A Preliminary Approach to De-“Objectifying” Bone Implements

Advances in archaeological microwear analysis provide new tools to examine bone “objects” created and used by past peoples. Nondestructive microscopy techniques can be employed to study bone objects, preserving the integrity of archaeological materials and minding stakeholder concerns regarding destructive analyses. This poster presents preliminary results from the study of experimentally created and archaeological bone objects using nondestructive microscopy. Employing an AxioZoom v16 stereoscope and a Zeiss LSM 710 confocal microscope, this preliminary research examines the value of traditional classifications of bone objects and interrogates our understanding of their role as both tools and “actors” in their relationships with people.

Riego de bofedales y formas de construcción de un paisaje pastoril de origen prehispánico, Andes centro sur
Distintos factores han llevado a conceptualizar el altiplano como un espacio hostil y deshumanizado, y el pastoreo de camélidos como una forma única de subsistencia en este ambiente “extremo”. Desde esta óptica, se ha promovido que los pastores andinos aprovechan los pastos que crecen aquí naturalmente sin intervenir en su crecimiento y maduración. Este enfoque se alimenta también por la baja visibilidad que generalmente posee la cultura material asociada al pastoreo. Para descentrar esta mirada, planteamos que las prácticas de manejo y cuidado de la naturaleza por parte de los pastores, especialmente de los bofedales, implican intervenciones importantes de los paisajes hídricos y vegetacionales, por medio de prácticas colectivas que acondicionan, potencian e incluso crean naturaleza con fines ganaderos. Presentamos los casos de Surire, Mulluri y Parcohaylla (Chile), donde realizamos prospecciones arqueológicas, estudios geoarqueológicos, DEM y de percepción remota, para caracterizar las arquitecturas hidráulicas en uso y en desuso, y evaluar el rol de estas intervenciones en el paisaje pastoril. Cuestionar la visión colonialista de los bofedales, implica desnaturalizarlos y comprender que la agencia de los pastores y sus tecnologías ancestrales son fundamentales para conservar los ecosistemas en los Andes, dentro del contexto actual de deterioro ambiental y crisis hídrica.

The Archaeology of Pastoral Landscapes in Mountain Areas of the Central Pyrenees and North of Spain
Seasonal pastoralism is a livestock strategy that shaped Mediterranean landscapes since ancient times. The recent development of archaeological research in mountain chains of southwest Europe has provided us with new data and interpretative models to study the livestock practices starting from their prehistoric origins. This paper focuses on ancient shepherds' occupations in an upland area of the Central Pyrenees. The research used the data collected in fieldworks carried on by the High Mountain Archaeology Group (Autonomous University of Barcelona) and ethno-archaeological approaches based on modern transhumant shepherds. The archaeological remains of huts, enclosures, rockshelters, and other architectural structures have been analyzed in order to develop a typological classification and chrono-functional interpretations. In addition, GIS analyses has been performed to know the settlement patterns of pastoral archaeological sites and their relationship with social and biological features of mountain spaces. The results show several changes in livestock strategies in a long-term sequence from late Neolithic to the twentieth century as well as continuities and discontinuities in the human shaping of the Pyrenean landscapes. Finally, the paper aims to discuss my current research on the archaeology of pastoral landscapes in other zones of northern Spain situated at low altitudinal levels.

Tlaloc, Ritual Economy, and Interaction: A View from Los Horcones, Chiapas

Located on the Pacific coast of Chiapas, the Early Classic site of Los Horcones is known for being an important gateway community where goods and ideas are distributed. Teotihuacano merchants established a strong presence that included exchanges of commodities and ideas. In this presentation, I would like to look more closely at the intertwined relationship of economic exchanges and ritual practices and how these might have served to help establish and maintain long-distance relationships. At the center of these relationships is Tlaloc, the Central Mexican deity along with a larger sacred mountain complex. Los Horcones' location on Cerro Bernal, a mountain that is not only strategically located but also deeply sacred and reminiscent of Tlalocan, may have served to reinforce some of these ritual economic principles on the Pacific coast of Chiapas. This ritual economy with a Teotihuacan origin served to support local authority and expand economic networks into the SE Maya region.

Excavations at Aguada Fénix E-Group

Aguada Fénix is a major ceremonial complex from the Middle Formative Usumacinta (MFU) assemblage that was discovered in Tabasco, Mexico, through lidar technology. The construction of this complex indicates the importance of communal labor, and there is no evidence of clear social inequality. The MFU features an E-Group in the central plaza. The Aguada Fénix E-Group, a La Venta Type, had two pyramids located to the west and the East platform measuring 400 m. Excavations on the E-Group Plaza began in 2018, but until 2020 evidence of ritual activities related to the central axis has been found, including offerings that contain green stone artifacts and ceramics similar to those found at other Middle Preclassic contemporary sites. Interestingly, recent evidence suggests that the people who deposited these offerings did not have access to green stone before La Venta had interregional influence. However, they shared cosmological concepts with other regions like quadriform motives and water cults.

Lidar and DepthmapX: Spatial Analysis of the Archaeological Site Malpaís de Tacámbaro, La Garita Sector

In the municipality of Tacámbaro, Michoacán, is located the archaeological site Malpaís de Tacámbaro, La Garita sector. It is an arm of lava spill where the presence of prehispanic structures that seem to be part of the first urban centers of the Middle Postclassic (AD 1200–1350) stands out. According to the *Relación de Michoacán*, it is known that between AD 1400 and 1450, Tacámbaro was conquered by the Uacúsechas who governed Tzintzuntzan; little is known about the population prior to the conquest by the Tarascans. Since it is located in the Malpaís, the La Garita sector has a high degree of architectural preservation, so it has been

possible to generate a plan of the structures, identifying three main types: quadrangular, circular, and special. In the specific case of the quadrangular plan structures (mainly), they have been related to housing units, so the use of the agent simulator offered by the DepthmapX software was proposed in order to begin the characterization of the term *quahta* (house) on which the political, social, and territorial relations throughout Michoacán are based.

García Mollinedo, Miguel (Tulane University)

[125]

Preclassic Standardized Complexes in the Middle Usumacinta Region

In the Middle Usumacinta region, located in southeastern Mexico, multiple standardized architectural complexes dated from the Middle Preclassic (1000–00 BC) have been detected with the use of lidar technology. Of these complexes, three belong to the Middle Formative Chiapas (MFC) pattern, at least 89 have been classified into the Middle Formative Usumacinta (MFU) pattern, and 59 more could be associated with this pattern. The degree of architectural standardization, the differences in proportions, and the spatial distribution of the complexes suggest that during the Middle Preclassic, a phenomenon of political and ideological integration was gestated in the region. Regional settlement pattern data was analyzed using analytical tools in geographic information systems (GIS) and digital elevation models (DEM) created from lidar data. This study consisted of the analysis of the distribution of the standardized complexes, their proximity to water bodies, and their correlation with geomorphological units. Subsequently, different GIS analyses were used to classify the complexes into archaeological sites. This classification served to propose a rank-size site hierarchy based on the area of the plazas and the volumes of the structures. Finally, this rank-size proposal was used to perform several spatial analyses, such as territoriality, mobility, visibility, and subsistence.

Underwater and Abovewater: Archaeology and Ethnography of Underwater Gathering and Diving Practices along the Coast of Southernmost South America

The coasts of the Fuego-Andean-Patagonian archipelago, south of Chiloé Island, have a length of over 80,000 km and roughly comprise three distinct areas: the Chonos archipelago, the western channels, and the Fuegian channels. The underwater world of this archipelago as a whole must have been a rich and coveted treasure. The ethnographic record provides some specific descriptions and portraits of Indigenous diving practices in historical times. Ethnographers mention that Kawésqar divers were able to reach even 8 m deep when gathering underwater resources. However, from these descriptions, the economic (and social?) importance of diving seems to change depending on the societies, apparently following a north-south gradient. In archaeology, there is little clear evidence of diving practices, but it is worth paying attention to it as its appearance opens up a whole new, submerged reality, perhaps experienced by only a few members of the group. Gathering activities, above- and underwater, would have involved very different techniques with their own tools, maritime species, and subsequent human pathologies. Through a multidisciplinary approach encompassing archaeology, ethnohistory, bioanthropology, and marine biology, our work is a review of the subject involving Indigenous diving practices and underwater resources.

The Illicit Sale of Human Skeletal Remains in Washington State: Where the Law Stands Now and Insights for Future Protections

Washington State has one of the most progressive sets of laws in the United States governing jurisdiction and

process surrounding the discovery and investigation of human skeletal remains. The law dictates how human skeletal remains—both forensic and archaeological/historic—are handled, and by whom, from discovery to disposition. One substantial gap in the law is the sale within the state of human skeletal remains. Because the initial jurisdiction falls to the individual counties, the lack of an explicit law necessitating their investigation has resulted in mixed application of the existing law. Here, we present case studies from Washington that illustrate these types of occurrences, how individual counties have handled them, present legal arguments under the existing law requiring their investigation and suggest more explicit changes to the existing law to clarify the issue. Through this research we hope to illuminate this problem and bring it to the attention of the archaeological community as well as lawmakers who may have similar gaps in their state laws.

Tzintzuntzan Archaeological Site: An Approximation to Its Astronomical Orientations

This presentation focuses on the astronomical orientations at the Tzintzuntzan archaeological site. This research progress presents our data from fieldwork: firstly, the measurements of azimuth and elevation from architecture alignments; second, the process of date calculation; and third, the hypothetical reconstruction of a horizon calendar. In addition, we present a photographic record of the sunset on dates marked by orientation alignments. Finally, we present the relationship between these dates and orientations alignment with the process of maize farming in the study area.

From Topography to Temporality at the Valencina Copper Age Mega-site (Spain): Low-Density Settlement, Gathering Place, or Both?

In the last two decades, mega-sites have become a defining feature in the research of Copper Age Iberia, opening up completely new avenues for the analysis of early social complexity in this region. One of the most fascinating cases is the Valencina de la Concepción-Castilleja de Guzmán site (Valencina, for short), located in the lower Guadalquivir River valley, Sevilla province (Spain). Recent research has shown this site, occupied between ca. 3200 and 2300 cal BC, to spread over ca. 450 ha and has revealed the scale and diversity of its monuments, which include, among others, gigantic ditched systems and well as tholos-type megaliths. Some newly discovered megalithic graves, like Montelirio and Structure 10.042-10.049, accommodated high-ranking individuals accompanied with material culture made on foreign raw materials and worked with accomplished technical skill. In this paper, we will use various cartographic sources to examine the topography of the site, coupled with the chronometric evidence currently available (which includes almost 300 radiocarbon dates). Our aim is to achieve a preliminary assessment of the reasons why Valencina spread over such a large area, and what its character was: low-density settlement, gathering place, or both?

Archaeological Surveys and Environmental Change: Mongolia and Montana Comparisons

Over the last 20 years extensive pedestrian surveys have been conducted along the Targavatai and Burgastai Valleys in northern Mongolia and in Weatherman Draw in south central Montana. What is clear, in both cases, is that the land surfaces of these areas have been greatly altered by changes in precipitation and soil depositional patterns. In both locations site visibility has either been increased due to erosion or disappeared as cultural materials are covered with recently deposited wind or water born sediments. This presentation takes a comparative look at these two different localities and demonstrates how new soil depositional processes have affected archaeological sites in both areas.

Gardner, Chelsea (Acadia University) and Christine Johnston (Western Washington University)**[173]***Digital Media and Online Resources in Ancient Mediterranean Teaching: Current Practices and Future Opportunities*

This poster presents the results of a 2021–2022 survey examining current uses of digital media and resources in teaching the cultures of the ancient Mediterranean, West Asia, and North Africa. For this study, digital media were defined as mass-communication products in different digital formats (videos, podcasts, blogs, etc.), while digital resources included data repositories (archives, databases, online collections, etc.), and interactive digital tools. The survey was circulated among teaching professionals in schools, museums, and other educational environments, and comprised quantitative and qualitative questions about current pedagogical practices in fields related to Ancient Mediterranean Studies, including archaeology. This poster presents the survey results, including discussion of the primary pedagogical benefits and challenges highlighted by respondents. The opportunities and considerations for multimedia use identified in the survey will be supported by theoretical frameworks within the learning sciences to outline best practices according to student-centered instructional design. The results of this survey demonstrate that the incorporation of multimedia resources in teaching can facilitate a shift from objectivist learning and traditional textbooks toward constructivist and critical pedagogical practices that empower students to think critically about both the past and the world around them.

Garnett, Justin (University of Kansas)**[138]***Chair***Garnett, Justin (University of Kansas)****[138]***Dueling with Basketmaker II Spear-Throwers: What Can We Learn from Mock Combat?*

Changes in weapon technologies are likely to affect many social dimensions. Understanding a society's weaponry is critical for making inferences not only about hunting but also how these groups engaged in conflict. The role of spear-throwers and darts in hunting is becoming better understood through a resurgence in their sporting use, as well as recent academic research into dart point efficacy. However, the combat dynamics of these weapons are still relatively unexplored. This research is largely phenomenological and experiential, and describes experiments in which Basketmaker II period (~4000–1500 BP) weapon replicas were used in simple but realistic mock combat by researchers dressed in personal protective equipment. This research will offer insights and help inform discussion related to the technological transition from spear-thrower to bow, and the value of hands-on experience with the tools we research.

Memory Culture and the Long O'odham History of Nanakmel Kii (Bat's Home), Tempe, Arizona

Archaeologists who study the relationship of memory to material culture or landscapes examine the ways in which history and cultural practice contribute to tradition-building and its perpetuation. Cultural practices are the daily embodiment of one's traditions, beliefs, or dispositions. These practices and events become part of group memory, which in turn influences future activities, including the way that Native American Tribes help manage traditional sites and sacred places. For a recent study of Bell Butte in Tempe, Arizona, appropriately known as Nanakmel Kii or Qmpanyk Nyiva ("Bat's Home"), researchers compiled the memory and material culture of one such place as a collaborative effort involving O'odham and Piipaash cultural experts. Reexamination of rock art and objects recovered by the Hemenway Expedition from a ceremonial cave clearly establishes O'odham and Piipaash affiliations with the butte and the role of O'odham songs in perpetuating the memory culture of this sacred place. O'odham recognition of the cave artifacts by name and function offers new insights regarding material culture and tradition, but in so doing questions previous cultural historical reconstructions that have long held sway in the Phoenix Basin that generally ignore historical connections and continuity with descendant communities.

[178]

Two Thousand Years of Small-Scale Mining in the Southern Atacama Desert

The southern Atacama Desert boasts a long mining history that evolved within small-scale kinship groups. In the Cachiyuyo de Llampos mountains, most mines were consistently exploited sporadically over time, resulting in a settlement pattern characterized by scattered mining camps from the Formative period up to the twentieth century. Despite the arrival of the Inca Empire and later, the Spanish, local miners continued to exploit the same territory using a decentralized approach, maintaining a remarkably similar spatial usage pattern even when faced with changes in architectural style. Significant changes to craft production occurred after the Spanish arrival. Bead-making activities involving copper ores and pigment production experienced a radical decline and likely disappeared. They were replaced by gold and copper mining. Nevertheless, Indigenous people remained actively engaged in mining activities, and the social organization modes of miners endured over time. In this presentation, we present a narrative of continuity and change within small-scale mining spanning centuries, offering a preliminary approach to understanding the long-term dynamics of this mode of production.

Scour at Artificial Reefs as a Means to Access and Study Quaternary Landforms

Using an innovative method, we report the successful location of submerged Quaternary landforms. Research into this new method was successfully carried out at erosional features associated with nine artificial reefs, along the Atlantic coastline of Georgia, termed scour nuclei, systematically identified and studied from 2021 to 2023. This successful exploitation of scoured sea floor created by artificial reef structures provides us with an enhanced ability to study the Quaternary archaeology, paleogeology, and paleoecology of submerged coastal margins.

"The Watchers Belonging to the Warriors": Military Surveillance among the Maya

Ethnohistoric accounts from highland Guatemala allude to surveillance systems and their personnel forming part of the integrated defense of Maya political territories during the Late Postclassic period, prior to the Spanish

arrival in 1524. Recent lidar-driven archaeological research in the Maya Lowlands suggests that ancestral forms of landscape surveillance date back as early as the fifth century CE. This paper presents evidence from the Buenavista Valley of northern Guatemala, indicating that the rulers of the Tikal dynasty used a network of fortresses and watchtowers to observe movement and other activities throughout their kingdom. Excavations of defensive works from the fortified El Diablo hilltop at El Zotz, as well as from the La Cuernavilla fortress, show the scale and sophistication of the defense system; recovered artifacts leave no doubt as to the martial function of these features. Viewshed analysis reveals the extent of the system's zone of control, highlighting the dual role that surveillance played in integrating and defending Tikal's political holdings. Although the Buenavista Valley system appears unique in its extent and complexity among Classic Maya polities, it is likely that future lidar analysis will reveal similar types of surveillance networks for the largest ancient kingdoms.

Exploring Ancient Subsistence Strategies through Community Archaeology at Puerto Malabrigo, Chicama Valley, Peru
We embrace community archaeology to explore ancient subsistence strategies and societal resilience to El Niño Southern Oscillation (ENSO) events at Puerto Malabrigo, Chicama Valley, Peru. Since the Middle Holocene, Andean societies have experienced ENSOs that, when most powerful, prompt heavy rainfall and flooding in some locations and severe drought in others. Today, Chicama residents continue to deal with ENSOs. In 2017, the people of Puerto Malabrigo, Chicama, fell asleep to thunder and woke up to pools as the rain leaked through their rooftops and huacos, mudslides, and devastated farmland. Malabrigo includes Chicama's irrigated floodplain, freshwater wetlands, the Pacific littoral, and the Paján Desert. Given Malabrigo's unique ecology, our research investigates how ancient Malabrigo residents survived and perhaps thrived from ENSO fluctuations. To make archaeological research on foodways and climate resilience more relevant to Malabrigo residents, we trained and hired local people in excavation and analyses and offered numerous site visits and educational and art workshops to students from February to August 2023. In this paper, we acknowledge potential risks and challenges to community archaeology and detail our methods that aim to share cultural heritage, integrate Indigenous knowledge systems, and broaden the vision of climate science to incorporate traditional knowledge.

In the Realm of Three Hills: Civic-Religious Architecture at Llano Grande, Copan, during the Late Classic Period (ca. AD 650–850)

The Copan Valley, located in western Honduras, has been inhabited by permanent communities since the Early Formative period (ca. 1400 BC). These early communities developed a lifestyle based on milpa agriculture, which continues today with the Ch'ortí Maya, the linguistic group that is the descendants of the ancient Copanecos. The origin of agriculture elsewhere in the Maya lowlands required a mechanism of time measurement to define the seasonality of the agricultural cycle. As an alternative to the monumental architectural complexes built in the Maya lowlands to measure the movement of the sun, the ancient Copanecos used the natural landscape as spaces that can be defined as E-Groups. In this work, it is argued that the site of Llano Grande functioned as an observatory with the hills of Cerro Piedra Colorada, Cerro Pacho, and Cerro de LLanetillos as natural markers that were used to observe and measure solstices and equinoxes to define the agricultural season.

A History of the Manteño of Bola de Oro: Understanding Manteño Adaptation to a Changing Climate through Age-Depth Modeling and Charcoal Abundance Analysis of Agricultural Landscape Modifications

A modified agricultural landscape of cultivation terraces and water retention ponds in the high elevations of the Chongón-Colonche Mountains of southern Manabí indicates a shift in agricultural practices by the Manteño civilization of coastal Ecuador (ca. 650–1700 CE). This shift must be understood through time as a societal response to a changing climate from the phases of El Niño-Southern Oscillation (ENSO) during the late Holocene. We use the abundance of charcoal within soils and sediments (excavated from three Manteño agricultural landscape modifications in the western slopes of the Bola de Oro Mountain that were identified through UAV-lidar and recognized in the field) as a proxy for the use of fire as a vegetation clearing strategy and, therefore, drier conditions at these elevations. Calibrated radiocarbon dates and age-depth modeling allowed for the identification of the earliest Manteño occupation in the mountain, the massive implementation of stone architecture and landscape modifications, the final abandonment of the region, and the eventual return of decedent communities. Manteño's success in a constantly changing climate can be attributed to their investment in transforming the most resilient environment in the territory, the cloud forest, due to the prolonged droughts and extreme floods from shifts in ENSO into a human landscape.

Paleolithic in Azerbaijan: Research History, Finds, and Dating

Until the middle of the twentieth century, Soviet archaeologists believed there was no Old Stone Age in Azerbaijan. However, as a result of the research of M. Huseynov, it was revealed that humans inhabited the territory of Azerbaijan during the Paleolithic period. The research conducted in the Damjili and Dashsalahli caves found evidence of ancient human settlement. Later, in the 1960s, excavation works began in the Azikh cave. The research revealed that hominins had chosen the Azikh cave as a place of residence a million years ago. Excavations in the cave provide us with valuable information about the activities of hominins in the Lower and Middle Paleolithic periods. In 1968, a mandibular bone believed to belong to a woman was unearthed in the cave. It is estimated that this jawbone dates back to 300,000–400,000 years ago. In my opinion, further research is needed to refine our understanding of the mandible. In the Guruchay valley, shreds of evidence suggest that humans settled there before the Azikh and developed the Guruchay culture. This culture is known as the oldest human traces in the territory of Azerbaijan. Ongoing research in the Paleolithic period continues to shed light on the region's history.

Climate Teleconnections Synchronize Human Population Dynamics

Climate variability can significantly constrain the population dynamics of ancient agrarian societies, although its direct influence is often mediated by a complex interplay of social, ecological, and technological factors. Untangling these relationships in the archaeological record is challenging due to the scarcity of spatially continuous paleoclimate data and the paucity of theoretical models that can capture the spatial dimension of these various influences. Here, we address this challenge by integrating archaeological data with spatially explicit paleoclimate reconstructions in a spatial metapopulation model. Our model shows how recurring spatial modes of climate variability, climate “teleconnections,” can synchronize population dynamics and mobility over extensive geographical scales and allows us to explore the sensitivity of this relationship to social and technological variables. Understanding how climate variability induces spatial synchrony in human populations offers fresh insights into cycles of human population expansion and recession and has broader implications for our understanding of long-term trends in social interaction, cultural evolution, and biodiversity.

Challenging Current Perspectives on Late Pleistocene Stone Toolkits across Beringia through Use-Wear Analysis

Microblade technologies are a structuring component of the Late Pleistocene archaeology across the Bering Strait because of their wide chronological and geographical extension. To fully understand the technoeconomical strategies underlying the success of this innovative toolkit in periglacial environments, we propose a macroregional technofunctional comparison of contexts yielding early microblade components on Hokkaido (Pirika), in Eastern Siberia (Kovrizhka IV), and in Interior Alaska (Swan Point). Use-wear data allow defining how tools were implemented (gesture, worked materials, hafting) and managed (sharpening, reuse, multiple uses, recycling, transport). Specific tool categories such as end scrapers were specialized in a task and had long biographies, while microblades were multipurpose tools with short lifetimes. Their high standardization and overproduction may have aimed at a fast and easy maintenance of composite tools. *Chaînes opératoires* were segmented at different steps (e.g., tools production and use, hide processing), facilitating the mobility of groups. These data show that in the contexts considered, the anticipation of needs was an important feature of the life of nomadic societies of hunter-gatherers.

Landscape History and the Built Environment at Liberty Hall

Like all landscapes, the one at Liberty Hall has been dramatically impacted by the people who lived here. Originally part of the Monacan Indian Nation's homeland for at least a thousand years, the hilltop site's proximity to a significant ford over the north branch of the James River and a pair of strong-flowing springs attracted first colonial farmers and then the Liberty Hall Academy, which was a predecessor to Washington and Lee University. After the academy moved in 1803, the site became a slave plantation. Fifty years of archaeological, historical, and oral historical research here has produced significant landscape-level data about the built environment and people who lived and labored at Liberty Hall. Using modern digital technology, we can begin to create models detailing this complex and ever-changing historical landscape with the recognition that these models will be refined and transformed as our ongoing work generates new data. This poster will show how this work has progressed over the last decade of research.

Pursuing Park Museums and Archaeology in Ghana: A New Frontier in Heritage Education and Development

How significant are newly established museums and archaeological projects in national parks to the future of Ghana's heritage education and community development? The inauguration of the Museum of Natural and Cultural Heritage at Shai Hills has revealed a promising relationship between archaeology, community engagement, heritage education, and community development in the country. These parks and resource reserves contain well-preserved archaeological sites, pilgrimage sites, historical landscapes, and biocultural heritage resources. This paper discusses the relevance and challenges of my recent archaeological research in the Mole National Park and Shai Hills Resource Reserve. It also examines the benefits of a biocultural heritage approach to archaeological research, heritage conservation, museum and heritage education, and community engagement and development. The paper concludes discussions by examining the ongoing collaboration between Professor Ann B. Stahl's Banda Thru Time Project and the Museum at Shai Hills Project, a component of the West African Biocultural Heritage Project I initiated in 2017.

CT Imaging and Radiocarbon Dating of a Gourd Container with Vertically Strung Olivella Shells: A Pueblo I Cache from Old Man Cave, Utah

We report the findings from a study of a gourd container recovered from Old Man Cave of southeastern Utah. Strung, spire-topped *Olivella* beads are visible on interior of the gourd, but sediment in and around the shells obscured the full nature of its contents. Computed tomography (CT) imaging allowed us to identify durable objects within the gourd in a nondestructive manner and enabled an accurate count of shells. The beads exhibit an unusual method of side-by-side stringing that we attempted to replicate through experimentation. Worn surfaces indicate that the beads had been strung and used this way for a lengthy interval. A sample of the gourd submitted for radiocarbon dating revealed that the cache dates to the Pueblo I period, sometime between 665 and 780 cal AD. This container might have been placed in the site as an offering to the ancestors who used this shelter during prior centuries.

A Diachronic Perspective on Wetland Resource Scheduling in Michigan: Evidence from the Potagannissing River

Nearly 15% of Michigan is covered by wetlands. These environments are widely regarded as critical components of Michigan's unique ecological makeup. From an archaeological perspective, the biological diversity, productivity, and dependability of these natural communities fulfill a variety of societal needs. Moreover, as a site for seasonal aggregation, coastal or shoreline wetlands can be easy to locate, access, and provide a wealth of warm-weather foods that support the carrying capacity of larger populations. In the case of the multicomponent Cloudman site (20CH6) on the Potagannissing River, microfossil evidence has provided a fuller picture of the utility and desirability of wetland resources, including economically important foods like Manoomin, also known as wild rice (*Zizania palustris*). Using carpological, palynological, and faunal data, the role of wetland resources at the Cloudman site can be explored in terms of long-term resource scheduling throughout the Late Woodland period and into the historic period. Results have begun to reveal landscape management and seasonality across the different occupations.

Sedimentary DNA Displays the Upper Paleolithic Human-Carnivore Interface in El Mirón Cave (Spain)

Humans and carnivores competed for the same ecological niche during the Paleolithic, including caves used as shelters that they even alternately occupied in many cases. Through the presence of archaeological material, including animal bones, we can assess the human occupation periods and their intensity. Iberia represents one of the main European human refugia during the Last Glacial Maximum (LGM) and therefore has a key interest in the understanding of the human population dynamics before, after, and during such climatic events. Here, we present genetic data from the complete stratigraphic archaeological sequence of the site of El Mirón Cave, from which we have recovered three human mtDNA sequences from Solutrean layers and multiple mammalian mitochondrial data from all the screened layers. In addition, we have also produced a new radiocarbon date and mitochondrial genome from a human Gravettian tooth from the vicinity cave of Chufín, extending the available data on such a period in the Cantabrian region. The animal data shows a differential presence of carnivore species through the archaeological sequence of El Mirón.

Geller, Pamela (University of Miami)**[89]***The Plastic Bag Paradox: Taphonomy and Complicity in the Archaeological Archive*

Plastics present a paradox for archaeology. They are ubiquitous and inevitable, taking myriad forms—bags for artifacts, tarps for units, containers for storage, etc.—in excavation and archival settings. Their utilitarian value is predicated on the presumption of durability and stability. But for how long and in what kind of conditions? Evidence marshaled highlights the inconvenient truth of plastics' degradations (plural, for not all plastics are built the same), as well as the discipline's analytical inattention to their taphonomic transformation. (This inattention is a special kind of irony for a field that prides itself on studying the preservation of material culture over the *longue durée*.) With a growing awareness of plastics' ties to global pollution and climate change, archaeologists' continued reliance may be read as complicity. The identification of sustainable alternatives is one possible solution. Though it is one not easily realized. Perhaps more realistically—and more in line with decolonial work—the plastics paradox nudges archaeologists to assess the unsustainability of our disciplinary ethos, especially those practices that promote endless excavation, storage, and curation of archaeological materials.

In our paper, we aim to demonstrate the use of spatial, genetic, and archaeological data in family studies by using a Medieval cemetery in Gać as our case study. An international team of archaeologists and anthropologists have partially recovered and examined a cemetery situated in the now-vanished village of Gać over three seasons, as part of a Mortuary Field School supported by the Slavia Foundation. The investigations have uncovered 206 burials dating from the fourteenth to the sixteenth centuries. The cemetery at Gać presents an excellent opportunity to examine family structures in the underrepresented context of Medieval Central Europe. Results from our spatial analyses indicate that the graves were not located randomly. Moreover, subadults burials form clusters, and the distance between the burials of women and those of subadults indicates a deliberate effort to keep them in close proximity. These patterns suggest clusters represent family units, formed mainly by the grave of a mother and her prematurely deceased children. Another interesting phenomenon is the observed custom of inserting additional skulls into the coffins of the deceased. This practice may have been a gesture of respect toward a deceased relative whose grave may have been accidentally destroyed during burial.

George, Richard (University of California, Santa Barbara), Douglas Kennett (University of California, Santa Barbara), Stanley Serafin (University of New South Wales, Sydney), Marilyn Masson (University at Albany, SUNY) and John Krigbaum (University of Florida)**[42]***Strontium Isotopic Evidence Reveals Sustained Levels of Intraregional Migration at the Postclassic City of Mayapán*

We examine the process of migration using strontium isotope ratios from human enamel to shed light on the organization of the Mayapán polity during the formation (1200–1250 CE), apogee (1250–1400 CE), and decline (1400–1500 CE) of the city ($N = 58$). Our results support consistent local aggregation within the Chicxulub Basin and immigration from across the Yucatán Peninsula. Although we did not identify migration from outside the Maya lowlands, the results suggest that intraregional movements remained a key component of the population structure during all three periods. Strontium data from the third molar of 16 burials suggests high residential mobility during childhood and adolescence prior to interment at Mayapán. While we identified considerable stability between socioeconomic groups within the sample population, we found higher similarity between high-status burials inside the monumental core and most low-status burials across the city than with high-status burials in the settlement zone, who all exhibited origins outside the Chicxulub Basin. Additionally, 13 out of the 17 casualties exhibited nonlocal values. These results suggest that the urban population consisted of a high percentage of first-generation immigrants and demonstrate the regional origins of the cosmopolitan nature of this important Postclassic period center.

From Gray to Gold: A Reexamination of the Woodland Period in Northeastern Illinois Using Legacy Collections and Gray Literature

Northeastern Illinois is an understudied, underappreciated region of focus in current archaeological discourse, particularly in Woodland period studies. Historically, archaeologists have concentrated on areas with the most conspicuous signs of ancient activity to the exclusion of the areas that connected them. In the Riverine-Great Lakes region most of the intensive archaeological work has been conducted at large villages and mound sites along the Illinois and Mississippi Rivers, however in recent decades more emphasis has been put on lesser studied regions. The Woodland period in northeastern Illinois has received little attention despite its important strategic location connecting the Great Lakes to the Mississippi River valley via its many rivers and overland routes. The archaeological record of northeastern Illinois may not be as rich as other regions, but it can still provide answers to important anthropological and archaeological questions. The goal of this paper is to demonstrate how disparate data from past surveys and excavations, historical sources, and personal communications can be used to test theories regarding diachronic changes in interregional interaction, settlement and subsistence, technology and religious practices during the Woodland period in the Riverine-Western Great Lakes region.

Geurds, Alexander (University of Oxford)**[296]***Mounds and Monoliths in Isthmo-Colombian Archaeology*

The Isthmo-Colombian Area entails an archaeology of landscape engagement. Well-attested are the material traces of shifting networks of human ideas that, through communities of practice, led to the creation of monumental landscapes and, with regional specificity, shared forms of artistic expression, from parts of Honduras and El Salvador to Colombia from around AD 300. This paper focuses on two primary sources of material evidence: one is through landscape alteration practices (e.g., mounding, rock art creation, pathway maintenance) and another is through the widely attested selection of igneous stone as an artistic material to behold and work (e.g., naturally-shaped rocks, carving of stone sculpture, elaborate grinding stones). Archaeological studies elsewhere convincingly argue for the creation of social space and time by means of such practices, allowing for communal memory and understandings of relatedness or difference when traveling the land. While the emerging area-wide picture is discontinuous and marked by stylistic variation, the mentioned practices of mound-creation and working with volcanic stone seems to be a repetitive preference. A new research project, briefly introduced here, will attempt to study such patterns from an area-wide perspective and argue for seeing the creation of mounds and use of monoliths as a social technology.

Ghaheri, Fatemeh**[169]***Understanding Climatic Condition, Ecosystems, Subsistence Strategies, and Human Adaptation through Microbotanical Analysis in Late Holocene Northern Mesopotamia*

The semiarid region of Northern Mesopotamia has consistently encountered significant climatic variations. Therefore, human societies in the region developed innovations in environmental management and agricultural strategies, given the crucial role of agriculture in economy, trade, and politics all throughout history and in our modern world. Among all the different methods and approaches to study human societies in the past phytolith analysis stands out due to its multifaceted capabilities allowing us to examine various aspects of history. Since phytoliths indicate plant parts, plant species, and plant subfamilies, and they are preserved in different conditions, they offer a highly reliable proxy even in areas where other forms of evidence such as pollen cannot be preserved. The interpretation and assessment of phytolith data across different spatial contexts enables us to analyze the function of spaces, human-environment interaction, climatic conditions, and agricultural strategies. Drawing on compelling new microbotanical phytolith evidence gathered from Iron Age sites in the Kurdistan region of northern Iraq, this study discusses the functionality and construction techniques of buildings, utilization of diverse micro-environments and plants, and implementation of rainfed and local irrigation as vital methods to manage environmental fluctuations, agricultural challenges, and subsistence strategies prevalent at the time.

Gibbs, Anna**[171]***Reevaluating Conclusions: New Data and Theories on Intrasite Find Distribution in Medieval Incastellamento, San Giuliano Plateau, Lazio, Italy*

The San Giuliano Archaeological Research Project (SGARP) began excavations in 2016 to elucidate the complex occupational history of the San Giuliano landscape in Lazio, Italy. The archaeological record indicates diachronic habitation spanning the Bronze Age to the medieval period evidenced by a large Etruscan

necropolis and a hilltop medieval fortification. In 2020, my undergraduate thesis research focused on this medieval fortification and process of *incastellamento* (the relocation of large parts of the medieval Italian population into defensible, fortified sites between AD 700 and 1200), by using ArcGIS, artifact distribution patterns, and associated architectural features, to draw conclusions about spatial usage, social function, and behavior dynamics in the medieval castle zone. Since 2020, two field seasons have occurred, and the new data have led to a reevaluation of previous conclusions and a refinement of methodological and theoretical practice. This poster will offer a critique of my previous work, as well as introduce new techniques for including glass shards in a finds analysis, differentiating between coin types, and add several new spatial categories to the GIS statistical cluster functions along with the use of the theory of materiality to address the arbitrary, non-critical grouping of artifacts.

Bone Color as a Tool to Interpret Differing Cremation Patterns in Bronze Age Eastern Hungary

The Bronze Age Körös Off-Tell Archaeology Project (BAKOTA) has excavated 84 burials from a Bronze Age cemetery (Békés 103) located in the Lower Körös Basin in Eastern Hungary. Radiocarbon dates indicate that the cemetery was used for several hundred years, with the most active phase between 1600 and 1280 cal BC, a time that has been associated with the abandonment of tells in the region at the end of the Middle Bronze Age. Most of the burials were cremated and placed in ceramic urns. While cremation is a common mortuary practice in Hungary during the Bronze Age, grave good and body placement patterns differ by region, and little is known about the specifics of how bodies were prepared and processed prior to burial. Bone color, as a reflection of cremation temperature, has been assessed in 30 of the cremation burials at Békés 103 to explore whether mortuary treatment differed by age, sex, grave goods, or over time. Earlier research on the site with a smaller sample found that bone calcination was more common in nonadults between the ages of 6 and 12. Here, we assess whether this pattern remains when more of the burials are examined.

The Irish Medieval Patron-Client State in World Perspective

The state of the O'Briens, at times called the Kingdom of Limerick, lasted from the mid-eleventh century until it accepted the sovereignty of Henry VIII at the end of the sixteenth century. In its features it conforms to the model of the patron-client state that William Sanders formulated to distill the similarities in organization that were apparent in historic African kingdoms and the polities of the Classic period lowland Maya. While it is to be doubted that the Classic Maya possessed states, the Kingdom of Limerick compares well with historic East African states, as well as with the kingdoms of the Goths of Late Antiquity. This paper updates Sanders's model and demonstrates its fit to historic Celtic, Gothic and Bantu kingdoms. It will be shown that all patron-client states began their existence as chiefdom confederacies that evolved into states where alliances between the participating leaders continued to play a key role. Aristocratic polygyny posed a constant challenge to the state's stability that was dealt with in different ways by the historic states. Though born in violence, contrary to expectations, patron-client states proved to be remarkably stable and resilient. The reasons why they were so will be explored.

Population Dynamics and Subsistence Variability on the Farming/Hunter-Gatherer Boundary: Central Western Argentina as a Case Study

This case study integrates times-series of multiple types of proxy to evaluate causal relationships between population dynamic, subsistence/diet variation, and ecosystem change. The presentation evaluates whether intensification based on wild and domesticated resources takes different evolutionary trajectories. We present trends in population dynamics in central-western Argentina (CWA) regarding two main processes: intensification in resource exploitation and the introduction of domesticated resources. CWA was occupied by hunter-gatherers since the Late Pleistocene / Early Late Holocene. It is proposed that in the North and Center of CWA, this lifestyle was disrupted by the introduction of domesticated plants (i.e., maize, beans, quinoa, and squash) ca. 2500 BP. In the South of CWA, exploitation of wild resources under a hunter-gatherer system continued until historic times. We employed summed probability distribution of radiocarbon dates to estimate changes in population density and carbon and nitrogen stable isotopes analysis to reconstruct the human diet. We compared both lines of inquiry in three geographic and ecologically distinctive areas of CWA to explore the relation between population growth/decline, the carrying capacity of the environment, and cultural responses. We propose that cultigens impacted each area differently, which could respond to specific feedback between environmental constraints and population dynamics.

Vertical Economy of Prehispanic Pacific Coast Guatemala

The prehispanic and indigenous cultures of the Pacific coast of Guatemala are usually known from ethnographic research and ethnohistorical sources that relate to specific local communities and to local archaeology that relates to specific sites. In this paper, I present how environmental diversity leads to interdependence and integration of the whole region. Among the data, I present various ethnographic and ethnohistoric information and compare it to past archaeological summaries. In conclusion, I pick up the suggestion of Spanish ethnohistorian Elias Zamora Acosta and compare this interregional system to the concept of “vertical economy” known from the Andean region.

Collaborative Archaeological Research in Central America: A View from the Community of Mogue, Pusa Drua Area, Congreso Local de Tierras Colectivas Emberá Wounaan, Darién, Panama

Over the past three decades, archaeologists and Indigenous communities throughout the Americas have developed varied approaches to collaborative archaeological research. In North America, where there is some legislative recognition of Indigenous sovereignty over cultural heritage, such approaches have transformed the landscape of archaeological research. In Central America, where paradoxical state policies partially recognize Indigenous sovereignty over ancestral lands but all archaeological heritage is under national control—facilitating settler encroachment and inhibiting Indigenous stewardship of cultural landscapes—these frameworks have had much less impact on archaeological scholarship. Despite this challenging political context, conducting collaborative research with Indigenous communities can have ethical and epistemic significance in Central America. We first discuss how co-designing research in the Emberá tierras colectivas of Mogue (Darién Province, Panama) in accordance with Indigenous traditions of knowledge production and governance, which involve reciprocal knowledge sharing, building emotional ties, and transmission protocols, continues to transform what is defined as collaborative archaeological practice in this community. We then illustrate how collaborative interpretations have advanced scholarly understanding in established domains of regional archaeological research. We conclude by discussing broader implications of Indigenous traditions of knowledge production, which mandate a concern by archaeologists for community-based, rather than national, stewardship of cultural heritage.

Big Ideas on Big Migration(s): Paleoindian Colonization of the Americas, Revisited

In the mid-1990s, David Anderson was already an accomplished National Park Service archaeologist and scholar in the US Southeast and beyond. I was a fresh out of Arkansas MA with a Shuttle Radar Topography Mission (SRTM) data tape from NASA's Jet Propulsion Lab (JPL) and some big ideas on the peopling of the Americas that meshed well with Dave's own. When I reached out to Dave for a copy of his growing fluted-point database, the precursor of the Paleoindian Database of the Americas (PIDBA), a collaboration was born that would lead to our colonization of the Americas paper in *American Antiquity* (2000) and many others. That publication remains one of the most cited Paleoamerican archaeology papers today and has held up remarkably well over the decades. This paper revisits that popular work and updates the most probable East Asian cultural hearths, timing, and routes of Paleoamerican migration(s) of the late Pleistocene.

The Jones-Miller Legacy Collection: Reexamining the 10,800-Year-Old Bison Butchery Site

The Jones-Miller Site, located in the eastern Colorado tri-state area, was excavated in the mid-1970s. The Hell Gap complex site has been credited as the only bison butchery site of its kind and size in Colorado, yielding 41,000 *Bison antiquus* bones, 200 stone tools, 11,000 pieces of debitage, and hundreds of liters of soil samples. In 2017, the Jones-Miller Collection returned to Colorado from its long-term loan at the Smithsonian to be rehoused and added to the collections at the Denver Museum of Nature & Science. Dennis Stanford, the principal investigator, worked with many colleagues to conduct a robust set of research

sharing about and explaining the site, including carbon dating, tool analysis, paleoclimate reconstructions, and general zooarchaeological analyses. Stanford planned to publish a manuscript compiling these results, but unfortunately, this did not come to fruition. Here, we present our work rehousing, cataloguing, and reexamining the collection. Additionally, we will share our findings that replicate the results Stanford and team had while highlighting differences in our results from those that the Jones-Miller research team found. Finally, we share future goals, both for the unpublished manuscript, and the future of research with the collection.

Paleoenvironmental Reconstruction at Poverty Point Using Ancient Sedimentary DNA: Potential and Challenges
Poverty Point is a wonder of engineering, with over 2 km² of earthworks constructed over several hundred years around 3500 BP. While the timing of the deposit's construction has been a topic of research for nearly 100 years, there has been relatively little investigation into the resources that would have encouraged large populations to gather, contributing to construction of the earthworks. Exploration into subsistence remains has been difficult because the acidic soils of the region tend to degrade macrobotanical and faunal remains. Researchers therefore often rely on comparative samples found at other sites in the region to draw conclusions about the subsistence resources used at Poverty Point. Innovations in ancient sedaDNA (sedimentary DNA) extraction techniques offer potential avenues for reconstructing subsistence data. In this paper, we address the potential of these new techniques as well as the challenges collecting sedaDNA from tropical environments. Specifically, we discuss recent improvements to sedaDNA extraction, library preparation, and targeted enrichment protocols that enhance both the efficiency of sequencing and the detection of target organisms using fragmented and damaged DNA molecules. While tropical locations are not ideal for measuring sedaDNA, these innovations increase the likelihood of recovering ancient ecological information from less favorable environments.

Gillespie, Jeanne and Cherra Wyllie [129]

Framing Unequal Boundaries: Women, Queens, and Gender

Since the landmark 1986 *Blood of Kings*, kingship has been a central theme in the archaeology, iconography, and epigraphy of the ancient Americas. Despite recent discoveries, the topic of women rulers remains ancillary to the larger view of male-dominated social and political power. During the past 30 years, roles of women have been presented within broader discussions of gender, with the 1996 Dumbarton Oaks symposium "Gender in Prehispanic America" infamous for its contentious divides. Although gender theory is more widely accepted today, the identification of women in iconography and archaeological context is fraught with residual a priori assumptions that an individual is sexed male until proven otherwise. In Olmec studies, as well as other areas, courageous scholars who challenged these norms were often castigated by their predominantly male colleagues. Only now are their interpretations being reevaluated by a new generation of scholars. This presentation focuses on women in Mexican Gulf Coast archaeology and art history, both the scholars and historic personages that continue to shape our understanding of this oft-neglected region.

Gilmore, Kevin (HDR)**[329]***Vicksburg before the Siege: Paleoenvironment, Population Expansion, and a Delayed Woodland to Mississippian Transition in the Lower Mississippi Valley*

Based on recent archaeological work at Vicksburg National Military Park, the Late Woodland to Mississippian transition in the Lower Mississippi Valley extended beyond the traditionally defined end of the Woodland period, with evidence suggesting the Coles Creek-Kings Crossing phase (1000–1100 CE) persisted as late as 1200 CE. This work also suggests stable, mesic climate and pressure from a growing population contributed to the expansion of Kings Crossing phase people into the less agriculturally productive loess hills ca. 1050–1200 CE. Population grew significantly 600–700 CE and 950–1050 CE, reaching a stable peak ca. 1050–1200 CE. This correlates to more than a century of greater precipitation and climate stability 1017–1139 CE. Sustained occupation of the loess hills during this period is indicated by the presence of Kings Crossing phase ceramics throughout the Vicksburg project area, a burn feature containing cultigens dated 1050–1210 CE, and fired clay suggestive of a wattle and daub habitation structure. Stable, mesic conditions and population growth contributed to an expanding and more socially complex and agriculturally productive periphery. Sustained occupation of the loess hills ended during a period of significant drought and increased climate volatility 1140–1250 CE accompanied by rapidly decreasing population, and withdrawal to more fertile floodplain environments during the subsequent Plaquemine (1200–1450 CE) period.

Gilson, Simon-Pierre**[259]***Chair***Gilson, Simon-Pierre, Christian Gates St-Pierre (Université de Montréal) and Andrea Lessa (Museu Nacional do Rio de Janeiro)****[259]***Shark Remains in Brazilian Coastal Settlements*

Precolonial Brazilian coastal sites are rich in shark centra and teeth. They are frequently found inside the sediment matrix or as funeral deposits. The presence of shark teeth has been approached from zooarchaeological and ethnohistorical perspectives along with experimental archaeology and use-wear analysis. The Rio do Meio site was used as a study case. The combined methods allow us to infer data about shark fishing techniques and objectives used by native groups, the extraction of shark teeth through the use of heat from flames or hot water, the use of shark teeth as tools, the discard of fragile shark teeth unsuitable for manufacturing objects, the use of shark teeth as projectile tips. Finally, the study of the remains allowed us to reflect on the place and the fishing techniques as well as the processing of shark carcasses and their transport.

Coming into Ohio: Early Paleoindian Mobility

In this paper, we propose a new idea for the early colonization of Ohio, which is likely applicable to other previously glaciated regions. Concentrations of Paleoindian materials around wetland features may represent the first resource locales exploited during colonization. These areas became less attractive as megafauna and other resources declined. This pattern of Early Paleoindian land use may provide an alternative explanation for the distribution of Paleoindian materials in similar environments and provide further insights into seasonal mobility.

Curaçao's Oldest Site: Dates from the Rif St Marie Rockshelter Revise Earliest Island Settlement

In 2022, the Curaçao Cultural Landscape Project (CCLP) initiated a long-term field investigation on the ecological legacy of Indigenous and European colonial occupation of Curaçao, in the southern Caribbean. Excavation at a recently identified rockshelter site along the inland bay of Rif St. Marie (RSMA) identified significant archaeological deposits comprising lithic and coral artifacts, shell and bone, and several large combustion features. Three closely aligned radiocarbon dates on charcoal place the RSMA Rockshelter within the Archaic period and indicate that the site is Curaçao's earliest, extending the antiquity of human settlement on the island to the early fourth millennium BC. We report on the archaeological findings to date from the RSMA Rockshelter and the implications of the revised settlement chronology for Curaçao's earliest colonization and the evolution of the island's cultural landscapes.

Impermanent Architecture, Monumentality, and Landscape Transformation in the Sierra Nevada de Santa Marta, Colombia

From AD 100 to 1600, the northern and southern faces of the Sierra Nevada de Santa Marta were permanently transformed by prehispanic societies who built hundreds of stone and rammed earth towns throughout an area encompassing over 7,000 km². Despite the extent and scale of their work, only the stone foundations of their towns remain, hidden beneath forests, pastures and farmland, as the standing architecture was all built from perishable materials. How then can we reconcile impermanence with monumentality and analyze in more subtle, varied, and complex ways how societies seek to signify, change, and transform the places they inhabit?

Giraldo Tenorio, Hernando (Universidad del Cauca) and Marcela Benavides Imbachi (Universidad del Cauca)**[220]**

Diferenciación social y económica en la comunidad prehispánica de Moscopán, suroccidente de Colombia
Recientes investigaciones arqueológicas sobre las unidades políticas prehispánicas del suroccidente colombiano resaltan que las desigualdades sociales no fueron el resultado del control diferencial en la producción de ciertos bienes ni en la acumulación de riqueza por parte de la elite, sino en prestigio y el uso de la religión como fuente de poder. Sin embargo, los datos siguen siendo escasos para muchas unidades políticas. En esta charla se presentan los resultados de la investigación arqueológica sobre diferenciación social y económica de una comunidad prehispánica de la región de Moscopán, un asentamiento prehispánico con estatuaria y localizado entre los cacicazgos de Mesitas y el valle de Popayán.

Walking in Winter Landscapes: Reflections on Temporality and Seasonality in Stone Age Rock Art of Northern Europe
Temporal changes and surroundings are of vital importance to hunter-fisher-gatherers (HFG) and guide activities of HFG in northern Europe throughout the year. Lifeways differ between and within the regions of northern Europe, e.g., coastal northern Norway, inland central Sweden, or lake districts of Finland. The cynegetic activities (activities connected to hunting) of HFG change dramatically by the seasons of the year. Temporality, seasonality, seascapes, and landscapes are represented in HFG rock art by site location, motifs, scenes, and compositions related to “seasonal” activities. Stone Age rock art is a window to major innovations of people living in winter landscapes (e.g., skis, snowshoes) or seascapes (boats). Most rock art sites would have been accessible throughout the year; rock carvings in the tidal zone or near rapids would be snow- and ice-free during winter, while vertical cliffs with rock paintings would be exposed and more visible and accessible during winter. In turn this would have impact on how we study and interpret the lifeways of people inhabiting Frozen Worlds of the past. The backdrop of the study is comprehensive fieldwork during the last 20 years, studying rock art, rock art sites and their location during different seasons of the year.

Petrographic and Geochemical Analysis of Pottery from the White Marl Archaeological Site, St. Catherine Parish, Jamaica, West Indies

White Marl is the largest, most intensively inhabited late-precolonial site documented for Jamaica, with an artifact assemblage dominated by massive quantities of ceramics. Its size and structural organization suggest that it functioned as a major sociopolitical/economic hub among the increasingly complex chiefdoms in the Greater Antilles. To address the origin of materials from which White Marl pottery was produced, petrographic and geochemical analyses were conducted on samples of ceramics and nearby sediments. Compositional analyses of White Marl ceramics display consistencies across sherds that represent the full range of vessel forms and functions. Mineralogically, clay, quartz, well-weathered rock fragments, and feldspars dominate, with minor opaque minerals, muscovite, and amphiboles. Local raw sediments display varying compositions across samples, although one sand sample collected ~60 m south of the site was consistent with the pottery. The homogeneity of the analyzed ceramic population and similarity to nearby sediments indicates that White Marl pottery was locally produced, with the proposed material origin being the Above Rocks Inlier granodiorite. However, some sherds consistently plotted as outliers in the neutron activation analysis, suggesting a different geochemical origin for those few samples. Current analyses are investigating sherds from sites contemporaneous with White Marl to address potential intercommunity relations.

Pomp and Circumstance at an Ancient Maya Village: The 2023 Season at Group M of the Medicinal Trail Community, NW Belize

This poster provides a summary of the 2023 archaeological investigations conducted at and around Group M of the Medicinal Trail Hinterland Community, an ancient Maya site in northwestern Belize. Group M is a nonresidential masonry architectural group located at the north end of the Medicinal Trail Community. It is situated on a knoll, with a sharp topographic drop north, east, and west of the group. It is located on the northern terminus of the ridgetop that also includes formal residential Groups A and B and represents the northern boundary of the community. Initial survey and brief excavations from the 2017 field season indicated the group was atypical of architectural groups from elsewhere in the community, not being residential or a work area associated with terraces. Topographic mapping, drone photography, and courtyard excavations were undertaken. These findings, in addition to others from the 2023 field season, provide evidence for the interpretation of the group as a ceremonial center. This has implications for our understanding of Group M's function and significance within the community, as well as larger implications for ritual behavior among the rural non-elite Maya.

New Orleans City Archaeology Initiatives

In 2018, the City of New Orleans hired a full-time archaeologist as part of their \$2 billion FEMA partnership for infrastructure work stemming from the Hurricane Katrina disaster. Monitoring projects have unearthed data concerning the construction of the city's roadways, especially historic paving types and streetcar infrastructure. Colonial or earlier sites within New Orleans's geographical footprint are targeted and given special preference in the federally funded monitoring endeavors, although their identification has been challenging in an environment of heavy disturbance from prior utility and roadway construction. The archaeologist's current priority is administering these 200+ grant-related projects; however, issues involving Section 106, or archaeological resources in general, arise on a regular basis, lending credence to the potential for this position even after this grant. This paper documents the findings from these infrastructure projects: patterns of precontact and postcontact land usage and development, identification of additional target areas with unique historical value, and suggested approaches to better protect or mitigate archaeological resources within the City of New Orleans in the future.

Preliminary Report on the Faunal Material from the Deserted Medieval Village Site in Ballintober, Co. Roscommon, Ireland

This paper presents a preliminary faunal analysis from the deserted medieval village site in Ballintober, Co. Roscommon, in Ireland. Studies on faunal materials from medieval villages during the Anglo-Norman conquest and colonialism of Ireland are currently few, but they are crucial to better understand human-animal interaction in this period of social and political change. This study will illuminate aspects of the daily lives of ordinary people, an area understudied in high medieval Ireland compared to monastic and other castle and elite sites. The preliminary data from the excavated house plot in the village at Ballintober show signs of food processing and a range of domestic species, and the results of the analysis will reveal the animal abundance and diversity within this domestic context. These data will help answer questions about subsistence economies and life histories of the animals in the village. I will also discuss the evidence of modification and processing to draw interpretations about butchery practices and diet, and I will further compare the archaeological data to the historical data. While these results presently concern the earlier layers of occupation, this preliminary report provides new insight into human-animal interaction in medieval villages during the Anglo-Norman occupation.

Settlement Patterns, Urbanism, Neighborhoods: Comparative Perspectives from Grupo Gallinazo and Cerro San Isidro, Coastal Peru

This paper explores the formation, morphology, and neighborhood organization of two early urban settlements on the north coast of Peru—Grupo Gallinazo (~100 BCE–700 CE), Virú Valley, and Cerro San Isidro (~800 BCE–1500 CE), Nepeña Valley. Investigating variations in spatial arrangements and settlements at these two sites allows for a series of comparative insights into urban trajectories along the north coast of Peru. I pay particular attention to the potential of geospatial methods in relation to the different geological, architectural, and other anthropogenic processes at play in site formation and settlement growth. I discuss the results of survey operations at both sites, highlighting their sociocultural implications. Ultimately, the paper highlights the value of comparative analysis in studying ancient urbanism in the Andes and emphasizes the diversity of urban spaces throughout the region.

Scaffolding Archaeology, Education, and Collaboration at Sesquicentennial State Park, Columbia, South Carolina
Sesquicentennial State Park, built by the Civilian Conservation Corps and opened to the public in 1940, contains multiple archaeological sites representing both precontact and historic occupations. Current archaeological excavations are focused on investigating the history of nineteenth- and twentieth-century African American communities that were present prior to the park's construction and not currently represented in park interpretive narratives. Since May 2022, collaborations between South Carolina Parks, Recreation, and Tourism and the University of South Carolina have developed a collaborative approach centered on educational opportunity and community outreach. This presentation discusses the ways in which collaborations with local descendants and a focus on educational engagement among K–12 and postsecondary

institutes have directed the research design of the Sesquicentennial archaeology project. These collaborations have directly contributed to the development of interpretive materials seeking to magnify the potential community outreach and engage diverse stakeholders throughout the state.

Oceanic Tendencies: Ritual Landscapes, Oyster Shells, and the Social Worlds of Marine Resource Exploitation in Early Medieval Britain

Oyster shells have been discovered across multiple sites in Britain, often as part of shell middens which have been interrupted almost exclusively as food refuse. But whether inland or by the sea, people in Britain had used oysters and other mollusks to help make their religion. Oyster shells were often deposited at many Roman and early medieval ritual sites, including temples, burials, and pits, indicating a long-term and widespread use of oysters as ritual objects. At the same time, isotopic data has suggested that while the diets of some coastal communities were dominated by marine resources in the early medieval period, other people were less interested. This paper thus interrogates the chronology and geographic distribution of ritual oyster consumption and shell deposition within Britain at the end of the Roman period through the early medieval period. Such an approach also situates narrowly focused economic studies of marine resources and their exploitation within a rich social world of late Roman and early medieval sea environments.

Collectors, Public Archaeology, and Regional Surveys: Contributions of Stuart Struever

Stuart Struever developed several important and innovative approaches during his time in Illinois. I use my own Lower Illinois Valley research to focus on Struever's contributions in three areas: 1) working with collectors and amateur archaeologists, 2) focusing on engaging and interacting with the public, and 3) encouraging archaeological surveys of large regions. Many years ago, when I was an undergraduate, Struever had me conduct a study of plummets by interviewing 70 landowners and amateur archaeologists, determining their collector territories, how long they had collected, then examine their collections to see if they had ever found a plummet. I documented a total of 350 plummets with good provenience and with individual collecting territories covering the majority of the region by about 70 years. Struever loved interacting with the public and argued that archaeology had an obligation to inform, engage, and interact with the public in a variety of ways. Having spent a number of years as Struever's assistant, I outline some of his perspectives on public engagement. Finally, Struever consistently argued for a regional perspective, although he did not necessarily understand statistical sampling. Nonetheless, he worked to include the entire Lower Illinois Valley region for many research questions.

Pequot Subsistence Practices during the Seventeenth Century: A Zooarchaeological Analysis of the Calluna Hill Site (59-73), Groton, CT

Previous studies have provided a baseline for Indigenous subsistence practices in southern New England both before and after European colonization, but there are few archaeological sites that can speak to subsistence

during the early years of colonialism in the seventeenth century. This project uses zooarchaeological analysis and a comparative analytical framework to examine the faunal remains from Calluna Hill, a seventeenth-century Pequot habitation site in Groton, Connecticut, to better understand Pequot subsistence practices and persistence throughout the seventeenth century. Traditional zooarchaeological lines of inquiry were used to identify a list of species, skeletal elements, taphonomy, and depositional processes present at the site. The study further examined the results using intra- and intersite comparison to show the presence, nature, and distribution of faunal remains throughout Calluna Hill and to contextualize the findings in a broader regional discourse. The results provide insight into Pequot subsistence, hunting, butchery, processing, disposal practices, and human-animal relationships during a time of cultural stress and conflict with Europeans and contribute to a more nuanced understanding of Pequot identity, social dynamics, and the broader impact of European colonialism on Indigenous people and their homelands.

Twenty Years of Mesoamerican Obsidian Research at the EAF

Among the first materials compositionally analyzed at the EAF were obsidian objects from the Maya site of San José, Belize. Since then, we have analyzed tens of thousands of obsidian objects from Mesoamerica (primarily from the Valley of Oaxaca) as part of our study of the ancient Mesoamerican economy. Using these new analytical results as well as a comprehensive database of other sourcing studies for the region, we have documented large-scale shifts in the transport and acquisition of volcanic glass indicative of changes in political geography and transport routes between ca. 1600 BC and AD 1520. Here, we revisit the results of our prior network analyses using distance fall-off curves. These new analyses illustrate the role that political geography played in the distribution of obsidian in Mesoamerica, for instance, the selective acquisition of Pachuca obsidian by political allies of Teotihuacan during the early Classic or the role of the Tula and Chichen Itza in the distribution of Ucareo obsidian during the Terminal Classic period. However, in common with our prior analyses, we find that obsidian was likely moved through a number of channels and routes in Mesoamerica, often independently of direct political control over production and distribution.

The Lucayans and Their Rodents: Precolumbian Hutia Management in the Bahama Archipelago

The Lucayan Taino of the Bahama archipelago actively bred and managed the hutia rodent (genus *Geocapromys*) for centuries before the arrival of Europeans. Seven field seasons of excavations at the precolumbian Lucayan site of Palmetto Junction on Providenciales, Turks & Caicos Islands have produced exponentially more hutia skeletal material than has been collectively recovered from all other archaeological contexts in the Bahama Archipelago combined. Analysis of a representative sample of these remains via zooarchaeology by mass spectrometry (ZooMS) has established that many individuals in the Palmetto Junction hutia population were of nonlocal species endemic to the Greater Antilles, thus demonstrating that a culture of hutia translocation and management was well established in the Lucayan world. The presentation will discuss the results of ZooMS analysis on 75 individual hutia samples, temporally contextualized via a

robust sample ($n = 20$) of correlated AMS dates. This multivariate analysis is funded by an NSF DDIG, and is developing the most comprehensive timeline of human translocation, management, and exploitation of *Geocapromys* sp. ever attempted in the West Indies

La Ocupación Barbacoa de la Sierra Norte del Ecuador: Una revisión de la evidencia toponímica

La única evidencia lingüística disponible de los idiomas que se hablaron en la Sierra Norte del Ecuador en los albores de la conquista inca se encuentra en la toponimia no-kichwa ampliamente dispersa en la región. Durante la primera mitad del siglo XX investigadores como Paul Rivet (1907), Jacinto Jijón y Caamaño (1940, 1941), Carlos Emilio Grijalva (1947, 1988) y Telmo Paz y Miño (1960, 1961) recogieron y compilaron copiosa información toponímica de la Sierra norte, la misma que hoy debe ser analizada a la luz de los nuevos hallazgos de la etnohistoria, la arqueología y la lingüística histórica a fin de trazar con mayor precisión la ocupación barbacoa en la región así como los contactos que mantuvieron los hablantes de lenguas barbacoas en la Sierra norte con otros de origen etnolingüístico kichwa, sobre todo desde la primera mitad del siglo XVI. En esta presentación expondremos los resultados de nuestro análisis más reciente de la evidencia toponímica para la Sierra norte, cotejándolos con datos etnohistóricos y arqueológicos para concluir con una propuesta cartográfica de las principales marcas toponímicas barbacoas que nos permita deslindar con claridad su distribución geográfica.

Changes in Decoration through Time: An Analysis of Salinar Pottery found in Huanchaco, Moche Valley, North Coast of Peru

The late Early Horizon (400–200 BCE), also known as Salinar in the north coast of Peru, was a key moment immediately after the influence of the Chavín de Huántar sphere of interaction. Salinar pottery bears distinct designs and motifs that have never been properly studied. This paper presents a first systematic analysis of the varied decorative designs on ceramics found on Salinar occupational levels at the ceremonial site of Jose Olaya-Iglesia Colonial in Huanchaco. This analysis focuses on changes in decoration through time along with the frequency of designs by burial contexts based on gender. These changes may reflect functional, environmental, political, ritual, or cultural factors. Overall, the distinctive white-on-red ceramic style of the Salinar period traces a distinctive timeline of change that can tell us more about the sociocultural aspects of this period and lived experiences through painted, carved, applied, and sculpted designs on the pottery.

Gonzalez, Albert (Cal State University, East Bay)**[15]***The Abandoned Intersection: Race and Class and the Diversification of Archaeology's Ranks*

Archaeologists are quick to connect race and class in conversations about the dead. However, in our discussions of the living—especially on BIPOC archaeologists and their work—class takes a backseat to race, an outcome I call “wealth blindness.” I argue that, as professional archaeologists working to diversify our ranks, we owe it to our descendant constituencies, students of color, and BIPOC colleagues to re-couple wealth and race. I further argue that the rhetoric of Community Cultural Wealth (CCW), despite its well-deserved reputation for spurring equity in student and professional success, sometimes serves inadvertently to encourage wealth blindness among us. CCW’s theorization often obscures wealth gaps between those BIPOC populations that successfully break into archaeology and those that never attempt it in the first place, despite population-wide interest. I present anecdotal evidence to support these points, offering narrative fragments from my own experience as a hood-raised Latinx archaeologist and formerly incarcerated high school dropout. In doing so, I hope to encourage my colleagues to dedicate time and resources to rerouting BIPOC school-to-prison pipelines toward our field and to opening their eyes to wealth in the recruitment of BIPOC archaeology prospects at all levels.

González, Cristian [28] see Saintenoy, Thibault

Gonzalez, Edith (University at Buffalo SUNY)**[148]***We Carry It within Us: Shared Colonial History and Control of Caribbean Cultural Heritage Collections*

To quote James Baldwin, “History, as nearly no one seems to know, is not merely something to be read. And it does not refer merely, or even principally, to the past. On the contrary, the great force of history comes from the fact that we carry it within us, are unconsciously controlled by it in many ways, and history is literally present in all that we do. It could scarcely be otherwise, since it is to history that we owe our frames of reference, our identities, and our aspirations.” From the seventeenth century to the nineteenth century, the Caribbean underwent an intensive process of colonization, where islands frequently changed hands between European powers, yet were primarily occupied by Indigenous and Afro-Caribbean peoples. This begs the question who should control cultural heritage collections when multiple and sometimes competing communities of relevance can make a viable claim to a shared history. This paper examines the access to collections held off island, concerning shifting ecologies which are a cornerstone of modern Barbudan culture and identity.

Gonzalez, Nicholas (University of Connecticut)**[199]***Settling the Score: A Comparative Mesowear Analysis Using Qualitative and Quantitative Methods on Capra aegagrus Teeth*

The study of mesowear on ungulate teeth is a useful tool for reconstructing environmental conditions. The method has seen several improvements over the past decade, resulting in its increased applicability to a greater number of species and dental elements as well as the development of fine-tuned digital measuring techniques. Recent mesowear studies have attempted to quantify the method to address concerns of subjectivity, research bias, and replicability with the original scoring method. This prompts questions about which application of the method is “better,” if this distinction is meaningful, and which application more accurately depicts paleoenvironmental signals. In this study, I assess two mesowear methods: the traditional scoring method devised and improved on by Fortelius et al. and the more quantitative measuring method proposed by Jiménez-Manchón et al. by applying them to the wild goat assemblage from the Early Epipaleolithic site of Wadi Madamagh, Jordan. Although the quantitative method has been proposed to be more precise, it proved difficult to replicate, reducing its efficacy. Comparing the methods resulted in conflicting paleoenvironmental signals, which are addressed here.

Mountainous Landscapes in NW Spain: An Archaeological Examination of Current Debates about Rewilding, the Anthropocene, and the Culture-Nature Divide

I envision Landscape Archaeology as a scientific program, comprising interdisciplinary methods and theories, that rigorously analyzes the long-term processes of landscape formation. This approach integrates archaeological, paleoenvironmental, and ethnographic datasets to produce socially relevant knowledge about human behavior, delving into the social, productive, and symbolic aspects of societies. The potential of Landscape Archaeology for establishing theoretical connections with other disciplines among social and Earth sciences is broadly assumed by its practitioners, although it might not be clear enough beyond the boundaries of our field. Archaeologists should pay more attention to contemporary issues related to landscape management and policies. We can strengthen claims for the adoption of measures pursuing global citizenship and social justice, based on the promotion of critical thinking among better-informed citizens. We cannot leave behind local communities living in rural areas, usually ignored by governance bodies. This paper relies on my ongoing investigations of rural landscapes in the Cantabrian Mountains (NW Spain), examining the role of pastoralism in the anthropization of upland areas since late prehistory. It constitutes a fruitful horizon to inform policymaking on tourism, heritage and land-use management, challenging the nature/culture divide in public perceptions about landscapes and enriching discussions around the Anthropocene or rewilding.

Mesolithic and Neolithic Recipes under the Microscope: A Comprehensive Approach for the Study of Archaeological Food Remains

Research into food in archaeology has traditionally focused on the potential resources and ingredients from the identification of recovered plant and animal remains, as well as cooking technologies including pottery,

ground stone tools, fire installations, etc. However, the different processes behind the preparation of food and meals have only recently started to be disentangled. Advances in the application of coherent and cohesive methodological approaches involving different types of high-resolution microscopy (digital microscopy and scanning electron microscopy) in combination with organic residue analysis (ORA) have enabled the successful identification of a variety of archaeological food remains, shedding light on past food choices and cuisine. These methods have provided a new means of characterizing archaeological assemblages with charred food remains present as representative of past “recipes,” allowing the study of the *chaîne opératoire* of food, which links plants and animals to cooked products for consumption. This paper presents methods and results from the study of Mesolithic and Neolithic food remains from a variety of geographical regions, from Iberia to East Asia.

The Usage of Levels of Detail in Lidar Survey to Increase the Digital Applications on Maya Archaeology.

The advantages of lidar survey applied to the identification of archaeology under forested areas has been evident since the early twenty-first century. Most lidar studies have been done by placing the laser devices on aircraft, and in more recent years, drones. However, this is still quite an expensive endeavor that relies on several variables to succeed (forest density, number of pulses, weather, etc.). In this research, we test different lidar sensors (drone, hand-held, and close-range) to locate and document the ancient Maya architectural remains at and around the sites of San Clemente, Zapote-Corozal, Quemada-Corozal, and Torre-Corozal, both protected under the forested canopy and left exposed on the open fields. We aim to achieve and display lidar in a range of levels of detail to balance the possibilities and needs of lidar survey in order to interpret and understand the Maya remains, at small and large scales. Our research has proven that these methods are complementary and can benefit the creation of a solid ground base for the application of the incipient technologies such as the creation of digital twins, the application of sourced-based 3D digital archaeology, and the new functions that come with the usage of machine-learning codes.

States of Vulnerability: Examining Moche-Era Practices of Care in Life and Death

The way that communities cared for their living and dead holds great potential to elucidate the cosmovision of the Moche. Ritual practices during the Moche period involved human offerings that include women, children, and men at different stages of life. At the Late Moche site of Huaca Colorada, many of the 29 human burials from distinct contexts demonstrate that their involvement in these depositional events was due to their state of vulnerability. We define a “state of vulnerability” as a phase of time when an individual requires greater care due to age, illness, or pregnancy. In this paper, we examine several examples for the way that practices of care create and reinforce ritual significance during phases of renovation and maintenance of the physical and emotional health of the site. Mobilizing frameworks from bioarchaeology of care and socio-emotional theory, we argue that the time required to care for individuals in these vulnerable states while

alive sacralized their deaths. The diverse life stages of the burials from Huaca Colorada highlight the varied experiences for communities living at the site and their investment in caring for their loved ones in both life and death.

The Presence of Sacrifice in Chichen Itza and Tenochtitlan: Two Faces of the Same Story

In Chichen Itza and Tenochtitlan's religious thought, sacrifice was a creative act closely related to cosmic genesis and world sense. This behavior is evident not only in the archaeological record but also in the iconography. Two of the most common artifacts associated with this ancient practice in both cities are sacrificial stones used for heart sacrifice rites: the polyhedral artifact known as *techcatl* and the Chac Mool, a human figure seated, with the upper back raised, legs drawn up to the buttocks, and hands holding a vessel, disk, or plate. At Early Postclassic Chichen Itza, architectural and other material cultural evidence suggests that victims' blood was offered to the bellicose solar deity, whose daily journey through the sky depended on such liquid. During the Late Postclassic Tenochtitlan, there was a similar militaristic ideology; however, it also included the earth deity, Tlaltecuhli, as the other primary recipient. This paper aims to draw attention to the similarities and disparities between both sites. We relied on analyzing sculptures, historical texts, iconography, and other information found in the material culture. We suggest that the Flower World—a floral spiritual domain—ideology is present in both cities and shows more commonalities than differences.

Landscapes and Chronology of the Chullpa Phenomenon within the Lauca Basin (18°S)

The Carangas region, named after a late prehispanic and early colonial chiefdom in Qollasuyu (south-central Andes), preserves over 600 chullpa mausoleums associated with walled hilltops, administrative centers (tambos), and regional movement routes. Carangas's chullpas exhibit a great diversity of architecture, as well as geographical and territorial settings. The highest concentration of chullpas is found in the Lauca basin, a high-altitude and low-demography region, with clusters including adobe constructive traditions, exceptional polychrome paintings, and Cuzco-style stone masonry. Supported by the UCL IoA PhD program and the Redes andinas project (Incipit-CSIC), this study is carrying out a regional approach in the Lauca basin to research the variability of chullpas' chronology and landscape setting within this region. On the one hand, an AMS radiocarbon dating protocol reveals the diachrony of the chullpa phenomenon from the Late Intermediate period through the colonial period. On the other hand, computational modeling of chullpas' architectural and locational characteristics has allowed us to assess chullpa placemaking's rationales, which seem to have changed over time. By examining both chronological and locational variations, this research aims to discuss the role chullpas played in ancient landscapes, bringing together the living, the ancestors, the mountains, water sources, and agricultural fields.

Recent archaeological findings in the neotropical region of South America are central to understanding the early adaptations of Paleoamerican populations to diverse ecosystems, especially tropical areas, between 14,000 and 9000 BP—a period marked by significant paleoenvironmental and paleoclimatic shifts. This study focuses on the critical role of lithic technology in unraveling the subsistence strategies of the first human groups. Recent 3D morpho-technological analyses on lithic assemblages from cerrado and Amazonia biomes have revealed a variety of toolkits, including bifaces and multifunctional unifacial artifacts, highlighting a deep-seated relationship with the region's ecological mega-diversity. These new data, particularly concerning “plano-convex” artifacts, indicate not just a culture significantly geared toward plant exploitation and medium game hunting but also the potential engagement in early soil and forest modifications, showcasing previously unknown levels of adaptability and technological sophistication. Our presentation will further explore these groundbreaking discoveries, offering a nuanced perspective on Paleoamerican adaptations during a critical period of human settlement, emphasizing the complex interactions with diverse neotropical biomes during the Pleistocene-Holocene transition. This research invites a reassessment of the historical understanding of settlement processes in South American tropical regions, adding depth to the depiction of early human adaptive strategies and technological advancements.

Goodman, Reed (New York University) and Paul Zimmerman (University of Pennsylvania)**[60]***Using Ramped Pyrolysis and Oxidation (RPO) to Date and Characterize Geoarchaeological Deposits: A Pilot Study from the Ancient Mesopotamian City of Ur*

Geoarchaeological sediments represent robust archives of human-environment interactions. Given the growing importance of paleoenvironmental research in anthropology and the absence of critical chrono-stratigraphic and ecological evidence from challenging contexts/regions, opportunities to refine chronological frameworks through novel instrumentation are desirable. We report on the application of a uniquely suited thermal fractionation method, ramped pyrolysis and oxidation (RPO), to extract chronological and paleoenvironmental proxy data from geoarchaeological samples when coupled to radiocarbon and stable carbon analyses. RPO, developed at the National Ocean Sciences Accelerator Mass Spectrometry (NOSAMS) facility in Woods Hole, MA, was initially created to date and explore the chemical composition of carbon-poor sediments from the Arctic seafloor. As a proof of concept, we used RPO to analyze recently collected sediment samples from exposed archaeological sections at Ur, Tell Muqayyer, an important Mesopotamian city in southern Iraq. Sir Leonard Woolley excavated deep pits at Ur in the 1920s and dated their strata through ceramic sequencing. Ultimately, we compared RPO results with Woolley's interpretations to evaluate the method's potential for chronology building in archaeology. We also discuss the prospects and limitations of RPO more broadly based on additional measurements from the site and region.

Goodsell, Joanne (US Army Corps of Engineers)**[4]***Mindful Mitigation: Reconceptualizing the Resolution of Adverse Effects through Considered Consultation*

To comply with Section 106 of the National Historic Preservation Act, federal agencies are required to consult with the State Historic Preservation Officer, Native American tribes, and other parties to seek ways to avoid, minimize, or mitigate the adverse effects of their undertakings on historic properties. Historically, archaeologically driven standard mitigation measures for resolving adverse effects to Native American archaeological properties have comprised excavation for data recovery, destructive analysis, and long-term curation requirements, regardless of input from consulting tribes. Increasingly, the rote application of standard archaeological approaches to Section 106 mitigation is being challenged by Native American descendant communities, who dispute the notion that meaningful consultation has occurred when the outcome continually favors scientific inquiry over the cultural values and beliefs, and scientific knowledge and wishes, of Indigenous people. Prompted by our tribal partners, the US Army Corps of Engineers, Sacramento District, is moving toward more approaches to mitigation on civil works construction projects that involve and acknowledge tribal knowledge and preferences. This presentation focuses on some of these projects, the contexts within which alternative mitigation needs were determined, and the positive outcomes achieved through a more collaborative, thoughtful, and anthropological approach to Section 106 compliance.

Goodwin, Graham [321] see Rissolo, Dominique

Goodwin, Whitney (Archaeometry Laboratory at the University of Missouri Research Reactor)**[255]***Feasting, Shell Middens, and Monumentality in Northeastern Honduras*

At the site of Selin Farm (AD 300–1000) in northeastern Honduras, recent research revealed repeated episodes of large-scale feasting occurring over a period of nearly a thousand years leading up to major shifts in local social and political organization (Goodwin 2019; Reeder-Myers et al. 2021). Shell midden mounds at the site contain large deposits of well-preserved pottery, lithics, and faunal remains disposed of as part of feasting events, including one artificial mound that represents the earliest example of monumental architecture in the region. Feasts have been identified as arenas where local politics are played out—emergent leaders use these performances to merge long-standing traditions and new rituals (and ritual objects) in an effort to alter their social standing. By focusing on feasting contexts and evaluating the origin of the pottery used in these settings via compositional studies using neutron activation analysis, the current study aims to bring together information on participation in regional exchange systems and emerging complexity in northeastern Honduras to understand how these two significant sociocultural changes were intertwined in the past.

In 2007, a children's book about Cypriot history entitled *The Island that Everyone Wanted* was published.

Despite being aimed at a juvenile audience, this title aptly encapsulates the history of Cyprus, i.e., as an island

coveted by imperial polities from the Assyrians to the British. Throughout this nearly 3,000-year period, imperial states were drawn to Cyprus to extract and manipulate its *longue durée* values, especially its metallic and agricultural resources and/or its strategic location along trade routes and between Mediterranean and Near Eastern states. Because of Cyprus's historical situation as a frequent imperial possession intertwined with large-scale macroeconomic and political networks, Wallerstein's world-systems theory has proven to be an effective analytical framework to explore how local society changed during eras of premodern, "world-system"-level connectivity. Two eras particularly salient for such analyses are the Hellenistic and Roman periods, when two economically exploitive, yet politically diverse, imperial states (the Ptolemies and the Romans) manipulated Cyprus as a peripheral possession from the cores of Alexandria and Rome. Through a comparative archaeological analysis of coinage, sculpture, and architecture, this paper assesses the continued utility of world-systems and globalization approaches for understanding premodern processes of social change in Hellenistic and Roman Cyprus.

Cosmology and Lunar Calendar of a Prehistoric Rice Farming Society in Japan: An Experimental Simulation with arcAstroVR

In Japanese prehistory, the foraging of the Jomon economy was followed by the Yayoi period, which was based on rice cultivation and metal tools introduced from China. During the Yayoi period, social stratification developed, and small chiefdoms arose in western Japan. According to Chinese records of one such chiefdom, Yamataikoku, the solar year was divided into two seasons, spring and fall. The Yoshinogari site (300 BC–AD 200) in northern Kyushu Island is one of the most important sites as a settlement corresponding to this period. To evaluate speculations on cosmology and calendar, we developed arcAstro-VR, which uses Unity as a 3D engine with sky, terrain, and 3D object data by lidar survey and reproduces them in VR space. The simulation of celestial bodies uses the plug-in function of Stellarium. As a result, the relationship between the Northern Tombs and Mt. Unzen Fugen, over which Canopus and Southern Cross shone in winter, was confirmed. On the other hand, the axis of the Northern Inner Enclosure coincided with the direction of the appearance of the full moon near the winter solstice during the high moon period, which repeats every 18.6 years. This suggests that moon-reading was practiced as an agricultural calendar.

Building Capacity: Educating and Training Submerged Terrestrial Archaeologists

In spite of an increased interest in submerged terrestrial landscapes and an increased need for trained professional archaeologists to support offshore energy development projects, educational programs in the advanced survey technologies, analytical software and methodologies, and educational coursework necessary to discover and interpret submerged landscapes remains in a nascent stage of development. Faculty with the University of West Florida contributed educational outreach opportunities to support a NOAA grant awarded to explore paleolandscapes and the ca. 8000 BP shoreline of the outer continental shelf of the western Gulf of Mexico. These educational and training activities included graduate student support, high-impact educational practices, and mentorship and training in basic analytical techniques on samples derived from the grant-supported fieldwork. Additionally, a course in submerged terrestrial archaeology was offered to professionals and students in August 2022. Over several days, working professional archaeologists and scholars presented overviews of cultural historical contexts as well as lectures on submerged site modeling and discovery. Course participants were asked to consider what a successful submerged terrestrial higher educational program might include. This paper summarizes the results of these activities and more specifically considers the challenges of standing up a program in submerged terrestrial archaeology at a regional comprehensive university.

The Blurred Line between Insider/Outsider Positionalities

There has been a serious reckoning with problematic histories in our discipline, which have involved extractive research—outsiders' removal of objects and knowledge from local communities. Increasingly, researchers are attempting to address the harms perpetuated by these histories by better serving communities. Often, however, insider/outsider positionality is not so binary. It can be challenging to ethically determine whose perspectives to champion and to come to terms with the ways our own unique positions along the insider/outsider spectrum impact research goals. In this paper, four early-career archaeologists critically consider their multidimensional positionalities. The first studies the material legacies of the Manhattan Project in Oak Ridge, Tennessee, and reflects on her relationship to the topic as the daughter of a resident physicist. The second, an India born researcher, negotiates her class positionality in the study of material culture associated with Bengali identity in various socioeconomic and international contexts. The third seeks to promote inclusive heritage interpretations of the legacies of Japanese colonial rule in twentieth-century East Asia. The fourth, a pro-immigrant researcher from the global north, studies refugee resettlement in the global south. Their examples demonstrate the complexity of outsider/insider positionalities and speak to the limitations of relying on “serve-the-insiders” approaches.

Graesch, Anthony (Connecticut College)**[304]***Human-Object Severance: Archaeological Interventions in Contemporary Material Flows and Massive Discard*

After decades of aspirational spending, and in houses brimming with tens to hundreds of thousands of objects, North Americans have amassed inventories of belongings that are extraordinary for their scale and complexity. In a process largely devoid of ritual, these lifelong-amassed collections are often thoroughly purged from domestic architecture at the conclusion of homeowners' lives, dropping out of time and memory. Building on Jeanne Arnold and colleagues' archaeological ethnography addressing the material worlds of American families, this presentation considers whether we owe anything to the objects that once constituted the social lives of households. I highlight two pilot studies where researchers staged archaeological interventions in seldom-seen bureaucratic "flows" of waste for the purpose of isolating massive domestic discard events. Such interventions, I argue, afford an examination of relational materialities seldom enjoyed in other archaeological contexts and thus are essential to developing an anthropological understanding of the dissolution or severance of human-object relationships. Drawing on several datasets, I problematize the classic archaeological notion of "systemic" and I operationalize more recent conceptualizations of "assemblage." Finally, I reflect on the ways that discarded possessions "haunt" the past and the present when their social lives are reanimated in the context of archaeological research.

Gragson, Ted (University of Georgia)**[233]***Chair***Gragson, Ted (University of Georgia), Lydia Allué Andrés (Universidad de Zaragoza), Victor Thompson (University of Georgia), Faith MacDonald (University of Georgia) and Brett Parbus (University of Georgia)****[233]***Mercadal from the Onset of Settlement through the Medieval Crisis in Southern Aragon (Spain)*

San Miguel de Mercadal is one of 23 villages abandoned in the late fifteenth century during the Medieval Crisis in the Comunidad de Aldeas de Daroca created AD 1248 to encourage resettlement and self-defense of the southern borderlands of the Kingdom of Aragon. In 2023 we conducted a geophysical and satellite survey of Mercadal and its surroundings combined with shovel testing, surface collection, limited excavation, and recovery of datable material. The 5 ha village is delimited by a water canal and stone embankment and includes tightly spaced stone foundations of functionally distinct structures linked by interior pathways centered on a Romanesque chapel still used by local residents. Modeled radiocarbon dates from 2023 indicate settlement beginning AD 771–889 coinciding with Banu al-Muhajir control of the upper March of Al-Andalus from the fortified city of Daroca, which contrasts with both the narrative history presenting the region as vacant until liberation from the Moors and the earliest documented reference to Mercadal in AD 1280. Morphometric analysis of the area surrounding Mercadal revealed varied water management features and different land types that social memory and documentary evidence indicate are associated with agropastoral activities since at least Mercadal's inclusion in the Comunidad de Aldeas.

Graham, Caroline, Lia Kitteringham (Colorado State University) and Edward Henry (Colorado State University)**[232]***A Geoarchaeological Examination of the Elijah Bray Site: Exploring the Extent of the Pinson Landscape, West Tennessee, USA*

Pinson Mounds, located along the South Fork of the Forked Deer River (SFFDR) in West Tennessee, is considered the largest Middle Woodland (ca. 200 BCE–CE 500) ceremonial center in the Southeast. Containing at least 13 earthworks, the site provides important opportunities to examine complex social and environmental interactions among societies across the Eastern Woodlands. However, Pinson represents only one collection of earthworks along the SFFDR. Private ownership of the Elijah Bray Site, a satellite property 8 km to the southeast and containing two known conical mounds, has hindered archaeological understanding of the overall Pinson Landscape. Growing relationships with landowners have provided access to the site. This presentation will discuss data obtained from recent geophysical surveys and lidar analyses of Elijah Bray. We will also discuss analyses of a bulk soil sample column collected from a road-cut soil profile adjacent to Mound I that included particle size analysis, sequential loss-on-ignition, and magnetic susceptibility to test whether this exposed profile represents human landscape modification. Findings from this study expand our understanding of how Indigenous peoples interacted with their environments across the SFFDR, allowing us to lay the foundations for a landscape biography of the wider Pinson Landscape.

From Feathers to Teeth: Remaking the Natural World on an Early Creole New Orleans Plantation

Throughout the colonial period, plantations played an important role in shaping the social and economic landscape of early New Orleans. Though rarely considered as part of the urban fabric, these plantations relied on localized geographies while fostering the growth of distinct economies and contributing to the development of New Orleans Creole culture. This paper examines everyday objects found on a late colonial plantation in the neighborhood of Faubourg Tremé to reconsider the significance of the plantation in the city's colonial history. From feathers to teeth, archaeological assemblages reveal how plantation residents—both free and unfree—relied on mundane objects and the natural landscape to shape emerging Creole aesthetics and identities in the eighteenth- and early nineteenth-century city.

Monitoring At-Risk Archaeological Features Using Phone-Based Lidar at Fort Irwin National Training Center, California

In 2002, the Installation Archaeologist at Fort Irwin National Training Center began an “Off Limits Monitoring” (OLM) archaeological site monitoring program to assess at-risk sites for disturbances and to provide recommendations on how to reduce risk and protect these sites in the training areas of Fort Irwin. A robust live-fire military training program, climate change, and the rugged environment of the Mojave Desert itself have created unique challenges for effectively monitoring these protected sites. Auxilo Management and Ayuda Companies contractors for the Department of Public Works (DPW) are working with the Installation Archaeologist to find innovative ways to track and evaluate these changes and risks over time. This poster presents data from a new, multiyear initiative using phone-based lidar units to track changes in high-risk site features over time. Using an iPhone 14 Pro, we scanned four features—(1) petroglyphs, (2) a sniper's nest from World War II Era military training activities, and (3) two thermal features at risk due to erosion and active alluvial sediments—using the Scaniverse App. Sites were rescanned five months later with results assessed using the program Cloud Compare to determine a schedule for future monitoring efforts.

Grauer, Kacey (Stanford University)**[275]***Hydro-Social Transformations and Economic Realities at Aventura, Belize*

This paper presents legacies of water supplies at the Maya site of Aventura, in northern Belize. During its ancient occupation, Aventura was a city with ample water resources integrated into its settlement. Access to this water was not restricted by economic status as local political ecology was organized heterarchically. In 1848, refugees of the Caste War in Mexico established small villages in the area. Oral histories indicate that water was managed at the household level, as people grew rice and fished in waterlogged landscape. By the end of the nineteenth century, the landscape had dried out due to a combination of deforestation and sugar cane monoculture, both fueled by colonial interests. Today, sugar cane fields dominate Aventura, except where the land remains too wet for this “thirsty crop” to thrive. These legacies make for complex heritages: while local NGOs seek to revitalize Maya agricultural ceremonies, livelihoods remain intricately entwined with the colonial sugar cane industry. By examining these diverse historical contexts and their reverberations, the water supplies at Aventura demonstrates how intricate ecological, political, and economic dynamics continue to shape the region.

Grávalos, M. Elizabeth (Stanford University) and David Chicoine (Louisiana State University)**[50]***Ceramic Paste Technologies at Cerro San Isidro, Nepeña Valley, Peru (ca. 500 BCE–1470 CE)*

Here we present the preliminary results of geochemical and petrographic analysis of ceramics from the site of Cerro San Isidro, located in the Nepeña Valley of Ancash, Peru. Cerro San Isidro was the principal urban settlement within the Moro Pocket of the Nepeña Valley throughout its history, which spanned the final Formative period through the Late Intermediate period (ca. 500 BCE–1470 CE). To understand ceramic production and exchange during the site’s occupation, we conducted laser ablation–inductively coupled plasma–mass spectrometry ($N = 117$) and petrographic thin section analysis ($N = 100$) on pottery fragments from excavated contexts. Our ceramic sample consists of various styles spanning the site’s use, including Circle-and-dot, Post-fire scratched, Pattern-burnished, Recuay kaolin positive painted, Casma incised, and Press-molded. We examine differences in their paste technology and use of geomaterials, while situating our findings within regional politico-economic trends. Doing so yields insights into changing ceramic production practices at Cerro San Isidro. Finally, we briefly compare our findings with previous compositional analyses conducted by the first author. This allows us to understand how ceramics at Cerro San Isidro relate to those recovered from other Ancash sites, expanding scholarly understandings of ancient Andean production and exchange networks.

Gravel-Miguel, Claudine (New Mexico Consortium), Grant Snitker (New Mexico Consortium), Jayde Hirniak (Arizona State University) and Katherine Peck (University of New Mexico)**[308]***Combining Aerial Lidar and Deep Learning to Detect Archaeological Features in the Piedmont National Wildlife Refuge, Georgia*

A growing number of archaeologists are using lidar-derived high-resolution digital terrain models (DTM) to detect and document archaeological features. Early adopters used visualizations to manually detect archaeological features; however, recent technological advances provide new tools that can considerably increase the efficiency and effectiveness of archaeological feature detection in DTMs. Our team uses deep learning convolutional neural network (CNN) models—a subset of the larger machine-learning (ML) toolset—to quickly detect archaeological features over large areas. CNNs specialize in the analysis of visual imagery, making them particularly useful for the detection of visual features. For this project, we trained U-Net models with VGG and ResNet backbones to detect the presence and location of archaeological cotton terraces in the Piedmont National Wildlife Refuge, Georgia. While not all models produced compelling results, the best ones reached recall (also known as the True Positive Rate) values >85% and detected terraces that had been missed during manual annotation, thus illustrating the robustness of this method. In

this presentation, we demonstrate the steps required to train our models, best practices for a successful use of this methodology, and the resulting maps and outputs it can create.

The Social Life of Crash Sites: Understanding World War II Sites in Context in the Search for Missing Air Crew
Archaeological sites are only rarely preserved as pristine moments in time, unaltered since the site was formed. More often, they are a continuous production, forming a part of the social and cultural landscape of the surrounding area. In this paper, we draw on Appadurai's idea of the "the social life of things" to explore the social life of World War II aircraft crash sites, through case studies drawn from our work at sites in Central Europe. Such sites, themselves disruptions into local terrains that may have archaeological significance, often preserve a record of visitation, development, and alteration reaching to the present day. One of the challenges in fulfilling the DPAA's mission of providing the fullest possible accounting of America's missing military personnel is disentangling the many ways that the postdeposition life of the sites has affected the potential for recovery.

Metallurgical Traditions of a Mongolian Habitation Site

Two models are employed to explain iron objects in assemblages from nomadic peoples of Mongolia. One argument posits that pastoralists imported Chinese iron objects, and when they practiced metallurgy, used methods learned from Chinese craftsmen. Another model, notably argued for by Jang-Sik Park, suggests that nomads practiced small-scale metallurgy to produce unique iron objects relevant for nomadic lifestyles. In this argument, Park emphasizes the difference between the Chinese-style tradition based on large-scale production of cast iron and an alternative based on small-scale production of bloomery iron, which was used in the production of objects excavated from domestic contexts in north-central Mongolia from 400 BC to AD 1300. This presentation supports the unique metallurgy tradition argument by offering further evidence of a metallurgy production features at Tsagaan Ereg, a domestic site in the forest-steppe region of Mongolia. Tsagaan Ereg contains multiple occupation events, including a Mongol-era (AD 1309–1412) multiyear seasonally occupied pit house. Forthcoming radiocarbon dates will place the furnace feature within the timeline of occupation of Tarvagatai Valley. Previous findings from metallurgical research in Mongolia have suggested that iron traditions were flexible and multiscalar; this presentation supports this conclusion by furthering the study of microscale iron acquisition and production.

Perishable Artifacts from Rockshelters and Caves in the Guadalupe Mountains of New Mexico and Texas: Dating and Stylistic Study of Sandals, Baskets, Matting, and Cordage from Early Twentieth-Century Excavations

The Office of Contract Archeology at the University of New Mexico is performing investigations of organic artifacts from two caves and seven rockshelters in the Guadalupe Mountains of southeastern New Mexico and west Texas. These caves (Burnet Cave, LA 101435, and Hermit's Cave, LA 4992) and rockshelters were excavated in the early twentieth century, and minimal stratigraphic information was recorded for these stratified deposits. Additionally, no chronometric dating has previously been performed on sites that include potential Paleoindian and Early Archaic occupations as the earliest uses of these shelters. OCA reports AMS dates for samples of organic artifacts from these locations curated at multiple museums and facilities that include sandals, baskets, matting, cordage, quids, raw material bundles, and several kinds of wooden artifacts. OCA has also recorded updated descriptive data on these items that include raw materials, production techniques, and conservative functional inferences. These data are presented to help provide chronological data about these shelters, to update information about this regional sample of organic artifacts, and to address stylistic variation in weaving methods for the large sample of sandals and basketry fragments.

Who Makes the Rules in Egalitarian Cities? A View from Bronze Age South Asia

By 2600 BC, the first cities had emerged in South Asia. Expansive and dynamic, the Indus civilization prompted the growth of massive settlements like Mohenjo-daro in Pakistan and Rakhigarhi in India. Both cities were part of a prosperous agropastoral economy that supported the invention of writing, long-distance exchange, large nonresidential buildings, planned neighborhoods, and a host of sophisticated craft technologies. And yet, like many of the world's first large-scale societies, the Indus civilization was conspicuously egalitarian, its people eschewing palaces, ostentatious tombs, asymmetrical wealth distributions, and individual-aggrandizing art. Where did the "rules" of Indus egalitarianism come from? This paper addresses this question, drawing from work of the economist Thomas Piketty. In this chapter, I grapple with the tensions between ideology and economic growth. If the rules of urban egalitarianism were simply upscaled from the pre-urban settlements, why were they so long lived, and how did they adapt to the growth in the urban phase? If, on the other hand, we detect glimpses of inequality in pre-urban settlements, then Indus egalitarianism was established within the Urban communities. This would suggest that Indus cities "invented" egalitarianism and prompt consideration of how its ideologies and technologies may have discouraged nontrivial disparities.

Archaeology of the Eastern Oyster: Collection and Curation Practices by North American Practitioners

Oysters have long served as both ecological and cultural keystone species. Across many coastal regions of the world, oyster-dominated shell middens and mounds are common features of the archaeological record. Oyster deposits serve as time capsules containing evidence of past environmental conditions, harvest patterns, and subsistence economies. Due to the substantial volume of oyster specimens recovered from coastal sites, archaeologists must often navigate challenges regarding the curation or disposal of assemblages. A primary challenge includes balancing finite space for long-term curation with the potential for future research of unanalyzed bulk shell collections. Here we present the results of a 2023 survey focused on assessing archaeological practices related to the recovery and curation of eastern oyster specimens in North America. The results identify practices across institutions housing archaeological oysters including museums, universities, government and Tribal repositories, and private CRM firms. We summarize trends in field research design, laboratory analyses, and approaches to curation. The broader impacts of this survey highlight commonalities and differences in curation practices as a foundation for discussing best practices in oyster curation and collections management, as well as how to improve inter-institution research across collections with implications for long-term curation care and applications to other shell taxa.

Ongoing Excavations at Big Village (42EM2861) in Range Creek Canyon, Utah

Excavations were conducted from 2007 to 2013 by the University of Utah at Big Village (42EM2861) in Range Creek Canyon, Utah, to explore questions related to Fremont residential site structure and adaptations, primarily by exploring the relationships between surface features and subsurface features and artifact assemblages. Additional excavations performed from 2021 to 2022 focused on two previously identified overlapping structures. Methods included total station and GIS mapping, triangulation mapping, 3D modeling, artifact recovery and analysis, radiocarbon dating, and starch analysis. A total of 5,478 artifacts were collected during the 2021–2022 excavations. Radiocarbon dating returned median dates inconsistent with stratigraphic

layering, confounding efforts to establish a precise chronology; however, the structures may be relatively contemporaneous as the 95% confidence intervals of the dates overlap. Further exposure of the features may contribute to a more robust understanding of site features and relationships. Prior studies of Fremont villages in the region indicate that surface rock alignment features are associated with pithouses, but this is confirmed neither by the limited previous studies performed in Range Creek Canyon nor by the current study, the results of which can contribute to understanding of Fremont adaptations and site structure within the broader context of Southwest prehistory.

Poverty Point's Plaza as Monumental Earthwork

Research at Cahokia, Raffman, and other sites has shown the folly of assuming that plazas are unaltered because they are level and dwarfed by the topography of surrounding earthworks. Their unassuming topography can conceal evidence of significant anthropogenic alterations, past activities, and buried features. Although Ford and Webb's classic monograph on Poverty Point made no mention of the large, flat area enclosed within their newly recognized C-shaped earthen ridges, other than to indicate that it contained a scarcity of artifacts, it is not a recent notion that earthmoving activities took place there. Multiple studies have documented an original undulating surface that was filled in places with occupational debris and loaded fills. Is today's relatively flat plaza, however, as pedantic as filling in potholes to create a level surface? Or do we need to look at the Poverty Point plaza in a new and holistic way—as a monumental earthwork with a complex construction history? We argue for the latter, bringing together what is known about the anthropogenic creation of the Poverty Point plaza from our work (since 2006) as well as other studies.

Black Studies and the Ontological Politics of Knowledge Production in African Diaspora Archaeology

Archaeologists often draw on theories from other disciplines to frame their research, which invariably draws our work into the orbit of larger political debates within and outside the academy. Even a subtle gravitational pull from these political bodies of theory can have substantial effects on how archaeologists conceive of past realities, especially since many social theories continue to perpetuate racist, colonial, capitalist, and sexist worldviews they were originally developed to justify. To demonstrate the effect this can have on archaeological knowledge production, my paper uses the work of Black studies theorist Sylvia Wynter to explore how archaeological studies that draw from neo-evolutionary and behavioral ecological theories

define what it means to be human in ways that pulls their work into the orbit of, and unintentionally reproduces, discourses intended to racialize and dehumanize Black women and men. While these theories are problematic in archaeology writ large, their use in African diaspora archaeology can be especially damaging for the people whose lives we study and whose descendants we collaborate with.

Weeksville Pictographs, Western Montana: The Importance of Location

Setting and geographic context have always been integral to rock art analysis and are important in combination with symbolic content for determining site function. The Weeksville Pictographs in western Montana exemplify intentional selection of a location for pre- and postcontact rock art by both Natives and immigrants. The precontact pictographs are dominated by red paintings in the Columbia Plateau style, and early Euro-American painted additions serve as roadside signs to advertise a store at the nearby town of Plains. This specific rock face has continuously served as a public billboard for travelers along a route through the western mountains, first as a historic Indian trail and subsequently as an early regional roadway. The site is important in the evaluation of what we categorize as graffiti and what might be erroneously removed in the guise of preservation.

Representation and Distribution of Fragmented Elements from Human Skeletons in Umm an-Nar Tombs: Impact of Secondary Mortuary Practices

Umm an-Nar (2700–2000 BCE) skeletons in the United Arab Emirates remain challenging to investigate due to secondary mortuary practices resulting in commingling, fragmentation, and cremation. Tombs contain multiple chambers, but little work has been done to examine whether certain skeletal elements may have been intentionally moved into particular chambers as part of funerary traditions. To assess skeletal representation, the minimum number of individuals (MNI) for Umm an-Nar tomb Unar 2 (2300–2100 BCE) was calculated for a variety of cranial and postcranial elements. To explore the potential for redistribution, the location of nearly 12,000 fragments was evaluated across 12 chambers. MNI estimates suggest that at least 411 individuals are represented, although estimates from the skull (MNI range: 328–411) varied dramatically from postcranial elements (MNI range: 183–234), suggesting that the skull was more likely to be returned to the tomb following secondary mortuary treatments, or that portions of the skull were more likely to survive. Additionally, while some chambers were generally favored over others for disposal of the dead, no significant differences ($\chi^2=47.6$, $df = 39$, $p = 0.16$) existed in the distribution of some skeletal elements over others across chambers, indicating a lack of preference for secondary placement of particular bones back into the tomb.

Human Body Parts from the Monumental Special Buildings at Pre-Pottery Neolithic (PPN) Göbekli Tepe, Southeast Türkiye

In recent years, the Pre-Pottery Neolithic (ca. 9500–8000 BC) site of Göbekli Tepe in Turkey has seen the emergence of some major hypotheses based on results from ongoing fieldwork. Perhaps the most significant new insight relates to site formation, especially the filling processes of the large monumental special buildings with their collections of characteristic limestone T-shaped monoliths. Until a few years ago, it was considered that human remains recovered during the excavation of some of these buildings were part of a massive intentional backfill of the structures at the close of their use-lives. In the case of the animal bones found in this fill matrix, this interpretation led to ideas of the building-burial taking place against the backdrop of a religious ceremony accompanied by feasting. For the less numerous human bones, this scenario implied the intentional deposition of selected human body parts. Naturally, this is a very interesting possibility given the topic of this symposium. However, new interpretations of the archaeology and site formation processes have challenged this hypothesis. Here, we will present our current conclusions regarding the archaeology at Göbekli Tepe and focus on their impact on the interpretation of human body parts recovered from the special buildings.

Finding Grasses in the Rock Art of Balanggarra Country, Kimberley, Northwest Australia

The floristic complexity of native Australian grasslands means they are a haven for biodiversity, and have provided a range of subsistence, material, and sociocultural resources for Indigenous peoples. Disentangling the ways in which people engaged with these environments is a complex task, and has, to date, relied on the limited examples of grass materials in archaeobotanical assemblages, and residue studies of grinding patches. This paper examines a unique and relatively unstudied form of past human-grass engagement, expressed in the rock art of Balanggarra Country, northwest Australia, where native grasses were coated with pigment and printed onto rockshelter surfaces. These motifs, termed grass prints, are associated with the oldest dated rock art in the Kimberley and embody a history of complex environmental engagements. Drawing on iconographic analysis and experimental archaeology, this paper argues that grass prints were created through repeated impacts using culturally significant grass species, including *Themeda triandra* and *Oryza rufipogon*, leaving behind highly detailed and morphologically attributable prints. Grass prints reveal micro-morphological details that demonstrate a repeated emphasis on the seeding inflorescences of grasses, suggesting native grasses may have played a more significant role in forager-environment relationships during the post-LGM period in the Kimberley than previously thought.

The Ralph Solecki Collection: Revisiting Forgotten Materials in an Urban New York Landscape

Ralph Solecki, made famous for his work arguing for the “humanity” of the Neanderthals of Shanidar Cave, contributed invaluable in his early career to Northeast American archaeology by excavating sites in the New York metropolitan area which would soon become inaccessible due to urban expansion. First collected in the 1930s, the materials in the collection span from the Transitional/Late Archaic to the early 1800s, including Indigenous pottery and lithics as well as European manufactured products. This poster addresses research of a collection that is being visited for the first time in 19 years. Using different ceramic analysis techniques, our research will focus on determining regional extents of communities of practice in terms of ceramic design and looking at how cultural transmission can highlight the mobility of indigenous people in the Northeast during the Woodland period. Analyzing this collection, which represents materials largely either buried under urban architecture or hidden away in museum collections, will open opportunities for fresh perspectives about this period of time in Northeast history.

The Archaeology of Citizenship in the Nation's Capital: Reconsidering DC's Legacy Collections

As the United States redeveloped restrictions on birthright and naturalized citizenship over the late nineteenth century, Washington, DC, served as a testing ground even though none of its residents held full citizenship because they lived in the city. Depending on the issue at stake, definitions of good citizenship increasingly integrated private consumption—from cleanliness to childrearing—with public consumption like trash in front yards or visits to beer gardens. Archaeologists readily direct analysis to the primary objects of these discourses, from teaware to alcohol. Our approaches less frequently consider the political and moral implications attached to the range of daily consumption that occurred alongside trends in important objects. This paper revisits archaeological collections from across the District to compare the domestic consumption of working class District-born, migrant, and immigrant Washingtonians. Attending to how goods were used allows us to understand citizenship not only through a set of objects indexing political participation but as material practices that can change the terms of that participation. How did Washingtonians fashion alternative forms of power and belonging after the end of Reconstruction?

Reassessing Plants and Pastoralist Foodways in Ancient Eastern Africa: A Preliminary Report on New Excavations at Luxmanda, Tanzania

Scholars increasingly emphasize that pastoralist foodways centered on livestock systems—being variable and flexible—are especially responsive to climate stress and other drivers of food insecurity. We ask something ostensibly simple but as yet poorly understood in eastern Africa: How, and why, have pastoralist foodways changed over time? Pastoralist economies have been examined primarily through animal bones found at archaeological sites; new isotopic and molecular methods have shed light on patterns of dairy consumption. We hypothesize that wild and/or indigenous crop plants would have been deeply embedded in pastoralist cuisines throughout the Pastoral Neolithic (ca. 5000–1200 BP) as well. Excavations at the 3,000-year-old pastoralist site of Luxmanda, Tanzania, have yielded preliminary evidence suggesting plant processing on grinding stones. We challenge analogical frames of reference, which have long foregrounded the (modern?) triad of milk, meat, and blood, used to understand early pastoralist cuisines in eastern Africa. Ethnobotanical work with pastoralist and agropastoralist communities in this region will aid in contextualizing archaeological findings and provide critically needed reference material as well. Finally, we introduce the discovery of a new site near Lake Basotu in north-central Tanzania that may finally allow for regional archaeological comparison.

Investigations in the Barber Wheatfields, Saratoga National Historical Park 2019, 2021

Battlefield archaeology was conducted in the Barber Wheatfields at Saratoga National Historical Park for two seasons in 2019 and 2021. This battlefield was the catalyst for the second battle of Saratoga, colloquially known as the Battle for Bemis Heights, and ultimately led to an American victory over the British Army. The victory at Saratoga was a turning point in the American Revolution and compelled France to side with the Americans in the conflict. While metal detection was used to document the ebb and flow of the battle and the concentration of artillery and musket fire, geophysical surveys were used to guide target selection for archaeological investigation for key structures on the battlefield. Drone-based lidar was used to collect site micro-topography and multispectral data. These high-resolution data were the base for integration of all the project spatial data in GIS, enabling spatial query and modeling of data to inform interpretation of the tactical landscape and engagement of this battle. This poster presents the results for these two seasons of investigation.

Whales, Chiefs, and Seal Stomachs: Understanding Ceramic Adoption in the Kodiak Archipelago

This study uses technological investment thinking and experimental archaeology to examine decision of the socially complex hunter-gatherers of the Kodiak Archipelago to adopt ceramics, ca. 500 cal BP. This decision is puzzling for two reasons: (1) ceramic adoption on Kodiak lags centuries behind its adoption on the adjacent mainland, and (2) evidence of pottery is largely limited to the southern half of the archipelago. Ceramic adoption on Kodiak occurs at a time of unprecedented population levels, resource intensification, and social complexity. Additionally, pottery tends to be found where marine mammals are most abundant. These two factors have suggested the hypothesis that ceramics were adopted to facilitate the mass-production of surpluses of marine mammal oil, a dietary staple, potentially for trade. Using experimentally derived values for return rates and manufacturing times of competing oil-rendering technologies, I evaluate the plausibility of this hypothesis: does it make sense to choose to make a pot if, and only if, one wants to render a surplus quantity of oil?

Insights into Early Medieval Irish Glass: Preliminary Findings, Promises, and Limitations of an Archaeometric Analysis

Glass is a common find on early medieval Irish sites, having been found in association with native Irish settlement-enclosures, monastic centers, and Viking towns. Evidence for secondary production (the recycling and reworking of existing glass to form new objects) has been identified for each of these site types. No evidence for primary production (making glass from raw materials) has been found. As a result, all early medieval Irish glass represents imported material, which could have then been reworked at secondary production centers. Prior research has established chronologies for European glass compositional groups from late antiquity through the early medieval period. While there has been some work on the early medieval Irish glass assemblage (e.g., identifying imported vessels, visual classification of beads, and limited chemical analysis), a more thorough understanding of the chemical compositional groups represented in the Irish assemblage embedded within the broader archaeological context of settlement, craft production, and exchange practices holds the potential to improve our understanding of the early medieval Irish socioeconomic structure. In this paper, I provide preliminary insights from a pXRF analysis of a selection of glass from eight early medieval Irish sites and discuss the promises and limitations of a wider archaeometric study.

Grossman, Kathryn (North Carolina State University) and Tate Paulette (North Carolina State University)**[215]***Rethinking Caprines-As-Capital: Pastoralism and the Low-Power States of Early Mesopotamia*

In ancient Mesopotamia, animal husbandry was intimately bound up with the process of state making. The twin institutional powers of palace and temple managed enormous herds of sheep and goats. But were these animals mere wealth-on-the-hoof, staple goods supporting a classic system of staple finance? Or were they something else, operating simultaneously across multiple registers, not just economic resources but complicated forms of social, political, economic, and religious capital? In this paper, we argue for the latter. Drawing on a theoretical framework that blends social zooarchaeology with a low-power model for the states of early Mesopotamia, we seek to complicate both the politics of state making in the region and the existing literature on human-animal-divine interactions. In a world of aspirational states and incomplete authority, sheep and goats served as a tool of strategic ambiguation, a means of projecting an image of broad-based sovereignty that did not yet exist in practice.

Dating Classic Maya Houselot Markers in Northwestern Belize

Surrounding the ancient Maya site of Xnoha in northwestern Belize are residential areas with houselots delineated by Linear Stone Boundary Markers (LSBMs). Lidar from 2016 revealed hundreds of such houselots. However, until now, we had no understanding of the dates of construction of the LSBMs. In 2023, backhoe testing was undertaken to determine that construction dates of the LSBMs were Early Classic at approximately 20 locations. If dates from other locations remain consistent with this sample, we must consider the implications of the rapid rise of Xnoha and the equally rapid rise of the idea of defining private space and the very idea of privately controlled exterior space.

Co-stewardship, Preservation, and Archaeology in Southern Arizona's National Park Units

The National Park Service (NPS) is increasingly focused on strengthening relationships with tribal governments through policies designed to promote the co-stewardship of natural and cultural resources located on Native American ancestral homelands. Recent Secretarial Orders and Policy Memorandums provide leadership and direction from the top, but parks are ultimately responsible for effecting positive changes on their own and in collaboration with tribal governments and communities. This is no simple task, especially in park units where past archaeological research, interpretation, and management have strained relationships with local descendant communities. This presentation will discuss the recent successes and challenges associated with the co-stewardship of ancestral places in southern and central Arizona.

Current Research on Early Social Change in the Utcubamba Basin

In contrast to a long history of study of the Late Intermediate period societies of the Utcubamba Basin, research focusing on pre-Middle Horizon social change has only begun within the last 10 years. In this paper we examine existing literature from early archaeological contexts and introduce findings from our own recent research that hints at broad social changes that occurred throughout the Utcubamba Basin. We review recent literature that indicates maize was introduced as early as 1340 BCE, but intensive agriculture and land clearing practices may have been regionally variable; we briefly address the presence of petroglyphs and other forms of representation present in the area similar to those found throughout the northern central highlands; we present our evidence for intraregional variation in ceramic styles; and finally present our evidence that mountaintop centers were important spaces for incipient communities and places of social interaction before the development of indigenous Chachapoya communities with stone architectural traditions after 950 CE.

Guerini, Giulietta (Scuola Normale Superiore, Pisa)**[109]***Mirrors in the Adriatic Region: Holders, Contexts, Exchanges*

The ancient Adriatic Sea (seventh–second century BC) was a place where consistent encounters and trades happened between the many peoples and cultures who lived on its shores (Etruscan, Picenes, Daunians, Greeks, Illirian . . .). This paper focuses on the use of mirrors in this area by analyzing the contexts where they were been found (mainly, but not exclusively, tombs) in order to understand who their holders were and how these objects could also be moved between quite distant places whether for trade or following the owners. In fact, there are port cities, such as Spina, on the delta of the river Po in Northern Italy, where people with different origins coexisted (mainly Etruscans and Greeks but also Celts, Umbrians . . .) and so also mirrors belonging to different productions have been unearthed. What were the similarities and differences in the use made of mirrors in every cultural district overlooking the Adriatic? Were these objects perceived as distinctive of their own tradition and carried with them by the owners or instead were they luxury objects traded together with other similar ones? A complete survey of the Adriatic documentation allows to advance knowledge on these issues.

Guernsey, Julia (University of Texas, Austin)**[128]***Chair***Guernsey, Julia (University of Texas, Austin) and Kathryn Reese-Taylor (University of Calgary)****[128]***Tuber Cultivation and Tropes of Fragmentation in Mesoamerica*

Acts of deliberate fragmentation characterize tuber cultivation. Root plants rarely produce seeds, so new tubers develop by fragmenting the stem and inserting the severed portion into the ground, from which new tubers develop. Evidence of deliberate fragmentation likewise characterizes stone sculptures, ceramic figurines, and other objects produced during the Preclassic period. The trope of fragmentation also appears in broadly shared myths in which dismemberment, or partibility, was crucial to the creation of the world: breaking, and burying or returning fragments to the earth, was a prerequisite to making. We argue that acts of deliberate fragmentation, both for objects and tubers such as manioc, were viewed as germinative and crucial to the social and economic well-being of communities and that the trope of fragmentation provided a framework for practices both ceremonial and agricultural.

Guevara-Duque, Maria Isabel (University of Illinois, Chicago; Field Museum Field Museum of Natural History), Laure Dussubieux (Field Museum of Natural History) and Gary Feinman (Field Museum of Natural History)**[50]***From Jalisco, Mexico, to Quimistán, Honduras: Analyzing Mesoamerican Metals from the Field Museum*

Copper artifacts were prominent in Mesoamerica during the last precolonial millennium, more widely distributed than silver and gold. Mesoamerican copper was formed into axes, axe-monies, rings, pendants, bells, and needles, among other artifacts. The most used alloy in this region was copper-arsenic, and there are two metallurgical traditions identified. The first, found in north and west Mexico, connected to North American cold hammering and annealing, and the other in central Mexico and southeastern Mesoamerica, which incorporated South American cold hammering, annealing casting, and lost wax methods. This paper is an overview of an ongoing characterization project via portable-XRF and laser ablation–inductively coupled

plasma–mass spectrometry involving copper artifacts held at the Field Museum of Natural History in Chicago. The results show that close to half of the artifacts are pure copper, and the rest are copper-based alloys, with Cu-Sn and Cu-As being the most prominent. Gold and silver were also found in one artifact each. The alloy mixtures seem to be related to the provenience and the type of artifact analyzed. This information and conclusions will contribute to the ongoing discussion on the use and distribution of copper-based artifacts in Mesoamerica and the rest of the continent.

Landscapes of Silence at the First Baptist Church

Recent excavations at the First Baptist Church on Nassau Street in Williamsburg, Virginia, have illuminated significant information about the site, most notably the presence of over 60 burials. However, the First Baptist site also provides an opportunity to literally excavate the history of our own discipline. Following the concept of an “anthropology of White supremacy” (Beliso-de Jesus & Pierre 2020), I examine the history of archaeological research at the First Baptist site from 1956 to present and its contrasting deployments: first to erase the First Baptist community from the museum landscape and, 70 years later, to uncover and memorialize that same history. I discuss the creation of physical and symbolic landscapes within the museum and the ways in which Black history was displaced during the creation of Colonial Williamsburg. I then examine the ongoing, community-driven archaeological project which is resituating the site within the visible historical landscape. In the past five years, the project has garnered national and international attention as an example of ethical, community-engaged research. However, I suggest that while this project is a good start, there is still much work to be done in the pursuit of a truly ethical, reconciliatory archaeology.

Circum-Atlantic Responses to the Late Antique Little Ice Age (536–660 CE)

Studies of North Atlantic cultures around the margins of the Bermuda Azores Subtropical High offer opportunities to observe parallel impacts on cultures on both sides of an ocean on four continents (Americas, Eurasia, Africa) as changes in global average temperatures influence the size and position of the High. Of special interest is the influence of the Late Antique Little Ice Age, the globally coldest climate episode in the last 2,500 years. Its inception marked the change in general terms from a warming world with high sea levels and heavy precipitation toward an ice age of declining sea level and cool savannahs. We assume that change in global environment emerges into the realm of a Historical World Crisis when it appears on both sides of the Atlantic at the same time. In the first millennium CE this is a meaningful quantification because similar hegemonic social structures dominated both hemispheres. The lynch pin of the sixth-century world crisis is the fact that the Rome and Teotihuacan experienced sudden, severe changes at virtually the same moment in history with any differences in precise timing explainable in terms of other variables in their multivariable, cascading systems failures.

Gunsenheimer, Antje (University of Bonn)**[59]***Reconsidering the Penal System in Aztec Society: A New Perspective on Human Sacrifice and Enslavement*

The contribution deals with the question of how crimes were punished in the Aztec penal system. We know that Aztec society—as many other premodern societies—did not have prisons for long-term punishment of crimes, nor for any forms of preventive detention. Based on primary sources, it will be discussed in how far Aztec society used forms of temporarily limited enslavement to organize atonement and reparation. Furthermore, it will be debated to what extent the social affiliation to a calpulli had an impact on those forms of punishment and their control. In this context, forms of capital punishment are examined and questioned if supposedly human sacrifices in Aztec society were part of the penal system.

Guo, Siyun, Yu Dong (Shandong University) and Alice Yao (University of Chicago)**[315]***Herding in Shifting Politics: A Preliminary Isotopic Study on Dian Lake Faunal Remains, Southwestern China*

This paper combines isotope analysis from collagen and hydroxyapatite patterns from the Bronze Age to imperial periods in the humid subtropical highlands of southwestern China. We sampled and analyzed 28 faunal bones and four teeth from two occupation sites in the Lake Dian basin that are associated with the Dian polity (ca. 700–100 BC) and span into the Ming-Qing period (ca. AD 1600–1900). The combined results from carbon, nitrogen, and oxygen isotope identify a pastoralist animal regime markedly distinct from the herding practices more typical of the semiarid temperate grassland and offer a contrasting view of specialized herd management oriented around the symbolic and political significance of certain livestock species in the constitution of highland society. Pairing this isotopic research with Dian animal art and iconography, we expand on the social significance of certain species based on the varying kinds of animal rearing and “veterinary” care accorded to different animals.

Gupta, Neha (University of British Columbia)**[63]***Discussant***Gusick, Amy (Natural History Museum of Los Angeles), Nakia Zavalla (Santa Ynez Band of Chumash Indians), Wendy Teeter (Santa Ynez Band of Chumash Indians) and Amber Lincoln (Natural History Museum Los Angeles)****[8]***Navigating State and Federal NAGPRA Regulations in California*

In California, there are approximately 109 federally recognized tribes and at least 55 tribes not recognized by the federal government—the most of any state in the United States. Most, if not all, of these tribes have been displaced by the colonial occupation that ushered in the California Mission system and the centuries of disregard for traditional territories, treaties, and tribal sovereignty. Enactment of NAGPRA in the 1990s provided some form of recourse for Native American tribes to reclaim and repatriate their ancestors and cultural material. However, recognizing gaps in this law, in the early 2000s California enacted a state level NAGPRA law (CaINAGPRA) that provides a pathway to repatriation claims for state recognized California Native American tribes. While both federal and non-federal tribes in California have been working together on repatriations for decades, CaINAGPRA has solidified this process. While the dual federal/state process can be challenging, NAGPRA/CaINAGPRA practitioners are working together to develop best practices for concurrent NAGPRA/CaINAGPRA processes. The newly formed California Community of Practice is one such organization that provides space for practitioners to discuss best practices and acts as a training ground for those working toward efficient and respectful consultation and repatriation in California.

The Use-Life of Spanish Colonial Metal Artifacts from Carnué, New Mexico

The acquisition of metal tools on the Spanish colonial frontier of New Mexico was a rare occurrence, but it is an activity we may be able to better understand through analysis of their production, modification, and utilization as well as sourcing their elemental makeup through XRF. Metals of various types were utilized by settlers for agriculture, cooking, medical treatment, mining, religious practices, tailoring, trade, woodworking, and similar activities. Using XRF to identify either their mining or production source would enable us to more accurately depict the trade networks of colonial New Spain. The late Spanish colonial site of San Miguel de Carnué offers an opportunity to test the metal artifacts recovered in two excavations conducted in 1946 and 2022 to identify and formulate the likely routes of trade and production techniques that the raw metal or their products took to arrive at the settlement.

A Granular Analysis of Public Comments to Proposed NAGPRA Revisions

In response to stagnated repatriation efforts in the 32 years since the Native American Graves Protection and Repatriation Act (NAGPRA, 43 CFR 10) became law, a new proposed rule to revise implementation regulations was entered into the federal register in October 2022 (RIN 1024-AE19). The rule proposed accelerated timelines for entities holding Native American materials to enter notices, consult with tribes, and repatriate objects and human remains in their possession. Over a comment period of 105 days (inclusive of a three-week extension), 181 written public comments on these proposed changes were submitted. Comments represent input from tribes, the general public, universities, museums, and other individuals and institutions engaged in NAGPRA work. Participation in open comment sessions, discourse at meetings, press coverage, and anecdotal information and experiences can all lend an overall impression of how the proposed rule has been received. This work aims to focus the lens of NAGPRA work in the present moment by providing a granular, objective analysis of the public written comments including comment source, institutional affiliation, length, overall stance on the rule, and trends or commonalities in feedback minutiae. RIN 1024-AE19 is currently in its “Final Rule Stage.”

Mortality Profiles from Massive and Attritional Guanaco Deaths in Southern Patagonia, Argentina: Implications for Hunter-Gatherer Archaeology

Mortality profiles are valuable for discussing hunting strategies and the effects of natural deaths on population age structure. Although these studies have been developed over several decades, there is still a lack of actualistic information that allows us to discuss patterns derived from different causes of death. This paper presents modern mortality profiles from natural deaths in the Coyle-Gallegos River interfluvium (southern Patagonia, Argentina). We surveyed guanacos killed by winter stress (493 individuals), entangled on wire fences (53), and guanacos killed by various causes for an unknown number of years in the canyon bottom (33). Unexpectedly, juvenile individuals dominate the mortality profile of winter stress, especially the young of the year, indicating age-selective deaths. Juvenile (0–2 years) and senile (+9 years) individuals are the best represented in the canyon and fence, producing an attritional profile dominated by the most vulnerable individuals of the population. Our actualistic results alert us about the variability of mortality patterns that natural events can generate and invite us to evaluate the different conditions under which these deaths occur and are affected by taphonomic processes.

Questioning Social and Labor Relations in Contract Archaeology from a Feminist Autoethnography

I use an autoethnographic and feminist perspective to reflect on how the field practice of preventive archaeology has been developing in Colombia. I draw on experiences from my own work to question the naturalization of inequalities and violence present in everyday interactions during the implementation of development projects, involving different actors (archaeologists, engineers, and workers). The analysis of these experiences has allowed me to reveal how the epistemological differences between the disciplines of engineering and archaeology are connected to the inequalities of class, gender, and race preexisting in the different contexts in which the trade is developed, resulting in unequal treatment in which the feminine and the masculine are hierarchical categories used to deploy power. These situations are exacerbated by the framework of infrastructure projects, which operate under notions of time and economic efficiency that add tensions between the actors. The reflections I propose to present aim to generate questions about the progress of archaeology as an anthropological discipline and its impact on nation-building, as well as to inquire about the places where academic knowledge is being built and its relationship with the working conditions of those who are doing archaeology in Colombia.

A 30-Year Search For Pictograph Photos of Moose Creek Bluff in Fairbanks, Alaska

I have been searching for the photographs and tracings made by J. Louis Giddings in June 1940 as reported in *American Antiquity*, Vol. 7, No. 1 (July 1941) since I was an undergraduate student in anthropology at the University of Alaska, Fairbanks (UAF) in 1992. When entering the program for my master's degree in the 2000's I had to content myself that these were not available after years of searching at intuitions that Giddings attended after leaving Alaska. I sent a request to the Haffenreffer Museum at Brown University in March 2023 if there were any of Giddings photos and tracings. In a reply from Rodney (Rip) Gerry, the

exhibition coordinator at archives, he had found the slides and negatives in April 2023 taken of the Fairbanks site by Giddings in June 1940, and in July he had located the original tracings. Locating these I will be applying the program DStretch and other graphic enhancement software to render the images for comparing with the sketches in the 1941 *American Antiquity* report.

Cultural Settlement and Water Management Strategies at Holtun, Guatemala

Water management is intrinsically associated with the development and support of complex societies. Water was a significant source of power among the ancient Maya. Although traditional research characterizes water management as homogeneous and monolithic, recent studies show that it was highly variable and adapted accordingly. The case of Holtun, a modest-sized site, adds to the research on water management as most case studies focus on large primary centers with significant sources of water. Despite water resources at Holtun are relatively small, they supported the development of a large community. Holtun developed social complexity during the Middle Preclassic period (1000–350 BC) and although some water catchments remained centralized, most of the springs remained outside of formal control on the outskirts of the site. However, during the Late Classic period (AD 500–900), permanent settlement with signs of social status emerged outside of the civic-ceremonial center, claiming territory around water resources. Although the function of this settlement is still not clear, its location suggests that water management was in part a strong motivation. Research on cultural settlement and water management at Holtun demonstrates the complexity and heterogeneity of the ancient Maya civilization in the process of developing and maintaining social complexity.

NAGPRA at the University of Wisconsin, Milwaukee and the University of Wisconsin-Oshkosh

This paper provides a case study of NAGPRA implementation within the University of Wisconsin System focusing on two institutions: the University of Wisconsin, Milwaukee, and the University of Wisconsin, Oshkosh. Both institutions have long-standing programs of Midwest archaeology, within their respective anthropology departments, that have generated extensive archaeological collections from hundreds of regional sites. Although both campuses had initiated compliance with the Native American Graves Protection and Repatriation Act and its regulations (NAGPRA) soon after the act was signed into law, it is unclear if any meaningful consultation, documentation sharing, or collection examination followed. Within the past three years, both campuses have recommitted to NAGPRA efforts to effect repatriation all NAGPRA items within their archaeological collections. Concurrently, the UW System developed broader policies to ensure ongoing compliance with NAGPRA as well as engagement with Tribal Nations.

The Effect of Sex on Diet: Isotopic Variation among North and South American Foragers

The extent to which subsistence labor was divided among archaeological forager populations of the Americas is currently debated. This analysis uses bone isotope chemistry and Bayesian mixing models to examine trophic variation between female and male individuals from North and South American forager populations. We observe that on average male individuals tend to occupy higher trophic levels than females, suggesting differences in subsistence labor. However, we further observe that average meat/plant contributions differed little with considerable overlap in female and male dietary values. The data suggest that sex exerted little effect on diet and, ostensibly, division of subsistence labor among forager populations of the past.

The Viking Great Army: Weighing Up Reuse

This paper focuses on reuse of material culture looted by the Viking Great Army when it raided England in the late ninth century CE. This material included gold, silver, and copper alloy, which was sometimes melted down to turn into other artifacts and also cut up for use in exchange in the form of bullion. Bullion exchange required weights to portion out the loot. Many of these were fashioned from lead and inset with fragments of jewelry, other decorative metalwork, and coins, often of some antiquity. This paper will survey the range of insets, exploring the messages that were conveyed through their reuse. This will be shown to extend far beyond traditional interpretations that they served a mere decorative function or a means of distinguishing one weight set from another. These lead inset weights were symbols of political authority, sometimes drawing on the authority of coinage. They also reflected the adventures of the army and the places they had visited and peoples they had encountered, in England, Ireland, and on the continent. Some of these inset weights have been found in ritual deposits, including burials, reinforcing the symbolic associations of the weights and their reused insets.

Lead Isotope Analysis Providing Insights Regarding Pecos Pueblo's Role in Spanish Colonial New Mexico

Pecos was one of the major Puebloan communities in New Mexico from circa AD 1450 until the 1790s. As the nexus of an interregional-intercultural network, this pueblo became a dominant economic force in Pueblo-Plains-Hispanic interactions throughout most of the Spanish colonial period. A metal detection sample survey within the pueblo's midden area produced iron arrow points and lead musket balls, reflecting multiple Comanche and Apache attacks during the eighteenth century. Numerous copper sheet scraps, the detritus from fabricating varieties of objects for both trade and personal use, were also recovered. Lead isotope

analysis was conducted on one lead ball and one copper sheet scrap to determine the likely ore body source(s) of these two metals. Resultant information underscores the socioeconomic and geopolitical complexities that defined Pecos Pueblo during New Mexico's Spanish colonial period.

Resource Networks of Sanxingdui

Located in southwest China, Sanxingdui is well known for its outstanding and unique bronzes as well as gold, jade, and other high-value artifacts. However, the origin and circulation of these precious resources have not been disclosed. The author believes that the strategic location contributed greatly to the prosperity of Sanxingdui. It was located at the crossroads of several important civilizations. In the north, the Shang Dynasty connected Sanxingdui with bronzes and other resources. To the south, large amounts of cowries and ivories probably circulated from South/Southeast Asia to Sanxingdui and even transferred further to Yinxu.

Sanxingdui acted as the transfer connection between the south and north. To the west, many ideas and techniques of Sanxingdui such as gold, beaten bronzes, divine trees, and animals were probably related to Central/West Asia. To the east, Sanxingdui connected the cultures in the middle and lower Yangtze River by Zun, Lei vessels, and other items. Together, the different Yangtze River cultures formed a culture belt and interacted with the Shang Dynasty. Sanxingdui formed a complex network with its peripheral cultures that provides a new perspective to better understand the site and region.

An Isotopic Study of Diet at Mtwapa, Kenya (Fifteenth–Eighteenth Centuries CE)

This project investigates the diet and foodways at Mtwapa, Kenya, on the East African coast during the fifteenth to eighteenth centuries. During this period, local East African populations negotiated Portuguese colonialism in the region. Stable carbon and nitrogen isotopic analyses were conducted using bone collagen from 28 individuals interred at Mtwapa, Kenya. $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values suggest individuals from Mtwapa consumed C_4 diets with some reliance on marine resources. Individuals from later family tombs have higher $\delta^{15}\text{N}$ values, suggesting higher consumption of marine protein compared to individuals from earlier tombs. Individuals from earlier tombs also have more C_3 isotopic values relative to later tombs. Isotopic results suggest reliance on local products and terrestrial domesticates with limited dietary differences between sexes.

Six Decades of Research into Ancient Maya Settlement in Belize

Nearly 60 years ago Gordon Willey's team published *Prehistoric Maya Settlements in the Belize Valley*, initiating the study of ancient Maya communities with a focus at Barton Ramie in Belize. The lead continues to this day with the first archaeological application of lidar by the Chases at Caracol. These are but two salient examples of the centrality of data collection on Maya settlement emanating from Belize. Scholars working in Belize have led the way in understanding ancient Maya settlement. Documenting the dynamic methodologies and new understandings that have resulted from three katunob of research, this paper presents an overview of the diverse settlement studies supported by the nation of Belize. We show how these significant studies have contributed and influenced a new level of appreciation of the importance of Belize to the knowledge of all lowland Maya prehistory.

Co-constitutive Peripheries: Settlement Landscapes of Power and Memory on Mauritius

This paper examines changes in settlement patterns in Mauritius over the seventeenth through twentieth centuries and the ways these landscapes are remembered on the island today. I emphasize agro-industrial landscapes as a specific cultural mode of land use and as a spatial phenomenon that has come to define so much of the contemporary tropical island landscape in Africa and elsewhere. By systematically reconstructing the first century of the partitioning of Mauritius into private estate parcels, colonial administrative centers, and trading ports, I also define the spaces formed between the plantation boundaries as areas where free people of color–built communities, particularly in coastal and mountainous regions. Villages formed later in the nineteenth and twentieth centuries are still named after the estates they once belonged to, having expanded out of or adjacent to the domestic quarters of plantation workers. These names are a residual, a shadow of the colonial plantation still imprinted on the contemporary landscape. As such, plantations and independent villages emerge as co-constituted spaces, each peripheral to the other. More broadly, this paper highlights the intertwining of the industrialization of agriculture, the racialization of labor migrations, urbanism, and how these processes impacted the formation of local communities.

[69]

Mapping Structural Vulnerability through Nutritional Deficiencies, Infection, and Burial Location at the Colonial Maya site of Tipu (AD 1543–1707)

Structural vulnerability, an individual or population's risk for adverse health outcomes, is the product of various financial, environmental, biological, and social variables. Factors including disease, food security, exposure to trauma, and social status all contribute to any individual's level of structural vulnerability. While clinicians make modern determinations of structural vulnerability, determining archaeological levels of structural vulnerability requires a more theoretical approach. Tipu, a colonial Maya site in central-western modern-day Belize, was occupied from the Postclassic (~AD 900) until AD 1707. The site sat at the edge of the Spanish colonial world, providing Tipuans with a buffer from the traditional disease, death, and warfare narrative. Despite Tipu's distance from major colonial powers in the northern Yucatán, decades of research at the site have suggested a varied social experience for those living on the colonial frontier. This poster explores how structural vulnerability can be used in bioarchaeological investigations and, specifically, how structural vulnerability can shed light on burial patterning for the over 500 individuals interred at the site of Tipu.

[171]

The Chitimacha Migration to the Eastern Atchafalaya Basin

This poster delves into the complex history of the Chitimacha Tribe, tracing their migration and cultural transformation in the face of colonization. The arrival of the French marked a pivotal moment, introducing diseases, displacement, and cultural assimilation to the tribe. This research synthesizes historical documents, archaeological findings, and georeferenced maps to unravel the tribe's migration journey to the eastern Atchafalaya Basin. Through historical analysis and spatial visualization, the study explores how the Chitimacha navigated their changing environment and power dynamics with neighboring tribes. Utilizing historical accounts from figures like Swanton, Gatschet, and Swadesh, as well as georeferenced maps, this research underscores the importance of interdisciplinary methods in understanding the Chitimacha Tribe's past. By depicting settlement patterns over time, the study contributes to the knowledge of the tribe's history while recognizing the gaps in existing research. The findings shed light on the tribe's past and emphasize the need for continued collaboration with the Chitimacha community. Acknowledging the limitations of historical maps and documents, this work advocates for the inclusion of Indigenous voices and perspectives in reconstructing

their history. This study paves the way for deeper exploration, cultural revitalization, and cooperative research that empowers the Chitimacha Tribe to reclaim their silenced narrative.

Interrelationships among Histories of Landscape Evolution, Environmental Change, and the Cultural Record in the Illinois River Valley and Beyond

Stuart Struever's Foundation for Illinois Archeology (FIA) and subsequent Center for American Archeology (CAA) programs were incubators for interdisciplinary research including intensive geoarchaeological research. Following Struever's vision, program geoarchaeologists were allowed free rein to explore, develop, and apply methodologies to document histories of landscape evolution, depositional environmental contexts of cultural deposits, and their interrelationships in the regions' large alluvial valleys and related upland systems. Approaches were developed and applied in early years to Koster and other sites, landforms, and landscapes in the Illinois and Central Mississippi River valleys, their tributaries, and surrounding uplands. Subsequently, these methodologies and models were improved, practiced, and applied far and wide by at least six former members of the CAA geoarchaeology family tree. Wide-ranging results include recognition of midwestern patterns of alluvial and colluvial fan sedimentation, soil formation, and prehistoric human settlement. Our research shows the significance of observational scale, demonstrates the stratigraphic predictability of landform sediment assemblages in large river valleys, and identifies changing valley environments through time and their relationship to prehistoric settlement and resource use. We also show the significance of valley and upland erosion surfaces to site distribution and context and document the southernmost periglacial features in central North America.

Forgotten Children: Infant Skeletal Legacy Collections of the W. D. Trotter Anatomy Museum, New Zealand

Infant skeletal remains in anatomical legacy collections can provide an important source of historical information on the interactions of gender, class, and religion during pregnancy and infant loss. Founded in the nineteenth century, the W. D. Trotter Anatomy Museum at the University of Otago houses more than 2,000 models and anatomical "specimens." This research aimed to provide an inventory of the fetal and infant skeletal remains, identifying their provenance through archival analysis of accession data and an investigation of the social context of collection. Collated, this information was related to their bodies' likely path of acquisition by the University. An osteological analysis was carried out to assess the minimum number of individuals, estimate age-at-death, and evidence for pathology and dissection. Most of the infants within the collection died around the time of full-term birth, and some have evidence for developmental pathology, birth trauma and/or postmortem dissection. These remains went through a process of commodification and objectification resulting in their retention as developmental teaching "specimens" and examples of pathology. The historical context and legislation around body donation suggests structural inequality played a role in the acquisition of these infants' remains from their mothers, who were primarily poor and unmarried.

Object Itineraries of Metal Artifacts from the Stark Farm Site Complex (22OK778)

Object itineraries allow archaeologists to analyze material culture with less bias, while acknowledging both Native and archaeological perspectives, by considering the many different contexts through which an object moves in time and space. In this paper, I focus on creating a deeper understanding of European-made metal

objects uncovered at Stark Farm (22OK778), a site occupied from the Late Mississippian period through the Early Contact period in northeastern Mississippi, by using an object itinerary theoretical framework. I examine how European-made metal objects were transformed and used by the Chicasa as a way to introduce a more collaborative and holistic approach to the other analytical methods being used at Stark Farm. This process was completed using robust statistical analysis and contextual analysis to investigate how the agency and movement of these European-made objects were transformed as they entered Indigenous contexts and interacted with different people, places, and things.

An Investigation of Bone Preservation as a Result of Environmental and Cultural Variables in Mortuary Contexts

This study investigates preservation and molecular integrity of bone through an experimental study focused on variation in mortuary practices. The objective of this study examines how different mortuary rituals affect bone preservation, particularly in an area with a freeze/thaw effect, and how simulated mortuary contexts will impact the stable isotope values in bone. Modern pig rib bone samples were used as a proxy for human bone, in order to address these questions. Each sample was incorporated into a uniquely reconstructed burial environment. These environments include burial in a coffin, submersion in freshwater, burial in peat moss to simulate purposeful deposition in peat bogs, simple deposit in soil, ground surface exposure, and cloth wrapping simulating postmortem body processing/mummification. The methods of the experiment involved recording of pre-analysis control samples for baseline preservation and stable isotope signatures. Results are then compared to the postdepositional samples that have been in their simulated environments through a range of seasonal variation. The results provide insight into the varied factors that can influence bone preservation due to different environmental and culturally constructed mortuary conditions.

Updates on the Geoarchaeology of the Latest Pleistocene and Earliest Holocene at the Page-Ladson Site, Florida

The Page-Ladson site in the Aucilla River basin in northwestern Florida, a drowned terrestrial locality, contains strata with well-preserved organic materials in archaeological contexts, allowing us to create absolute cultural chronologies, re-create paleoenvironments, and discuss human subsistence strategies. For the past several years, we have been investigating a cultural component in a soil that has ages spanning the Younger Dryas and earliest Holocene and is located 4–6 m below the modern water line, extending previous research the site. The soil contains multiple diagnostic artifact styles, indicating repeated reuse of this key landscape localities, and provides some of the few radiocarbon ages in the entire US Southeast for several diagnostic styles. In 2022, a Suwannee point was found in association with numerous wood fragments, allowing the first absolute ages to be obtained for this type. This paper summarized our recent investigations at the site.

Practicality in the Enforcement of Human Remains Trafficking in Louisiana

The Louisiana Department of Justice (LDOJ) has routinely monitored online sites for trafficking of human remains and antiquities since 2007. Since that time, new state laws have been enacted to strengthen the ability to confiscate illicit materials from private sellers and, when appropriate, to transfer those materials to descendant communities. During this time, LDOJ employees have been involved in over 100 cases regarding the wayward disposition of human remains and antiquities, not all of which are nefarious. Often consultation and providing a repository for items in transit provides all the protection these items need, ultimately keeping them safeguarded from further commodification. Given the unique legal position of LDOJ, its anthropologists are able to work directly with law enforcement around the state to investigate and enforce aspects of this trade. This enforcement provides scenarios where anthropological theory meets meaningful and practical realities. Here we present three case studies that highlight a variety of recovery scenarios, the approaches and resources required for action, and why resolution has or has not occurred. Through these studies, we are able to examine new trends in enforcement and the functionality of new and existing laws and discuss the practicality of establishing similar methods in other jurisdictions.

Precious People: Indigenous Medical-Spiritual Relations in the Archaeology of Maya Childhood

Previous studies of bodily ornaments from burial contexts have often fixated on notions of wealth, social inequality, and prestige. Although we consider analyses focused on economic wealth, we turn, in particular, to Indigenous and ladino (mestizo) medical-spiritual understandings of bodily ornaments. We find that this perspective is best understood from the perspective of children. This paper examines the marine shell, bone, ceramic, and stone bracelets and necklaces of children from Late and Terminal Classic burials at the Maya site of Ucanal, Petén, Guatemala, and compares them to burials from a range of time periods throughout the Maya Lowlands. By incorporating ethnographic and ethnohistoric research on Indigenous Maya and ladino medical-spiritual practices and acts of care, we underscore the relational understandings of Maya ornaments worn by children and their role in the articulation of caring relations between parents and their precious children, in repelling spiritual forces and winds carrying illnesses, and in the making of social persons. While attention and respect for Indigenous medical-spiritual practices are slowly but increasingly recognized in contemporary medical practices in Guatemala, Mexico, and elsewhere, archaeological perspectives also benefit from multivocal perspectives on children and their well-being.

[42]

Developing Temporally Relevant and Spatially Robust Sulfur ($\delta^{34}\text{S}$) Isotope Baselines for Archaeological Studies of Residence and Mobility

Many of the central questions of archaeology engage directly with themes relating to movement, mobility, and migration. The two most common isotope systems that have been exploited for this purpose are strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) and oxygen ($\delta^{18}\text{O}$), with sulfur isotopes ($\delta^{34}\text{S}$) being a much more recent addition to the isotopic arsenal for investigating residence and mobility. Because the application of sulfur is not limited solely to tooth enamel, by targeting skeletal tissues that represent different periods in an individual's lifetime, it has the possibility of directly tracing residence, isotopically, an individual throughout a lifetime. The poster presented here demonstrates that in the rush to apply this isotope system to past remains our overall appreciation of the natural variability of $\delta^{34}\text{S}$ in the environment has not been well characterized, which may be leading researchers to developing archaeological narratives and broad models of $\delta^{34}\text{S}$ variations across regions that are "importantly wrong." Furthermore, it presents methods for developing more robust baseline data for interpreting archaeological $\delta^{34}\text{S}$ values, thusly moving the state-of-the-art forward.

Hamilton, Marcus (University of Texas, San Antonio)
[308]

On Effective Theories of Macroarchaeology

Archaeology reconstructs human behavior in the past from a biased, sparse, and fragmentary record, at multiple scales of space and time, from site-specific local events, to regional, continental, and global patterns. However, in practice, it is not always clear at which scale we are asking archaeological questions, and how different scales are integrated by theory. Across the sciences, the prefix "macro-" (i.e., macroeconomics, macrophysics, macroevolution, and macroecology) refers to the macroscopic dynamics that emerge from lower level processes as we coarse-grain to larger scales. Effective theories are the invariant dynamics that allow us to generalize and renormalize across scales, the fundamental set of dynamics preserved as we coarse-grain: how do the general properties of one scale influence the general properties of other scales? I discuss how an integral aspect of the proposed "macroarchaeology" must be centered on the development of effective theories.

Marshlands and Early Mesopotamian Urban Form

The marshlands of the Tigris-Euphrates delta were for millennia among the largest wetland systems in Eurasia. The Gulf coast, the river delta, and marshes extended further north ca. 8000–2000 BCE than they do today. As a result, the world's earliest cities in southern Mesopotamia may have emerged 6,000–5,000 years ago within or on the edge of wetland and littoral zones. Cuneiform texts, archaeological evidence, and geoarchaeological data make clear that marsh resources were central to some early cities' economies. In this paper, I consider how a wetland environment, and later environmental shifts, may have affected early Mesopotamian urban form. Remote sensing and survey data demonstrate that the third millennium BC city of Lagash (Tell al-Hiba) was composed of spatially discrete sectors bounded by multiple surrounding walls and watercourses and separated by open spaces. The evidence is suggestive of a marshy or watery local environment, corroborating geographical reconstructions from cuneiform texts. The discontinuous, walled nature of inhabited areas differs from the nucleated form of later Mesopotamian cities and would have had social and logistical ramifications for inhabitants. Spatial ethnoarchaeological observations collected from archival images (1950s–1970s) of recent Iraqi marsh settlements aid in interpretation of the archaeological data.

Blazing New Trails: Rethinking the Extent of the Ancestral Pueblo Road Network in the Northern San Juan Region

Historically, research on prehistoric roads in the southwest has been heavily focused on Chaco and the San Juan Basin, however, these enigmatic anomalies extend into the Central and Western Mesa Verde Regions as well. Lidar data for the Four Corners area has made it possible to peer through the trees and shrubs of the Great Sage Plain and observe the surface traces of previously unrecognized segments of roads. These new finds provide context for the organization of the great house system in the north, highlight differences between areas of the wider prehistoric world, and may even give us clues about the roads' significance. When considered at a regional scale, the extent of these features paint a picture of a highly integrated society that had the organizational power to complete massive and complex infrastructure projects through intercommunity cooperation.

[209]

Queer Imaginatives, Normative Narratives: Examining Archaeological Theory and Conceptions of Hunter-Gatherer-Fisher Labor and Social Identity

Archaeology's role and capacity to present multiple narratives about the past situates the discipline as a locus for competing power dynamics: What stories about the past are prioritized? How are stories constructed? Which stories are utilized for crafting a generalizable theory about "human nature"? At the same time, contemporary archaeology has recognized the need for multivocality in cultural heritage narratives and material interpretation. In this paper, I broach these matters by examining ways queer theory has been integrated within hunter-gatherer-fisher studies and the effectiveness of new knowledge production in changing archaeological perspectives. I do so by analyzing major journal publications, introductory archaeological textbooks, and public history projects as archival evidence for the discipline's production of knowledge and assess how normative frameworks are created and perpetuated in conceptualizations of past labor and social identity. In so doing, this paper assesses the manners in which contemporary archaeological theory is interrupting narratives that circulate in wider public domains—and the limits of this interruption. I conclude with making room for lively queer imaginatives to stretch and bend these limits.

Handley, Jordan (Stantec) and Norman Easton (Yukon University)**[120]***The Formation and Distribution of a Chindadn Component Tool Assemblage: Insights from Microwear Analysis*

This paper presents the results of an extensive use-wear analysis of the lithic assemblage recovered from the Chindadn component at the Little John site (KdVo-6). Within the context of Little John, this component dates from the Late Bølling Allerød Interstadial to the Younger Dryas (14,300–11,900 RCYBP). The study population included 219 specimens from five tool classes assigned via traditional macroscopic attributes, including 1) bifacial tools, 2) cores, 3) flakes, 4) flake tools, and 5) modified pebbles and cobbles. Results of this analysis identified a sub-assemblage of 60 used tools via microscopic use wear. Spatial distribution of this sub-assemblage was subsequently mapped revealing further insights into assemblage formation and intrasite distribution of Chindadn lithic technology. Regional archaeologists have been promoting detailed analyses of lithic assemblages dating to the earliest cultural occupations of Eastern Beringia, which remain elusively defined and an area of debate. The results of this study indicate that use-wear analysis has potential to advance understandings of the technological organization of these early occupations.

Handziuk, Natalia (University of Notre Dame)**[169]***Olive Oil and Urbanism: Specialized Production in Late Fourth Millennium Southwest Asia*

During the Early Bronze Age (3800–2000 BCE) southern Levantine agricultural infrastructure developed on a region-wide scale to facilitate the accumulation of surpluses in the newly emerging urban landscape. Olive oil grew to be an important staple and luxury product. This discussion focuses on an EB IB (3300–3050 BCE) olive oil production site in northern Jordan where rock-cut features in the countryside were uniquely sealed with in situ materials by a collapse event. I reconstruct the olive processing and oil production based on rock-cut features, architecture, lithics, and reconstructable ceramic vessels. A combination of vessel production analysis (Roux 2019) and assessment of function, aided by organic residue analysis by gas chromatography–mass spectrometry (GC-MS) is employed to reconstruct olive oil production and consumption habits at the site. By elucidating how different pottery types were used in olive oil production and storage, I suggest these processes can be identified in other archaeological contexts through ceramic assemblages. I use the EB IB olive press to discuss the relationship between the ceramic assemblages, arboriculture, surplus accumulation, and emergent urbanism during the southern Levantine Early Bronze Age.

While the Archaic (700–480 BCE) was a transformative and tumultuous period in ancient Greece, there is a considerable lack of paleodietary studies for this time. The recent excavation (2012–2016) of ~1,500

individuals from the Archaic period Phaleron cemetery in Athens provides a means of illuminating the dietary habits and social organization of Archaic Greek individuals. For this presentation, we use stable isotope analysis to infer the temporal dietary patterns of ancient Greece and the dietary habits and social organization of 60 adult individuals from the Phaleron cemetery. We will address two research questions: (1) Do dietary signatures in ancient Greece significantly change over time? and (2) Are there significant differences in the dietary signatures of the Phaleron individuals according to grave type, skeletal sex, and age categories? The bioapatite carbon data and the results of statistical analyses suggest that there were no significant differences in dietary signatures between the Archaic period Phaleron individuals and Classical period individuals. Results regarding grave type, skeletal sex, and age categories are forthcoming. The lack of viable collagen data from this study limits our interpretations and demonstrates the importance of investigating alternative preparation protocols for stable isotope analysis of poorly preserved bone.

An Analysis of Maya Eccentric Forms from the Holmul Region, Petén, Guatemala

Geometric, anthropomorphic, zoomorphic, and abstract forms comprise the variety of lithic silhouettes of Central America. Commonly called eccentrics, these elaborate, technically remarkable forms are often recovered from ritual offerings and elite burials. This paper addresses more than 60 eccentrics recovered in the Holmul region, primarily from the sites of Holmul and Witzna, and identifies ways that these forms can inform ritual practice, symbolic significance, and potential communities of craftspeople. Eccentric size, thinning, skill of execution, and material choice are considered across multiple assemblages.

Searching for Marketplaces at Blue Creek and Xnoha

Marketplaces are a vital component for the economic interdependence of ancient Maya kingdoms. In our view, marketplaces were also definitional components of Maya central places of power as much as the presence of ostentatious presentations of architecture were. The Blue Creek Archaeological Project has been investigating multiple aspects of ancient northwest Belize for three decades. In this presentation, we will discuss the five central places of power we have identified and focus on the sites of Xnoha and Blue Creek, where we are participating in the marketplace project by testing soils and other variables to identify these features.

Shaded Canyons and Mesquite Fires: 13,000 Years of Ethnobotany in Eagle Nest Canyon

The value of several significant archaeological sites investigated by the Ancient Southwest Texas Project in Eagle Nest Canyon (Val Verde County, Texas) is a testament to the conservation and stewardship of landowners Jack and Wilmuth Skiles. From the beginning it was anticipated that these investigations would yield an ample archaeobotanical assemblage, as perishable plant materials are preserved in several dry rockshelters in the canyon. These fragile remains provide a unique perspective into the nuanced relationships between plants and the ancestral Indigenous peoples of the Lower Pecos Canyonlands. The exquisite

preservation, abundance, and diversity of the remains require a dedicated archaeobotanical program. Results thus far verify that the primary plant foods prepared in earth ovens consisted of desert rosettes, such as lechuguilla and sotol. Diversity of fuelwood indicates opportunistic selection of all available local resources, rather than preference for particular species. The assemblage suggests that the late Pleistocene landscape was characterized by taxa common in the area today, though with perhaps a larger proportion of woody plants. Use of mesquite in cooking features is verified at ca. 13,000 years ago. A solid foundation for future archaeobotanical work is in place thanks to the stewardship and generosity of the Skiles family.

The Curation and Preservation of Archaeological Materials from Panama: Challenges and Opportunities

The Smithsonian Tropical Research Institute (STRI) in Panama has become a key repository for archaeological materials collected within the country over the past 50 years. A number of these collections are also currently housed outside of the country at Temple University in Philadelphia. The keepers of the collections at Temple are faced with the task of returning these materials and associated documents to Panama in a state that is compatible with STRI's repository guidelines. This will require a significant amount of work as materials range from the artifacts themselves to the field records associated with their collection and the laboratory records associated with their analyses. The return of these materials to Panama will be a major step forward for the preservation of the country's cultural heritage. Proper curation of these collections and digital technologies will allow for better documentation and access to them for researchers and scholars as well as enhancing public awareness of Panama's rich history. This paper reports on the process and progress made on this collection's journey from curation at Temple to ultimate preservation at STRI.

Beyond Reuse: Reengagement and Interdiscursivity in the Pictish Built Environment

Recent archaeological work on the people known as the Picts of northern Britain (ca. 300–900 CE) has revealed that many of the Picts' characteristic monuments and structures made use of materials previously made significant in prehistory. A portion of the Pictish "symbol stones"—a class of stone monuments bearing a distinctive iconographic repertoire—were crafted from prehistoric megaliths, while Pictish period hillforts are often modifications of Iron Age enclosures. Scholars have speculated on the relevance of these practices to identity formation and legitimation in this period, with Pictish elites possibly positioning themselves in relation to the prehistoric past. Yet, to focus solely on reuse risks ignoring other practices which may partake in similar kinds of signification. Symbol stones are often placed near or within prehistoric sites, while "new" Pictish hillforts bear formal resemblances to Iron Age constructions. Drawing on insights from semiotic anthropology, this paper places Pictish period reuse within a broader category of interdiscursive phenomena including citation, imitation, and reappropriation. It examines spatial statistical results from a study of symbol stones and hillforts, traces these features' possible modes of interdiscursivity, and sketches hypotheses for the relevance of these modes to processes of identity-making in the Pictish period and beyond.

Death in a Time of Transition: A Spatial Analysis of Mortality in Fenner, NY, from 1850 to 1880

Historical and anthropological demography has long focused on the spread of infectious disease in urban spaces across time. However, few studies have examined disease in rural contexts over time. Using census records, township maps, and archaeological data to map locations and causes of death in GIS, this project

examines mortality from chronic and infectious disease in Fenner, New York from 1850 to 1880. This project aims to address the following questions: What is the epidemiological landscape of rural New York during the mid to late 1800s? Is it consistent or does it change over time? Is there spatial patterning of disease across time or during specific census years? We find differential mortality patterning in this rural farm community when compared to nearby urban sites from the same period. Rather than widespread mortality crises from infectious disease, small, localized mortality clusters are present within one or two households. We also find no temporal patterning in disease prevalence in any given census year, with the exception of tuberculosis, which decreased in prevalence over time. This project provides new insights into the mortality landscapes of rural spaces during the Second Epidemiological Transition.

Karen Adams and Early Agricultural Period Research: A Synthetic Approach Using Niche Construction Theory

In the last 30 years Early Agricultural period research has documented a series of substantial early farming settlements in four river valleys: the Santa Cruz in the Tucson Basin, the Río Boquilla at La Playa in northern Sonora, the Río Casas Grandes in northern Chihuahua, and the Upper Gila River in southeastern Arizona. These four valleys can be viewed as part of a larger Early Agricultural period Riverine Phenomenon. Karen Adams's collaborations with us and other teams have played a critical role in developing this rich record. We use these data to argue that the developments in these four valleys are consistent with niche construction theory as outlined by Bruce Smith and Melinda Zeder. We briefly review these four cases, and suggest that niche construction theory is a useful, but incomplete, framework for understanding these processes. We conclude by showing that Karen Adams's thoughtful and meticulous paleobotanical contributions were fundamental to a new understanding of these watershed developments in the archaeology of Northwest Mexico and the US Southwest.

Building a Novel Archaeobotanical Framework to Investigate the History of Plant Foods in Aboriginal Australia

With a wide variety of biomes and extreme fluctuations in water availability, Australia's Channel Country saw Indigenous Australians develop a unique suite of subsistence strategies to live in this environment. Ethnohistoric accounts report combinations of semipermanent habitation and seasonal mobility, intensive

seed collection, storage and grinding, leading to claims that Channel Country saw the development of agriculture. Determining the nature of precolonial Indigenous food production has potential to rewrite understandings of subsistence regimes across the continent, but an understanding of plant exploitation in Australia has been largely ethnographic in the past. Archaeobotany is rarely utilized; there is widespread belief that plant remains are not preserved in Australia. In this presentation we discuss a research project in which flotation and dry sieving are being used to extract plant remains from *gunyahs* (houses) and open-air camps, from a range of biomes across Mithaka Country in southwest Queensland. We aim to identify food taxa present, and develop a framework for empirically distinguishing plant collection, management, cultivation, and domestication in precolonial Australia. Drawing on the macrofossil record, this paper presents our preliminary results, including a predictive approach for identifying forms of plant use and the first results of seed analysis from the *gunyahs*.

Refining Airborne Laser Scanning Data to See through Mayapán's Dense Vegetation

I present a workflow for optimizing the classification of airborne laser scanning point data and the selection of appropriate surface visualization techniques to improve the identification of archaeological and environmental features at the Postclassic city of Mayapán. The initial 2013 digital elevation model enabled the identification of thousands of structures in and around the city. Still, ground-checking revealed that the dense canopy and low vegetation obscured many structures and walls in parts of the study area. Starting with the raw laser scanning data, I developed a systematic workflow for testing different point classification methods and visualization techniques to improve feature identification in areas with different surface vegetation types. No single ground point classification or surface visualization method is best. Specific combinations of point classification methods and visualization techniques can be tailored to different surface conditions to improve feature identification. I found that three different point classification methods and a set of visualization techniques produced the best results across the varied surface conditions of the study area. The results of this project are the identification of hundreds of previously hidden features that, after additional field-checking, will contribute to answering broader research questions and support additional research in and around Mayapán.

Building Relationships and Sharing Information: A Gathering of the Midwest NAGPRA Community

The first NAGPRA Community of Practice, established in 2019 through the University of Denver, illustrated the vital role communication, listening, and learning plays among institutions and tribal partners as we move forward in fulfilling our NAGPRA responsibilities, including ensuring the return of Native Ancestors and cultural objects. The need for regionally focused communications between institutions, tribal communities,

and interested parties quickly became evident and in 2021 the Southeastern NAGPRA Community of Practice was formed. Since that time, individual states such as Colorado and Wisconsin have also formed statewide groups to discuss and share information relevant to NAGPRA. The Midwest NAGPRA Community of Practice was initiated in summer 2023 with the goal of facilitating improved communication among midwestern institutions, historical societies, and tribal communities regarding best practices, information sharing, and relationship building. Our poster summarizes how we started the Midwest NAGPRA Community of Practice, our goals, future initiatives, and the progress that has been made during the Community's initial year.

Layout, Construction, and Rebuilding of Landscape Features at Poverty Point World Heritage Site

Questions persist about the layout and building sequence of Poverty Point's landscape features, and the planning and rapidity of overall site construction. A research program using geophysics, stratigraphic coring, lidar, and targeted excavation that began in 2006 continues to yield new data and interpretations about the ridges, timber circles, plaza, and other features. Magnetic survey reveals that the concentric ridges are comprised of smaller components roughly analogous to mound construction stages. Innermost ridges 1 and 2 include multiple, contiguous, and overlapping components, whereas the outer ridges have fewer, more consistently aligned components. Some aisles in ridges 1 and 2 may have been added after ridge construction. Many of the timber circles are clustered near the aisle and plaza intersections, but other circles are interspersed with ridges 1 and 2 and suggest organic growth. The rebuilding of some ridges and many timber circles, massive filling to raise portions of the plaza, and new information about the Mound E Ridge and West Plaza Rise, suggest a protracted and complex construction history.

A History of Archaeology on Key West

The island of Key West has a rich and fascinating history as the "southernmost point" of the continental United States. Because of its strategic and iconic location, Key West is the most heavily developed and altered island in the Florida Keys. Despite the island's infamy and storied past, neither Monroe County nor Key West City employ an archaeology preservation program for municipal or private lands. As a result, it is unknown whether intact pre-European archaeological deposits exist on the island. In this paper, I discuss the archaeology and environmental history of Key West and offer research directions for the future.

Embedded Identity: Preliminary Analyses of Mogollon Corrugated Vessels

Between 1250 and 1450 CE, the cultural landscape of the US Southwest transformed as diverse communities migrated from their homelands into areas with long-established local populations. The processes behind this new shared multicultural identity were complex and required individuals from both migrant and local Mogollon communities to negotiate diverse traditions. This paper examines Arizona State Museum

corrugated-ceramic collections from before and after this period to investigate identity in these diverse communities. In my preliminary data, I consider attribute variation of whole corrugated vessels in the Mogollon region, from the fine-grained analysis of how the coiling was achieved to their overall design. My study seeks to give corrugated ceramics in the Point of Pines area and Arizona Highlands the same level of scrutiny as painted ceramics using indicators of identity embedded in their production with communities of practice as a theoretical framework. I analyze each vessel for production practices, form, and design using a portable magnification tool, profile gauge, measuring stand, and digital rollouts. Given the complexity of corrugated wares, their widespread use, and the visibility of the designs, I hypothesize that people used the decorated forms of these wares to negotiate their identity in multicultural communities across the Mogollon region.

Life on the Edge: Fifty Years of Belize Wetland Archaeology

In the early years of Maya archaeology, Belize was considered peripheral, and the wetlands were at the far edge of this pseudo-backwater. It was not until Turner and Harrison's seminal study of Pulltrouser Swamp in the 1970s that Belizean wetlands moved from the edge to center stage in Maya archaeology. Northern Belize contains some of the largest tracts of wetlands in the Maya Lowlands, providing rich repositories of well-preserved pollen, phytoliths, and macrobotanical remains, which have yielded some of the earliest evidence of Maya cultivation. Geomorphological studies have greatly advanced our understanding of the construction, use, and abandonment of Maya ditched and drained fields in Belize. In recent years, lidar mapping and other geospatial tools have shown that wetland modifications in Belize were much more complex and expansive than previously thought. Our own investigations in Northern Belize's Crooked Tree Wildlife Sanctuary reveal wetland enhancements were not only vast but varied in use, with some serving primarily as large-scale fish-trapping facilities, rather than as agricultural fields. In tracing the last 50 years of wetland investigations, we show how research in Belize has moved the field forward and continues to be at the forefront of cutting-edge scholarship across the Maya Lowlands.

Cave du Pont and the Western Basketmaker World

Over the last two decades, new archaeological findings have challenged traditional ideas about the Western Basketmaker culture. We now know that the processes involved in the origin and spread of early farming in the western Puebloan region were much more complex than previously recognized. Rather than resulting

from a single wave of migrations that brought in a homogenous culture and lifeway, the new data suggest that corn and Basketmaker II materials spread through processes that included both migration and diffusion. In this poster, we present new information from the Cave du Pont site to explore the identities and lifeways of the people who used that cave. These findings are then compared against those of other Western Basketmaker II sites to explore the place of Cave du Pont in the Western Basketmaker world.

Bronze Age Economic Transitions in Western Mongolia

Although the late Holocene saw tremendous changes in foodways across the eastern Eurasian steppe, poor preservation of organic and faunal remains make it challenging to trace important changes like the introduction of pastoralism during the Bronze Age and beyond. Here we present preliminary results from two archaeological field sites in western Mongolia with potential to answer important archaeological questions about this important period in Eurasian prehistory. The first site is a high-elevation ice field site which was apparently used as an Argali sheep hunting site during and after the Bronze Age. The site holds the remains of dozens, perhaps hundreds, of Argali sheep and other large game animals such as elk and ibex. Additionally, many artifacts of hunting gear have been recovered including “scare sticks,” wooden arrows, and bone and metal arrowheads, some still hafted to their arrowshaft. Excavations at a second site, a dry cave, have revealed a multi-millennial-year history of foodways in western Mongolia and appear to capture the transition from a mostly hunter-gatherer way of life to horse-mounted pastoralism. Findings from these two sites have incredible potential to broaden our understanding of horse domestication and the transition to nomadic pastoralism.

Hornos, Adobe, and Hands-on Learning at Southern Arizona National Parks

The power of breaking bread together is well documented. Adobe, or earthen architecture, is an equally documented and important structural material. Combining the two, we get *hornos*, Spanish for earthen outdoor oven. While the term *horno* is not known by many visitors to National Parks, many K–12 students in urban and suburban Tucson, Arizona, are familiar through family use. Their architecture is often far more vernacular and utilitarian than pizza ovens in affluent neighborhood backyards. This talk features a K–12, nontraditional educational project at the Desert Research Learning Center in Tucson, modified from one taught at Cal State East Bay by Dr. Gonzalez. The approach humanizes past and present cultures. Through the simplicity of experimental design and construction of a scale model *horno*, K–12 students better understand classroom lessons regarding technology, social structures, and cultural identities. With its in-person modality, this outdoor activity has students’ hands too muddy to pick up phones, thus making it AI proof. Further, students can see themselves and their friends in this important STEM activity, bridging the divide between home and academic institution. Ultimately, the use of this culinary archaeology allows students to connect past and present cultures through experimental design and tangible handiwork.

Preliminary Analysis of Archaeobotanical Remains Recovered from Late Classic Maya Marketplaces in Northwestern Belize

Archaeobotanical analysis of Late Classic Maya remains is a rapidly growing field of study. While much has been written about the different types of plants that the Maya used, very little is known about how and

where these plants were traded and their connection to regional integration and exchange networks. An analysis of the sediments collected from the 2023 Maya Marketplace Project revealed preserved macrobotanical and microbotanical remains from several sites. This presentation examines some of the preliminary results from these analyses and discusses the feasibility of using archaeobotanical remains to identify ancient marketplaces.

Exploring Daily Lives through an Intrasite Comparison of Architectural Remains at Fort St. Joseph

Archaeological investigations spanning 25 years at the historic site of Fort St. Joseph (20BE23) have uncovered over 320,000 artifacts and several telling features, allowing us to learn more about the daily lives and identities of those who once occupied this eighteenth-century mission, garrison, and trading post in southwest Michigan. An analysis of the architectural remains has revealed the projected layout of four buildings at the site where fur traders and their families resided in addition to a possible domestic and workshop complex for the resident blacksmith. Middens and refuse deposits found in association with these buildings contain large quantities of animal remains and artifacts. Here we report on our preliminary investigation of these material remains in order to find similarities and differences among the occupants identifying as French, Native Americans, and métis and their families.

Over a Decade of Design-Build Archaeology on the California High-Speed Rail, Construction Package 1 from Madera to Fresno, California

The California High-Speed Rail Authority (Authority) is responsible for planning, designing, building, and operation of the nation's first high-speed rail system. The high-speed rail system is being built through a series of design-build contracts. Construction Package 1 (CP-1) runs 32 miles from Avenue 19 in Madera County to East American Avenue in Fresno County. This long-term, compliance-based archaeological research consists of historical period discoveries, mitigation, and compliance through parts of rural San Joaquin Valley and downtown Fresno using a design-build approach. Initial Phase I inventories of the APE (totaling 1,651 acres) were completed in 2012 in two separate NRHP Section 106-compliant EIRs with associated MOAs, MMRPs, and ATPs under one Section 106 PA. Record search results identified eight eligible or potentially eligible, historical period archaeological resources within the APE and five within 0.25 miles of the APE. In the last 10+ years, 1,569 acres of APE have been added and surveyed, producing hundreds of isolated historical period artifacts. During construction, we have tested 36 newly identified sites; four are potentially eligible, and 32 sites were recommended as not eligible. Fifty-nine Banker's boxes of historical period artifacts have been analyzed and the Authority is collaborating with the City of Fresno on curation.

Harvey, Nick (Western Michigan University)**[197]***Scanning to Share: Investigating the Use of Photogrammetry for Public Outreach*

Archaeologists strive to improve the methods used to record and preserve the archaeological record for future research, interpretation, and outreach. The process of photogrammetry has improved their ability to curate and share archaeological evidence by using photos to create 3D images of excavation units, features, and artifacts. Using this technology, archaeologists and museum staff can capture the intricate details in a digital composition that can be displayed in exhibits, uploaded to websites, or simply stored in digital archives. Unfortunately, the resources needed for this process are not always available for smaller museums and repositories. To investigate the time and funding needed to employ photogrammetry on archaeological items, I will experiment with various scanning programs on artifacts recovered from the historic site of Fort St. Joseph located in present-day Niles, Michigan. Small finds from this site are typically displayed in exhibits and used in outreach programs, signifying the need to produce 3D images and printed items in order to increase the accessibility of these objects to the general public.

Harvey, William [158] see Torreggiani, Irene

Hasaki, Eleni (University of Arizona)**[282]***Energetics of Potters and Painters in the Athenian Industry of Decorated Ceramics (600–400 BC)*

Scholars have long debated the size of workforce in a niche industry of decorated ceramics in ancient Athens (600–400 BC) by using a variety of proxies mostly relying on the finished products themselves. In this paper I offer a bottom-up approach by calculating the time investment involved in potting and painting decorated wares. Far from a sprint race, the *chaîne opératoire* was an endurance endeavor with an eye to maintaining the health of the craft practitioners, minimizing their risks, and maximizing their profits through guaranteed sales. The energetics of ceramic artisans were fully embedded in their ceramic ecology for optimal collection of clay and fuel, drying time requirements, and animal hair collection for their slip brushes. Based on interviews and experimental sessions with practicing potters and painters, I estimated the energetics for producing three wheel-thrown vessels used in ancient symposia: a drinking cup (*kylix*), a storage vessel for wine (*amphora*), and a mixing bowl for wine (*crater*). These shapes vary considerably in size, curvatures, extent of decorated surfaces, and differentiation of technique and composition leading to insights on how different sectors of the Athenian ceramic industry invested their time and resources.

Hasan, Nomaan**[271]***Chair***Hasan, Nomaan****[271]***Mixing Times: Excavating Shared Pasts in Contemporary India*

As material forms become central to the ongoing formulation of history and national identity in contemporary India, archaeology is acquiring an increasingly prominent place in the popular imagination. Initially motivated by the current regime's interest in ascertaining the provenance of and recovering buildings allegedly usurped by Muslims, numerous organizations have emerged with the aim of providing archaeological education to the general public. This paper draws on ethnographic work with archaeological activists working to develop an appreciation of *sanjhi virasat* (shared inheritance), which is advanced as a national treasure to which both major religious communities (Hindus and Muslims) have contributed and is therefore meant to be nourished across religious divides. Through practices of archiving, publicizing, and memorializing, the activists attempt to put forward a composite history that counters ascendant majoritarian narratives. To understand their efforts, I bring archaeological writings on cultural mixture into conversation with archaeological

concerns on temporality. While prevailing scholarly work seems to account for mixture by pluralizing time and celebrating multi-temporality, the paper asks how multiple temporalities may coexist but in tension, premised on a denial of the other. What conceptual resources are available to archaeology to address such a conflict?

Early Social Life of Andean Tuber and Seed Domestication

The transition from hunting and gathering to agriculture initiated fundamental changes in the way people interacted with plant communities in areas beyond their places of origin. The South American Andes is one domestication center that provided two of the world's most important crops: potatoes and quinoa. The domestication processes of both *Solanum* spp. and *Chenopodium* spp. began in the Andean highlands, yet our knowledge of the processes of domestication and the commitment to agriculture lags behind other regions. Decades of research on the Taraco Peninsula in the southern Lake Titicaca basin have amassed a systematic set of archaeological data that spans the periods that saw dramatic climatic change as well as the shift to more sedentary, agricultural lifeways. Recently, we have been focusing on potatoes and chenopods, and their early evidence in the archaeological record, to gain a better sense of their domestication process in the Titicaca Basin once the inhabitants of the region began to settle as the climate became particularly amenable to agriculture, around 3000 BCE. Through archaeobotany we are tracking how the first settlers of the basin engaged with these future staples and how these actions interweave with the Andean ontology of landscape engagement.

A Latin American Choreography: Entanglements of Solidarity and Collaboration for a Forensic Archaeology

Latin America was and still is one of the most prominent areas for the development of forensic archaeology and anthropology. It is a common sense between researchers of the field that this Latin American perspective started with the Argentinian forensic team in the 1980s, and gradually new teams with more or less the same approach were created in different countries, unfortunately due to the context experienced throughout the twentieth century of dictatorships, internal conflicts, and generalized violence. This paper explores Latin American choreography in the weaving of an epistemology aimed directly at the communities affected by this violence. This Latin American know-how has implied, and still implies, ways of understanding violence in a scientific approach where communities are the center and subject-researchers-activists in the research. Focusing on the development of this field in some Latin American countries, I propose to identify this theoretical-methodological entanglement that has become involved in different countries with diverse and common histories that generates a Latin American identity of acting against violence and pursuing justice.

Hawkins, Alicia (University of Toronto Mississauga) and Heather Walder (University of Wisconsin, La Crosse)**[86]***Applying Glass Bead Chemistry to Examine Wendat Village Intrasite Organization*

Glass bead compositions and typologies from late sixteenth- and seventeenth-century Wendat villages in Ontario have been used to examine chronological differences and regional exchange networks; these artifacts may also be useful for investigating patterns of interaction and change within individual village contexts. Here, we test this hypothesis by examining spatial patterning within three Wendat village sites: Ball, Warminster, and Le Caron [Santimo]. At these sites, others have used historical evidence combined with archaeological data to identify areas of core occupation and later expansion, shifts in the village's boundaries over time, and individual longhouse structures. Robust radiocarbon chronologies aid in understanding these social patterns for the Ball and Warminster villages. This paper examines data from both polychrome and monochrome glass beads ($n = 117$ LA-ICP-MS samples) from these sites. It discusses patterns of glass bead chemistry in relation to current interpretations of intrasite spatial organization. This research demonstrates how glass bead compositions may be useful for exploring social differences and community organization across time and space within individual settlement locations.

Hawkins, Kayt (Kathryn) (University College London, Institute of Archaeology [ASE])**[115]***Food for Thought? The Use of Ceramic "Baby" Bottles in Roman Britain*

Since the mid-nineteenth century in Britain, a small collection of Roman spouted ceramic vessels have been assigned the functional description of "infant feeders" or "baby bottles," primarily through their recovery from infant and child burial contexts. Vessels of this type have been recorded from across the Roman Empire, yet in Britain they are relatively rare and have no comparable prehistoric predecessors. More recently, literary and bioarchaeological research has provided important information on maternal and infant health, breastfeeding and weaning patterns, and the potential role of these vessels in such care practices; roles that have been strengthened by residue analysis showing such vessels may have held dairy products. This paper draws on a recent survey of the "baby" bottles of Roman Britain and complementary program of Organic Residue Analysis to explore this phenomenon at a local level. Through combining material, scientific, contextual, and literary evidence, what can these vessels tell us about family life and maternal feeding choices in the context of a Roman province on the edge of the empire.

Hawkins, Rebecca (Algonquin Consultants Inc.)**[40]***Discussant***Hawkins, Rebecca (Algonquin Consultants Inc.) and Scott Willard (Miami Tribe of Oklahoma)****[101]***The Turpin Project: A Tribal Perspective*

The relationship between American Indian tribes and American archaeology—both its practice and its practitioners—has always been complicated and is still often fraught with a lack of consonance. Although the engagement of tribes as consulting parties in federally mandated (Section 106) projects has slowly increased over the last nearly half century, such consultative engagement (let alone participation) typically is less common and less robust when it comes to archaeological research projects. We discuss here how the Turpin Project has, by contrast, provided a unique opportunity for the Miami Tribe to engage with archaeological research. The importance of our relationship with the project results, in part, because some of our research interests overlap with the project's, given the Miamis' early historical presence in this late precontact site's vicinity. Still more important to the Tribe, however, is the opportunity the Turpin Project has provided for us to lay the groundwork for the reburial of remains exhumed from the site in the late nineteenth and mid-twentieth centuries. While such a focus might run directly counter to many archaeological research programs, the Turpin Project has itself focused on reconnecting descendant communities to the site and on furthering repatriation.

ICP-MS Investigation of Geochemical Differences between Archaeological Ceramics from Terrestrial and Submerged Environments, La Altagracia Province, Dominican Republic

Geochemical studies of archaeological ceramics often assume little to no postdepositional change to the makeup of the artifact. This study uses ICP-MS trace element and lead (Pb) stable isotope analysis to investigate how a freshwater submerged depositional environment affects the geochemical signatures of archaeological ceramics. We test the null hypothesis that there is no measurable geochemical difference between ceramic assemblages from underwater cavern sites and assemblages from terrestrial sites in the same region (La Altagracia Province, Dominican Republic). Results indicate statistically significant ($p < 0.01$) variation between assemblages in the concentrations of 10 trace elements (V, Cu, Zn, As, Sr, Zr, Cs, Ta, Tl, U), leading to a rejection of the null hypothesis. Results also show a wider range of Pb isotope ratios in ceramics recovered from submerged sites than terrestrial sites, leading to further investigation of regional Pb isotope variation. These results suggest that ceramic artifacts recovered from underwater sites may be unsuitable for inclusion in comparative geochemical studies that assume the geochemical fingerprint of a ceramic artifact is a direct proxy for that of the original vessel. Results of this study will impact sampling design of future ceramic analyses and contribute to understandings of underwater archaeological site formation.

Archaeological Survey in the Lower Save River Valley, Southern Mozambique

Southern Mozambique, with extensive Quaternary-aged deposits, shows great potential to inform on early modern human behavior. Despite its geographic proximity to well-known southern African hotspots of Stone Age archaeology, the area represents a major gap in our knowledge due to civil war and political instability in the late twentieth century. In 2023, we began a systematic survey of the lower Save River valley in the southern half of Mozambique. This area had no previously documented sites, but we chose this valley because of the occurrence of exposed Quaternary gravel and sand deposits along drainages leading into the Save River. The initial reconnaissance survey in 2019 found that these deposits on the north side of the valley contained abundant raw material in the gravels and lithic scatters dated to the Middle and Later Stone Age. Testing at one locality, Zimuara I, confirmed the presence of stratified deposits in a ~2 m thick soil exposed in a quarry. Later Stone Age (LSA) were found in a buried contexts within the well-developed soil. An OSL age of 40 ± 3 ka provides the oldest dates for the LSA in Mozambique. Here, we report the preliminary results survey and test excavations of Zimuara.

A Bioarchaeological Analysis of Antemortem Postcranial Trauma Patterns within the Archaic Greek Cemetery of Phaleron

The Phaleron cemetery dates to the Greek Archaic period (700–480 BCE), a time of great political and social upheaval. Textual accounts from the Archaic period are limited, making bioarchaeological analysis integral to understanding the lived experiences of everyday ancient Athenians. This project focuses on antemortem postcranial trauma, examining patterns in quantity and location to better understand the activity and behavioral patterns of the individuals buried at the Phaleron cemetery. Intra-cemetery patterns of antemortem postcranial trauma and burial contexts are also analyzed. These analyses serve to identify potential social or economic differentiations within the cemetery.

Furthering 3D Digital Representation Methods: An Introduction to the Application of Neural Radiance Fields as an Alternative to Photogrammetric Modeling

Photogrammetry has seen increasing utilization within archaeology in recent years but with the rise of this representational methodology has come several challenges including the loss of context, inaccurate reproduction of surfaces, and difficulties processing thin objects. Emerging free open-source machine-learning technology can produce novel scenes known as neural radiance fields (NeRFs), which present a valuable alternative when creating 3D representations of objects, sites, and survey areas. While photogrammetry reproduces 3D geometry by matching features to create a polygonal mesh, the artificial intelligence powered NeRF software creates a continuous scene made of view-dependent radiating sources of light. This allows NeRFs to depict elements with unclear geometry, such as the sky and a more accurate representation of how light reflects off the subject from different angles; therefore, producing more lifelike facsimiles of the subject matter. NeRF utilizes the same data collection methods as photogrammetry, making it an accessible addition to the archaeologist's digital repertoire that can be employed not only on future endeavors but past ones as well. The research presented demonstrates the various facets of NeRF technology and how it can help us preserve, record, analyze, and educate within an archaeological context.

Were the Fiber-Tempered Sherds from Claiborne (22Ha201) Made at the Site?

This presentation discusses the preliminary results of our study concerning fiber-tempered sherds from six loci in the Southeast in order to determine if any of the fiber-tempered pottery found at Claiborne, a Poverty Point culture site in coastal Mississippi, were made locally or imported. We analyzed such pottery and soil samples from the Wheeler Basin (Metzger site), south-central Louisiana (Ruth Canal site), the Savannah River (Stallings Island), the St. Johns River (Tick Island), the Apalachicola area in Florida, and Claiborne itself. We addressed this question using two techniques, petrographic thin sections and pXRF analysis, the results of which are discussed.

Rock Art Distribution in the Windwards in the Caribbean: A GIS Locational Perspective

Rock art locations in the Caribbean are well known and include caves, waterways, coasts, inland rock formations, and ceremonial enclosures. Mythological (caves as centers of origin and fertility) and practical considerations (guardians of fresh water sources) have been offered as general explanations for their settings. GIS procedures offer an opportunity to explore in greater detail particular site locations, in addition to suggesting possible reasons for the observed site distributions. Our exploration of rock art settings in the Windward Islands involve comparing rock art distributions with petroglyphs and those with workstones (boulders with cupules and/or sharpening lines) to non-rock art distributions employing such environmental factors as distance from fresh water sources, elevation, and astronomic positioning, and such rock art attributes as element number and image types.

[173]

Microremains in Sediment as Indicators of Human Activity

Plant microfossil analysis has been utilized for environmental reconstruction at numerous archaeological sites around the world; however, the process of preparing and examining samples is labor intensive, requiring skill and a large investment of time in order to manually obtain sufficient count numbers. Furthermore, observations based on microfossil datasets are restricted in their scope by a reliance on a limited set of diagnostic morphotypes. The project presented in this poster explores a semi-automated method for analyzing microfossils extracted from archaeological samples. Additionally, in order to acquire a finer scale picture of localized ecological changes over time, we are performing a metagenomic assessment of ancient microbial taxa. Our objectives are (1) to develop a more economical method for microfossil analysis, and (2) to determine if patterns observed in microfossil datasets are reflected in corresponding microbial communities with the potential of providing additional insights into prehistoric human activities (e.g., colonization events, farming, etc.).

Social Structure Indicated by the Distribution of Bronze Resources in the Sanxingdui Culture (ca. 3200–3000 BP), Southwest China

Bronze was one the most precious resources for the Sanxingdui culture in southwest China, and the distribution of bronze resources reflected the social structure of Sanxingdui culture. This paper investigates the latest artifacts excavated from the eight burial pits at the Sanxingdui sacrificial site, and through cross-pit match of artifacts, classification of prototypes of artifacts, and observation of the relative location of the pits, the bronzes are divided into two groups, which means the bronzes originally had been displayed in two contemporary temples housing different activities. The type and number of bronzes owned by the temple that recorded the ruler's sacrificial activities far exceeded that of the temple recording the ruler's daily ritual activities, manifesting an extraordinary enthusiasm of Sanxingdui people for sacred rituals, and thus the social structure of Sanxingdui, in which divine power excelled over secular power, can be recovered.

He, Yahui (Stanford University)**[179]***Exploring Plant Exploitation and Food Practices in the Loess Plateau, China: A Comparative Microbotanical Analysis in Urban and Rural Settings during the Late Neolithic Period*

During the late Neolithic period in the Yellow River region (ca. 5000–4000 cal BP), a significant wave of urbanization unfolded, marked by the rapid development of settlement hierarchies, social stratification, and interregional interactions, which laid the foundation for the emergence of early state-level political structures. This period also witnessed the proliferation of sophisticated pottery types, notably vessels used for alcohol consumption and serving purposes, including pitchers and cups, in north China. However, the role of pottery assemblages, plant exploitation, and related food practices in mediating and shaping sociopolitical dynamics within both urban and rural contexts in the northern Loess Plateau region remains largely unexplored. This study presents a comparative microbotanical analysis of plants from elite and non-elite settlements and elite mortuary contexts, shedding light on the plant composition and food practices that shaped the social relationships, political structures, and urbanization processes in the region during the fifth millennium BP.

Headrick, Annabeth (University of Denver)**[273]***Teotihuacan, Chichen Itza, and a Cautionary Tale of Corporate Commerce*

Teotihuacan exhibits a broad trend of shared wealth, exhibited by numerous luxurious apartment compounds whose residents accessed considerable quantities of valuables, as reflected by portraiture of richly clad mid-elites and the mass production of costume elements. Chichen Itza similarly eschewed royal portraiture in favor of works portraying group assemblies of opulently adorned mid-elites. These characteristics inspire analyses focusing on whether these political capitals had individual rulers or corporate systems of governance, sparking comparisons of political structure across Mesoamerica. Less discussed are the potential costs of burgeoning members of society entitled to the trappings of wealth and status. This paper explores the economic implications of the mass consumption of exotic goods at Teotihuacan and Chichen Itza, including the vast trade networks, resource extraction, and labor necessary to create and move high value goods. Comparisons will be made to the seventeenth-century Dutch, a society with a proliferating middle class whose consumption was supported by global networks of extraction. While recognizing the evidence for increased access to wealth, this discussion will also explore the economic costs of the impulse to consume luxury goods, tempering the celebration of these societies as altruistic forms of governance.

Healan, Dan (Tulane University) and Blanca Paredes Gudino (Instituto Nacional de Antropología e Historia)**[214]***Ancient Tula and Its Interactions with Other Areas of Mesoamerica*

Over the course of time, archaeological investigations at Tula, Hidalgo, have recovered increasing evidence of systematic exchange with other areas of Mesoamerica spanning Tula's initial growth in the Epiclassic period and its Early Postclassic apogee. The material evidence at Tula itself includes finds from many parts of Mesoamerica, and in some cases includes luxury goods from ritual and other contexts associated with Tula's political and religious elite. Many other such items, however, including some of the most sensational recent finds, have been recovered from contexts associated with the everyday domestic realm, including a wide variety of residential structures throughout the ancient city, revealing a multitiered exchange system whose components include not only the movement of goods to and from Tula but their movement within the city itself. Stratigraphic and chronometric data indicate notable long distance exchange activity beginning in the Epiclassic that continued and flourished in the subsequent Early Postclassic period. Evidence from other sites provides some perspective on Tula's role as a donor in several cases.

Re-tying a Wayu: Connecting a Cranial Mask in the Smithsonian to Its Community of Origin in Huarochirí, Peru
To prehispanic Andeans in central Peru, donning a facial-bone mask, a *wayu*, reanimated the dead and honored ancestral victories. Following these masks' description in the ca. 1608 Quechua-language manuscript of Huarochirí, scholars presume Spanish priests destroyed them to extirpate the "idolatry" of ancestor worship. Our collaboration with one town in Huarochirí explores a possible *wayu* extracted by a North American collector in 1888 and held in the Smithsonian today. Conversations with municipal and communal representatives of that town have identified possible next steps, including (1) the identification and exploration of potential sites from which the *wayu* was extracted, to promote community identification with the Indigenous past and provide resources via tourism; (2) bioarchaeological research on the *wayu*'s pre-1608 identity and ritualization; and (3) the ethnohistorical recontextualization of its collection, in which community leaders are brought to the Smithsonian to research the mask's relationship to modern cultural and environmental heritage (e.g., masked dances and agricultural knowledge). We explore this process as a model for collaborative research across overlapping national ethics and legal imperatives. How might Andean ancestors dislocated by earlier anthropological collecting be reencountered by communities today, and what might archaeologists and other researchers do to help in that process?

Heath-Stout, Laura (Stanford Archaeology Center)

[124]

The Negative/Contested/Dark Heritage of Disability Institutions

When I told a leading Massachusetts disability activist that I was starting an archaeological heritage research project on the state institutions for people with intellectual disabilities, he flinched. "But those are sites of trauma and oppression, nothing empowering like 'heritage!'" he exclaimed. The three "schools," all listed on the National Register of Historic Places, were indeed eugenicist institutions where terrible conditions and abuse catalyzed lawsuits that led to the closure of two and the shrinking of the third. The two closed campuses now belong to municipal governments, and the crumbling buildings are increasingly covered with weeds and graffiti as debates rage about what kind of redevelopment would be appropriate. Disabled activists seek to make the histories of institutionalization more widely known, understood, and memorialized, while town governments seek profitable uses of the land and buildings, and many nondisabled residents downplay the horrors of the institutions or even regret the closure of large employers in their communities. In this paper, I will test the applicability of "negative heritage," "contested heritage," "dark heritage," and related theories to these cases, reflecting on the early stages of my project on disability history and heritage.

Warrior, Priestess, Queen: Scythian Women and Their Roles

The Scythians were a group of people originating in Central Asia that migrated to what is now Ukraine and Southern Russia from the eighth to the seventh centuries BCE. They are well known for their nomadic way of life, horseback warfare, and apparent lack of a patriarchal society. There is significant evidence that Scythian women were treated as equals to Scythian men. I will use thorough research of archaeological sites and findings, scholarly articles, and relevant literature. I will show Scythian artifacts as well as artifacts from other societies depicting the Scythians. I found evidence of the roles of Scythian women through research of Scythian burial sites, art, weaponry, and clothing. There is also evidence spread throughout ancient Greek society—art, myths, writings of Greek historian Herodotus, etc. Though the "Scythians" may not be known by many people, the "Amazons" are. Though the depiction of Scythian women as Amazons began in ancient Greece, it continues today in modern media. The impact these women have had on women around the world for thousands of years is immense. I wish to shed more light on who these women were, and the important role they had in their society and ours.

Hechler, Ryan (Tulane University)**[220]***Discussant***[220]***Chair***Hechler, Ryan (Tulane University)****[220]***Monumental Manipulations: Varied Inka Colonial Tactics of Spiritual Embedment among Cara Ritual Centers of Northern Ecuador*

Tawantinsuyu's consolidation of northern Ecuador was characterized by unique moments of conquest, and reconquest, of the incredibly resistant Cara people. The principal Cara polities were the Cochasquí, Cayambe, Caranquí, Otavalo, and Quinche, each with monumental ritual centers, defined by massive earthen platform mounds. The Inka Empire was not only concerned with a physical subjugation of these centers, but also their spiritual conquest. The largest mound at Cochasquí was appropriated by the Inka and modified into a Cuzco-style structure. The Cara rebelled during Emperor Wayna Qhapaq's rise to power. The first Cara polity to fall during the Inka reconquest was Cochasquí, which, though allegedly burned by Tawantinsuyu, was reoccupied thereafter. The entire population of Quinche was deported and replaced with mitmaquna, ethnic enclaves relocated from within the empire. An Inka Temple of the Sun was established there in the middle of local mounds. Alternatively, the site of Inka-Caranquí was not placed among an important monumental site but was a ground-up Cuzco-style endeavor. The Inka tactics of spiritual embedment were varied and disruptive to local identities. Unfortunately, the realities of preservation and insufficient government intervention have resulted in much of the architectural evidence being destroyed at these sites.

Heckman, Jasmine (US Fish and Wildlife Service)**[305]***Where Does the Responsibility Lie? The Long-Forgotten Federal Collections and the Repositories That House Them*

The federal government is responsible for a huge number of archaeological collections in the United States, and yet not all of these collections are housed in federally compliant repositories, while many collections are not even known to exist by the agency. But whose problem is this—the archaeological repository housing the collections or the agency? Many steps have been taken by agencies over the years to locate collections and house them in compliant repositories, but there is still so much work to be done if we are to be considered ethical stewards of these collections. The responsibility for these collections, including confirming the long-term steward of the collection, should fall on the federal agencies. This paper provides a snapshot of curation efforts for various agencies and suggestions on how agencies can work with archaeological repositories to identify and confirm collections under the long-term stewardship of the federal government. When federal agencies gain a more thorough understanding of their collections stewardship responsibilities, the agencies can ensure the proper care and management of the collections in repositories through sufficient funding streams, provide increased access to descendant communities and approved researchers, and fulfill the federal requirements stipulated in 36 CFR Part 79.

Heffner, Sarah (US Army Corps of Engineers)**[4]***USACE and Section 106: Programs, Actions, and Authorities*

This presentation provides an overview of various United States Army Corps of Engineers (USACE) programs and authorities that require compliance with Section 106 of the National State Historic Preservation Act, such as the Regulatory Program, Section 408 Program, Civil Works Program, and Military Programs Installation Environmental Support Program. Here we provide examples of the activities regulated by each program, USACE expectations for cultural resources reporting and documentation, and how USACE coordinates with other federal agencies and federally recognized Indian tribes.

Heigel, Darren (University at Buffalo), Amanda Schmidt (University of Washington), Lucille Katzman-Tranah (University of Washington), Hollis Miller (SUNY Cortland) and Ben Fitzhugh (University of Washington)**[99]***Archaeology of the Past, Present, and Future: Insights from Youth Engagement in Old Harbor, Alaska*

This past summer, we traveled to Kodiak, Alaska to conduct archaeological fieldwork as part of the Old Harbor Archaeological History Project (OHAHP). This year, OHAHP partnered with Old Harbor community organizations to co-facilitate a cultural camp for local Indigenous youth. Serving as counselors, we aimed to expose Indigenous youth to archaeology by teaching them archaeological methodologies, while working with adult community members to create an enriching and fun cultural learning environment. As counselors, we were given the unique opportunity of learning and working with Alutiiq community presenters, who taught subsistence, dance, language, and arts. Thirty-five community members of varying ages joined us at our camp on Sitkalidak Island to participate. This poster will share our experiences from the cultural camp and discuss the importance of archaeologists' connections with community members. Specifically, our poster will discuss the importance of communication, interpersonal relationships, and flexibility as vital skills when engaging with communities in the context of archaeological outreach. We will also spotlight camp activities facilitated by Alutiiq community presenters, and their connections to the archaeological project. Ultimately, this poster will demonstrate how community-based work can support descendant populations and improve the quality of archaeological research.

Heilen, Michael (Statistical Research Inc.) and Shelby Manney (Arizona Army National Guard)**[173]***Living Data: A Digital Data Collection and Management System for Landscape Archaeology*

As more and more data are born digital, archaeologists increasingly focus on operationalizing and refining data models, workflows, and practices. Important considerations include not only whether data will be useable for their intended purpose but also whether data generated by archaeological projects will be findable, accessible, interoperable, and reusable for future research and management efforts. Additional concerns include whether and how primary data, paradata, and metadata are preserved, who controls them, and how they are governed. Studies have shown that the earliest stages of the data life cycle—i.e., how data are modeled and collected—strongly influence the outcome of later stages of the life cycle. As such, data collection methods should seek to maximize the suitability of data to fulfill all subsequent life cycle stages. This poster presents a cloud-based, digital data collection and management system developed for landscape surveys. We show how the data are modeled, collected, and stored; how the primary data can be visualized, analyzed, and integrated using semi-automated workflows; and discuss the implications of the approach to the interpretation and management of archaeological landscapes.

Heinrich, Frits (Vrije Universiteit Brussel), Laura Motta (University of Michigan) and Annette Hansen (Vrije Universiteit Brussel)**[256]***New Frontiers in Ancient Diet and Nutrition: Developing Innovative Methods for Quantitative Compositional Analysis of Desiccated Archaeobotanical Remains*

This methodological paper presents on the development of new chemical methods to obtain functional, nutritional, and antinutritional compositional data from desiccated archaeobotanical specimens. It discusses the potential, pitfalls, possible applications, and significance of novel approaches to quantitatively assess the composition of ancient cereals and pulses in terms of a diverse array of macronutrients, micronutrients (e.g., vitamins, amino acids, and trace elements including “minerals” such as iron and zinc), functional compounds (e.g., gluten), and antinutrients (e.g., phytate). As a case study, it showcases the trace element/mineral results obtained from the archaeobotanical assemblage from the Greco-Roman village of Karanis in the Fayyum region of Egypt. The work presented is being carried out within the context of the Flemish Science Organisation funded project Rethinking Roman Nutrition and the Belgian federal Excellence of Science project AGROS (Agriculture, diet, and nutrition in Greco-Roman Egypt: Reassessing ancient sustenance, food processing and [mal]nutrition) and is executed by an international interdisciplinary consortium comprised of five universities and led by the Vrije Universiteit Brussel (VUB).

Heisinger, Bryan (US Forest Service, Pike National Forest, Colorado)**[332]***The Archaeology of Skiles Shelter (41VV165)*

Skiles Shelter (41VV165) is a small south-facing rockshelter near the mouth of Eagle Nest Canyon. While the site lacks the extensive organic preservation typical of dry rockshelters in the region, it is notable for its Pecos River style rock art, diversity of bedrock milling features, and prominent burned rock midden (BRM) accumulation. Excavations conducted in 2013 and 2014 by the Ancient Southwest Texas Project (ASWT), coupled with specialist analyses, have illuminated the site's long-standing use as an earth oven facility by hunter-gatherers in the Lower Pecos Canyonlands, as well as its punctuated inundations from historical flood events in the canyon.

Heitman, Carrie (University of Nebraska, Lincoln), Octavius Seowtewa (Zuni Cultural Resources Advisory Team), Curtis Quam (Zuni Cultural Resources Advisory Team), Gilbert Yuselew (Zuni Cultural Resources Advisory Team) and Michael Gchachu (Zuni Cultural Resources Advisory Team)**[269]***(Re)Connections through Time: Developing a Model for Multimodal Storytelling about Zuni Cultural Connections*

Native communities have long been excluded from the process of knowledge construction about their ancestral places. This exclusion has taken many forms: lack of voice or authority in museum excavations, curation, and exhibits; inaccessibility of collections that were removed from Native lands to geographically distant institutions or sold to collectors; the use of non-Native knowledge systems to classify and describe ancestral items; maps of ancient places that omit contemporary Tribal lands/Nations and Indigenous forms of mapping; and the use of anglicized place-names that obscure Native connections. In aggregate, these systematic exclusions alienate Native people from their own history and impoverish our national understandings of the past. In this poster, we describe a collaborative project between the Zuni Cultural Resources Advisory Team and the University of Nebraska, Lincoln, funded by the Andrew W. Mellon Foundation. Our work is focused on the physical process of reconnecting with ancestral collections and places and creating digital films that directly reach Zuni Pueblo community members. We hope this work will inspire the next generation of Native artists, museum curators, and cultural resource managers and provide a model for how we might confront the history of archaeological extraction and amplify enduring Indigenous histories of connection.

An Integrated Study of Late Archaic to Early Woodland Lithics and Ceramics of the Coastal Savannah River Valley

The Late Archaic (3000–1000 BCE) to Early Woodland (1000–500 BCE) transition of the South Atlantic Bight is characterized by vast sociotechnical changes. Research of these periods has been dominated in recent decades by the study of large shell rings and their likely attendant ceremonial happenings, in part because coastal erosion has necessitated mitigation. This poster will explore the Late Archaic and Early Woodland components of 38JA200, a large multicomponent site located in the Port Royal Sound of South Carolina. Through analysis of ceramic and lithic assemblages recovered during Phase I research, we explore how this landscape held host to a wide range of quotidian activities during a more than 1,000-year period. We also provide new data to refine local lithic and ceramic sequences in a context absent of shell rings.

Striking a Balance: Ethical and Methodological Challenges in Virtual Reality Experience Design for Cultural Heritage Applications

Virtual reality is a valuable tool for public engagement and education, offering an immersive platform for the exploration of archaeological and cultural heritage landscapes. While not a gaming endeavor, cultural heritage VR draws from 3D gaming technologies and techniques to create the platform at the heart of immersive experiences. However, designing such experiences poses unique challenges due to the sensitive nature of the subject. Our project, Canyon Country Cultural Landscapes VR, aims to provide visitors to Bears Ears National Monument and its surroundings opportunities to delve into the region's rich cultural heritage and material culture. The project combines landscape-scale 3D environments with content from Indigenous communities, conservationists, land managers, and archaeologists to educate users about the history, fragility, and contemporary significance of these landscapes, all while emphasizing proper site visitation ethics. To achieve these goals, we must strike a balance between guiding users through the experience, conveying essential information in a nonlinear fashion and respecting the subject and descendant communities' cultural sensitivities. This presentation explores the challenges and solutions encountered during the project's development. It sheds light on the distinct considerations involved in creating collaborative cultural heritage VR applications, offering insights into the compromises and innovations shaping these efforts.

Some Highlights from the Past Two Decades of Archaeological Research in New Orleans

It has been nearly 19 years since Hurricane Katrina nearly destroyed the city of New Orleans, and 14 years since the Deepwater Horizon oil spill created immeasurable damage to the Louisiana coastline. While one would be hard pressed to find much good that came from those events, recovery efforts in the aftermath of these disasters brought in billions of federal dollars to rebuild local infrastructure and restore the Louisiana coast. Cultural resources investigations performed to fulfill the requirements of Section 106 for these federal projects essentially have created a "golden age" for archaeological research within the New Orleans metro area. This paper will highlight some of the major projects that have occurred with the author's participation and important findings that have resulted from those investigations.

Geological Knowledge, CRM, and the Lithic Cultural Landscape of Eastern Oregon

From the impressive buttes and craters where it can be quarried to the shining black flakes speckled across vast sagebrush plains, obsidian and its procurement, use, and discard has defined the human experience of eastern Oregon's landscape since time immemorial. Cultural resource management (CRM) practitioners must be proactive about documenting the tangible and intangible elements of eastern Oregon's lithic cultural landscape. This preliminary research draws on published sourcing studies from both academic and "gray" literature to explore how obsidian is embedded within Indigenous social and spatial networks. Because it can be sourced to specific locations on the landscape, obsidian can bind together even distant sites and the people used them through their shared relationship to a particular place. We then consider the role of obsidian sources and associated lithic scatters in constructing an integrated cultural landscape and discuss potential challenges to managing and protecting them from potential impacts within the context of CRM.

The Scope and Contributions of the Hieroglyphic Corpus of Belize to Our Understanding of the Ancient Maya

The epigraphic corpus of Belize is often considered as being limited in scope, with few monuments and few contributions to the historical sources of the Classic Maya. Yet, discoveries in recent years have considerably changed this picture. Some of the more spectacular discoveries include (1) Altar 26 at Caracol (dated to AD 884); (2) the jadeite plaque at Nim li Punit (recording a statement of ownership and exalted pedigree); (3) the Komkom Vase at Baking Pot (the longest text on a vase); (4) panels of the hieroglyphic stair of K'an II of Caracol, at Xunantunich (supplying crucial information regarding the dynastic crises of the Kanu'l royal house); and (5) the glyphic panel of Tzunun (that likewise mentions the Kanu'l). However, there are also more mundane discoveries that help us to understand the structure of ancient Maya society, including textual material in residential burials and pseudoglyphic-texts on building facades. Here, we present an overview of the epigraphic corpus, considering its scope, nature, genres, longevity, and context. The historical information of the texts is also considered, in light of regionalism, connections, and references to other centers and polities, without which our understanding of ancient Maya history would be all the poorer.

An Examination of the Virgin Pueblo within the Grand Canyon Parashant National Monument

The Virgin Anasazi Region of the southwestern United States of America is a relatively unrepresented region in archaeological literature. In the past, the undeveloped nature of the region combined with the region's remoteness have resulted in a dearth of unconsolidated literature on the archaeology of the region. Recent archaeological investigations by universities, government agencies, and environmental consulting firms have shed new light on the region. As the region is currently undergoing rapid development and population growth with predicted increases in site visitation, understanding the complexities of the region is vital to the preservation of the cultural resources in the area.

Henderson, A. Gwynn (Kentucky Archaeological Survey)**[64]***Moderator*

Henderson, A. Gwynn [272] see Pollack, David

Henderson, Breanna (Lochmueller Group)**[98]***Twelve Metrics for Creating Effective and Sustainable Public Archaeology*

Archaeology is the study, and by extension, the story of cultures, and everyone deserves access to their stories and those of their ancestors. The better one's understanding of archaeology, culture, and history, the better understanding of themselves and those around them. This research seeks to answer what approaches are needed to create sustainable and effective public archaeology programs. Due to the extreme importance of further efforts of inclusion, collaboration, and diversity within archaeology, this analysis quantifies multiple ways in which public archaeology can be achieved and showcase that it is possible to provide impactful programs for a variety of communities and audiences, no matter how lavish or economic one's budget may be. During this research, characteristics that successful outreach programs have in common were identified, and 12 metrics were created that can be used for analyzing outreach models. These metrics were designed after careful consideration of the current public archaeology models. These metrics are not meant to be rigid or to grade programs, but to highlight the methods used in successful outreach. Programs should be individualized to their audience and their needs. This work is meant to inspire more outreach efforts at any level.

Using the History of a Slag Concentration to Understand Variability in Angkorian Iron Production Sites in the Phnom Dek Metallurgical Landscape, Cambodia*

The Phnom Dek metallurgical landscape represents the single largest iron smelting region in mainland Southeast Asia. Located 100 km east of Angkor in central Cambodia, our surveys have identified over 20 production sites and a total of 150 individual slag mounds active between the sixth and twentieth centuries. Iron smelting during the Angkor period (ninth to thirteenth century) experienced a massive increase in the number, size, and distribution of iron production locations and correlates directly with the expansionary phases of the Khmer Empire. Excavation at the Tonle Bak site, 2 km south of Phnom Dek, revealed the first evidence of Angkorian furnace bases within a 5 m high slag concentration and the repetitive smelting process used to generate the mound. Combining dates from in-slag and excavated charcoals, iron tools, and geomagnetic intensity analysis, this presentation establishes a timeline for one mound and uses this model to estimate production across the landscape. More importantly, we attempt to explain the variability in mound form and size within a given site through the lens of ritual practices, local spirits and ethnographic analogies from the Kuay, the traditional iron smelters in this region.

Big Data and Possibilities for New Urban Comparisons at and around Cahokia Mounds, USA

Situated in present-day Collinsville, Illinois, Cahokia Mounds is considered globally as the premier example of precontact American Indian urbanism in North America. However, understandings of Cahokia's early population density, spatial arrangement, and scale are primarily drawn from relatively small areas within and surrounding the site's boundaries. As such, we know less about how Cahokia became an urban catalyst that influenced Mississippian lifeways throughout Eastern North America. Our project, The New Cahokia Atlas, is building on the work of Melvin Fowler and scholars over the last 30 years by examining the process of Cahokia's urban development from an unprecedented perspective. It includes a magnetometry survey that will record roughly 200 readings per square meter to visualize more than 5.5 km² of Cahokia's buried landscape, paired with geospatial analyses that allow us to work toward elucidating the urban growth of this UNESCO World Heritage Site. When complete, this will be the largest geophysical dataset in the Americas and among the largest in the world. In creating a dataset of this scale, we are attempting to noninvasively examine Cahokia in ways previously not accessible. Our project is also working with several Tribal Nations to ensure tribal access to, and input on, these data.

The Uprising: A Role-Playing Game as an Educational Aid in an Archaeology Seminar Course

In this paper, I discuss an analog role-playing game (RPG) entitled The Uprising, which I designed for an undergraduate university course on the archaeology of the senses. I reflect on how gaming in the classroom builds on recent pedagogical research and promotes participation not possible with traditional lectures alone. I summarize the gameplay and game design choices and elaborate on how the students and I have collaborated to improve the game during the two semesters of its use. I discuss how the RPG format combines student choice, chance, and information from the archaeological record to promote an engaging educational experience. I share student feedback, mention some fun and unanticipated outcomes of the game, and consider how the activity may evolve in future iterations. Finally, I provide some context about how the game fits with other assigned activities and materials and how broader elements of the course design, including the syllabus itself, may benefit from a degree of "gamification." I conclude that, though it incorporates elements of fiction and creative interpretations of the archaeological record, the RPG activity helps students relate to the ancient past in a unique way that befits an exploration of the archaeology of the senses.

Archaeological Exploration of Digital Spaces

Cultural processes extend into digital places and create archaeological sites that unfold in relationships

between physical assemblages and assemblages that are not physical. Archaeological sites like these require that we translate our methods and extend our theory to understand behavior in the contemporary world. A distinction between two types of archaeological sites can be made: Some digital places resemble 3D spaces, such as the constructed landscapes of many videogames. Other digital places have no apparent landscape, such as the “spaces” where collaborative work takes place, chat rooms, or discussion forums. Archaeology is uniquely positioned to make sense of human culture and to contextualize the use of these new kinds of places within larger social systems and long-term change. An archaeology of spaceless places is necessary to make sense of the relationships of power and trajectories of technological change in the recent past. This paper describes a case study in which behavioral chain analysis is used to analyze a digital assemblage and identify relationships of power and labor within a specific cultural context. An archaeology of digital environments will open new avenues for applied and collaborative archaeological inquiry.

Afanasievo Settlement Archaeology in the Altai Republic

The Afanasievo culture in the Altai Mountains (ca. 3300–2800 BCE) has long captured our attention as the first pastoralists to spread to Inner Asia. Known almost exclusively through osteological remains and material culture from mortuary contexts, settlement data have remained scarce for characterizing the subsistence economy, access to domesticated horses, and interaction with Indigenous hunter-gatherer communities in the Altai region. Recent excavations by the Rise of the Altai Mountain Pastoralism Project (RAMPP) at Nizhnyaya Sooru located in the Altai Republic provide a rich record of Afanasievo domestic deposition, architectural remains, and occupational history, representing a well-preserved and high-use settlement. Utilizing a range of analytical approaches, including zooarchaeology, ZooMS, faunal stable isotope analysis, paleoethnobotany, human and animal paleogenomics, radiocarbon dating, and material culture analysis, the RAMPP team provides a close examination of Afanasievo daily life that has so far foiled understandings of how early pastoralists settled in the Altai and connected to new environments and social landscapes of local hunter-gatherers.

Stable Isotope Analysis Study of Dietary Change from the Qing Dynasty to Modern Day in Northwestern Taiwan

Taiwan has a unique cultural and dietary history within Asia. This is in large part due to the local indigenous Austronesian populations, recent mass migration and colonization from peoples across China, as well as colonial occupations by the Netherlands, Spain, and Japan over the last 400 years alone. However, this recent history and its impact on dietary culture in Taiwan today is not well documented. This study applies stable isotope analysis to a large sample of Taiwanese teeth (both enamel and dentin) samples from three distinct temporal periods that cover approximately 300 years: the Qing dynasty Taiwan (1683–1895 CE), Japanese occupation (1895–1945 CE), and into the early twenty-first century. In this poster we present new carbon,

oxygen, and nitrogen stable isotope data to reconstruct dietary and migration practices over these periods. These data are compared to historical sources, both secondary and primary, of recent dietary cultural history of Taiwan, as well as previous Taiwanese and Chinese studies utilizing stable isotope analyses from deeper archaeological time scales. These new data elucidate Taiwanese dietary trends over time, including aspects of gendered differences in food intake as well as cross cultural exchange.

Mythic Time ReCORDeD: Ropes, Sacrifice, and World Renewal in Late Postclassic Maya Murals

Ropes and cords in the form of twisted vegetal fibers, or entwined vegetation or serpent bodies, are a common component of Mesoamerican iconography from the Formative period (1500 BCE–250 CE) into the contact era. They serve a variety of functions such as measuring/framing devices, bindings for captives or animals, and portals or pathways connecting celestial and/or underworld locations. This presentation explores examples of cords from Late Postclassic (1250–1520 CE) murals and codices from the northern Maya region. A particular focus is on painted frescoes documented on the outer walls of Structure I from Santa Rita in Chetumal, Belize, which portray a series of figures connected by ropes that encircle their wrists. These deity and ancestral beings are situated in specific places within the ritual-mythic world that correspond to dates marking the completion of 360-day periods. Various interpretations of the rope iconography have been presented, which I suggest involves setting time in motion in conjunction with foundation rituals linked to establishing or birthing place. Following Amos Megged (2010:244), I explore the idea that cords represented in narrative scenes may have cued readers to what he calls “future memory” by connecting otherworldly events of the remote past with present and future reenactments.

Evidence of Maya Metalworking from Mensabak, Chiapas, Mexico

Evidence of precolumbian Maya metallurgy is increasingly coming to light with numerous finds occurring in the Guatemalan highlands and the northern part of the Yucatán Peninsula. In this paper, we present new evidence of Maya metallurgy from the Mensabak region of Chiapas, Mexico, that dates to the Late Postclassic / early Spanish colonial period (AD 1200–1550). Our finds consist of copper-based prills, bell fragments, and casting sprues along with potential crucibles and bone tools for metal processing. Based on this evidence we argue for the existence of regionally specific metalworking techniques as well as artifact styles. Additionally, we highlight some of our initial experimental archaeology aimed at understanding past Maya metallurgy. In general, our findings in Chiapas allow us to begin to conceptualize metalworking as part of multifunctional places and develop a broader conception of the technological process along with its variations.

Changes and Innovations in Yucatecan Beekeeping Production on Ranchos and Haciendas in the Early Twentieth Century

During the first part of the twentieth century, Yucatec ranchos and haciendas were spaces where various technological, economic, and landscape changes occurred derived from new beekeeping production strategies. The adoption and cultivation of *Apis mellifera* to produce greater quantities of honey and wax meant a cultural and material change among the descendant communities. One of the consequences was the reduction of the productive management of the native Mayan bee known as *melipona*. In this paper we will show how some of the changes linked to the use of ancient meliponaries and apiaries, present in different Yucatecan ranchos and haciendas, derived in different management strategies, the adoption of new species and innovations that sought to intensify the production of products derived from the hives. Archaeological evidence and various historical documents, related to the presence and use of spaces designated for beekeeping, suggest changes in the technologies implemented and the different strategies for bee production in places such as Rancho Hobonil, Santa Rosa, and Hacienda San Pedro Cholul. In most cases, these changes and innovations brought with them an increase in socioeconomic disparities and impacted different aspects related to the social memory and identities of the native communities of the Yucatán Peninsula.

Regional Food Paths of Ancient Tropical Agriculturists: A Multi-isotope Approach

Understanding dietary patterns in past societies is critical for interpreting economic and social transformations. The analysis of dietarily derived isotopes is a reliable source of categorical information about the types of foods consumed by an individual. Furthermore, multisystem-isotope analyses can clarify inferences about food sources and relative protein/carbohydrate contributions. We present dietary data from three Maya regions (Northern Lowlands, Central Lowlands, and Highlands) and one Mesoamerican descendant society (inhabitants of the Nicoya Peninsula, Costa Rica) during the Classic to early Postclassic periods using carbon ($\delta^{13}\text{C}$), nitrogen ($\delta^{15}\text{N}$), and sulfur ($\delta^{36}\text{S}$) stable isotopes from bone collagen with $\delta^{13}\text{C}$ and oxygen ($\delta^{18}\text{O}$) stable isotopes of dental bioapatite. We contextualize our results compared to reported isotopic data from over 1,000 individuals from Mesoamerica and the Caribbean. We discuss patterns based on behavioral choices (diet) and geology (probable food and water sources). In specific areas in the Maya Lowlands, C_3 plant-consuming animals were being eaten along with maize (C_4 plant)-consuming animals. This pattern varied regionally and temporally, with a marked increase in maize consumption toward the end of the Classic period and the beginning of the early Postclassic period.

The Use and Circulation of Seaweeds along the Western Coast of South America

The exploitation and consumption of seaweeds is a thriving matter of research, arguably started in the 1980s by the ethnographic work of Shozo Masuda in the Andes. This study goes beyond local discussions or milestones about proxies and dates and performs a large-scale follow-up on the available information on seaweed use and circulation along the Andean coast of the South Pacific Ocean. Trends can be clearly observed in five areas based on archaeological, ethnohistoric, and ethnographic data. The definition of these areas broadly corresponds to the biological availability of certain seaweed species and the environmental

conditions related to cultural areas. A constant pattern is the coastal exploitation and consumption and inland circulation of these resources; while the quantity of exploited species and uses given to them vary significantly between nutritional, agricultural, trading, and ritual purposes. An open discussion is the importance played by seaweeds in prehispanic societies along the Andean coast and their archaeological traceability if preservation is not optimal in certain contexts. These trends are discussed regarding modern phenomena, like aquaculture and recent reliance on algae for industrial and gastronomic purposes. A current diagnostic on seaweed uses is finally offered, leaving open questions about human reliance on marine ecosystems.

An Archaeology of Dictatorship in Cuba: The Escuadrón 41 of the Rural Guard in Matanzas (1958)

The archaeology of dictatorships in Latin America has had a significant development in the last decades, especially focusing on the south and central continental experiences. However, there is a lack of attention to the dictatorial processes in the Caribbean from an archaeological perspective. Cuba is not the exception. After the military coup of March 1952 led by former president Fulgencio Batista, Cuba entered in a dictatorship that resulted in a bloody violence with extreme state repression which included imprisonment, forced exile, murder, disappearance of people, and the display of corpses in public spaces. By 1958 a former colonial fortress became a torture and detention center known as the Escuadrón 41 of the Rural Guard in the city of Matanzas. Its destruction after the Cuban Revolution, presents it as an atypical case study, illustrating a process of forgetting that contrasts with the national master narratives. Here, I present the preliminary results from the first archaeological project focusing on Batista's dictatorship. Integrating archaeological excavations, underwater surveys, testimonies, and archival research, I explore the destruction of the site after the Cuban Revolution, while contributing to the understanding of a traumatic past from new material referents.

Multiproxy Approach to Identify Pottery Contents in Postclassic Xochimilco, Mexico: An Interdisciplinary Approach to Prehispanic Foodways

Mesoamerican food has been studied for years, and although much is known about many of the native practices and ingredients, the archaeological study of food in Mesoamerica is still developing and we are learning that we know far less of it than we thought. For this research, we applied a multiproxy approach that involved the use of GC-MS, starch grain analysis, FT-IR, and spot test to identify the residues of food preparation and consumption in ceramics from two Postclassic excavated areas in Xochimilco, Mexico. We focused on domestic non-ritual contexts. This research showed interesting data about ingredients and preparation techniques that we were not aware of or that might not be clearly referred to in historical sources. We also investigated the markers of nixtamalized maize. As part of the investigation, we were also able to obtain new perspectives on pottery use and form-function interpretation. This is one of the first studies to apply a multiproxy approach of

this type, and we were able to show the importance of using different methodologies to better understand the invisible residues of one of the most important activities of ancient people: food preparation and consumption.

Olmec Iron-Ore Mirrors from San Lorenzo, Veracruz / Los Espejos Olmecas de Mineral de Hierro de San Lorenzo, Veracruz

During the heyday of the Olmec capital of San Lorenzo (1400–1000 cal BC), iron-ore mirrors from nonlocal sources were traded from distant regions. The Central Valleys of Oaxaca have been hypothesized as one of the possible sources, if not the main one. Iron ore was then used by the Olmec to create drill components such as bearing blocks and as personal adornments with shiny, light-reflecting surfaces known as mirrors. Kent Flannery's proposal during the 1960s was that the Oaxacan site of San José Mogote was the polity in charge of mining the iron ore and manufacturing the mirrors. New evidence from excavations carried out by the San Lorenzo Tenochtitlán Archaeological Project from 1990 to 2013 and a thorough reanalysis of Flannery's data shows that this assumption may be an overestimation.

Understanding Food Production in Teotihuacan: New Approaches

Teotihuacan was one of the largest and most prominent ancient cities in Mesoamerica during the Classic period (150–600 CE). The city housed an estimated population of 100,000 people at its height, all in need of food, shelter, and basic necessities. Spaces dedicated to the production and consumption of foodstuffs in the city's different districts have been difficult to identify through excavation and remote sensing. New studies in different apartment compounds and the technologies available today might reveal valuable information about food production practices and subsistence strategies. This, in turn, allows us to start placing these practices in the living spaces to understand how they were inserted into the quotidian lives of the city's inhabitants. In this paper, we apply a variety of analyses (chemical residue, GIS, petrography, and spatial distribution) on ceramic and grinding stone tools to conceptualize food production in the ancient city of Teotihuacan, Mexico.

[173]

NASA's Contributions to Remote Sensing in Archaeology

For more than four decades, NASA has played an outsized role in advancing the use of satellite imagery for archaeological applications. Starting in the 1980s, NASA archaeologist Dr. Tom Sever organized the first conference on archaeological applications of remote sensing, infusing NASA Earth Observations into cutting-edge archaeological research being conducted around the globe. Sever's interdisciplinary approach to archaeology influenced applications of remote sensing beyond the discipline, including the establishment of the UNESCO Maya Biosphere Reserve and the development of the flagship NASA-USAID SERVIR program. Today NASA continues to drive archaeological applications of remote sensing data through research solicitations and capacity building. Additionally, NASA's commitment to Open Science has contributed to the widespread availability of remotely sensed big data, a resource primed for uptake by the archaeological community to address automated identification of archaeological features through deep learning, fieldwork planning and practice, modeling of past environments and environmental variability, and cultural heritage impact and risk assessments. Feedback collected from this presentation will inform a needs assessment on the future of remote sensing in archaeology for this important community of practice.

Herold, Hajnalka (University of Exeter, UK)**[91]***Archaeology of Early Medieval Central and Eastern Europe in the Context of “Global Middle Ages”*

The intent behind the notion of “Global Middle Ages” has generally been to broaden the scope, especially geographically, that we examine when discussing the Middle Ages. An important component of this has been widening the field of view beyond western Europe and the Mediterranean. However, a broad territory, situated geographically in the very area between western Europe and the Mediterranean, has largely been left out of consideration, especially in English-speaking scholarship: we rarely see central and eastern Europe discussed in works that bear a “Global Middle Ages” tag. This paper argues that central and eastern Europe was strongly embedded in the medieval world and the study of the Middle Ages cannot be truly “global” without including this broad territory. One reason for the absence of this region, especially for the earlier part of 500–1500 CE, could be the lack of consistent written sources in most of this area before the eleventh–twelfth centuries. This is where archaeology can play a decisive part—the archaeological record is rich and detailed, albeit less well known in an international context.

Herr, Sarah (Desert Archaeology Inc.)**[238]***Discussant***Herrera, Marta (Profesora titular jubilada) and Juan Camilo Niño (Universidad de los Andes)****[220]***El Maya de los Sindagua y el Awá-Pitt contemporáneo*

En la literatura sobre los Sindagua producida en los siglos XX y XXI es un lugar común hablar sobre su exterminio a principios del siglo XVII. Sin embargo, es difícil sustentar esta aproximación al analizar las cifras que figuran en visitas y cuentas de tributarios de la provincia de Barbaocoas de los siglos XVII y XVIII. En efecto, en esos documentos que, en general, señalan la “nación” a la que pertenecían los indígenas, los clasificados como Sindaguas aparecen como mayoritarios al menos hasta 1720. Una situación igual de diciente se observa hoy en día. Tal y como pudimos constatar personalmente, los actuales Awá, hablantes de la lengua awa pitt reconocen una enorme proporción de los nombres Sindaguas registrados en un documento del siglo XVII. El documento, parte de un proceso judicial que se adelantó contra los Sindagua en 1635, cuando fueron derrotados, indica que su idioma era el Maya, sin dar más explicaciones. La familiaridad de los Awá con el Maya de los Sindagua registrado en los documentos habla de continuidades y discontinuidades que serán las que discutiremos en esta presentación.

Herrera, Roberto (City University of New York [CUNY])**[157]***Chair***Herrera, Roberto (City University of New York [CUNY]) and Francisco Corrales-Ulloa (National Museum of Costa Rica)****[157]***Diversity in Southern Central America: Exploring Late Aguas Buenas / Early Chiriqui Period Sites in the Diquís Subregion*

Southern Central American archaeology is a rich tapestry of variation that makes the task of discerning distinctions and commonalities a difficult one, hindered by a lack of systematic research, particularly in southern Costa Rica. This study offers initial findings from recent fieldwork conducted at two contemporaneous Aguas Buenas period (300 BC–AD 800) sites, Cantarero and Pejeperro. By examining these sites, we aim to shed light on both interregional and intraregional interactions delving into how material consumption and local resource utilization align or deviate from each site’s social functions. We also contrast the findings with interpretations from two contemporaneous sites, El Cholo and Bolas, examining their compatibility with existing models for vertical and horizontal social dynamics.

Traditional Dishes and Culinary Improvisations: Elite Gastronomy in the Maya Area

Over the past few decades, understandings of cuisine in the Maya area have been radically amplified with the use of new techniques. Some methods offer the opportunity to directly connect artifacts and features with actual plant food residues. The ability to recover microscopic residues of food from sediments, artifacts, and human teeth has revealed not only a broad list of ingredients but a wide array of practices and recipes. Here, we draw on our previous paleoethnobotanical research across the Maya Lowlands to develop an understanding of Classic period cuisines, integrating new evidence from the Southern Lowlands. We consider the emergence of elite foodways, and how elite gastronomic practices factored into broader political maneuvers and private performances. We also tentatively suggest a taxonomy of local traditions that did not conform to a strict elite “grammar.” By addressing commonalities and departures from a core and canonic elite cuisine, we highlight how local elite expressions reified culinary norms but also manifested fluidity and flexibility in culinary practice. Paralleling work with other types of elite assemblages, we illuminate how privileged actors drew on broader cultural logics to make their cuisines intelligible, yet also locally improvised in significant ways.

Water Technology and Symbolism in the Andes (Cordillera Blanca, Ancash, Peru)

Dominated by the glaciated mountain couple Huascarán (male, 6,768 m) and Tullparaju (female, 6,395 m), the cultural landscape of the Callejón de Huaylas has long been shaped by stark contrasts in water availability. This paper showcases how water infiltration and surface runoff catchment technologies developed, as techné and as logos. Drawing on survey and excavation data from the environs of Tullparaju, it argues that glaciers became increasingly key for gravity irrigation farming under irregular climatic conditions marking the End-Formative (EF, ca. 2400–1800 BP) and late Middle Horizon (1200–1000 BP) and suggests the rise of paramount ceremonial centers as associated with the development of major inter-catchment water transfer systems. The complementary male/female opposition in the present landscape is discussed in the light of rock art at the pacarina of Keushu and suggested to reflect a precolonial moiety division. The interplay of anthropic lakes, bofedal wetlands, and glacier-fed gravity irrigation in ritual and mortuary practices is sketched out and contrasted with the violent decoupling of the technical and symbolic aspects of water management during the early colonial period. Present mismanagement of water surplus triggered by ongoing glacier retreat is seen rooted in this process.

El Torno del Cielo: A New Spin on Regional Interactions from the Río Grande de Chone, Manabí

Precolumbian societies of the Ecuadorian coast have long attracted the interest of archaeologists studying

regional interactions, since the evocative Sámano-Xerez (1844 [1528]) chronicle of encounters between Spanish conquistadors and Manteño trading vessels. The deep histories of these regional social interactions remain avid topics of research (Beekman and McEwan 2022). Contributing to these and other discussions, the Proyecto Arqueológico Río Grande de Chone has worked in the largest tributary of the Río Chone, positioned in the heart of Manabí's coastal cordillera. Excavations at the sites of La Narusa and Platanales and regional survey demonstrate the Río Grande was occupied since at least the mid-third millennium BC. Settlements of the Late Valdivia and Chorrera cultural traditions provide new information regarding local and regional connections these communities maintained. Changes in ceramic production and highland sources utilized for obsidian demonstrate far-flung material exchange and vibrant sociopolitical relationships. Additionally, the PARGC's encounter with a small second-millennium BC shrine provides a prescient example of early religious architecture. With elements recalling the spiral architecture of their Amazonian contemporaries and the stepped platforms of their coastal Peruvian neighbors, this shrine's construction by past residents of Platanales suggests their spiritual and social universe extended far beyond the coastal cordillera.

A Spatial Analysis of Excavated Mortuary Features from La Playa, Sonora, Mexico (SON F:10:3)

Covering an area of nearly 10 km², La Playa (SON F:10:3) is one of the most important archaeological sites in northwest Mexico. Significantly, La Playa has one of the most extensive Early Agricultural period deposits in the US Southwest/Northwest Mexico. It is also being impacted by severe sheet erosion that forms arroyos and impacts many of the archaeological features at the site. Long-term research at La Playa began with the Proyecto La Playa in the late 1990s. Since then, the Proyecto La Playa has conducted annual excavations and surveys at the site. Much of this research has focused on excavating mortuary features—primarily inhumations—that are at risk of erosion. Interestingly, there is no apparent cemetery space for these features, which are widely distributed. For this paper, I complete a spatial analysis of these mortuary features from the digitized feature sketch maps. I examine whether there are spatial patterns related to sex, burial orientation, number of individuals, and age. I also look for any associated correlations within the site sub-areas or landform. For this presentation I do not show any images of human remains, either photographed or hand-drawn.

Jewel of the Sierra: An Interdisciplinary Approach to Understanding Lake Tahoe's Underwater Historical Context and the Development of a Sensitivity Model for Cultural Resource Identification

The US Army Corps of Engineers' (Corps) Regulatory Program regulates work and structures within Lake Tahoe, a navigable water of the United States, under the Rivers and Harbors Act of 1899. The recent lifting of a local building moratorium has resulted in a resurgence of private, commercial, and public development around the lake margin. The resulting sudden increase in Regulatory permit applications prompted the Corps to develop a sensitivity model for identifying underwater cultural resources to guide compliance with Section 106 of the National Historic Preservation Act at Lake Tahoe for the Corps' Regulatory Program. Using geologic and remote sensing data, combined with tribal consultation, ethnographic information, previous

underwater archaeological investigations, and historical records, the Corps has developed a historical context for the underwater environment at Lake Tahoe, which in turn facilitated the creation of a sensitivity model to guide cultural resource identification efforts for undertakings regulated by the Corps. This session provides a summary of Lake Tahoe's historic context and presents the underwater cultural resource sensitivity model. The model will continue to be refined as cultural resource identification efforts for individual undertakings proceed.

Compositional Analysis of Ceramics from the Medieval Port of Madayi, Kerala, India

Beginning around the eighth century the volume and scale of exchange between the societies around the Indian Ocean and southeast Asia increased substantially. Archaeological work at the trade port community of Madayi, in the Kerala State, southwest India provides evidence of the integration of this south Indian community into the contemporary global economy. The small size and erosion of the surface of sherds has removed some of the painted and glazed decoration making identification through physical observation alone difficult. Typological, petrographic, and LA-ICP-MS analysis of glazed and earthenware recovered during the project has identified locally produced ceramics while other pottery sherds originated in southern Mesopotamia, China, and southeast Asia.

Curated Objects in Relational Networks of the Western Arctic

Nineteenth-century Inuit and Yupiit living on the coasts and islands of the North Pacific inhabited a landscape populated by spirits, animal persons, and object-beings. Human observance of rules and rituals was necessary, but not sufficient, to regulate this fluid, animated ecosystem. Magical practices, deeply embedded in relational ontologies, enabled humans to navigate this complex more-than-human world, materializing and reproducing

social networks that made life possible. This paper investigates the material evidence of magical practices in northern Alaska and the islands of the Bering Sea, exploring how humans employed curated objects such as beads, special stones, and animal parts to communicate, protect, and facilitate exchange—actions necessary to daily survival. Ethnographic data from the nineteenth-century contact period informs interpretation of earlier Thule-era material culture recovered archaeologically.

It's Complicated: Additional Insight into the Source(s) for Poverty Point Copper

As the largest and most complex archaic period earthwork site in Eastern North America, and the center of an extensive exchange network covering a wide region of eastern and central North America, Poverty Point has been the subject of considerable research efforts. Among this body of research, Hill and colleagues (2016) used laser ablation–inductively coupled plasma–mass spectrometry to examine the elemental composition of six copper artifacts from Poverty Point, and compare that to the composition of known sources in the Appalachians and Great Lakes. The results suggested an Appalachian source, contrary to previous assumptions that positioned Lake Superior as the expected source of Poverty Point copper. Encouraged by these results, an additional nine Poverty Point copper artifacts were analyzed using the same methods, and this analysis is reported here. Unlike the previous analysis, eight of these nine copper artifacts exhibited compositional profiles consistent with sources in the Lake Superior basin, while only one showed similarities to Appalachian sources. This new analysis adds detail to the complex interactions that structured the Poverty Point exchange system.

Structuring Liminality: Terminal Classic C-shaped Structures in the Puuc Region

This paper discusses excavations between 2006 and 2008 in the Grupo Chanchich at Huntichmul, Yucatán. Huntichmul is one of the larger sites in the eastern Puuc, with a strong Terminal Classic apogee. The Grupo Chanchich is of interest because it is a formal arrangement of C-shaped structures nestled in the center of the civic-ceremonial architectural zone of Huntichmul, adjacent to an Early Puuc Civic Complex. A review of the location, layout, features, and artifact and ecofact assemblage of the Grupo Chanchich, in the context of a comparative analysis of previously recorded Puuc C-shaped structures, provides the basis for a typology of C-shaped structures. Subsequent lidar and ground survey in the eastern Puuc has resulted in the identification of several groups very similar to the Grupo Chanchich. Their shared formal architectural grammar suggests a level of complexity and regional integration amid the breakdown of Classic Maya sociopolitical institutions. This paper also considers the functional significance of C-shaped Structure Groups and discusses our interpretation of these groups as potential marketplaces.

Recovery Efforts at a Second World War Aircraft Crash Site on the Island of Luzon, Republic of the Philippines

The Defense POW/MIA Accounting Agency's (DPAA) mission is to provide the fullest possible accounting of missing service members from past conflicts. More than 81,000 service members remain missing, and almost 50% of those losses are attributed to America's efforts during the Second World War in the Indo-Pacific region. Through close partnership with the DPAA and the National Museum of the Philippines, the Center for Recovery and Identification of the Missing (CRIM) at the University of Illinois, Chicago executes missions

throughout the Philippines to aid in the recovery of this large portion of missing service members. This poster illustrates CRIM's recovery process at a Second World War aircraft crash site in a remote location on the Island of Luzon in the Philippines. We illustrate how the project has evolved from historical research and site location to large-scale excavation and digital landscape modeling. Due to the difficult nature of the site, the CRIM team draws on an arsenal of archaeological methods in the endeavor to provide a full accounting of the II service members who remain missing from this air loss.

Baked In: Remnant Production Gestures from Potters in the Tarascan State

We examine the traces of production gestures that ceramics producers left behind on the surface of 100 sherds excavated at Urichu, a minor administrative center for the Tarascan (P'urépecha) state (1350–1524 CE), in the Lake Pátzcuaro Basin, Michoacán, México. These sherds represent the Early and Late Postclassic time periods at the site, approximately 625 years (AD 900–1000/1100–1525). Direct information on the potters' production gestures during the manufacture of ceramic vessels, following the methodology Valentine Roux, enables us to identify production techniques and evaluate how those might have changed over time. The sherds were visually inspected using a 10× pocket loupe, a 10× magnifying table lamp, and a Dino-Lite Edge microscope. Predominant gestures indicated hand-building, rather than mold or rotational modeling. We conclude that the dominant productive techniques used by these potters remained relatively stable through time, even though the potters experienced significant social and economic changes during the emergence of a state.

The Archaeology and Anthropology of Megafauna Exploitation in the Kalahari Desert of Southern Africa

Southern Africa has some of the world's largest elephant (*Loxodonta africana*) populations. Botswana, Namibia, and Zimbabwe all allow elephant hunting by safari company clients. Wildlife departments in the three countries engage in problem animal control (PAC) to reduce human-elephant conflict (HEC). Local indigenous community members, while not allowed to engage in elephant hunting themselves, receive some benefits in the form of meat from elephants that are killed by safari company clients. Historically, San groups such as the Tshwa of Botswana and Zimbabwe were renowned elephant hunters and trackers. This paper will

examine trends in elephant hunting that have occurred over time in Botswana, Namibia, and Zimbabwe. Particular attention will be paid to the hunting technology employed in this megafaunal exploitation. The archaeological and anthropological implications of these activities are addressed.

Identifying Parrots, Songbirds, and Toucans with New Zooarchaeology by Mass Spectrometry (ZooMS) Markers
Archaeological and historical evidence has demonstrated the sociopolitical, economic, and ritual significance of parrots, songbirds, and toucans in precontact Americas. In Mesoamerica, these birds, along with their plumages and their capabilities to sing and mimic sounds, were highly valued. However, taxonomic identification of avian fauna can be challenging with traditional zooarchaeological methods, especially of non-subsistence species. While development of zooarchaeology by mass spectrometry (ZooMS) enabled accessible taxonomic identification of morphologically similar species and fragmentary remains for mammals and fish, biomarkers for birds, particularly non-subsistence species, remain underdeveloped. We conducted ZooMS analysis on modern reference specimens of parrots, songbirds, and toucans from the Americas, successfully identifying potential biomarkers at order, suborder, family, and subfamily levels. We then use these markers and existing data from several archaeological sites to determine if low abundance avian species represent birds potentially exploited for plumage or song. Our novel ZooMS markers demonstrate how underrepresented American avian taxa can be identified and enable further explorations of nuanced research questions on non-subsistence birds in past societies.

Distinguishing Cervids and Bovids in the Americas Using Zooarchaeology by Mass Spectrometry (ZooMS): Authentication and Development of New Peptide Markers

The Cervidae family has long been central to societies throughout history, whether as venison meat or raw materials, as gifts from long-distance trades, and as trophies in ceremonial acts. However, species-level cervid exploitation and management remain underexplored due to identification difficulties from other sympatric cervids and bovids. Prior research has also focused on Eurasian species instead of the American taxa. To address such challenges, we generated new zooarchaeology by mass spectrometry (ZooMS) peptide markers for six cervid and two bovid species. We present novel biomarkers for one cervid (*Cervus canadensis*) and two bovid species (*Ovis canadensis* and *Antilocapra americana*) from the Americas, and we demonstrate the presence of four new marker regions. Taking both peptide markers and geographical ranges in conjunction, all cervid species can be identified to the species level and are distinguishable from sympatric bovid species. We also identify three distinct patterns in white-tailed deer (*Odocoileus virginianus*) spectra, which we suggest as being representative of white-tailed deer, mislabeled mule/black-tailed deer (*Odocoileus hemionus*), and hybridized deer, respectively. Pending confirmation of peptide sequence variations using liquid chromatography with tandem mass spectrometry (LC-MS/MS), our results reveal that ZooMS enables species-level distinctions in cervids and bovids of the Americas.

Resilience and Empowerment: 100 Years of Archaeological Mothers in the Field

While much has been written recently highlighting pioneering women's contributions to archaeology, there

has not been a systematic study of their roles as mothers and how they navigated their personal lives in a male-dominated field. In this paper I contextualize the role of motherhood in archaeology from an historical perspective, highlighting documents and biographical accounts of British and American women archaeologists from the late nineteenth through the mid-twentieth centuries. Through a close read of dozens of biographies, autobiographies, and memoirs, I explore how women and mothers wrote about and navigated the intersections of their personal and private lives, and how mothering affected their professional work. These mothering accounts are viewed through a matricentric feminist theoretical lens that seeks to contest, challenge, and counter the patriarchal oppressive institution of motherhood and seeks to imagine and implement a maternal identity and practice that is empowering to mothers (after Andrea O-Reilly). These important, overlooked historical accounts from the field serve as a context for current experiences of motherhood and archaeology and can help normalize motherhood in an empowering, meaningful way that can push the field to be more inclusive and supportive of the needs of mothers and parents.

Reevaluating Bone Artifact Collections and Their Histories at the Museum of Northern Arizona

Animal bones and the artifacts manufactured from them have long existed in conflicting archaeological and museum classification systems. Curating institutions once classified them as non-artifactual, or as ecofacts, and only in more recent years have worked animal bones been categorized as artifacts. Regardless of these inconsistencies, many bone artifact assemblages from the American Southwest have been analyzed, although not in earnest, creating inaccurate databases. By reanalyzing bone artifacts from several sites across the Arizona Colorado Plateau and by using comparative collections and braiding methodologies, gaps in their care and identification emerge. From incorrect species identification to poor refitting and lacquering techniques, developing an improved profile of archaeological bone artifacts helps emphasize their significance to Indigenous cultures, update museum databases, and support decolonizing practices by prioritizing the use of collections rather than active excavation. Here, we present several case studies using faunal assemblages from five sites curated at the Museum of Northern Arizona demonstrating the knowledge that can be gained from more descriptive analyses respective of their curatorial histories.

Collections-Based Pedagogy: Where Pasts Meet Futures

There has been a recognized teaching crisis in archaeology for at least 25 years—almost as long as there has been a “curation crisis.” In this reflection, I focus on collections-based university teaching in American archaeology. As in the popular archaeological imaginary, archaeological instruction has long emphasized fieldwork over work with existing collections. How have existing archaeological assemblages been used to teach archaeological thinking, create new knowledge, or convey values of our field? Why haven’t they been/aren’t they used more? What are the pragmatic and ethical implications of pedagogy with collections? This paper considers the past, present, and future of these questions via practitioners’ reflexive critiques of collections-based teaching from the past 25(ish) years. These debates are situated with reference to object-based pedagogy in the fields of museum studies (both critical and operational) and educational theory (especially related to research-based and service-based learning). The university classroom is an articulation

point for archaeology as social practice, a setting where university-educated people—whether they become archaeologists or not—encounter disciplinary views on history, identity, power, and social change. It is also a setting of opportunity, where we reckon collectively with the discipline's pasts to shape its futures.

Touching the Colors of the Past: Ochre Painting Workshops at the Origins Centre Museum, South Africa

Ochre is a colorful thread that meanders through our human story. This iron-rich pigmentous rock became habitually used by *Homo sapiens* during the Late Pleistocene in Africa. It was later used in the creation of rock art paints and is still used around the world in various ways. Ochre painting workshops are offered at Origins Centre Museum in Johannesburg, South Africa, as part of the larger museum experience and outreach program. The interactions offer an immersive, archaeologically inspired activity to bring the past to life and to make the museum content more meaningful; to touch the past and be a part of it. The workshops are created using archaeologically informed content and tools to teach about the past uses of ochre while allowing the attendee to explore the subject from different ways of producing ochre powder, different tools for mixing and painting, to the range of ingredients used as binders and aggregates. The workshops allow the colors of the past to come to life. However, they also create a platform for meaningful, culturally-specific accounts of current ochre applications (from ingestion to sunscreen) that could inform our understanding of past archaeological ochre use practices.

Itom Hiaki Lutu'uria: Validating Archaeology with Our Yaqui Truth

Non-Indigenous anthropology and historiography of the Yaqui people have concentrated on two foci: sixteenth-century resistance to Spanish conquest followed by supposed wholehearted acceptance of Jesuit Catholicism in southern Sonora, and late nineteenth- / early twentieth-century migration from Mexico to the United States to escape Porfirian genocide. This has resulted in a narrative of Yaquis as foreign refugees in the United States that ignores Yaqui traditional understandings and significant historic and archaeological evidence. *Itom Hiaki Lutu'uria, Our Yaqui Truth*, tells of Hiaki ancestors traveling, trading, and living among other communities throughout the Sonoran Desert region and beyond for many centuries before the arrival of European invaders. As part of a Pascua Yaqui Tribe-sponsored effort to expand understanding of Yaqui history, we are documenting oral traditions and reconsidering archaeological data and historic records that illuminate the ancient Yaqui presence across the greater Southwest.

HistoGenes: Integrating Genetic, Archaeological, and Historical Perspectives on Eastern Central Europe of the First Millennium CE

I will present the ERC-sponsored project HistoGenes, an interdisciplinary project that engages archaeologists, geneticists, anthropologists, and historians in a fine-grained analysis of more than 6,000 burials in the Carpathian Basin between 400 and 900 CE in order to understand population changes, mobility, social structures, and cultural practices in this complex region. The presentation will consist of two parts: first, I will present the guiding principles and methods that we are employing and developing in the project, which include a comprehensive analysis of carefully selected individual cemeteries rather than representative sampling; inference of close and distant biological relatedness from genetic data obtained from each individual with preserved skeletal remains and analysis of large networks of identity-by-descent connections; incorporation of both archaeological and genetic data in a joint statistical framework; detailed analysis of grave types, grave goods, spatial organization of burials and isotopic signatures, including Sr, N, and O and anthropological and pathogen analysis of select burials. Second, I will illustrate the effectiveness of this method by presenting a case study drawn from the project conducted by the HistoGenes team from ELTE University in Budapest, the Institute for Advanced Study, University of Vienna, and Max Planck Institute of Evolutionary Anthropology.

Climate and Cultural Responses in Belizean Prehistory

Over the past 25 years, numerous paleoclimate studies have been published across the Maya Lowlands, providing the climatic context for cultural change from Preclassic through modern times. Increasing archaeological studies have followed suit by documenting cultural responses and adaptations to major climatic changes, such as drought and hurricanes. Here, we summarize the paleoclimate records that have been published across Belize, identifying general trends through time and space. We also present new and published archaeological data from multiple areas of Belize in order to gauge the growth, decline, and reorganization of regional populations that may have co-occurred with climatic changes. Together, we aim to assess how climate, particularly drought, may have shaped Belizean prehistory from the Preclassic to colonial periods.

El pasado y presente de la meliponicultura de los mayas yucatecos

La meliponicultura yucateca actual experimenta dos realidades contrastantes: por un lado, enfrenta un escenario crítico que poco tiene que ver con el auge del que gozó en el pasado, y por el por el otro, es objeto de algunos esfuerzos por rescatarlo y preservarlo con el fin de evitar su extinción como práctica productiva y cultural, sobre todo por sus propiedades medicinales. En este trabajo se muestra el papel medular de la meliponicultura en el sistema milpero de los mayas yucatecos y en la economía en la Colonia, revelando así su auge en el pasado. Asimismo, se pretende dar cuenta de las diversas expresiones religiosas que sustentaban la crianza de abejas meliponas durante este período. Como tercer objetivo, se argumenta que, en la actualidad, la meliponicultura ha dejado de ser una práctica común entre los mayas yucatecos, orientándose al tratamiento técnico-productivo para garantizar la producción efectiva de miel para su comercialización y uso medicinal, como un esfuerzo por evitar su desaparición, aunque desvinculada del

trasfondo cultural y simbólico que lo caracterizó en el pasado. Se trata de un estudio etnohistórico que se sustenta en fuentes documentales en maya yucateco y en español, así como en investigación etnográfica.

Incorporating Soil Micromorphology into First American Research: A Tale of Two Sites

Over the past several decades, the application of soil and sediment micromorphology in geoarchaeology has flourished, especially outside of the Americas. Despite widespread acceptance and use of various micromorphological techniques by our European counterparts, a similar fluorescence has yet to occur among geoarchaeologists who are focused on the early archaeological record in the Americas. Here, we demonstrate the utility of soil micromorphology at two Paleoindian sites: Bluefish Caves in the Yukon Territory of Canada and the Genevieve Lykes Duncan (GLD) site in the Chihuahuan Desert of Southwest Texas. The Bluefish Caves site consists of four rockshelters preserving loess and colluvium, and GLD is an open-air site with stratified cultural deposits in alluvium. In addition to being in dissimilar geomorphic and bioclimatic setting, the sites have different paleoclimatic histories. Here, we show how soil micromorphology can address issues of stratigraphic integrity, evaluate site formation processes, and aid in paleoenvironmental reconstructions. We suggest that the future of First American research should consider incorporating micromorphological analyses into geoarchaeological research designs.

Impact Notches on Megafaunal Limb Bones: Hammerstone versus Carnivore Tooth Notch Shapes on Samples of Experimental, Paleontological, and Archaeological Bones

Impact notches on megafaunal limb bones can be diagnostic of marrow extraction and tool blank production behavior by hominins. Notch shape statistics have been applied to impact-fractured megafaunal limb bones from Old World Paleolithic sites to demonstrate hominin technology that begins 2.6 mya in Africa. We compare data from experimental cow femora breakage experiments, first from hammerstone-produced notches, and second from experimental static pressure notches on cow femora to mimic tooth impact. Comparative statistics demonstrate significant differences in notch shape between high-velocity impacts and static pressure. We compare percussion notch shape on cow femora with notches on camel limb bones from a 550–780 ka paleontological site in California and a 350 ka site in Nebraska. These notch shapes match the pressure-produced notch shapes and appear to be representative of tooth pressure notches. These data are then compared to notch shape from experimental hammerstone breakage of elephant femora and notches on archaeological specimens of mammoth limb bone. The notch shapes on elephant and mammoth limb bones compare well with the hammerstone impact shapes on cow bone but not with the notches produced by

pressure. We propose that impact notch shape can identify human versus carnivore-produced notches in the archaeological record.

Shellfishery Management and the Socioecology of Community-Based Sustainability

How do human settlements grow sustainably? What is the capacity of both our institutions and our local ecologies to mediate the pressures of demographic growth? Nowhere are these questions and challenges more critical today than in coastal zones, where populations grow exponentially. For millennia, Indigenous populations across the globe have navigated the complexities and sensitivities of estuarine ecosystems, leaving robust archaeological records of long-term, adaptive histories. This study seeks to understand how the management of public goods, specifically shellfish, and the organization of key social institutions may have changed over time on the Georgia Coast (USA), ca. 500–1,000 years ago, as densely populated towns grew. More specifically, we investigate the growth of one of the largest Ancestral Muskogean towns to have existed along the Atlantic Coast, on Ossabaw Island, and the ways shellfisheries were collectively managed in the face of growing demographic pressures on both local ecologies and social, political, and economic institutions. To do so, we employ a shellfish dataset from 23 sampled household shell middens across a single town to evaluate the kinds of pressures that population growth may have had on shellfish resources and how people organized access and use-rights to these resources across households.

From Micro-histories to Macro-trends: Constructing Time and Temporality in the Lower Illinois Valley

One of Stuart Struever's primary contributions to the archaeology of the Lower Illinois Valley was his work outlining a regional culture-history that sought to organize and lend substantive temporality to critical trends and transformations in human social processes. The empirical foundations of these histories were primarily variability of ceramic styles and technologies across space and time. We build on Struever's contributions by leveraging a Bayesian interpretative framework that formally integrates ceramic data and radiocarbon data at multiple scales. At the macroregional scale, we evaluate the temporal framework of the regional ceramic chronology using extant radiocarbon and ceramic data. With a suite of new AMS dates from the Middle Woodland period Mound House site (11GE7), we explore (1) how regional ceramic chronologies articulate with site-based assemblages and (2) construct a high-resolution internal chronology for the site, which Struever considered to be one of the most important mound centers in the region.

[202]*Spanning the Southern Appalachians and the Archaic–Woodland Transition: Comparing Patterns of Plant Use and Land Use in East Tennessee and Western North Carolina*

The transition from the Late Archaic to the Early Woodland periods in the Southern Appalachians is visible archaeologically by the widespread adoption of pottery, associated with changes in mobility. Here we compare changes in plant use on both sides of the mountains, which suggest that Late Archaic groups in East Tennessee cultivated native crops by 4,000 years ago, while their neighbors in western North Carolina did not pick up this practice until the Early Woodland period, around 3,000 years ago. We explore changes in land use between these two periods in both regions as well tease out nuances in decisions to invest in native crops made by groups in the Ridge and Valley versus the Blue Ridge Mountain region.

Hollenback, Kacy (Southern Methodist University), Christopher Roos (Southern Methodist University), Whitney Goodwin (University of Missouri Research Reactor) and Francesco Berna (Simon Fraser University)**[285]***Finding Fire: Techniques for Identifying Ephemeral Ceramic Firing Features in the Archaeological Record*

Firing is an important step in the life history of ceramic objects, or what some would refer to as a *chaine opératoire*. The firing environment of ceramics can yield insights into changes in fuel choice and abundance, labor estimates, degree of craft specialization, and perhaps even ritual and belief. In contrast with formal firing structures, such as kilns, or large firing features, such as large-scale communal open bonfire firings, the detection of small-scale, open firing features can be difficult. For one, they can easily be confused with hearths. Research presented here explores a possible open firing feature from the northern North American Great Plains at the Elbee Site in the Knife River Indian Villages National Historic Site, North Dakota. Step-wise clay oxidation analysis, experimental archaeology, and microarchaeology (micromorphology, charcoal reflectance, micro-FTIR, SEM) are combined with excavation data and ethnoarchaeological cases to build a model of inference.

Holley, Marsha (University of Alabama) and Frank McMains (Independent Researcher and Photographer)**[24]***Spinning Knowledge: Applications of High-Resolution Photogrammetry and Experimental Archaeology with Lithic Gorgets at Poverty Point WHS*

Photogrammetry, the production of 3D models from composite photographs, presents numerous possibilities in archaeological research and expands the accessibility of the field. We will discuss the potentials of high-resolution photogrammetry as an important resource, not only for research and analysis but also for consultation, collaboration, and accessibility. Focusing on a case study containing 250 lithic gorgets from Poverty Point WHS, we demonstrate the usefulness of high-resolution photogrammetry as an important tool for experimental research and use-wear analysis. This paper delves into the lack of research and interest on ground stone in the Lower Mississippi River Valley and fills important gaps of knowledge pertaining to the potential functions of lithic gorgets in the southeastern United States, particularly within the Poverty Point Culture. The photogrammetric methods demonstrated strengthen research and center accessibility and consultation as key proponents of archaeological research.

Holley-Kline, Sam (University of Maryland)**[166]***Transnational Labor in Maya Archaeology, 1910–1930*

Discussions of knowledge production and working conditions in archaeology increasingly draw scholarly attention to labor, as represented in recent work by Allison Mickel, Paul Everill, and others. For the most part, discussions of labor focus on the interpretative losses spurred by colonial relations of knowledge production and unfair working conditions, especially among locally hired workers and in colonial contexts. However, institutions like the Carnegie Institution of Washington, the Penn Museum, and others depended on the labor of transnational workers. I use recent archival research in the American Philosophical Society and the Carnegie Institution for Science to sketch out the origins, participation, and management of transnational workers in the Maya region. I conclude by arguing that understanding transnational labor in Maya archaeology during the early twentieth century enables a bottom-up understanding of the politics of archaeology in context, especially vis-à-vis race, export economies, and corporate imperialism.

Hollimon, Sandra (Santa Rosa Junior College)**[304]***Women's Leadership and Ritual Specialization in Coast Miwok and Kashia Pomo Cultures*

Employing theoretical and interpretive frameworks influenced by the research of Jeanne E. Arnold, I examine the roles of women in the ritual organizations of these two Native California cultures. I address the antiquity of these ritual systems and the ways that their secret societies promoted regional integration. The ritual and political specialists known as *maien* (Coast Miwok) and *walipo* (Coast Miwok and Kashia Pomo) are the focus of my discussion. I examine the similar beliefs and practices in these ritual systems, and women's leadership in social control in these cultures. I conclude by placing the roles of elite women in the broader context of sociopolitical organization in Coast Miwok and Kashia Pomo cultures.

Holly, Donald (Eastern Illinois University)**[168]***Chair***Holly, Donald (Eastern Illinois University)****[168]***The Archaeology of Forgetting, and the Dorset*

Forgetting, an attendant to culture change, is the stuff of history. When cultural innovations, exchange, and adoption occur, previous customs, knowledge, technology, and other dimensions of culture are lost—they are forgotten. This paper considers the phenomenon of forgetting and its permutations—the passive forgetting that is more or less an accepted outcome of change, the willful forgetting of erasure, and the accidental forgetting that is unintentional and undesired—as a way of understanding culture loss among the Dorset Paleolnuit peoples of the Eastern North American Arctic.

Holman, Lindsay (Jacksonville State University)**[197]***The Value of 3D Models in the Classroom*

This poster demonstrates the pedagogical value of 3D models of ancient artifacts for teaching ancient history. I produced 3D replicas of two examples of Herzog's tesserae, with permission of the museums that hold the original artifacts, to teach classes about Roman material culture, ancient Mediterranean slavery, and Roman freed persons. The 3D models were printed to scale and include the Latin inscriptions present on all four sides of the Roman tessera. I have adapted this exercise for the topic and audience. Nevertheless, when using the 3D printed examples there was ample engagement from students at the high-school level, first-year students in undergraduate surveys, and students in upper-level undergraduate courses. The experiential learning exercise asks students to note their observations, hypothesize who used these artifacts, and what

they were used for. In upper-level surveys, this paved the way for discussions of historiography in a way that engaged more students in the class. Students theorized the function that nineteenth- and twentieth-century ancient historians posited for these artifacts. The 3D examples would accompany the posters allowing viewers to engage with them. The poster will also include 2D images of the original artifacts.

Mobility and Animal Economy in the Early Nuragic Culture: A Case Study from South-Central Sardinia

The origins of Sardinia's Bronze Age Nuragic Culture remain poorly understood. Few early Nuragic sites have been systemically excavated and published, making it difficult to assess the social, political, and economic processes that took place in the Middle Bronze Age and laid the foundations for the culture's Late Bronze Age florescence. The research project ZANBA: ZooArchaeology of the Nuragic Bronze Age is contributing to new understandings of the political economy of the early Nuragic settlement of Sa Conca 'e sa Cresia, located on the Siddi Plateau in the Marmilla region of south-central Sardinia. Combining morphological analysis of the faunal assemblage with carbon, nitrogen, and strontium analysis of domesticated animal remains, ZANBA is assessing hunting, animal husbandry, and patterns of mobility to understand changing economic strategies and their relationship to the growth of power at the site.

The Human Place in Northern Mongolian Food Webs

Mongolian culture has been defined by nomadic pastoralism for nearly 5,000 years. Throughout that time, nomadic pastoralists built a specific niche in their local ecosystems. The Darkhad Depression of Northern Mongolia represents a case where traditional nomadic pastoralist lifestyles are at the forefront of the climate catastrophe despite these practices being sustained for thousands of years. Human-inclusive food web studies are one way that archaeological techniques can be used as tools for resolving modern ecological questions about resilience and sustainability in the face of climate change. Food webs are ecological networks linking consumers and resources within an ecosystem, i.e., who eats whom. When modern food webs are combined with archaeological data, the role of humans within their local ecosystems can be extrapolated back in time to gain deeper understandings of humans' roles in and impacts on their ecosystems. This is especially important when asking questions about how certain practices can be sustained for thousands of years and how those practices entrench humans into specific ecological roles. Here, we plan to present the preliminary results from ethnographic interviews of nomadic pastoralists about their niche in the local ecosystem of the Darkhad Depression and how it has changed throughout their lifetimes.

Hoopes, John (University of Kansas)**[222]***Contributions of Richard G. Cooke, PhD, MBE, to the Study of Isthmo-Colombian Iconography*

Richard Cooke's pioneering studies in zooarchaeology of the Neotropics have redefined the way that archaeologists, art historians, ethnohistorians, and ethnographers utilize data from faunal remains, not only in the reconstruction of past environments, subsistence strategies, and diet, but also in the interpretation of nonhuman animal species in the art and iconography of the Isthmo-Colombian Area. His meticulous and perennially critical work produced detailed evaluations of fish, birds, reptiles, amphibians, mammals, and insects in media ranging from pottery to goldwork, emphasizing Indigenous peoples' powers of empirical observations of the natural world, in so doing contributing to our understanding and valuation of detailed observations of the fauna of prehispanic Panama. With his exhaustive multidisciplinary approach, Cooke consistently raised the bar for archaeology with respect to responsible reporting and documentation of Indigenous zoology in the context of modern ecology and the testing of iconographic interpretations using hard, empirical evidence based on careful scientific excavations.

Hoover, Corey (Louisiana State University)**[198]***Human-Environment Relationships and Spatial Organization in the Nepeña Valley, Ancash Peru*

The built environment is not a simple, haphazardly constructed idea. The human condition and cultural components, combined with environmental factors have undoubtedly influenced the built environment situated within landscapes. Not only are these landscapes environmental, but also social. In addition, these landscapes are not static and are subject to change based on many factors including human to human interactions, human to environment interactions, and environmental processes. This investigation explores an ontological approach to landscape, movement and spatial organization. It uses ethnographic and geospatial approaches to explore interactions between humans, social, and environmental spaces. This study takes place in the Nepeña Valley in Ancash Peru, host to archaeological sites spanning from the Preceramic to Late Horizon. This work will focus on utilizing geographic information systems and spatial analyses in order to discuss human-environment interactions through time and space taking advantage of several techniques such as ecological modeling, historical environmental datasets, and landscape models while considering the ontological approach when constructing datasets, defining significant variables, and interpreting data outputs.

Hoover, Hannah (University of Michigan)**[323]***Networking Households, Building a Nation: Investigating the Social Organization of Eighteenth-Century Yamasee Towns in South Carolina*

The application of social network analysis to archaeological research in the US Southeast has largely focused on interregional mobility and exchange. In this paper, I instead explore how small-scale social networks maintained by households shape larger-scale community structures. For several millennia in the US Southeast, households were the domain of women and the dominant institution for organizing social relations in Indigenous communities. Households were also places where new and old cultural traditions were mediated during the colonial period. In the seventeenth and eighteenth centuries, the volatility of the Indian slave and fur trades led to the emergence of several powerful multiethnic Native nations. This includes the Yamasee, a community of ancestrally diverse people who migrated to and built a nation in the Port Royal Sound of South Carolina at the turn of the eighteenth century. Herein, I compare practices of household ceramic production, focusing on raw clay processing, paste recipes, and macro-stylistic traits, from domestic contexts at six Yamasee towns to map the nodes, ties, and strength of social networks that connected Yamasee households through kinship and social learning. These multiscale networks facilitated this period of Yamasee nation-building, ultimately culminating in 1715 with the Yamasee War against the Carolina colony.

Channel Islands National Park has been steadily increasing tribal involvement into all aspects of archaeological field work through a series of cooperative agreements, funding collaborative survey work, monitoring of vulnerable sites, hands-on treatment and stabilization, and broader efforts related to access and traditional use. This paper shares lessons learned on successfully navigating co-stewardship efforts, and reports on results from the 2023 field season on Santa Cruz and Santa Rosa Islands within Channel Islands National Park, California.

Hopper, Courtney (University of British Columbia) and Camilla Speller (University of British Columbia)**[215]***Paleoproteomic Perspectives on the Subsistence Decisions of Later Stone Age Herders in Namaqualand, South Africa*

Ceramic-bound protein characterization, or paleoproteomics, can provide vital insight into the species-specific dietary decisions preserved in the pottery of past populations. This insight is particularly relevant for understanding the subsistence choices of Later Stone Age (LSA) herders living in the Namaqualand coastal desert of South Africa. In this region the sheer number of morphologically similar bovid species often found at archaeological sites, when fragmentary, are difficult to identify to species. However, a rich and underutilized archaeological resource exists in abundance: ceramic sherds that preserve the biomolecular traces of ancient meals cooked in pottery. Although organic residue analysis (ORA) of ceramic residues is a powerful tool it can only characterize the preserved lipids of past meals into broad categories (dairy, ruminant, non-ruminant), lacking the taxonomic specificity often needed when both wild and domesticated ruminants of a similar size are present. To test the feasibility of paleoproteomic characterization of ancient pottery from Namaqualand, ~50 potsherds previously characterized through ORA were selected from four archaeological sites to investigate protein preservation. Proteomic analyses of ceramics will be integrated with previous ORA and faunal composition data to examine how LSA herders living in Namaqualand incorporated domesticated and other wild ruminants into their diet.

Hopt, Justin (Oregon Department of Fish and Wildlife) and Daniel Pettit (Oregon Department of Fish and Wildlife)**[269]***Cultural Resource Management of Denman Wildlife Area, Southwestern Oregon*

The Oregon Department of Fish and Wildlife (ODFW) currently manages the 1,858 acre Denman Wildlife Area, located within the Rogue Valley of southwestern Oregon. The Denman Wildlife Area contains a dynamic fluvial and cultural history that makes archaeological management and habitat restoration of the wildlife area challenging. Included within the boundaries of the wildlife area is the confluence of the Rogue River and Little Butte Creek. The Rogue River has shifted course at least four times between 1855 and 1983. Additionally, the confluence of the Rogue River and Little Butte Creek is the reported location of several precontact village/camp sites as well as the described location of the Lupton Massacre, a devastating event that started the Rogue River War of 1855–1856. Following all of this, the area was then utilized for a World War II training encampment known as Camp White. None of this history has been well documented archaeologically. This study presents the results of background research and initial field work on the Denman Wildlife Area and presents recommendations for how best to manage future work, both archaeological and habitat restoration, on the wildlife area.

Hopwood, David (Vancouver Island University) and Emily Munroe (Vancouver Island University)**[68]***Life within Death: Contextualizing Burial Practice at Kenan Tepe, Turkey, from the Ubaid Period to the Early Bronze Age*

Kenan Tepe, Turkey, is a multi-period archaeological site that was occupied during the Ubaid period (5000–4000 BCE), the Late Chalcolithic (3360–3020 BCE), and early Bronze Age (3000–2800 BCE) (Parker and Cobb 2012). During each of these periods residents of Kenan Tepe conducted distinct burial practices. These burials included the remains of individuals ranging from in utero infants to older aged adults and represent multiple burial types and patterns. The excavated burials provide insights into individual health and social position; and reflect deeply embedding meanings in the burial practice. However, the practice of burial does not exist outside the larger social context. Shifting settlement patterns, socioeconomic systems and ideologies impact the practice of burial. An examination of the burial practices from the Ubaid to the Early Bronze at Kenan Tepe provides a window into a changing society and helps to situate the site in a larger regional and temporal context.

Why Bappir Matters: Using Experimental Archaeology of Beer in the Classroom

As a unique category of socially charged material culture, beer has origins stretching back to people's first obsession with wild grain. The deep time prehistory of beer coupled with the unique role of its psychoactive properties makes it a compelling bridge between academic archaeology and the public, allowing for approachable discussions of the ancient past. Experimental archaeology allows us to bring beer into the classroom in a significant (not necessarily tipsy) way. In a recent upper-level Material Culture Analysis course, I challenged students to create modern homebrew recipes based on the famous Hymn to Ninkasi, specifically involving the creation of *bappir*, or beer bread. This module includes experiments with malting grain, interpreting ancient texts for operational chain clues, using organic residue analysis and floral evidence to predict ingredients and flavor profiles, and of course brewing based on the students' research. Through the hands-on experimentation students gain a better sense of what this beverage was in an ancient Mesopotamian context, how to use operational chains to understand a form of technology and devise research strategies, as well as perhaps drinking beer like a Sumerian . . . through a straw.

Pragmatism and Peacebuilding: Building an Empirically Honest, Ethically Engaged Archaeology

Building on literature from peace and conflict studies as well as social justice movements, I consider the role and responsibilities of archaeologists as we grapple not only with our positionality in the present, including our roles as citizens and scholars, but the manner in which we mobilize the past in aid of the future. I address recent critiques of engaged archaeologies and argue for the central importance of both empirical honesty and an underpinning in pragmatic philosophy as we frame our explorations of the past for purposes of social justice. I draw specifically from my work in embedding archaeology and heritage with conflict transformation in Northern Ireland to argue for a pragmatic approach that engages archaeological evidence as an active component of peacebuilding dialogue that is challenging and constructive rather than uncritically conciliatory.

Pragmatism, in these circumstances, is the most effective paradigm for a future-oriented, epistemologically honest, and ethically grounded archaeology.

Understanding Ancient Maya Expedient Lithic Technology: Raw Material, Production, and Use

Expedient flaked stone tools, generally defined as those which are produced as needed, without standardization, and with little to no investment, are less often examined in the archaeological record than formal stone tools, those which require more skill and effort to produce following a prescribed method or template. This is certainly the case in sedentary societies, where formal tools and expedient (or informal) tools coexisted and were used differentially in a variety of situations. Throughout the Maya area, expedient tools are used both in contexts of resource shortages and in resource-rich contexts. Such contrasts are illustrated in the use of both local (chert) and nonlocal (obsidian) resources. We provide case studies from the eastern Maya Lowlands which illustrate the variable contexts in which expedient technology was utilized both to conserve resources and in those areas in which conservative strategies were not necessary. As such, we argue that previous discussions of the connection between sedentism and expedient technology require more nuance, and that expedient technology as a strategy has many causes. In the Maya area, studies of expedient lithic technologies can provide information on access to raw materials and the economic networks through which people acquired their tool resources.

Conversion on the Periphery: Bioarchaeology of Religious Identities in Early Medieval Bohemia

The ninth and tenth centuries in Central Europe have historically been characterized by political consolidations around Christian leadership. As Christianity gained influence in the region, conversion altered far more than religious beliefs: political landscapes, material culture, and bodies were also transformed. The

skeletal remains and mortuary contexts of 260 individuals from the early medieval Akropole and Kanín cemeteries at Libice nad Cidlinou in what is now Czechia are compared to examine how social status and engagement with Christianity influenced daily life as well as mortuary practices for people in central Bohemia. To do so, osteological data is integrated with archaeological and textual sources. Results suggest that individuals buried at the more peripheral Kanín cemetery were more likely to participate in alternative, pre-Christian mortuary traditions, while those buried in the centralized, elite Akropole burial space were more likely to follow Christian practices and prescriptions in daily life as well as in death. This study highlights the performative potential of conversion for particular social strata as well as the rich syncretism shaping expressions of early Christianity in Central Europe.

Early Ceramics in Charleston's Tidal Region

In June 2023, archaeologists and volunteers from the Drayton Hall Preservation Trust conducted a two-day limited data recovery at a private residence along Charleston's historic Battery. The lot, impacted by both Civil War bombardment and the 1886 earthquake, holds significance as the current house was built by a Drayton descendant in the 1880s. Located beyond the walled city, the East Battery area was assumed to be largely undeveloped until the nineteenth century due to tidal flooding. However, the discovery of significant ceramics dating to the seventeenth and early eighteenth centuries may shed light on potential early homesteads in this tidal region and raises questions about early trade routes and goods that may have played a role during the early settlement of Charleston.

Historical Archaeology in Belize: Maya Continuity amid Colonial Landscapes

We can trace the roots of historical archaeology in Belize to 1974, when David Pendergast launched a project at a site known locally as Indian Church, not surprisingly owing to the remains there of an early church. Today, the site is known as Lamanai. Identification of Spanish colonial sites in Belize such as Lamanai and Tipu began with J. Eric S. Thompson's investigation of Spanish documents. In 1978, guided by Thompson's research, Grant Jones and David Pendergast visited what excavations in the 1980s confirmed to be Tipu. Tipu and Lamanai represent the first two excavations of historical Maya sites in the southern Maya lowlands. Ethnohistorical research by Grant Jones, Angel Cal, and Nigel Bolland, among others, has expanded the scope of "traditional" Maya archaeology to include historical sites. Archaeologists in Belize have investigated early historical sites as well as more recent villages, camps, and towns representing Belize's diverse colonial period

cultures including the British, Creole, San Pedro Maya, and even ex-patriated Confederates. In this paper, we summarize the development of historical archaeology in Belize, which has revealed new data about the continuity of Maya occupation amid the changing cultural landscape of the colonial period.

Can Chullpas Provide a Better Understanding of Territorial Organization during the Late Intermediate Period? New Perspectives through Pacajes and Lupacas Areas and Their Influences in the South-Central Andes

The construction of chullpas in the south-central Andes, and more particularly in the Lake Titicaca basin, is certainly one of the major characteristics of the Late Intermediate period (1000–1450 CE). Building on prior research and extensive surveys coupled with spatial analysis, this presentation aims to shed new light on the role of chullpas in territorial organization and identity construction during a period marked by political fragmentation. By examining the Lupacas and Pacajes territories, situated along the southern and western shores of Lake Titicaca, we illustrate the significance of these structures within the core territories of chiefdoms, as well as in their broader spheres of influence, such as the western valleys of Tacna. Our work allows us to reconsider the many forms that these structures can assume, but also to better understand the political changes that seem to occur between the Late Intermediate period and the Late Horizon (1450–1532 CE) in the peripheral valleys, illustrating the alliances and influences that occurred at the arrival of the Incas in the region.

Picuris Ethnogeography

This paper explores the deep history of Picuris Pueblo's commitment to its surrounding landscape through

traditional knowledge of the meanings inscribed therein. We focus on both natural places (springs, mountain peaks, clay deposits) and cultural constructions (rock art, medicine boulders, race tracks, and other “shrine” features), along with the stories that surround them. Our primary goal is archival: at the request of the tribe, to create a written record of significant places, place-names, and place-based traditions for future community members, a task that feels pressing as key elders with traditional knowledge have recently passed. But our research is simultaneously an attempt at critical mapping and is consequently mobilized by land claims and water dispute issues. From the tribe’s perspective, our work is not uncovering any new evidence; rather it reaffirms what the tribe already knows. Framed in a political manner, however, such ethnogeographical work—through the documentation of place-names and archaeological evidence of space/place practices—supports Picuris’s political assertion of its sovereignty over the watershed. Finally, our work offers another important example of placemaking in the American Southwest, examining how places become saturated with meaning.

Using AI Tools in ArcGIS to Identify Mining Features in Northern Georgia

During the course of a cultural resources survey in Bartow County, Georgia, for the Georgia Department of Transportation, several features related to past mining activities were identified on the surface. These features, consisting of mining cuts and collapsed tunnels, could be identified from lidar available from the USGS. This project takes these ground-truthed mining features and evaluates various AI-enhanced methods of image and point data classification within ESRI’s ArcGIS program for identifying these types of features. The goal is to arrive at a method that will allow the classification of the mining landscape of northern Georgia by identifying likely extant features. The resulting dataset will aid in the planning of cultural resource management activities by identifying areas with a high likelihood of mining related features as well as creating a process that can be applied to other places and landscapes with similar records of mining.

Maya Dental Modifications: Insights from Ka’kabish, Belize

This research investigated the intentionally modified dentition found within chultuns at the Maya site of Ka’kabish, Belize. The site has a history spanning from the Middle Formative (800–600 BC) to the Postclassic (AD 900–1500) periods. The primary aim of this research was to closely examine the modified dentition, evaluate any dental pathologies present, and contextualize the sample in relation to the mortuary context from which the remains were excavated. In conducting this research, we worked to gain a deeper understanding of the potential sociocultural and biocultural factors that may have influenced the observed trends in dental modification seen at Ka’kabish. Further, this research contributes to growing body of literature that seeks to determine whether dental modification was a practice confined to specific individuals of particular social class or status. Additionally, it seeks to ascertain whether dental modification had any impact on overall dental health and whether the observed trends in dental modification at Ka’kabish differ from those at other sites, locally, regionally, and globally. Through the execution of this research, a more comprehensive understanding of how sociocultural and biocultural elements shaped dental modification trends and why populations engaged in these practices at Ka’kabish may be achieved.

English Colonists and Complex Foodways in an Early Northern “New England” Frontier

The Great Bay Archaeological Survey (GBAS) explores one of the most unique estuaries along the Atlantic Ocean and a place that formed an important early frontier in seventeenth-century colonial “New England.” GBAS’s research is revealing unexpected dynamism in the lived experiences of early colonialism for both

settler colonists and regional Indigenous communities (Pennacook Abenaki peoples). We present a working analysis of a faunal assemblage from one early colonial English site to demonstrate how critical understanding foodways is to moving beyond simplistic narratives of the colonial experience in “New England.” English-introduced domestic animals, most abundantly sheep, constitute much of the assemblage and the element distribution indicates these were butchered and consumed on-site. Sheep are primarily being killed when they are juveniles, which may indicate English colonial food preferences. However, when this evidence is considered alongside the fact that the assemblage has a notable amount of wild fauna (or in Abenaki, *awaasak*), an important alternate potential interpretation of this pattern arises—food stress led English colonists to adapt and engage with and learn from regional Indigenous peoples for their survival. This interpretation resonates with trends seen in the floral remains from the site as well as other artifacts.

Subsistence Strategies across the East Eurasian Steppes: Exploring Connections between Diet and Dental Pathology

Within the vast Eurasian steppes, early populations utilized subsistence strategies that were uniquely developed in response to local environmental settings, and recent bioarchaeological work has underscored this connection. This study explores the relationship between dietary intake and dental pathology, focusing on dental calculus, antemortem tooth loss, and carious lesions. The formation and severity of dental calculus, while associated with factors such as oral health and genetic predisposition, has also been potentially linked to diets high in protein, and can preclude caries formation. However, the nature of this connection and how it manifests in multi-resource pastoralist populations, as compared to hunter-gatherers or agriculturalists, has received less attention. To address this, we have compared populations from Mongolia, southern Siberia, and Inner Mongolia, from archaeological contexts spanning from the Bronze Age to the medieval (Mongol) period. The findings demonstrate the interconnected biological processes of these conditions in relation to dietary intake and also help establish a baseline for comparing dental pathology rates and oral health among multi-resource pastoralist communities across time and place. To this end, the results provide a measure for characterizing the rates of these dental conditions in relation to variable subsistence strategies in the steppe region.

Mountains, Obsidian, and Power in Classic Mesoamerica

Lithic analysis at various sites in the Maya area, such as Plan de las Mesas, Kaminaljuyu, Copan, and Piedras Negras reveal regional differences between obsidian tool production, distribution, and consumption. Some patterns in obsidian economies were shared between these sites, as well as others more distantly located such as Los Horcones, but all of them seem to have a special relationship with Central Mexico. Some shared cultural characteristics include sculptural and architectural traditions, as well as site placement vis-à-vis sacred mountains and obsidian sources. I revisit Robert Santley's ideas about Teotihuacan expansion and the control of obsidian sources but with the goal of revising them based on recent archaeological data from the previously mentioned sites. The hypothesis is that Teotihuacanos in foreign lands, or local people influenced

by Central Mexican culture and religion, established hilltop sites for ideological, economic, and strategic reasons, as a suite of techniques of governance for political expansion. An important factor was either real or imagined control over obsidian blade cores and their distribution elsewhere in Mesoamerica. At some sites like Kaminaljuyu, this project failed in a short time, but at Copan, these techniques succeeded well into the Late Classic, long after Teotihuacan had collapsed.

Using ArchaMap to Help Datasets Talk to Each Other: A Case Study from Southwest Archaeology

The Center for Archaeology and Society Repository (CASR) at Arizona State University holds collections for thousands of archaeological sites. These collections are an important resource for the archaeological community, yet accessing them is difficult due to a lack of awareness of which sites are available. An exemplar of public access to data is the CyberSW project. Many sites in the CASR collection are included in CyberSW, yet it is challenging to identify corresponding sites. Here we show how ArchaMap can help solve this and related problems. ArchaMap is part of the CatMapper family of tools designed to aid in integrating datasets, documenting the integration, and making metadata about new merged datasets easily accessible. Using ArchaMap, our team has linked thousands of sites in the CASR collections and CyberSW database, permitting new synthetic analyses. A user can access the application, use the search engine to find a site, and identify whether connections exist to CyberSW, CASR, or other entities, datasets or even publications. More generally, ArchaMap can be used to reconcile and merge many categories of archaeological data from any region in the world and allows users to find the data and make connections across datasets.

The Decline of Darts in Late Formative Taraco (Southern Lake Titicaca) and Its Implications for the Rise of Tiwanaku Hegemony

In this paper, we argue that both arrows and darts were used in the Taraco Peninsula (south Lake Titicaca) until the end of the Middle Formative period (around 250 BC), after which arrow technology began to predominate. A statistical, morphological, and chronological analysis of 187 projectile points recovered by the Taraco Archaeological Project (TAP) shows that large projectile points associated with dart technology (5C) seemed to have disappeared before the end of the Middle Formative (250 BC), while smaller points with concave bases (5D) continued into the Late Formative through Middle Horizon periods (250 BC–AD 1050). Furthermore, we show that narrow-stemmed triangular points (4E) first appeared in the Late Formative I period (250 BC–AD 300), rather than during the Middle Horizon period as previously thought. We propose that the small concave-base projectile point (5D) was primarily used as an arrow beginning in the Late Formative period, and that the narrow-stemmed triangular projectile point (4E) was exclusively used as an

arrow. Furthermore, our analysis suggests that the appearance of morphological innovations in projectile points during the Middle and Late Formative periods may signal identity formation activities related to the rise of Tiwanaku hegemony rather than hunting activities.

A Big Look at Small Tools: An Analysis of the Emergence and Dispersal of Microliths in Eurasia

The appearance of microliths and their rapid spread throughout Eurasia is one of the major developments in the evolution of Paleolithic technologies, since microliths and microblades, as part of complex modular tool packages, became the dominant technology in the Pleistocene (around 25,000 years ago) and persisted into the Holocene. Microliths are small stone blades that measure less than 50 mm in length. Typically assumed to have been hafted to projectile weapons, microliths have been seen as an important innovation because they were portable, multipurpose, and standardized tools. Despite the importance of microliths in Paleolithic record, there has been no large-scale, comparative analysis of the contexts of the emergence of these miniaturized lithics and, as such, we lack a broader understanding of the drivers of the emergence and spread of these microlithic technologies. In this study, I created a database of microlith site dates and used contemporary spatial and statistical analyses to investigate the environmental and technological contexts of the emergence and dispersal of microliths across Eurasia. This allows researchers to better understand cultural innovation and diffusion in the prehistoric past and how technological innovations facilitate, reflect, and impact human interactions with each other and their environments.

More Than a Notion: Archaeology's Issue with Using Social Theory to Comfortably Perceive the Lives of Marginalized Peoples

In archaeology, we like to theorize about those who lived at the margins of society, the systematically oppressed, the class struggle of those who existed at the bottom and the “creative” ways in which they “persisted,” “resisted,” and survived. However, despite this seemingly progressive effort to understand marginalized peoples in the past, the discipline continues to have a problem with “othering” the systematically oppressed by merely fitting the violence they experienced and the “choices” they made into trendy sociological theories. As a first-generation, mixed Xicana of Indigenous Mexican descent from the hood who

escaped the school-to-prison pipeline, I found this mirage of understanding in archaeology especially deceiving; I realized that my peers and colleagues who liked to perceive the lives of people from disadvantaged backgrounds often forget that we still exist and become uncomfortable when we assert our existence and/or relay information about our lived experiences. This paper discusses my personal experience navigating higher education and career making in academic archaeology and the ways in which I have observed that the discipline continues to chronically theorize the lives of BIPOC from impoverished and marginalized backgrounds, despite claiming to want to understand the complexities of many of our ancestral pasts.

Buy One, Get One: The Legal and Sociocultural Context of “Gifting” within the Australian Human Remains Trade

Today’s online human remains trade—how it operates, where remains come from, and how algorithmic amplification allows for complex networks to form between buyers, sellers, and middlemen—has seen an increasing amount of research and media attention. Underpinning this interest is the growing realization that poorly regulated trafficking inflicts genuine psychological harm on the living (whether relatives of body donors or descendant communities), as well as accrues losses to the archaeological record or risks the jeopardization of crime scenes. Much of this work has focused on the Global North. Within the Global South, Australia is recognized as an emerging market country for many categories of cultural heritage, including human remains, despite relatively comprehensive legislation. This paper reviews the function and socio-legal context of a specific seller’s tactic used to bypass algorithmic detection and circumvent legislation, so far seen only among Australian human remains collectors: photographs of human remains are offered for sale and the remains themselves are included as a “gift.” Better understanding how this tactic is used and propagated through online communities is necessary to not only advocate for the closing of this loophole, but also to identify similar loopholes used by collector networks elsewhere.

Nonlocal White Ware in Montezuma Canyon and Its Implications

In Montezuma Canyon, southeastern Utah, San Juan Redware is the dominant decorated ceramic type in ceramic assemblages dating to the late 800s and 900s (AD). In ceramic assemblages from the site of Nancy Patterson Village (42SA21 I0) that date to this time period, 26% of the sherds are red ware, and several lines of evidence suggest red ware was made at or near the site. White ware is much less common, and it is not clear how much of it was locally produced. Recent analyses have identified white ware sherds from the Chuska Chaco regions in AD 900s assemblages from Nancy Patterson Village and other Montezuma Canyon sites, but no systematic effort has been made to identify trade wares in any of these assemblages. This poster will report on temper analysis of white ware sherds in AD 800–900s assemblages from several sites in Montezuma Canyon to document the prevalence of Chuska and Cibola White Ware in Montezuma Canyon. It will also explore the implications of these ceramic types for understanding connections between southeastern Utah and the Chaco region.

A Plethora of Points at the Haynie Site

The Haynie site (5MT1905) contains two of four Chaco-style great houses that make up the Lakeview Community in southwestern Colorado. Recent excavations by Crow Canyon Archaeological Center at the Haynie site have produced a large quantity of projectile points. The proportions of projectile points compared to pottery sherds can help explore the abundance of these tools when compared to other sites in the region. We examine the latest data from ongoing excavations at the Haynie site to understand this pattern.

Maritime Lifeways and Technological Choices of the Englefield Culture (7000–5600 cal BP) in Southern Patagonia: Insights from Obsidian and Bone Tool Analysis

The Otway Sea and Strait of Magellan region in Southern Patagonia witnessed the emergence of maritime lifeways approximately 7,000 to 5,600 years ago, leading to the establishment of the “Englefield Culture.” This culture is characterized by its bone and lithic technology, notably the use of green obsidian. Our research is dedicated to reconstructing the toolkits employed by the Englefield Culture through use-wear analysis, with a focus on three sites from Englefield Island: Bahia Colorada 1, Pizzulic 2, and Englefield 1. Our findings uncover the existence of distinct toolkits tailored for various activities within this culture. These encompass specialized implements for hunting purposes, including bone harpoons, spears, and obsidian weapon heads. Notably, woodworking tools such as bifacial knives and flake tools reveal compelling evidence of reactivation and persistent reuse. Another category of tools was dedicated to processing soft and medium elastic animal materials. Finally, among the macrolithic tools, sharpeners and pebbles with traces of bone work stand out. Our research emphasizes the remarkable standardization and technical coherence evident within these toolkits, particularly discernible in the hunting and woodworking implements. This cohesion likely played a pivotal role in sustaining their maritime way of life and navigation practices.

Tame, Feral, and Pest Species: Plants and Animals at the Edges of Domestication and Human Control

We love to think that we are firmly in charge of our domestic spaces, and we love sharply delineated definitions. The designations of “wild” and “domestic” species speak to this; we define domestic species as those who have changed irrevocably under the reproductive control of humans. However, there are still species who exist in the spaces in-between: “tamed” wild animals living in human habitats and in cooperation with humans, feral plants and animals who are domesticates breaking away from human control, and pest species who live within and because of humans, but are unwelcome. Genetically and morphologically, however, pest species may be undergoing or have undergone genetic changes that we usually associate with domestic species. Likewise, feral animals often display behaviors and traits that we believe to have been “bred out” of them. This study the narratives around domestic species as well as domestication studies and studies of human- animal relationships to explore how the beings who live in the gray areas between wild and

domestic may reveal biases within domestication theories. Examining the life histories, paleopathology, and mobility of these species may have implications for how we interpret and approach their presence in assemblages and in human history.

Leadership on the Battlefield: Lessons Learned from Eight Years of Systematic Metal Detection on Conflict Sites
American Veterans Archaeological Recovery (AVAR), an American 501c3 nonprofit that uses archaeological fieldwork to help military veterans transition into new lives and careers, has been participating in and directing metal detection surveys on conflict sites since the program's inception in 2016. This was done both to increase engagement through providing veterans with an opportunity to work in an environment they were uniquely qualified to understand, and because the physical and mental impact of metal detection survey was determined to meet AVAR's goal of assisting veterans. This presentation will provide comparative mental and physical health data demonstrating the benefits of metal detection survey, emphasizing the unique leadership and management tools AVAR has developed in order to promote morale and efficiency in veteran field crews undertaking this type of work.

Terrace Construction and Use across Five Centuries at Ollantaytambo, Peru

Archaeologists are increasingly examining remains from the past, including durable landscape features such as terraces, earthen mounds, and seemingly "abandoned" sites, in terms that query not just their initial construction, but also ongoing use and reoccupation. In this paper, I present new research into the origins of dramatic terrace complexes built around the town of Ollantaytambo in Peru's Cusco region. Excavation data clarify the history of the construction of those fields: unlike similar terrace complexes in Peru and beyond, Ollantaytambo's fields were not built over an extended period. Rather, Ollantaytambo's fields were constructed during a relatively brief flurry of activity sponsored by the Inka state and functioned as a physical manifestation of Inka power. I conclude the paper by considering how the original values ascribed to those terraces by the Inka changed through use across subsequent centuries, including under Spanish colonial rule. While Ollantaytambo's fields were built by an imperial power, local farmers have subsequently used those fields to resist and subvert attempts at top-down control. I draw on this case study to suggest that Ollantaytambo's fields, and other similar earthen constructions, can be put to new purposes and ascribed new values depending on social context.

[88]

Our World: Archaeologists and Zuni Knowledge Keepers Create a Shared Narrative of Life in the Mogollon Highlands

The Mogollon Highlands of west-central New Mexico, despite a flurry of archaeological activity in the mid-twentieth century, have long been treated by archaeologists as a cultural backwater of the American Southwest. Boundary zone, frontier, and crossroads are labels that most frequently are applied. However, these labels are incorrect and a product of deep-seated assumptions by archaeologists, as well as a lack of accessible research. Since 2015, the Denver Museum of Nature & Science has conducted pedestrian surveys around the town of Reserve, New Mexico, that demonstrate the incredibly rich history of the Mogollon Highlands. Data from these surveys is presented and interpreted here in collaboration with members of the Zuni Cultural Resource Assessment Team.

Composite Bone Black Kunwarddebim at Madjedbebe, the Alligator Rivers Regions, Northern Australia

Unusually saturated black pigment in the Kunwarddebim (rock art) at the northeastern end of the Madjedbebe rockshelter prompted an in situ analytic program of Raman and portable X-ray fluorescence spectrometry. Here described results suggest a complex paint recipe for this black paint: a mix of bone black, magnetite rich minerals, and some organic components. We discuss this composite paint recipe in the broader context of the Mirrar Traditional Owners' rich record of continuous occupation that stretches some 65,000 years back in time.

Consulting on Reburial Efforts

The Bureau of Reclamation is actively working within the foundations of its authorities to move beyond just regulatory compliance of the Native American Graves Protection and Repatriation Act (NAGPRA) to better support needs identified by Native American tribes, such as reburial of their ancestors. Published over 20 years ago, 43 CFR part 423 Public Conduct on Bureau of Reclamation Facilities, Lands, and Waterbodies, prohibits all human burials on Reclamation land. An effort started in 2020 to revise and update sections in 43 CFR part 423 afforded Reclamation the opportunity to improve the Memorials section §423.28 related to reburials, with a focus on consultation with Tribes. The proposed rule would address the circumstances of reburials for Tribal cultures and communities, especially where human remains of Native American ancestors are inadvertently discovered or were previously collected.

Hurst, Stance [86] see Speer, Charles

Hurst, Winston (Bohunk Inc.) and Fred Nials**[96]***Shaping the World and Running for Corn: Monumental Agriritual Landscapes in the Dry-Farm Belt of the Ancient Puebloan, Northern San Juan*

Newly available USGS lidar imagery has confirmed the reported existence, and greatly expanded the known extent, of ancient ritual and agricultural earthworks in the northern San Juan region. These findings are transforming our understanding of early Puebloan landscape manipulation, with large implications for Puebloan community organization and food production technology. The landscape-scale earthworks include (1) extended bermed swales or “roads” extending overland between localities; (2) looping road-like features resembling racetracks; and (3) vast, agricultural field systems visible as sprawling landscapes rippled by sets of parallel low ridges separated by broad swales. The roads and loops frequently occur in association with recognized great houses (community centers) and pass through the berm-swale field landscapes. Early stage investigations suggest a strong association with great houses and communities of the Chaco era (AD 1000s–1100s). We argue that the association between the bermed archaeological fields and roads reflects an ancient Puebloan ritual connection between running and agricultural productivity and discuss them as complementary features in unitary “agriritual” landscapes. This paper focuses on the roads as ritual landscape features. A separate paper by Nials and Hurst details and discusses the ridge-swale agricultural systems.

Huskey, Delphi (East Carolina University), Megan Perry (East Carolina University) and Robert Tykot (University of South Florida)**[68]***The Relationship between Isotopic Evidence of Childhood Diet and Childhood Rickets in a Nineteenth-Century Jordanian Bedouin Population*

The site of Tell Hisban offers a unique perspective on the history of metabolic disease among nineteenth-century Middle Eastern Bedouin populations. Compared to regional samples from the same period, Hisban has a high rate of childhood metabolic disease, including rickets. Many infants at the site died with active rickets, and analysis of interglobular dentin (IGD) in adult dentition identified adult survivors of childhood rickets. Vitamin D deficiency is typically linked to insufficient UVB radiation, while cultural or other biological risk factors can play important roles, particularly in an environment with adequate levels of sunlight. Here, we use stable isotope analysis ($\delta^{13}\text{C}$ and $\delta^{15}\text{N}$) of incremental dentin samples from three adults with evidence of childhood rickets and three without to identify a relationship between childhood diet and weaning patterns and vitamin D deficiency. The isotopic evidence suggests any variation in diet and weaning practices was not linked to rickets. Understanding the weaning history and early childhood diet of adults who survived rickets in infancy can illuminate potential risk factors and provide comparative material for eventual isotopic analysis of individuals who did not survive rickets in infancy.

Hussey, R. (National Park Service)**[312]***The Cove Conundrum: Managing Culture, Nature, and Tourism in Cades Cove, Tennessee*

Cades Cove, located within the Great Smoky Mountains National Park, Tennessee, is the stage of competing interests related to contested historical narratives, natural landscapes, and increased tourism demands. Originally within the Cherokee ancestral homeland, the Cove witnessed Euro-American early nineteenth-century settlement, which reshaped the area. The Cove was transformed again in the early twentieth century through federal intervention that converted the Appalachian lived landscape into a romantic representation of nineteenth-century rustic mountain culture that endures today. In this talk, I discuss the ongoing cultural resource management initiatives of Cades Cove as its constructed landscape is reshaped by archaeological excavations, ecological restoration, tourism, and the voices of Indigenous and Euro-American descendant communities. On one hand, we contend with infrastructural changes to support the five million annual visitors and possibly restore a portion of the Cove to its pre-European state. On the other hand, current

archaeological efforts have the potential to elevate Native American cultural representation in the area, while current collaborations with descendant groups work to enhance and correct cultural representation and safeguard historic structures and cemeteries. Overall, this talk provides insight into the realities of cultural resource management within the federal service while highlighting initiatives to help resolve these contentions.

The Matlatzinca-Aztec City of Tlacotepec: Results of the Proyecto Arqueológico Tlacotepec/Tlacotepec Archaeological Project

In 1565, the Matlatzinca Pablo Ocelotl and the Nahua Alonso Gonzales appeared before a Spanish judge in lawsuit over lands in the community of Tlacotepec, in the Toluca Valley of Central Mexico. While describing the rise and fall of their families under Matlatzinca, Aztec, and Spanish rule, both swore their families were longtime residents of community. In 2023, the Proyecto Arqueológico Tlacotepec/Tlacotepec Archaeological Project conducted an intensive survey of the Postclassic Matlatzinca-Aztec site of Tlacotepec, focusing on evaluating the timing and degree of Triple Alliance control in an intermediate province of the empire. This poster presents preliminary survey results of the chronological and cultural affiliations of the site, its spatial extent, and intrasite patterning. The site has been occupied from Early Postclassic through the present, and the survey found materials associated with the Early Postclassic through early Spanish colonial periods. The material at the site is predominately Matlatzinca, with evidence for interaction with the Basin of Mexico limited to the end of the Late Postclassic, adding an additional page to Pablo and Alonso's story.

Archaeological Research Trends in Nunatsiavut

Archaeological research in Nunatsiavut has benefited from past large-scale survey, testing, and excavation efforts that have served as the foundational bodies of work and knowledge on which subsequent projects have been built. These wide-ranging projects opened up innumerable new avenues of inquiry and for decades served as the framework that subsequent research expanded from or refined. However, recent trends in archaeological research in Nunatsiavut are cause for concern, especially in light of increasing development, visitor activities, and climate change pressures. We explore the possible causes for this shift and highlight critical areas of research in a plea for renewed interest in fieldwork in the region.

Taxonomy and Taphonomy of Beringian Flora and Fauna from the Southern Yukon-Alaska Borderlands with Reference to the Little John Site (KdVo-6), Yukon, Canada

The Southern Yukon-Alaska Borderlands (SY-AB) is geographically coincident with the southeastern extent of Pleistocene Beringia. This unglaciated land mass formed a unique refugium along the northwestern margins

of the Cordilleran ice cap to the east and south and the Brooks Range glacial mass to the north. This poster summarizes the currently known range of late Pleistocene flora and fauna within the SY-AB as revealed by lake core sediments, accidental recovery during the course of Alaska highway construction, and controlled excavations at the Little John site (KdVo-6), Yukon. Due to the paucity of rigorously excavated sites and subsequent analyses, regional perspectives of the late Pleistocene biota within the SY-AB are less defined than at the local level. This emphasizes the need for increased dedicated archaeological investigations of an area so important to understanding how and when humans arrived in and adapted to a new land.

Periods: Out in the Open

For women discussing our menstruation cycles in the context of the workplace is a double-edged sword. I am a boomer. Back in the day we didn't talk about periods, or cramps, or heavy flow days because those conditions were weaponized against us by the patriarchy. Fast forward 40 years: the status of women in archaeology is amazingly good compared to other industries; however, the reluctance to discuss, and institute accommodations for, our "bad" days remains. The question of how we can normalize menstruation in the workplace is the topic of this poster.

Money Grows on Trees: Arboricultural Proxies and Engendering Ancient Maya Finance

Among the Classic and Postclassic period Maya, cacao beans were one of the most common forms of currency. Ancient Maya art depicts this money, which grows on trees, as tribute in courtly scenes most often populated by men. Yet contact period ethnohistoric documents consistently attribute ownership of trees to women. While contemporary cacao groves are limited to the wetter southern Maya Lowlands and Pacific coast, geoarchaeological and archaeobotanical datasets have recently confirmed the cultivation of cacao in depressions in the drier Northern Lowlands. This paper uses Northern Lowland lidar data to explore the Classic period spatial relationship between domestic settlement and relic cacao groves and the Postclassic period relationship between rainfall and the size and configuration of plots of land that may have been used for arboriculture. The results invite consideration of how gender intertwined with state finance and market exchange.

Hyde, Elisabeth (Brigham Young University)**[197]***3D Modeling in Excavation*

Photogrammetry and 3D Modeling are tools that are greatly underutilized in excavation. Yet, they are very helpful to archaeologists. There are both drawbacks and benefits to using 3D modeling. However, this study of features in southeastern Utah shows that the positives outweigh the negatives. Although they can be tricky and time consuming to generate, 3D models using photogrammetry can be used to digitally preserve sites, saving a complete representation of a site or feature for later study without having to find and dig up the feature again. Stratigraphy can be studied using a 3D model, for instance. Another use for a 3D model is to look at the feature from a different angle, to be able to see things from a new perspective. This is especially invaluable if a feature is difficult to get to.

Hyland, Ethan [201] see Trujillo-Hassan, Daniela

Hynes, Mary (Illinois State Archaeological Survey)**[137]***Documentation: The “Other” Artifact*

An artifact without associated documentation has limited archaeological value. Yet the need or desire for analysts and authors to retain associated documentation beyond the deposit of artifacts commonly results in the failure to transmit this essential part of the collection to the repository where the artifacts live. With the increase of born-digital files, it becomes even more difficult to corral the various types and formats of documentation related to a project for curation, including analysis, email, messaging, or in-person conversations that may include decision-making processes or interpretations that affect a holistic understanding of the project. The hybrid nature of information mandates curation strategy that safeguards both paper and digital data for the future. This paper details how the Illinois State Archaeological Survey is using the recent reassessment and relocation of our 24,000 ft³ collections to a new facility to guide a parallel reassessment of associated project documentation. Our “project close-out” procedure provides a model for addressing gaps in knowledge and organizing site documentation to preserve the archaeological record for future researchers.

Iacobucci, Alec**[285]***AMFOrA: Computer Vision for Macroscopic Ceramic Fabric Analysis*

The prospect of using computer vision to aid or automate the production of archaeological data is not new to archaeology. Computer vision offers a number of advantages compared to traditional approaches to quantifying archaeological data, including replicability, precision without fatigue, and the ability to expand the size of datasets analyzed. The present research examines the adoption of an automated computer vision protocol for analyzing ceramics from surface surveys. The study of macroscopic elements of ceramic construction—namely, the quantification and measurement of temper, nonplastic additions to the raw clay—can produce a wealth of information that allows a nuanced interpretation of archaeological ceramics such as determination of origin or intended vessel use. This type of analysis has distinct potential for survey ceramics where years of surface wear and erosion preclude more common classifications such as form or surface treatment. Since the analysis software takes 2D scans as raw data, data generation is easily integrated into

current intensive survey methodologies. This research examines 800 sherds collected over multiple survey seasons throughout the area of Son Servera in Eastern Mallorca (Spain) through an open-source ceramic analysis package developed for Python to generate a deeper understanding of the Son Servera Landscape

An Introduction to the Comparative Urban Traditions Project, with Emphasis on the East and Southeast Asian Case Studies

The Comparative Urban Traditions project aims to rigorously explore pre-industrial cities and urban communities in all their complexity and diversity. Focusing on a set of archaeological case studies that are representative of a range of different time periods and geopolitical contexts, the approach is sensitive to both the social production and social construction of space. The similarities and differences that emerge through comparison of the morphological structure of different cities, assessment of the diverse services these centers provided, and consideration of the dynamic lived experiences of the multiplicity of residents and assorted visitors who constituted these urban communities, will not only contribute to a better understanding of the range of variation inherent in these expansive settlements, but also inform us as to the physical and social characteristics that they shared. This presentation will focus specifically on case studies from East and Southeast Asia.

La producción prehispánica de cal en la región de Ichkaantijoo, Yucatán, México: Caracterización de morteros por medio de ciencias de materiales aplicadas

En este estudio se caracterizaron pisos de cal arqueológicos de ocho sitios de la región de Ichkaantijoo, Yucatán, de distintas temporalidades (1000 aC-1300 dC) por medio de técnicas de ciencias de materiales, a fin de identificar los procesos de la producción artesanal prehispánica y reconocer las diferencias y similitudes en tiempo y espacio. El análisis se hizo por medio de FTIR, FORS, XRD, XRF y Petrografía. Los resultados muestran tres grupos de morteros de cal para los pisos, todos compuestos por carbonatos de calcio (CaCO₃), pero con distintos agregados. Proponemos que las diferentes huellas químicas y físicas de las muestras responden a distintos carbonatos de calcio y silico-aluminatos obtenidos de diferentes minas, ya que éstas son abundantes en la región. Los resultados muestran más variación en la composición y temperaturas de los morteros durante el periodo Clásico (250-1000 dC), indicando experimentación e innovación durante este tiempo. Asimismo, corroboramos el uso de carbonato de calcio geogénico en los pisos lo cual ha sido previamente reportado por Hansen (2000) en Guatemala.

Ibarrola, Mary Elizabeth (University of Texas, Austin)**[227]***From Personal Amulets to Shared Rituals*

Since the inception of the field of Historical Archaeology, much has been made of the small finds interpreted as residues of African spiritual belief and ritual practice. Beads, X-marked fragments, and pierced coins, first the subject of the “search for Africanisms” that characterized American plantation archaeology, have since been examined as evidence of continuity and change in ritual practices, been used to trace specific links between diasporic communities and varied African cultures and religions, and have been highlighted for the idiosyncratic and highly interpretable nature of their creation and use. In this paper, I consider how we might extrapolate understandings of group dynamics, particularly the formation and functioning of community, from these objects. I examine small finds from several North Florida sites and consider how these objects might be used to study the communities in which they were produced, utilized, and discarded. I seek to use materials typically associated with individuals to think about communal ritual practices and the shared maintenance of spiritual communities.

Ichikawa, Akira (Kanazawa University)**[1]***Social Responses to Volcanic Eruptions: Comparative Studies in Central America and Japan*

Volcanic eruptions are hazardous events that affect past cultural and historical trajectories. However, despite several catastrophic eruptions having been recorded, some populations have chosen to continuously live in hazardous environments. Based on a long-term archaeological perspective, this paper shows human response, adaptation, resilience, creativity, and innovation in specific volcanic areas, such as Central America and Japan. These two comparative case studies highlight the importance of ritual practices as responses to unpredictable natural events and the creation of novel innovations by different social groups, as potential responses to volcanic disasters. Additionally, the data suggest that social and environmental turmoil caused by volcanic eruptions could have created an opportunity to reconsider existing social systems, beliefs, subsistence strategies, and technologies, triggering the emergence of new leaders who could manage social groups in the chaotic period. Finally, I present a case in which archaeological data and historical accounts contributed to the survival of recent human lives, demonstrating the potential for ancient disasters to inform the present.

Ichikawa, Akira [314] see Perry, Gabrielle

Iglesias, Christina (California State University, Los Angeles) and Ann Scott**[221]***A Two-Decade Assessment of Maya Cave Archaeology*

Twenty years ago, Ann Scott presented “The Historical Context of the Founding of Maya Cave Archaeology” at the SAA meetings in Montreal documenting the history of Maya cave archaeology from the 1970s to its emergence as a self-conscious field in 1997. It is fitting, therefore, that this presentation considers the expansion the field has undergone in the last two decades, its current state, and directions for the immediate future. Thematically, the investigation of the constructed subterranean and the interpretation of human skeletal material in caves appear to be two dominant directions that current research is taking while the analysis of speleothems may be an underdeveloped interest coming into its own. I see the field at a crossroads due to the lack of active cave surveys and few cave archaeologists still actively involved in field research. Scott’s original paper suggested that the beginning of her Foundation period in the 1980s was a generational transition. Now 40 years later, the field appears to be heralding a new dawn from survey to cave studies expanding to the subterranean.

Evidence of Coastal Use by Foragers: Inferences from Pottery Petrography from Two Pleistocene Sites, Tanegashima Island, Japan

Tanegashima Island in the southernmost region of Japan has the earliest evidence of a large quantity of ceramic production by late Pleistocene foragers of eastern Eurasia. The island is also part of the southern Kyushu region, where the pottery-bearing occupation is found under well-dated tephra dated to ca. 12,800 cal BP, termed the Incipient Jomon. In our previous research based on visual and stereoscopic analyses of pottery from three sites and petrographic analysis combined with neutron activation study from a site suggested that pottery produced on the island had local raw material procurement signatures, in the vicinity of sites. In this study, we examined pottery thin sections from the Onigano and Okunonita sites, previously studied through visual analyses. Our results indicate that some pottery produced on the island has relatively rounded mineral and rock inclusions, that are more common in sediments near the coast. This study provides an insight that ceramic producers were users of resources relatively close to the paleo-coast, not just inland that had previously been hypothesized.

Long-Term Geomorphological History and the Farming Landscape of Pañamarca

In this presentation, we discuss the results of the geomorphological survey carried out parallel to the archaeological fieldwork in 2018 and 2019. The analysis of geological profiles at alluvial terraces, satellite imagery, and radiocarbon dating produced a 9,000-year sequence showing the high dynamism of the Nepeña River through time, affecting the topography, distribution of resources, and ultimately the location of settlements. Finally, we will present a preliminary look at the agricultural landscape of the surroundings of Pañamarca during the first millennium CE.

Salvage Excavations of a Painted Maya Tomb at Ayiin Winik, Northwestern Belize

In 2023, the Belize Estates Archaeological Survey Team (BEAST) field assessed recently acquired lidar data. This effort included documenting a previously unknown large ceremonial center, Ayiin Winik, located between the La Lucha Escarpment and the Rio Bravo in northwestern Belize. Exploration of the site identified a rare double ballcourt, a parapet-lined sacbe, a large palace, a hilltop acropolis, several large altars, and stelae. At a large hilltop group south of the main plaza, team members identified a large looters’ tunnel that cut through the center of a large pyramidal structure, B-1. This tunnel exposed at least four major construction phases and vaulted rooms, along with ancient graffiti and a looted tomb. The tomb itself is a

vaulted room with cream-colored panels bordered by vertical red bars and a red band painted around the top of the chamber's wall. While the style of the painted tomb mimics the elaborate Early Classic tombs at Rio Azul, Ayiin Winik's tomb lacks painted glyphs and artistic designs. This paper presents and discusses the results of BEAST's salvage excavations to contextualize the tomb within the region's Early Classic period.

Climate and Human Behavior Studies for Our Warming World: An Introduction to the Models, Methods, and Data

This presentation provides a practical introduction and toolkit for investigating relationships between climate and human behavior. The urgency of addressing the problems of our warming world is beyond the responsibility or exclusive domain of climate scientists or specialist—it is a shared human responsibility. Public or scholarly contributions do not require specialized climate knowledge. Some foundational conceptual models, assumptions, methods, and data of climate and human behavior studies will be presented. The intent is to expand competence in this domain to enrich documentation and interpretations of the past so that insights will emerge to contribute to preparing for and responding to our warming world. While the North American Southwest is the geographical focus, the approach advanced is applicable in drylands worldwide.

[56]

The Emergence of a Large Community at Aguada Fénix, Tabasco, Mexico, and Its Legacy

The site of Aguada Fénix features an artificial plateau, which measures 1,400 × 400 m horizontally and 10–15 m vertically. Nine causeways and corridors radiate from the plateau. These monumental constructions were built between 1050 and 750 BC. This building, discovered in 2017, turned out to be the largest and oldest monumental structure in the history of the area that is conventionally called the Maya lowlands. We do not have any evidence of marked social inequality. Aguada Fénix was built probably during the transitional period from mobile lifeways to more sedentary ones and from mixed subsistence practices to more intensive maize agriculture. Collective ceremonies and construction projects likely served to bring a large number of people together and to promote shared cultural values during this period of significant social change. Early community leaders in this region possibly provided templates for rulership in later periods, which continued to emphasize the elite control of astronomy, calendar, and public ritual.

Boron Isotopes: A New Tool for Characterizing Wetland Use in the Past

Ethnographic and historical evidence shows that wetlands are highly variable environments, and humans exploit them in both spatially and seasonally specific ways. Reconstructing such patterned use with currently available archaeological methods is extraordinarily difficult or, in most cases, impossible. We have identified a promising new tool for precise interpretations of human (and animal) wetland use. Work done at the Facility for Isotope Research and Student Training at Stony Brook University has demonstrated that boron isotope

analysis can distinguish between saltwater and freshwater environments and thus between different locations within coastal wetlands. Moreover, as boron's isotopic composition is predictably related to environmental conditions like pH, it is an effective proxy for distinguishing between seasons, salinities, even the ends of a pond. This paper presents data on spatial and seasonal variation in boron isotopes taken on wetland taxa widely used by humans. We highlight the advantages of using boron isotopic analysis to investigate seasonally and spatially dependent subsistence and mobility strategies within past wetlands.

Precolumbian Low-Density Urbanism in the Llanos de Moxos

This presentation summarizes archaeological and lidar data from the Casarabe culture (~500–1400 CE) in the Llanos de Mojós savannah and forest mosaic in southwest Amazonia. Lidar revealed a four-tiered settlement system that spread over 4,500 km² with large extensive sites reaching up to 315 ha and whose civic-ceremonial architecture exhibits stepped platforms, on top of which lie U-shaped structures, rectangular platform mounds and conical pyramids. These large, central sites, surrounded by concentric polygonal banks, connect to different ranked sites with raised causeways stretching over several kilometers. Massive water-management infrastructure, composed of canals and reservoirs, completes the settlement system of this engineered landscape. The Casarabe-culture settlement pattern represents a particular type of tropical low-density urbanism and land use not previously described in Amazonia that adds to the growing number of urban societies in tropical South America.

Between Fishing and Rites of Passage at Death: Recent Developments from Excavations at Jicarita Island, Coiba, Panama

A recent focus on insular areas has expanded our knowledge on the abundance and diversity of insular, coastal, and pelagic habitats harvested from ca. 6200 BP. Inspired by Richard Cooke's vision to explore the Coiba Archipelago, in 2023 the authors returned to Jicarita Island to investigate the techniques for processing Pisces and the fishing traditions among the ancestors of Quevi Cabo at a precolumbian fishery dating between cal 1290 and 1060 BP. The excavations of a domestic structure with its fireplace, presumably used for the preparation and drying of fish, included species that frequent clear water columns such as mackerel (*Decapterus macarellus*), black skipjack (*Euthynnus lineatus*), red snapper (*Lutjanus viridis*), and hogfish (*Balistes polylepis*), among others. The

fishery site also exposed the presence of two semiotic traditions at the height of its occupation and surficial burial features of non-elite individuals with scarce offerings, but ones that linked them to a maritime way of life. During the presentation the authors will address the relevance of this unique site in the context of emerging complex societies and focus on the current state of zooarchaeological and material analyses.

[265]

Cahokia-Style Engraved Stone Tablets

The Cahokia Birdman Tablet is the iconic example of what defines this artifact category, with engraved graphics on the obverse and crosshatching on the reverse of a rectangular stone tablet. Other tablets from Mississippian contexts have similar combinations or variations of these three features. Some may only exhibit crosshatching on one or both sides. This study examines 40 examples of tablets, most that would qualify as Cahokia-Style with at least the rectangular form and either graphics or crosshatching, or some combination of those, while others are more “marginal” and a few “outliers” may include only one feature. The function of the tablets currently is unknown. About half have been recovered in excavations but not in contexts that imply function, with one possible exception. Most are made of sandstone or other abrasive stone, but they do not appear to be abraders, as the crosshatching grooves are usually uniform in depth and width, unlike the usual abraders that have tapering grooves in irregular patterns. Those with graphics may have a more ritual function while the others a more practical one.

Seventeenth-Century Clay Industries at ca. 1670 Charles Towne, Charleston, South Carolina

The restoration of Charles II to the English throne created a flourishing of economic growth, philosophical change, and a new focus on scientific experimentation in the English empire. The Carolina colony was founded in 1670 with the intent to create an ordered and profitable society for its colonists that was focused on agriculture and local industries within the colonies. This study targets specific examples that evidence clay as a source for and byproduct of 1670s industry, trade, and commerce that molded and shaped Carolina and its colonists, revealing information about the elite private property owners, indentured servants, and enslaved Africans that labored to transform Carolina into a successful colony. This study utilizes laser ablation–inductively coupled plasma–mass spectrometry (LA-ICP-MS) analyses on 146 samples from three distinct clay wares—kaolin tobacco pipes, redware, and colonoware pottery—recovered from contexts at the ca. 1670 town settlement. Here, we establish an elemental signature for future comparative studies and gain insight into English global and regional trade and commerce as well as the early local clay industries founded in the Carolina colony.

The Ancient Occupation of the East Terrace at Cerro San Isidro, Moro District, Peru

This poster reports on the results of archaeological excavations carried out at the ancient human settlement of Cerro San Isidro located in the Moro region of the middle Nepeña Valley, north central coast of Peru. In particular, we expose and analyze stratigraphic, architectural, and material data recovered in the unidad de excavación 5 (UE5) at the East Terrace (Terraza Este) in 2022. The East Terrace is one of several human-made flat areas perched on the slopes of the San Isidro hill where fieldwork since 2019 has revealed a rich and complex human occupation going back more than 2500 years ago. Through block excavations, UE5 sampled 125 m² and vertically exposed stratigraphic contexts with multiple superimposed occupational and architectural phases. Overall, the contextual information recovered, including the architectural organization, hearths, storage areas, food remains, animal dung, and other material remains, point to a series of multi-functional residential occupations over the long history of the East Terrace. Three radiocarbon measurements from the East Terrace point to a complex and intermittent occupation between 350 cal BCE and 1450 cal CE. We integrate the various strands of evidence into a discussion of the ancient occupation of the East Terrace.

Excavation at an Early Upper Paleolithic Site of the Tarvagataiin Am, Northern Mongolia

While early modern human dispersals occurred in Northern Eurasia around ~45–40 ka ago, a cultural phenomenon often labeled as the Initial Upper Paleolithic (IUP) is identified in Central and Eastern Europe, but also in West, Central, and Northeast Asia. Despite significant progress in our understanding of the timing and routes of these population movements, the processes leading to the installment of modern human populations in Northern Eurasia remain unclear. Following the IUP, around 40–33 ka, archaeological assemblages broadly referred to as early Upper Paleolithic (EUP) show an increase in the number of regional variants probably reflecting a higher cultural diversity. Here we report the recent excavation of Tarvagataiin Am site in northern Mongolia. The site is situated in a terrace along the Khudel River, which is one of the tributaries of the Selenge River valley system. Artifacts are found from an alluvial sedimentary context of bedded fine sand and sandy-silt, 145 cm below the ground surface. The low energy deposition of the site matrix accumulated in an alluvial context, thereby suggesting that the site has a high potential both for precise geochronological control and for a good preservation of human activities.

Drawing from the Past to Inform the Future: Exploring 500 Years of Skagit River Salmonidae Abundance
Recovery plans and goals for Pacific northwest salmon, trout, and char (*Oncorhynchus* spp., Salmonidae) seek to conserve and restore these keystone species throughout the Salish Sea and its watersheds. Archaeological data offer a window into past Salmonidae life-histories and can provide a long-term record of the species and their relative abundance for conservation practitioners. In this paper we examine the archaeological record of Salmonidae abundance within the Tronsdal site on the Skagit River delta, Washington State, as part of our larger efforts to reconstruct Salmonidae life-histories for restoration. We calculate the ratio of the Salmonidae number of identifiable specimens (NISP) to the number of all fish remains within each temporal context (NISP Salmonid / N All Fish) to examine change in abundance through time. Our data reflects a trend of fluctuating Salmonid abundance—early levels show high or increasing abundance, followed by a sharp decline and subsequent increase. Although abundance is one criterion within the Viable Salmonid Populations parameters used across Puget Sound to monitor and restore healthy salmon populations, this index will allow a longer-term baseline for ecological restoration efforts for rights-holders throughout the Skagit River watershed and contribute to baselines across the Salish Sea.

“To Kill” or “To Sacrifice?” Sahagún and the Translation of Mortal Violence

Spanish accounts from sixteenth-century colonial New Spain tell us that the Aztecs “sacrificed” humans, a notion that has been corroborated and expanded by scholars from a variety of disciplinary perspectives, including archaeology, anthropology, history, and religious studies. One question that has tended to escape critical scrutiny is whether a corresponding semantics of “sacrificial” killing may be found in accounts written in the Aztec language Nahuatl or whether the notion of Aztec human sacrifice should rather be seen as a figment of Spanish colonial translation. To explore this issue, I examine narratives of Aztec as well as of Spanish mortal violence in the Franciscan missionary Bernardino de Sahagún’s book on the conquest. As I show, a comparison of the Nahuatl texts with the Spanish translations illuminates how missionary translation practices augmented the semantics of “sacrifice,” creating a conceptual distinction between Aztec and Spanish mortal violence that is absent in the Nahuatl source language.

Jacobson, Jodi (Center for Archaeological Studies, Texas State University) and James Ramsey (Wyoming State Parks)**[200]***Beyond Consumption: Evidence for Animal Bone Use in Music, Art, and Ritual in Texas*

Animal bone was utilized for more than subsistence purposes. Most non-subsistence use has been focused on utilitarian tools. Bone-use beyond subsistence and utilitarian tool use is rarely identified or considered for its cultural impact or implications. Often it is difficult to identify in the archaeological record, and is frequently overlooked, with its functionality beyond subsistence ignored within Texas archaeological assemblages. Faunal material from two sites in Dallas County, Texas (4IDL433 and 4IDL434) are compared and contrasted. The two sites are in close proximity and may represent concurrent usage and a cultural association to each other. Findings of the faunal analysis are discussed and the data indicating connections to non-subsistence activities including ritual, music, and art presented.

Jaffe, Yitzchak (University of Haifa)**[132]***Chair***Jaffe, Yitzchak (University of Haifa)****[132]***An Introduction to Failure in the Archaeological Record*

Archaeological theory has engaged little with failures, at least at certain scales. In this introduction, we attempt to lay out issues with the anthropological definition of failure while also drawing attention to issues of scale. While archaeologists readily identify “Big F” failures, such as social collapse and site abandonment, they less frequently consider “small f” failures (mistakes and blunders) that plague the everyday. How can we reinsert failure into “trowel’s edge” interpretations? Not doing so, we argue, has serious consequences for appreciating the humanity of past peoples.

Jaimes Betancourt, Carla (University of Bonn) and Patricia Ayala (University of Chile)**[124]***Heritage and Territoriality: Past, Present, and Future Perceptions among the Tacana, Tsimane, and Mosestén in Bolivia*

Preliminary results of the collaborative methodologies applied in two years of intense fieldwork in the Bolivian Amazon will be presented, and we will reflect on the different roles played by archaeological and sacred sites in the Tsimane, Mosestén, and Tacana indigenous territories. Furthermore, we consider how materiality is a permanent link between the past and the present and manifests the cultural continuities existing among some of these same actors. A central aspect of the project lies in its collective, holistic, and transdisciplinary approach, which fosters an ontological dialogue between local Indigenous communal researchers and Western cultural and natural heritage specialists (such as archaeologists, anthropologists, biologists, and museologists). In its broader implications, the research aims to contribute to a critical approach of heritage and its reconceptualization through cross-cultural dialogues, creating new theoretical frameworks for heritage conservation, protection, museumization, and dissemination at local, national, and global scales. Recognizing the dynamic nature of heritage processes, the project acknowledges their social, political, and economic ramifications among all societies involved.

Jalandoni, Andrea (Griffith University)**[112]***State of the Art: Digital Methods for Rock Art Research in 2024*

Rock art is under constant threat from natural and anthropogenic deterioration and one of the challenges for archaeologists is to document and study this invaluable heritage before it disappears. Digital archaeology, the use of information technology and digital media for archaeological research, is essential for recording, analyzing and envisioning rock art to meet this challenge. Digital methods, such as 3D modeling and DStretch (decorrelation stretch), are already becoming standard because they produce more accurate recordings and are more cost-effective than traditional methods. Furthermore, there have been significant innovations in rock art research through assimilating methods from other disciplines (e.g., GIS, data science, and remote sensing) and using data collected from rock art sites in Australia, Southeast Asia, and the Pacific. These advances have not only improved research potential but have also helped Indigenous and non-Indigenous people to engage with their cultural heritage more tangibly.

Jalbert, Catherine (Terracon Consultants Inc.) and John Hall (Terracon Consultants Inc.)**[43]***Wooden Features on the Jicarilla Apache Nation: An Analysis of Navajo and Apache Land Use*

The Jicarilla Apache Nation (JAN) reservation was established in Northern New Mexico in 1887 with additional lands added to the southern boundary in 1907–1908. Today, the reservation comprises approximately 879,917 acres of pinyon-juniper uplands and sagebrush flats in lower elevations. Prior to the establishment of the JAN reservation, these lands comprised a portion of the Dinéyah homelands; archaeological evidence of early habitation by ancestral Navajo and earlier Paleoindian, Archaic, and Puebloan ancestors is present throughout the landscape. While minimal structural remnants are encountered for earlier periods, ubiquitous wooden features demonstrate the diversification of animal husbandry practices in the period after the Pueblo Revolt. These features range from large-scale traps to smaller corral and pens representing cultural and socioeconomic shifts from communal hunting to majority pastoralism of herd animals post-1868. Using extant data from the New Mexico Cultural Resources Information System (NMCRIS) and the JAN Tribal Historic Preservation Office (THPO), this poster will present an aggregated analysis of archaeological sites containing wooden features within JAN reservation lands (1887–1908). This will include a comparison to similar features identified in adjacent regions and a discussion of salient issues in refining use history when land-use, repair/modification, and wood salvaging behaviors are considered.

James, Sydney (Arizona State University)**[150]***Archaeology for the Land: The Potential of Community-Based Archaeology for Land Stewardship*

When archaeologists are community focused and projects are community oriented, archaeology possesses the capability to go beyond data collection for the sake of academic research. Successful community-based participatory archaeological research has yielded a range of results—from raising public awareness of local history, to implementing outreach education programs, to connecting stakeholder groups, and even so far as to boost local tourism economies. This list is not exhaustive. Community-based archaeology, when

implemented properly, has demonstrated benefits for communities and archaeologists alike and still has potential to go farther. The SAA maintains that archaeologists are stewards of the archaeological record—but for whom? Indigenous communities in the United States and elsewhere have long been some of the best stewards of their lands, both culturally and environmentally. As a result of the impacts of colonialism, however, much of that traditional knowledge has been ignored or lost. Community-based participatory archaeology holds the unique potential to serve stakeholder communities by recovering knowledge. It may also serve to advocate for land rights and the implementation of traditional ecological knowledge (TEK) on a larger scale. This talk will explore the potential of community-based archaeology for land stewardship for Indigenous groups in the United States and beyond.

Quantifying Earth Oven Fire-Cracked Rock: A View from the Langtry Rock Midden

This paper highlights quantification data from the author's thesis, including the methodology of 33 archaeological excavations in the Edwards Plateau and Lower Pecos Canyonlands in which fire-cracked rock (FCR) quantification attempts were made. My excavations at Langtry Rock Midden (41VV168) were conducted to provide a well-documented FCR quantification dataset for comparative study. LRM is an earth oven facility on the Canyon Edge overlooking Eagle Nest Canyon. Radiocarbon dates place main midden accumulation during the Late Archaic and Late Prehistoric, BP 1650–1019. I used Rock Sort, an FCR quantification routine developed by the Ancient Southwest Texas Project, to document the LRM deposits and compare FCR data with those from other Eagle Nest Canyon sites. Rock Sort is a consistent FCR measurement methodology that permits a rigorous approach derived from prior experiments and studies. It incorporates the three pillars of quantification: size-class sorting, counting, and weighing to calculate volume, density, and mass, as well as FCR morphology to estimate how many earth ovens were constructed at the burned rock midden (BRM).

Advances in Strategic Cultural Resources Support from the Air Force Civil Engineer Center and Argonne National Laboratory

Argonne National Laboratory supports the Air Force Civil Engineer Center in implementing comprehensive cultural resources management at several Department of the Air Force installations in the southeastern United States. The Southeast is experiencing extreme weather events more frequently, presenting opportunities for improved methodologies and solutions for preserving important cultural resources in the region. Coastal cultural resources are especially vulnerable to erosion, inundation, storm surges, high force winds, and sea-level rise, highlighting a vital need for updated and localized strategic planning. Overcoming these challenges also requires adaptive approaches for mitigating climate-driven adverse effects on cultural resources. Argonne supports a variety of projects in the region, including state-of-the-art coastal risk

modeling that leverages the latest Earth sciences research at Argonne, living shoreline construction, and 3D laser scanning all aimed at mitigating imminent climate effects on cultural resources, as well as tribal consultation, archaeological investigations, and digital curation, which are more focused on long-term strategic planning. These efforts support regulatory compliance and safeguard future public engagement with critically threatened cultural resources managed by the Air Force.

Integrating Neanderthal Legacy: From Past to Present

In 2020, a four-year Action, entitled Integrating Neanderthal Legacy: From Past to Present (iNEAL) (CA19141) financed through the European Cooperation in Science and Technology (COST), started. The Action is aimed at assessing and addressing biases in Neanderthal legacy and creating a pan-European (and wider) network of scholars involved in Neanderthal research. The ever-growing datasets related to Neanderthals (archaeological, fossil, genomic, etc.) resulted in specialization of scientists of different disciplines that often have less than adequate understanding of other fields involved with Neanderthal research. Further, socioeconomic factors and different trajectories of development of scientific disciplines in different countries resulted in biases toward the “Western countries,” while many of the sites in e.g., former “Eastern bloc” were poorly represented or published. The iNEAL Action is addressing these (and other) biases through its working groups (WG1: the fossil data; WG2: Cultural data; WG3: Molecular data; WG4: From past to present). Special attention is given to training of young researchers where disciplines are underdeveloped. Further, among the Action goals is bridging the gap between scientists and other interested parties (general public, touristic sector, museums, business, legislators, etc.) in order to utilize socioeconomic aspects of various types of Neanderthal legacy.

Evidence of Painted Mimbres Ceramic Production Patterns in the Sapillo Valley from the Analysis of Lake Roberts Vista Site Painted Sherd Collection

This presentation discusses the findings of a project investigating ceramic production in a hinterland of the Mimbres region, from a diachronic view across painted ware types. The Sapillo Creek Valley is a volcanic upland in southwestern New Mexico between the Mimbres and Gila River Valley culture-centers. The painted pottery recovered in 1995 from Lake Roberts Vista, a medium-sized Mimbres-Mogollon pithouse and pueblo habitation site, represents the full occupation timeframe (550–1130 CE). Sample sets of painted ceramic tempers from Lake Roberts Vista and alluvial sands from side drainages in the Sapillo Valley were analyzed by petrographic mineral characterization under low-power optical microscopy and X-ray diffraction. Combined, these methods provided technologically and cost-accessible implementable data. A comparison of the mineral datasets was used to point to answers regarding where local Mimbres potters obtained temper raw materials, likely production loci, Lake Roberts Vista’s level of on-site production, and changes in these patterns across time. My results highlighted drainage groups concentrated around large sites as likely temper sources utilized by local Mimbres potters. Locational shifts over time were noted, generally following site

growth/decline patterns. The tested ceramics paint a picture of an active distribution network within the valley and acquisition from outside.

Killing and Sacrifice in the Precolonial Codices

Human sacrifice and cannibalism are hallmarks of colonial discourse, which was developed to justify the conquest of the Americas. Particularly Aztec worldview has been presented consistently as pivoting on human sacrifices to “bloodthirsty devils” (in terminology of the conquerors). Eyewitness accounts are conspicuously scarce, but this paradigm dominates most historical written sources of the colonial period as from the first records (e.g., Cortés) and was later further elaborated in retrospect by the Spanish missionaries (e.g., Sahagún). Consequently, many archaeological remains and ancient images are perceived through this lens, often without scrutinizing the evidence and without searching alternative possibilities of interpretation. Clearly, there existed ritualized forms of death penalty for criminals and enemies (e.g., by stabbing them in the chest), but how many of those may be termed “sacrifices”? The ancient cultures gave special funerary treatments to bodily remains, but to what extent do these indicate “sacrifices” rather than worship of ancestral relics? Decolonial theory and Indigenous Methodologies stress the importance of discrimination-free language and thought. In an effort to deconstruct and elucidate the issue, this paper will examine relevant scenes from precolonial Mexican pictographic codices and compare them to colonial accounts.

[215]

Neolithic Pastoralist Practices at Masis Blur, Armenia’s Ararat Valley

Neolithic settlements appeared across the Southern Caucasus in the early sixth millennium BCE. Ongoing excavations, along with zooarchaeological and isotopic research, are clarifying how these communities used the landscape and managed livestock in the context of mixed farming. In this paper we present new zooarchaeological data from recent excavations, in conjunction with stable carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) isotope analysis of bone collagen and stable carbon and oxygen ($\delta^{18}\text{O}$) isotope analysis of sequentially sampled tooth enamel from livestock from Masis Blur, one of the earliest Neolithic sites in the Southern Caucasus. Our results indicate that the occupants of Masis Blur engaged in a predominantly caprine-based herding economy, which depended on seasonal mobility to high-elevation pastures in the summers. These seasonal strategies were in place in the earliest known phases of occupation at Masis Blur and demonstrate sustained linkages between highland and lowland regions in the Ararat Valley in the early sixth millennium BCE. Finally, we also highlight how these data illuminate the diversity of herding strategies in the region more broadly.

Jarman, Cat [233] see Kassadjikova, Kalina

Jary Rosser, Pamela [192] see Lindley, Tiffany

Jasper, Kathryn (Illinois State University)**[22]***Mapping Agricultural Landscapes in Roman and Post-Roman Italy*

In the context of an archaeological excavation in northern Lazio, Italy, this paper will discuss solutions for incomplete datasets in the study of premodern agriculture. The focus of excavation is a Roman imperial period, monumental fountain located 300 m from the western coast of Lake Bolsena in central Italy. Its high quality of construction and materials and its remote rural location suggests the fountain was part of a larger complex, likely a Roman villa. Answering questions about the identity and motivations of the fountain's patron hinges on uncovering how its construction related to the agrarian economy, to local export and import and consumption of goods in the region. Reconstructing premodern agriculture is nearly impossible because it inevitably depends on incomplete datasets; but theoretical models are possible. The presentation speaks to the value of adopting a digital praxis to the study of historical source materials and turning sources into data. My approach blends analysis of historical documents with modern datasets of the physical environment, when relevant, to generate hypothetical ancient and medieval landscapes and practices in GIS databases for analysis.

Jazwa, Christopher (University of Nevada, Reno), Aomar Akerraz (Institut National des Sciences de l'Archéologie), Stephen Collins-Elliott (University of Tennessee Knoxville), Katelin McCullough (Hollins University) and Katie Tardio (Bucknell University)**[95]***Mauretanian and Roman Settlement Chronology in the Loukkos Valley, Northern Morocco*

Archaeological understanding of the chronology of pre-Roman and Roman occupation of northern Morocco has typically been determined by datable materials from large urban sites. We expand the scope to include smaller sites in the Loukkos River Valley near present-day Larache to investigate the understudied lives of rural populations in Roman North Africa. These sites are associated with the major site of Lixus, which was an important urban center as early as the eighth century BCE. We use radiocarbon dates and datable ceramics from four smaller sites, AC106 (HESP46), Sidi Moulay Abdeslam (HESP17), LA21 (HESP51), and Koudiat Hmamou (LA43/HESP23), in the hinterland surrounding Lixus to better understand local settlement patterns. Preliminary radiocarbon dates indicate occupation extended from at least 180–40 BCE (95.4% range) to 430–580 CE (95.4% range), with the greatest concentration of dates from the first to third centuries CE. This is consistent with the most intensive periods of occupation at Lixus. Radiocarbon dates, along with ceramic chronologies, allow us to refine the chronology of construction and expansion of these smaller hinterland sites. By investigating smaller sites, we are able to better understand the nature of Roman expansion into Morocco, particularly the settlement of river valleys outside major urban centers.

Jelinek, Lauren (Bureau of Reclamation)**[297]***Chair***Jelinek, Lauren (Bureau of Reclamation) and Kelly Jenks (New Mexico State University)****[297]***Making Invisible Labor Visible: The Invaluable Contributions of Mentors*

Mentorship plays a critical role in preparing new archaeologists for their future careers. Often dismissed as trivial compared to other roles such as project management or program development, it constitutes a long-term investment in the future of the individual, their specialty, their organization, and the profession as a

whole. Mentors provide aspiring professionals with opportunities to gain practical experience that often cannot be simulated in a lecture hall or field school. Furthermore, mentorship is integral to the development of problem-solving and conflict-resolution skills. Terry Majewski transcended her role as an academic mentor, providing guidance in managing the challenges that arise in heritage management, relationship building, the publication process, and professional service. Through her excellent mentorship, she encouraged others to become mentors themselves.

Bridging the Divide between Industry and Educators: Preparing Future Archaeologists

Preparing students to work in heritage management is a difficult and increasingly urgent task. Some of the biggest challenges faced by educators include large student-to-teacher ratios, the logistical demands of transporting students to and from project areas, the expense of purchasing and maintaining appropriate equipment and software licenses, and the time and effort required to supervise students and comply with reporting requirements. Students desperately need real field and technical writing experience to be effective in this industry. Additionally, the industry as a whole needs more qualified archaeologists to meet growing demand. One potential solution to some of these challenges is for universities to partner with land-managing agencies on survey and site recording projects. This paper describes previous and ongoing efforts to work with federal, state, and municipal partners on projects that train students in the practice of heritage management.

Kin, Ancestors, and Commensality: A New Vision for Huari Urbanism in Middle Horizon Peru (600–1000 CE)

Home to as many as 70,000 residents at its height, Huari was the largest city in the precolumbian Andes. The city's organization, however, has long perplexed scholars. There is abundance evidence for wealth and significant social stratification, alongside displays of violence and power. Yet, researchers have yet to find large plazas, broad avenues, a ruler's palace, a main temple, specialized production centers, or any of the other indications of centralized planning and control that are the anchoring features in most Mesoamerican

and Andean cities. In a word, Huari looks like a mess, especially during its first centuries. In this paper, I argue for a new model of Huari urbanism based on commensality. The importance of feasting in Andean politics is well-recognized and Wari governance appears to have been based on the shared preparation and consumption of large amounts of food and drink among a few people. Politics were ritually charged and ancestor-centered, predominately taking place within D-shaped temples and the internal patios of elite residences that could only fit a couple dozen people. Huari, in essence, was forged one party at a time, created in a cacophony of intimate meals hosted by competing elite.

Zooarchaeological Evidence for Early Human Subsistence Patterns during the Precontact Occupation of Amalik Bay, Alaska

Limited research has been done concerning the zooarchaeological evidence for specific subsistence patterns of Amalik Bay, Alaska. Excavation and survey of the Amalik Bay, Alaska, conducted in 2008, 2021, and 2022 recovered faunal remains associated with cultural materials from sites XMK-00020, XMK-00028, and XMK-00001 thought to have origins in the Takli Cottonwood phase (1800–1500 BP). Of note are multiple bone tools produced on antler. Remains were identified to the lowest taxonomic level possible and taphonomic postdepositional modifications were recorded using the comparative zooarchaeological and paleoecological collection at the University of Tulsa. A selection of samples of these materials were taken for ¹⁴C dating, to be included in the results. Zooarchaeological results indicate that faunal materials consist of a range of species, both terrestrial and marine, in a variety of taphonomic degrees of preservation. Specifically, human utilization and consumption included a high percentage of medium size waterfowl (supported as integral by past research for 7500–4100 BP), caribou and seals. These results shed light on bone utilization and subsistence patterns within these Alaskan residential sites.

Collaboratively Creating a Digital Collection Database

Digital curation has become a critical component of a method of archaeological collection management, and UofL's CACHE recently received an NEH Foundation grant to develop a collection database. Digital curation helps collection managers organize and preserve collection records, monitor artifact conditions, and promote accessibility. Digital databases are vital; however, they are not directly addressed in 36CFR79, NAGPRA, or other curation laws. Therefore, we will be collaboratively building a database in partnership with digital curation experts, the Eastern Band of Cherokee Indians, and Louisville African American community members. We present collaboration goals and preliminary results of a survey we are using to guide database development.

Cultural Heritage Management on Alaska's North Slope: Navigating without a Map in a Time of Rapid Change
Management of, and research on, cultural heritage in the Alaskan Arctic has changed significantly. The changes were much needed and long overdue, but they have brought new challenges to all parties. Accelerating permafrost degradation and coastal erosion have made traditional management strategies no longer viable. More clearly needs to be done to create a path forward that works for all concerned parties, especially descendant communities and local heritage centers. This paper looks at some of those challenges and

suggests possible ways forward that might lead to stronger collaboration between researchers and descendant communities (as opposed to mere box-ticking consultations) and true co-management of cultural heritage.

Overview of a Photogrammetry / Map-Stories Approach to Heritage Management on Barbuda

Archaeological sites on the island of Barbuda are increasingly under threat from natural disasters and human practices. Photogrammetry is a promising tool to preserve detailed spatial data of threatened sites for future study and present sites to both researchers and the public using technologies such as virtual reality (VR) and augmented reality (AR) that offer a more intuitive and embodied experience than traditional media. During the 2023 field season, photogrammetric models of 10 sites on Barbuda were created. Seven of these sites are of the colonial era and include military fortifications, administrative buildings, and industrial sites, two are from the Archaic time period and consist of an opportunistic stratigraphic excavation of the Strombus Line (a shellfish midden) and a petroglyph in a cave, and one is modern and consists of a corrugated metal shelter on a wharf. These models were then incorporated into web-based AR and VR exhibits, and one was 3D printed. This presentation reports on the process and outcomes of these modeling projects, including technical obstacles, broader impacts, potential uses, limitations, and ethical considerations, as well as how this project highlights the need to apply the historical approach to digitally mediated archaeology, as advocated by Richards-Rissetto and Lindaut.

Does Political Organization Impact the Severity of Population Recession?

A critical question raised by 20 years of intensive archaeological research is: What processes drive the long-term expansion and rapid recession of human populations? In this poster, we test the hypothesis that variation in the violence of long-term population expansion and recession is caused by differences in the scale and inclusiveness of social and political integration. To test this hypothesis, we compare the population dynamics of case studies in Mesoamerica, the US Southwest/Northern Mexico, and eastern North America. We use large datasets of archaeological radiocarbon, estimates of resource production, and estimates of changes in public architecture to study the impact of political integration versus resource production on human population. This work allows us to test a general tradeoff between political integration that fuels short to medium term population growth but sets population systems up for population overshoots and decline.

Cultural Continuity in Southeastern New England: The Cultural Landscape of the Pokonoket Sites

Recent CRM investigations have shed new light on an area known to be an extensive Native American home site and cultural gathering place spanning back thousands of years to present day. The Pokonoket Cornfield Site in Dighton, Massachusetts, was first recorded in 1939 by avocational archaeologists who described it as being “a large habitation site of indefinite size.” Diagnostic artifacts suggested the site was occupied at least during the Late Woodland and Contact periods. Along the edge of the cornfield, a large oak tree known as “the Council Oak” is known to have been a seventeenth-century meeting location for King Philip (Metacom)

and his Wampanoag warriors during the King Philip's War (1675–1676). Investigations conducted within the site and surrounding vicinity by the Public Archaeology Laboratory Inc. (PAL) for a proposed transmission line project recovered evidence to suggest an earlier occupation of the Pokonoket Cornfield site as well as a Middle Archaic occupation of an adjacent hilltop, designated the Pokonoket Hilltop site. New data from the Pokonoket Hilltop and Pokonoket Cornfield sites contribute to the extensive record of Native American occupation of the Taunton River drainage basin dating back at least 8,000 years to the present day.

Lake Lahontan: A Pleistocene Pluvial Lake in the Northwest Great Basin: Paleoenvironments and the Archaeological Record

Israel Russell in 1883 suggested that the shorelines of ancient Lake Lahontan were so pristine that the lake must have been only a few hundred years old. Today it is known that this spectacular Pleistocene Lake, present in a unique environment, has been around for at least the last two million years with an extraordinarily complex history. Increasing evidence of human entrance into the Northwest as early as 14,000 to 18,000 BP, following the Columbia River into the interior Great Basin, is creeping into the picture. I wish to present some glimmering evidence of the dramatic changes that Paleoindians had encountered in this complex and dynamic paleoenvironment.

Advances in World-Systems Analysis in Mesoamerica

With the refinement of world-systems analysis into the nested network model (i.e., bulk goods, political/military, prestige goods, and information), Chase-Dunn and Hall (1997) have proposed a research strategy that is applicable to ancient processes of globalization. From the vantage of West Mexico, this presentation will operationalize the model and show material culture patterns that shed light on the nature and impact of cores (Teotihuacan and Tula) on semi-peripheries and peripheries. The period from AD 200 to 1200 will be examined using data from Central Mexico across the expanse of West Mexico and into the NW/SW.

Species Identification of Shark Vertebrae Using Collagen Type I: Toward Ichthyoarchaeological Identification

Sharks are apex predators, and their presence in the world's waters serves as an indicator of the health of marine ecosystems. The species-specific identification of sharks in archaeological materials is essential for reconstructing ancient exploited ecosystems and improving current marine baselines to support conservation efforts as these fish are severely threatened due to overexploitation and habitat destruction. Vertebrae are

one of the most common types of shark remains in ichthyoarchaeological assemblages. Identifying their taxonomy on the basis of morphological characteristics is challenging due to the high species diversity and the wide variety of morphologies within the vertebral column. In this study, we present the initial results of the construction of a collagen reference database for sharks to facilitate paleoproteomic identifications of ichthyoarchaeological remains. Our results consist of collagen type I extracts from vertebrae of five shark species, that were trypsin-digested and analyzed using LC MS/MS and MALDI-TOF to visualize peptide mass fingerprints and amino acid variations in collagen peptides. This presentation showcases the data generated so far and proposes a proteomic approach for taxonomic identifications.

Employment and Applications of Airborne and Handheld Lidar Scanning at Calakmul

The archaeological site of Calakmul has a long history of archaeological research and documentation, from the initial sketches and hand-drawn plans to those created using precise topographical instruments, to the recording of the different architectural spaces. Nowadays, the use of innovative technologies such as lidar opens new perspectives to appreciate the spatial distribution of architecture in and around the site. It allows us to recognize features on the ground that had not been detected before. During the 2023 field season of the Proyecto Arqueológico Bajo Laberinto, we had the opportunity to carry out a series of lidar surveys using a sensor with SLAM technology in different contexts within the site. This has allowed us to register distinct types of details in the architecture and to evaluate the use of this type of technology for different objectives such as detailed monitoring of the deterioration of the architecture or its use in places with difficult access.

Intercambio de materiales pétreos durante el Posclásico Temprano (900-1200 EC) al sur de la cuenca de México: El caso de Acatla-Tulyehualco

Los recursos pétreos son una materia prima imprescindible para la obtención de instrumentos, manufactura de joyería y objetos de consumo ceremonial. En este trabajo se emplean diversas metodologías de estudio que incluyen el análisis tipológico, la caracterización de la materia prima y el estudio de los contextos de procedencia de los recursos pétreos de Acatla, una aldea del Posclásico Temprano. El análisis incluyó lítica tallada y lapidaria empleando pXRF y EDS con el fin de determinar la materia prima y procedencia. Los resultados indican que el yacimiento de Ucareo fue el más importante para la obtención de navajillas prismáticas, mientras que Otumba fue la principal fuente para artefactos manufacturados mediante percusión directa. En las "piedras verdes," se pudo observar que fueron seleccionadas para la manufactura de objetos suntuarios, hachas o cinceles. Para caracterizar esta materia prima y evaluar su procedencia, se realizaron análisis para distinguir las preferencias en el color (colorimetría), el análisis composicional en elementos mayores (SEM-EDS) y elementos traza (XRF). Los resultados indican una preferencia por tonalidades verdes y rocas serpentinitas; también se identificaron materiales en Jadeíta del Motagua, resultados inesperados que sugieren que las aldeas modestas de este periodo estuvieron involucradas en las redes de intercambio.

Los vehe ñuhu o santuarios en los códices mixtecos

Una manera de conocer los santuarios de la época precolonial es a partir de la evidencia arqueológica, sin embargo, debido al tiempo que ha transcurrido y, principalmente, a su destrucción durante la colonización en

1521, la evidencia material con que se cuenta es escasa y fragmentaria, siendo necesario recurrir a otras fuentes. En este caso, los códices mixtecos son una excelente fuente de información de primera mano para estudiar los *vehe ñuhu* (santuarios), especialmente los que estuvieron en uso durante el Posclásico (900-1521 dC). Estos lugares sagrados se muestran en los códices principalmente como parte de topónimos y en relación con rituales y/o narrativas sagradas. En un estudio reciente que realicé me enfoqué únicamente en los lugares en donde se llevaron a cabo los diferentes actos rituales. En este sentido, mi principal indicador de la presencia de un santuario en los códices fue la realización de algún ritual. Con base en los análisis propongo una clasificación en cuatro grandes grupos: Santuarios Construidos, Santuarios Naturales, Paisajes Sagrados y Santuarios Temporales. De tal forma, en esta ponencia hablaré de los santuarios que fueron representados en los cinco códices mixtecos precoloniales y presentaré, con algunos ejemplos, la clasificación que propongo.
