Through the Parita Archaeological Research Project (PARP), we have investigated socioeconomic change in the Central Region of Panama using several different scales of analysis. More specifically, we examined the relationship between episodes of social change and the following factors: sociopolitical organization, craft specialization and economic interdependence, and control and manipulation of trade goods, subsistence resources and ritual space. Despite the presence of some long-distance trade goods, the majority of goods, high-status and utilitarian, appear to have been acquired locally. Our results do not support the existence of chiefdoms with great disparities in wealth and power, as detailed by the chroniclers in the sixteenth century for Panama and suggested by excavation of elaborate burials. On the other hand, we argue that there was more socioeconomic autonomy than previously thought.

Hallett-Desguez, Emily and Curtis Marean (Institute of Human Origins, School of Human Evolution)

[356] *A Comparison of Two African Mediterranean MSA Adaptations: The Cape Floral Region and the Maghreb*

Our lineage evolved in Africa when the earth was in the MIS 6 glacial phase, ~190 thousand years ago (kya). At the continent scale, it has been demonstrated that Africa became arid during glacial phases. However, Mediterranean climates within Africa offered humid refugia during past glacial phases. There are two regions within Africa that are characterized by Mediterranean climate: the Cape Floral Region (CFR) of South Africa and the Maghreb of northwest Africa. These two regions also have Middle Stone Age (MSA) archaeological sites that reveal the earliest proxies for symbolic and complex behavior. These proxies include shell beads, regionally distinct stone and bone tool technologies, and the incorporation of coastal resources into the diet. The appearance of these proxies in the archaeological records of the CFR and the Maghreb is roughly contemporaneous, despite being separated by a distance of over 8,000 km. Here we compare the African Mediterranean MSA adaptations and chronologies with a focus on two archaeological localities: Contrebandiers Cave, Morocco and Pinnacle Point, South Africa. Both were excavated with comparable advanced field technologies and excellent contextual control, and therefore allow the first methodologically controlled comparisons to be made between the MSA of Morocco and South Africa.

[192] *Preserved Paleoindian Site Potential and Regional Geological Patterns in Florida's Karst Rivers*

Hundreds of Paleoindian artifacts have been found in northern Florida, mostly by avocational archaeologists and collectors. Many archaeologists have noted the correlation between Paleoindian artifact locations and known chert outcrops. Further, many of these finds were recovered from Florida streams by SCUBA divers, often in displaced contexts or in areas with no sediment. Extensive research in portions of the Aucilla River has allowed archaeologists to arrive at some understanding of site formation processes and Paleoindian activities in that river. This research was extended into other portions of this discontinuous karst stream system and five other Florida rivers to determine if local trends could be used to understand regional site formation processes and Paleoindian site potential in other nearby systems. To this end, we conducted targeted sonar and diver surveys of portions of rivers known for Paleoindian finds and conducted Livingstone coring, test excavation, geologic profiling, or augering in areas with sediment accumulations to explore subsurface sediments and to look for areas with the potential for preserved archaeological sites. This exploration has allowed us to reach a greater understanding of the extreme heterogeneity found in

Florida's fluvial systems and has refined our ability to predict Paleoindian site locations.

Hallihan, Melissa (University of Notre Dame) and Jenny Fucillo (University of Notre Dame)

[311] *The Hidden Life of Notre Dame: A Study in Library Graffiti*

On the graffiti-covered desks and walls of the eighth through eleventh floors of the University of Notre Dame Hesburgh Library lies a study in duality—highly public expressions of students' most private thoughts. Studying samples of graffiti left behind by decades' worth of college students allowed us to examine aspects of life at Notre Dame that were not normally visible. An analysis of 107 pieces of graffiti yielded that 47% were sexual in nature and 53% pertained to non-sexual topics (e.g. religion, sports, school, race, current events). The greater the distance from the entrance to each floor, the higher the frequency of graffiti, and the higher the floor, the more risqué the content—suggesting students view graffiti as a private confessional for the expression of personal thoughts and exploits not deemed “appropriate” for day-to-day conversation.

Studies of graffiti in public areas of present and historical communities can lend archaeologists insight into aspects of life that don't make the history books; it can show us what the voiceless truly experienced as it is an anonymous outlet for opinions free from authoritative restrictions. In this case, students use library graffiti as a tool to voice opinions and frustrations without fear of retribution.

[220] *Maxillary Lateral Incisor Agenesis: A Case Study of Hypodontia from the Smith Creek Site, Mississippi*

Human skeletal remains recovered from the Smith Creek Site in Adams County, Mississippi came to the Louisiana Department of Justice for analysis. Twenty-six individuals recovered required a full bioarchaeological analysis to inventory the remains and document as much information as possible before final disposition. Of particular interest, one individual displayed the relatively uncommon trait of missing permanent maxillary lateral incisors. In order to determine whether the missing incisors resulted from congenital absence, ablation through intentional removal, or antemortem loss, further analysis of the maxilla was conducted. The use of x-rays in addition to metric and macroscopic observation imparts specific data supporting an argument of agenesis of the incisors for this individual. Additionally, the larger context from around the region where the human remains were recovered and the prevalence of this abnormality are discussed.

Halmbacher, Alexandria (University of Colorado)

[75] *What Does Their Storage Say About Them? An Interpretation of Domestic Storage Practices at the Classic Period Maya Village of Cerén*

Around A.D. 650 the Loma Caldera eruption entombed the Classic Period Maya village of Cerén in 4-6 meters of volcanic ash. This resulted in the exceptional preservation of structures, artifacts and botanical remains, providing archaeologists with a unique opportunity to study the household complexes and their related activities. However, much of the previous research concerning the households at Cerén has primarily focused on its economic activities. As a result, archaeologists have yet to address the socio-cultural aspects such as status, wealth, authority and moral order of the household and its members. Part of the reason for this emphasis on the economic is a narrow conceptualization of the domestic space and materiality. Therefore, this paper proposes the use of domestic storage practices to better understand the socio-cultural aspects such as status, wealth, authority and moral order of household complexes at Cerén. Storage provides an ideal medium to evaluate these dimensions because it represents a confluence of the spatial, symbolic, social and material worlds. Interpretations of the domestic storage practices of households at Cerén suggest its inhabitants lived within a complex and dynamic social heterarchy.

Halperin, Christina (Princeton University)**[88]** *Cosmopolitanism: New Theoretical Considerations of the Mesoamerican Epiclassic*

Previous theoretical considerations of the Mesoamerican Epiclassic period have situated social change as part of social evolutionary processes of state collapse, the networking of a few religious and political-elites (e.g., cult of Quetzalcoatl), the proliferation of market economies, and the beginning of an "International Style." This paper considers notions of cosmopolitanism as a new theoretical framework for thinking about Epiclassic processes. It has long been suggested that Epiclassic art styles were eclectic and cosmopolitan wherein artisans creatively selected from and incorporated various foreign influences into their own local political and religious expressions. This paper, however, proposes new ways of thinking about cosmopolitanism that broadly incorporates three key factors: migration, political-economy, and social identity expressions. It evaluates this framework within the context of the Classic Maya collapse and the emerging presence of previously small, frontier polities in Peten, Guatemala.

Hambacher, Michael (CCRG, Inc.), James Robertson (Michigan Department of Transportation) and Randall Schaetzl (Department of Geography, Michigan State University)**[280]** *Late Prehistoric Food Choices in the Upper Great Lakes Region: Evidence from 20OT283 and 20OT3 in the Lower Grand River Valley of Michigan*

Research into Late Prehistoric subsistence strategies used by residually mobile hunter-foragers in the Upper Great Lakes region indicate that there is a complex interplay in the choices made between the exploitation of natural resources and the incorporation of maize and other domesticated plants into those economies. Recent excavations of food processing and storage features coupled with soils analysis elucidating their depositional histories at two Late Prehistoric sites have provided new insights into the nature of these adaptations. Paleobotanical, phytolith, organic residue, and faunal analysis indicate that wild rice, aquatic tubers, and sturgeon are also important components of the traditionally assumed dominance of deer, nuts, and maize as key subsistence resources during this period.

Traditional approaches to the Iron Age have constructed complex chronologies based on artifact typologies, mainly pottery and metal, with radiocarbon dating being long neglected. Such views are now untenable, with recent Iron Age research showing that typological dating produces sequences that are regularly too late. Furthermore, regional syntheses anchored by chrono-typologies fail to provide a robust analytical methodology for better understanding the nuances of the settlement landscape and social dynamics. This paper will explore the interim results of the Leverhulme-funded "(Re)Dating Danebury hillfort" project, which aims to use radiocarbon dating and Bayesian modelling to gain better understanding of the timing of construction, remodeling, and abandonment of Danebury hillfort and nearby sites, and to investigate how the archaeologically visible transformations at the different Iron Age sites relate to one another chronologically across the region. This new artifact-independent chronology is being used critically to reassess the existing pottery sequences and the social interpretations produced by the original Danebury project, and secondly, to develop fresh perspectives on the settlement dynamics of the area.

Hammer, Emily (University of Chicago)**[14]** *Mobile Pastoralists and Lowland-Highland Interconnectivity in Southeastern Turkey*

In Turkey and other mountainous parts of Eurasia, archaeologists have primarily targeted lowland sites for investigation, leaving highland areas relatively unexplored. Drawing on ethnography of twentieth-century tribes, scholars have assumed that mobile pastoralists were one of the major agents connecting lowlands and highlands in all post-Neolithic periods. However, little data has been collected on such people or on mobility practices. In this paper I briefly review empirical evidence for the origins of vertical transhumance in Turkey, and present a recent analysis of survey data showing how mobile pastoralists of the last 500 years in southeastern Turkey moved through and improved their local landscapes. The data suggest that vertical transhumance may not have been as widespread in the ancient past as archaeologists have traditionally assumed, but this could be due to biases in the collected evidence. More surveys and excavations focused on upland areas, like the presented case study, are necessary for understanding the role of pastoralism in long-term connections between highlands and lowlands, and for shifting the conversation concerning highlands and mobility away from common tropes such as such as the exteriority of mobile groups to state level societies, the “invisibility” of pastoralists, and pastoral degradation of the environment.

Hancock, R.G.V. [140] see Hawkins, Alicia

Hand, Bianca (College of Wooster) and P. Nick Kardulias (College of Wooster)**[51]** *Hellenistic and Roman Votive Sculptures as Markers of Foreign Influence on Cyprus*

The Hellenistic and Roman periods on Cyprus (310 B.C.- A.D. 330) were times of transformation. Drastic changes in politics such as the movement of the island capital to Paphos, new coinage, and the introduction of Christianity into the region had pervasive and deep consequences throughout the island. These changes can be traced through the artistic record, specifically through votive statues, since these can be seen as a reflection of social and political conditions in the region. As one of the

premiere forms of expression and identity, art can be used to gauge the level of foreign influence a culture has been exposed to. As values and social structures change, so does their visual representation. By tracking these changes, one can determine different styles and discern vital information about past foreign interaction. By interpreting terracotta figurines found in religious sanctuaries at Athienou-Malloura and surrounding sites such as Golgoi, Arsos, and Salamis, this study seeks to determine the level of foreign influence in the region and whether or not it had an impact on the religious and/ or ritualistic practices of the sanctuaries and the types of people giving these offerings.

[162] *Subsistence and Site Function in Historic Contexts*

The empirical integration of large, composite, datasets drawn from published sources has seen recurring interest among archaeologists seeking to trace trade, cultural influence, and subsistence patterning. Following Landon's call for increased data comparison in historic archaeology we investigate the potential to integrate zooarchaeological and ethnobotanical metadata from Anglo-American contexts in the 16th to 19th centuries in the Northeastern United States and Canada. This poster presents our findings on the influence of cultural and environmental patterning in subsistence practices using floral and faunal datasets from forts, farmsteads, and villages. Results highlight the inter-related nature of cultural and environmental factors on human subsistence and present a holistic view of subsistence patterns within the Anglo-American colonies. Statistical comparison of sites by function increases our understanding of the influence of local environments on colonial diets and may inform upon future investigation of social status, chronological subsistence change, agricultural niche construction, and cross cultural comparisons.

Hanks, Bryan (University of Pittsburgh, Department of Anthropology), Chuenyan Ng (University of Pittsburgh, Department of Anthropology), Roger Doonan (University of Sheffield, Department of Archaeology), Elena Kupriyanova (Chelyabinsk State University) and Nikolai Vinogradov (Chelyabinsk State Pedagogical University)

[345] *Redefining Subsistence Practices and Strategies at the Local and Micro-regional Scales in the Context of Late Prehistoric Trans-Eurasian Food Globalization*

The diffusion of metalworking, horse-drawn transport, and use of domesticated plants and animals across the Eurasian steppes and forest-steppes have dominated recent scholarly discussions of second millennium B.C.E. socio-economic development. The term "globalization" is routinely used to characterize these early processes and key horizons of technological development. This paper draws on recent archaeological field research in the Southern Ural Mountains of the Russian Federation to emphasize the importance of modeling local trajectories of trade and exchange in addition to the resilience of local and micro-regional scale ecological adaptation and socio-economic strategy. This seven-year program of field research has provided the foundation for examining more effectively complex practices of food use as embedded within broader trends of subsistence practice, conflict and warfare, and pan-Eurasian technological development. Data from regional survey, settlement patterning, zooarchaeology, paleobotany, and stable isotopes from human and faunal remains will be drawn on to redefine late prehistoric subsistence practices and strategies in north central Eurasia.

[350] *Understanding the Paleogeography and Maya Ditched Fields along the Rio Hondo, Belize and Mexico*

In recent years, we have identified numerous sets of ditched agricultural fields along the Rio Hondo

floodplain. In this paper we examine the paleogeographic and archaeological contexts of these fields. The commonalities of their settings offer perspective on their social functions and insight into who controlled them and how this control was manifest into settlement patterns. We discuss the geography of the riverine zone, the settings in which ditched fields are found and known related archaeological data, which in some respects is still too limited. Finally, we turn to our work in identifying and confirming intensive agricultural systems, their extent and importance in the political economy of the ancient Maya.

Hanselka, Kevin, Leslie Bush (Macrobotanical Analysis) and Phil Dering

[256] *The Archaeobotany of Kelley Cave (41VV164): A Glimpse of Prehistoric Plant Use in the Lower Pecos Region of Texas*

Sheltered sites in the Lower Pecos region of Texas are renowned for their spectacular plant preservation. Recent excavations in Kelley Cave (41VV164) in Eagle Nest Canyon yielded abundant well-preserved plant remains within Feature 4, a large pit thought to represent an earth oven facility with a complex history of use and abandonment. Most of the plant materials from Feature 4 probably represent the accumulation of waste products of plant foods prepared in other nearby earth ovens, intermingled with manufacturing waste produced as agave and sotol leaves were stripped into fiber for twisted twine or for weaving mats or baskets. These materials illuminate ecological interrelations between the prehistoric site occupants and the surrounding natural landscape, and have implications regarding: preferences and selection of local plants for food and fuelwood; behavioral patterns of food plant harvesting and processing; modification of plant parts into material culture such as tools, cordage, and textiles; seasonality of site use; and the nature of past environments surrounding the shelters at time of site occupation. In this paper we present the results of an ongoing archaeobotanical analysis of the plant materials from Feature 4 and from other contexts within Kelley Cave.

[170] *Guns, Shipwrecks, and Investigations of Spanish Colonial Trade and Privateering in the 17th Century: The Chagres River Maritime Borderland, Panamá*

For more than 500 years, Panamá's Chagres River has been a nexus for maritime activity. The river served as the original trans-isthmian passage between the Caribbean Sea and the Pacific Ocean where precious metals, gems, and other commodities were transported in support of Spain's empire and mercantilist policies. The wealth created by this trade led to the establishment of Spanish cities, ports, and fortifications on either side of the isthmus protecting the maritime borderland of Spanish holdings from the rest of the world. Panamá City became a strategic and geographic focal point connecting the Caribbean and the Pacific and the promise of wealth attracted many to seek their fortunes in this borderland. In 1670, the English privateer Henry Morgan amassed the largest fleet of privateers and pirates in the history of the Caribbean to attack Panamá and disrupt Spain's trade network. Using the Chagres River to cross the isthmus, he sacked Panamá City and dealt a substantial blow to Spain's control in the New World. Recent archaeological investigations have resulted in the study and interpretation of material culture related to Morgan's lost ships and a shipwreck whose remains and cargo symbolize Spain's economic hegemony within this maritime borderland.

[205] *Bioarchaeology, Barbados, Eastern Caribbean: Isotopic Analyses of Teeth and Bone from Human Remains*

Bioarchaeological studies have grown in sophistication and are now helping test assumptions about island garden agriculture (palm, cassava and/or maize) and the relative contributions of marine proteins. Bone and teeth samples from five sites on Barbados were processed by Center for Applied

Isotopic Studies, University of Georgia and data are reported for $\delta^{13}\text{C}_{\text{co}}$, $\delta^{13}\text{C}_{\text{ca}}$, $\delta^{15}\text{N}_{\text{co}}$, and $\delta^{18}\text{O}_{\text{ap}}$. Stable isotope ratios, adjusted ratios, and apatite-collagen spacing correspond with results from elsewhere in the Lesser Antilles. After adjustment, all of the $\delta^{15}\text{N}$ bone and teeth samples are within the food web range for marine protein resources. Adjusted values for samples from Heywoods, Chancery Lane, Goddard, and Light & Power sites are indicative of a mollusc diet. A Shell Oil site sample has a value indicating terrestrial resources (fauna or C3 plants). Shell Oil and Goddard site samples $\delta^{18}\text{O}_{\text{ap}}$ values suggest use of brackish coastal springs. The $\delta^{18}\text{O}_{\text{ap}}$ values for Chancery Lane, Heywoods, and Light & Power match values expected for springs originating from upland coral terraces on Barbados, or might indicate off-island origins.

Hansen, Richard

[408] *The Mirador Basin: A Synthesis of Research and Conservation Programs in northern Guatemala*

Major research programs in the Mirador Basin of northern Guatemala and southern Campeche, Mexico, have provided new data relevant to the origins, dynamics, and collapse of complex societies in the Maya Lowlands. Data suggests that the origins of sedentary societies began earlier than previously thought, and that the dynamics of complexity included complex agricultural sophistication, elaborate communication and trade systems, logistics development, and vast political, economic, and social dominance within the circumscribed region primarily in the Middle and Late Preclassic periods of Maya civilization. Furthermore, the factors that gave rise to socio-political complexity were damaged by a multitude of issues, including climate change, inept leadership, and a conspicuous consumption of resources resulting in the collapse of the major centers of the Basin near the end of the Late Preclassic period (ca. A.D. 150). Subsequent research has demonstrated the roles and activities of subsequent inhabitants in the monumental sites within the Basin and clarified the settlement distribution and formation of Maya societies living within the ruins of the ancient Kan kingdom. New conservation strategies for art and architecture at several major sites within the Basin have also provided protective measures and consolidation practices that have proven useful and productive.

[254] *Intentional Destruction of Cultural Heritage: Evidence in Syria and Iraq*

The current conflict in Syria and Iraq serves as a dramatic case study of intentional damage to cultural heritage during conflict. This paper details examples of damage that can be detected using high-resolution satellite imagery in coordination with local ground documentation and verified media reports. These examples are part of the analysis done by the American Association for the Advancement of Science's (AAAS) Geospatial Technologies Project "Developing a Research Community and Capacity for the Study of Cultural Heritage in Conflict" funded by the National Science Foundation and in connection with the Smithsonian Institution and the University of Penn Museum's Penn Cultural Heritage Center. The type of damage varies according to the site, location, and degree to which it has seen active conflict, sectarian strife, and population displacement. As the extent of destruction caused by ISIS (ISIL or Da'ash) increases, and the violence in Syria and Iraq expands, it is vital to better understand the link between ethnic or sectarian violence and damage to cultural heritage sites. This paper illustrates this link using satellite imagery coupled with traditional and social media reports of incidents to contribute to the much-needed systematic documentation of human rights violations in this conflict.

[311] *Illicit Trade Networks in Spanish Texas*

This poster presents the results of an investigation of the contraband market and frontier trade networks that existed in Spanish Colonial and Mexican Texas. The archaeological record dating to the late 18th and early 19th centuries in San Antonio is defined by the appearance of English-made goods, predominately refined English earthenwares, illegally imported from New Orleans. This investigation compared artifact collections and documents from the Bexar Archives spanning the Colonial Period through Mexican Independence to examine the origins of contraband trade in Spanish Texas and to document the changes in the illicit goods market during this period. The results suggest that although the French/Spanish illicit trade networks in the mid-1700s are widely considered to constitute the “golden age of Spanish smuggling on the Texas-Louisiana frontier,” (Galan 2008: 203), significantly more evidence of contraband trade exists in both the archaeological and archival records following the Louisiana Purchase in 1803. The evidence recovered through this study highlights the complex social relations and trade networks involving Tejanos, Anglo-Americans, indigenous groups, and a wide range of other players who had a significant role in the development of the region’s identity in the 19th century.

Hanus, Kasper Jan and Emilia Smagur (Institute of Archaeology, Jagiellonian University)

[286] *“Reconstructing” an Archaeological Landscape of NW Cambodia beyond the Borders of the Greater Angkor Using Satellite Imaging*

Prehistoric and historic societies have established the material dimension of space through either the physical alteration of the landscape or the formalized recognition of space. Although the latter aspect is rather difficult to trace archaeologically through the use of aerial images, physical modifications of the landscape are often still visible. The northern part of Tonle Sap basin were subjected to intensive survey using satellite imaging in order to identify anthropogenic adjustments on the surface. As a result, a wide range of archaeological features, primarily occupational mounds, moats and field systems, were recognized. Documented structures reveal a populated landscape of rice farmers who cultivated their fields radiating from the circular, inhabited mounds. At substantial parts of several sites, past inhabitants took a further step to alter their environment by digging a moat. The current issue that is under an extensive investigation is to understand how this landscape contributed the cultural processes that shaped the Greater Angkor as a low-density urban complex.

Hard, Robert (Univ of Texas at San Antonio), Jacob Freeman (University of Texas at San Antonio) and Raymond Mauldin (University of Texas at San Antonio)

[167] *Considering Robustness and Vulnerability in Texas Hunter-Gatherer Social-Ecological Systems Using Stable Isotope Data*

We analyze stable carbon and nitrogen isotopic data from over 200 foragers from inland, riverine, and coastal settings on the Texas Coastal Plain. Prehistoric foragers on the Texas Coastal Plain faced the challenge of maintaining a robust supply of food despite constant changes in their environments, including seasonal changes and changes that occurred over decades-to-centuries, like climate change and sea level rise. Given that coastal estuaries and inland river valleys had resources that peaked during different seasons, the best strategy for maintaining a consistent supply of food should have been to move between both settings on a seasonal basis. However, this strategy may have engendered vulnerabilities to longer term climate changes and periods of rapid sea level rise. The generally high productivity of coastal settings was, at various points, reduced by rapid sea-level rise, while inland climate change, such as periods of aridity, affected productivity of terrestrial ecosystems. Therefore, were subsistence regimes established by foragers on the Texas Coastal Plain sensitive to periods of aridity and rapid sea level rise or were subsistence regimes robust to such long-term environmental changes? Our study has implications for understanding the ability of human societies to cope with environmental change at multiple scales.

Hardy, Thomas (University of Pennsylvania)**[411]** *Hybridized Objects and Colonization Practices: Ceramics from Minaspata, Cuzco, Peru*

In recent years, archaeologists studying ancient colonialism have shifted from a top-down view, emphasizing “colonizers” and “colonized,” to a more careful consideration of how local social practices are situated in global colonial structures and dynamics. Material cultures and technologies play a crucial role in this colonial encounter, as material objects manifest and actively transmit signs of ideology, power and resistance. Minaspata, a local site located in the Cuzco Valley of the south-central Andes, provides an interesting case study to explore the role of material culture in colonization processes, particularly as these objects change due to cultural interaction and hybridization practices. This paper will present evidence from ceramics recovered during recent excavations at Minaspata, focusing primarily on surface decoration and paste composition, in order to explore certain facets of the materiality of these objects, and the social dynamics which such apparent cultural transference and appropriation might entail. In this discussion, I will explore two potential examples from Minaspata and the larger Cuzco region, both of which involve the social dynamics of colonialism, but in different ways: one involving the Wari colonization of the area during the Middle Horizon, and the other involving the consolidation of the Inca state.

Hare, Timothy (Morehead State University) and Marilyn Masson (SUNY, University at Albany)**[194]** *Tracking Luxury Craft Production across Mayapán's Physical and Social Landscapes*

Considering luxury production activities in Mayapán's urban landscape reveals new data regarding a complex and diverse economic system. We explore the evidence for luxury production activities at households attached to elite palaces at this Postclassic Maya capital city. Surplus crafting at Mayapán varied according to scale, intensity, and the value of surplus items. Crafting of valuables such as effigy censers, figurines, copper objects, and stucco sculptures, was more closely supervised (or performed by) elites compared to the majority of the city's workshop goods that were independently produced and circulated freely via marketplace exchange.

Harke, Ryan**[223]** *Discussant***Harkey, Anna (University of California - Berkeley)****[237]** *Walls Speak: Architectural “Neighborhoods” in Late Intermediate Period Peru*

In the Yanamarka Valley in central Peru, the Late Intermediate Period saw dramatic changes. Whole villages moved from the valley floors to dense, defensible hilltop settlements, and were still living there when the Incas colonized this region a century later. The remote locations of many of these sites – both those forcibly abandoned under Inca rule, and those which continued on into the early Colonial Period – mean that numerous domestic round houses, storage spaces, patio walls and pathways still stand relatively undisturbed. At first glance their pirka architecture may seem uniform, but a closer look shows variation ranging from subtle differences in stone shapes, sizes, or mortar thickness, to more striking decorative embellishments. Morphometric and spatial analyses of these attributes reveal both the wide range of stylistic choices made by their makers, and the subtle ways in which those choices varied from one area of a site to another as well as through time. These patterns offer a glimpse into the community of those who built and used these houses, reflecting neighborhoods of shared practice, possible kinship ties, or perhaps even the areas where residents of Middle Horizon villages had settled and, together, built their new homes.

Harkins, Kelly [384] see Buikstra, Jane

Harkleroad, Eric**[131]** *A New Approach to Warfare*

Lines of evidence, such as weapons, skeletal remains of victims of trauma, iconography, fortifications, etc., that are typically used to argue for the presence or absence of warfare in a society are often ambiguous. As a result, researchers frequently reach contradicting conclusions from the same data. In situations where there are few material remains this problem is magnified, making it hard to draw conclusions about warfare. I put forward a new approach to the discussion of warfare that shifts the focus away from the presence or absence of armed combat and instead looks at the spatial distribution of the material remains in society, circumventing some of the problems with previous approaches. I utilize Practice theory, focusing on the idea of habitus, to look at the place of warfare in everyday life. While I am primarily concerned with the difficulties of identifying warfare through material remains and the application of Practice theory to the study of warfare I discuss these topics using Maiden Castle in Dorset England during the Iron Age as an example of how this approach can meaningfully implemented.

Harkness, Rebecca (Arizona State University)**[273]** *Social Diversity and Public Interaction Space in Classic and Postclassic Mimbres*

In the Mimbres region of the US Southwest there is a substantial increase in the diversity of ceramic wares between the Classic (A.D. 1000-1130) to the Postclassic (A.D. 1250-1450) periods. As an increase in ceramic diversity could indicate the presence of a more diverse community, it is possible that Postclassic settlements would experience greater challenges in creating and maintaining social relationships within a settlement. Weissner (1983) suggests that people's sense of predictability of others behavior can be contributed to similarities in material culture. I am interested in understanding whether the diversity indicated in the pottery is associated with efforts to manage social interactions. In this study I quantify the diversity of painted ceramics at Classic and Postclassic villages along with the extent of enclosure of plazas which are main areas of social interaction in the villages. Taking ceramic diversity as a measure of social diversity and potential social unrest, I expect that where ceramics are most diverse, plazas will be more enclosed such that people can observe each other on a day-to-day basis.

Harmansah, Omur (University of Illinois at Chicago) and Peri Johnson (Independent)**[47]** *Landscape Archaeology and Political Ecology in Anatolia: The Yalburt Yaylasi Project 2014 Season*

Since 2010, Yalburt Yaylasi Archaeological Landscape Research Project has been investigating the politics of Hittite borderlands in a region known as Pedassa in antiquity, currently located within the Turkish province of Konya. In the 2013 and 2014 seasons, the project focused on the Kuru Gol Basin, a dried lake basin within the survey region, where Turkey's largest coal-operated power plant

and its open pit mine is planned in the next few years. Due to recent marginalization of this waterless landscape of resilient pastoral communities, previous archaeological projects assumed the Kuru Gol Basin and the highlands around Yalburt Yaylasi to be archaeologically empty, therefore supporting the decision to build the power plant. Instead, the Yalburt Project team's work in the last two seasons documented a rich archaeological landscape of settlement mounds, cemeteries, fortresses, caves, and lowland settlements in the Kuru Gol basin. Following the Yalburt Project's recommendation, the regional preservation council of Konya Province has registered numerous sites as first degree archaeological sites, thereby slowing down the imminent construction plans of the power plant. In this paper, the authors present the preliminary results of the 2014 season as well as the political ecology of the Kuru Gol Basin.

Harrington, Lucy and Natalie Clark (Bureau of Land Management Grand Junction Field Off)

[260] *Predicting Archaeological Site Locations in the McInnis Canyons National Conservation Area in Colorado*

Archaeological predictive models are used in two main applications to 1) identify areas of cultural resource sensitivity in an unsurveyed area and 2) better understand historic and prehistoric use of a landscape. The model created here straddles these two applications, serving to predict cultural resource sensitivity in the primarily unsurveyed McInnis Canyons National Conservation Area (MCNCA), and to understand the distribution of known sites in that area. The Bureau of Land Management (BLM) manages the NCA and its resources. The goal of this predictive model is to aid the BLM in the management of the cultural resources within the MCNCA and better understand which areas may have been important prehistorically and historically. McInnis Canyons is a relatively new national conservation area, less than 10% of it has been surveyed for cultural resources. A predictive model is extremely useful to the land managers in this case. Hopefully it will aid in decision making processes and facilitate the creation of new recreation facilities. Predictive models have been met with varying success rates. The predictive model created here was at least partially successful during initial testing, further inventory will prove its utility.

Harrington, Katherine (Brown University) and Linda Gosner (Brown University)

[368] *Daily Deeds and Practiced Patterns: Using Interdisciplinary Collaboration to Advance the Study of Daily Life in the Classical Mediterranean*

The patterns of daily life are vitally important to our understanding of the past. What people do to make ends meet, to worship their gods, and to take care of their families and property help define a culture and create identity. However, the routine practices of non-elite people, often occurring in non-monumental spaces, have often not received significant scholarly attention, especially in Classical Archaeology. However, since 2013, an interdisciplinary group of graduate students from six departments at Brown University has met bi-weekly to discuss recent advances in the study of daily life in the past worldwide and to "workshop" dissertation chapters and other student work. The research of our workshop participants spans four continents and 4,000 years of human history. Our workshop has covered topics such as settlement and household archaeology, rural archaeology, resource acquisition, agriculture, and craft production in our various fields of research. We, the two workshop organizers, here present the ways in which a comparative focus on these themes can help re-conceptualize and reinvigorate the study of daily life in our own field of research, Classical Archaeology.

Harris, Matthew (URS Corporation) and Grace Ziesing (URS Corporation)

[48] *Pennsylvania Predictive Model Set – Realigning Old Expectations with New Techniques in the Creation of a Statewide Archaeological Sensitivity Model*

Sponsored by the Pennsylvania Department of Transportation (PennDOT), this project endeavored to create a statewide Archaeological Predictive Model (APM) based on the known locations of over 18,000 recorded pre-contact archaeological sites within the Commonwealth. The purpose of this

project was to create a set of sensitivity maps to aide in transportation planning and assist in the cultural resources management process. The creation of an APM covering 46,000 square miles required the development of a new set of computational and statistical tools for the storage and management of massive datasets, the use of parallel and “cloud” computing to apply modern statistical methods, and the adaptation of data science techniques developed in fields such as biology, ecology, and medicine. While the resultant approach was grounded in the lessons of nearly 40 years of APM study, the project demanded a fundamental rethinking of our field’s approaches and expectations. This presentation will explore the project’s mission, outline the computational framework and statistical methods used, evaluate the findings, and discuss the benefits and challenges of such an approach.

Harris, Susan, Rainer Schreg (RGZM, Mainz), Corina Knipper (Curt-Engelhorn-Center, Archaeometry) and Lynn Fisher (University of Illinois Springfield)

[93] *Communities of Archaeological Inquiry: Documenting a German Neolithic Landscape in Cooperation with Avocational Archaeologists*

This poster explores the history, methods, motivations, and contributions of three avocational archaeologists whose lifelong legacies helped to shape an international research project on the Neolithic settlement of the southeastern Swabian Alb in Germany. Their efforts to document site locations and build significant private collections span three generations, from the 1920s to today, and led to the discovery of a rich archaeological landscape previously unrecognized by professional archaeologists. In the context of cultural heritage preservation law in the state of Baden-Württemberg, we consider the history of relationships between avocational and professional archaeologists and the benefits and pitfalls of scientific cooperation between these groups. We argue for the importance of documenting private collections and developing such partnerships for the success of regional settlement pattern studies. For example, due to local knowledge of the landscape, access to community networks, and opportunity for year-round observation, most site locations were identified by avocational archaeologists. Also, larger and more diverse surface collections were amassed than was possible for our short-term systematic surveys. At the same time, communication between professional and avocational archaeologists can lead to more systematic documentation and reporting of private collections. We reflect on strategies for improving and strengthening such cooperative efforts.

[105] *Small is not Necessarily Bad: 2000 Years of Sustained Habitation on Ebon Atoll, Marshall Islands*

Islands have long been extolled as ideal ‘laboratories’ where comparative analyses between high volcanic, continental, makatea (or raised limestone) and low coral islands or atolls have provided insights into the speed and tempo of social, technological, and economic change of insular societies over centuries to millennia. The severity and chronology of human impacts on pristine landscapes is a common theme in island archaeology. Ironically, the diminutive atolls—most only a few square kilometers in land area—exhibit some of the best evidence for ancient societies living sustainably. Totalling less than 6 km² in land area, Ebon Atoll, southern Marshall Islands, consists of 22 islets that surround a 104 km² lagoon. At nearly 2 km long, Ebon has the largest pit agricultural system of any atoll that parallels a near-continuous habitation zone. A multi-year archaeological program resulting in more than 100 m³ of excavations is used to examine a 2,000 year record of continuous occupation. Here, we key on the records of shellfish and finfish exploitation to show that, unlike other island types, atolls may exhibit some of the best evidence for humans living sustainably.

Harris, Alison (Dept. of Archaeology, Memorial University of Newfoundland) and Vaughan Grimes (Dept. of Archaeology, Memorial University of Newfo)

[112] *Exploring Human-Canid Interactions among the Dorset Using Stable Carbon and Nitrogen Isotope Analysis*

The scarcity of clearly identifiable dog bones and artifacts associated with dogsled traction has led many archaeologists to posit that the Dorset did not keep domestic dogs. While this statement has

implications for the ability of the Dorset to cope with the variability of the arctic environment, it may also be an oversimplification of the problem. Canid remains do occur on Dorset sites, albeit in low numbers, but they are not identifiable to species based on skeletal morphology alone due to the similar size of large domestic canids and wolves. We apply stable carbon and nitrogen isotope analysis to the remains of large canids recovered from Groswater and Middle Dorset sites in Newfoundland, Canada, in order to determine the major sources of protein consumed by the canids. The stable isotope data indicate that, like the Dorset humans, the Dorset canids consumed a significant amount of marine-derived protein. The results are also consistent with stable isotope data from other domestic canids kept by archaeological, marine-adapted populations. This suggests the occasional, idiosyncratic possession of domestic canids by the Dorset in Newfoundland.

Harris, Megan

[122] *Replication of Stone Disk Beads from the Salish Sea Region, British Columbia*

This poster presents the methods and results of experimental replication of stone disk beads from the Salish Sea region along the south coast of British Columbia. This particular type of beads is abundant across the region and found in a variety of contexts. Despite their ubiquity, little is known about their production.

Through this poster, I discuss the methodology of the four experiments I conducted to replicate these types of beads using similar lithic raw materials, tools, and methods to those used in the past. Experimentation involved the alteration of production techniques (individual vs. mass production) and production tools (stone vs. bone and stone). The purpose of bead replication seeks to provide suggestions for methods and strategies in production.

Harris, Kathryn (Washington State University)

[300] *The American Falls Obsidian Source: Near, Far, or Unknown?*

Harris' 2011 Master's thesis sourced obsidian artifacts from the Kyle Canyon Spring site (10-BT-8). Obsidian source characterization suggested a large circulation range for the prehistoric people using site 10-BT-8, with strong emphasis placed on the American Falls obsidian source. This result was unexpected, given that it is 120km from 10-BT-8 and a nearer, arguably higher quality obsidian source is only 50km away. In my thesis, I concluded that the people occupying 10-BT-8 over the last 3,000 years were utilizing both distant and local obsidian sources while moving over a wide area of southeastern Idaho. However, newer evidence points to multiple outcrops of the American Falls obsidian source with unique geochemical signatures near the site. Using a Correspondence Analysis of trace element data recorded during obsidian sourcing, I show that there is strong statistical support for other outcroppings of the "American Falls" obsidian source. Ultimately, this could drastically change interpretations made in my thesis as well as influencing future interpretations of obsidian sourcing results from other Idaho archaeological sites.

Harrison, Ramona (City University of New York)

[351] *The Gásir Market and the Möðruvellir Farm: A Cross-Disciplinary Approach to the History of Human Ecodynamics in High Medieval Iceland*

This paper reconciles the results of the long-term Gásir and Hinterlands Project with the underpinnings of historical research of the area. The harbor and trade site complex at Gásir and the monastic estate at Möðruvellir were central areas in the region. Zooarchaeological and environmental data from these sites and hinterlands sites suggest that Hörgá Valley as closest supplier of animal products, may have changed its livestock management strategies, potentially to partake in increasing internationally oriented exchange. Archaeological data from Hörgá Valley farming sites, from the Siglunes fishery in Siglufjörður, and the central sites will be evaluated. Historical data will provide a general idea of site status, land ownership, and livestock numbers. Evidence from both disciplines serves to address the following research questions: 1) Can the historical evidence together with the zooarchaeological/environmental evidence demonstrate sustainability of Hörgá Valley farming economy? 2) Is it possible to evaluate the degree of the

economic effect that international exchange had on the economy in comparison with the size of peasant subsistence farming?

Harrison-Buck, Eleanor (University of New Hampshire)

[350] *Ancient Maya Wetland Features in the Eastern Belize Watershed*

The Belize River East Archaeology (BREA) project is examining the wetlands of the eastern Belize Watershed. Within this 6000 km² study area, there exists 122 km² of perennial wetlands (28% of all wetlands in Belize). Here we report on the beginning stages of our investigations of an expansive wetland area in the northern part of the BREA study area. Through aerial survey we have identified ditched and drained fields and other canal features that resemble ancient wetland features found elsewhere in Belize and the Gulf Lowlands. Our long-term research goals are: 1) to document the history and aerial extent of wetland use and surrounding Maya settlement; 2) to examine the relationships that exist between wetland agriculture and climate change; and 3) to understand the local and regional economy of wetland agriculture and aquaculture, specifically during the Late-to-Terminal Classic Transition (ca. A.D. 750-900)—a period characterized by long-term drought, political collapse, and shifting political economies in the Maya Lowlands. With attention focused on the associated settlement, this project will shed light on the populations wetland environments were able to support and the role wetlands may have played in both local and regional economies through time, particularly during periods of extended drought.

Harrod, Ryan (UAA)

[229] *No Big Dudes Here: Bioarchaeology of Social Control at Aztec Ruins*

The discussion of elite leaders in the Greater Southwest has primarily focused on Chaco Canyon. This project extends that discussion to the later site to the north called Aztec Ruins. Because of its size and some architectural similarities to sites in Chaco Canyon, it has also been suggested to be a regional center with considerable political-economic power. Morris recovered a number of human skeletal remains from Aztec Ruins between 1916 and 1922. One burial in particular is of interest because Morris suggested in 1924 that this male might represent a warrior based on the items that he was buried with. The characterization of warrior status has led some to argue he was an elite leader of the community. The intent of this research was to assess the validity of the warrior/leader hypothesis by comparing this individual to all other burials recovered from Aztec Ruins and then to compare Aztec Ruins with Chaco Canyon burials. Analysis of 55 individuals recovered from Aztec Ruins, as well as prior research conducted at Chaco Canyon, indicates how social control may have been carried out within a number of different social processes that do not fit a model of powerful elites and passive servants.

[287] *3D Modeling – Breakthrough or Fad? Bronze Age Towers in Oman and Excavations of an Aksumite Town in Ethiopia*

Three-Dimensional modeling is rapidly transforming reconstruction, visualization and conceptualization of ancient architecture. Many archaeologists are enthusiastic about 3D modeling and implementation of 3D methodologies has been rapid; others remain skeptical that the outcomes of 3D modeling justify the time and resources expended. This paper considers the strengths, weaknesses, and future prospects of 3D models. We discuss results of two projects that used photogrammetry and advanced GPS to model a Bronze Age tower monument in Oman, as well as

stratigraphy and sub-surface architecture of an Aksumite town in Ethiopia. Major issues considered include the role 3D models play in: 1) cultural heritage management, public outreach and archiving a digital record of archaeological remains, 2) revealing the design of ancient architecture and monuments as compared to more traditional methods of drawing, and 3) illuminating the social and political dynamics of ancient societies.

[119] *ENSO and the Rabbits of Baja California*

The El Niño/Southern Oscillation (ENSO) is a major source of climatic variation worldwide, with significant impacts on modern human and animal populations. However, few detailed records exist on the long-term effects of ENSO on prehistoric vertebrate populations. Here we examine how lagomorph deposition rate, population age structure and taxonomic composition from Abrigo de los Escorpiones, a well-dated, trans-Holocene vertebrate fauna from northern Baja California, Mexico, vary as a function of the frequency of wet El Niño events derived from eastern Pacific geological records. Faunal indices vary significantly in response to El Niño based precipitation and sea surface temperature, with substantial moisture-driven variability in the middle and late Holocene. The late Holocene moisture pulse is coincident with previously documented changes in the population dynamics of other vertebrates, including humans. As the frequency and intensity of ENSO is anticipated to vary in the future, these results have important implications for change in future vertebrate populations.

[273] *When Do You Stop and Why? Site Boundary Definitions at University Indian Ruin, Pima County, Arizona*

Not much is found in the scholarly literature regarding site boundary definitions: boundaries defined for management purposes may be different from precolumbian geographical boundaries. This is the case at University Indian Ruin (UIR), a 13-acre parcel listed on the National Register of Historic Places, and owned by the University of Arizona. Homeowners in the neighboring community, also listed on the National Register as Indian Ridge, routinely retrieve sherds while performing yard maintenance showing that the UIR site extends past its current managerial boundaries. Survey and test pits in Pima County rights-of-way help Pima County understand what subsurface deposits they have to manage. The juxtaposition of the two testing methods also inform on the usefulness of Class III survey in such heavily disturbed contexts. Finally, a new site boundary for UIR is suggested.

[366] *Re-discovering the Copan Sub-Stelae Caches: A Collection Stewardship and Re-Identification Project*

Beginning in 2013, the authors have engaged in an archaeological collection stewardship project at the ceramic artifact repository in the Centro Regional de Investigaciones Arqueológicas at Copan, Honduras. Responding to a request from the Instituto Hondureño de Antropología e Historia to address a serious concern that the contextual information had become separated from hundreds of

objects, we initiated a re-identification process to ensure the long-term care, access, and use of the ceramic collections. Focusing first on the famous Copan sub-stelae and altar caches, the authors established a protocol that can be carried forward to numerous other objects from excavated contexts. As a result of the work, the objects and their ritual context are being re-analyzed seventy-five years after their discovery in light of new technological breakthroughs. The work underscores the importance of collection stewardship coupled with archaeological training both for archaeologists and local institute managers.

Hartley, Corey (Kleanza Consulting Ltd.) and Lap Kwan Tang (Kleanza Consulting Ltd.)

[121] *Utilizing Tablets for Mobile Data Recording in a CRM Context*

This poster session illustrates the effective utilization of tablet computers in archaeology using a cultural resource management (CRM) case-study. CRM in British Columbia requires rapid turn-around times between site identification, investigation, reporting, and project development. This dynamic makes tablets ideal for generating complex datasets from archaeological sites in short periods of time. Digital data can be imported into GIS or database management systems immediately, without transcription or data processing. We were able to make alterations to project footprints day-by-day that effectively avoided archaeological site boundaries and management zones. During our 2014 field season, we customized FileMaker, a relational database application useable on both PC and iPad tablets to collect typological, metric, geographical, and photographic image data. The tablet enables users to control, share and store data in the field. This creates fewer inconsistencies in reporting and allows for more accessibility, making it possible for informed management decisions to be made in the field. This accessibility of data through the use of tablets can transfer to all aspects of CRM and allow for data sharing on the macro scale.

[322] *Where Does Your Community Live? The Trowelblazers Experience*

The TrowelBlazers project is a community-sourced digital archive of short biographies and images of women whose significant contributions to the fields of archaeology, geology, and paleontology have often been overlooked. Originating in a conversation on Twitter between four early-career researchers, the project began life as a Tumblr blog designed to share inspirational images and stories of women researchers in the past. Different social media accounts allow us to interact with a number of communities, including students, academics, professional archaeologists, archivists, and museum staff, as well as members of the general public and professional organizations. We have had coverage in mainstream media, hosted a Wikipedia editathon, coauthored a chapter in an ebook, and written several guest posts on blogs of like-minded collaborating organizations, such as institutional archives. By not only focusing on individual women but also identifying the networks in which they worked, we have been able to develop a uniquely connected approach with multiple partners in real-world engagement with advocacy groups and the wider public. This paper explores how understanding how multiple audiences engage with different social media, online, and real-life aspects of the TrowelBlazers project is key to maintaining interest, creating new content, and building awareness of women's contributions.

Hastorf, Christine (University of California-Berkeley)

[414] *Agriculture Is a State of Mind: The Andean Potato's Unending Domestication*

Most scholars agree that territoriality and commitment to a landscape participated in the domestication syndrome and agriculture. The geophyte *Solanum*, the potato, is a particularly engaging crop to study domestication origins, being a stem tuber, with wild species growing throughout the Andes of South America, it is only with recent genetic research that we know its likely

location of domestication. Wild potatoes continue to be found in potato fields today, aiding the diverse varieties still being domesticated in the Andes. When we study early potato farming in the Andean highlands we rely upon archaeological evidence. The early dates we have suggest a long engagement with the potato, even before farming. While the archaeobotanical data are still scant for early geophytes in the Andes, the archaeological evidence allows us to conclude that *Solanum* was collected, processed and eaten from an early time, at least by 7000 B.C. Through digging and disturbance, geophytes were encouraged to produce and thrive. This harvest-while-planting farming provides a unique agricultural trajectory for the domestication syndrome. Recent genetic work on the origins of potatoes suggests a long and continuous process of domestication.

[302] *Geological Hazards, Climate Change, and Human Resilience in the Islands of the Four Mountains of Alaska: Preliminary Archaeological Findings*

Archaeologists with the NSF-funded research project "Geological Hazards, Climate Change, and Human Resilience in the Islands of the Four Mountains" conducted their first season of fieldwork on Chuginadak and Carlisle Islands, Aleutian Islands, Alaska, in 2014. Preliminary results identified multiple component village sites. These include the Ulyagan site on Carlisle, with a Russian period and one or more prehistoric period occupation. Large, rectangular houses and metal artifacts represent the Russian occupation. Lithic artifacts recovered from below the Russian occupation represent the prehistoric component in possibly two or more cultural lenses, and include bullet shaped style points similar to those found at the Margaret Bay site on Unalaska, Alaska. The U.S. BIA previously dated the lower components at this site to 3200 ± 70 radiocarbon years before present (RCYBP), $1940 \pm$ RCYBP, and 1690 ± 70 RCYBP (Cooper 1991). Archaeologists also identified prehistoric occupations at three sites (Blue Cove, Black Peak, and Applegate Cove) on nearby Chuginadak Island. Confirmation of the ages of these occupations is awaiting radiocarbon results, and further excavations will occur in 2015.

Haubt, Robert (Griffith University)

[149] *The Rock Art Database: Centralizing and Streamlining Heritage Data Using the CIDOC Reference Model*

The Rock Art Database is a rock art heritage project at the Place, Evolution and Rock Art Heritage Unit (PERAHU) at Griffith University. It is designed to bring members of the greater rock art community together in one centralized global network to discuss and share rock art information. The platform functions as a hub including data repository and data visualization tools to curate and share digital data sets and encourages members to contribute to the system to improve and streamline rock art data management frameworks. This paper discusses the implementation of the CIDOC Reference Model in the Rock Art Database. It looks at data ontology, metadata management and technological advancements in collaborative cyber environments within the greater rock art community. Exploring relational and hierarchical structures of planning, recording, managing, monitoring and disseminating data from World Heritage to national and local projects the paper is concerned with identifying knowledge gaps within the CIDOC Reference Model and existing rock art management systems. The project currently focuses on but is not limited to Australian rock art management.

Hauer, Craig and Sean McMurry (Enviroscientists, Inc.)

[392] *Constructive Monitoring: Finding Successful Solutions for Environmental, Engineering, Cultural Resources, and Public Relations Challenges in the Constructed Landscape of the Presidio of San Francisco, California*

In 2012-2014, AMEC successfully balanced the needs of the National Park Service (NPS), the Presidio Trust, and regulators to preserve historic resources, maintain public relations, engineer safe and effective solutions, and address environmental concerns during remediation activities to remove

contaminated soil at the Presidio of San Francisco, a NHL and NRHP-listed property. For over 150 years, the Presidio, located near the Golden Gate Bridge, was used by the U.S. Army to protect San Francisco. Remedial activities removed approximately 14,800 cubic yards of contaminated soil. Working with NPS staff, AMEC archaeologists developed an archaeological monitoring, sampling, and excavation strategy that preserved archaeological resources while keeping the project on schedule and budget. The 32 features recovered included a buried 1870s ammunition magazine and large, intact 1870s and 1890s coastal defense battery features. This presentation discusses how the features recorded during monitoring fit with the history of the Presidio.

[3] *Evaluating NAA, pXRF, and LIBS from the Perspective of Ochre from Gledswood Shelter 1, Queensland, Australia*

Gledswood Shelter 1, Queensland, Australia was utilized by prehistoric people for 40,000 years. As part of the investigation of ochre from Gledswood Shelter 1, several samples recovered from different levels of the shelter were subjected to NAA (neutron activation analysis), pXRF (portable X-ray fluorescence), and LIBS (laser induced breakdown spectroscopy) to identify which samples might have come from the same quarries. Actual sources for the ochre are not known. These analyses provided an opportunity to compare and contrast the information obtained from each of the three elemental analysis methods. In addition, information obtained from all three methods was leveraged to better understand the nature of the samples. Each method has its strengths and weaknesses but together provide more robust characterization of the samples than any one method alone.

[305] *Water, Hospitality and Difference in Everyday Life*

Water has generally been viewed as a basic metabolic need whose capture and distribution provides a nexus through which power flows. The household becomes a place of water consumption where subjectification was achieved in other domains and subsequently inscribed into the container. In this paper I take a slightly different approach. Specifically I ask the question, at what point does water become a convenience and how does its status as a convenience inflect both material practices of the household and social reproduction of governance in everyday life? This paper draws on recent trends examining the relations of power in everyday life focusing on daily rituals of hospitality. I rely on a case study from the eastern Caribbean. Perhaps no resource was more precious to 18th century Caribbean colonies than fresh water. Seasonality of weather, land modification to grow cash crops, and the demands of factories to process those crops made water a precarious resource. Here I examine water as a vector of social reproduction in the settlement and household. As such water, and the containers that store it, become less a marker of distinction, but active agents in the creation of difference.

Hauser, Sheila Jon (Wichita State University)

[373] *Were the Wichita Using Ilex Vomitoria while Living along the Arkansas River In Kansas*

Were the Wichita consuming Ilex vomitoria in a ritual context while living in the Arkansas River basin in Kansas? Prior to moving into the Arkansas River basin, the Caddoan speaking tribes of Wichita were located further south in Oklahoma and Texas, where Ilex vomitoria grows naturally and was consumed; however it is not a plant that naturally thrives in Kansas. To determine if there is evidence of Ilex vomitoria use, FTIR testing was performed on pottery sherds found at the Paint Creek site (14MP1). FTIR testing has also been performed on laboratory created teas from Ilex vomitoria, Mescal beans, and Yerba Mate for comparison. The results of this testing can provide great insight into the lives of the Wichita while they lived in Kansas.

[296] *Ethnoarchaeology plus a Theory of Behavior: Jim O'Connell's Hadza Work*

O'Connell's Hadza work shows how combining behavioral ecology with ethnoarchaeology magnifies the power of ethnography to help interpret the past. O'Connell's systematic observations and analyses of Hadza hunting and treatment of big game gave us robust falsification of received notions about our ancestral past, including ideas about scavenging, variation in faunal assemblages, and prey transport. His vision as both an archaeologist and ethnographer extracted the richest kind of evolutionary anthropology from our Hadza project. Without O'Connell as a guide I would have learned so much less from the Hadza. And so would you.

Hawkins, Alicia (Laurentian University), Joseph Petrus (Laurentian University) and R.G.V. Hancock (Anthropology Department, McMaster University)

[140] *LA ICP-MS Analysis of Glass Beads from 17th Century Huron-Wendat Sites in Ontario*

We present the results of a preliminary study of glass bead chemistry from several contact period Wendat sites in Ontario. Much important work on the chemistry of glass beads found in Ontario was carried out by Hancock and colleagues using Instrumental Neutron Activation Analysis in the last several decades. We compare our results with theirs. In some cases we were able to analyze the same beads that had been previously examined using INAA. We consider our results in terms of insights they may provide on early contact period dynamics in the Great Lakes.

[180] *Agriculture and Empire in the High-Altitude Atacama Desert*

How did prehispanic farmers make a living in the hyperarid, high-altitude Atacama Desert, and how did their lives and landscapes change under different political regimes? In this paper, we discuss our ongoing project on irrigated landscapes in the interfluvial region between the Upper Loa and Salado rivers in northern Chile. Research has focused on two sites (Paniri and Topaín) with remarkably well preserved spring-fed canal and terrace systems and a residential and administrative center (Turi) that were occupied in the Late Intermediate (ca. 1000–1400 A.D.) through Inka (ca. 1400–1540 A.D.) periods. How did Late Intermediate farmers manage water, crops, and labor and how were these practices transformed under the Inka? Our interdisciplinary effort to address these questions has included mapping, test excavations, attempts to date agricultural features, examination of agricultural soils, archaeobotanical analysis, and paleoenvironmental studies based on geological survey and pollen and diatom analyses. We report on our preliminary findings, analytical and interpretive challenges, and planned future research.

[180] *Chair*

Hayden, Brian (Simon Fraser University) and Suzanne Villeneuve

[153] *The World of Secret Societies: Dynamics from the Northwest*

Secret societies are one of the most under-theorized and ignored aspects of prehistoric societies in

archaeology, yet they may be pivotal in understanding major developments in sociopolitical complexity in the past. Probable prehistoric examples of secret society remains include the elaborately painted caves of Upper Paleolithic France, the communal structures or caves of the Early Near Eastern Neolithic (Gobekli Tepe, Jerf el Ahmar, Nahal Hemar, and others), and the kivas and caves used in the American Southwest. In order to develop a sound theoretical foundation for the role of secret societies in the past, it is essential to understand how they functioned ethnographically. Some of the best ethnographically documented examples of secret societies among complex hunter/gatherers come from the Pacific Northwest and California (e.g., the hamatsa society). We will focus on the exclusive recruitment techniques and strategies that were ethnographically used to create control over politics and economics by secret society members, and the evident goal of such societies to promote the self-interests of their highest ranking members.

[150] *The Inglewood Mammoth (Maryland) and Others Like It*

The Inglewood mammoth site near Largo, Maryland - radiocarbon dated in 1982 to 20,000 rcybp - shares features with other mammoths recovered in North America and Mexico: It has no lithics associated with the bones, and some of the elements have been fragmented. Over 25 years ago I interpreted the bone-breakage as recently done by heavy equipment, but another researcher now interprets it as done by humans in antiquity. I provide a first look at the site's bone maps, sediment profiles, and other essential information, and compare the data from Inglewood with other sites having broken proboscidean bones and (usually) no lithics. These finds have been variously considered as kill, butchery, and bone-quarrying locales. Taphonomic logic (and occasionally illogic) in the interpretations of these sites is an important part of ongoing debates about the timing of the peopling of the Americas.

Hays, Christopher and Richard Weinstein (Coastal Environments, Inc)

[220] *A Tale of Two Sites: The Connections Between Poverty Point and Tick Island*

Poverty Point and Tick Island were two of the most important sites in the southeast during the Late Archaic period. Previously we have demonstrated a probable connection between the sites, which are separated by over 700 miles, through the identification of Lower Mississippi Valley loessal PPOs at Tick Island, and St Johns pottery, likely from the area of Tick Island, found at Poverty Point. In this paper we identify an additional set of artifacts that are found at both sites but are not known to be present at any other Late Archaic sites between them, except for the Poverty Point culture site-Claiborne. The most plausible explanation for their co-occurrence at the Poverty Point and Tick Island is through some type of interaction. The items include perforated baculum bones, PPO style plummets, stylized human faces made from clay, clay tubular pipes, toy or miniature pots, decorated bone pins, and a distinctive decorative pattern on PPOs that is unique to both sites. We attempt to explain the purpose and nature of this connection using anthropological theory on symbolic gift exchange and the political and symbolic importance that tribal societies attach to acquiring esoteric knowledge of distant lands.

[303] *Ancient, Modern, and Post-Modern: Pueblo Mural Painting of the Southwestern U.S.*

Over a period of centuries between about A.D. 1000 and 1540, Ancestral Pueblo communities in

what is now the southwestern U.S. developed elaborate, iconic mural painting traditions. The most detailed and best-known murals were excavated in kivas (ceremonial structures) at the sites of Awat'ovi and Kawayka'a on the Hopi Mesas, Arizona, and at Pottery Mound and Kuaua near Albuquerque, New Mexico. These murals not only express ritual and worldview in the 15th century but inspire contemporary artwork by Hopi artists such as Fred Kabotie and his son Michael Kabotie.

[352] *Lesser Antillean Rock Art of the Caribbean: A Regional Perspective*

Dubelar's 1995 compendium of rock art sites including sketches and photographs of the petroglyphs from the Lesser Antilles remains a critical resource for the study of the region's prehistoric images. The work has been supplemented in recent years with additional documentation efforts of known and newly discovered sites. The focus of this paper is on the characterization of Lesser Antillean rock art by detailing site and image distributional patterns across the arc of various islands. The Hofman et al 2007 investigation, among others, of shifting trade and sociopolitical networks during the area's prehistoric period provides an interpretive context.

Hazard, Rebecca and John Dudgeon (Idaho State University)

[233] *Developing a Microfossil Key for Fiji from Modern Herbarium Specimens*

Microfossil analysis provides a valuable proxy for inferring prehistoric environmental conditions, as well as direct evidence for the presence of agricultural domesticates and other important subsistence cultigens. However, the body of reference material for identifying individual plant morphotypes is lacking. Here we present our preliminary efforts at assessing the efficacy of modern herbarium specimens as a key for identifying archaeological sedimentary and calculus-derived microfossils. We present a simplified method for extracting phytoliths, calcium oxalates and starches from modern plants and compare frequencies recovered from specific plant parts, which may provide insight into differences in relative abundance observed in Fijian archaeology.

[306] *Empire at Chichen Itza Revisited*

In the chapter on Chichen Itza within the *Forest of Kings*, Schele and Freidel masterfully redirected a half century of research that had largely pressed the foreignness of the site. Instead, they revealed the city's Maya impulses and explored how Classic period strategies of conquest warfare transformed to integrate a type of inclusive diversity. Their suggestions of Chichen's willingness to incorporate their enemies into a grander regional system redefined Epiclassic conversations over Maya or Toltec dominance, offering a new model for Epiclassic Maya cities that drew from Classic period kingship but were less concerned with one, unified vision of identity. In particular, their model for militant strategies may be extended beyond the regional to distant lands outside of Mesoamerica. By coupling economic strategies that used the military for trade and the acquisition of exotic prestige goods with the integrative model of Schele and Freidel, we can better see how the city not only had aspirations for regional dominance, but made calculated efforts to use its military for economic purposes in lands much further away. Evidence for the military's economic functions comes from the deposition of exotic goods throughout the site and the visual evidence recorded in murals and sculpture.

[412] *More than just a Shiny Stone? The Sources and Significance of Obsidian Found in Early State Contexts in the Near East*

Obsidian is a visually attractive material. Artifacts made of obsidian are regularly documented in early state contexts in the Near East (for example Atij, Gudeda, Mari, Ras Shamra, Atchana, Mozan) and its use for vase manufacture is well known at sites such as Acem, Kultepe, Atchana, Warka, Ur and so on. It is also used to make beads and other personal items (Ur, Assur and elsewhere). Less well known though, are the origins of the obsidian from which these objects are made. In our paper, after an overview of the range of objects made of obsidian, we will focus on those for which we have geochemical data. Our evaluation of this data will allow us to discuss whether the origin of the obsidian as a material was taken account of by contemporary society or whether its appearance was the main reason for its selection. We will consider whether its origins affected how and where it was used or whether its exotic nature had ceased to be significant.

Hearth, Nicholas

[38] *A Forgotten Facet of Fedick: Scott's Contributions to Maya Lithics Research*

Scott's body of multidisciplinary and collaborative research resists categorization to a single rubric, even in ones as broad as historical ecology or cultural geography. However, many archaeologists I've met who haven't worked directly with him only understand his long-term research projects within these two paradigms. Few remember or realize that Scott began his graduate school career examining the lithic economy of the Tikal-Yaxha survey transect and that he has continued to facilitate and involve himself lithics-related projects as a professor. A brief review of his work and the work that he facilitated and collaborated with his students reveals a substantial body of literature on the roles of stone tools in social complexity, economy, food-ways, and agriculture in the ancient Maya world. It illustrates his long-term interest in lithic studies as a vehicle to get to the "nuts and bolts", so to speak, of ancient Maya society, as well as an alternative area of research to his more widely-read research of ecological-based approaches in Maya studies.

Heath, Joshua (American University) and David Witt (SUNY Buffalo Grad Student)

[63] *Reshaping Identities through the Destruction of Artifacts*

Archaeological artifacts can be used to foster a powerful feeling of national pride, or they can be held up as a sign of previous degeneracy and destroyed to 'purify' a populace. For example, artifacts such as Egyptian pyramids, Mesopotamian Lammasu, Afghani Buddhas, and Malian Sufi Shrines represent cultures and conditions that do not fit the fundamentalist identity of Islamists groups. While modern states have often—and rightfully—raised these artifacts as evidence of equality with Euro-American cultures, fundamentalist Islamic groups are not simply spurning this connection to their cultural heritage, they are destroying the remnants of those cultures to make it more difficult for those connections to be made. By contrasting case studies where states explicitly tie themselves to the ancient world against states or other actors that wish to destroy artifacts that connect to a non-fundamentalist past, it is possible to see how these different approaches lead to the creation and curation of different identities. Through this examination of the intersection of agency, history, and belief, it will be possible to show the roles archaeological artifacts and previous cultures play in modern identity creation.

Heath, Margaret (Bureau of Land Management) and Maureen Malloy (Project Archaeology)**[236]** *Project Archaeology's Role in the Rise of Heritage Education in the United States*

Archaeology education has been a part of archaeological practice in the U.S. for the past 30 years and is firmly rooted in the discipline's widely shared belief that public education about archaeology is key to protecting and preserving sites. But archaeology education has broadened to encompass educational goals and cultural heritage values that are much broader than only site protection. The goals of Project Archaeology—which began collaboratively in Utah to combat site looting and destruction—have evolved to include “use(ing) archaeological inquiry to foster understanding of past and present cultures; improve social studies and science education; and enhance citizenship education to help preserve our archaeological legacy.” This paper provides an overview of the history of heritage education as it has evolved in the U.S. since the 1980's, with an emphasis on the role and development of Project Archaeology within this broader context.

Heath, Laura (Boston University Department of Archaeology)**[249]** *Pottery on the Periphery: Postclassic Ceramics from La Laguna, Tlaxcala, Mexico*

This poster examines life at the periphery of the Postclassic Mesoamerican World System, discussing the access that rural or peripheral people may have to the larger economic, political, and informational networks of their region. It addresses these questions by presenting an analysis of the Epiclassic and Postclassic period ceramic assemblages from the site of La Laguna, Tlaxcala, Mexico. Almost all of the sherds come from Feature 185, a sheet midden context deposited during the late Postclassic period (c. 1300-1521 CE). During this period, many small *āltepēmē* (central Mexican city-states) coalesced economically and culturally into a system described as the Postclassic International World System by Smith and Berdan, and the Aztec Triple Alliance emerged as dominant. Although La Laguna was a small rural settlement on the periphery of this society, the wares and iconography present in the ceramic assemblage show that its inhabitants were involved with the regional economic and intellectual interactions of the time. I present the assemblage in terms of ware, vessel form, and iconography, and suggest avenues for future research on Postclassic ceramics in Tlaxcala.

Hechler, Ryan (McGill University) and William Pratt (Texas State University - San Marcos)**[307]** *Representing Difference in the Precolumbian Andes: An Iconographic Examination of Physical "Disability"*

This paper will review iconographic representations of physical disabilities and differences from several Andean societies from different time periods, such as the Inka, Chimú, Wari, Tiwanaku, and Moche. People with physical disabilities were actively included in many societies throughout the Precolumbian Andes. Many cultures developed their own social perceptions that benefited people with physical disabilities and differences and they often thought the disabled were more intimately connected to spiritual worlds. People with differences were rarely depicted in a manner of despair, or being helped by others; quite the opposite, people with disabilities were virtually always operating independently even when depicted with a larger group. Artistic depictions of people with disabilities and physical differences often presented such individuals as being active – frequently participating in ritual, playing music, and even appearing content. People with physical differences and disabilities are some of the most overlooked individuals in current Andean research.

Hedenstierna-Jonson, Charlotte (Stockholm University, Sweden)**[18]** *Identity, Self-Image and Cultural Expression in Viking Age Sweden*

The people of Viking Age Scandinavia shared a common culture and could as a group be regarded as Northmen or people from the North. It is clear, however, that contemporary Northmen recognized differences between, and divisions within, their own cultural and political sphere. In order to advance in our interpretation and understanding of the Northmen and their geographical expansion during the Viking Age, we need to recognize these differences, which they themselves were well aware of. The Viking Age was a time of transition when an older societal structure gradually formed into Medieval society. In this formation process symbols were chosen and altered to represent the desired self-image of the members of that society. The manipulation of cultural behavior, symbols

and material culture is one of many mechanisms used by societies to distinguish themselves vis-à-vis others. As archaeologist we can study these material remains. Reaching the individuals tend to be more difficult. This paper is part of the Swedish research project the Atlas, where archaeology is supplemented by osteology, isotope analyses and genetics to reach a further understanding of Viking Age identities.

Hedlund, Jonathan (ERO Resources)

[65] *Lithic Material Sources and Implications for Trade and Travel through the Smith River Basin in Northwest California*

Excavations at the Hurdy Gurdy Bridge site (CA-DNO-1028) recovered a collection of lithic artifacts representing both local and exotic sources of material. Identification of both probable and definitive source locations indicates transportation of lithic material occurred from coastal, Klamath Mountains, south-central Oregon, and north-central California regions. Obsidian subjected to OH and XRF analysis from Hurdy Gurdy Bridge site along with sites located at the confluence of the Middle and South forks of the Smith River, (CA-DNO-89/H) and downstream from the confluence at Jedidiah Smith State Park (CA-DNO-26, CA-DNO-332, CA-DNO-333, CA-DNO334, and CA-DNO-XX13) confirms occupation of the region from the Early Holocene to the Contact period, and representation of the different lithic source locations varies through time. While the confluence sites have a nearly bivariate split between south-central Oregon and north-central California the obsidian from the Hurdy Gurdy Bridge site is almost entirely sourced from north-central California. This disparity, coupled with source locations of non-obsidian material, has implications regarding not only the settlement differences and external trade relationships between the Hurdy Gurdy Bridge site and the confluence sites, but also regional implications regarding trade, movement, and settlement between the interior and coastal regions.

Hedquist, Saul (University of Arizona)

[343] *Ritual Practice and Exchange in the Late Prehispanic Western Pueblo Region: Insights from the Distribution and Deposition of Turquoise at Homol'ovi I*

Archaeological and ethnographic evidence demonstrate the importance of turquoise among past and present Pueblo groups. In this paper I examine the social uses of turquoise and other blue-green minerals at Homol'ovi I, a late prehispanic Hopi village and the most intensively excavated site within the Homol'ovi Settlement Cluster. I explore intra-site patterns of deposition (i.e., the content and context of turquoise deposits) and stylistic variation among objects in an effort to identify differential practices and material expressions within the pueblo. In addition, I assess the geologic provenance of turquoise from the site using high-precision measurements of lead and strontium isotopes. Recent studies indicate turquoise from at least two geologic locales—the Cerrillos Hills (New Mexico) and Canyon Creek (Arizona)—was acquired and consumed by Homol'ovi I inhabitants. These source investigations, coupled with those from other contemporaneous sites in the region, clarify the flow of turquoise across the late prehispanic Western Pueblo landscape and illuminate regional patterns of acquisition and exchange.

Heffner, Sarah (PAR Environmental Services, Inc.)

[45] *Exploring Healthcare Practices of Chinese Railroad Workers in North America*

Chinese laborers on the North American transcontinental railroads performed dangerous and labor-intensive work, and many died or were seriously injured as a result of explosions, cave-ins, and severe and unpredictable weather. These workers received meager wages and may have faced additional health risks from ethnic violence and malnutrition. Little is known about how these individuals treated their injuries and ailments and, to this date, not a single document written by a Chinese railroad worker has been discovered. Analysis of medicinal artifacts recovered from railroad sites in Idaho, Nevada, and Utah, dating from 1869-1910, combined with research on existing documentary and archaeological sources on Chinese medicine in 19th-century North America, can provide us with a better understanding of the healthcare practices of Chinese railroad workers.

Hegberg, Erin (University of New Mexico)

[128] *Making Ends Meet in Frontier New Mexico*

In 19th century frontier New Mexico consumer relationships reflected important social networks that were essential to the survival of Hispanic settlements. These relationships played a vital role in the formation and maintenance of modern Hispanic identity during the Mexican and American Territorial Periods. Visually and functionally similar plainware ceramics were produced and used by many different cultural groups on the landscape in New Mexico in the 19th century. Hispanic residents were able to acquire their pottery from several sources. Using close statistical analysis of technological styles in the New Mexican plainware ceramic assemblages of four 19th century residential sites, this paper examines personal relationships Hispanos cultivated with neighboring Pueblo and nomadic Native American groups to acquire their pottery, and the implications of these relationships for Hispanic identity. Preliminary results indicate that social identities and ethnicities on the frontier were becoming more binary as a widening division opened between Hispanic and Native American groups. Hispanos sought to minimize the social markers of their hybrid histories and Native American relationships in response to American prejudices. However, it appears that Hispanic identity also grew to encompass a wide range of settled lifestyles and personal histories.

Hegel, Casey [7] see Haggard, Alyssa

Hegel, Casey (Humboldt State University)**[131] *Depopulation and Massacres: Bioarchaeological Evidence of Violence within the Ancestral Pueblo of the Southwest Region of North America***

This paper investigates forensic data within the Southwest region of the United States for indicators of violence, conflict, and warfare related events. The main focus is the Mesa Verde region of the Southwest and other sites inhabited by the Ancestral Pueblo. In this area, I examine forensic evidence supportive of trophy-killing and cannibalism; both have documented evidence at other sites in the Southwest area. Different types of trauma, such as, cut marks and blunt force trauma are also examined. Information about the human remains will be examined and incorporated in the analysis, including the condition, location, placement, and patterns of violence. The age and sex of the human remains found within this region are also documented when that data has been determined from the remains. The data are used to examine how depopulation and warfare events in this region affected burial patterns and treatment of the dead.

Heidkamp, Blair (College of Wooster) and Olivia Navarro-Farr (College of Wooster)**[205] *Tomb of the Goblets: Revisiting a Middle Bronze Burial from Pella in Jordan***

Pella is among the longest inhabited sites in the Southern Levant, with first occupation in the Paleolithic and down through the late Islamic phase. Robert Smith began The College of Wooster excavations there in 1967. In the first season, excavations were focused on the Western Church Complex and the Eastern Cemetery. One of the tombs excavated, Tomb 1, possessed in excess of 100 artifacts, mainly ceramic vessels. Publications of that season's work contain only a short report on the tomb. Published reports offers limited interpretation about the possible significance of the material that dates to the Middle Bronze period and that has the potential to inform us about this transitional phase at the site. The present study undertakes a detailed reexamination of Tomb 1 contents curated at the College of Wooster. The examination encompasses a broad range of artifacts, including the four carinated feasting goblets that served as the basis for the label Smith applied to the tomb. In revisiting this specific tomb, I plan to broaden the coverage of the artifacts, including the four carinated goblets. Another goal of this study is to encourage the re-examination of previously excavated materials, which can lead to new discoveries.

Heidke, James (Desert Archaeology, Inc.)**[55] *Figurines and Farmagers***

Two temporally-sensitive fired clay figurine styles were identified among the 282 fragments recovered from the Early Agricultural period archaeological site known as Las Capas, located in Tucson, Arizona. The earlier style was only recovered from the 1220-1000 B.C. stratum, while the later style was just recovered from the 930-730 B.C. strata. Virtually all fragments were found in

domestic trash deposits. Previous interpretations of similar figurines relied on the assumption that they represent anthropomorphic beings and were used in practices or ceremonies related to ancestor veneration. However, the cross-cultural approach that led to that conclusion is insufficiently sensitive to the historical specifics of Early Agricultural period figurine use. Figurine manufacture began at the time when people started growing some of their food while continuing to hunt and gather the rest. Multiple lines of evidence indicate that predominantly male, Uto-Aztecan-speaking migrants brought maize farming to the Sonoran Desert. The evidence from Las Capas suggests that they also introduced a ceremonial complex involving maize symbolism, that botanomorph human or anthropomorphic plant figurines/effigies were an essential part of that symbolism, and that those objects played an important role in reciprocal obligations between human and non-human beings that would have led to successful harvests.

[250] *Zooarchaeology of the Late Intermediate Period in Minaspata, Cuzco, Peru*

Minaspata, a site located in the Cuzco Valley of the south-central Peruvian Andes, contains evidence of occupation spanning continuously from the Early Horizon through the end of the Inca Empire. In 2013, several units were excavated in order to better understand the social transformations which occurred in local populations due to colonial practices, both under the Wari state in the Middle Horizon and in the early consolidation of the Inca heartland. Analysis of the faunal remains of the excavations can shed light on the shifting patterns of food consumption, butchery practices, and bone tool manufacture which occurred during the transition from the beginning of the Late Intermediate Period (LIP, A.D. 1000-1400) to the terminal Inca occupation at the end of the Late Horizon (LH, A.D. 1400-1532). The results of the securely dated faunal remains from the 2013 excavations will be presented and placed within a larger cultural and regional context related to the transition from the LIP to the LH and the consolidation of the Cuzco region under the early Inca state.

Hein, Anke (Ludwig Maximilians University Munich)

[286] *Environmental Preconditions and Human Response: Subsistence Practices at Prehistoric Settlement Sites in the Liangshan Area, Southwest China*

The Liangshan Area in Southwest Sichuan is known for its great diversity both in geographic layout and ethnic composition. It is furthermore characterized by a highly diverse archaeological assemblage, whose date and cultural affiliation is in large parts still unclear. To solve this problem, in recent years archaeological fieldwork has focused on settlement sites, whose stratigraphy promises to aid in establishing a local chronology and furthermore provides insight into the daily life of past people. This paper focuses on the lithic and ceramic assemblages from prehistoric sites in the Liangshan area, introducing raw material, object form, and technical details. Furthermore, the nature of the ceramic material and building features are taken into account to conclude on past subsistence practices and modes of living. The main objective is to identify the major differences and similarities between the assemblages from different sites and sub-regions, and draw conclusions on site functions and location choice, which in turn can help to highlight the interplay between the complex environment of the Liangshan Area and its past inhabitants.

Heindel, Theresa (University of California - Riverside)

[75] *Xanthosoma violaceum and the Maya Diet: Root Crop Use in Ancient Maya Agriculture*

Research on ancient Maya agriculture has historically been focused on seed crop cultivation, but the

recent discovery of a Classic period manioc field near the site of Ceren, El Salvador has shed new light on the possibility of intensive root crop cultivation by the ancient Maya. Another root crop, however, *Xanthosoma violaceum* (colloquially known as “malanga”), was also encountered in a household garden. Through the use of multiple lines of evidence, I have compiled a summation of malanga’s possible agricultural roles and opportunities for future research. Ethnographic studies suggest that malanga was most likely processed in a similar way to manioc, and ethnohistoric evidence has been helpful in understanding whether malanga could have been used as famine food or as a supplementary crop. Iconography has also indicated that malanga may have had religious and cultural importance. Finally, in conjunction with current archaeological evidence, I argue that malanga probably was grown in swampy, inundated soils in kitchen garden settings. More broadly, I believe that my research on malanga will provide new and important information on the ancient Maya diet, and how to further investigate past root crop use.

Heins, Sarah (University at Albany - SUNY) and Jordan Karsten (University of Wisconsin Oshkosh)

[166] *Fauna from the Eneolithic Mortuary Site of Verteba Cave, Ukraine*

Animals associated with human burials provide insight into mortuary rituals of ancient groups. This study is the examination of faunal remains from Verteba Cave (3,951- 2,620 cal B.C.), a site in western Ukraine associated with the latest period of Eneolithic Tripolye-Cucuteni (TC) culture. Relative abundances of taxa were compared to published data from other TC sites. Remains from red deer and cattle are the most frequent fauna of the Verteba Cave assemblage. The sample also has a high percentage of dog, fox, hare, and bird relative to assemblages from settlement sites. Osteological remains of birds are rarely found, suggesting their lack of importance in subsistence economy. Their presence at Verteba Cave, along with relatively high frequencies of fox, hare, and dog indicate that these fauna may be important to mortuary ritual of the TC. Clay figurines of bulls, sheep, pigs, and birds, and ceramic depictions of dogs, bulls, deer, and birds are commonly reported in middle and late TC periods. These results suggest the importance of birds in TC mythology, and also highlight the significance of dogs in mortuary context. Fox and hare may also be important to mortuary rituals, but less important symbolically.

Heitman, Carrie (University of Nebraska-Lincoln)

[235] *Creating Communities of Collaboration through Digital Archaeology and the Digital Humanities*

Over the last 10 years, I’ve been involved in various forms of “digital archaeology” with different forms of public and community outreach. In this paper I profile the more and less successful forms of public and community engagement entailed in these digital efforts. I also discuss current efforts to concurrently engage in humanistic and scientific forms of digital archaeology through communities of collaboration.

Heller, Abigail (North Carolina State University) and Mary Schmidt (North Carolina State University)

[94] *Combatting the Curation Crisis in North Carolina*

Archaeologists have an obligation to ensure the long-term survival and accessibility of collections that embody the tangible remains of community heritage and collective history. This study presents two examples of collaboration between state- and university-based archaeologists that address the current curation crisis and provide much needed training for future professionals. The North Carolina Office of State Archaeology Research Center (OSARC) is the state’s repository and steward for archaeological materials that are owned or maintained by the state. OSARC faces funding and staffing challenges due to increasing demands of curatorship and recent economic downturns. OSARC and North Carolina State University Anthropology graduate students are collaborating in efforts to mitigate the statewide curation crisis by working with two collections from historic sites that were lost to time for nearly 40 years. The study demonstrates how student involvement in solving the

curation crisis also helps future archaeologists develop a sense of responsibility for the collections they produce. These cases exhibit how collaborative work can give emerging professionals an understanding of how to evaluate and prioritize collection restoration/conservation needs, technical skills in collections management, curation and conservation techniques, research potential assessment, and familiarity with the state and federal standards that collections must meet.

Heller, Eric (University of California Riverside)

[130] *Ancient Maya Elite Political-Economic Practices at La Milpa North, Northwestern Belize*

Archaeological research has increasingly revealed the role of elite labor and influence in ancient Maya political economies. Rising awareness of the complexity of ancient Maya socioeconomic organization and attention to households as loci of production has led to new understandings of the structures and practices of production within elite households and the position of elite individuals in relations of production that extend beyond their households. Status-enhancing material goods of elite manufacture were often essential to the performative legitimization of social difference while the physical practices of elite production were themselves socially and materially transformative processes. Based on recent excavations at the Late to Terminal Classic site of La Milpa North, a hinterland palatial compound in Northwestern Belize, this paper explores various political-economic strategies employed by palace residents. These strategies include both the organization of non-elite production and the direct production of material goods necessary for the expression of identity and the socioeconomic reproduction of the household. In directing the labor of others and engaging in the manufacture, use, and exchange of status-enhancing objects, elites of La Milpa North produced and reproduced social and economic difference.

Helmke, Christophe (University of Copenhagen), Jesper Nielsen (University of Copenhagen) and Ángel Iván Rivera Guzmán (Instituto Nacional de Antropología e Historia)

[88] *Tracing the Footsteps of the Mapa Tradition in the Central Mexican Highlands*

More than four decades ago H.B. Nicholson compared the so-called Palace Stone from Xochicalco to a page in a Late Postclassic or Early Colonial manuscript. Showing numerous calendrical dates and toponymic signs connected by a path marked by footprints the monument readily recalls the mapa tradition that is so well documented in the central Mexican highlands at the time of the Spanish conquest. In this paper we explore the Epiclassic evidence of this tradition, discussing not only central features of the Palace Stone, but also additional monuments from Xochicalco and sites in the vicinity, such as the recently discovered Tetlama stela, that belong to the same genre. Thus, we provide a preliminary analysis of the formal features and contents of these fascinating monuments that record an important narrative history and founding myth of Xochicalco and some of its satellite communities. Furthermore, we shall also introduce the evidence that suggests that the conventions of this tradition can ultimately be traced back to Early Classic Teotihuacan.

[192] *Preliminary Investigations at Brownstone, an Underwater Site Adjacent to the Inundated Paleo-Suwannee River Channel, Florida*

Underwater exploration and excavation of target loci along the inundated Paleo-Suwannee River Channel has recently focused on the Brownstone site. The western edge of the paleo-channel in the study area contains several grades of cryptocrystalline chert and dolomite. Materials recovered and attempts to access underlying stratified deposits are detailed. Further, correlation of the inundated Pleistocene landscape and known riverine features with timing of human occupation and utilization of adjacent terrestrial areas has led to some novel insights regarding the early occupation of Florida. Recent observations of storm driven, and sea level rise, salt water incursions in the GOM are discussed within the context of the ever shrinking, now submerged Pleistocene landscape.

Henderson, Lucia (Fellow, Metropolitan Museum of Art)

[196] *All in Good Time: the "New Highland Chronology" and the Sculptures of Kaminaljuyú, Guatemala*

This paper considers the impact of the new highland chronology proposed by Dr. Inomata on prevailing interpretations of the stone sculptures of Kaminaljuyú. The revised chronology moves the archaeological record of Kaminaljuyú approximately 300 years forward, shifting the site's sculptures to a wholly new cultural and chronological framework. This paper begins the process of re-contextualizing the art of Kaminaljuyú by investigating the ways in which the new chronology disrupts and/or supports prior interpretations and analyses of sculpture from the site. It focuses on two major sculptural styles: full-round sculptures known as "potbellies" and bas-relief sculptures carved in a Maya style. The former, now dated to ca. 400B.C.-100A.D., appear to reflect localized belief systems about sacred landscape and power, while the latter, now dated to ca. 100B.C.-250A.D. reveal new and evolving concepts about kingship that crossed broad cultural and regional divides. By re-positioning these two sculptural traditions in time, the paper serves as a preliminary consideration of the ways in which the new highland chronology forces us to reframe our interpretations of art and ideology at ancient Kaminaljuyú.

Henderson, A. Gwynn (Kentucky Archaeological Survey)

[236] *What Could Archaeology's Impact Be on Education?*

Twenty-five years from now, as America's educators put into place yet another "new" set of standards, and classroom teachers endure yet another pedagogical adjustment, will archaeology be at the table, included as an appendix, or invisible? Predicting the future is risky business, but the intrigue of the past never fails to engage learners. It's our responsibility as educators to nurture that engagement and channel it toward understanding. Drawing from the preliminary results of a piloting project in four Kentucky schools, we discuss the strengths and weaknesses of using Project Archaeology: Investigating Shelter as a vehicle for inquiry-based teaching and deep conceptual understanding of diverse humanities subjects, and offer suggestions for what archaeology's impact can or could be in the social studies of the future.

Henderson, T Kathleen

[304] *Archaeology at the Head of Canal System 2, Phoenix, Arizona*

Recently, Desert Archaeology, Inc. has had opportunity to conduct several archaeological projects for the City of Phoenix west and northwest of the Park of Four Waters, near where the main trunk canals that fed prehistoric Canal System 2 originate and diverge from the Salt River. Seven of these trunk canals have been encountered, along with numerous distribution and lateral canals, water control and catchment structures, seasonal and semi-permanent habitations, and the first irrigated Hohokam fields to be exposed in plan. Establishing the ages of these features, especially the canals, has been a primary focus of research. The numbers, types, and ages of the features documented by these projects illustrate that people were using the canals and locale terrain in a variety of ways across time. Highlights from these projects, summarized in this paper, reveal the Hohokam's intimate knowledge of their landscape and how to manipulate it to best advantage. Conditions that might eventually have contributed to their collapse are also discussed. The findings highlight why study of the irrigated spaces between prehistoric settlements is crucial to fully understanding how the Hohokam managed to thrive for so many centuries in their desert environment.

Hendrickson, Mitch (University of Illinois at Chicago)

[286] *Hydraulic Nodes of Empire - Redux: Evaluating the Role of Artificial Water Tanks as Indicators of Territorial Control in Cambodia's Medieval Landscape (6th to 15th Century CE)*

Elaborate water management systems in the form canals, bridges and massive reservoirs (baray) are a defining characteristic of medieval Khmer occupation across their former territories in mainland SE Asia. Beyond the cities, hydraulic control is further manifest in the widespread distribution of smaller water tanks (trapeang) visible across Cambodia and southern Laos. Found variously in

association with temples, road infrastructure and settlement mounds these reservoirs represent a key data set for understanding the religious, political and socio-economic structure of the Khmer landscape. Using high-resolution imagery from GoogleEarth, this paper re-examines the formal and spatial variation of these hydraulic nodes with a particular focus on identifying temporal trends associated with specific architectural phases during the Angkorian period (9th to 15th c. CE). The results provide a more holistic view of Khmer settlement patterns that interrelate directly with the periods of development, expansion and downfall of the Khmer Empire.

[164] *Analysis of Fatty Acids in Precontact Ceramics from Barbados, West Indies*

Analyses of organic residues on ceramics complement other types of archaeological evidence used to characterize diets of populations colonizing and adapting to Caribbean islands. Gas Chromatography-Mass Spectrometry (GC-MS) was used to identify compounds sampled from 20 sherds excavated from two households, the Goddard Site 200 B.C.- A.D. 300 and Chancery Lane Site A.D. 800-1500 located on the island of Barbados. Measurable peaks of fatty acid residues are present on six samples from the Goddard Site. Smaller traces of fatty acids are present on Chancery Lane sherds. A comparison is made of fatty acids by sherd type and characteristic (rim/body, size, decoration), and visible types of residue (black and/or white substances). The specific composition of the observed fatty acids might yield evidence for garden crops (e.g., maize, cassava, and/or palm lipids) and animal resources such as fish and turtle. Results contribute to the growing field of molecular archaeology and environmental archaeology in Caribbean archaeological studies.

[172] *Subsurface Spatial Signatures of the Quotidian from the Olmec Heartland: Insights from Ground-penetrating Radar Surveys of the Los Soldados site, Veracruz*

Archaeological examinations of the Olmec civilization in the tropical lowlands of Mexico have focused largely on the elite and grandiose aspects of the society. Research conducted through the PAAP instead chose to explore non-monumental aspects of the Olmec. Investigations of the Los Soldados site in southern Veracruz included ground-penetrating radar (GPR) surveys of four areas. Although GPR is a geophysical method not often successful in tropical lowland settings, it proved successful in the delineation of several features that are interpreted as refuse pits and living surfaces. We present these findings within the broader interpretive context of domestic features at Los Soldados and the Olmec region.

[311] *Ceramic Variability in the Ocmulgee River Big Bend Region of Georgia, Post 1540*

Spanish colonization of the South Atlantic coast in the 16th and 17th centuries had wide reaching effects on the greater Southeast. The Big Bend region of the Ocmulgee River Valley lies about 160

km from the coastal mission effort. However, Native Americans in the area were in contact with Coastal Native groups both prior to and after European contact, making the area a good case study to better understand how changes in the social structure of Native groups on the coast affected the interior of Georgia. This poster will present preliminary results of ceramic analysis from two Native American sites in the Big Bend Region, one which is characteristic of the local Lamar pottery, and one which is characteristic of pottery local to the coastal mission area, though not made there. Macroscopic analysis of changing tempers and styles will be compared to pottery made in the mission influenced area. Understanding changes in vessel forms and construction techniques, along with changes in style will show the nature of interaction between the Native groups in the Big Bend region and groups in coastal Georgia. These analyses will give insight into the nature of social change after European contact in the region.

[410] *Death on the Early Formative Oaxaca Coast: The Human Remains of La Consentida*

The initial Early Formative period site of La Consentida was occupied between 1950 and 1550 cal B.C. This early village community on the western Oaxaca coast has produced evidence of some of Mesoamerica's oldest known ceramics, mounded earthen architecture, and musical instruments, but the site's human remains have received little attention thus far. The people of La Consentida lived and died during a period of social and economic transformations, including the establishment of sedentary villages, a gradual shift toward agriculture, and reorganization of communal interactions that ultimately produced hierarchical social complexity. In this paper, we present information regarding the archaeological context, bioarchaeological analysis, and isotopic dietary indicators offered by these early Mesoamerican burials. Skeletal analyses indicate variations in health, pathology, and dietary practices. Isotopic indicators are still under analysis, but may indicate significant early maize consumption. Features associated with the human remains, including a ritual cache containing faunal remains, ceramics, and a musical instrument, indicate some of La Consentida's mortuary practices, as do offerings interred with individual burials. As some of Oaxaca's earliest known human remains, the burials of La Consentida offer a rare opportunity for multidisciplinary investigation of the mortuary practices, diet, and lifestyles of initial Early Formative period Mesoamerica.

[336] *Minding the Ideological Gap in Consulting Archaeology*

This paper discusses recent results from an anthropological research program within a large archaeological consulting firm, highlighting some key ideological differences between consulting archaeologists and Indigenous archaeologists. Using interviews with a cross-section of archaeologists, the study combines results with previous research to illuminate the gap between these two groups with a focus on goals, practices and concerns. We attempt to shed light on areas for improvement and we challenge consulting archaeologists and their clients to move towards equitable partnerships developed through collaborative practices resulting in meaningful projects and deliverables. Acknowledging that the road is long, this paper seeks to move past discussing the issue by identifying the disparity between consulting archaeologists and Indigenous community members. This research provides a starting point to develop creative and sustainable relationships that meet the complex needs of large scale consulting archaeology.

Herdrich, David and Christopher Filimoe hala (University of Hawaii)

[391] *A Comparative Analysis of a traditional Western Polynesian Tupua at Swains Island, American Samoa*

In 2013 an archaeological survey was conducted on Swains Island, American Samoa, a remote atoll in western Polynesia. This paper presents a comparative analysis of a traditional Polynesian religious structure known as a tupua that was identified and documented during the survey. The tupua is a unique structure when compared to other religious structures that have been described in the archaeological and ethnohistorical literature. However, analysis shows that individual structural

features are similar to other religious structures in western and eastern Polynesian. Accounts of traditional voyaging to Swain Island support the idea of interaction between Swains Island and the islands of western Polynesian and eastern Polynesia and raise questions as to the influences on, and the development of, the design of this religious structure, and others in the region.

[26] *I Don't Do Mountains: Regional Survey in the Tequila Valleys of Jalisco*

Steve Kowalewski has created the largest full-coverage survey block in the entire world. He has championed survey because of the information it provides on regional and macro-regional processes. This can only be done by walking transect after transect covering large amounts of land. There is neither magic nor trick; it only takes hard work. Steve's leadership and teachings on survey methods have benefited even the most peripheral areas of Mesoamerica. Based on the methods I learned from Steve, I implemented a full-coverage regional survey in the Tequila valleys of West Mexico covering nearly 1000km², assembling an important corpus of data. The implementation of full-coverage survey has enhanced our understanding on diverse anthropological problems such as increasing social complexity, the dramatic sociopolitical changes at the end of the Classic period and how these changes are linked to larger macro regional processes. Finally, the Postclassic, a key period that had been neglected, is now beginning to be understood. The survey has opened thousands of years of occupation that can and are contributing to the development of anthropological theory on early states, and it has provided a diachronic, dynamic perspective on the prehispanic history of the valleys (long durée).

[268] *Algonquian Coastal Gardens and Landscape: Interpretations from Archaeobotany*

This paper explores how coastal Algonquian and shell midden sites in Tidewater Virginia relate to the greater Virginia Algonquian landscape. Through archaeological plant remains (including macrobotanical, starch grains, and phytoliths), ethnographic records, and historical documents, I am exploring landscape and garden designs along the shores of the coastal plain. The project's archaeological sites span a combined 1,600 years (early Middle Woodland period to the early Colonial era), and the archaeological and archaeobotanical remains offer a window into transformations and uniformity of landscape management and cultivation throughout this time span's historical and temporal transitions. The evidence suggests that coastal sites fit into a diversity of roles related to subsistence and population movement and that the landscape's ecology was entwined with community and traditions.

[403] *Bronze Age Mobility in Montane Ecosystems of Eastern Kazakhstan: A Preliminary Isotopic Investigation*

The nature of mobility carries significant implications for social interaction in pastoral societies. This paper presents a preliminary analysis of radiogenic strontium and stable oxygen isotopes of domesticated fauna remains excavated from Bronze Age sites across the mountains of eastern Kazakhstan. Results are contextualized with the ecological and geographic backdrops surrounding the sites and placed into a diachronic perspective of pastoral interaction and herding strategy. This research helps to investigate how the Bronze Age herding populations of Central Asia seem to have driven larger social and cultural processes across the region while materially appearing to maintain

insular community organization.

Hermitt, Elijah (Pennsylvania State University) and Kirk French (Pennsylvania State University)

[248] *The Palenque Pool Project: Sourcing the Sand from the Main Picota Pool*

Many sites in the Maya Lowlands relied heavily on water storage features in order to sustain the annual dry season. However, in Palenque the opposite challenge was presented, as there was an abundance of perennial water flowing through the city. Palenque's ancient name of Lakamha' or Big Water was indicative of this issue. In response, there were intricate water management systems constructed in order to divert the water underground through aqueducts. In May of 2014, the Palenque Pool Project began excavation and consolidation of the largest pool in the Picota Group, about 1 kilometer west of the site center. Although the function of the pool will likely forever remain a mystery, its placement adjacent to one of Palenque's two stelae and its similarity to modern Maya examples suggest ceremonial use. Beneath an approximate 40 cm of mud and debris lies a 10 cm layer of sand atop the bedrock floor. Being that Palenque is devoid of the granular material it must have been imported. A series of tests, including X-ray fluorescence (XRF), were utilized in determining the sand's origin. This poster outlines our results.

[52] *Starch and Ceramics: Dietary Transition and Technology in the Sigatoka Valley, Fiji*

Food production and manipulation, as well as associated technologies during Fijian prehistory are understudied archaeologically. Human colonization of Fiji occurred circa 2640 BP. Colonists subsisted on a diet composed of marine resources (fish, shellfish), and terrestrial fauna (bats, birds, tortoises). In contrast, 1,000 years later, most Fijians had transitioned to a fully agricultural diet. The contemporary Fijian diet centers on cultivated starches, imported originally by Fiji's colonists, and is based on low-level food production (small gardens). Starchy foods (i.e., taro, yam, cassava) require intense cultivation to become viable. They also require cooking before becoming edible. Undecorated ceramic fragments recovered from the Sigatoka Valley, Viti Levu, Fiji, were analyzed for presence of adhered starch, either modified or unmodified. Dating to the Post-Lapita period, identification of starch residues provides evidence of rapid subsistence change in Fijian prehistory. Results will reveal technological aspects of this dietary transition, especially the use of pottery as a cooking tool, and will answer methodological questions regarding starch extraction and identification.

Hernandez, Hector (Universidad Autonoma de Yucatan)

[76] *Capitalism and Material Culture of the Poor: Consumption, Reuse, and Discard of Glass Bottles at Hacienda San Pedro Cholul, Yucatan*

In Yucatan at the turn of the twentieth century, industrialization of henequen production and the export of binder twine heightened socioeconomic inequality and encouraged consumption of non-local manufactured items within native communities. Yet, the official history of capitalist expansion and globalization in Latin America has been written by and for the dominant class. Often, the material record shows that new and traditional technologies were appropriated in particular ways by poor people and offers a more balanced view of indigenous response to global capitalism. This paper focuses on the analysis of the archaeological remains from the workers' house lots at Hacienda San Pedro Cholul, Yucatan. I examine the hypothesis that the henequen workers were not conspicuous consumers, but conservative recyclers. The disposal of materials within the domestic compounds informs interpretations of different activities, economic issues, and foodways from these historic households. Based on the distribution of glass bottle remains and their use, discard and recycling patterns, I will discuss the consequences of shifts in labor organization and consumption patterns among classes at the regional and household scales. Economic growth and rapid industrialization had drastic social and cultural repercussions within Yucatec indigenous communities in the first half of the twentieth century.

[408] *Tintal, a Late Preclassic Maya City in the Mirador Basin, Peten, Guatemala*

Tintal is an ancient lowland Maya city of the Kan kingdom located 28 km southwest of El Mirador in the north central Peten, Guatemala. Preliminary data from fieldwork conducted by the Mirador Basin Project establish that Tintal was a major urban center contemporaneous with similar large centers within the Mirador Basin such as El Mirador and Nakbe. These and other cities of the Basin were linked by a system of wide elevated causeways during the Middle and Late Preclassic Periods (ca. 600 B.C.– A.D. 150). Investigations to date have focused upon site mapping and excavations of monumental structures and significant features. These include the Henequen and Mano de Leon pyramids, the large Central Ball court, the Jade Causeway, an impressive defensive moat which encircles the epicenter of the city, a royal tomb from the Early Classic Period (A.D. 300 – 400), and Stela 01, a large Preclassic stela carved from red sandstone imported from a distant source. Results of the investigations allow for a greater understanding of the occupational history of the site, which collapsed at the end of the Preclassic Era and was re-occupied during the Late Classic and Terminal Late Classic Periods (A.D. 600–900).

[129] *La interacción cultural en la cuenca alta del río Lerma: las subcuencas de Ixtlahuaca-Atlacomulco y Temascalcingo*

El río Lerma representó el escenario ideal para el asentamiento de poblaciones desde el periodo Preclásico. Estos habitantes primigenios de las subcuencas de Ixtlahuaca-Atlacomulco y Temascalcingo establecieron vínculos con diferentes regiones culturales, por lo menos desde el periodo Preclásico hasta el Posclásico y aprovecharon todos los recursos disponibles en un medio privilegiado por el paso del río Lerma, con el que establecieron un equilibrio respetuoso y un nivel de desarrollo similar a las de las regiones vecinas. Se evaluarán los vacíos de información determinados por la carencia de estudios regionales que no ha permitido comprender las estrategias de los pueblos para la sobrevivencia. Se discuten los mecanismos a partir de la evaluación de los indicadores arqueológicos, que posibilitaron la interacción tanto con el occidente de México, como con el vecino valle de Toluca y la cuenca de México. De particular interés, será el examen de recursos como la cerámica que permita reconocer la diversidad cultural y, en determinados casos, la posibilidad de asociar ciertas tradiciones cerámicas con una filiación étnica.

[257] *La Cueva de la Colmena: Bioarchaeological Analysis of a Funerary Context from the Sonora – Sinaloa Project / R. A. Pailes 1967*

In the past six years the Centro INAH Sonora has turned its gaze to the Archaeological Collections under its charge, keeping priority on conservation, research, documentation, and registration of such collections. Key to these collections are the results of the archaeological research conducted by Dr. Richard Allen Pailes in 1967 as part of the Sonora-Sinaloa Project. The main goal of the project was the recognition of different surface locations in the basin of the Mayo and Fuerte Rivers and excavations at two sites or locations "type". This research was his doctoral thesis. One of the sites excavated, La Cueva de la Colmena, resulted in the discovery of a funerary context, including an

adult and an infant, the latter with a personal outfit consisting of a snail shell necklace, earrings and a pendant, and with both presenting intentional cranial modification. The focus of this paper is the bioarchaeological analysis of this feature to answer the following questions: Is there a biological-cultural relationship between these two individuals? Are there social status differences between them? How does this finding fit into the current landscape of research in this area?

[227] *Interaction and Ethnic Boundaries in the Lurin valley: Yauyos and Yschmas in the Archaeological Record*

The Peruvian central coast is widely known in the archaeological literature as the locus of small polities that co-existed in environments of limited resources through cooperation and competition. However, most archaeological research has been greatly influenced by ethnohistoric accounts which populated the Late Intermediate Period in the Andes with a number of warring societies, and not on direct archaeological evidence. Recent research points towards a more complex scenario, in which the Inka Empire played a key role in shaping these societies into the chiefdoms recorded by the written sources. In this presentation, I will focus on the Lurin valley, in the central coast of Peru, where the lowlands were inhabited by the Yschma, a chiefdom-level group organized around the central oracle of Pachacamac. In the upper valley, the Yauyos were considered as foreign invaders that encroached on the Yschma lands and were later allied to the Inka. This presentation builds on a continued program of research in the Yauyo territory, focusing on the material correlates of the Yauyos in their core region, possible indexes of interaction with their coastal neighbors, and the ultimate role of the Inka Empire in defining the ethnic boundaries and relationships between Ychsma and Yauyos.

[273] *Pithouses and Placemaking on the Southern Colorado Plateau*

Pithouse period settlement on the southern Colorado Plateau was the subject of vibrant research in the mid-twentieth century as Southwest archaeologists explored the validity of the Mogollon and Anasazi archaeological culture areas. In subsequent years the region became a laboratory for anthropology, as the rich data lent itself to studies of population dynamics in the famously heady days of New Archaeology. Since the mid-1970s, research on these first millennium A.D. sites has been confined to cultural resource management projects. In this poster we revisit earlier research – particularly excavations by Rogge and the Southwest Expedition at the Connie Site (A.D. 400-600) and Webb Tank site (A.D. 600-850) -- and introduce new excavations by Desert Archaeology at the Beethoven site (A.D. 600-850) in the State Route 77 right-of-way to explore what pithouse settlements can tell us about settlement, mobility, and aggregation and place-making in a region that challenges simple interpretations about the transition to village life.

Herrera, Roberto (HDR Inc., Hunter College C.U.N.Y)

[246] *The Best of All Worlds: Exploring Exchange and Interaction with Nicoyan, Caribbean Costa Rican and Panamanian Societies at the Southern Costa Rican site of El Cholo*

Recent work at the mid to late Formative site of El Cholo reveals that from at least the third century A.D., occupants of this mound complex interacted with Costa Rican Caribbean watershed social groups, as well as western Panamanian Chiriquí societies. Evidence also demonstrates contact from

as far north as the Guanacaste Nicoya region in place by the tenth or eleventh centuries A.D. Further analysis of the site suggests that interaction was likely initially predicated on trans-cordilleran ethnic and ritual affinities with the Caribbean watershed, a dynamic still observable in the present day Talamanca Mountains of Costa Rica. Data also suggest a gradual adjustment to an increasing southern influence from the seventh century towards the end of El Cholo's occupation. The presence of intermontane movement along with previously documented Panamanian links highlights the particular position inhabitants of the Upper General Valley occupied, allowing them to access and integrate northern and southern influences into their own particular expression. This tropical verticality, linking spatially disparate social groups into a viable if loose network is a key point of investigation as more research suggests the over 3000 meter high Talamanca Range served more as a conduit rather than obstacle .

Herrera López, María Claudia (Programa Arqueológico San José de Moro)

[203] *An Approach to the Tombs and Rituals in Area 49 in San José de Moro*

San José de Moro (SJM) is one of the most important Moche cemeteries studied on the North Coast of Peru. It is recognized by the presence of several elite tombs and strong evidence of rituals that took place along with these burials. SJM also has its own style of pottery manufacture which is easily differentiated from southern styles. It is important to mention that the Moche society was divided between those who inhabited the north and south areas of their territory. In this context, during the last field season, we excavated a boot shaped tomb associated with a Moche V stirrup bottle, which is the first evidence of the presence of Southern Moche recorded at the site. Furthermore, a concentration of infant pit tombs stands out, among which a particular context shows different characteristics from the mortuary practices usually displayed in infant burials as we plan to show in this poster.

[35] *The Rockhouse Hollow Rockshelter, Ohio River Valley*

Recorded within the sediments of Rockhouse Hollow rockshelter in the Hoosier National Forest in southern Indiana is a rich history of prehistoric occupation spanning 10,000 years. Unlike any other site in Indiana, Rockhouse Hollow has produced artifacts from all prehistoric cultural time periods, with the notable exception of the Paleoindian Period. Although the site had already been looted for decades, excavations in 1961 produced a wealth of lithic and faunal data that have not yet been published. Because of extensive roof fall within the rockshelter, looting both prior and subsequent to the 1961 excavation, and a fire that destroyed some field data, questions remain regarding the stratigraphic profile within the rockshelter. During the summer of 2014, an Indiana University Geology Department field school reopened the 1961 units to better understand the stratigraphic context of artifacts recovered in 1961, and test whether Paleoindian-aged sediments might be preserved. This paper discusses the archaeological, faunal and geoarchaeological data recovered during the 2014 excavations. These data indicate that this important rockshelter in the Ohio River Valley was used for many purposes by people exploiting multiple ecosystems through the millennia.

(Institute of Archaeology and Ethnography, Armenia)**[401]** *Isotope Diachronic Changes in Armenia during Neolithic and Chalcolithic Period: Environment, Herding Strategies, Human Dietary Practices*

The Caucasus, at the crossroads of Europe, the Middle East and Central Asia, is a key region to investigate the modalities of the distribution of plants. Our study aims at documenting the presence of C4 plants, wild and domestic as millet crop and detecting their management and consumption through this area using stable isotope analysis of human and animal remains. Two Armenian archaeological sites, Aknashen (Late Neolithic) and Godedzor (Late Chalcolithic), allowed a detailed sampling of 95 terrestrial, domestic and wild, animals and freshwater fishes and 5 humans. High carbon values for the wild Neolithic animals indicate a variable but significant consumption of C4 plants, whereas no C4 plants intake is detected for the Chalcolithic animals. Different positions of domestic animals in the food chain between Neolithic and Chalcolithic suggest different herding management linked to the environment. Human Neolithic carbon isotope values suggest a consumption of wild animals and freshwater fish, not detected in the Chalcolithic humans. Pooled with our other data from the Caucasus area, results suggest a heavy consumption of wild C4 plants along the Kura River since the Neolithic as well as the consumption of millet at the end of the Bronze Age.

Herschend, Frands (Uppsala University, Sweden)**[57]** *In Search of Something Better*

In the 7th and 8th century CE, Scandinavian societies developed a stratified social structure based on ownership of land dominated by relatively few people. When the population grew during the 8th century this created a society with few opportunities not least among the landless who were partly engaged in handicraft at rural production sites linked to the urbanized European economy. This created a situation in which raiding, conquest, colonization and state formation became attractive opportunities.

Herzog, Nicole (University of Utah) and Anne Thomas (University of Utah)**[362]** *What Can Hogup Cave Starches Tell Us about Diet That We Don't already Know? Context, Preservation, and the Comparison of Archaeobotanical Analyses*

Starches preserved on prehistoric artifacts including ceramics, ground stone and other lithic tools have assisted archaeologists in better understanding the relationships between technologies and food products, food processing, activity areas and tool function. However, little research has been done to identify differential starch preservation across these artifact types. In order to test whether starch preservation is uniform across tool types, and to examine whether starch records are congruent with other types of archaeobotanical records, we examined ground stone tools, basketry and sediment samples from three strata within the Hogup Cave site. Using diagnostic starches recovered from both ground stone and basketry, a species list of plant foods was generated. This list was compared to a list of plant foods recovered from fecal and macrobotanical analyses to determine whether they reflect a similar dietary assemblage. Results highlight the mismatch between the two, and suggest that starch analysis is an invaluable tool in identifying the presence of plant foods otherwise undetected in macrobotanical or fecal assemblages. Additionally, starch research can shed light on the specific uses of twinned and coiled basketry by providing evidence of the types of cooked and raw foods commonly handled with this technology.

Hess, Karen [162] see Kasper, Kimberly

Hester, Thomas (Emeritus) and Harry J. Shafer (Professor emeritus, Texas A&M University)**[292]** *Ancient Maya lithic Craft Specialization at Colha, Belize*

Beginning in the Middle Preclassic, the rise of small centers in the agricultural area of Northern Belize gave impetus to the intensive manufacture of stone tools at Colha. Craft specialization, mass production and export of stone tools and symbols were deeply entrenched by Late Preclassic times. Examples will be provided on the use of certain tool forms in agriculture and construction throughout the region. Additionally, some artifacts were made mainly for caches, lithic symbols, and locally, for

bloodletting. Wide export of some of the latter categories has been demonstrated. By the Late Classic, some modified tool forms are seen, though the "Colha School" utilizing raw materials and ongoing techniques clearly continues. The Terminal Classic flintknappers maintained many facets of the long-lived technology, although a series of workshops have been studied that focused on blade cores and blade projectile points. This may well reflect the wars among centers that are reported at this time. To be briefly noted in this paper are the changes in population and technology that appeared in the Early Postclassic, marking an end to the "Colha School" of lithic production and distribution.

[288] *Long Term, Community Level Protection and Management of Waterfowl in Mývatn N. Iceland*

Archaeological, paleo-environmental and ethnographic research in the lakeside community of Mývatn, N. Iceland, is uncovering the millennium-long history of interactions between people and seasonal populations of waterfowl. Protection of waterfowl from hunting seems to have been applied in tandem with annual, managed egg harvesting as a common resource management strategy. The interdisciplinary investigation underway seeks to understand long term norms and local traditional knowledge (LTK) governing wild bird management while investigating the specific components of these economic practices that contributed to their apparent long term ecological sustainability. As the Mývatn region experiences economic and spatial changes that could interact with views concerning conservation, we aim to understand the changing context of birds as a natural resource and to explore the potential discursive implications of this long term narrative of sustainable paleoeconomy.

[410] *The Bioarchaeological Paradigm of Human Remains Decay in the Zapotec Mortuary and Funerary Rituals*

Archaeological, iconographic and ethnohistorical sources have been used to examine diverse cultural practices of Zapotec society before European contact. Cultural practices related to violence and warfare, such as captive taking for ritual sacrifice and slave labor, played an important role in Zapotec imperial expansion during the Late Formative through the Classic period. In the Valley of Oaxaca research has been done to understand these cultural practices. Whatever, bioarchaeological data to corroborate these cultural practices, such as intentional cutmarks in the cranium, mandible, cervical vertebrae and ribs, traumas, and other bone lesions, as demonstrated by the carved stones from Monte Albán, are lacking. Thus, this paper is going to provide a series of explanations of why human remains within the Valley of Oaxaca do not show marks from decapitation, acts of violence, or other cultural practices related to the Zapotec imperial expansion. Furthermore, using bioarchaeological approaches to body decomposition and skeletonization, I will address another cultural practice related to body disarticulation in both the mortuary and funerary contexts. This result is going to align the paradigm of how other lines of evidence vary from what has been suggested by from the archaeological, iconographic and ethnohistorical evidence.

[91] *Pre-Classic Obsidian in the Northern Tucson Basin*

This poster focuses on the investigation of sourced obsidian artifacts found in and around the Cañada del Oro Valley in southeastern Arizona. The goal of this study is to understand the evolution of social interaction and obsidian distribution during the pre-classic Hohokam periods (ca. A.D. 700-1150) and how they compare to patterns in neighboring areas. There are no obsidian sources immediately adjacent to the Cañada del Oro Valley or Tucson Basin regions. Therefore, investigation of obsidian distribution allows for a better understanding of the social interactions taking place. Previous studies have indicated that obsidian artifacts are small in number during these periods, but later proliferate. Examination of the patterns during these earlier periods will allow for a better understanding of obsidian distribution as it underwent a major change in the Hohokam Classic period (ca. A.D. 1150-1450).

Higgins, Steven [294] see Potts, Alastair

Higgins, Howard (TRC Environmental Corp.)**[336] *Consultants Are People Too: Meaningful Consultation and Archaeology***

Gaining meaningful information from traditional community consultants can often be difficult. Furthermore, exactly what constitutes such information has changed over time. Recently the focus in archaeology has shifted from a point-based search for specific locations to a landscape-based approach aimed at information that can be used to define the attributes of traditional cultural properties, so that areas which could contain them can be managed. This paper explores the elements needed to obtain such information. It is argued that the archaeological researcher needs to be sensitive to the goals and cultural perspective of the consultants, as well as be knowledgeable about the cultural limitations imposed upon these individuals. It is further argued that honesty and true sharing are essential elements- the researcher must be honest about why the questions are asked, to what uses the information will be put, and the likely outcomes of the action for which the consultation is occurring. Consultation, in the view of the author, is two sided and can't be successful if otherwise. The paper concludes with an example of consultation with a Navajo family concerning a strip mine. Discussed are the purpose of the consultation, the results, and why it was a success.

Higuelin, Ricardo [249] see Navarro, Mariana

Higueras, María (Alejandra Higueras)**[172] *Las figurillas cerámicas de Los Soldados, Veracruz: Una evidencia de la relación cultural y de identidad de una comunidad Olmeca.***

En el sitio arqueológico Los Soldados en el estado de Veracruz, México se recolectaron 450 fragmentos de figurillas de barro, fruto de 4 temporadas de investigación del Proyecto Arqueológico Arroyo Pesquero. El sitio Los Soldados pertenece al periodo Formativo Medio (900-500 a.C.), es un sitio Olmeca situado a 11km al suroeste de La Venta y a 5km al norte de la localización del sitio Arroyo Pesquero. Las figurillas de barro como material arqueológico han aportado información para poder observar e identificar cronologías, así como las relaciones culturales entre sitios vecinos, contemporáneos o de la misma etnicidad y tradición cultural. Sin embargo se ha decidido abordar a las figurillas cerámicas desde la perspectiva de su función la cual está cargada de un discurso ideológico de la sociedad que habitó este sitio. Dentro de este trabajo se propone que las figurillas cerámicas contienen un discurso que puede ser dependiente de la cultura a la que pertenecen (Olmeca) y a veces un discurso individual y propio de la sociedad que las reproduce con fines específicos como: ritual, económico, de propaganda política o propaganda religiosa.

Higueras, Alvaro (MIRAS Azerbaijan)**[279] *Alternative Strategies in Confronting Looting and Trafficking in Defense of Peruvian Portable Heritage.***

In this presentation I aim to address two issues: first, the state of looting and trafficking of monumental and portable heritage in Peru today, and, second, to propose new strategies to contribute to solving the problem of looting and trafficking. The novel strategies I propose are only

part of the solution: they should be compounded and should help strengthen the effectiveness of old, tried and partially successful enforcement strategies. The diversification of options is urgent amidst critical scenarios which Colin Renfrew, among others, has unequivocally delineated and decried in the last decades. I propose that cultural authorities and managers in Peru should focus its efforts to safeguard cultural heritage along three principles to establish its policies, strategies and future laws: (1) Shared responsibilities; (2) Patrimonial sovereignty; and, (3) Appropriation of heritage. I would also suggest two strategies that would be dynamic engines to the above principles: (1) Renewing ancestrality; and, (2) Innovation beyond the laws. These novel options to address the present two issues affecting cultural heritage aim to diversify parallel endeavors towards that goal and make more open, public and understandable the consequences of looting, and, ultimately, commit the public to a central role in participating in this task.

Hildebrand, Elisabeth (Stony Brook University) and Anneke Janzen (University of California – Santa Cruz)

[414] *The Nile vs. the Rift: Exploring Contrasts in the Spread of Food Production in Africa ca. 4200 BP*

Characterizing the patterns and processes of early food production across Africa is difficult because the continent's large landmass, diverse physiography, and regionally specific environments and crops hinder generalization. Due to these challenges, accounts of early food production in Africa tend to be narrative syntheses: they either present a detailed sequence of developments in one specific region, or 'follow' the spread of food production from the earliest herding in the eastern Sahara <7000 BP to the arrival of livestock and crops at the southern tip of the continent ~2000 BP. Trans-regional comparisons present an alternative way to make sense of Africa's tremendous diversity, but are seldom employed in an explicit manner. They can use similarities and contrasts between different areas to help explain variation in the causes and consequences for the spread of food production in distinct contexts. This paper compares two such instances ~4200 BP: the spread of southwest Asian crops and farming methods up the Nile Valley within areas where herding was already practiced, and the spread of herding as the initial form of food production in the eastern African rift system.

Hildebrandt, William (Far Western Anthropological Research Group)

[341] *Middle Archaic Expansion into High Elevation Habitats: A View from the Southwestern Great Basin*

Several researchers have hypothesized that high elevation habitats were not intensively used until after 4000 cal BP when lowland settlements became more stable and logistical hunting organization emerged. This paper evaluates this hypothesis by comparing the relative frequency of Pinto versus Elko/Humboldt series projectile points across a variety of lowland and upland settings in the White Mountains/Owens Valley area.

Hildebrandt, Tod (Far Western Anthropological Research Group)

[341] *Divergent Histories: Prehistoric Use of Alpine Habitats in the Toquima and Toiyabe Ranges, Central Great Basin*

Alpine villages are extremely rare in the Great Basin. To date, villages located at elevations above 10,000 ft. are only known to occur in the White Mountains and the Toquima Range. Demographic forcing and climatic change has been used to explain the existence of these villages, but these propositions do not identify more specific selective pressures that led to the establishment of high-elevation villages in some ranges but not others. Comparison of artifact distributions and environmental structure in the Toquima Range, where a village exists, and the Toiyabe Range, where one does not, supports the notion that alpine villages may have been subsidized by intensive exploitation of mid-elevation pinyon groves associated with low-cost travel corridors, which facilitated transport of pine nuts to upland village locations. This study also reveals that limber pine may have played a role in alpine village subsistence, and identifies the need for further research on the value of this resource.

Hilditch, Jill (University of Amsterdam)

[25] *Fabrics of Space and Time: Multiscalar Analytical Approaches to Social Process in the Middle Bronze Age Aegean*

Acknowledging analytical scale, or emphasizing the importance of moving coherently from macro to micro to elemental, is not a new concept within ceramic analysis. The work of David Peacock since the 1970s has demonstrated the necessity of a multiscalar approach, yet our attempts to combine techniques that bridge these various scales of analysis have met with mixed success, particularly when confronted by assemblages that include a spectrum of fine to coarse wares. This paper highlights recent studies in automated scanning electron microscopy with linked energy dispersive spectrometers (SEM-EDS) that have created an opportunity to integrate data from multiple analytical scales in a more robust way by offering a seamless combination of textural and mineralogical data. The case study of pottery production during the later Middle Bronze Age at Akrotiri on Santorini is used to investigate issues of social process and interaction across spatial and chronological boundaries. The results show that the integration of multi-analytical datasets across whole assemblages offers huge potential for investigating ancient ceramic technologies and their communities of practice, as well as their development through space and time.

[28] *Thinking through Dogs in the Arctic*

Canids are among the most commonly encountered animals in archaeological assemblages worldwide. Using examples from the Arctic, I discuss some of the key ways that humans employ dogs to think about their relationships with other humans, animals, and the world around them. While dogs were often treated similar to human persons, they were also used to distance and distinguish “real people” from others. Ethnohistoric evidence suggests that a dynamic tension existed in the Arctic between humans and dogs. With this evidence in mind, I argue that the ubiquity of dogs at many archaeological sites reflects 1) the symbolic potentiality inherent in dog behavior; and 2) the ambivalence and fluidity of dog-human relations.

Hill, Rebecca (Logan Simpson Design), M. Scott Thompson (Arizona State University), Holly Young (Pueblo Grande Museum) and Cory Breternitz (PaleoWest Archaeology)

[123] *It Takes a (Big) Village: Preserving the Legacy of Pueblo Grande*

Archaeology can marshal new digital infrastructure not simply to rescue endangered legacy information, but to revive and enhance those data for innovative research approaches. Over the course of two decades, Soil Systems, Inc. (SSI), collected vast amounts of archaeological information and digital data during the company's work at Pueblo Grande, one of the largest and most centrally-located of the Classic period Hohokam villages in the Salt River Valley. This poster highlights efforts to reawaken SSI's invaluable archaeological data and physical collections from Pueblo Grande, and collaborations toward synthesizing these resources incredible research potential for Southwestern archaeology. It describes an ongoing initiative that uses the Digital Archaeological Record (tDAR) to reconstruct and publish aggregated digital data sets for much of SSI's data recovery projects at Pueblo Grande. In addition, it discusses Pueblo Grande Museum's endeavors to work with recently donated physical collections from SSI's projects on privately-owned parcels of the site and to tie those collections to the digital data. Together, these efforts are integrating one of the largest bodies of data available for a single prehistoric settlement in the American Southwest to foster new understandings of Pueblo Grande and Hohokam archaeology.

Hill, Allison (California State University, Northridge) and Julienne Bernard

[143] *Assessing the Use of Lithic Artifacts in the Manufacture of Fiber Technologies at Cach Cave*
Cache Cave exhibits one of the most significant in situ assemblages of basketry and cordage recorded within the Chumash culture area. The abundance and quality of the unique items preserved in this cave system attest that caching served as one important aspect of site function. The presence

of utilitarian lithic artifacts, identified during excavations at the cave in 2012 and 2014, suggest that this site may have served additional functions throughout the duration of its use. The association of these lithics with fibrous technologies such as cordage, nets, and baskets suggests the cave may have functioned as a locale for textile manufacture. To determine if Cache Cave was a locus for the manufacturing of fibrous materials, we compared the results of a lithic microwear analysis with experimentally replicated wear patterns of plant processing to determine how the lithic artifacts from this assemblage were used. This paper presents the preliminary results of these analyses with the intention of enhancing our understanding of how Cache Cave was utilized by the local Chumash community in the past.

[280] *Portable X-Ray Fluorescence Analysis of Copper Trace Element Composition: A Methodological Pilot Study*

Copper artifacts are widely represented in prehistoric sites of eastern North America and their presence in any particular region is often used in reconstructing exchange and social networks. Early interpretations were predicated on assumptions that native copper from which materials derived from the extensive copper deposits in the Lake Superior region. However, as early as 1903, assessment of copper trace element composition has been used to test such hypotheses. A number of methods have been used, including traditional assay, various forms of spectrography, and, more recently, instrumental neutron activation analysis (INAA) and laser-ablation inductively coupled plasma mass spectrometry (LA-ICP-MS). Of these, LA-ICP-MS has become the most powerful, effective, and widely used, yet the method suffers from high costs and restricted access to limited facilities. In recent years, the availability of portable X-ray fluorescence (pXRF) systems has made elemental studies more readily available for a number of archaeological applications. We explore the use of pXRF for copper composition studies by comparing results from several copper samples of known upper Great Lakes provenance analyzed by both LA-ICP-MS and pXRF methods. Early tests indicate that pXRF analyzers exhibit sufficient sensitivity and precision to potentially discriminate some sources of native copper.

[294] *Agent Based Models of Ache Foraging and Grouping*

We show using detailed environmental and behavioral data from the Ache of Paraguay that agent based modeling can simulate correctly many aspects of human foraging behavior. We then show how this modeling technique can be used on projected paleolandscapes in the Cape Coastal Region between Blombos Cave and Pinnacle Point to predict diet, movement patterns, group size, population density, and other aspects of the behavioral ecology of human foragers in the region.

Hill, Austin (University of Connecticut) and Andrew Petersen

[409] *UAVs at Ruwayda, Qatar: Photogrammetry and Thermal Imaging for Feature Detection and Site Recording*

As part of the "Visualizing Qatars Past" project, drones are being used at the Islamic Period site of Ruwayda, on the north coast of Qatar, to document extant structures and investigate buried features. A Microdrone equipped with visible light, near infrared, and thermal sensors was used to document the fort and surrounding areas. By combining thermal imaging of the site with photogrammetric mapping, it was possible to identify architecture in and around the site that is difficult or impossible to identify from the ground. This novel aerial survey methodology is guiding ongoing excavation decisions at the site.

[337] *Nunalleq Past and Present – Discovering a Yup'ik Archaeological Heritage*

The Yup'ik, the Indigenous people of the Yukon-Kuskokwim Delta, have since the 19th century been in the center of ethnographic research in the Arctic. Yup'ik customs and material culture have been collected and investigated with the pretext of preserving a 'vanishing' traditional lifeway. Today

Yup'ik culture is vibrant with a strong connection to traditional subsistence strategies and ways of life. However, Yup'ik history is very much the history of the 'Other', retold and written from a post-contact Western perspective. Yup'ik history, however, has much deeper roots than that, and archaeology can provide an insight to this neglected part of the Yup'ik past. This paper presents the Nunalleq ('old village') archaeology project, built in collaboration between archaeologists and the Yup'ik community of Quinhagak, Alaska. Focusing on a Bering Sea pre-contact village site, it strives to bring together archaeological investigations and local traditional knowledge to recover a forgotten Yup'ik past. The intersection between past and present created by the archaeological process shapes a meaningful material heritage, embedded in the local culture and animated by scientific discoveries. When in true partnership with local stakeholders, archaeology can contribute to strengthen Indigenous heritage.

[257] *Research and Curatorial Work on the Archaeological Collections Recovered in Sonora by Dr. Richard A. Pailes*

Since 2009, following Instituto Nacional de Antropología e Historia (INAH) implementation of new public registration protocols for cultural material heritage, we started intensive work inventorying, cataloging and registration of the archaeological artifacts recovered during the Sonora – Sinaloa Project/1967 and the Economic Networks: Mesoamerica and the American Southwest between 1975 – 1978 project, both conducted by Dr. Richard Pailes. These studies provided the foundations for new insight into Sonoran Serrana prehispanic cultural dynamics and make a breakthrough in the archaeological research of Northwest Mexico. These collections are now a substantial part of the cultural resources under the custody of Centro INAH Sonora (CIS). The collections are currently being revalued as they constitute a testimony of archaeological research history in Northwest Mexico with a great deal of contextual value. Under this vision, we have been working on several lines of research, including the technological processes and their contexts analysis and interdisciplinary work on the search for raw material sources, development of virtual catalogs, and the association of the results to the current regional research scene.

[194] *The 16th Century Merchant Community of Santa Maria Acxotla, Puebla*

Although merchants were an important component of the prehispanic and post-conquest landscape, not much is known about the internal organization of merchant groups and the structure of their respective communities. This paper examines the size, composition, and internal organization of the small merchant community of Santa Maria Acxotla located in the Puebla-Tlaxcala basin of highland

Mexico. Census data collected 39 years after the conquest suggests that specialized merchant communities operated relatively unchanged well into the 16th century. The information from Santa Maria Acxotla is summarized and compared to the Aztec period site of Otumba, Mexico, that is known to have contained a pochteca merchant community in the Basin of Mexico. The data from Santa Maria Acxotla provide new data on how merchant communities may have been organized prior to Spanish Conquest.

[145] *A Religious Perspective on State Formation Process in Seventh Century A.D. Japan*

Religion played an essential role in the state formation process in seventh century Japan. After Buddhism was introduced from Korea in the sixth century, more than 600 Buddhist temples were erected by the middle eighth century. There are some distinctive layouts of temple complexes, and the central authority greatly contributed to temporal change in the layouts. A considerable change took place in the middle seventh century, which marks the beginning of the national policy to adopt Buddhism as a state religion. At the same time, indigenous Shinto rituals also became formalized. Shinto rituals came from the primitive worship for the mountains and springs, but a considerable change in patterns of Shinto rituals occurred in the middle seventh century. New ceremonial goods appeared at the Naniwa Palace in Osaka. Typical Shinto ritual sites from the late seventh to early eighth centuries in local regions were located next to Buddhist temples. Although provincial government offices were maintained by local elites, a set of Buddhist temple and Shinto ritual in a local region suggests that Buddhism and Shintoism were used by the central authority to gain more control over local regions.

[401] *Predict and Confirm: Survey and Excavation at Three Candidate Sites for Late Neolithic Occupation in Wadi Quseiba, Jordan*

In 2012 and 2013, a team from University of Toronto surveyed the Wadi Quseiba drainage in northwest Jordan. The survey had two goals. The first was to discover evidence of Late Neolithic habitation and landscape use. Many large villages declined or were abandoned at the end of the Pre-Pottery Neolithic and we sought to augment our knowledge of Late Neolithic sites to help learn why this might be. The second was to increase the efficiency and reliability with which sites are located. To this end we experimented with Bayesian optimal-allocation methods. Following the survey, small-scale excavations in 2014 on three "candidate sites" revealed convincing evidence of Neolithic occupation. One site, WQ335, had surfaces and possible architecture along with many diagnostic artifacts from the Late Neolithic Wadi Rabah phase (ca. 7.5ka BP). Another, WQ117, revealed round pit structures along with many diagnostic Yarmoukian phase (ca. 8.5ka BP) artifacts, including a pebble figurine. A third site, WQ120, revealed later (Iron Age and Roman) remains over probable Pre-Pottery Neolithic elements. This paper will discuss results of the 2014 excavations and their role in confirming predictions based on survey results.

[52] *The Colossal Hats (Pukao) of Monumental Statues: An Analysis of Shape Variability among the Pukao of Rapa Nui*

As part of monumental statue (moai) construction during the prehistory of Rapa Nui, islanders quarried bodies of red scoria, carved them into hats (pukao), and placed them atop statues measuring up to 10 meters tall. Despite overall great interest in moai and the improbable magnitude of pukao that were raised to reach their positions on the heads of statues, few studies have investigated pukao production and transport. This study seeks to analyze three-dimensional

variability of pukao using 15,000 photos of 50 pukao found near statues and 13 red scoria cylinders located in quarries. These models are used to evaluate which surface features are stylistic with related temporal and spatial variability and which are functional and relate to construction and transport of these multi-ton objects. The functional detail has the potential to shed light on how prehistoric islanders designed pukao to be placed atop moai. To this end, additional three dimensional models of statue platforms (ahu) and moai are combined with the models of pukao to test the feasibility of the conventional hypothesis that the pukao were placed atop moai using stone ramps.

[174] *Potential 1.5 Million Year Old Phantom Hearth at FxJj20 AB, Koobi Fora, Kenya*

Identifying the control and use of fire in domestic spaces in the Early Pleistocene is contentious, due to the lack of physical evidence preserved in the record. The ephemeral nature of fires results in a sparse archaeological record. Further, the evidence for fire may degrade quickly depending on the depositional context of the burial environment. The potential for identifying fire in the early Pleistocene archaeological record, where accepted hearth features are unknown, relies heavily on the ability to recognize in situ patterns, which indicate the presence of fire. New work at the site of FxJj20 AB, Koobi Fora, northern Kenya, has revealed spatial evidence indicating a potential 1.5 million year old hearth feature. Further testing of the deposits is required, but the initial spatial analysis of chipped stone and fossil bone indicate at least one locus of activity on the site. Combined with the presence of thermally altered stone and sediment, this indicates that a hearth feature may be present. Work is continuing, geochemically and micromorphologically, to determine the presence of combustion feature residues, and whether the evidence of fire can be behaviorally associated with the abundant evidence of hominin occupation at FxJj 20AB.

Hockett, Bryan (Bureau of Land Management)

[415] *Primitive Economic Man: R.I.P.*

Primitive Economic Man (PEM) paradigms have been popularly applied in economics, nutrition science, sociology, psychology, and anthropology to explain human behavior for almost two centuries. PEM contains two general assumptions: (1) that most humans make cost-benefit decisions to further their own personal economic or political condition; and (2) Darwinian selection favors these cost-benefit trade-offs; in other words, the children of selfish, cost-benefit oriented individuals differentially survive in greater frequencies through time. Regarding subsistence practices, the application of PEM paradigms has led to the development of a host of models that suggest Darwinian selection has acted upon human behavioral choices to favor those that lead to the maximum caloric intake possible relative to work effort. These models remain popular in archaeology despite the fact that nutrition science falsified this assumption a century ago in 1915. This paper explores more specifically why PEM deserves a proper burial if we ever hope to fully understand and appreciate diachronic trends in human subsistence practices. At the same time, there are components to PEM paradigms that should become important pieces to broader, more holistically based models of human dietary choices through time.

Hodges, Charles (Pacific Geoarchaeological Services) and Brandy Rinck (SWCA)**[10]** *Geoarchaeology of the Bear Creek Paleoindian Site, King County, Washington: The Stratigraphic Framework*

The Bear Creek site (45KI839) in Redmond, Washington, has yielded important information about Native American settlement, subsistence, and technology in the Puget Lowlands during the Late Pleistocene-Holocene transition (LPH). The depositional sequence within the site represents a well-preserved stratigraphic and archaeological record extending from the postglacial and early Holocene, and is characterized by several clearly expressed shifts in depositional environments. The high amount of lithological variability characteristic of deposits in glaciated terrains can result in difficult-to-interpret unit-to-unit heterogeneity if a strictly lithostratigraphic approach to the classification of depositional units is employed. In order to reduce place-to-place variability, and yet retain the capacity for detailed characterization of the depositional sequence in individual archaeological units as well as refer to major regional postglacial environmental shifts, we grouped facies types into discontinuity-bounded allostratigraphic units. This allowed us to correlate and compare deposits both vertically and laterally across the site within single depositional environments, including those that often produce heterogeneous sets of facies. We have organized our observations of the site stratigraphy utilizing a combination of data derived from distributions of lithofacies types, the geometry and character of the allostratigraphic bounding contacts, and most importantly, micromorphological analyses of both allostratigraphic and lithofacies contacts.

Hodgetts, Lisa [25] see Moody, John

Hodgetts, Lisa (University of Western Ontario), Colleen Haukaas (Archaeological survey of Alberta) and Laura Kelvin (University of Western Ontario)**[302]** *Delivering on the Promise: Mobilizing Knowledge in the Ikaahuk Archaeology Project*

Partnerships between local communities and academics are becoming increasingly important in addressing a range of research questions in a warming Arctic. These approaches hold great promise for archaeology, but community participation in research demands that archaeologists rethink the aims and outcomes of our work. Here, we reflect on the ways in which our efforts to engage the Inuvialuit community of Sachs Harbour in our archaeological research project on Banks Island, NWT have shaped the project aims and desired outcomes. Our efforts to democratize archaeological recording and reporting through the use of photogrammetry, 3D modelling and Facebook could facilitate community-based documentation of archaeological sites threatened by coastal erosion and other climate change-related impacts on the Arctic archaeological record.

Hodgkins, Jamie (University of Colorado Denver)**[356]** *Variation in Butchering Intensity between Glacial and Interglacial Cycles at Pinnacle Point 5-6*

The archaeological assemblage and long stratigraphic sequence at the site of Pinnacle Point 5-6 in Western Cape, South Africa affords the opportunity to explore temporal (and possibly environmentally-mediated) changes in human behavioral regimes in the late Pleistocene. Here, examination of butchering intensity is used as a preliminary test of the hypothesis that humans would have intensified the processing of terrestrial prey in times of cooler, dryer climates, when sea levels were low and the coastline and marine resources were further from the Pinnacle Point sites. To do so, faunal remains were sampled from three stratigraphic levels corresponding to different MIS stages: 1) the top portions of level LBSR (81 ± 4 ka); 2) level ALBS (72 ± 3 ka); and 3) the lowest portion (Thandesizwe) from level SA.D.BS (71 ± 3 ka). The LBSR is contemporaneous with the interglacial MIS 5A high sea-level stand, whereas the ALBS and SA.D.BS correspond to the beginning of the MIS 4 glacial period. Although the results of the zooarchaeological analysis are somewhat consistent with intensified butchery in the MIS4 levels based on the frequency of cutmarks on the bone fragments, no such pattern was discerned for percussion marks, suggesting that increased marrow extraction was not a part of the strategy.

Hoff, Aliya (Arizona State University), Dominique Meyer (University of California, San Diego), Michael Hess (University of California, San Diego), Fabio Esteban Amador (National Geographic) and Dominique Rissolo (University of California, San Diego)

[355] *Integrative 3D Visualization for Spatial Analysis and Interpretation of Rock Shelters in Quintana Roo, Mexico*

The integration of multimodal and multiscalar 3D imaging and visualization techniques can be used to explore ritual and non-ritual uses of rock shelters by analyzing potentially meaningful relationships between natural and constructed features. Situating rock shelters within the greater context of Maya subsurface ritual practice may in turn help further define the Maya concept of caves. LiDAR and SFM can be integrated with traditional mapping techniques and ArcGIS to rapidly and precisely document the architectural and natural attributes of a cave. The resultant models of multiple scales and resolutions are combined to facilitate seamless and uninterrupted movement between distinct domains of the cave in its entirety and within the context of the surrounding landscape. Whereas the aforementioned techniques permit the visual and quantitative analysis of spatial relationships between features, stereo panoramic photography equips us to view different spaces within a single 3D photorealistic image and enables analysis and interpretation of visual details that point clouds and maps oftentimes fail to convey. When visualized in a 3D immersive environment, integrated digital techniques produce the most accurate and realistic recreations of the physical and experiential space and facilitate collaborative, accessible, and holistic interpretations regarding both ritual and quotidian utilization of caves.

[30] *Inyan: Towards Understanding Sioux Quartzite and a Sacred Landscape*

Both archaeological and ethnographic evidence supports the idea that the locations of petroglyphs and pictographs are considered sacred. In the Northern Plains of North America, the Jeffers Petroglyphs and similar petroglyph sites along the Red Rock Ridge are part of a landscape which includes habitations, petroforms, lithic reduction sites, and quarries. We report on the results of archaeological fieldwork at four sites along the Red Rock Ridge near the Jeffers Petroglyphs: a habitation site (21CO34), two quarry sites (21CO53, 21CO56), and a smaller petroglyph site (21CO55). Our focus is the material evidence which reveals the range of activities at these sites and the use of lithic raw materials, including Sioux Quartzite. The diversity of the habitation site tool kit suggests a wide range of activities for the site's occupants. The quarry site assemblages are more enigmatic, but demonstrate that the Red Rock Ridge was an important source of stone. Shovel tests at the petroglyph site produced lithic artifacts, including non-local raw materials and abundant fractured Sioux Quartzite suggesting quarry activity was widespread. This material evidence tells us about the complexity of human activity on the landscape and adds to our understanding of how people experienced this sacred place.

[225] *Gila River Indian Community's Wildland Fire Archaeology Program*

Wildland fires have the potential to impact a variety of resources, and cultural remains are among those most vulnerable. Unlike most natural resources, archaeological sites including structures, artifacts, and sacred places are irreplaceable once damaged or destroyed. Over the past three decades, archaeologists have increasingly served as technical specialists on wildland fire incidents. Cultural resource specialists are now included in strategic planning and implementation of fire

suppression and post-fire recovery efforts. In order to adequately manage or avoid negative impacts to cultural resources during wildland fires as well as other emergency events, the Gila River Indian Community Cultural Resource Management Fire Archaeology Program was created in 2008 in collaboration with the Bureau of Indian Affairs, Pima Agency. Through participation in the Fire Archaeology Program, staff archaeologists are trained in a variety of cultural resource management activities that are undertaken before, during, and after fires. These include Federal, State and Tribal regulations, fire safety training, fireline surveys, evaluation of potential impacts, and the incorporation of protection measures. The latter include a variety of strategies to protect archaeological sites from the effects of fire, fire suppression, and subsequent erosional threats within severely burned environments.

[411] *Identifying Transcultural Processes: The Wayana-Apalai and Tiriyo Example*

The majority of ethnographic museum-collections were generally created to show a distinct indigenous culture based on examples from the material culture. These collections were created to give the impression that the features of a certain material culture, recognizable in form, design and material, are essential and genuine to a particular indigenous group. My research in the field of Museum-Ethnology, investigating transcultural processes reflected in objects of material culture, refers to transformations caused by contact to other indigenous groups living in the same region and to representatives of western cultures. These contacts are reflected in the material culture: not only regarding the used materials, like metal, fabric, glass, or even plastic, but also ideas, introduced from the outside. The latter concerns for instance western concepts about the elements that the material culture of a certain indigenous group should contain. Using the example of the Wayana-Apalai and the Tiriyo, two Carib-speaking indigenous groups from the Guyanas, I would like to discuss this topic, based on ethnographic collections from German, Swiss and Brazilian Museums.

Hofman, Courtney (University of Maryland), Torben Rick (Smithsonian Institution) and Jesus Maldonado (Smithsonian Institution)

[339] *Tracking Translocations: Interdisciplinary Approaches to Animal Translocations on the California Channel Islands*

One of the greatest human impacts on the environment has been the intentional and unintentional introduction of plants and animals around the world. Islands are particularly susceptible to ecological change following introductions, but distinguishing between natural and cultural introductions of wild taxa is often challenging. Here we present our interdisciplinary approach to investigating the origins of California Channel Island terrestrial mammals that can serve as a framework for helping distinguish natural and cultural translocations around the world. This approach integrates archaeological, isotopic, genomic and radiometric data to explore the role of human agency in island biogeography. Focusing on deer mice (*Peromyscus* spp.) and island fox (*Urocyon littoralis*), we examine the timing, origins, and evolutionary history of these species and how humans have influenced their biology and biogeography. This approach allows us to evaluate natural events from ancient hunter-gatherer environmental interactions to inform island conservation and management.

[95] *Research Excellence + Business Competence = Success: A Proposed New M.A. Program in Heritage Resource Management at Simon Fraser University*

Many cultural/heritage resource management professionals struggle to boost research excellence in an increasingly competitive global marketplace. The new master's level professional program in Heritage Resource Management (HRM) under development at Simon Fraser University provides junior C/HRM practitioners with opportunities to enhance their professional tool kit and boost their

research credentials. Our survey of traditional and online HRM master's offerings identified 16 comparable programs. We review these programs in terms of admission standards, course offerings, and graduation requirements. We also surveyed recent M.A. graduates from SFU archaeology, prospective students for the proposed program, and likely employers to identify their specific interests and preferences. The survey results provide the guiding principles for a proposed M.A. program that integrates a) online and traditional classroom instruction; b) recent B.A. graduates and more seasoned professionals; and c) coursework in HRM research design, professional practice, and business management.

[244] *Territorial Organization in the Upper Belize River Valley: Multi-Scalar Settlement Patterns at Baking Pot*

Evidence suggests that the influence of regional polities in the Upper Belize River Valley shifted through time, with political centers ascending and declining in power. Archaeological research by the Belize Valley Archaeological Reconnaissance (BVAR) project utilizes a regional approach to understand the political development and disintegration of three major centers: Cahal Pech, Baking Pot, and Lower Dover. This paper uses a multi-scalar settlement approach to understanding territorial organization in the Upper Belize River valley through time. Regional perspectives utilize LiDAR data supplemented by systematic surveys and excavations, focusing on spatial patterns that distinguish territories between sites. Extensive settlement research at Baking Pot allows for more fine-grained analysis of political and economic interaction through time. At the site level, we focus on distinguishing settlement clusters and their relationships with natural and constructed features. We present the geochemical results of an XRF analysis on obsidian artifacts to understand patterns in resource procurement and exchange networks. At the community level, we focus on Settlement Cluster C to examine strategies of community interaction and integration. At the household level, we assess patterns of household production, ritual, and political interaction. We contrast Preclassic, Classic, and Postclassic patterns to identify major changes in organization through time.

[401] *Processes of Immigration and Adaptation in Late Chalcolithic Northeastern Syria*

An incursion of immigrants into the Khabur River drainage of northeastern Syria exemplifies a set of historical processes that are sometimes suspected, but often discounted as unrealistic or unprovable. The principal processes are (1) emigration from a homeland and immigration into a new land, (2) selective transmission of culture traits to a new locale, (3) divergent adaptation, (4) assimilation of new traits, and (5) formation of a new cultural tradition. These processes are exemplified by six Late Ubaid sites in the Khabur and one in southern Anatolia.

Holeman, Abigail (University of Virginia)

[22] *Levels of Hierarchy in Northern Mexico: The Color of Ritual at Paquimé, Chihuahua, Mexico*

In societies across the ancient world, incipient leadership and centralization were founded on connections to the cosmological through ancestors, origins, and other ritual practices. At Paquimé in northern Chihuahua, Mexico these ritual practices were expressed through the language of color symbolism. Color/directional symbolism is a cosmological principle that acts as a deep structure for societies in the Puebloan U.S. Southwest and Mesoamerica. Red, black, yellow, white, and

blue/green become the language through which the world is created and differentiated. I contextualize the oft-discussed exotic goods found at Paquimé with the more locally available material to argue that color/directional symbolism was operative during the Medio Period. Emerging leaders at Paquimé used color to inscribed links to the supernatural onto the architecture, both public and private as part of a new political strategy during the Medio Period. Looking at the interplay between household ritual and community ritual elucidates how ritual action becomes an arena for political change.

[230] *A Tale of Two Houses: Soil Chemical and Floor Assemblage Evidence of Domestic Activities at the Menoken Site, North Dakota*

Although they are often used by archaeologists to identify activity patterns within domestic spaces, floor assemblages are influenced by a variety of cultural and natural formation processes, especially those related to abandonment. By contrast, soil chemical traces are thought to be less vulnerable to alteration by subsequent activity and, therefore, are treated as primary residue of activities in their original location. Although the formation histories of these two types of evidence differ, the integration of these independent data sets improves our ability to generate holistic inferences about the structure, use, and perception of domestic space. Here we compare geoarchaeological and floor assemblage data to identify and map traces of domestic behavior through the life histories of two Late Woodland period (ca. A.D. 1200) lodges at Menoken Village (32BL2) in central North Dakota. Excavations by Stanley Ahler in 1997-1999 and 2005 reveal that the two structures have markedly different styles of architecture despite a similar oval-shape, size, and penecontemporaneity of occupation. We integrate the two lines of evidence to compare the patterns of use and abandonment of these domestic structures to evaluate whether or not the uses of these spaces were comparable despite the architectural variation.

[412] *The Vast and Secret Museum of Chiriqui: Stripping the Sharpness and Beauty from obsidian*

Prominent, recent explorations of the role of sensory data in archaeology detail the linkages of bodily senses, material objects, and remembering or forgetting to invoke the 'vast and secret museum of historical and sensory absence' in analyses. In this paper, I examine the residues and associations of chthonic power and senses that can cling in social memory to volcanic materials. This serves as a query for why an entirely useful material was not in use in the Chiriqui culture area that spans present-day western Panama and eastern Costa Rica; obsidian is rare to nonexistent in Chiriqui artifact assemblages. The closest obsidian sources were likely Honduras and Guatemala to the north or southern Colombia and eastern Ecuador to the south. Given the vast distances that other artifact classes traveled in the precolumbian past, this should have provided little impediment. Standard archaeological considerations of utility or access, I argue, are insufficient explanations for this absence. In the area of the Barú volcano, in particular, perhaps the role of 'obsidian' (i.e., 'useful stone powerfully linked to the volcano') was played by dacite slabs, basalt columns, and even tephra that circulated widely in the Chiriqui past.

Holmes, Charles (University of Alaska Fairbanks), Ben Potter (Anthropology Dept., University of Alaska Fairbanks), Josh Reuther (Museum of the North, University of Alaska Fairbank) and Barbara Crass (Shaw Creek Archaeological Research, LLC)

[360] *Archaeology of the Shaw Creek Catchment, Central Alaska*

Research begun in the 1990s focused within a small valley system, Shaw Creek Catchment (SCC),

within the middle Tanana valley. Investigations show that long-term habitation and resource exploitation began about 14,200 cal. BP at Swan Point, the oldest site in Alaska. Both Swan Point and Mead date to the terminal Pleistocene. Together they constitute key sites for interior Alaska archaeology with their distinct multi-component records illustrating changes in environment, technology, fauna, and behavior throughout the Holocene. The 13,000-11,500 cal. BP period, with multiple radiocarbon-dated hearths and associated fauna, is well-represented at SCC sites. Items of carved bone (personal adornment) occur at Mead. Large animals, e.g., elk and bison, were important; however, a broad based economy, consisting of smaller mammals, birds, and fish, is clearly evident in the inventory. The Northern Archaic, while less remarkable in artifact counts, hearth features, and fauna, is represented at most SCC sites. Obsidian, unavailable locally, is common to all time periods and found in nearly every site. Five obsidian sources (one unknown) chart the distant geographic regions where, diachronically, SCC inhabitants acquired this valued material, by travel or trade. In 2014, we began a multi-year program to identify new sites and better understand those already known.

Holst, Irene

[186] *Human and Natural Processes Affecting Starch Grain Morphology in Archaeological Contexts*

Over the past decade an increasing number of archaeological starch grain studies have made important contributions to our understanding of prehistoric diets and subsistence strategies. The research has also generated a number of questions concerning the identification and interpretation of starch grain records from the Neotropics and elsewhere. Some of them involve possible modification of archaeological grains from cooking and grinding. Starch may also be susceptible to damage or degradation from natural processes such as heat, drying, and fungi and enzymatic activity. We examined this issue systematically in manioc (*Manihot esculenta*), maize (*Zea mays*), squash (*Cucurbita moschata*) and beans (*Phaseolus vulgaris*) by describing and quantifying the natural structure and modifications of starch from fresh samples and samples air or sun dried before and after grinding. Our findings will lead to a better understanding of the human-induced and natural processes that contributed to the morphology of starch grains recovered from human teeth, grinding stones, and sediments.

[276] *Ancestral Pueblo Site Distribution Data from Los Alamos National Laboratory on the Pajarito Plateau*

The Pajarito Plateau of northern New Mexico has been a place of significant archaeological study for over one hundred years. Situated just north of Bandelier National Monument, Los Alamos National Laboratory (LANL) is situated on 25,395 acres of the northern Pajarito Plateau, 90.9% of which has been surveyed for heritage resources. LANL manages over 2,000 archaeological sites, 1,505 of which are affiliated with the Ancestral Pueblo culture. This study has two primary objectives: the first is to present an overview of Ancestral Pueblo sites located at LANL using GIS data for three Ancestral Pueblo periods: Developmental (600 to 1200 A.D.), Coalition (1200 to 1325 A.D.), and Classic (1325 to 1600 A.D.). The second objective is to look at occupation on the Pajarito Plateau more broadly by comparing the distribution of LANL sites with site location data from Bandelier National Monument for these three Ancestral Pueblo periods with a focus on formation and reconfiguration of social organization and cultural-linguistic groups. The goal is to put the data from Ancestral Pueblo sites at LANL into conversation with previous archaeological research from the National Park Service to expand our understanding of site distribution on the Pajarito Plateau for Ancestral Pueblo populations.

[55] *Anthropogenic Effects on Soil Quality of the Las Capas Irrigation System*

A soil quality study was conducted at the Las Capas site to document and evaluate the soil

productivity and hydraulic soil properties of this ancient agricultural irrigation complex. This site presents an unprecedented opportunity to study the complete configuration and evolution of the oldest irrigation system documented in the Southwest to date. Mechanical stripping permitted earthen berms around small field grids to be identified so that soil samples could be collected in relation to nearby uncultivated control samples. Long-term indicators of agricultural soil quality, such as organic carbon, nutrient content, and hydraulic soil water properties, indicate that anthropogenic changes were favorable for agricultural production and that the Las Capas irrigation system was sustainable. Canals regularly supplied water to the fields, but they also supplied nutrient-rich sediments that continually renewed soil fertility, enough to counter nutrient losses resulting from crop uptake, volatilization, leaching, and oxidation. Fields have significantly elevated organic carbon, nitrogen and available phosphorus levels relative to the borders, and levels that are slightly below but comparable to the control soils. Sodium and sodium adsorption ratios, though elevated in the Las Capas fields, are far below levels that could have had a serious detrimental effect on crop production.

[166] *Variability in Neolithic Cattle Populations: A Case Study from the Orkney Islands*

The Orkney archipelago, at the northern end of Scotland, has a rich and well preserved record of Neolithic settlement. Radiocarbon dates from northern Scotland indicate the establishment of farming communities quite soon after those in southern England. However, the process by which agriculturalists reached these far northern territories is still not well understood. Faunal analysts (Watson 1931, Noddle 1983) have drawn attention to an apparent distinction in morphology between the cattle imported into Orkney and those found in Neolithic settings in southern England. This study examines size characteristics of Orkney cattle, comparing them with published data from southern England to test the hypothesis that they represent a separate and distinct population. If true, the inference might be that the initial agriculturalists in each region originated from different points on the European continent. Additionally, cattle from the Early and Late Neolithic stages on Orkney are compared to evaluate the possibility of new livestock introductions at the transition between cultural phases. The analysis of livestock remains from the Orkney Neolithic can potentially address issues regarding the arrival and establishment of agriculture in the northern regions of Great Britain, and, by implication, the migration patterns of the Neolithic inhabitants of northwestern Europe.

[349] *The Settlement Remains of Sanxingdui -- A Preliminary Study of Chronology and Site Development*

From its initial discovery in 1929, much research has been conducted on the site of Sanxingdui, making it the most famous and most important Bronze Age site in all of Sichuan if not Southwest China. While the sacrificial pits with their singular bronze objects have already been discussed in great detail by many scholars, the settlement of Sanxingdui, its structure and development are still poorly understood. Based on a consideration of the stratigraphic sequence and comparative analysis of the content of the various layers, this paper argues that considerable changes took place throughout the development of the site, especially between Phases I and II and also between Phases III and IV. Considering the limited amount of published material currently available, this paper cannot completely solve the issue of the chronology and development of the settlement of

Sanxingdui, but it points out some of the major unresolved issues and suggests potential avenues for further research.

Hood, Larkin (University of Washington)

[94] *"A True Sign of Learning": What College Students Learn About Teaching and Learning from a Museum Docent Program*

Burke 101 is a museum program developed to provide undergraduate students at the University of Washington an opportunity to share their knowledge in a particular discipline. The program is organized around a course in which students work together to create hands-on, interactive activities for visitors using museum specimens. Observations of students' interactions with visitors as well as analysis of student oral and written reflections indicate that initially students find their teaching experiences students in the museum galleries challenging and very different from teaching and learning practices in traditional classroom settings. Yet by the end of the course, many students report increased confidence in assuming a facilitator role, assessing visitor knowledge, and adjusting task challenges. These behaviors are associated with best practices in classroom teaching, as well as museum settings. Some student responses indicate that in teaching museum visitors, they have become more aware of their own learning in classroom settings. These reported changes have implications for students and instructors in the college classroom.

[411] *Imitating from Memory: Hybrid Vessels and Attempted Replications of Stylistic Elements from Central Panama in the Prehispanic Ceramics of Costa Rica*

The ceramics of Central America are replete with examples of stylistic influence that represent attempts by local potters to reproduce foreign styles from distant lands. Examples include attempts to reproduce elements of Late Classic Maya styles in ceramics of the "southern periphery" of Mesoamerica. This paper presents evidence for attempted but imperfect and even inept reproduction of elements from the opposite direction—territories far to the south and east—by identifying elements of Coclé-style designs typical of central Panama in both bichrome and polychrome vessels of northwestern and eastern Costa Rica between ca. A.D. 300 and 1300. The specific divergences between these part-imitation, part-local objects and the vessels from whose styles they borrow suggest that these hybrids were not the products of permanent migrants, itinerant potters with practiced knowledge of their own ceramic styles, nor direct copies from imported models, but rather reproductions from memory of elements that had been observed during long-distance interactions between ceramic artists of Costa Rica and Panama. They are interpreted as evidence for inter-ethnic appropriation of ideas and symbolism between distinct communities in the Isthmo-Colombian area.

[38] *Preparing for the Future through Rock Mounds and Research*

Mentoring and strong teaching methods are the hallmarks of Scott Fedick's career. When just an undergraduate, Fedick took a chance on Anna Hoover and guided her into studying an ancient agricultural technique that is actually still practiced today. Chi'ich mounds, or small rock/pebble mounds, are utilized where surface soils are thin of temperatures are dry and arid. Serving as both mulch and root stabilizers for vines, shrubs and trees, these little features can be found in archaeological contexts and in modern communities in the Yalahau region.

Hopkins, Maren (Anthropological Research, L.L.C.)

[153] *From Orioles to Airplanes: O'odham Traditional Cultural Properties and Traditions of Travel through the Western Papaguería*

Ethnographic research conducted on Barry M. Goldwater Range East with members of the Tohono

O'odham Nation identified a series of ancient and historic travel routes relevant in O'odham history and contemporary traditions. These routes range from ancient foot trails leading to the Sea of Cortez to historic wagon roads and modern highways connecting O'odham communities. The O'odham commemorate important places in their history through place-naming, storytelling, songs, and traditional cultural practices. These traditions show how places associated with memory and experience deeply influence the way people use the land, and how communities interact. Furthermore, this work gives insight to land managers, archaeologists, and other researchers about O'odham cultural memories of landscape, and demonstrates how preservation of and access to the land is significant for the retention and transmission of O'odham cultural values and practices.

[41] *Plant Use at Diablo Valdez, Santa Cruz Island: Evidence from Macrobotanical and Starch Grain Remains*

This paper considers both macrobotanical and starch grain evidence for terrestrial plant use at Diablo Valdez (SCRI-619/620) on Santa Cruz Island, California. This inland site consists of a rock shelter as well as an open-air living space, and was occupied from ca. 5900 years ago and into the Historic period. Macrobotanical remains were recovered from 140 liters of soil, while starch grain analysis was conducted on six bowl fragments. This paper contextualizes these results within a broader discussion of combining macro- and microbotanical evidence from four other sites on Santa Cruz Island. Starch analysis reveals a number of plants not represented in the macrobotanical record, demonstrating the importance of using combining these analyses.

Hora-Cook, Elizabeth (Utah State University) and Judson Finley (Utah State University)

[362] *Fremont Farming at the Margins: Assessing Horticultural Potential in Jones Hole Canyon, Utah*

Jones Hole Canyon, east of the Uinta Basin, experienced a population increase during the late Formative Period (between A.D. 1000 – 1300), roughly coincident with reductions in farming populations in the Uinta Basin. The subsistence economy of these Fremont-era occupants of Jones Hole remains unresolved: did they acquire food primarily through foraging like the canyon's Archaic Period predecessors, or did they supplement foraged foods with horticultural products in a manner reminiscent of earlier Uinta Basin populations? This poster takes the first step toward answering this fundamental question by modeling environmental constraints on maize cultivation in Jones Hole Canyon. A GIS model of horticultural suitability indicates that Jones Hole Canyon can presently support maize cultivation, based on historic records of temperature and precipitation, and further work is underway to adapt this model to prehistoric climate data. Additionally, above-ground granaries in the canyon point to seasonal storage of horticultural products. Taken together, these two lines of evidence suggest that maize cultivation was a viable option for late Formative occupants of Jones Hole Canyon.

Horn, Sherman (Tulane University), Terry Powis (Kennesaw State University) and David Pendergast

[147] *Of Watery Rocks and Slumbering Crocs: A Reappraisal of the Middle Preclassic at Altun Ha and Lamanai*

A half-century of targeted excavations in northern Belize has generated one of the most detailed databases of Middle Preclassic (900 – 350 B.C.) settlement in the Maya Lowlands. Information from sites such as Cuello, K'axob, and Colha has provided the basis for economic and political models of Preclassic development in northern Belize and the eastern Maya Lowlands in general. The comparatively modest Classic-period architecture at these sites permitted extensive exposures of early occupations, which pose logistical problems at larger urban centers like Lamanai and Altun Ha. Middle Preclassic occupations at large centers in northern Belize remain poorly understood and

understudied, despite the potential insights they may offer into the emergence of social complexity and the development of political hierarchy in the area. In this paper we review extant and unpublished data from Lamanai and Altun Ha to compare aspects of Middle Preclassic architecture, material culture, and burial practices. We evaluate how this evidence relates to existing models of early community development in northern Belize, and use these data to explore the nature of interaction networks that linked these communities to other Middle Preclassic settlements within and beyond the surrounding area.

[7] *Shaping identities through Physical and Cognitive Landscape Modifications in the Rat Islands, AK*

Low mound groupings were defined during the multidisciplinary Rat Islands Research Project during the summer of 2014. These mounds are clustered in at least three areas on Kiska Island and Segula Island. Traditionally interpreted as “bird mounds” by non-Aleuts, these mounds were thought to be places where birds habitually sat over millennia and where the resulting enriched soils fostered exaggerated vegetation growth relative to the surrounding landscape. While various bird populations do in fact make use of these mounds, the test excavation of Mound 14 in KIS-051 produced lithic evidence supporting the notion that these mounds are the result of human modifications of the landscape. Prehistoric Aleut populations had a complex notion of identity. One hypothesis for these mounds is that they represent a dynamic relationship between prehistoric Aleut group identity and the physical landscape. Geographic information systems provided an avenue for a deeper understanding of the complexities behind Aleut social constructs on the physical landscape through spatial analysis.

Horne, Joseph

[375] *Maya Ceramic Production along the North Coast of the Yucatan Peninsula: Diagnostic Attributes Associated with Unslipped Wares at Viste Alegre*

Along the northeastern portion of the Yucatan Peninsula prehistoric ceramic production practices included a variety of utilitarian forms. During recent work at the Maya coastal site of Vista Alegre, Jeffrey Glover and Dominique Rissolo recovered a high volume of unslipped plain and striated sherds. Due to the absence of complete vessels as well as the mixing of materials stratigraphically, classifying the sherds typologically has proven problematic. This paper examines and compares unslipped ceramic material from Vista Alegre with other diagnostic material recovered within the northern Maya Lowlands and the Yalahau region specifically. This comparative analysis is essential in further clarifying the chronology at Vista Alegre along with addressing the distinguishable traits that embody the ceramic wares of the region. Understanding the variability of the unslipped wares of this region will supplement further archaeological research in this part of the Maya world.

Horneman, Rennie (California State University, Long Beach), Carl Lipo (California State University, Long Beach), Terry Hunt (University of Oregon) and Vincent Bonhomme (School of Mathematics and Statistics, University of)

[412] *Morphometric Analysis of Stemmed Obsidian Tools from Rapa Nui (Easter Island, Chile)*

Of the few resources available to prehistoric people of Rapa Nui (Easter Island, Chile), obsidian was plentiful. Yet out of the countless surviving shaped obsidian artifacts that are found on the island, virtually all of them are of the same general class, the mata'a. Mata'a are flaked obsidian stemmed tools formed from a hard-hammer primary flake. As relatively simple stemmed obsidian tools with wide blades, their form is similar to artifacts known as mata'a found on other Polynesian islands such as the basalt artifacts found on New Zealand, Pitcairn and the Chatham Islands as well as New Britain, Papua New Guinea. Remarkably, all of the mata'a from Rapa Nui are of a single form with no apparent functional differentiation. Here, we have undertaken a morphometric outline analysis of a large collection multiple mata'a obsidian tools from Rapa Nui and compared similar obsidian tools known elsewhere in the Pacific. Relative to other locations, we show that that statistically distinct shape classes suggest that Rapa Nui obsidian tools are part of an as yet unknown social or technological function.

Horning, Audrey (Queen's University Belfast)**[340]** *Empirical Honesty and the Ethical Role of Archaeologists in Divided Societies*

Negotiating the politics of the present while staying true to the evidence of the past is the central challenge of responsible, ethically-engaged archaeological practice: the line between the archaeologist and the citizen is never clear cut. Questions of moral obligation and the imperative to respect multiple perspectives are of particular resonance when dealing with contested histories in conflict-ridden and post-conflict societies. Archaeology in these contexts carries risks, but also the potential for transformative social benefit. In post-Troubles Northern Ireland where society remains divided into two communities, broadly drawn as Catholic/Nationalist and heir to the Gaels, and Protestant/Unionist/ heir to 17th-century settlers, archaeology is playing a critical role in conflict resolution through bringing evidence for a shared past to discourses over a shared future. But mobilization of this past for the benefit of the future involves choices over the exploration and interpretation of archaeological evidence, and explicitly destabilizes oppositional community identities, making cross-community collaborative practice essential. As an archaeologist working with local groups across the community divide, the need to balance issues of evidence, ethics, and respect for individual and community narratives is the subject of constant negotiation but is core to the development of an empirically informed, ethically-engaged archaeological practice.

Horowitz, Rachel (Tulane University)**[292]** *The Organization and Economic Activity Related to the Extraction and Production of Utilitarian Tools in the Mopan Valley, Belize*

A major topic of recent study about the ancient Maya is the role of elites and non-elites in the ancient Maya economy. Such studies have illustrated that different types of objects operated within varying economic modes; therefore the methods of production and distribution of diverse types of objects should be examined individually. This paper will examine the economic role of utilitarian chert tools in the Late to Terminal Classic Maya economy. This paper will utilize an examination of the chaîne opératoire, or lithic production sequence, of the lithic materials from Callar Creek Quarry, a chert quarry and production site located in western Belize, to study the control of raw material sources and lithic production in the Mopan Valley. The materials from Callar Creek Quarry will be compared with those from two other chert quarry/production sites in the Mopan Valley. Through these data this paper will argue that access to chert raw materials, and the production of utilitarian chert tools, was controlled by non-elite households adjacent to the quarry/production areas.

[365] *Understanding Settlement Organization through Geophysical Survey at the Morton Village Site, IL*

Geophysical surveys at the Morton Village site are revealing the nature and distribution of occupation across this landscape and helping to guide the excavation program. Magnetometer surveys undertaken between 2010 and 2014 of 7.3 ha have identified numerous structures and pits. Results indicate a densely occupied village covering about 3.5 ha with more dispersed facilities outside this core. No evidence of a stockade has been found. By targeting specific magnetic anomalies, excavation is providing essential dating evidence and cultural material, thereby improving the geophysical interpretation as well as our understanding of the spatial organization and evolution of the site as a whole. This poster presents an overview of the magnetometer results to date, and includes a recent test of high resolution ground-penetrating radar survey that demonstrates the potential of this method for detecting additional features and adding further detail.

Horton, Elizabeth (National Park Service)

[43] *Connecting Communities to Place: Public Archaeology at Fort Vancouver National Historic Site*

The National Park Service (NPS) pursues multiple opportunities to partner with community organizations and engage the public in our ongoing archaeological and historical research program at Fort Vancouver in southwest Washington. Our focus is to increase our understanding of the people who lived at this multicomponent historical archaeological site. The park forms a large portion of the Vancouver National Historic Reserve, which is significant for its role as the headquarters for Hudson's Bay Company (1829 to 1860) and U.S. Army (1849-WWII) operations in the Pacific Northwest, as well as traditional Pre-Contact use of lands along this stretch of the lower Columbia River. Our Cultural Resource staff use archaeological compliance activities, undertaken during long-term rehabilitation/adaptive reuse of historic structures throughout the Reserve, to engage with park visitors. Our programs are designed to involve a wide range of visitors, from primary, secondary and university students, to youth organizations, family groups, community groups, and individuals. This paper will discuss various educational outreach strategies used by park staff to connect with public by creating a sense of place, which is crucial to public stewardship and long-term management of these resources.

Horton, Mark (University of Bristol)

[56] *Ethics and In-situ Science*

The process of archaeological excavation is in itself destructive and excavators can and do cause irreparable damage and the demolition of site context. Archaeological ethics reacts to protect artifacts and sites that are in danger of destruction or loss. The desire to protect cultural heritage causes many ethical theorists to suggest that artifacts must not be recovered at all from their contexts. However to allow the find to remain in the ground opens it up to theft, destruction and loss just as much as the successful retrieval and cataloguing of the artifact. The simple answer is the retention of artifacts by local guardians of history and the supervised study of the archaeological record by scientific methods that do not cause the destruction or degradation of said artifacts. This paper discusses the nuances of in-situ scientific study as it relates to such fieldwork-friendly instruments as the PXRf, whose genesis have allowed the lab to travel to the artifact and has greatly reduced the danger to artifacts and increased the power of local Archaeological societies but allowing them to retain their local heritage.

[274] *Utilizing Corrugated Wares to Explore Regional Variations in the Virgin Branch Puebloan Culture*

This poster will examine the variation of corrugated ceramics from the Virgin Branch Puebloan sites located on the Shivwits Plateau and in the lowland region of the Moapa Valley. Variation between these two regions is examined, as well as changes in corrugated designs over time and differences between wares. These data allow us to evaluate patterns of social interaction, trading networks and learning interactions between sites and regions.

Hosking, Nada (UC Berkeley)

[395] *Simulating the past - The use of 3D technologies in archaeology*

To deal with the destructive nature of archaeological excavations, today's archaeologists are using new technologies to create 3D records of not only the archaeological sites, but also the archaeological process. This project explores how photogrammetry and 3D modelling can support theoretical approaches to the phenomena and processes by which Paleolithic out-of-context imagery, especially that which is engraved, is produced. Using 3D technologies can allow researchers to simulate a variety of scenarios, including placement, shading, and relief. A light source, such as a flickering hearth fire, from a certain angle can give an engraving a three-dimensional quality, and cause the depictions to "project" from the cave walls. This study will help us rethink how such imagery has been reproduced for study purposes, and hopefully, will propel scholars in the field to move ahead towards using 3D technology to explore the phenomenology of the Paleolithic imagery in its spatial context.

[4] *The Structure A-15 Maneuver: A Novel Application of Structure from Motion Mapping at Chan Chich, Belize*

The Chan Chich Archaeological Project (CCAP) has been utilizing Structure from Motion (SfM) technology to document investigations at various scales ranging from individual artifacts to landscapes for the past two field seasons at Chan Chich, Belize. SfM is an imaging analysis algorithm that creates 3D models from a series of overlapping digital photographs, and the resulting data can be exported as a digital elevation model, an orthorectified image, or a 3D model. In 2013, the CCAP successfully experimented with a methodology that combines ground based and pole aerial photography to map an entire mound. Structure A-5, however, is relatively low and grass-covered mound that is devoid of tree cover and represents ideal conditions for testing the methodology. In 2014, the project employed the same methodology on a much more challenging and prototypical case: a badly looted, 15-meter tall temple-pyramid entirely covered in large tropical trees and low undergrowth. Our goals with the Structure A-15 investigations were to produce a topographic map of the mound, map the looters' tunnels and trenches in three-dimensions, and merge both datasets into a single 3D model. In this paper we present the results of this novel application of SfM mapping at Structure A-15.

A point that we want to emphasize is that "cognitive archaeology" is a catch-all phrase that covers pretty much every aspect of human existence. To truly discuss cognitive archaeology, we need to define the specific areas of interest in each case. Given our position that cognitive capacities as such existed from at least the late Middle Pleistocene, we are interested in questions about evolution of social cognitive constructs. These constructs portray the plasticity of cognitive mechanisms and how they interacted with the changing circumstances that shaped and modified perceptions of self and society through prehistoric time. Here we specifically examine the concepts of 'others' and 'strangers'. While this may be preliminary and rather speculative, we suggest that this issue can be addressed from contextual archaeological data, to the effect that we can trace changes in the perception of social identities.

Howard, Jerry**[304]** *Modeling Water Allocation and Scheduling in Canal System 2*

A great deal of progress has been made in understanding the physical layout, paleohydraulics and sociopolitical organization of Hohokam Irrigation systems. A relatively comprehensive database now exists for Canal System 2 identifying the location of main canals and the configuration and size of canal channels. Models of the available discharge, or the quantity of water available at points along the main canals, have been constructed. However, our understanding of the sequencing and nature of water deliveries is limited at best. How did the Hohokam organize the delivery of water to individual fields and lateral canals? This paper examines possible models of water allocation and water scheduling in Canal System 2. The water requirements for individual fields, including the quantity of water for specific irrigation cycles for maize agriculture, are established. The duration and sequencing of water deliveries to fields along a lateral canal are examined. The potential patterns in the sequencing of water deliveries to the series of lateral canals along a main canal are explored. Finally, potential patterns of water distribution and scheduling for the entire irrigation system are suggested. The implications of these models for system operation, agricultural success and social organization are discussed.

Howe, Mark (US State Department - USIBWC)**[282]** *The International Boundary Commission (IB.C.) and Projects along the U.S. – Mexico Border (1928 – 1941)*

The International Boundary Commission (IB.C.) conducted many projects along the entire U.S. – Mexico border during the Depression. Many of the projects were in cooperation with the Mexican Commission (Mexico) as per treaty stipulations. These projects were conducted under funds from agencies such as the Public Works Commission (PWC), Works Progress Administration (WPA) and others. Examination of the original documents and maps at the present International Boundary and Water Commission (IBWC) offices in El Paso, Texas has shown an interesting range of individual and Commission attitudes to structures and projects. Discussion will focus on the projects along the border, pertaining to repairs, repainting and costs to the historic monuments defining the border that were established in the 1800's. Additionally, a comparison of the monuments and those down the Rio Grande to the Gulf of Mexico will be examined and discussed.

[282] *Chair***Howell, Ryan (Bureau of Land Management), Meghan Forney (University of Oklahoma), Holly L. Andrew (University of Oklahoma) and Stephanie Stutts (University of Oklahoma)****[98]** *Trials, Tribulations, and Triumphs of Bringing Project Archaeology to Oklahoma*

In conjunction with Secretary of the Interior's new Play, Learn, Serve and Work Initiative, the Bureau of Land Management's Oklahoma Field Office in Tulsa, Oklahoma has vastly expanded its archaeological outreach program by partnering with Project Archaeology. This partnership marks the first occasion Project Archaeology has been represented in the state of Oklahoma. Initially, we felt creating a new Project Archaeology Program in a state that has had none before would present a monumental task to overcome. However, this turned out not to be the case. Upon announcing our intention to bring Project Archaeology to Oklahoma, we were met with a flood on interest and willing partnerships. Oklahoma presented itself as a great case study in the creation of a Project Archaeology program from scratch. Through the process, we uncovered several tips and techniques for helping to bring Project Archaeology to a new state.

Howell, Cameron (University of South Carolina)

[131] *Mississippian Conflict and the Role of the Fission-Fusion Process: An Example from East Tennessee*

Increasing intensity and frequency of conflict over time is a noted characteristic of the Mississippian Period in the southeastern United States. To examine the question of why violence increases, researchers have examined many cultural institutions and environmental mechanisms that can defuse tensions as well as those that exacerbate chances for warfare. A key theoretical construct is the use of bufferzones that help to lower tensions by creating separation between competing groups. However when applying a Fission-Fusion model to Mississippian cultural growth and spread, bufferzones are replaced by frontiers that bring groups into greater contact and increase the chances of conflict. How these concepts can potentially play out are illustrated with an example from East Tennessee which incorporates Blitz and Lorenz's modified Fission-Fusion framework with landscape approaches to examine the question of why and how conflict increases during the Mississippian period.

[312] *A Demographic History of Housepit 54, Bridge River Site, British Columbia*

Demographic change can have significant impacts on socio-economic and political strategies employed by complex foraging and fishing peoples. Recent research at the Bridge River housepit village, located near Lillooet, British Columbia, has demonstrated that two short periods of rapid demographic growth followed by a period of decline led to significant changes in food acquisition and storage, settlement arrangements, and social relationships. While these patterns are well understood on a village-wide scale, shifts in household demography have not been adequately addressed. This poster presents the first analysis of intergenerational demographic change at Bridge River drawing data from excavations of Housepit (HP) 54, a long-lived medium-sized residential structure. More specifically, we develop data from at least seven superimposed anthropogenic floors at HP 54 dating ca. 1100-1400 cal. B.P. to test hypotheses regarding relationships between demographic patterns and subsistence decision-making, storage behavior, and patterns of social competition and cooperation. We expect to draw implications from this research that can enhance our understanding of village-wide trends.

[81] *Seas of Change: Overfishing and Colonial Encounter in the Gulf of Maine*

This paper looks at the story of the colonization of New England from the perspective of the Ocean. It was the Ocean, and its marine resources, that first brought Europeans to the Northwest Atlantic and into contact with the region's indigenous communities in the 16th and 17th centuries. As Europeans expanded their colonial presence on land, they likewise expanded their presence on the sea, increasing commercial fishing in the Northwest Atlantic. During this early colonial period, New England colonists valued the ocean as a commercial highway, a rich source of commodities, while also fearing it as a place that could display God's Providence directly to men. Indigenous

communities had a well-developed relationship with the ocean based on millennia of subsistence-level resource extraction (non-commercial) and they appreciated the ocean and its marine resources within their traditional religious frameworks (including as animate). In this paper, we explore how indigenous communities at one local maritime site in the Gulf of Maine, the Seabrook Site, were impacted by the views of the ocean developing among European colonists during the 1600s, how this changed their physical relationship with the ocean, and how they expressed internal conflicts about changing relationships in material culture.

[25] *New Faces, New Pressures, New Pots: Collective identities in action in the ceramic record at Lamanai, Belize*

For the ancient Maya residing at the urban center of Lamanai, the period encompassing the Maya Collapse and its aftermath (A.D. 750-1150) was a time of significant changes in the fabric of day-to-day life. Widespread economic and political instability across the Lowland region seriously impacted both community and extra-local affairs. Networks of socio-economic interaction and affiliation were disrupted and people were on the move, seeking to relocate to more stable environs. The strong evidence at Lamanai for the presence of migrants indicates that significant changes in community make-up did occur. Ceramic change during this period indicates shifts in manufacturing priorities, patterns of demand, and ritual and ceremonial practice that reveal a new emphasis on fostering a shared sense of community 'oneness'. Although Lamanai's story is ultimately one of community resilience, this paper examines the social dynamics of the process of community integration that enabled this outcome. Drawing from the extensive stylistic, petrographic, geochemical and microstructural data on the development of local ceramic manufacturing traditions, this paper examines: 1) how individual and collective social identities and relationships changed, and 2) how these social dynamics of community integration may have contributed to successful mitigation of real and perceived pressures on multiple scales.

Howland, Matthew (UCSD Anthropology Department), Brady Liss (UC San Diego Levantine and Cyber-Archaeology Labor), Craig Smitheram (UC San Diego Levantine and Cyber-Archaeology Labor), Mohammad Najjar (UC San Diego Levantine and Cyber-Archaeology Labor) and Thomas E. Levy (UC San Diego Levantine and Cyber-Archaeology Labor)

[241] *Investigating the Social Dynamics of Iron Age Copper Production: Preliminary Results from New Excavations at Khirbat al-Jariya, Jordan*

This paper presents preliminary results from the 2014 Edom Lowlands Regional Archaeology Project (ELRAP) excavation at Khirbat al-Jariya (KAJ), an Iron Age copper production site in southern Jordan's copper ore-rich Faynan region. To complement earlier work on copper production activities at KAJ, industrial and administrative areas were sampled. Stratigraphic excavations in both these areas applied a cutting-edge cyber-archaeology workflow in order to ensure the best-possible spatial precision, accuracy, and detail in documentation and recording strategies. An intensive program of real-time GIS data recording (ArchField), Structure from Motion (SfM), and other techniques were applied. Ongoing research with the data, collected from these areas aims to investigate the social dynamics of copper production in the southern Levant during the early Iron Age, just prior to the peak of industrial copper industry during the period as exemplified by nearby Khirbat en-Nahas – the largest IA copper factory in the southeastern Mediterranean region. By combining investigation of a non-industrial area at the site and one of the industrial slag mounds, we aim to complement knowledge gleaned from past and present excavations of copper production contexts at KAJ in order to develop a more complete picture of life at the site.

Hristova, Petya (UCLA (alumna))**[368]** *In the Twilight of a Brave New World: From Multimedia Work Areas to Material Transformations in the Late Chalcolithic and Neolithic in Bulgaria and North Greece*

Putting together gold and graphite to decorate a pot, did not become a widespread practice in Balkan later prehistory but it was rather a mark of an intriguing entanglement of innovation and tradition, materials and images. This paper considers evidence of specialist production according to Costin's model as it can be surmised on the basis of data from Chalcolithic and Late Neolithic contexts in Bulgaria and northern Greece. It reflects on how mixing materials and techniques in search for a particular visual effect imbues familiar shapes with transformative agency in possible efforts not only to maintain but also to expand existing social networks. Specialists created conduits of technological advances in multiple media, while pursuing innovations within regional symbolic repertoires of prestige, using traditional forms such as graphite decorated ware with other kinds of elaborated objects. By studying the dynamics of specialized crafts, we can learn eventually how the later prehistoric societies in the Balkans operated and ultimately transformed into a mosaic of various forms of sociopolitical organization and cultural expression at the onset of the historical epochs.

Hronec, Laura (Bureau of Land Management, Roswell Field Office), Jeremy Iliff and Philip Watts (Bureau of Land Management)**[358]** *Quad Maps: Integration of Archaeological Data in GIS*

For most federal agencies, using GIS has become standard practice. Hardware and software, such as mobile GPS units and ESRI products, are incorporated into archaeological work flows around the country. These are used to collect information pertaining to artifacts, sites, and surveys; however, this has not always been the case. Prior to these innovations, compasses and topographic maps were used to track this information. At the Bureau of Land Management (BLM) Roswell Field Office (RFO), two hundred plus quad maps contained information regarding artifacts, sites, and surveys that had yet to be incorporated into a digital system. Using ArcMap, these quad maps were scanned, georeferenced, clipped, and incorporated as layers starting in the summer of 2012; however, this approach caused ArcMap to slow and crash often. As a means to avoid complications, the clipped georeferenced maps were made into a mosaic dataset. The dataset was updated as quad maps were scanned, georeferenced, and clipped. In the summer of 2014, all quad maps with archaeological data had been incorporated into the mosaic dataset with minimal issue. Through digitizing these maps, the BLM RFO has provided a more comprehensive view of the archaeological resources and inventories within the resource area.

Hruby, Zachary (Northern Kentucky University) and Jason W. Barrett**[292]** *Pride and Prejudice in the Maya Lowlands*

Although they represent the foundation on which ancient Maya economies were predicated, Mayanists traditionally have ignored non-obsidian lithics in their entirety. We present an historical overview of how artifacts made of chert and related stones have been traditionally analyzed and documented in the archaeological literature of the Maya Lowlands, then examine the important contributions lithic studies have made in the past few decades. The institutionalized neglect of this material class has been perpetuated by several long-held assumptions, which are inaccurate. Contrary to entrenched belief, chert resources are neither homogeneous nor are they homogeneously distributed across the Maya lowlands. The idea that measurable and informative technological, and stylistic, variation exists both spatially and temporally among tool classes also runs counter to traditional dogma. We conclude with a discussion of how the intricacies and regional variability of ancient Maya economic organization remains in a nascent state by ignoring one of their most critical resources. Non-obsidian lithic analysis can inspire a new era of enlightenment in ancient Maya research through systematic incorporation into project agendas and institutional course offerings.

Hsieh, Ellen (Cotsen Institute of Archaeology, UCLA)**[238]** *Early Spanish Colonialism in Manila: A Historical Archaeology Viewpoint*

The establishment of Spanish Manila in 1571 marked a turning point in global history. Historians

have extolled the roles of Manila as a hub of global trade networks and a key locus of cultural exchange between the East and the West. Nevertheless, the power relationships that defined colonial life in the Manila area were taken for granted by scholars. The major ethnolinguistic groups of colonial Manila - the Spaniards, the indigenous Tagalog, and the Chinese - formed a specific urban landscape during the early colonial period. This ongoing archaeology project aims to reevaluate the power relationships between these ethnic groups through an analysis of consumption in colonial and global contexts. The preliminary analysis of excavated materials from sites in Manila area since 1960s is showing that archaeology offers an alternative perspective of colonial history in Manila. This presentation provides an important reference in terms of cultural change in East and Southeast Asian waters and the Spanish empire in the New World during the early modern period.

[402] *A Novel Method to Hypothesize the Movements of Archaeological Metal: A Case Study on Bronze Metallurgy in the Central Eurasian Steppe Belt by the Second Millennium B.C.*

Traditionally, archaeometallurgists have focused on the provenance of metal, which assumes a direct linkage between the chemistry of metal ores and metal objects. On the basis of this assumption, they have attempted to reconstruct the flow of raw material across regions/cultures. However, this approach is potentially flawed, since the recycling of metal would alter the initial composition of objects, making the straightforward comparison of metal and ore chemistry problematic. Rather than associating metal with ores, a new method proposed here treats the chemistry of objects as the records of their life history. The chemical composition encloses the information concerning bronze recycling and recasting, suggesting the possible circulation of metal across space and time. Certain metallic elements, with predictable thermodynamic behavior, may indicate the flow of metal between different bronze-producing societies. This model is applied to the bronze assemblage in the central Eurasian Steppe Belt between 2200 and 1700 B.C., ranging from Siberia to Don River Basin. The chemical results show that the tin-bronze production, possibly from the Altai region, moved westward to the Volga River Basin. On the other hand, major copper resources potentially concentrated on the Minusinsk Basin in the east and Cis-Ural/Volga regions in the west.

[149] *What the Imagery Offers: Rock Art in the Study of Ancient Chacoan Culture*

More than a hundred years of archaeological investigation have been focused on Chaco Canyon and, more recently, the Chaco World. Most of that work has been related to Great Houses, Great Kivas and the related material culture found therein. Exhaustive analyses of the archaeological data has brought much to light in our understanding of the Chaco phenomenon, and raised many more questions that are currently being researched. The authors of this paper contend that a wealth of information has yet to be tapped from a prolific Chacoan artifact – the rock art imagery. Thousands of rock art images exist throughout the canyon, some directly associated with the Great Houses and many more spread along cliff faces and boulders between and beyond the impressive architecture. Now that a majority of the carvings and paintings within the Chaco Culture National Historical Park boundaries have been documented, it is time to bring rock art into the mix. This paper shows that Chacoan rock-art played an important role in the development of Ancient Chacoan culture, as well as influenced the imagery of surrounding—and farther flung—Ancient Puebloan communities.

Huang, Tsuimei (Professor at Tainan National University of the Arts)**[234]** *The Bead Strings with Jade Huang Pendants of the Zhou Period of China: Revived Tradition or Adopted Fashion*

Among the numerous neck/chest ornaments consisting of jade huang pendants (arc-shaped jade pieces) in Chinese archaeological finds, two distinct groups are most noteworthy: the Neolithic (5th-3rd millennia B.C.E.) necklaces from the lower Yangzi valley and the early 1st millennium bead strings of Western Zhou period in the mid and lower Yellow River Valley. Because the huang pendant is mentioned in Chinese texts as important ancient ritual paraphernalia, these unique artifacts have become topics of scholarly interest with regard to their origins, evolution, and ritual meanings. Moreover, archaeological studies suggest that aside from reflecting the rekindled interests in past cultural traditions, the bead strings with jade huang pendants of Western Zhou period likely have witnessed communications and stimulus from outside cultures. The use of multi-colored body ornaments that prevailed during the 2nd Millennium B.C.E. in Gansu/Qinghai and the Loess Plateau of Northern China, such as those consisting of carnelian, turquoise beads, and arc-shaped pendants in metal materials, possibly have acted as a catalyst for the emergence of a new fashion in Western Zhou.

Hubbard, Emily (University of Toronto)**[401]** *Storage, Surplus and Wealth at a Chalcolithic Site in Israel*

Excavations at Tel Tsaf, Israel have provided evidence of large mudbrick silos, animal pens and potential feasting activities. Tel Tsaf dates to the earlier part of the Chalcolithic period which spans from c. 5200-3600 B.C. and marks a transition from egalitarian villages to the eventual cities of the Early Bronze Age in the region. Towards the end of the Chalcolithic period social stratification becomes more visible within the archaeological record as evidenced by hoards of copper items in caves, formal off-site cemeteries, and shrines or ritual sites. Large-scale storage also becomes visible during the Chalcolithic period. In this contribution, I combine micromorphological analysis from Tel Tsaf, with published architectural, faunal and botanical evidence, to discuss and clarify the interconnectedness of storage, surplus and wealth. Social and economic theories play key roles in this discussion. A clearer conceptual framework of the complex relationships among storage, surplus and wealth contributes to our understanding of the changes seen in the Chalcolithic period of the region, and also has important implications for addressing similar issues in pre-historic societies elsewhere.

Hubbe, Mark (The Ohio State University) and Christina Torres-Rouff (University of California - Merced)**[384]** *Morphology and Culture among the Middle and Late Intermediate Period inhabitants of Catarpe (San Pedro de Atacama, Chile)*

Catarpe Tambo represents one of the clearest pieces of evidence for an Inca presence in north Chile's Atacama oases. The tambo was built and used north of the oases, in the San Pedro river canyon. Catarpe was chosen by the Incas as the local administrative center, however the valley was already densely occupied since at least the Late Intermediate Period (A.D. 1000-1400). Here, we study morphological affinities and the distribution of cranial vault modification among over 300 individuals from the two largest Catarpe cemeteries with the objective of exploring whether the occupation of Catarpe is associated with the presence or influx of groups with different biological and/or cultural identities when compared to other settlements in the area. Our results show that there are no significant differences among the Catarpe cemeteries, nor any strong differences between Catarpe and several other contemporaneous local sites. However, the later, and much smaller, cemetery of Catarpe 1, which includes Inca objects among the grave goods, does demonstrate an increase in morphological variation, suggesting the influx of foreign individuals close to the arrival of the Incas in the area.

Hubert, Erell**[187]** *Representing and Negotiating Moche Identity in Everyday Life*

Material culture used in daily practices plays a crucial role in mediating personal experiences, social

identities, and wider socio-political phenomena. Based on my doctoral dissertation, I more specifically explore the ways miniature anthropomorphic figures used mostly in domestic contexts participated in the negotiation of the identities of Moche colonists settling in the Santa Valley (north coast of Peru) between the fifth and the ninth century A.D. Figurines in particular seem to have played an important role in uniting Moche colonial communities through both imagery and the practices in which they were used. Indeed, they contributed to the construction of a normative image of a Moche body distinct from that of indigenous people, underlined the importance of women as intercessors in the lives of Moche people, and created a sense of belonging through their ubiquitous use in the daily lives of all colonists. Unlike ritual objects such as finely painted and sculpted vessels materializing a religious and political ideology centered on social hierarchy and warfare, figurines responded to daily concerns of Moche colonists in the Santa Valley for their cultural identity and for social cohesion, concerns born from their position as colonial actors.

Huckert, Chantal (Universidad Veracruzana)

[198] *Imágenes en la Vestimenta de las Figurillas Sonrientes de la Costa del Golfo*

La investigación que realizo actualmente conduce al análisis formal e interpretativo de los glifos cefaloformes de reptiles híbridos representados principalmente en la vestimenta de las Figurillas Sonrientes en custodia del Museo de Antropología de Xalapa, Veracruz. En este sentido, propongo exponer una ficha señalética por cada referente reptil, que incluya los rasgos determinantes, realistas e híbridos, su campo de acción definido por los pictogramas que lo acompañan en la vestimenta, y vinculados con otros reptiles de Mesoamérica.

Retomando las pautas y metodología que propuso, en su momento, el arqueólogo mexicano Alfonso Medellín Zenil para realizar una tipología de los tocados y establecer las conexiones estilísticas con el arte teotihuacano, zapoteco y maya (1960; 1987), en esta ocasión mostraré múltiples lecturas que tienen los significados y discursos transmitidos por los glifos y pictogramas, desde el ángulo de la iconografía y de la historia del arte en el contexto general de las culturas del Golfo en el periodo del Clásico tardío, confirmando que las imágenes, pictogramas y glifos en las figurillas, esculturas y fragmentos cerámicos del Centro-Sur de Veracruz, son también testigos directos del pensamiento religioso y filosófico de las sociedades que los manufacturaron.

Huckleberry, Gary (Geoarchaeological Consultant)

[304] *Stratigraphic Evidence for Large Floods in Canal System 2, Phoenix, Arizona*

Recent excavations conducted downstream from Park of Four Waters have provided new evidence of damaging floods within System 2 between A.D. 1050-1400. Two main canals contain stratigraphic evidence of uncontrolled Salt River. One canal (Hagenstad) contains evidence for two floods, the last one causing the alignment to be abandoned. The other canal (Woodbury's North), contains a flood deposit that filled the channel and led to its abandonment. A combination of ceramic, ¹⁴C, and luminescence ages indicate that the two Hagenstad Canal floods occurred A.D. 1050-1300; the Woodbury North Canal flood occurred A.D. 1300-1400. These floods correspond in time to an overall period of low discharge variability on the Salt River based on tree-ring reconstructions. An exception is the possibility that the flood terminating Woodbury North Canal may correlate to high annual discharge in the Salt River during the A.D. 1380s. Tree-ring reconstructions of annual discharge do not adequately capture individual floods of cultural significance. Combined geological and dendrohydrological methods are needed to better understand the timing and impact of large floods on Hohokam canal settlements.

Huddlestan, Stephanie (Kleanza Consulting Ltd.), Amanda Marshall (Kleanza Consulting Ltd.) and Jenny Lewis (Kleanza Consulting Ltd.)

[336] *On the Front Line: Collaborative Archaeology between CRM Archaeologists, Academics and First Nations Communities*

First Nation's heritage concerns are at the forefront of many large-scale and controversial development projects across the province of British Columbia. How developers and Cultural Resource Management (CRM) Archaeologists choose to address these concerns can significantly

impact working and political relationships. CRM archaeologists are on the front lines balancing and navigating complex, and sensitive socio-political heritage issues. Our small CRM company, Kleanza Consulting Ltd. (Kleanza), has found success conducting collaborative research in this challenging environment. We have found that in order to conduct meaningful work, archaeologists must be sensitive, adaptable, flexible, and above all must practice a community based and community driven approach. This approach requires a large investment building relationships between competing CRM companies, academics, contractors, and clients. Researchers must be locally based to gain specialized community knowledge and understand how to work within complex current and traditional socio-political frameworks. This presentation focuses on a selection of projects that demonstrate the changing dynamics of CRM archaeology and community collaboration in the face of considerable development.

Huebert, Jennifer (University of Auckland)

[52] *Anthropogenically Driven Decline and Extinction of Sapotaceae on Nuku Hiva (Marquesas Islands, East Polynesia)*

The native forests of the central and eastern Pacific Islands were extensively modified by Polynesian settlers, but our understanding of these processes is generalized. In the first large study of anthropogenic forest change in the Marquesas Islands, the identification of two members of the Sapotaceae family in archaeological charcoal assemblages was notable. Plants from this taxonomic group are poorly represented in Eastern Polynesia today, and the findings of *Planchonella* and another species (cf. *Sideroxylon*) indicate the geographical distribution of trees in this family was once more extensive than it is today. They further suggest that some Sapotaceae may have been common elements of the indigenous lowland forests of the eastern Polynesian high islands. Both taxa were found in early cultural contexts at sites in three valleys, and decline to almost undetectable levels by the late prehistoric period. These declines could be attributed to habitat destruction, overexploitation of the wood, and seed predation by introduced rats. Other data suggests links with reductions in native frugivorous bird populations should also be explored. This study has informed on a group of plants that are not well-represented in pollen spectra in the region, and highlight the usefulness of archaeobotanical data in studying paleoecological processes.

Huerta, Edgar (Cal State Fullerton)

[172] *Observations Concerning Ash-Tempered Pottery from the Archaeological Site of Los Soldados*

The use of volcanic ash as temper in Olmec pottery is generally known, unfortunately its temporal and spatial distribution at the site and regional levels remains poorly understood in the Gulf lowland regions. This paper presents the results of conventional microscopy and thin section petrographic analysis identifying the distribution of ash temper within the Los Soldados' pottery assemblage. This is done with an attempt to illustrate the relationship of ash temper in proportion to other paste components and pottery types. Results indicate that ash-tempered pottery from Los Soldados, possibly represents similar trends identified at Sierra de Los Tuxtlas underlining the importance of ash temper as a marker of technological, cultural and behavioral changes influencing the manufacturing, distribution, and use of pottery. Taking a domestic economy and household archaeological perspective, the results of this research addresses implications regarding typological, chronological, and polity influence perspectives in the Olmec lowlands.

Huff, Jennifer (University of Washington)

[52] *Holocene Transitions in Highland Papua New Guinea: Linking Climate Change to Changes in Subsistence and Mobility with New Models and Data*

Highland Papua New Guinea (PNG) is a region of independent invention of non-cereal-based agriculture. Consequently, the transition from a mobile lifestyle to a sedentary residential pattern, and the transition from a forager/gatherer subsistence practice to the adoption of agriculture by the past peoples of highland PNG have been a subject of considerable interest for archaeologists. Models of

these transitions have changed through time with the arrival of new evidence such as palynological paleoecology reconstructions and improved radiometric dating techniques. The research presented here will add a statistical meta-analysis of site use changes through the archaeological record of the PNG highlands and the results of an ongoing reanalysis of the largely expedient lithic assemblages of multiple highland sites. Theory and methods for lithic analysis that have been developed since the original analysis of this collection provide new data to test models of residential pattern and subsistence change especially relative to global climate changes during the Holocene.

Huffer, Donelle

[97] *Ceremonially and Ritually Associated Archaeofaunal Remains from Two Sites Near Wide Ruins, Arizona*

Zooarchaeological analyses of faunal bone assemblages often focus on the role of animals in human diet and subsistence and as sources of raw materials. Yet animals also fill social and symbolic roles in human societies, and ceremonially and ritually associated archaeofaunal remains have significant interpretive potential. Recognizing the special emphasis accorded to certain animals and their remains and the social factors that shape faunal bone assemblages permits explanation within broader frames of reference that transcend strictly utilitarian-centered interpretations. Investigations conducted by Northland Research, Inc. at two sites near the community of Wide Ruins, Arizona on the Navajo Nation recovered ceremonially or ritually associated taxa. This poster presents these remains as archaeological evidence of the social significance of animals in the prehispanic Pueblo region and interprets their occurrence within a framework that incorporates contextual analysis, ethnohistoric research, and descendent community perspectives.

[403] *Stable Isotopic Insights into Changing Diets, Population Mobility and the Origins of Pastoral Nomadism in Early Bronze Age Mongolia*

This paper presents human and faunal bone, dentine and enamel stable isotopic data from a small ($n = 30$) Bronze Age skeletal assemblage excavated from a large burial mound (khirigsuur) complex ($n = 2000$) located in northwest Mongolia (ca. 3,500-2,700 BP). Covering 900 sq. km and spanning 600 years, osteological and mortuary data suggest no strict correlations occurred between individual age and sex estimates, and the size or form of burial mound, suggesting instead that khirigsuur variation signifies nascent social stratification over time. With numerous human bone AMS dates at hand, we examine if increased enrichment of nitrogen and depletion of carbon over time reflects the increased consumption of specific plants and terrestrial protein by certain individuals (of either sex), suggestive of nascent inequality amongst so-called egalitarian nomads. Furthermore, we query whether or not temporal variation in strontium and oxygen values reflects at least low-level exogamy during the Early Bronze Age, and how extra-local origin may or may not be reflected in mortuary treatment. This data adds to previous research conducted in 2007, allowing further assessment of how social organization changed over time, and add anthropological context to studies of early pastoral nomadism within the mixed C3/C4 steppe biome.

Huffman, Thomas (University of the Witwatersrand)

[23] *Salvage Excavations on Greefswald: Leokwe Commoners and K2 Cattle*

The relationship between Leokwe and Leopard's Kopje people represents the first known ethnic interaction in pre-colonial southern Africa. As the subordinate partner, Leokwe had roles befitting their 'first people' status. Salvage excavations at the Leokwe Main Rest Camp uncovered 'extra' cattle kraals, while Leokwe faunal assemblages there and elsewhere contain high percentages of low-status cattle bones. Thus, Leokwe herdsman were probably tending the cattle of K2 elite. Two sites on Schroda and one on Little Muck suggest that Leokwe people were also ritual specialists: they appear to have been involved with rites-of-passage and rainmaking. Evidently, the ethnic distinction of Leokwe people disappeared as Mapungubwe became a state under a sacred leader.

[250] *From Trash Pile to Temple Wall: The distribution of Formative Period Sherds in Adobes at the Omo M10A Tiwanaku Temple*

This project addresses site formation and construction processes in the Omo M10A provincial Tiwanaku temple in the Osmore drainage of southern Peru (ca. A.D. 500-1100). We will test the hypothesis that this structure was constructed using adobes made from soil deposits containing cultural materials from local, Formative Period Huaracane occupations (ca. 1750 B.C.–A.D. 600). This will be done by detailing the manufacture of Tiwanaku adobe bricks and charting the association of Huaracane style ceramic sherds with adobe materials in the temple's architectural collapse levels. Despite the extensive occupation of the Huaracane culture in the Osmore drainage, previous research suggests that the interaction between the indigenous Huaracane and the Tiwanaku colonists was minimal. However, abandoned Huaracane village middens would have been readily available sources for organic clays used as the principal material of adobe. In the Omo temple, Huaracane cultural materials are found embedded in mudbricks, and statistical analysis of ceramic collections indicates that these sherds are rare on temple floors and in activity deposits. Detailing the distribution of Huaracane ceramics at Omo M10A, and relating clusters to floor-levels and architectural features, will contribute to a more complete understanding of construction techniques and site formation processes at this important Tiwanaku center.

Hughes, Erin and Lindsay Johansson (University of Colorado, Boulder)

[260] *Gunnerson Revisited: A Reconsideration of Plains Promontory Relationships*

On the basis of new excavations within the Promontory caves, archaeologists are beginning to gain a better understanding of when and how Promontory people lived (Ives et al. 2014; Johansson 2013). Some preliminary data also gives credence to Steward's (1937, 1940) argument that Promontory people were Athapaskan and that the caves represented one stop on a route taken from Dene lands in Canada to the Plains and Northern Southwest where Athapaskan speakers (Apache and Navajo) were first encountered by Euroamerican explorers. To connect the Promontory to Apache groups on the Plains, Gunnerson (1956) suggested ties with the Dismal River aspect. However, similarities between the two groups were discounted for chronological reasons. Using new dates on Promontory as well as a different understanding of the relationship between Promontory and Fremont, we reexamine the possibility that Gunnerson was correct in suggesting a relationship, but incorrect in which group preceded the other.

Hughes, Richard

[341] *Looking at High-Altitude Obsidian Use in the Great Basin*

Until recently, most of what was known about the prehistoric use and conveyance of obsidian in the Great Basin was derived from analysis of time-sensitive artifacts recovered from caves and rockshelters. Over the past 35 years, however, archaeological research conducted in high-altitude settings has provided new insights about synchronic and diachronic patterning unique from many lowland assemblages. This paper will present the results of obsidian provenance analysis from sites in the White Mountains of central eastern California and sites atop Mt. Jefferson in central Nevada, highlighting similarities and differences between the temporal patterns in obsidian use identified in both areas.

Hull, Kathleen (University of California, Merced)

[175] *Communal Ritual, Communal Feasting, and the Creation of Community in Colonial-Era Los Angeles*

This paper examines archaeological and ethnohistoric data that speak to the role of communal events and practices in the creation and maintenance of real and imagined communities during the colonial era for native people in the Los Angeles Basin. Communal ritual and associated feasting had a long tradition in this region, and persisted into the colonial era despite the incorporation of many native people into Mission San Gabriel and the Pueblo of Los Angeles. Archaeological data suggest such communal activities served to sustain native communities, in part by creating persistent places of memory and commemoration in the rapidly changing colonial landscape revealed especially by mission records.

[289] *A Geoarchaeological Approach to the Interpretation of Incomplete Spatial Data*

As in all archaeology, geoarchaeologists sample discrete loci and use those data to make generalizations about broad areas. When interpolating and extrapolating from known data points, errors may be introduced which can bias interpretation. Here, examples from CRM illustrate some of the challenges of analyzing discontinuous or otherwise incomplete spatial data.

Hung, Ling-yu (Indiana University)

[102] *Migration, Diffusion, and Trade: Potting in Neolithic NW China*

Painted pottery traditions in Neolithic Northwest China emerged through diverse processes of human migration, technical transmission, style imitation, and material exchange. Starting around 6000 years BP, Yangshao farming communities expanded incrementally farther upstream along the Upper Yellow River drainage and westward along the Hexi Corridor. The painted pottery tradition introduced by Yangshao immigrants developed into different chronological and regional styles in Northwest China over the course of several thousand years. Additionally, as exemplified at the famous Liuwan site, our inter-disciplinary study demonstrates that cultural assimilation and material exchange played important roles in the spread of painted pottery known as Majiayao, Banshan, and Machang. These multiple lines of evidence support a new synthesis about the production and circulation of Neolithic painted pottery in Northwest China.

[9] *Provenance of Archaeological Copper Alloys by pXRF*

Recently, there has been significant interest in the use of portable x-ray fluorescence devices (pXRF) for cultural materials applications, particularly the non-destructive provenance determination of archaeological materials. Historic copper alloys, typically brasses and bronzes, can often be sourced using elemental analysis to reveal regionally and temporally specific impurities and trace element signatures. We investigate the analytical performance of five different pXRF spectrometers for the non-destructive quantitative analysis of historic copper alloys both as prepared samples and field specimens.

Hunt, Terry (University of Oregon) and Carl Lipo (California State University Long Beach)

[233] *The Evolution of "Hyper-Locality" on Rapa Nui (Easter Island)*

The archaeology and prehistory of Rapa Nui (Easter Is.) reveals a paradox. Despite the island's diminutive size and the lack of natural barriers preventing social interaction, prehistoric populations on the island show patterns of "hyper-locality." Evidence from ancient human genetics and multiple artifact classes show significant co-variation with space on an enigmatically small scale. Such spatial autocorrelation is likely explained by the structure of interactions in the context of Rapa Nui's environment; however, it is unclear why such localized interaction would be so prevalent on such a small island. We explore conditions leading to the evolution of "hyper-locality" and consider the implications for Rapa Nui and beyond.

[330] *Discussant***Hunt, Robert and Scott Ingram (University of Texas at Arlington)****[304]** *Towards a Food Production Calendar for the Lower Salt Valley*

A food production calendar for the Lower Salt River Valley would amplify our understanding of the largest prehistoric irrigation system in the New World. Hunt and Ingram have assembled a food production calendar for the Akimel O'odham (Pima) and Hohokam of the Middle Gila River valley (Kiva 2014). A question is whether this calendar can be extended to the Lower Salt River valley. The environmental variable for which we have the most information is air temperature. The historical records of agriculturally relevant air temperature for the Phoenix Basin are presented. Analysis of the temperature data supports the extension of the Middle Gila calendar to the Lower Salt. Two crops of maize per solar year are often possible. Last freeze is a not infrequent problem in March for the first corn crop. First freeze is not a problem for maize. The growing season is sufficiently long to permit a cotton crop to mature. What little is known of the Salt River flow regime is articulated with the proposed cropping calendar for the Lower Salt valley. The implications of the Middle Gila and Lower Salt food production calendars for carrying capacity and trade are discussed.

Hunter, Ryan (National Park Service, Midwest Archeological Center) and Dawn Bringelson (National Park Service, Midwest Archeological Center)**[120]** *Site Distribution Patterns at Indiana Dunes National Lakeshore*

Recent work at Indiana Dunes National Lakeshore has increased survey coverage, allowing for consideration of site distribution patterns within the dunes. Specifically, we focus on Native American short-term habitation sites located within the Tolleston dune formation. Although the eastern and western units of the park are separated by only approximately 5 miles of private land with industrial development, site densities differ significantly between the two units. These differences remain even when one controls for differences in survey intensity, types of sites identified, and general dune types. Several forms of soil analysis, including analysis of sediment particle size and optically stimulated luminescence, are considered at both site and non-site locations across the park to explore possible differences in dune formation and stability. Movement of sediments as dunes stabilize and destabilize can be seen through particle size sorting patterns and dates from optically stimulated luminescence. Through this, small-scale differences in environment are considered as explanations for habitation patterns, as well as for depositional processes affecting site identification.

Huntington, Yumi (Jackson State University)**[187]** *Head Motifs on Cupisnique Style Ceramics: Emblems of Cultural Identity in Early Andean Art*

The term "Cupisnique" is applied to the culture and artifacts found in the Cupisnique ravine located between the Jequetepeque and Chicama valleys of northern Peru. Most Cupisnique-style ceramics were created between approximately 1200 and 200 B.C.E. These artifacts are characterized by stirrup spouts, dark black or brown hues, and engraved head motifs on well-polished surfaces. Previous scholars have emphasized religious interpretations of these ceramics, arguing that Cupisnique head motifs depict the supreme deity, images of a sacrificial head, or a shaman portraying in the midst of a transformative trance. This paper argues that the engraved head motifs on Cupisnique-style ceramics can instead be understood as emblems of cultural identity and socio-political power in the Cupisnique region. During the Initial Horizon period, traders from Ecuador

brought items such as spondylus shells to the northern coast, and people from the northern highlands introduced the San Pedro cactus and potatoes to this region in return. Since different ethnic groups mingled along the northern coast of Peru, the Cupisnique people likely felt the need to distinguish themselves and claim ownership of their land, a task that they performed in part through the language of engraved ceramic motifs.

[34] *Finding the Balance: Case Studies in Collaboration and Community Engagement from the American Southwest*

In this paper we explore the challenges and benefits of conducting archaeological field work in rural communities where many stakeholders have vested interests in our research. Doing work in such situations can often feel like a complicated juggling act as one seeks to build relationships with local landowners, diverse community members, and various government agencies, while at the same time meeting the needs of student participants and achieving research goals. The benefits to all parties, however, can be substantial. Our paper highlights two ongoing multi-institutional collaborations that are engaging the public, training young scholars, and answering “big picture” archaeological questions. We focus particularly on balancing public outreach with student education as we strive to raise awareness of the importance of cultural resources and the ethics of responsible archaeology.

[201] *Touching the Past in Museums: Issues of Authenticity and Identity for Crafted Replicas and 3D Print Facsimiles of Rare, Perishable and Iconic Artifacts*

Traditional museum presentations of rare or fragile archaeological artifacts are dominated by displays behind glass; vision dominates the sensory experience. The emotional connections built by more multisensory engagement with artifacts offer a better appreciation of the ancient objects and an enhanced museum visit. The research focused on icons of identity which were too precious to allow handling and items which were too fragile to touch, such as ancient perishable textiles and basketry. The modern audience is shifting its expectations from passive viewer to active participant and the project offered ways of adapting to this change using a range of media to connect past and present and overcome the emotional and physical distance between ancient objects and their modern audience. Ideas were drawn from a range of sources and disciplines and installations were developed to deliver a range of touch experiences within a variety of museum and outreach settings. Crafted replicas were used alongside very new technologies such as 3D prints in a series of museum trials. The results showed that visitors had an enriched museum experience using these techniques because interactive and multi-sensory displays using these methods resulted in closer engagement with the ancient objects.

[303] *Revisioning the Relationship between Man and Jaguar: A Reassessment of the Olmec Paintings of Oxtotitlán, Guerrero, Mexico*

The rock art of the Oxtotitlán and Juxtlahuaca caves are among the earliest known examples of Mesoamerican figurative wall painting. As part of the recent research initiative examining the Oxtotitlán cave paintings, re-illustration presents new images of the ancient artworks. Detailed field drawings are combined with multispectral imaging data and analysis of painting technology to precisely record the art, even when lines are no longer visible to the naked eye. Increased clarity of the calligraphic linework, better documentation of the uneven rock surface, and refinement of iconographic details significantly alters the style and content of some well-known images. The Oxtotitlán paintings are the work of experienced artists who were proficient in complex iconographic systems and talented in representation. This paper presents the rock art at Oxtotitlán in context both

within the cave site and among the stratigraphy of multiple painting events, as well as considers how previous archaeological documentation of these artworks has shaped notions of Olmec belief systems.

[187] *Sacrifice and Social Identity: Untangling Identity from a Mass Burial at Matrix 101, Huaca Las Ventanas, Peru*

Typically, burials are laden with symbols of social identity such as age, sex, and wealth of grave goods. However, conceptualizing individual or group identity can become problematic when examining non-modal or deviant burials.

During the 2011-2013 field seasons, the National Sicán Museum and the Lambayeque Valley Biohistory Project recovered over 200 individuals from a Late Middle Sicán (A.D 1050 - 1100) sacrificial context designated Matrix 101. Constructed in three separate phases during a protracted El Niño event and just before Sicán political collapse, Matrix 101 involved burial characteristics well outside normal Sicán burial practices. Burial reopening and manipulation, body position, burial placement, and lack of grave goods all deviate from modal Late Sicán burials and sacrificial contexts. What were the victim's social identities? Why were they buried in an elaborate funerary context? Were they elites or commoners? Utilizing a compiled database of contextualized Sicán burials, we examine age, sex, health, and burial patterns of the victims. Preliminary results indicate that most of these individuals were Sicán elite buried in a non-modal fashion, though a few may have been members of the local Muchik ethnic group. This information allows a better understanding of events leading to Sicán political collapse.

[253] *Patterns of Postclassic Ceramic Exchange in the Toluca Valley and Surrounding Areas of Central Mexico*

In Central Mexico, the Late Postclassic period encompasses the expansion of both a robust market system and the growth of the Aztec Empire. However, increasingly refined chronologies in multiple subregions have made it clear that changes in economic and political organization did not happen simultaneously, nor did they happen consistently across the region. This poster presents data on the changing geographic patterning and intensity of ceramic exchange at the site of Calixtlahuaca, in the Toluca Valley during the Middle and Late Postclassic periods (A.D. 1130-1530). The discussion of exchange incorporates both type-based ceramic classification and INAA. The pattern observed at Calixtlahuaca is then compared to patterns of ceramic exchange at contemporaneous sites in the Basin of Mexico and Morelos.

[13] *Lies, Damn Lies, and CRM—Archaeology as White Power and Neoliberal Statecraft*

In 1989, anthropologist Bruce G. Trigger (1937-2006) successfully showed archaeology to be a conduit for social power. What he did not elaborate on was that archaeology largely represents a racialized form of power insofar as most archaeologists are white and those whose past they "study" are largely minority Indigenous peoples. Further, while Trigger considered archaeology a bourgeois pursuit, he did not adequately account for the near wholesale commercialization of archaeology in the form of cultural resource management (CRM) (2006:544-5). As such, Trigger never developed a complete theory of archaeology as statecraft, let alone one of neoliberal statecraft. In this paper, I reimagine Northern American (USA/Canada) archaeology as a tool of the racialized neoliberal state. A technology of government, archaeology permits the clearance or erasure of Indigenous heritage from the landscape in advance of capitalist development. Insofar as archaeologists are "making money out of misery," the practice constitutes disaster capitalism. As a state tool (or "craft"),

archaeology is on the wrong side of history. Archaeology is ultimately about state governance, not apolitical “scientific exploration”—about environmental racism, not ethical “conservation.” The way forward is complicated, but it must include public shaming, for only then will archaeologists act.

[112] *Inter and Intra Site Patterns of the Late Pleistocene Fauna from the Little John Site (KdVo6), a Multi-Component East Beringia Site in Yukon Territory, Canada*

The Little John site holds an extensive record of human occupation spanning 14,500 years ago to the most recent past. Due to a combination of taphonomic factors, the Late Pleistocene deposits are particularly rich in culturally modified faunal remains related to the subsistence economy of the founding and early human occupants of the upper reaches of the Tanana River Valley of interior Alaska and Yukon. In this presentation we report on the current results of our analyses of the Little John fauna, including identified species and element distribution, evidence of taphonomic and cultural modification, and apparent changes in subsistence through time at the site within the context of the dynamic climatic fluctuations of the Late Pleistocene – Early Holocene transition. We conclude with a comparison of the Little John fauna with faunal remains from a set of contemporary Late Pleistocene sites in East Beringia.

Hutira, Johna (Northland Research, Inc)

[97] *The Public Benefit of Archaeology: An Economic Perspective from the Wide Ruins Community.*

A re-occurring theme in current Cultural Resource Management activities involve the term “Public Benefit”. A majority of the discussions using that term refer to archaeological contributions to our understanding of a shared cultural patrimony. A lesser known aspect of Public Benefit is the direct monetary gain a community sees as a result of CRM work. On a general level, archaeological projects contribute via payroll and sales taxes. On a local level, area businesses benefit from spending by the field crew and contractor. Additionally, when local labor is used, particularly in an area of high unemployment, the added influx of wages can alter the economic status of the community members. Finally, using local labor provides on-the-job training for area residents. In the summer of 2014 Northland Research, Inc. undertook a large data recovery project in the Wide Ruins community located on the Navajo Nation. Eighty percent of the crew was Native American, many from the Wide Ruins Chapter. This paper presents an analysis of the economic impact of that project to the Wide Ruins Community as well as the benefits Northland realized having a primarily Native Crew.

[87] *Assessing Hominin Involvement with the Faunal Assemblages from Bundu Farm and Pniel 6, Northern Cape, South Africa*

The transition from the Early Stone Age (ESA) to the Middle Stone Age (MSA) represents an important technological shift in hominin behavioral evolution in southern Africa. Subsistence behaviors during this transition, however, are relatively unknown due to a lack of faunal preservation or insecure associations between lithic and faunal accumulations. Often, these sites originate from riverine, lakeshore, and spring deposits, locations that likely attracted hominin hunters and other carnivores in search of prey. Distinguishing features of these open-air faunal accumulations that relate directly to hominin activity from those produced by other natural processes is critical for

assessing hominin subsistence behaviors during the ESA/MSA transition in southern Africa. Here I present an analysis of the faunal assemblages from Bundu Farm and Pniel 6, two transitional ESA/MSA open-air sites located in the Northern Cape, South Africa. This analysis is supported by a neotaphonomic study of modern bone accumulations surrounding a complex of seasonal waterholes at Ngamo Pan, Hwange National Park, Zimbabwe. Comparisons between the fossil and modern assemblages suggest primary access to animal carcasses at Bundu Farm fauna, but only secondary access at Pniel 6. Overall, there exists a variable signature of hominin subsistence during the ESA/MSA transition in southern Africa.

Hutson, Scott (University of Kentucky)

[142] *Inter-site Causeways as Political Infrastructure in the Northern Maya Lowlands*

In the Maya lowlands, several polities oversaw the construction of long causeways that connected regional centers with smaller settlements. As infrastructure, such causeways have been shown to facilitate exchange of basic goods between people at different sites. Archaeologists also view these causeways as political statements that materialize the extent of a polity and emphasize hierarchical relations between settlements on the causeway. Recent research along the 18km long causeway between Uci and Cansahcab, Yucatan, Mexico, suggests that Uci's leaders attempted to use the causeway as part of strategies for administering rural villages. This research also shows that the causeway did not, however, have much of an effect on regional settlement patterns. The causeway certainly outlasted the Uci polity, and it was re-used in a variety of ways, none of which evince a particular reverence for its original purpose.

[115] *Towards a Socio-Ecological Understanding of Agrarian-Based, Low-Density Urbanism in Early Tropical State Formations*

Archaeological examination of the remains of the early tropical states in Central America and Asia have demonstrated that, although they exhibit a unique type of settlement pattern, they do represent large, sophisticated, and undoubtedly “urban” state formations. The unique urban footprint of these tropical states – in which settlement units of varying size and complexity are scattered across the landscape, and agricultural lands and green zones extend up to, and even into epicenters – has come to be referred to as “agrarian-based, low-density urbanism.” We are just now beginning to explore, in detail, the nature and significance of this variety of urbanism, with particular emphasis on understanding: 1) Why it seems to characterize many of the earliest state formations to appear in the world’s tropical zones? 2) What it tells us about the nature of socio-economic and socio-political organization in these regions? 3) What specific resiliencies and vulnerabilities are associated with this urban footprint? and, 4) Whether we can use our archaeological knowledge of low-density urbanism in the past to inform some of the contemporary urban re-visioning projects that are currently being initiated in the tropics.

[141] *Soil, Landsurfaces, and Settlements under Lava: The Case of Cuicuilco, Mexico*

First societies based on agriculture settled the Mexico Basin around 3000 years ago (from B.C. 1500 to A.D. 100), during the Formative period, according to Mesoamerican chronology. Cuicuilco is one and probably the first of these Formative sites in the Mexico Basin and is located in the southern part of Mexico City, in an area covered by lava flows from the Xitle volcano, named El Pedregal. The age of the eruption has been established around 1,670+/- 35 years B.P. It is considered that Cuicuilco was probably abandoned as a direct consequence of this eruption. We have started a survey looking for sites where the paleosurface, inhabited by Cuicuilcs, is still preserved. This landsurface has been found in several places, just below a thin dark grey ash and the thick Xitle lava flow. The buried paleosol has abundant artifacts. We study this paleosol in order to reconstruct environmental conditions in the area during the settlement, as well as the impact of human activities in the area. The paleosol has a very hard and dark organic horizon and does not rest directly under the lava. However the lava has caused an extraordinary effect of compaction that it is necessary to discriminate.

[115] *Adoption of Ceramic Technology: Case Study from Incipient Jomon of Southern Kyushu (ca. 13,500/14,000 – 12,000 cal yr BP)*

Hunter-gatherers of late Pleistocene Japan were among the first in the world to adopt ceramic technology. Archaeologists have suggested that in southern Kyushu, these people of the Incipient Jomon period (13500/14000-12000 cal yr BP) also used large grinding stones, stored food, occupied pit houses, and made boats for navigation; they had signatures of reduced residential mobility. Nevertheless, there have not been systematic tests to assess the hypothesized decreased residential mobility. Identification of pottery production zones and circulation helps us to infer degrees of sedentism. Detailed analyses of production processes allow us to assess prioritized performance characteristics and functions intended by producers. Inferred functions would help contextualize pottery production, consumption, and transportation patterns. The objective of our study is to better understand economy and degrees of sedentism, and intended pottery function, when ceramic technology emerged in southern Kyushu. We examined pottery from three Incipient

Jomon sites in Kagoshima Prefecture; two from the northeastern Satsuma Peninsula surrounding Kagoshima Bay, and one from Tanegashima Island. Ceramics were analyzed visually, mineralogically, with xeroradiography, and with porosity tests. We present our results on ceramic sourcing and technology to provide inferences on production zones, circulation, and the producers' intended functions.

[23] *Iron Producers, Iron Users*

Participation in technological activity in sub-Saharan Africa is often discussed in terms of identity, whether that is framed by gender, kinship, status or ethnicity. In particular, social distinctions between iron producers and iron users are well known from the ethnohistorical and ethnographic records of numerous African regions, providing important information as to the social organization and values of a particular society. However, recognizing these identities in the archaeological remains of metal objects, metal working and/or metal production presents a significant challenge, not least because of the fluid nature of identity itself and the changing parameters of inclusivity or exclusivity in economic activities.

Drawing together evidence from Ethiopia, Uganda, Kenya and Tanzania, this paper will discuss different ways in which the identities of past iron producers can be explored through archaeological data, before considering the impact of interactions between different groups – whether iron producers or iron users – on iron production technologies and artifact style. Through a careful combination of archaeological, analytical and ethnoarchaeological research, it is possible to identify groups and interactions in past metal-working technologies, with a view to gaining a broader appreciation of past social relationships.

[25] *A Characterization Study of Some of the Earliest Ceramic Building Materials from Sites in Rome and Its Surrounding Area*

Roman roof tiles and architectural terracottas constitute an important resource for the study of the architectural development of early Rome, through the detection of different sources and perhaps workshops in the region of the Roman capital. Unfortunately, the location of possible clay sources available to the Roman tile-makers has been obscured due to the city's extensive urbanization. However, a drilling project in the area of the Roman Forum and other sites offers important evidence of clayey levels in an ancient valley close to the River Tiber and access to these has permitted their integrated study by means of petrography and chemistry. So far 132 tiles and architectural terracottas dated between 7th - 6th centuries B.C. have been studied by means of petrographic and chemical analysis (INAA). More than half of them come from 11 sites in Rome and the rest are from the broader region. The integration of the petrographic and chemical approach has allowed the identification of four main ceramic fabric groups and some smaller subfabrics. Their comparison with the raw materials, as well as to tile wasters recovered from the area of Tarquinia, shed light on ancient tile production and distribution.

[338] *The Power and Narrative of Liminality: The Quadripartite Badge in Maya Iconography*

Ancient Maya iconography primarily depicted elite individuals in idealized states of being and rationalized their power and authority through ideological concepts. This study reexamines previous assumptions made concerning the Quadripartite Badge. This motif is examined based on iconographic associations and contexts, as well as temporal and spatial distributions. The spread of this motif is demonstrated through time and its spatial distribution is noted for its political consequences. It is established that elite women from Tikal and Calakmul disseminated this iconography. This was done most frequently by marriage alliances, as seen in the number of newly 'arrived' women carrying the Badge. Other iconographic associations of the Badge revealed a strong association with the Maize God and the cyclical nature of agriculture. For the continuation of the maize cycle and renewal of universal forces, sacrifice was required; the completion of ritual sacrifice was demonstrated through the depiction of the Quadripartite Badge. Indicating the liminal status of its user, it is frequently placed in scenes of transformation and rites of passage. This one expression of power simultaneously validated earthly and otherworldly power, ensuring the continuation of the cosmos, the perpetuation of the sun and maize cycles, and favorable dispensation from the gods.

[333] *How Archaeologists Can Identify Human Resilience and Vulnerability to Climatic Conditions*

If interdisciplinary concepts such as resilience and vulnerability are to be useful to archaeologists, then understandable methods of identifying these complex social phenomena are needed. Archaeological approaches that use familiar methods and material indicators can be used to explore these topics. This presentation will demonstrate how both human resilience and vulnerability to climatic conditions can be identified using changes in residential abandonment rates and food storage behavior. When regional-scale and long-term data on these behaviors are compared to paleoclimatic records of changes in climatic conditions, resilience and vulnerability to these conditions can be identified, compared, and quantified. Examples and results of the application of the method in the North American Southwest will be presented.

[196] *A Revised Kaminaljuyu Chronology and Its Implications for Social Processes*

An evaluation of new and existing data indicates that the Middle and Late Preclassic portions of the Kaminaljuyu chronology need to be shifted 300 or 400 years later. This paper primarily examines relevant radiocarbon dates and then discusses the implications of this revision for our understanding of how centralized polities with rulership developed in the southern Maya area and in the Maya lowlands.

[291] *Comparing World-Systems: Empire Upsweeps and Non-core Marcher States Since the Bronze Age*

This is an examination of one of the implications of the hypothesis of semiperipheral development: that major increases in the sizes of polities have been attained by the conquests of semiperipheral marcher states. We use the comparative evolutionary world-systems perspective to frame our study of upsweeps of the largest polities in four regional world-systems and in the Central system since the

Bronze Age. Each of the twenty-two identified upsweeps is examined whether it is an instance of a semiperipheral marcher state formation. The hypothesis of semiperipheral development holds that polities in between the core and periphery have been fertile locations for the implementation of organizational and technological innovations that transform the scale and the developmental logic of world-systems. This is because semiperipheral polities have less investment in older institutional structures than do core polities and greater incentives to take risks on innovations. In the marcher state formation, a recently founded sedentary polity on the edge of an older core region conquers the core and builds a core-wide empire that is significantly larger than earlier polities have been. We find that over half of the twenty-two empire upsweeps were likely to have been produced by the semiperiphery or periphery marcher states.

Intoh, Michiko (Michiko INTOH (Professor))

[77] *Clay and Technology: Micronesian Ceramic Tradition*

Pottery tradition in Micronesia was diverse in terms of technology, due to various factors, such as historical and/or cultural reasons and the natural environmental conditions. Above all, the nature of clay resource available to the potters has significant effect upon forming techniques and products. Thanks to William Dickinson's wide-ranging geological knowledge and active involvement in mineralogical studies of excavated pottery from Oceania, our understanding on prehistoric pottery technology has significantly been developed. This paper examines the technological variation of prehistoric pottery makings described in Micronesia, focusing on the tempering technique in particular. All the early pottery traditions identified in high islands of Micronesia have fine beach sand (most are calcareous) mixed in the clay as a temper. This tradition was comparable to the early Lapita pottery traditions in Melanesia and western Polynesia. The subsequent changes observed in Micronesian pottery were diverse. It is most probable that the technological alterations to avoid using calcareous sand temper had caused the variations in technology and in the products.

[226] *A Multi-Proxy Approach to Investigate Human-Plant Interactions in Amazonia: A Case Study from the Llanos de Moxos*

This paper summarizes the results of a multiproxy study on the past human impact of Late Holocene peoples across different regions of the Llanos de Moxos. In the Monumental Mound Region, paleoecological data show that the savanna soils were sufficiently fertile to support crops; maize being a predominant one. Macrobotanical remains from mound habitation sites in this region documented the presence of maize (*Zea mays*), squash (*Cucurbita* sp.), peanut (*Arachis hypogaea*), cotton (*Gossypium* sp.), and palm fruits (*Arecaceae*). Microbotanical results confirm the widespread use of maize, along with manioc (*Manihot esculenta*), squash, and yam (*Dioscorea* sp.). These results represent the first comprehensive archaeobotanical evidence of the diversity of plants cultivated, processed, and consumed by the prehispanic inhabitants of the Amazonian lowlands of Bolivia. Investigations in the geometric earthworks that occur in the Bella Vista region show that in what is today land covered by terra firme forest, the inhabitants exploited a naturally open savanna landscape that they maintained around their settlement despite the climatically driven rainforest expansion that began ~2,000 yr ago across the region. The benefits of these multiproxy approaches are discussed.

[375] *Unit-Stamped Red Jars in the Southern Lowlands: New Insights into Ceramic Production and Exchange*

Monochrome red jars and bowls featuring unique unit-stamped designs have been excavated from

Late Classic contexts throughout the southern Petén and the areas surrounding the Maya Mountains. Adorning apparently utilitarian vessels, these unit-stamps show both a consistency in size and application across their spatial range, as well as a great diversity in the preferred motifs depicted. Combining a new ceramic chronology developed at Lubaantun and data from across southern Belize and the southern Petén, this paper seeks to understand how the unit-stamp designs and the vessels they adorned varied spatially and temporally. An attempt is also made to establish if one area in particular was the progenitor of the monochrome red unit-stamped system, or if it developed in situ across multiple sites in the Southern Lowlands. Additionally, the new data are compared to the dominant polychrome types from the same area to determine the variation between elite and non-elite exchange networks. From both the new and reinterpreted data, new explanations of the relationships between elite and non-elite pottery production and exchange from the Late Classic Maya Lowlands are explored.

[90] *The Benefits of Virtual Offices for a 21st Century Cultural Resource Management Consulting Firm*

In today's day and age, we have created technology to help benefit our interaction, our communication, streamline our workload and increase our work output. The need to be in person or in house all the time as a business has changed. A company is able to save resources by allowing employees to work on their own schedule, but yet still accomplish all of the tasks and workload, and exceed deadlines, by being virtual. This form of business leads to a more relaxed and happier lifestyle for those employees involved. Having a virtual business and/or virtual office gives you the ability to be flexible, on the go, more energized, and more relaxed. This way of business allows you to accomplish more without having the huge overhead of those "in house" companies. It allows a company to invest in more travel, marketing, promotions, and equipment which allows the business to succeed even better. There are multiple companies and business owners that live by the virtual office and their companies are thriving like crazy!!

Isla, Johny (ANDES - Centro de Investigación para la Arqueología y el Desarrollo) and Markus Reindel

[31] *Un nuevo patrón arquitectónico de la cultura Paracas en la sierra sur del Perú*

En nuestras recientes investigaciones de la cultura Paracas en la vertiente occidental de los Andes del sur del Perú hemos encontrado un nuevo patrón arquitectónico, cuyo elemento básico lo constituye una estructura en forma de D, que se encuentra combinada en número de dos, tres y más elementos. En el caso ideal se forma un círculo perfecto, generalmente sobre una colina artificialmente modificada, y alrededor de un patio hundido. En el sitio de Cutamalla se han identificado doce complejos circulares, de unos 40 m de diámetro cada uno. Durante las prospecciones en la sierra de Lucanas se han identificado por lo menos ocho sitios más con complejos similares, formándose así un patrón arquitectónico recurrente y bien establecido. Por el tamaño de sus componentes y su ordenamiento formal y repetitivo, este nuevo patrón arquitectónico de la cultura Paracas se podría denominar como monumental. Todavía se desconoce la función de las estructuras circulares. Por el momento parecen ser exclusivas de la región de Lucanas. Existe un vínculo con tradiciones arquitectónicas de la sierra sur del Perú y del norte de Bolivia, de las cuales, sin embargo, nos faltan todavía datos concretos para establecer comparaciones de mayor envergadura.

[154] *Heading North: Landscape Use and Food Technology at the Initial Stage of Farming Expansion in the Balkans*

During the spread of farming from the Near East to Europe, farmers and their domestic plants and animals gradually penetrated into new environments. Reaching the northern periphery of the Balkans (present day Serbia, northern Bulgaria, Romania and Hungary), early farmers encountered for the

first time an ecological zone that significantly differed from the natural habitats of their domesticates. The continental environmental conditions, i.e., frosty winters with snow cover, stronger expressed seasonality, diverging precipitation regimes, for example, must have put considerable pressure on their traditional farming system, calling for biological adaptations in the plant and animal populations. Instead of biological adjustments, however, a rapid cultural adaptation ensued. In comparison to the areas of origin in Anatolia and the southern Balkans, diversity of crops was radically reduced, the composition of herds changed, and the use of wild resources became increasingly important in the northern Balkan peninsula. The modifications in the food economy were accompanied by a transformation in the traditional ways of storing, processing, and consuming food. In this paper, we explore the emergence of distinct strategies of landscape management, food acquisition, and food processing with the initial adaptation of farming to European continental conditions.

[182] *Mobility, Exchange, and the Fluency of Games: Promontory in a Broader Sociodemographic Setting*

We are currently undertaking new investigations of the Promontory Cave 1 and 2 (Great Salt Lake, Utah) collections Julian Steward excavated in the 1930s along with renewed excavations in both caves to explore Steward's suspicion that these A.D. 13th century assemblages were created by migrating ancestral Apacheans. Artifacts for gaming are richly represented, including a ball, hoops, feathered darts, cane, wooden, and beaver tooth dice, and markers or counting sticks; a guessing game using buried moccasins may also have been played. Rather than simple recreation, such games often figure in ceremonial contexts, while the geographic scope for commonalities in the gaming pieces is vast, suggesting another aspect of their play. In Native North America, the gambling that frequently accompanied these games often took place between members of different communities with ambiguous relationship prospects, becoming more acceptable with increased social and kinship distance. The ubiquity of the Promontory gaming materials may reflect an "enemy-friend" relationship with neighboring groups such as those found at the nearby terminal Fremont site of Chournos Springs. Gambling can only provide such a medium when the games played are mutually intelligible. Thus, gaming materials can serve as an archaeological proxy for sociodemographic interaction, particularly in migratory contexts.

[53] *In Search of Upper Paleolithic Sites in Alluvial Contexts in the Tsukh (Chikoi) Valley, Northern Mongolia*

Mongolia, located at a key crossroads for human migration between central, eastern, and northern Asia, is important for understanding a number of current hotly debated archaeological topics, including the possible human exodus out of northern Eurasia at the Last Glacial Maximum (24,000-18,000 cal yr BP), the emergence of microblade technology as an adaptation to extremely cold and harsh environmental conditions, and the route and process of an initial modern human migration into high latitudes (and ultimately into the Americas). Notwithstanding the significance of Upper Paleolithic research in Mongolia, the ages of many sites are not supported by reliable geochronological evidence due to their poor preservation in colluvial contexts. In 2013 a team of Mongolian, Japanese and American researchers began survey and initial testing of sites along the

Tsukh, or Chikoi in Russian, River where a number of high, stable alluvial terraces have been identified. Here we present the initial results of subsurface testing at the Bayantsagaan'uul-1 site (49°45'29"N, 107°31'51"E) and pedestrian survey along the river.

[142] *Human-Object Relationships in Classic Maya Contexts: Object Technologies, Political Participants, and Cultural Infrastructures*

This paper examines the foundational cultural infrastructure provided by seemingly quotidian objects in Classic Maya (ca. A.D. 250-900) contexts. These materials (things like ceramic vessels, stone benches, and mirrors) carry out prosaic tasks (e.g., containing, supporting, reflecting), but also higher-order relational work, taking on roles as non-human "persons," and as partners in social relationships. In this paper, I focus on these human-object relationships in order to recast our view of objects and their technological significance, and to frame Maya political systems as structured around both human and non-human participants. To do this, I look at representations of human-object relationships on Classic-era painted ceramic vessels and carved stone monuments. In particular, I examine moments of interaction and intersection, including bodily engagement and communication between people and objects, in order to address several related questions: What kinds of work are these objects carrying out? How are humans and objects involved in mutually constitutive ways? What do we learn about the technology of objects and their role in providing underlying cultural infrastructure in ancient polities through examining the dynamics of their efficacy on short and long time scales (including the contexts necessary for their successful functioning, and moments of apparent material failure)?

[169] *Bioarchaeology of the Chincha Kingdom: Life History Patterns in a Chullpa Population from the Late Intermediate Period and Late Horizon mid-Chincha Valley, Peru*

This paper considers evidence for population health and lifestyle in the Chincha polity during the Late Intermediate Period (LIP) (ca. 1000-1400 A.D.) and Late Horizon (LH) (ca. 1400-1532 A.D.). Beginning with the Chroniclers, scholars have described the Chincha as a large complex society with population organized into distinct economic sectors (e.g., coastal fishermen, merchant core, and inland agriculturalists). Previous archaeological studies have demonstrated evidence for fishermen and artisans in the lower valley, but no evidence for life outside of the lower valley has been considered. Following an upper valley archaeological survey and previous demographic study on human remains, a bioarchaeological survey of a looted communal tomb in the mid-Chincha Valley provides a first glimpse into health status among populations outside previously studied areas. We identified over 115 individuals of all age and sex groups and collected data on health status and trauma in that population. Here, we compare our evidence to regional trends and consider evidence for workload within the context of horizontal social organization among the Chincha. Future work will further explore lifestyle dynamics in the mid- and upper-valley and seek to interpret the role of these populations in the larger social and economic structure of the Chincha Kingdom.

[399] *Lime Preparation in Ancient Roman Architectural and Marine Mortars*

Romans prepared lime for the volcanic ash mortars of conglomeratic concretes using methods (Vitruvius, de Architectura 5.1.2-3) that are reflected in modern Italian lime industry terminology. In mortars of architectural concretes in Rome (1st century B.C.E.–3rd century CE) builders mixed

quicklime with freshwater to form stiff putty (grasello di calce) and then incorporated moistened scoriaceous ash, shown by an experimental reproduction. Pure calcite in unburnt particles (incotti) suggests pre-orogenic Jurassic-Cretaceous limestone of the Monti Sabini 30km northeast of Rome, rather than syn- and post-orogenic Cenozoic carbonate deposits with detrital silicate minerals. High calcium lime (94 wt% CaO) was likely calcined at the quarry; no marine limestone aggregate occurs in the concretes. In mortars of maritime harbor concretes (1st century B.C.E.–2nd century CE) drilled by ROMACONS, builders used fine sand- to gravel-sized lime (zolle or greggio di calce) mainly calcined from local limestone, with high calcium compositions (Portus, Pozzuoli Bay), mixed calcic and dolomitic compositions (Cosa, Anzio, Egnazia, Caesarea, Alexandria) and, rarely, argillaceous compositions (Chersonessos). The lime was likely aged in freshwater (calce spenta e maturata), mixed in a trough with pumiceous ash, and submerged in submarine forms. Carbonate rock is the predominant aggregate of eastern Mediterranean harbor concretes.

[278] *A Local Expression of "Salado" in Tonto Basin*

"Salado" refers to a series of local expressions developed when populations were faced with the challenges of increased population sizes, migrants, and complexity. Local populations incorporated ceramic styles, iconography, architecture, and community organization from new arrivals and surrounding populations in ways that were adaptive and fostered integration. This brought migrants into the fold, albeit keeping them at a safe distance with limited participation and membership. To have excluded migrants would have led to attacks and raiding. Ceramic data, architecture, community rooms used for ritual observances, and burial data are used to examine one such local development in the Tonto Basin, Arizona.

[356] *Pinnacle Point 5-6 and Diepkloof Rockshelter (South Africa): Testing the OSL Ages and Constructing a Standardized MSA Chronology*

Single grain optically stimulated luminescence (SG-OSL) dating has made a major contribution to our understanding of the chronology of the Middle Stone Age of Africa. The accuracy of many of the SG-OSL chronologies has been verified by other independent dating techniques. Diepkloof Rockshelter (DRS), however, has produced disparate chronologies that have resulted in a dating controversy. Criticisms raised have been used to cast doubt on and, in some cases, dismiss the chronology for the Howiesons Poort (HP) and Still Bay (SB) presented in Jacobs et al. (Science 322, 733–735, 2008). As a result, an alternative age model and interpretation of the ages, durations and relationship between the HP and SB techno-complexes has been proposed. In the process of doing so, the published ages for Pinnacle Point Site 5-6 (PP5-6) have also been questioned. In this presentation, I will demonstrate why the SG-OSL chronology of DRS is robust by directly addressing the concerns raised and by presenting new data. I will also present a complete chronology for the PP5-6 sedimentary deposits. These two new data sets will then be used to assess the merits of the two divergent age models for the HP and SB in southern Africa.

[353] *Documentation of Rock Art Complexes in the Mongolian Altai: From the Unknown to World*

Heritage Status

This paper describes the complex process of documenting two huge rock art complexes and a third very old complex, in the Altai Mountains of Mongolia. Previous to our work in this region at the Mongolian border with Russia and China, all three complexes were virtually unknown except to local herding populations. Our project began with a survey of a broad region in Bayan Ölgii aimag and the identification of the complexes on which we wished to concentrate our efforts. This initial phase was followed by the multi-year process of their documentation. Our project began before there were any detailed maps available for this border region. Our gradual development of appropriate mapping, using a variety of sources, coincided with building an analytical system that allowed us to divide each complex into manageable sectors and to link specific images and panels to GIS data points. Our system also allowed us to map specific motifs (e.g., vehicles, riders, wild bulls) and probable cultural periods across the complexes. This paper will conclude by briefly describing the analytical process we used to support the nomination (successful) of these sites for World Heritage status.

[67] *Colonial Developments in a Global Context- Complex Connectivity in the Western Zhou World*

The period of Western Zhou (1046-771 B.C.E.) is often identified with the genesis of Chinese civilization. As the Zhou expanded their borders and influence they developed a Chinese political tradition that would eventually formalize and consolidate the elite culture and practices of this emerging world. While postcolonialism theory has been successful in highlighting the multi-directionality of regional interactions in the ancient world, globalization offers a wider approach, geographically and temporally, that is most beneficial for cases of colonial contact among larger scale processes of supra-regional developments. The state of Yan 燕 - an important polity established by the Zhou - provides a case study for this new perspective on Western Zhou expansion: the bronzes found in the realm of the Yan polity are shown to have been locally used in a variety of ways that reflect a continued incorporation of Zhou material culture into indigenous communities, rather than the expansion of the Zhou power and the subsequent assimilation of local peoples. More than just a unique period of colonization, this paper finds the Western Zhou influence to represent an increased stage of interaction and connectivity within the larger process of globalization that preceded it.

[139] *Human Volunteers and Mechanical Arms: Quantitative and Comparative Analysis of Bone Surface Modifications Created by Humans and Machines*

Zooarchaeologists use traces on bones to understand something about the ecology and subsistence behavior of our ancestors. Although we may not be equipped with the proper interpretive analogues to understand the possible range of roles hominins had in past ecosystems, numerous taphonomic studies have investigated the quantitative and qualitative characteristics of natural and cultural bone surface modifications (BSM). Most experimental taphonomic research relies on 'naturalistic' simulated situations in which bones have been trampled, gnawed, fed to various carnivores,

butchered, and shot at with projectiles. However, the physics behind the creation of a mark are poorly understood and difficult to control under these circumstances. This study holds constant the physical variables that affect actualistic assemblages, such as force of the strike, angle of the strike, or velocity of the strike, and measures how they translate to characteristics of BSM, such as their shapes and sizes. This is done for human experiments with volunteer butchers given specific instructions and in experiments using a mechanical arm where each individual variable can be held constant. Comparison of the two experimental datasets shows that mark attributes are governed by basic physics and that these laws can be applied to interpreting ambiguous marks in zooarchaeological assemblages.

James, Steven (California State University at Fullerton)

[282] *New Deal Archaeology at Buena Vista Lake in the San Joaquin Valley and the Sierra Madre Mountains: The 1933-34 CWA-Smithsonian Institution Project in Southern California*

Perhaps the earliest Federal Civil Works Administration (CWA) archaeological project in California was conducted during the winter of 1933-34 at five sites along Buena Vista Lake in Kern County by the Bureau of American Ethnology (BAE), Smithsonian Institution. The project location was chosen for several reasons: mild winter climate, high number of unemployed men from nearby oil towns, and large, deep prehistoric sites. At the height of the excavations, the labor force amounted to 187 men. BAE archaeologists William D. Strong and William M. Walker directed the work, with field supervision by Edwin F. Walker (Southwest Museum), and UC Berkeley graduate student Waldo R. Wedel, who later wrote the final report. As an outgrowth of the project and in order to determine the boundary between the Yokuts and eastern Chumash, Strong conducted a two-week archaeological reconnaissance in nearby Cuyama Valley and the Sierra Madre Mountains with local cattle rancher James G. James, who had explored archaeological sites in the region containing well-preserved perishable artifacts and was a distant relative of the author (my grandfather's first cousin). The significant results of the CWA-Smithsonian Buena Vista Lake project and subsequent survey by Strong and James are discussed in this presentation.

James, Vivian (University at Albany)

[397] *"Of What Use Is a Bear?": Examining Black Bears (Ursus americanus) as a Capitalized Resource in Northeastern North America during the Woodland and Colonial Periods (A.D. 1300-1800)*

One of the largest terrestrial mammals in Northeastern North America, black bears (*Ursus americanus*) were an important dietary component throughout the Woodland and Colonial Periods (A.D. 1300-1800). Previous research has demonstrated an increase in the frequency of black bear remains recovered from archaeological sites in New York State that have been dated to this five hundred year period. Primarily interpreted as a subsistence resource, the use of black bear secondary products has been acknowledged, but not fully discussed in the literature. Black bears and ursine secondary products were valued as a commodified resource in both Iroquoian and European capitalized economies. Trade networks are not limited solely to economic capital, but also rely on social, cultural, and other forms of capital to develop and maintain economic structures. This study, which focuses on black bears as both an Iroquoian and European resource in what is now New York State, reviews literature related to archaeological black bear remains and secondary black bear products as well as relevant historical documents within a framework of anthropological economic theory to demonstrate that black bears were increasingly capitalized in Northeastern North America during the Woodland and Colonial Periods within both social and trade networks.

[405] *The New Public Archaeology: Evolving Concepts in International Public Archaeology and Interpretation*

In this presentation I discuss evolving concepts in public archaeology and interpretation. I give two examples, one from South Carolina, USA, and the other, as of early 2014, in Crimea, Ukraine, on how these concepts have been proposed and applied at sites and parks. In many parts of the West, the overarching trend is an increasing involvement of non-professionals in planning and carrying out archaeological and cultural heritage studies and public interpretation. We look at three evolving concepts in public archaeology: Activist Archaeology; Inclusive Public Interpretation and Presentation; and Sustainable Cultural/Archaeological/Heritage Tourism. Outside the West, when these principles are introduced, for cultural and political reasons, many sites and parks are challenged to adapt and may even reject them. In these arenas, our continuing exchanges of experience and concepts, our collegial collaborations, can build trust as lessons are learned on both sides about the international applicability and feasibility of these principles.

[127] *Antelope Cave and Far Western Anasazi Lifeways of the Virgin River Region*

The dry deposits of Antelope Cave on the Uinkaret Plateau in northwestern Arizona have yielded a rich artifact assemblage and abundant faunal and botanical remains dating to the late Archaic, Basketmaker II, and especially late Pueblo I/early Pueblo II times. The collections recovered through archaeological work provide especially useful insights into Ancestral Puebloan life in this region. These activities include rabbit drives for food and the production of rabbit skin textiles, sandal repair and perhaps construction, and evidence of wide ranging forays for food and raw material for various material goods. The subsistence-related data sets demonstrate the importance of hunted prey, farming, and gathered foods. These data provide critical and rare perspectives on resource use that contrasts starkly with many Virgin Anasazi sites to the north. These contrasts are particularly visible in the archaeofauna recovered from the cave when compared to assemblages along the Virgin River. Taken together the recovered record provides substantive evidence that Puebloan people practiced seasonal movements and the use of both wild and cultivated resources. This flexible subsistence strategy crosscut a diverse landscape and illustrates how Ancestral Puebloan people exercised their intimate knowledge of the land.

[305] *The Earthly Production of Fleshy Subjects in the South-Central Andes*

A specific range of human subjects, or fully socialized, moral persons- rigorously categorized according to age, sex, kinship, and so forth -are, of course, the most critical 'things' that any society seeks to produce. I investigate the production of prehispanic human subjects in the Lake Titicaca Basin of the South American Andes. To understand the emergence of the Middle Horizon center of Tiwanaku at around A.D. 500, I investigate the deployment of innovative spatial, material, and iconographic technologies that sought to create entirely new sorts of moral persons at the beginning of the Andean Middle Horizon. Indeed, those subjects produced the Middle Horizon that we archaeologically apprehend. I argue that Tiwanaku's emergence correlated with the production of emergent moral subjects who subscribed to a novel, redemptive set of relational but also consumptive and even predatory practices. Becoming and remaining a fully moral Tiwanaku person was supremely contextual and fraught: it required continual return to a monumental landscape that emphasized both 1) the consumptive practices required to be a fully Tiwanaku subject and 2) the ritual violence required for that existential transformation.

[406] *Migrations and Exchange: Early Pastoral Mobility in Kenya Assessed Through Stable Isotope Analysis*

Specialized pastoralism emerged in Kenya around 3000 years ago and has adapted with changes in the social and ecological landscape to this day. Ethnographic research has documented significant changes in herding strategies among pastoral groups throughout colonial and post-colonial periods. Stable isotope analysis sheds light on how crucial mobility was in maintaining herds before the appearance of iron-using and –producing peoples in the region. Intra-tooth sequential sampling of livestock tooth enamel presents an isotopic record of diet during tooth formation, and can thus track movements across the landscape. These analyses were conducted on enamel of livestock teeth from several Savanna Pastoral Neolithic sites in the Central Rift Valley and neighboring plains of Kenya. Some sites are clearly the result of specialized pastoralist pursuits, and other sites indicate a mixed economy of pastoralism and foraging. While carbon stable isotope ratios do not indicate seasonal altitudinal mobility up to higher elevations, this does not preclude herding of livestock long distances at low elevations. $^{87}\text{Sr}/^{86}\text{Sr}$ ratios can reflect movement across geologically distinct soil complexes. Recent analysis of the strontium isotope composition of livestock tooth enamel provides another line of evidence for pastoral mobility.

Jarman, Catrine (University of Bristol)

[18] *Female Mobility in the Viking Worlds*

Recent reassessments of the gender balance among Viking Age Scandinavian populations in the British Isles have suggested a greater presence of immigrant women than previously thought. At the same time, increasing support for a view of the Viking world as a diaspora, with a sustained network between the original and the acquired homelands, has necessitated a better understanding of the mechanics of the migration process. This paper evaluates interdisciplinary evidence for the level of mobility among women in the Viking world, through an evaluation of archaeological, historical, and scientific data from Northern Europe. ^{87}Sr and ^{18}O isotope data from burials from central Norway suggest that the level of mobility among women may have been higher than suggested historically. ^{13}C and ^{15}N dietary analysis demonstrates diverse, non-gender specific diets from the same region. This questions the traditional interpretation of strict gender roles during the Viking Age, in which women were largely excluded from the outward expansion from Scandinavia. The paper argues that women were active participants in the migration process, both through the creation of alliances forged to strengthen ties between homelands old and new, and as communicators of culture and social identities within the Viking diaspora.

[35] *Aurignacian(s) in the Mas d'Azil Cave (Ariège, Pyrénées, France)*

Mas d'Azil cave is one of the most important karstic landmarks in southwestern France. This prehistoric research hotspot is mainly famous for evidence of Magdalenian and Epipaleolithic cultures, but recent researches were confirmed the existence of traces of the oldest occupations of the Upper Paleolithic, poorly documented so far. In this case, the discovery of an in situ cultural sequence containing older and recent Aurignacian opens up largely new possibilities. First, because the cave contains a chronological sequence never recognized in earlier work; this sequence revealed by recent surveys confirms the presence of an older Aurignacian (cf. Péquart's excavations

in the "Silex Gallery"), while providing the first evidence of recent occupation phases, which has no known regional equivalent. Second, these observations cast new light on a context that, for the Aurignacian, is greatly lacking in the French central Pyrénées; that of a vast cavity at the bottom of a deep valley that possibly corresponds to another settlement type in the territory; significantly different from (and complementary to) the "small" caves often "perched" in the landscape, which is by far most of the information we currently have to describe this culture in this region.

[32] *Freshwater Availability and Prehistoric Settlement Patterns on California's Northern Channel Islands*

An important variable that influenced prehistoric human settlement patterns on California's northern Channel Islands was the availability of freshwater. Existing models of settlement use watershed size as a proxy for water availability. However, in semi-arid regions, this approach has limitations because ephemeral streams common in these environments may lose much or all of their flow to groundwater. We have developed a hydrological model that incorporates measured and modeled geospatial/temporal data for climate (precipitation, solar radiation, wind speed, relative humidity, temperature), soils, vegetation, and topography to simulate the complex land-surface-groundwater behavior of island hydrology. We also discuss the role of fog and fog-drip as a freshwater input into this system. We discuss the implications of this model for the location of permanent settlements on the northern Channel Islands during the past 5,000 years. Climate projections are constructed as input to the model for hypothetical 100-year intervals that represent wet, dry, and average conditions.

Jeanty, Naphtalie (University of California, Berkeley)

[15] *Tracing Relationships among Buffalo Soldiers in 19th Century Fort Davis, Texas*

The historic archaeology of US cavalry forts in the 19th century allows for exploration of a wide range of social issues and historical questions. Using examples from Fort Davis, Texas, this study analyzes Buffalo Soldier troops stationed there from 1867-1891. It presents results of an investigation of male identified homosociality within black communities by tracing male relationships within 19th century gendered labor spaces. A queer perspective allows this research to focus on the bonds and relationships amongst African American soldiers that did not subscribe to traditional heteronormative practice. Because so often these relationships are obscured within documentary and material record, this paper engages with queer politics that aim to address queer identities within African American communities- both historic and modern.

[123] *The Digital Legacy of Public Archaeology in the Phoenix Basin, Arizona*

Federal undertakings, particularly flood control and water transmission projects, have served as the impetus for some of the largest public archaeology projects in Arizona since the 1950s. The Central Arizona Project, a 336 mile diversion canal that distributes water from the Colorado River into central and southern Arizona, was the largest and most costly transmission system constructed in the United States. It took nearly 25 years to identify and mitigate the cultural resources within the project area, which in turn generated an enormous amount of archaeological and ethnographic data, only a fraction of which was readily accessible to scholars in regional libraries. Since 2009, the Bureau of Reclamation has been working with the Digital Archaeological Record (tDAR) to create an online digital library of Central Arizona Project (CAP) archaeological reports. Currently, Reclamation has made 130 records available through tDAR. The CAP records have received 27,000 views and 1,200 downloads, numbers which attest to the continued importance of this project within the

archaeological community. By partnering with tDAR, Reclamation continues to ensure this project's legacy and facilitate use of project data for current and future research projects.

[210] *An Integrated Phytolith and Geochemical Approach to Understanding Activity Areas and the Choice of Building Materials in Neolithic Sites Using Ethnographic Analysis*

The Neolithic in southwest Asia is an important period in human history which saw the advent of sedentism, agriculture, and ultimately the rise of complex societies. It is also, however, one of the most poorly understood. This is partly due to problems associated with site recognition and partly because of the lack of preservation of many forms of evidence, particularly biological. As a result, many Neolithic sites are comprised of a series of structures, the construction and function of which is difficult, if not impossible, to unravel. With this in mind we have been developing an integrated method to increase our understanding of such sites based on more durable forms of evidence, i.e. phytoliths and geochemical elements. Using an ethnographic approach we sampled a number of buildings from a recently abandoned mud and stone constructed village in Jordan, to help us understand building construction and to establish if different activity areas have specific phytolith and geochemical signals. We then used the results of this analysis to help us interpret the Neolithic sites of WF16, Beidha and Ain Ghazal.

Jenks, Kelly (Fort Lewis College)

[99] *Simulating Engagement: Teaching Students about Stakeholders*

In my introduction to archaeology class, one of the most difficult topics to make my students understand and care about is the role of stakeholders in shaping archaeological research. This subject is simply not engaging in a lecture format. So, instead of lecturing about diverse perspectives, I ask students to participate in a simulated stakeholder meeting. The recent controversy over the development of fracking at Chaco Canyon provided the inspiration for my hypothetical scenario, in which multiple stakeholders are asked to weigh in on a proposal to allow hydraulic fracturing in an area rich with cultural resources. Students are assigned the role of a stakeholder, provided with basic background information, and given one week to research their role before the simulation. Afterwards, they are asked to reflect on their experiences in a response paper. In this poster, I describe the activity in greater detail, offer my own reflections on its successes and failures, and make suggestions about how it might be adapted to suit other audiences.

[148] *Exploring the Relationship between Folsom and Midland Points in the Southern Plains*

The relationship between Folsom points and Midland points in the Southern Plains remains an unresolved topic of debate. At the scale of individuals, it has been suggested that the fluted Folsom point was a symbolic object made by a person(s) of power to alleviate risk in hunts. Along similar lines, differences between Folsom and Midland points have been attributed to the relative skill differences between knappers. At a broader scale, some have questioned the association of Folsom and Midland, suggesting that the two might represent separate population groups or that Midland was a later development. Finally, some suggest that Folsom and Midland points were made by populations who switched from Folsom to Midland point production during periods of raw material scarcity. This paper uses current evidence to explore these hypotheses, focusing primarily on the latter two which are, in my view, the most likely explanations.

Jensen, Jacob [4] see Becker, Rory

Jensen, Anne (Bryn Mawr College)**[302]** *Nuvuk, Birnirk, Utqiagvik, Walakpa and Beyond: All Those Sites Will Soon Be Gone*

These are all classic sites, but many of them were last excavated a half century or more ago. New questions and new methods require types of data that was not collected back then; additional excavation with finer provenience control is also needed. Such work has been undertaken at sites like Cape Espenberg, but only at the Nuvuk cemetery in North Alaska. The apparent assumption by those not working in the area has been that the sites were stable, and that there was no hurry. That is no longer the case. Erosion rates have increased tremendously, due to warming permafrost, sea ice retreat and longer ice-free seasons. Nuvuk is averaging a loss of 10 m a year. Coastal erosion exposed a house at Walakpa in 2013. Small scale salvage was done, and additional funding was sought to excavate the structure and associated area, but a single fall storm in 2014 destroyed the structure before funds were secured. This paper highlights a problem with current funding mechanisms. The review process is such that funds cannot be available to deal with an important endangered site during the next field season, even if a competitive proposal is prepared on very short notice.

Jeremiah, Kristen (Public Archaeology Laboratory, Inc. (PAL))**[281]** *Lithic Variation and Tool Technology at the East Pasture Site, Martha's Vineyard, Massachusetts*

In 2003 the Public Archaeology Laboratory, Inc. (PAL) completed survey and data recovery excavations at the East Pasture Site, located immediately east of Menemsha Pond on Martha's Vineyard, Massachusetts. The investigations revealed a multi-component site dating from the Early Archaic to Late Woodland/Contact Period, and recovered a total of 19,679 artifacts and 24 cultural features. The artifact assemblage was dominated (99%) by lithics, including debitage, projectile points, groundstone tools, raw materials, utilized flakes, cores, performs, unifaces, scrapers, choppers, blades, drills, and others. Of the total diagnostic projectile points, 71% were which William Ritchie defined as Late Archaic Squibnocket Stemmed in 1969. The contexts in which the points were recovered at East Pasture suggest a temporal association to the Late Archaic through Woodland Periods, which challenges the traditional association between Small-Squibnocket Stemmed projectiles and the Woodland Period on the Vineyard. This paper details the results of the investigations with emphasis on the recovered lithics and Archaic Period occupation.

Jerrems, William**[150]** *The Rise and Fall of Lake Lahontan and the Climactic Implications for Paleoindian Inhabitants of the Great Basin*

The Lahontan Basin, a huge Pleistocene lake, located in the western Great Basin, northwestern Nevada, has had a long history of rising and falling water levels dependent on heavy precipitation and decreased evapotranspiration of the Pleistocene Ice Age climatic regime. Three subbasins occupy the western side of the Lahontan Basin and include Pyramid Lake, Winnemucca Lake and the Black Rock Desert-Smoke Creek subbasins; the focus of this presentation. The climatic implications of a filling and waning lake of such magnitude would have had a substantial impact on early inhabitants of the northern Great Basin. Recent evidence, a petroglyph panel on a tufa dome at the west shoreline of Winnemucca Lake, possibly the oldest artwork known in the Americas, has revealed a date of between 14,800-10,300 cal. yr. BP. This implies that the ancient lake had maintained a substantial high water level, filling all three subbasins for a much longer period of time than had been previously thought. These results have questioned the effect and duration of the Younger Dryas Chronozone particularly on Paleoindian habitation of the Lake Lahontan lakeshore and thus seriously questioned the archaeological interpretation of several early lakeshore sites.

[106] *Using Unmanned Aerial Vehicles for Aerial Photogrammetry on the San Diego Coastline*
Developments in Unmanned Aerial Vehicles (UAVs) over the past five years have allowed for their use among non-experts and the rapid development, at relatively low cost, of Unmanned Aerial Systems (UASs) or drones. UASs use the UAV platform to carry a variety of sensors. One of the most important developments coming from this technology is the ability to collect aerial photos for photogrammetry at relatively low cost. In an effort to better understand the uses, practical issues of operation, and future potential of UASs in archaeology this study will examine the process of acquiring and operating a large octocopter, data acquisition and data processing. The survey area is on the San Diego coast and is part of a larger effort by the Society of California Archaeologists (SCA) in conjunction with the San Diego Archaeology Society (SDAS) to map cultural resources at risk of damage by climate change.

[240] *Variations on an Osirian Theme: Gendered Expressions of Identity in Osiris Funerary Shrouds from Roman Egypt*

Throughout the Roman Period in Egypt, decorated shrouds with images of the god Osiris were used in mortuary rituals and wrapped around the mummified body of the deceased. Full-length painted images of the dead in the guise of Osiris, flanked by Egyptian funerary scenes, were effective modes of representation that reveal how gender was used to facilitate the transfiguration of the deceased and aid his or her journey in the afterlife. This paper examines gendered expressions of self-presentation and specifically investigates the iconography and composition of the Osiris funerary shrouds. An analysis of the inscriptions and representations of both males and females on the shrouds adds a new comparative dimension arguing that gender relations were fluid and dynamic—being made and negotiated through new and innovative magical and material resources. I explore the problematic relationships between death, Osiris, and the potency of masculine regeneration over feminine reproductive powers, and how these concerns were iconographically and textually addressed to preserve and commemorate the age and gender of the deceased. I conclude by revealing how the individualizing portraiture and the adaptable iconographic repertoire of the shrouds indicate a growing interest in the posthumous expression of gender and identity in Roman Egypt.

[346] *A New Classification of Masks from Guerrero Discovered in the Great Temple of Tenochtitlan*

This paper focuses on a new kind of typological analysis based on a quantitative procedure called Spectral Clustering. This technique uses Graph Theory to analyze the eigenstructure of an affinity matrix in order to partition data points into disjoint clusters. The original algorithms were developed a decade ago by mathematicians and machine learning professionals. To the best of our knowledge, this technique has not been applied before in archaeology despite its proven performance in partitioning a collection of artifacts into meaningful groups. As a study case we choose a collection of stone masks from Guerrero but found in the remains of the Sacred Precinct of Tenochtitlan, the main ceremonial Aztec center. The schematic features of these objects set them apart from other artifacts with more naturalistic style. This has attracted the attention of many specialists and during the last three decades the style of these items has been the subject of intense debate. Through the

application of Spectral Clustering we were able to segment this collection into well-defined groups. In the future, this could lead to a better typology of this collection.

[111] *Un acercamiento al estudio de las pinturas rupestres en el Cerro Danush, Oaxaca.*

La presente investigación tiene como objetivo mostrar el trabajo realizado en el cerro Danush localizado en la comunidad de San Mateo Macuilxóchitl de Artigas Carranza, Oaxaca; el cual tuvo como eje principal conocer las características que comparten los paneles de pintura rupestre de acuerdo a su ubicación en el cerro Danush, tomando en consideración las singularidades del paisaje.

La importancia del estudio de las pinturas rupestres radica en que estas son una de las primeras manifestaciones que el ser humano dejó para la posteridad, que se plasmaron en abrigos rocosos y cuevas en los que se observan diferentes motivos pictográficos. También se describen los elementos paisajísticos ya que se consideran sus características importantes para los asentamientos prehispánicos, siendo el mismo hombre el que ha proporcionado una carga simbólica al espacio.

Jiménez-Cano, Nayeli (Universidad Autónoma de Madrid)

[130] *A Zooarchaeological Record of Ancient Fishes from the Maya: Evidence from Fish Bones in the Study of Ancient Fisheries*

Large bodies of water surround the Maya Area, and its ancient inhabitants had close subsistence relations with the aquatic world by exploiting the resources that this scenario provided them. In this sense, fishes were one of the animals widely exploited by the ancient Maya and whose zooarchaeological study helps to uncover questions and pose new queries about their social and environmental uses. This paper gathers information about the archaeological presence of such resources from various settlements in the Maya Area. The occurrence of such animals is documented in at least 56 Mayan settlements from the Preclassic Period to Colonial times. Fish remains belonged to at least 78 species that were used for ritual, food and ornamental purposes. Also it evidenced the presence of a trade network between remote inland sites and coastal settlements. This corpus of information offers to explore a holistic zooarchaeological perspective of the ancient use of fishes and to lay the foundations of ichthyoarchaeological studies in the Maya Area.

Jin, Guiyun and Fuqiang Wang

[283] *Early Neolithic Plant Exploitation in East China*

Early Neolithic plant exploitation is a key subject for understanding the subsistence strategies of late hunter-gatherers and early farmers. As archaeobotany has developed in China, plant remains, together with other ecofacts, have been recovered from several early Neolithic sites around Shandong Highlands, East China. Preliminary results show changes in the role of plant resources. At about 10000 year BP, the inhabitants of Bianbiandong Cave relied mainly on animal food with very small amount of plants. At about 9000 year BP, the Zhangmatun people exploited at least 38 species of plant resources on the floodplain near the mountains in the south. There have been very few animal remains recovered from this open-air site. At about 8000 year BP, the diversity of plant remains from Xihe and Yuezhuang site decreased to 19 wild species of plants but with 3 species of cultivated or domesticated cereals (rice, foxtail and broomcorn millet) and more than 20 species of animals which were dominated by fresh water creatures.

[286] *Early Subsistence Practices at Prehistoric Dadunzi in Yuanmou, Yunnan: New Evidence for the Origins of Early Agriculture in Southwest China*

In 2010, flotation work was carried out at the site of Dadunzi in the Chuxiong Yi Autonomous Zone. A number of crops were recovered from this work including: foxtail millet, broomcorn millet and rice, as well as weeds originating from both fields and the natural environment. The results of the flotation show that at 4000 BP, that the Yuanmou site had already entered a phase of agricultural production and the majority of the diet of the inhabitants of this site came from these three crops. Agriculture at Dadunzi appears to have been of a mixed strategy of both upland dry field and wetland agriculture. Upland agriculture originated from Northwest China, while rice agriculture on the other hand is hypothesized to have entered this region from areas to the east and slightly north.

Jobbova, Eva (UCL)

[130] *New Research into the Dynamics of Human-Environment Relationships in the Maya Region*

Despite recent debates and new analytical opportunities in Maya archaeology provided by developments such as increased amounts of paleoclimatic data, the growing field of settlement archaeology and advances in Maya epigraphy, we still know very little about either short or long-term dynamics of human-environment relationships in the Maya region: for example, the choices humans make in response to extreme variability in rainfall patterns or changes in soil conditions. Does society become increasingly complex? Is collapse inevitable? Do people simply move, and if so, do their ideological and religious beliefs change, or do they remain the same? This paper responds to some of above-mentioned debates and attempts to address a continuing void in our knowledge of how the Maya responded to environmental variability. I examine changing Maya settlement through time, cultural and political trajectories through epigraphy, short-term ethnographic evidence for Maya community responses to recent environmental stress and long-term climate proxies. My presentation focuses on relationship between Maya society and the local environment over the long-term, from the Classic (c. 250 to 900 A.D.) to the Early Colonial (1500/1600 A.D.) period, while also taking into account socio-cultural agencies via information from the written record.

Jochim, Michael (Univ of Cal - Santa Barbara)

[40] *A Lacustrine Revolution: Adaptive Shifts in the Late- and Postglacial of South Central Europe*

The environmental changes in Europe at the end of the last ice age had profound effects on human populations. One of these changes, the development of numerous lakes in the region north of the Alps, created new habitats and niches that were rapidly exploited, with significant effects on many aspects of behavior. The record of environmental and archaeological changes in Switzerland and southern Germany are examined with an emphasis on subsistence, technology, and land use.

Johannesson, Erik (Pacific Lutheran University)

[20] *What You See Is What You Believe: Mortuary Ideology and Transmutations in Funerary Practice at the Advent of the Xiongnu Empire in Mongolia*

This paper examines the intersection of mortuary ritual and beliefs, at the edge between funerary ideology and religion. The formation of the Xiongnu polity in the 3rd century B.C.E. in what today is Mongolia included the introduction of new funerary regimes that conspicuously upended previous mortuary traditions. Xiongnu mortuary practice breaks a millennium-long convention of east-west orientation of funerary monuments and accompanying inhumations, the creation of visibly prominent and highly variable stone monuments, and a general low investment in grave-goods in the funerary assemblage. Instead, Xiongnu mortuary monuments are oriented north-south, are placed in areas with low visibility, shift the locus of material and labor investment, both quantitatively and qualitatively, to the funerary assemblage, and introduce marked standardization throughout the

funerary repertoire, from monument form to the inclusion and placement of grave-goods. Here I question if Xiongnu mortuary practices represent the introduction of new religious ideas, and argue that they imply the strategic implementation of new ideational constellations that subvert the instantiation of commemorative narratives celebrating local lineages of leadership. While Xiongnu funerary repertoires may have referenced new cosmological beliefs, they above all stressed the adoption of, and inclusion in, a distinctively “Xiongnu” political economy.

Johansen, Peter (University of British Columbia) and Andrew Bauer (University of Illinois)

[142] *The Techno-politics of Water and Iron: Resource Materialities in South Indian (Pre)History*
Water management and iron production were two socio-material practices deeply entangled with the politics of emerging social distinctions during the South Indian Iron Age. Beginning with small well-distributed modified rock pools and systematically dispersed iron-smithing facilities, Iron Age social actors laid specific claims to the materials, places and technologies of water management and iron production. This created and maintained a constellation of social differences and affiliations. Stepping back from a political economy of resource production, however, our interest here is with the dynamics of relational resource assemblages (e.g., materials, practices, infrastructures, knowledge) and their historical and ecological constitution. Here we investigate how the ‘distributedness’ of these assemblages both enables and constrains social and ecological conditions. In doing so we interrogate the interwoven relationship between the politics of resource production and the materiality of process, exposing a techno-politics that is uniquely disposed to this region’s ecology and history. We begin with the earliest archaeological evidence of water management and iron production during the South Indian Iron Age and end in the ethnographic present exploring how shifting orientations of assemblage components affect the value, meaning and experience of water and iron production, technology and consumption.

[95] *Engaged Anthropology at Cuyamungue, New Mexico*

In 2014 the Pueblo of Pojoaque and University of Colorado-Boulder began a collaborative project at Cuyamungue (K’uuyemugeh ‘stones falling down place’), an ancestral Tewa village. The goals of the project are to increase awareness of local ancestral sites in contemporary Pueblo communities; to strengthen local community identities; and to integrate archaeological, historical and traditional knowledge in telling the story of Cuyamungue. The first season of work involved surface survey, low-altitude aerial survey, assessment of museum collections and site visits with Tewa scholars and leaders. Initial results suggest the pueblo was founded in the late 13th century and was home to more than 1,000 people by 1400 CE. Cuyamungue continued as a smaller community through the first century of Spanish colonization, and its inhabitants participated in the Pueblo Revolt. In 1696, the remaining inhabitants moved to Tesuque and Pojoaque pueblos but returned periodically over the years to maintain their connection to their ancestral home. Cuyamungue also remains an important place in the consciousness of present-day Tewa people. Another important finding is that, under certain conditions, it is possible to trace adobe wall-lines from vegetation patterns in low-altitude aerial photos.

[108] *'Limestone Bars' as Power Objects among the Ancient Maya: a Consideration of Objects as Active Participants in Ritual Practice*

This paper considers how people and things come together in a ritual setting and attempts to break down the division between the human participants and the materials engaged. Using contemporary perspectives surrounding post-Marxian materialism, it is argued that archaeology has the means to explore the ways in which materials exhibit their active nature in particular contexts. With this in mind, this study will reassess small bar-shaped limestone artifacts that have been recovered from numerous archaeological contexts throughout the Lowland Maya area of Belize, Guatemala, and Mexico. A consideration of general size, shape and treatment suggests that these objects may have been tools and that their role in ritual practice transformed them into an active participant. Understanding that things can be active when articulated in an assemblage of social relations, enables scholars to disentangle subjective assumptions of value and meaning. In this case, it enables one to argue that a seemingly "ordinary" bar of limestone, an abundant resource in the Maya area, was seen as an object of power through its participation in ritual.

Johnson, Keith

[127] *The Setting: Location, Environment and Excavation History*

Antelope Cave is a large limestone cavern sunk beneath the rolling hills of the Uinkaret Plateau in northwestern Arizona. Native Americans lived in the cave intermittently for 4000 years during the Archaic and Puebloan periods. Environmental conditions over those thousands of years appear to have changed little. This paper addresses the variety and abundance of local resources available to the cave's inhabitants who lived in this semi-arid region north of the Grand Canyon. Flora in the vicinity of the site is scanty and characterized by xerophytic plants, grasses, and very few trees. Available fauna includes antelope, deer, rabbits, small rodents, snakes and birds. Just like in the area today, sufficient water for drinking, cooking and farming was a constant challenge for the cave's inhabitants and may have been a major factor contributing to the seasonal occupation of the cave. Archaeologists from three institutions excavated Antelope Cave in the 1950s and 1980s.

Johnson, John (Santa Barbara Museum of Natural History)

[175] *The Formation of Mission Indian Communities in South Central California: An Ethnohistorical Case Study*

The Mission Period in Spanish-Mexican California resulted in the breakdown of original independent native polities. Depopulation from introduced European diseases coupled with intermarriage between people from different tribal groups at the missions led to the disappearance of linguistic differences and the formation of new community identities named after the different missions. Alongside these processes of coalescence and ethnogenesis, political and traditional ceremonial activities continued that allowed social memory to be preserved of ancestral ethnic identities. Ethnohistorical study of records kept by Franciscan missionaries, as well as the rich ethnographic and oral historical information collected by anthropologist J. P. Harrington, permit a detailed examination of the incorporation of Chumashan peoples into the mission communities, processes of social change, and persistence of cultural identities in South Central California.

[162] *A Seedy Affair: An Archaeobotanical Study of the Johnston Site (36In2)*

Archaeobotanical research can provide archaeologists with insights into what plant resources past peoples were consuming and utilizing as well as the spatial organization of resource use and other activities within a site. Investigations at the Johnston Site, a large ring village located in Western Pennsylvania date back to the 1950s, yet until recently, relatively little research has been completed with archaeobotanical samples. This Late Prehistoric site is categorized in literature as representing the Johnston Phase of the Monongahela culture, but many questions still remain about village structure and its residents. Analysis of the carbonized wood and seeds retrieved through flotation not only provides a more detailed picture of the resources used by the Monongahela people but information on how those resources were distributed across features may clarify the use of space in this village. Applying archaeobotanical research to this site contributes to the understanding of Monongahela culture and provides a framework for future study.

Johnston, Janene (University of West Florida), Lara Homsey-Messer (Indiana University of Pennsylvania) and Karla Johnston (Hancock Biological Station, Murray State University)

[162] *Characterization of Plant Ash Morphology Using Scanning Electron Microscopy*

Calcitic plant ashes are a ubiquitous indicator of anthropogenic activity at archaeological sites. In conducive preservation environments, ashes may form undisturbed deposits in which individual ash crystals remain intact and identifiable. Under these conditions, ashes afford a unique opportunity to better understand both the human selection of fuel as well as to investigate changes in vegetation communities in response to climate change. This study seeks to characterize ash crystal morphologies for various hardwood and softwood species in the American Midsouth using Scanning Electron Microscopy (SEM). Preliminary data support previous research, which identified a morphological difference between deciduous and coniferous species. However, our results demonstrate that this pattern is less discrete than previously recorded, and indicate that the size and volume of crystals must be quantified in addition to simply qualitatively characterizing crystal shape. Moreover, ashes combusted from different anatomical parts of the same species (e.g., pine wood versus pine needle), show considerable differences in both size and shape and therefore require more robust indicators to differentiate. The ultimate goal of this research is to develop a comparative collection of ash crystal morphologies using experimentally combusted materials for comparison to archaeological samples from across the Midsouth.

Johnston, Susan (George Washington University)

[289] *Space as Place: Understanding Emptiness in Archaeological Landscapes*

One of the basic tenets of the landscape approach in archaeology is that we need to think beyond the idea of discrete sites and consider instead the use of an entire landscape (or landscapes). From this perspective, places in a landscape that do not contain "sites" as understood in the conventional sense were nevertheless woven into the lives of ancient people. This means that, in order to understand the past, we need to understand both the places where people left things behind and the places where they left no obvious trace, as well as the relationships between them. This not only affects the interpretation of the past but also how archaeological data is collected. These ideas are explored in this paper with examples from public archaeology in Rhode Island and from research in Iron Age Ireland, to begin to develop ways to think about the "empty spaces" of the past.

Johnston, Christine (Cotsen Institute of Archaeology, UCLA)

[368] *Market Exchange Seen Through the Mist: Network Visualization for Variable Data*

In analyzing micro and mesoscale distribution systems, it is necessary to identify the economic structures and elucidate the socio-economic conditions governing the interaction of agents. Of particular interest in assessing economies of the Late Bronze Age Mediterranean is the potential incorporation of extra-palatial actors in privatized production and non-centralized exchange. Central to this issue is the question of whether marketing activity was extant outside royal jurisdiction, providing independent access to imports and luxury goods. In recent scholarship, materially based frameworks including the Distributional Approach have supplemented traditional studies on the

location, and spatial configuration of the physical marketplace by examining the distribution of objects throughout consumption units. This paper will explore these methods while assessing the utility of certain approaches when applied to variable datasets. Using the Late Bronze Age Mediterranean port kingdom of Ugarit as a test case, the economic structure of the site will be profiled through an examination of small finds. With a lengthy excavation history, Ugarit offers an apposite example of the opportunities and limitations provided by large and variable datasets. The illustrative capabilities of Network Visualization will then be explored for contexts in which quantitative analysis is constrained by issues of data robustness.

[408] *Non-mounded Architecture, Invisible Housemounds, and the Problem of Settlement Identification and Demographics in the Mirador Basin*

In a landscape distinguished archaeologically by elite-dominated, often massive architecture, the small and unobtrusive is easily overlooked. Since its inception as a discipline, Maya archaeology's principal focus has been cities and the buildings that comprise them. These buildings, often of extraordinary scale, are typically represented in the archaeological record by mounds. This phenomenon of architectural "moundedness" has conditioned Mayanists' perception of settlement as a whole. Indeed, their search for settlement and demographic estimates has consisted almost entirely of the identification of mounded structures. Yet discoveries at numerous sites indicate that many Maya buildings and cultural activities are not represented by mounded remains. As illustrated by research undertaken in the Mirador Basin, a more productive approach re-conceptualizes the problem of Maya settlement and demographic identification in terms of prepared "surfaces," or sub-surface architecture whose discovery requires new and varied sampling techniques. The evidence of ancient behaviors, activities, and forms of organization that archaeologists seek are present primarily on these surfaces. Some such surfaces are mounded, but many of them are not. To obtain representative samples of Maya settlement, surveys must include intensive subsurface sampling—a practice too infrequently undertaken in the Maya Lowlands.

Johnstone, Dave

[323] *Round Structures: Their function(s)*

Round foundation braces for perishable walls are seldom the focus of excavation owing to their relatively unimpressive physical characteristics. However, these structures become common throughout the Northern Lowlands at the end of the Terminal Classic period, appearing in 50 percent of the surveyed sites. This paper will examine their possible function, and explain why they became so widespread.

Jolie, Edward (Mercyhurst University)

[143] *Preliminary Insights from the Cache Cave Textile Assemblage*

Much of what is known about the pre-contact textile industries of interior Chumash peoples derives from early archaeological investigations and nonprofessional collections acquired from caves and rockshelters during the late nineteenth and early twentieth centuries. The vast majority of this material is undated, poorly provenienced, and underreported, which makes interpreting such artifacts' technological stylistic variability and significance difficult. Recent recovery of more than 500 fragments of cordage, baskets, basket impressions in asphaltum, mats, and nets from secure archaeological contexts at the Cache Cave site thus stands to enhance considerably our understanding of interior Chumash woven technologies. This paper presents the results of preliminary technological stylistic analyses of the assemblage, considers insights from this material into the use of the site, and places the Cache Cave textile assemblage within the context of previous research on Chumash woven articles.

Jolivette, Stephanie (Statistical Research, Inc.), Amanda Taylor (SWCA Environmental Consultants) and Sarah Van Galder (Statistical Research, Inc.)

[152] *Accessing and Assessing Coastal Shell Middens on Private Property in the Pacific Northwest*

The majority of coastal property in the Pacific Northwest is in private hands. Although laws in Washington State protect archaeological sites on private property, such sites are traditionally only assessed on a case by case basis when the landowner seeks a permit. Landscape scale assessments of coastal resources in the Puget Sound region are rare. Here we compare the results of two such projects along Puget Sound; an academic project in the San Juan Islands conducted by researchers at the University of Washington and a cultural resource management project conducted by archaeologists from Statistical Research, Inc. for Pierce County Planning and Land Services. Cooperation from landowners varied between projects, but in both cases concerns about changing property values and land use restrictions were paramount. Both projects utilized public outreach to increase the participation pool with some success, suggesting that utilizing social networks to reach private property owners may be a viable solution for access issues. Evidence of extensive coastal shell midden disturbance due to both natural and anthropogenic causes suggests an urgent need to engage landowners as stewardship partners.

[299] *Surviving Trepanation: Approaching the Relationship of Violence and the Care of "War Wounds" through a Case Study from Prehistoric Peru*

The political instability that characterizes the early Late Intermediate Period (ca. A.D. 1000-1250) in Andean prehistory had widespread impacts on how people lived, ranging from changes in settlement patterns to an increase in skeletal trauma and infectious disease. This paper explores the social experiences of violence and its implications for healthcare, primarily through the analysis of a notable case study: a young male from Andahuaylas, Peru, whose skeleton evinces multiple lesions and fractures, post-traumatic impaired mobility, and healed trepanations. Trepanation, in particular, is a clear indicator of medical intervention, but is still just one step in the larger process of care and recovery. Using modern clinical literature, it is possible to approximate the physical impacts of trauma, surgery, and rehabilitation, and address the logic of treatment during this time. More generally, we address the accommodations afflicted individuals would need to convalesce and survive in a high-altitude fortified settlement. Results demonstrate the underlying role violence played in generating novel healthcare practices and reifying new social categories in the ancient Andes. Ultimately, such data can inform on the nuances of social organization required for such intensive care and the respective social experiences of disease and violent injury in the past.

Jones, Terry (Cal Poly San Luis Obispo)

[406] *Fish, Fishing, and Fish Bones on the Central California Coast*

In much of Native western North America fish and the aquatic technologies used to exploit them were associated with intensive hunter-gatherer economies and heightened levels of socio-political complexity. Central California, however, is more commonly associated with exploitation of acorns, a resource that also encouraged dense, sedentary, storage-dependent populations. The relative significance of fish to these less populous foraging groups has only recently become a focus of systematic study. Here we review salient diachronic patterns from over 200,000 fish bones from 99 sites investigated over the last 40 years with an eye toward variation related to technological change and/or economic intensification.

[6] *Depositional Circumstances of Three Paleoindian Sites along Lima Reservoir, Montana*

Wave action along the Lima Reservoir in Centennial Valley, Montana has exposed three adjacent

Paleoindian sites along the north shore cutbank. While these sites date to the same period and are near each other (within 1.5 miles), they possess markedly different geologic contexts. The westernmost site, 24BE43, is a surface scatter resting on an old soil with a very well-developed Btk horizon. The eastern site, 24BE52, is also a surface manifestation but it sits on a very thin soil capping what appear to be eroded lacustrine sediments. The center site, 24BE46, contains a likely Paleoindian subsurface component and younger surface cultural material. Using optically stimulated luminescence (OSL) dating, stratigraphic mapping, and sediment analysis, we determine the likely geomorphic sequence of events for these three sites and attempt to explain why they differ. Identifying which landforms and sediment types contain intact buried cultural material among these sites may help determine what other areas in Centennial Valley have good potential to contain subsurface archaeological deposits.

Jones, James (MN Indian Affairs Council)

[30] *Indigenous Cultural Resource Ceremonies*

Indigenous Cultural Resource Ceremonies looks at the relationship that Indigenous people have with archaeological sites and with sacred places. Spiritual connections that Indigenous people have with the land, waters and even with the stars and with the cycles of the moon. How is this relationship defined within modern archaeology and cultural resource management today? The relationship and the connections to places that we originate from. The villages, communities, towns, and the cities. Places are a way in which we identify ourselves, in Ojibwe culture that is the traditional way to introduce oneself. Your dodem and where you're from. Just like these artifacts that lay beneath the ground. What is it that lays there? What is the type of artifact or place? What is the age of the artifact or site? Where you're from, your community? This is one of the many ways that indigenous cultural resource ceremony is defined within everyday lives of Indigenous people. People have been interpreting our past and our cultures without having a clear understanding of who we really are as a people and have little or no understanding of our cultures and our spiritual beliefs.

Jones, Sharyn (Northern Kentucky University), Justin Cramb (University of Georgia) and Alison Weisskopf (University College London)

[77] *Mid-sequence Colonization and Occupation at Nukubalavu, Vanua Levu, Fiji*

Inspired by Bill Dickinson's broad and multifaceted perspective on the archaeological record of human colonization in the Pacific Islands, we present both new data from Vanua Levu, Fiji—informed in part by Bill's ceramic petrography from the site of Nukubalavu and reflections on the thalassic pattern of colonization in the central Pacific Islands. While a sea focus in the Pacific Islands is unremarkable, some Lapita, Late Lapita, and Mid-sequence occupations of Fiji reveal an intriguing pattern of colonization focused on somewhat marginal areas including small islands, tombolo, and seemingly isolated or separate sea bound land formations such as that found at Bourewa, Vorovoro, and Nukubalavu. We also describe recent archaeological work on Nukubalavu on Vanua Levu where a house foundation yielded organic material suitable for radiocarbon dating, zooarchaeological remains, Late Lapita and Mid-Sequence ceramics, coral files, charred and waterlogged archaeobotanical remains, and subsurface features.

Jones, Janet

[101] *Glass at the Crossroads: Production and Emulation at Phrygian Gordion*

Glass vessels recovered from over sixty years of archaeological investigation at Gordion (central Turkey), the capital of ancient Phrygia, range in date from the eighth century B.C.E. through the Roman period and represent nearly all techniques of glassworking. Several groups of luxury glass from Gordion illuminate key moments in the transmission of cultural influence and of glassmaking technology, production, and utilization from the Near East into the Mediterranean basin in the first millennium B.C.E. Molded glass objects from late ninth century through seventh century levels demonstrate that the Phrygians were either receiving glass objects from northern Mesopotamia, possibly in diplomatic exchange, or were themselves working glass by applying their expertise in

bronze casting to imported glass ingots. Molded vessels in the Achaemenid style from the later fourth century into the under third century B.C.E. suggest that the production of molded vessels was revived in this region under Persian influence. Categories of core-formed vessels at Gordion suggest that Phrygia may also have been a site of production during the late Classical and Hellenistic periods. This paper discusses how the important corpus of glass from Gordion informs our understanding of cultural exchange between east and west based on typological and chemical analysis.

Jones, Carleton (National University of Ireland, Galway)

[155] *Dating Ancient Field Walls in Karst Landscapes Using Differential Bedrock Erosion*

While karst environments present methodological and interpretive challenges to archaeologists, they also provide some unique opportunities. One of these opportunities is the ability to date field walls by measuring divergent rates of bedrock erosion underneath and adjacent to ancient walls. Field walls are traditionally difficult to date, either by using morphological typologies or through the association of diagnostic or chronometric materials. The method presented here, therefore, represents a valuable tool for archaeologists working in karst landscapes. The methodology is described along with a discussion of potential problems, drawing in particular upon evidence from the karstic terrain of the Burren in western Ireland. The methodology is then applied to a group of field walls on the Burren where independent archaeological and geomorphological evidence confirms the usefulness of the method.

[163] *Ritual or Dietary Use? Wild and Domestic Turkeys at Tijeras Pueblo (LA 581)*

Recent work on turkeys (*Meleagris gallopavo*) in the prehispanic Southwest (e.g., Speller et al. 2010, McCaffery et al. 2014) has highlighted both the long history of domestic turkey use in the Southwest and the concurrent exploitation of the local wild Merriam's turkeys (*Meleagris gallopavo merriami*). This new information has added to the ongoing debate over whether turkeys were domesticated for ritual or for dietary purposes. At Tijeras Pueblo (LA 581), turkeys eating a maize-heavy diet (presumably domesticates) and turkeys with an isotopic signature more similar to modern wild specimens (presumably Merriam's turkeys) have been identified in 14th century contexts. In this poster, we examine the contexts in which these turkeys were found to test the hypothesis that wild and domestic turkeys were treated differently by prehistoric Pueblos.

[169] *Fine China, Flatware, and Crockery: An Archaeological Reexamination of Chincha Domestic Contexts*

This paper considers how material culture reflects the manipulation and creation of identity through a reexamination of the Chincha ceramic typology using ceramic vessels recovered from two mid-Chincha Valley domestic contexts dating to the Late Intermediate Period (LIP) (1000-1400 A.D.) and the Late Horizon (LH) (1400-1532 A.D.). The Chincha Kingdom was an extensive and powerful trading polity that emerged during the LIP and continued into the LH. Previous studies identify three distinct zones within the lower-Chincha Valley (administration sector, coastal fishing district, and agricultural area), however not much is known about peoples living outside the central hubs of the Chincha Kingdom. The materials presented here derive from a series of systematic site surveys or two mid-valley domestic contexts conducted in 2014. The current analysis revealed a wide variety of vessel forms and a collection of stylistic motifs that provide insights into the construction of the social and political identities of these communities. This paper explores these different ceramic motifs and vessel forms to ascertain how the groups inhabiting these domestic sites identified themselves.

[249] *RTI (Reflectance Transformation Imaging) Examination of Weathered Sculpture for Accurate Delineation of Weathered Detail*

A test case applying advanced digital imaging to decipher weathered sculpture detail at Izapa, Mexico, was successfully initiated in 2012 by Dr. Jason Jones (University of Warwick) and completed in 2014 with support from CIR (Center for Izapan Research, ARCON Inc.) under INAH permit. A series of digital camera photos taken with lighting from different directions (highlight method) on each monument was analyzed and merged using computer software according to the Reflectance Transformation Imaging (RTI) technique as developed by Cultural Heritage Imaging and Hewlett-Packard Laboratories. This has provided an unparalleled way to review and interrogate stela details, which is far less prone to subjectivity than artistic drawings. The combined ability to view color, together with the surface shape and texture, helps resolve the difference between features carved intentionally and those arising from deterioration in the stone. Furthermore, the virtual re-lighting and magnification makes it practical to document features with a robust audit trail, which cannot easily be seen or photographed otherwise. These images confirm the superior accuracy of NWA photo drawings in Norman 1973, 1976 over artistic re-drawings from on-site/video inspection (NWA 1999, 2007 test case).

Jones, Eric (Wake Forest University), Pierce Wright (Wake Forest University) and Peter Ellis (Wake Forest University)

[275] *Examining the Non-Mississippian Southeast: A Comparison of the Intrasite Arrangement of Piedmont Village Tradition Settlements, A.D. 1200–1600*

Excavations at the Redtail site (31Yd173) have begun to reveal the internal arrangement of a Piedmont Village Tradition (PVT) settlement occupied during A.D. 1200–1600 in the upper Yadkin River Valley of the western North Carolina Piedmont. Research projects over the last 40 years have established similar information for a small number of settlements in the eastern and central Piedmont of North Carolina and Virginia. This research examines the morphology and spatial patterning of postmolds and pit features at the Redtail site and compares the results to those from sites in the Eno, Haw, and Dan River valleys. The results of this community-level analysis complement recent regional and sub-regional analyses of settlement ecology by displaying the variability across PVT settlement patterns on multiple scales. This has implications for a number of PVT cultural characteristics and phenomena, including social organization, economic exchange, and political relationships. These results further suggest a need to create a new and more complex model for studying the non-Mississippian, non-hierarchically organized societies and communities of the Late Precontact Southeast.

Jones, Brian (University of Connecticut) and Brianna Rae (Archaeological and Historical Services, Inc.)

[281] *A Snook Kill Phase Site in Marshfield, Massachusetts*

Archaeological and Historical Services Inc. recently excavated a rich Snook Kill phase site in Marshfield, Massachusetts. Dated features and diagnostic tools from the site indicate a radiocarbon age of 3500 years ago. Artifacts were recovered beneath a horizon of peat that had formed over the past 1500 years in this near-coastal setting. The strikingly pristine site documents a complete lithic artifact production, use, and discard sequence, from the reduction of rhyolite cobbles into carefully prepared cores, and large flake blanks into tools. Bifacial implements include numerous Snook Kill points, asymmetrical knives, and over a dozen awls. Refitting between debitage and tool fragments indicates two contemporaneous areas of activity. The organization of the site and spent tool kit suggest that a focused episode of construction occurred here, possibly related to bark canoe manufacture.

Jones, Catherine (University of Wisconsin-Milwaukee)

[301] *Mixed Burials and Commingled Human Remains Recovered from the Milwaukee County Institution Grounds Poor Farm Cemetery*

From the mid-1800s to its abandonment in 1974, the MCIG Poor Farm Cemetery in Wauwatosa, Wisconsin served as a burial place for institutional residents, unidentified or unclaimed individuals

from the Coroner's Office, and the community poor and indigent. Previous excavations at the cemetery in 1991 and 1992 recovered 1649 individuals in predominantly single interments with an occasional extraneous body part representing incidental amputation or autopsy. The 2013 excavations at the site yielded 650 additional coffin burials, including a significant number of multiple interments unexpected for a historic cemetery of this time. These represent a wide range of burial contexts, including multiple complete individual skeletons as well as body parts likely reflective of autopsy and medical school cadaver use. In addition, many graves contained debris consistent with general refuse disposal and/or medical waste. The Milwaukee County Poor Farm Cemetery Project has worked to carefully excavate these commingled burials, to separate the remains, and to return individuality to those whose stories have been lost.

[345] *A Climatic Imperative? Testing the Connection between Climate and Crop Adoption in the Indus and the Hexi Corridor*

Why might societies adopt new crops or change their cropping patterns? Climate change is one of several possible drivers, but its role in crop exchange has rarely been empirically tested and its importance relative to other factors, particularly cultural factors, remains controversial. As part of the Food Globalisation in Prehistory project, two isotopic studies have aimed to directly test the relationship between climate change and crop movement in particular contexts. One focuses on the Hexi Corridor, which is one of the main routes by which crops may have traveled between China and Central Asia. The other focuses on the Indus region in northern South Asia, where climate change has been invoked in both the spread of African, Eurasian and indigenous millets, and the decline of the Indus Civilization. In both cases, we have aimed to generate focused, archaeologically-relevant climatic data which have the capacity to provide a robust empirical foundation for testing the relationship between climate change and crop movement. In so doing, we hope not only to further our understanding of the possible role of climate in these two key locations, but to demonstrate new approaches and techniques with the potential for much broader application.

Jones, Ian (University of California – San Diego)

[402] *Questioning Technological and Economic "Decline" in the Medieval Rural Levant*

This paper argues against a common view of medieval Levantine villages as isolated from larger regional centers by examining a group of hand-made ceramics — commonly called Hand-Made Geometrically Painted Wares (HMGPW), and formerly "pseudo-prehistoric" wares — prevalent across the Levant from the 12th-17th centuries A.D. They are generally seen as the products of non-specialist village potters and, as the older name suggests, an example of technological decline. That view, though, is based primarily on ethnographic evidence from the late 19th and 20th century Levant, and hinges on a number of assumed, and generally unquestioned, dichotomies: urban/rural, specialist/non-specialist, wheel-made/hand-made. As HMGPW is the most visible indicator of

settlement during these periods in the southern Levant, these assumptions have influenced the ways archaeologists conceive of rural Levantine economies, leading to a view of villages as disconnected from larger centers where higher-quality, wheel-made pots were produced. This view, however, is at odds with historical evidence for substantial state investment in rural agriculture. In this paper, I present a broader approach to HMGPW — integrating archaeological and ethnoarchaeological insights from beyond the Levant — that helps us better understand what the widespread adoption and longevity of this “retrogressive” technology says about rural economies.

Jones, Kari

[416] *Before San Francisco: The Archaeology of El Polín Spring in the Presidio of San Francisco*
Archaeological research at El Polín Spring in the Presidio of San Francisco illuminates the early history of the city before San Francisco and Yerba Buena. Initial historic research and archaeological excavation at El Polín revealed what was interpreted to be the home and associated refuse midden of two intermarried colonial families. This is the first known Spanish-colonial occupation outside the walls of El Presidio de San Francisco, dating to sometime after 1812. More recent excavation at the site has uncovered additional features, including a terra cotta tile kiln, suggesting a more complex settlement. This paper explores the potential of the preserved archaeological site at El Polín to answer questions about the Spanish and Mexican period in what is now San Francisco. Current efforts to interpret this history to park visitors are also discussed.

Jorda Pardo, Jesus F. [155] see Aura Tortosa, J. Emili

Jordan, Keith (California State University, Fresno)

[39] *From Tula Chico to Chichen Itza: Implications of the Epiclassic Sculpture of Tula for the Nature and Timing of Tula-Chichen Contact*

Although most scholars now reject hypotheses of a Toltec invasion of Yucatan to explain similarities between the art of Tula and Chichen Itza in favor of models involving economic, political, and religious interaction between the two centers, questions remain concerning the nature and timing of this exchange. Some archaeologists and art historians posit a 9th-10th century florescence for “Toltec” Chichen, and argue that since this makes the “Toltec” style in Yucatan older than the Tollan Phase at Tula, most of the style features shared between the cities originated with the Maya. I examine the relevance of the Epiclassic relief sculpture of Tula Chico for this debate. The presence of reliefs of reclining figures in clear “Toltec” style at Tula Chico, in contexts predating their occurrence at Chichen Itza, suggests that claims for a predominantly Maya origin for that style stand in need of revision. Such rethinking is supported by other images from Tula Chico (eagles and Venus symbols), as well as by new studies of ceramics and chronology at Chichen.

Jordan, Amy (University of Washington)

[44] *Alone in the Deep Blue Sea: A Comparison of Indonesian Colonial Period Nutmeg Plantations and New World Plantations*

Plantations on the nutmeg-bearing Banda Islands are contemporaneous with early North American plantations and are an excellent place to investigate cross-cultural responses to colonialism. The Banda Islands were the world’s sole source of nutmeg in the 16th century and control over this spice was a major goal for European powers during the Age of Expansion. Consequently, the Banda Islands were the location of early experiments in colonialism by European powers and can provide information for cross cultural studies of the different responses to colonialism, as suggested by Deetz (1991). Using models of ethnogenesis and resistance developed from the study of New World plantations, I review how well these models fit the archaeological record from three colonial era nutmeg plantations in the Banda Islands, Maluku Province, Indonesia.

Jordan, Jillian (University of New Mexico) and Keith Prufer (University of New Mexico)

[248] *Late Classic Household Ceramic Production at Uxbenká, Belize*

Uxbenká, an Early Classic to Late Classic period Maya polity, is the most extensively excavated site in southern Belize. Recent ceramic analyses have succeeded in refining our understanding of the

extent and duration of occupation at Uxbenká as well as its position in regional interaction spheres. Like other sites in the Maya Lowlands, we know very little about household ceramic production due to the lack of workshops and tools, probable seasonal production resulting in low volumes of finished products, and firing areas located outside structures where excavations are focused, making it difficult to identify these contexts in the archaeological record. Recent analyses of previously excavated ceramic and lithic assemblages from settlement groups located in the southwest periphery of Uxbenká's hinterland revealed evidence of Late Classic (A.D. 600-800) household ceramic production. Evidence includes polishing stones, ceramic tools, and unifacially retouched chert flakes that may have been to scrape ceramic vessel walls. This poster presents the results of use wear analyses on ceramic production tools. These data, in concert with contextual and spatial data, provide information on household production and intracommunity interaction at Uxbenká.

Jordan, Alexis [301] see Freire, Shannon

Jordan, Alexis (University of Wisconsin-Milwaukee), Catherine Jones (University of Wisconsin-Milwaukee) and Shannon Freire (University of Wisconsin-Milwaukee)

[301] *The Sum of Their Parts: Reconstituting Individuality from Atypical Mixed Burials at the Milwaukee County Institution Grounds Poor Farm Cemetery*

Excavations in 2013 at the Milwaukee County Institution Grounds cemetery recovered 650 burials from one of four locations used by Milwaukee County officials for burial of more than 7000 individuals from the mid-1800s through 1925. Of those recovered during the 2013 excavations, at least 25% have been identified as multiple interments. The diverse depositional contexts of several of these burials are indicative of a variety of mortuary behaviors atypical for a historic cemetery during this period. The interment of partial human remains, medical waste, and presence of secondary burials suggest a deliberate departure from mortuary norms exhibited elsewhere at the site and have resulted in a loss of individuality for the deceased. Examination of the burial assemblages, associated historical documentation, and skeletal analyses will shed light on the society that conducted these atypical interments and allow us to retrieve a degree of individuality for those interred.

Jorge, Ana (University of Aberdeen), James Conolly (Trent University) and Rick Knecht (University of Aberdeen)

[337] *Soils, Plants, and Animals in the Making of Hunter-Gatherer Pottery in Coastal Alaska*

Explorations of human-environmental interactions in prehistoric Alaska tend to draw on biological, botanical and faunal data. Artifacts have often received much less attention beyond links to subsistence concerns and the gathering of additional paleoenvironmental information (e.g. wood and grass species). Pottery, in particular, has featured in such discussions only in regards to the processing of foodstuffs: both its suitability for particular cooking methods and the substances it may have contained. Yet, ceramic technologies can be viewed in terms of people's engagement with the environment and transmission of environmental knowledge as well as use of material resources. Ongoing study of pottery assemblages from the late prehistoric site of Nunalleq shows that ceramic vessels were often tempered with grasses, while lamps were often tempered with fur or not tempered at all. In the tundra and highly dynamic deltaic landscape of this part of Alaska, sourcing for clay required great understanding of the land and its sharp seasonal changes. This paper will argue that detailed ceramic technological studies can provide the opportunity to further explore interactions between prehistoric arctic hunter-gatherers and their environment.

Joslin, Terry

[32] *Fishing and Ecological Resilience on California's Channel Islands*

On California's Channel Islands, the Chumash and Tongva relied on a relatively consistent repertoire of small and medium-bodied fish species over a period of more than 10,000 years. Throughout all time periods, the majority of fishes in the archaeological record could have been procured from the near shore waters of rocky intertidal, sandy beach, and kelp forest habitats. There is also limited evidence for offshore fishing for large pelagic fish later in time. I argue that the significant continuity

in fish species caught through time reflects the abundance and resilience of fish in this highly productive marine ecosystem. Even during periods of lowered marine productivity small and medium-bodied fish were important contributions to islander diets, suggesting the fish resources around the islands were both abundant and stable through time. Various island assemblages show a dramatic increase in fishing alongside an increase in population density during the Late Holocene (4000 cal BP to present). This reflects the flexibility of subsistence fishing and its ability to be intensified to support larger populations. These results provide significant insights on the long-term adaptability of island fishers, and the role of rich marine fisheries in mitigating resource stress.

Joyce, Rosemary (University California Berkeley)

[16] *Interrogating "Property" at Neolithic Çatalhöyük*

Neolithic Çatalhöyük poses an interpretative challenge: while there is evident distinction among houses in elaboration, concentration of mortuary remains, and generational persistence, this did not translate into the kinds of material advantages that can be discerned as dietary privilege or preferential mortuary treatment. This has led to the characterization of the people of the site as "fiercely egalitarian". In this paper, I reconsider the established facts from the perspective of the ethnographic analysis of living societies on which the social model of the "house", used to understand Çatalhöyük, is based. Materially visible inequality is not always present in ethnographically, or else is blurred by processes such as distributed curation and use of materials by people other than their acknowledged owners. This leads to a reconsideration of what kinds of "property" can distinguish the estate of a house, with particular attention to what was labeled "immaterial property" in the initial definition of house societies. Economic stratification can be independent of hierarchies of status, prestige, or ritual power. I report on an investigation of one way that one form of immaterial property might be reflected archaeologically: through control of knowledge, or even authorization to produce, craft goods, specifically, pottery vessels.

[410] *The Bioarchaeology of the Cerro de la Cruz Cemetery*

This paper discusses preliminary bioarchaeological findings from the Late Formative cemetery at Cerro de la Cruz in the lower Río Verde Valley on the Pacific coast of Oaxaca. The Cerro de la Cruz cemetery has figured prominently in a long-running debate over the hypothesized conquest of the region by Monte Albán. We discuss the results of detailed bioarchaeological analyses of four individuals from the cemetery in the context of an ongoing regional study. Although taphonomic processes complicated the analysis, the individuals from the cemetery did not reveal evidence of traumatic injuries consistent with warfare. Instead, the range of pathological conditions visible on the bones is consistent with broader regional patterns. Although the age profile of the cemetery is clearly biased toward adults, this pattern appears to be the result of cultural selection and not death in battle. We also discuss the migration implications of a strontium isotope analysis from individuals in the cemetery. We consider the Cerro de la Cruz cemetery in relation to four cemeteries discovered in the region that span the Late Formative to the Early Classic periods.

Juarez, Santiago (University of Illinois at Chicago)

[237] *The Preclassic Maya Site of Noh K'uh: A Network of Communities*

In many societies around the world, the concept of community plays a central role in the formation of individual identities. Communities are subject to change and the focus on community identity provides a theoretical approach in which the individual can be situated in a broader sphere of social interaction. I research community through spatial analyses of human constructions at the Preclassic site of Noh K'uh in Chiapas, Mexico. My findings revealed that house-mounds clustered on hill-tops that were heavily modified to accommodate multiple structures. Through spatial observations and

other archaeological data, I propose that the site of Noh K'uh could be best understood as a collection of corporate households, in which individual buildings and platforms were designed to meet specialized needs. In practice, these aggregates were micro-communities where the processes of production, distribution, transmission and reproduction took place over very wide spread spaces that encompassed multiple buildings. Spatially similar to neighborhoods, these micro-communities were tightly knit with well-defined and unique identities that were constructed and maintained through ritual activities. As an early urban society, Noh K'uh offers the opportunity to study how populations organized themselves during an era of incipient urbanization.

[123] *Digging without Getting Dirty: Making use of Archival Data to Explore Variations of Labor Costs in Hohokam Residential Architecture at Pueblo Grande*

Archaeological research in Arizona's Phoenix Basin has been ongoing for nearly four decades, reaching its heyday during the 1990s. This resulted from large CRM projects associated with development in Phoenix, especially A.D.OT. The potential uses of data collected as a part of these excavations has only begun to be realized, and efforts to digitally preserve and make available these data accessible for new analysis are underway. At Pueblo Grande and elsewhere in the lower Salt River Valley, there was a rapid change from Hohokam pithouses to narrow-walled adobes at ~1150 A.D. This change was probably the result of environmental degradation, which made it necessary to use less wood and more adobe in house construction. Later, a second transition to massive-walled adobes enclosed behind towering compound walls occurred across the Hohokam region around 1275 A.D. Using archival data we calculated labor costs for more than 100 rooms at Pueblo Grande and compared them within and between architectural styles. We found the labor costs for massive-walled adobes were considerably greater than for other kinds of structures. From these labor costs we aim to better understand the architectural transitions, as well as examine potential wealth differentiation at Pueblo Grande and beyond.

Juengst, Sara (UNC-Chapel Hill)

[187] *Community and Ancestors in the Titicaca Basin during the Formative Period*

The Formative Period (1500 B.C.-A.D. 200) in the Titicaca Basin was a time of important social and economic changes, such as the establishment of sedentary settlements and long distance trade routes, increasing horticultural investment, and an emerging regional ritual tradition, Yaya-Mama. However, while archaeologists have documented and described these changes, less is understood about how they impacted local communities. In particular, Yaya-Mama has been interpreted in a variety of ways: as a unifying lake basin identity, a social mediator, a cult of ancestor worship and the emergence of social stratification. To investigate this ritual tradition and its impact on the lake basin, this project uses human skeletal remains excavated from four temple and two non-temple sites. Specifically, I ask how people participating in Yaya-Mama ceremonies were related, both socially and genetically, to others in the lake basin and how they negotiated changing community boundaries and identities. In this paper, I will report dietary and disease lesion data and the results of biodistance and strontium isotope analyses in order to reconstruct who shared access to resources, who was considered acceptable reproductive partners, and if participants at temple rituals were local or foreign.

Juleff, Gillian (University of Exeter)

[89] *Does Practice Make Perfect? Is It Possible to Read Technological Development in the Actions and Outputs of Individual or Group Practitioners?*

No smelter of iron, industrial or pre-industrial, expends energy in gathering raw materials, designing, building and running a furnace without the intention of producing useable metallic iron at the end of the process. Therefore their work is ultimately driven by a success imperative. At a macro, cultural-scale technological development may be readily discernable through indicators such as material/alloy properties, artifact traits and production levels. However, change is brought about by individual or small group actions, whether incremental or fundamental, and actions are rooted in more than one origin. This paper considers the interplay between actions derived from inherited and

established practice, ease (convenience), idiosyncrasy (personality) and optimization (conscious trial and error) and explores what opportunities may exist to detect these in the archaeological record. Two examples will be examined; the macro-morphology of smelting sites and residues, and the micro-morphology of tap slags produced during experimental smelting.

[88] *Incoherent Internationalism: Mayoid Elements in the Art of South-Central Veracruz*

During the Epiclassic period, several discrete iconographic motifs and technical qualities were adopted by peoples of South-Central Veracruz that have close affinities to art of the greater Maya area. For example, some Rio Blanco modelled-carved bowls mimic the iconography of Tiquisate wares of Escuintla, Guatemala. Nopiloa figurines bare well-known ties to figurines from Campeche, Mexico. Apparently indicating an alternate direction of artistic influence, decorative motifs common on polychrome plates from the Las Tuxtlas region of Veracruz were incorporated into plates of Maya manufacture. It will be shown that such artistic relationships are not indices of some unified, emergent world religion (Ringle, Gallareta Negrón, and Bey 1998) nor components of a broadly-shared, political-ideological system (López Austin and López Luján 2000). Instead, they seem intensely local and particular. This paper will posit that such cases of apparently disjunctive, long-distance copying or emulation must also be taken into account when considering the nature of multi-culturalism and interaction during the Epiclassic period.

Justeson, John

[259] *Language Contact and Intergroup Interaction in Precolumbian Mesoamerica*

Research on contact linguistics has shown that, and to a great extent how, the nature of the linguistic influence of speakers of different languages on one another relates systematically to the nature of the interactions among speakers of these languages. This paper will survey some of the evidence and inferences that historical linguistics can contribute to some of the culture-historical situations addressed by other papers in this symposium, from varying time frames, and will address some of the controversies and the kinds of analysis and evidence that seem to contribute to the understanding of precolumbian intergroup interaction across a range of times and places. Facets of this framework are applicable within other kinds of expressive systems. However, understanding the internal histories of languages and language families depends upon detailed documentation of Mesoamerican languages, and a great deal of the linguistic diversity remains to be documented. Until richer documentation work is done, especially on Oto-Manguean languages, linguistic resources will not be able to elucidate some of the major transformations in Mesoamerican prehistory.

[207] *From Burial Grounds to the Interpretation of Past Epidemics: Diagnostic Approach and New Insight on Funerary Practices*

Archaeological discoveries of mass graves testify to an abnormally high death rate linked to a specific event, such as wars or epidemics. Two research lines are fundamental to ascertain the nature of such crises: biological analysis of the exhumed skeletons (age, sex, and paleopathology), and research on the DNA of the ancient pathogens which may have caused the deaths. In addition, these burial sites provide insight into the impact of such a high mortality on funeral customs. At present, enough data are available, especially on plague, to develop an interdisciplinary strategy in order to interpret accurately mortality crises of the past. Therefore, we propose a synthesis on this topic based on several European burial sites related to epidemics. Through the analysis of

archaeological data, our aim is to better understand the attitude of ancient societies toward epidemic death, and to highlight discrepancies between the archaeological evidence and both the textual and iconographic sources that describe these peculiar events.

[388] *Priests' Houses and Architectures of Ideology in East Polynesia*

Most studies of East Polynesia religion focus on the largest monumental sites, those related to the "marae complex". Yet ethnohistoric documents indicate that a wide range of site types had ritual importance, including specialized structures within monumental ritual centers that had diverse functions. Priest houses form one element of the architecture of ideology. Can we identify the houses of full time ritual specialists in the archaeological record of East Polynesian in order to enrich our understanding of religion and social complexity in prehistory? Utilizing ethnohistoric data and archaeological case studies drawn from the Society Islands and the Hawaiian archipelago, I argue that priests' houses conform to specialized house sites and differ in sometimes dramatic ways from mundane sleeping houses, both in their spatial context and in their suites of artifacts and sub-surface features. I conclude that identifying formalized occupational specialists in the archaeological record adds to our understanding of the integrated nature of ideology and social and economic control as important power bases for socio-ritual elites in complex societies. Such a bottom-up perspective draws on the strengths of household archaeology while allowing for a contextualized approach to identify ritual practitioners and their association with monumental architectures of ideology.

Kaijankoski, Philip (Far Western Anthropological Research Group) and Jack Meyer (Far Western Anthropological Research Group)

[293] *A Land Transformed: Holocene Sea-Level Rise, Landscape Evolution, and Human Occupation in the San Francisco Bay Area*

The effects of landscape evolution on the archaeological record of the San Francisco Bay Area have been profound, primarily due to rising sea levels. These changes are illustrated through a trans-Holocene "tour" of the bay that incorporates the landscape context of many sites featured in subsequent papers. For the region's first inhabitants, this area was a vast inland valley rather than the state's largest estuary. The Holocene transgression is illustrated utilizing a new sea-level curve developed for region, which is based on an analysis of over three hundred radiocarbon dates from marsh deposits in the bay and delta. This curve is used to reconstruct the extent of the bay at various times in the past, illustrating just how much of the landscape once available for prehistoric human populations is now submerged. The terrestrial response to rising sea levels during the latter portion of the Holocene included infilling of formerly incised stream channels, alluvial deposition on surrounding floodplains, and the formation of extensive wetlands and dune fields, as illustrated by recent geoarchaeological studies from the region. These examples show how large-scale landscape changes structured the region's archaeological record, and likely explain why the early portions of California's past are poorly represented.

[240] *Where's your Mummy? The Business of Mummification in Late and Roman Period Egypt*

It is often said that the practice of mummification became a veritable business during the Late and Roman periods, when it was extended to include not only the elite, but also those on the lower end of the status scale. The increase in the number of bodies being embalmed led to the widespread adoption of more expeditious techniques, sometimes resulting in mummies that, though outwardly pleasing in appearance, concealed nothing but a jumbled mess of bones beneath their wrappings. The non-elite Late through Roman Period cemetery of the Wall of the Crow at Giza has yielded several examples of such presumed shoddy workmanship. In one example, a coffin contained one primary individual and three additional lower legs. In others, the bodies had been heavily

manipulated or were missing altogether. Scholars have often interpreted such 'fake' or 'composite' mummies as false advertising on the part of the embalmers. However, archaeological finds accompanying the Giza burials and the appearance of some of the coffins suggest that the mourners must have been at least somewhat aware of their imperfect contents, rather than unwitting victims of 'embalming fraud', perhaps influencing the way their loved ones were represented in death more than previously thought.

[146] *Quantifying Indianness: Commonsensical Practice in U.S. Bioarchaeology and Skeletal Biology*

Throughout the 19th and 20th centuries, U.S. museums and universities amassed massive stores of the skeletons of Native American people. These collections eventually became the source-base for bioarchaeology, a subfield of both physical anthropology and archaeology that emerged in the 1970's and continues producing interpretations about past Native American identities from the study of skeletal remains. Over the last few decades, the reburial movement and the passage of NAGPRA has slowed—or sometimes stopped—further collection of Native American remains, and has given indigenous people a say in the fates of their ancestors and a seat at the archaeological table. Yet, cultural interpretations in bioarchaeology and skeletal biology remain insular and informed by processual concerns with objectivity. This "objectivity," though, has commonly rested on older, biologized notions of identity, including claims that remains must "look Indian" to be related to or ancestral to contemporary Native people. Kennewick Man/The Ancient One represents the most famous recent instance of this interpretive tradition in bioarchaeology and skeletal biology. This paper, however, focuses on other more ubiquitous and less publicized cases to assert that common sense notions that equate morphology with cultural identity need further examination in the anthropological and archaeological sciences.

[180] *Innovations under Limitations: A Landscape Approach to Agricultural Practices and Water Management in a Frontier Zone of Medieval South India*

Agricultural intensification and water management are widely studied in the context of changing political complexity. My research, centered on semi-arid southern India, addresses this theme through a survey of three areas that exemplify the diversity of archaeological sites and trajectories of change in the Raichur region. Irrigation played a significant role in the expansion and intensification of agriculture in this region, achieved through the construction of reservoirs that conserved surface run-off during the monsoons. These reservoirs directly fed the agricultural fields and also replenished the underground water table, from which people drew water by constructing wells close to the embankments. Inscriptional and historical data provide the wider context within which the results of the systematic survey are analyzed. This research indicates that the spread of state society into the Raichur frontier zone did not by itself necessitate monumental investments in agricultural intensification. However, when political stress increased, local elites came to amass greater allegiance and control over resources that allowed them to construct and maintain substantial hydraulic infrastructure. The over-arching regional powers in turn depended on these local elites to control and extract resources from these frontier areas.

[237] *Creating a Community in Confinement: The Development of Neighborhoods in Amache, a WWII Japanese American Internment Camp*

In 1942 Japanese Americans from the west coast of the United States were forcibly relocated to incarceration camps scattered across the interior of the country. Constructed by the Army Corp of Engineers and designed to house around 10,000 individuals, these centers followed a rigid, gridded layout that allowed for the rapid construction of what were ostensibly cities. Residential sections were laid out in blocks, each containing twelve “apartment” buildings to which internees were assigned on arrival. Four seasons of intensive pedestrian survey at Amache in Colorado, accompanied by extensive oral histories, has determined that these residential blocks became neighborhoods with individual character and personalities. Particularly compelling are the internee-created landscaping features, which are sometimes coordinated at the level of the block. This paper will discuss the strategies of these frequently arbitrary arrangements of families for creating more cohesive units in a place they did not choose to live. Especially in light of the nature of institutional confinement, these results contribute to the disciplinary conversation about the social role of neighborhoods in the formation of community identity.

Kandler, Anne (City University London)

[191] *Analyzing Cultural Change*

The archaeological record provides information about frequencies of different cultural artifacts in potentially time-averaged samples. The temporal frequency changes of these artifacts reflect the dynamic of the underlying evolutionary processes but the question remains whether inferences about the nature of those processes, especially about the nature of cultural transmission processes, can be made on the base of observed frequency patterns. Here we develop a non-equilibrium framework which establishes whether observed frequency changes between samples at two different time points are consistent with different hypotheses about cultural transmission, in particular with unbiased, frequency-dependent and age-dependent transmission. We account for the fact that any evolutionary process acts on the population of artifacts and not only on the observed sample and allow for time-averaging mechanisms. The model produces theoretical samples conditioned on the considered transmission hypotheses and using Bayesian techniques we are able to infer which hypotheses could and more importantly could not have produced the observed frequency changes between the two samples. Lastly we apply the developed framework to a dataset describing the Linear Pottery Culture and show that unbiased and frequency-dependent transmissions are not adequate descriptions of the observed data. Age-dependent transmission, however, is mostly consistent with the observed frequency changes.

[49] *A Reexamination of the Terrestrial Animals Depicted on the Rock Art of Bangudae in Southern Korea: Problems of Animal Domestication and Chronology*

Many aquatic and terrestrial animals such as whales, sea lions and turtles, tigers, wild cats, deer, boars, and weasels were identified on the rock art of Bangudae, located in the southeastern part of Korean peninsula. The scenes of human figures, whale hunting, boats, and net and fence huntings are also presented. Some Korean scholars have suggested that domesticated animals such as cow, horse, sheep, goat, pig, and dog appear in the rock art. This paper argues that domesticated animals do not exist on the rock art and its chronology is much earlier than the Bronze Age (ca. 300 B.C. – 100 A.D.).

Kansa, Sarah (AAI / Open Context)

[123] *DINAA and Bootstrapping Archaeology's Information Ecosystem*

Data management is fundamental to the practice of archaeology in the 21st century. As such, archaeological data management requires wide engagement and capacity building across our discipline. Archaeological data management increasingly involves the choreography of diverse data, software, Web-based services, and communications channels deployed and curated by a host of

actors, ranging from individual researchers, to open source projects, libraries and archives, publishers, and commercial ventures. A major challenge centers on cultivating collaborative and synergistic approaches to working with digital data given the wide array of interests, players, and institutions involved. This poster presents the Digital Index of North American Archaeology (DINAA), a project that can help catalyze Web-scale collaboration in using data to understand the prehistory of North America. The project emphasizes Linked Open Data (LOD) strategies to publish governmentally-produced site file data without revealing site coordinates and other sensitive information. DINAA is an Internet index for archaeological concepts of culture histories, site types, diagnostic materials, investigation strategies, and important attributes. The poster illustrates how DINAA is starting to be used as an investigative tool and a tool to help cross-reference relevant data curated by researchers and institutions across the Web.

[200] *Academic Freedom, Data, and Job Performance in the Panopticon*

This paper explores the challenges in recognizing and rewarding greater openness and collaboration in archaeology, given neoliberal institutional realities. After years of advocacy, governments and major granting foundations have embraced many elements of the open science reform agenda. The White House recently made open access and open data in research a policy goal, and it is exploring other policies to promote “reproducibility” in federally-funded research, including archaeology. Despite open science’s success in entering the mainstream, the outlook for enacting meaningful improvements in practice remains far from certain. Archaeologists, like most scholars, face both tremendous competitive pressures and increasing time constraints on their research. It is a great irony that “data” in the form of normative publication performance metrics, dissuades many from sharing their own data. This paper explores how Taylorism, especially performance metrics, helps shape the published archaeological record. New policy requirements, including Data Management Plans, the growing prominence of new Web-based “Alt-Metrics”, and emerging Linked Open Data technologies will further expand the scope of performance monitoring. Open science and digital humanities advocates have struggled for recognition and autonomy to pursue their research goals. How will we encourage greater academic freedom and avoid further entrenching workplace surveillance?

[398] *Producing Pottery in a Province of the Hittite Empire*

The Hittite Empire seized control of Cilicia, corresponding with the present-day states of Mersin and Adana in the Republic of Turkey, in the latter half of the second millennium B.C.E. While this region was under imperial rule, Hittite-style pottery became the most common ceramic type. Geochemical analysis of the pottery from Tarsus-Gözlükule, an urban center within Hittite Cilicia, indicates that the Hittite-style pottery was locally produced. At the same time, alternative ceramic types are found alongside the Hittite-style pottery. These alternative types developed from Cilician traditions pre-dating the Hittite conquest and were made using the same raw materials as the Hittite-style pottery. The aim of this paper is to explore how pottery production was organized within the community of Tarsus-Gözlükule and to examine what this organization can say about the relationship that

developed between imperial and provincial actors. Ultimately, this paper will use the production of pottery as a means of speaking to the complex, inter-societal nature of empire.

[392] *49ers and Firm Foundations: A Short Archaeological History of San Francisco's Civic Center*

As part of the work undertaken as part of the rehabilitation of the historic Federal Office Building at 50 United Nations Plaza in San Francisco, the US General Services Administration uncovered some of the remaining foundations for San Francisco's old City Hall, which was destroyed in the earthquake of 1906. These foundations represent the easternmost extent of the city hall, which had not been previously documented. Previous work on the rehabilitation project had turned up artifacts that originated from another chapter in the site's history, when the civic center area of San Francisco served as the main burial ground for the city, Yerba Buena Cemetery. In this paper I will explore the archaeological history of this small but important part of San Francisco, the artifacts that GSA has uncovered at the site of 50 United Nations Plaza, and the role that the federal government plays in preserving and maintaining these historic resources.

[292] *Stone Tool Use in Late Prehistoric and Historic Contexts in the Eastern Mediterranean Region*

In part because of their lack of plasticity (compared to ceramics, for example), lithics exhibited relatively little change over long periods of time. This rigidity of form also conferred great benefits on lithics. With some modification, various stones could make extremely useful implements for cutting, scraping, drilling, incising, and abrading, grinding, or crushing various materials, even when compared to tools provided by new technologies. Indeed, both flaked and ground stone tools persisted even as new materials and technologies were introduced because their relatively low cost and high durability provided substantial value and utility for people. Specifically, this study examines the continuation of lithic technology from the end of the prehistoric period (Bronze Age) into subsequent historical phases (Archaic, Classical, Roman, Byzantine) in the eastern Mediterranean and Near East. In some instances, such as with threshing sledges and the use of millstones to grind grains, the technology persisted well into the 20th century and was a significant part of the domestic and political economy. The concepts that underlie this technological persistence are strategic thinking and economizing behavior on the part of people in cultures past and present.

[356] *Micromorphology Reveals Changing Levels of Site Occupation Intensity at Pinnacle Point 5-6*

Using simultaneously fine and coarse resolution sedimentary studies of the deposits of the MSA site of PP5-6 at Pinnacle Point, Mossel Bay, South Africa, it was able to reveal different patterns of anthropogenic input and behavior and how these changed through time. Through the microfacies approach using micromorphology it was documented that the PP5-6 sequence shows occupations characterized by small groups and short visits during MIS5. This part of the sediments is dominated

by numerous single and mostly intact hearth structures in a roofspall-rich matrix. The sea was very close to the site and the people were focused on exploiting the rocky shores. With the beginning of the glacial conditions of MIS4, the occupation of the site becomes much more intense. This part of the sequence is characterized by the occurrence of thick palimpsests of burnt remains, sometimes disturbed by small-scale sedimentary gravity processes. As sea level dropped and the coastline retreated, the geogenic input shifted to predominately aeolian sediments implying an exposed shelf probably associated with a rich but more distant coastal environment. Since sites dating to MIS4 are abundant in the Cape, we suggest that populations during MIS4 responded to glacial conditions with population growth and technological change.

[218] *Heritage and Sustainable Tourism In Turkey: The Case Study of Aktopraklık*

This paper will present the Aktopraklık Cultural Heritage Management Project, which was established as a result of the archaeological evidence excavated from the prehistoric site of Aktopraklık in northwest Turkey. The project encompasses all aspects of archaeological heritage as well as heritage and sustainable tourism. The paper discusses public outreach and interactive engagement through reconstruction of the prehistoric life, ethnographic exhibits, and experimental areas together with the conservation and presentation of the archaeological site. As the archaeological excavation on the site is still ongoing, the paper will also scrutinize the question of sustainability through in regard to the local and regional economy. One of the main ideas is to integrate the Aktopraklık Project into the existing natural and cultural tourism both on the local, national and global level. With the reconstruction of a traditional village near the prehistoric mound, for which the wooden architecture of the surrounding mountain villages has been chosen the local and regional population has been actively engaged in this project. The aim is therefore to redirect the focus of urban tourism towards the surrounding natural environment and rural life, while providing sustainable tourism via educational information about ecology, archaeology, history and rural traditions.

[162] *The Complexity of (Un)charred Seeds: Unearthing the Taphonomic and Cultural Processes at a Stó:lō-Coast Salish Settlement in the Upper Fraser Valley*

Many archaeologists overlook the presence of uncharred archaeobotanicals, specifically seeds, within excavated cultural contexts. Frequently assemblages of uncharred seeds receive little analytic attention due to the difficulty of differentiating taphonomic variables associated with their presence, including soil moisture, pH, and insect activity. Further confounding this methodological quandary, it is often difficult to distinguish between the “cultural” and the “modern” seed rain recovered within archaeological samples. As a result, most assemblages of uncharred seeds are excluded from analyses, and their interpretive significance is seldom addressed. This poster addresses the above methodological issues through the investigation of archaeobotanicals from Welqámex, an island-based Stó:lō-Coast Salish settlement in the upper Fraser Valley of British Columbia. Focusing our analysis on residential architecture, we consider the taphonomic and cultural processes accounting for the presence of uncharred archaeobotanicals recovered from house floors, pit features, and roof layers. We argue that rigorous sampling procedures - systematic collection of samples beyond features and across vertical space – afford an opportunity to analytically distinguish between cultural and natural site formation processes. In turn, we demonstrate how both charred and uncharred seeds further our understanding of variation and the choices embedded in foodways and medicinal practices among Stó:lō-Coast Salish extended-family households.

Kassa, Sonja (Central Washington University), Anne Parfitt (Central Washington University) and Patrick McCutcheon (Central Washington University)

[91] *Selective Conditions for Obsidian Stone Tool Manufacture and Use in Central Washington State*

The presence of obsidian in chipped stone tool assemblages in central Washington State is well known. Local, low quality obsidian sources have been documented occurring in conjunction with more commonly found nonlocal, high quality obsidian sources. Though the archaeological occurrence of obsidian is well documented in this area, a systematic study of the organization of technology using evolutionary archaeological approaches can help clarify how obsidian was selected and incorporated into stone tool industries. Recent x-ray fluorescence sourcing, paradigmatic lithic analysis, and statistical comparisons of obsidian frequencies from central Washington sites reveal patterns different from those noted in previous studies in the Pacific Northwest. First, source diversity varies through time, rather than decreases. Second, lithic attributes typically associated with local, low quality obsidian also occur on non-local, high quality obsidian. Third, obsidian frequencies do not follow a monotonic decay curve, where increased source to site distances should result in decreased source frequencies. These patterns demonstrate that understanding obsidian occurrence in central Washington is complex and best approached using evolutionary archaeology where scientific explanations for the observed obsidian lithic variation are possible.

Kassabaum, Megan (University of Pennsylvania)

[289] *The Importance of the Center: Exploring Circular Spaces in the Lower Mississippi Valley*

The mound-and-plaza complex is a hallmark of late prehistoric sites in the Lower Mississippi Valley. While these mounds and the spaces between them have been the focus of much productive research, many mound-and-plaza centers began as circular or oval-shaped middens and only later incorporated mounds. Moreover, sites organized around central "empty" spaces are common starting in the Archaic period. I argue that by examining these earlier and less frequently studied examples of "plazas," we can increase our understanding of how later mound-and-plaza centers are used and specifically, their functions as gathering places and locations of communal ritual activity.

[90] *Addressing Anthropogenic Safety Concerns in the Archaeological Workplace: A Case Study*

The changing nature of contract and academic archaeology has led to new safety challenges that cannot be addressed simply through adherence to OSHA regulations. In this paper we move beyond the still-relevant environmental safety challenges that were the focus of earlier work on archaeology and workplace safety, and examine anthropogenic safety issues that can commonly arise during fieldwork. We address issues such as potential theft, assault, harassment, uncontrolled animals, as well as the witnessing of crimes and other human-made safety challenges, and look at how other industries have responded to similar issues. We then introduce a recent long-term, large-scale urban architectural survey as a case study in how archaeologists can proactively respond to these challenges. Lastly, we argue that these challenges need to be explicitly addressed by employers within the archaeological sector, and that field safety manuals should be updated frequently as to enhance archaeologists' ability to participate in the Section 106 process and to effectively conduct research in a safe and efficient manner.

Katz, Sandra (University of Pittsburgh) and Kathleen Allen (University of Pittsburgh)

[109] *Stone Tool-Making at Two Sixteenth Century Cayuga Sites*

Cowan's (1999, 2003) research on small Iroquoian camp sites in New York State demonstrated that analyses of stone tools and debitage assemblages enable archaeologists to investigate which type of stone tool industry was emphasized at a site (core flaking versus biface reduction) and to draw

inferences about site function. This study illustrates the broader applicability of Cowan's approach for conducting micro-scalar analyses of technological organization. We compared debitage assemblages from one house at each of two 16th-century Cayuga sites in NY State, Parker Farm and Carman. Our analyses revealed a combination of core flaking and biface reduction within both houses, thereby indicating at least seasonal occupation and longer term use. Comparison of flake attributes from different areas within the structures showed more evidence of core flaking and/or early-stage biface reduction in the vestibule areas, and more evidence of late-stage reduction within family compartments. This finding suggests that task sequencing of tool production might have taken place inside these houses. Overall, this study demonstrates that coupling flake attribute analysis with typologically-based approaches to tool production (e.g., core flaking versus biface reduction) and site function can enhance our understanding of site role and the organization of stone tool production within Iroquoian households.

Katz, Jared (University of California, Riverside)

[133] *Music in the Court: An Analysis of the Status of Musicians in the Maya Court*

Just as there was a formal class of scribes in Maya courts, there was also a class of formal musicians. This paper will focus primarily on analyzing the position and social status held by musicians in the Classic Maya area. To begin, the paper will discuss musicians as a formal class within the Maya courts. Musicians are frequently depicted in iconographic portrayals of political events, and based on the garb they are shown wearing, it appears they formed cohesive groups. By analyzing the role of musicians in the court setting, we can gain a more complete understanding of both the composition and structure of Classic Maya courts, as well as the role of formal musical groups. Next, the paper will examine how other elites engaged with music. For example, several elite women were interred with musical artifacts; however, there are no depictions of women playing music at elite settings, demonstrating the gendered aspect of music. Music was widespread throughout the Maya court, and by analyzing both formal musicians, as well as other elites who played music, we can better understand the differences between those categories in order to see the role music occupied in the lives of the elite.

[89] *Behavioral Metallurgy of the Phoenicians, Carthaginians, and Neo-Punic Peoples*

Some cultures do not just adopt or develop innovative technologies, but actually define themselves based on their technological acumen. The Phoenicians were such a culture, whose economic reliance on metallurgical and maritime knowledge went further in defining their long-term communal cohesion than did other factors. Lacking historical texts written by Phoenicians, it is only through archaeology and archaeometric analyses that such a resource-based ideology can be reconstructed. Compositional and microstructural characterization using pXRF, XRD, VPSEM-EDS and metallography demonstrates that various Phoenician groups—from Tyrians to Carthaginians to Neo-Punic Roman subjects—manipulated a wide range of metallurgical techniques in order to preserve political autonomy, dominate trade in tin and precious metals, expand militarily, and subsist as colonial subjects. Metallurgical remains of ferrous and non-ferrous forging, smithing, and melting activities from three sites spanning roughly 1400 years are analyzed and interpreted through the lens of an identity based in technological achievement.

Kawano, Masanori (Meiji University)

[145] *Spread of Digging Tools and the Social Change in Kofun Period Japan*

This paper discusses an aspect of the social change that took place in Kofun Period western Japan as a result of evolution of digging tools. The iron blades of such digging tools changes from rectangular plates with bent edges to U-shaped edges in the fifth century A.D. This change was not merely morphological but technological as well. Background to this change was the introduction of highly advanced smithing technique from the Korean peninsula. This technological innovation diffused to all over western Japan in the following sixth century, which facilitated large-scale construction works, including irrigation system, and consequently resulted in the increase in productivity of wet rice agriculture. Behind this rapid spread of new technology was, I argue, the strategy of the central Yamato polity wanting to gain more direct control over local regions.

Kay, Marvin (University of Arkansas)

[74] *Breckenridge Shelter, Arkansas and the Younger Dryas*

In 2012 renewed excavations by Arkansas Archeological Survey personnel re-exposed 1960s test units of up to 3m thickness to further evaluate the unusually deep deposit and its stratigraphy; and to collect sediment, associated artifacts, and radiocarbon samples. Compared to Rodgers Shelter and Big Eddy, two well-dated alluvial archaeological sites in the western Ozark Highland of Missouri, Breckenridge Shelter is clearly of similar antiquity but represents a high hill slope setting within the White River drainage. Basal Breckenridge Shelter likely defines a Younger Dryas encampment, or encampments, by people who used two discrete technological systems--Dalton and Packard—that reflect the last of fluted and western stemmed point traditions in North America.

[7] *Geospatial Analysis of Areal (Polygonal) Units: Applications at the Site Level in Neolithic Cyprus*

For the first time in the age of GIS, there is a growing resurgence of interest in intra-site level spatial analysis. Many studies focusing on the application of GIS technology to site level phenomena focus, either explicitly or implicitly, on the analysis of fine resolution datasets. Realistically, however, few archaeological data are recorded as sub-centimeter points. The majority of archaeological data tends to be recorded at the resolution of the 1x1 or 2x2 meter excavation unit. These data are best considered as areal units; however, doing so presents a number of problems both technically and statistically. This poster will present results of the recent application of GIS-based intra-site spatial analysis using areal units to the pre-2014 chipped stone assemblage of 'Ais Giorkis, Cyprus. 'Ais Giorkis is an Early Aceramic Neolithic site (c. 9.5 kya) located in the western foothills of Cyprus' Troodos Mountains that has produced a chipped stone assemblage exceeding 250,000 pieces. This assemblage was recorded at a variable resolution, generally lower than 2x2 meters making it an excellent test case for lower resolution applications of GIS-based spatial analysis. This poster demonstrates several successfully answered questions using areal data at the site level.

Kealhofer, Lisa, Judith Field (University of New South Wales) and Adelle Coster (University of New South Wales)

[186] *Phytoliths and the Development of Agriculture*

Investigations of rainforest archaeological sites from the Koombaloomba Dam environs in the NE Queensland Wet Tropics, have established a human presence here since the early Holocene (Cosgrove et al. 2007). These open sites have yielded abundant archaeological finds including excellent preservation of plant macro-remains in the form of wood charcoal and the carbonized shells of some toxic starchy economic plant species including *Beilschmiedia bancroftii*, the Yellow Walnut. Examination of the microfossil record from soils collected during excavation at Urumbal Pocket (a Eucalyptus pocket within the rainforest) and Goddard Creek (rainforest) has revealed an in situ record of phytoliths and, through part of these sequences, starch remains. The Urumbal Pocket excavations also yielded a small grindstone fragment from which starch grains were recovered. This paper presents the compiled phytolith and starch data and discusses the possible interpretation of

site use and change through time as reflected in the plant microfossil record. Using recently developed analytical techniques for the analysis of starch we will explore the quantitative identification of starch to genera, and possibly species.

[105] *No Man or Woman is an Island Revisited: The Social Construction of Small Island Space*
The construction of space usually begins with the georeferencing of physical boundaries. As such, space becomes an external container that affects the structure of its contents. This paper explores the construction of space from the perspective of the individual. It begins by recognizing the minimal distance of face-to-face interactions and expands outward from there. The first step is to reject three-dimensional space and to situate the individual in an n-dimensional space. Production, consumption, procreation, mobility, exchange, and ritual are some of the common categories used to express dimensionality, but they tend to be investigated as cause-effect relationships. Yet these dimensions share more in common with clouds than they do terra firma. In practice, space is expressed in the creation of covalent and ionic bonds that define the social being, which is materialized through diverse expressions. Expressions of an infinite volume in a finite space. Archaeological examples from The Bahamas and Turks & Caicos Islands are used to examine social spaces on small islands.

Keener, Nichole

[12] *Hanna's Town Unbuttoned: An Archaeological Study of Clothing Adornment and Fasteners*
Of the three basic necessities humans need to survive – food, clothing, and shelter – clothing is often underrepresented archaeologically as fibers do not typically survive due to environmental challenges. Although often under-analyzed, these small commonly-found artifacts are valuable parts of the archaeological record. Through decorative and utilitarian buttons and fasteners, patterns can be identified to address questions regarding daily life during an occupation of a site. Patterns in the archaeological record reflect the way that people of a community portrayed themselves. One such community is Hanna's Town. Hanna's Town was an important center during the Revolutionary War, acting as both the original county seat of Westmoreland County, Pennsylvania, and one of the first North American communities to declare its independence from Britain. Although diversity of Hanna's Town's residents is not fully realized, the history and site continue to hold meaning to the local community today. Analysis of the button and buckle collection from Hanna's Town offers a unique glimpse into lives of historically silent members of this community, which helps relate its story to future generations.

Kehoe, Alice (University of Wisconsin-Milwaukee)

[340] *Introduction: Evidence-Based Practice versus Ivory Tower Careers*
As contract firms have become employers for the majority of archaeologists, evidence-based practice is demanded. Universities have responded by creating contract programs separate from traditional doctoral tracks. Some glorify theory construction, some others—where some of our presenters are affiliated—are responding to mandated public involvement by encouraging faculty and students to seek to work with local and descendant communities. Action archaeology, Kleindienst and Watson called it in 1956, when they were grad students in Sol Tax's department in Chicago. Theory, that is, hypotheses and interpretations, gets tested not in laboratory-like controlled projects but in confrontation with stakeholders, descendants, and not least, all the data a site vouchsafes. Archaeologists who have engaged with communities, particularly non-Western societies, often find inference to the best explanation greatly expanded and enriched by premises and experiences outside Western Enlightenment tradition. This broadened interpretive base reflects the postcolonial standpoint. We believe the YouTube video mocking the best-known theorists is a sign that the hollow Sound of Theory can no longer command all academic programs, much less

most practicing archaeologists. The musics of many folk sound instead.

[232] *Analysis of In-tact Mummy Bundles from the 2014 Field Season at Panquilma*

The Ychma site at Panquilma, dates from the 13th to 15th centuries, and lies in the Lurin Valley of central coastal Peru. The site provides an interesting case study for the development of ideologies, specifically mortuary rituals, due to the close proximity and the relationship the Ychma community maintained with the important Andean religious center of Pachacamac. Significantly, during excavations in the 2014 field season, two intact mummy bundles were found at the site. One was of an adult, found in the domestic sector and the other was of an infant, found in the funerary sector. It is the goal of this paper to describe and interpret the analysis of these bundles in order to contribute to the ideological dialogue of Yschma mortuary rituals.

[203] *Life at Achanchi: A High Altitude Chanka Burial Site from the Andahuaylas Region of Southern Peru*

Recent archaeological research from a high elevation (4,000 m asl) hilltop site in the Andahuaylas region of southern Peru offer new data to illuminate aspects of life and social organization within the Chanka society that lived during the tumultuous Late Intermediate Period (A.D. 1000-1400). In contrast to the machay (or cave) burials typical of this time period, an intramural burial site excavated from the ridgetop site of Achanchi may offer another perspective on this localized polity. This highly fragmented and commingled burial assemblage contains the remains of roughly 40 individuals associated with several burial goods, including a copper bracelet, nine ceramic vessels, and five human rib "trophies." Preliminary skeletal analysis suggests that raiding-style violence and infectious disease were features in this community that would have impacted quotidian lifeways. Furthermore, preliminary non-metric data suggests some individuals may be genetically related. This burial could thus represent a small social unit or extended kin grouping. Finally, the appearance of multiple types of cranial vault modification may suggest some degree of socio-ethnic integration within Achanchi during a time of heightened environmental and political stress and balkanization.

[243] *A Predictive Model for Submerged Prehistoric Sites, Northern New England and Canadian Maritimes*

Predictive models to address site location and preservation of submerged cultural resources have improved with growing societal interest in the nearshore. While some commonalities exist and are broadly applicable, working at a local scale requires an understanding of regional geology, geomorphology and sea level history, and the dynamic landscape processes that acted in the region through time. Along the Atlantic coast of Northern New England and the Maritime Provinces of Canada, varying bedrock and surficial geology, combined with complex postglacial sea level changes have created areas of high preservation potential and regions where only isolated, out of context artifacts are likely to remain. Our study of the archaeological preservation potential of the Bass Harbor and Green Ledges areas of the Maine coast illustrate the factors that lead to site formation and preservation in this region: abundant surficial materials available for reworking by waves to form productive terrestrial environments attractive to human use, occasional slow rates of sea-level change, and shelter by islands and shoals from open-ocean waves. While focused on the Maine and the Canadian Maritimes, this model is useful as a starting point for other glaciated regions

that have experienced both marine transgression and regression.

Kelley, Krystle (Texas Tech University)

[263] *Establishing the Acropolis: Two Seasons of Excavation at Chan Chich*

Open plaza spaces are a commonality among Maya sites. Excavating through the sealed contexts of these plaza surfaces can yield reliable data on the construction history of the site and how the space may have changed over time. This paper details the results from two seasons of excavations, which took place in May-June of 2012 and 2013 at the Maya site of Chan Chich in Northwestern Belize. Our investigations focused on the Upper Plaza, located at the acropolis of the site. Our investigations uncovered buried architecture below the plaza surface, as well as a series of plaster and compact dirt surfaces, a problematic deposit, a midden, and a burial that included human and canine remains.

[304] *Evaluating Multi-Sector Supply and Demand on Canal System 2 as a Component of a Complementary Hohokam Economy*

As one of the largest canal systems in the Phoenix Basin, Canal System 2 likely served as the economic, social, and political center of life for thousands of people residing on the north side of the Salt River. Canal System 2 capitalized on a fortuitous geographic location that permitted irrigation systems and associated fields to extend miles from the river. Despite the large size of the canal infrastructure, the low population density relative to the size of the system indicates that local residents may have invested more time in building, maintaining, and using irrigation networks than their nearby counterparts. This paper explores how high labor investments in irrigation agriculture by the residents of Canal System 2 may have contributed to demand for goods produced by specialists. Specialists located in areas less optimal for irrigation agriculture may have supplied goods to the residents of Canal System 2. The analysis evaluates the emergence of a Hohokam economy that relied on complementary exchange of agricultural and craft products by producers and consumers located in different areas of the Phoenix Basin.

[311] *"The City's gone—Nought...Remaining to Disclose the Site of this Forgotten Babylon:" Ephemeral Architecture and Identity at Black Rock City. (Apologies to Horace Smith; "Ozymandias")*

The temporary (at least physically) community of Black Rock City, which is constituted for one week each year in the Nevada desert at the Burning Man festival, is made up of hundreds of camps. Many of these camps create architecture, or create reference to architectural style and history, that helps cement a sense of identity to that particular camp. The architectural referents are generally not obscure, as they are intended to be read by both camp members and others who are not members of the camps but pass by in the process of interacting with fellow citizens of Black Rock City. By looking at the choices that are made in creating architectural stages, such as that at the Black Rock French Quarter among others, I explore the ways in which a sense of place is created that references both real and imagined localities.

Kelsoe, Camilla (University of Pittsburgh)

[283] *A Tale of Two Towns: Demographic and Economic Change in Two Middle Yangzi Communities*

The late Neolithic marked the emergence of a new kind of settlement pattern in the middle Yangzi river valley. During this period, large, tightly nucleated communities, many of which were surrounded by moats or walls, rapidly replaced the dispersed hamlets and small villages of the middle Neolithic. This dramatic transition in settlement organization may have been associated with significant changes in social and economic relations between individuals both within and between settlements. To address these possibilities, and their potential implications for the evolution of complex societies more generally, we compare the results of a full-coverage regional survey and a geochemical study of local utilitarian pottery. Our analysis indicates that demographic and economic change within these communities occurred at very different rates.

[229] *Archaeological Implications of Vegetation Shifts in the Northern Chihuahuan Desert*

Modern climate and ecological data from the Northern Chihuahuan Desert suggests that precipitation is temporally and spatially localized leading to pulses of plant production. Regional paleo-environmental models have been developed that focus on large temporal and spatial scales. These scales obscure short-term human adaptation within this region. We present a study of stable carbon and nitrogen isotopes of bone collagen from leporids that can provide a high-resolution proxy for aspects of the region's paleoecology. Cottontails and jackrabbits have a generalized feeding strategy, restricted home range, and short lives. As such, their diet, and their collagen, likely reflect local vegetation regimes at short (ca. 2 year) temporal scales. Focusing on carbon as an indicator of vegetation types and nitrogen as an indicator of aridity, 33 modern and 212 prehistoric (A.D. 600 to A.D. 1350) leporid specimens from 10 archaeological sites were analyzed. Our results show a dramatic shift in vegetation and an increase in climate variability over time that can be used to develop high-resolution models of prehistoric human adaptation within arid settings.

Kemp, Dylan (University of Montana), Kelly Dixon (University of Montana) and Nikki Manning (University of Montana)

[311] *Urban Landscapes: Social, Cultural, and Ecological Heritage*

Urban locations have an entire component of the landscape that is often overlooked: historic underground spaces. Not to be confused with the underground art and culture scene that occurs in a thriving, modern city, the historic underground can provide insight into a city's past social, cultural, and ecological heritage. Because this particular part of the landscape is often neglected in anthropological research, there are not a lot of resources available to understand the historic uses of these urban spaces. There is a common phrase, "build it from the ground up," yet there is a lot to be learned by modifying that to "build it from the ground, above and below." During 2012-2014, a study was conducted in Missoula, Montana, to investigate subterranean archaeological features including

steam tunnels, sidewalk voids, and city basement spaces to determine if the socio-cultural, economic, and cultural heritage of that city could be detected in the archaeological record. This project seeks to build upon that work by employing tried and true archaeological survey and historical research, but also newer, modern archaeological tools such as Geographical Information Systems and ground penetrating radar technology for a more detailed spatial analysis of historic urban design and urban ecosystem transformation.

Kendall, Heather (Simon Fraser University)

[185] *Chert Characterization and Provenance in the mid-Fraser Region of British Columbia*

Globally, chert is the most common rock material found in archaeological contexts. Its prevalence on the Earth's surface in Quaternary deposits and relative abundance in archaeological contexts indicate that it was an important resource material for ancient populations and, as such, can provide information about toolstone exploitation in prehistory. The results of this research suggest a local origin for the chert artifacts recovered from ST 109 at the Keatley Creek site (EeRI-7) in the mid-Fraser region of south-central British Columbia, but also to a remote origin for the toolstone deposits found within the study area. Elemental characterization suggests that although the chert deposits in the study area are geographically separate, they are likely derived from a larger parent chert source, redeposited in the mid-Fraser region by glacial activity prior to human occupation of the area. This thesis also demonstrates through the application of the Keatley Creek Lithic Typology that the visible properties of color and texture are not a reliable means for discerning the provenance of chert artifacts.

Kendrick, James

[29] *Recent Archaeological Studies in National Parks of the Northeast Region*

The Northeast Region of the NPS extends from Saint Croix Island on the Maine-New Brunswick border to Booker T. Washington National Monument in Virginia, and from Cape Cod National Seashore to New River Gorge in West Virginia. The national parks of this region contain the archaeological signatures of presidents, poets, war, human rights struggles, maritime history, industrial history, and thousands of years of American Indian heritage. This paper discusses recent archaeological studies in the national parks of this region. These studies range from baseline documentation efforts to inventories of areas threatened by climate change. Recent archaeological overviews are discussed, with those at Petersburg and Richmond National Battlefields highlighted. Several geophysical investigations have recently been conducted, and those at Longfellow National Historical Site and Booker T. Washington National Monument are reviewed. Recent inventories are presented, and those at Cedar Creek and Minute Man National Historical Parks are discussed. A progress report is given of the National Constitution Center project in Philadelphia, one of the largest excavations conducted within a national park. Attention is brought to sites threatened and damaged by climate change, with specific mention of sites at Cape Cod, Saint Croix Island, and Colonial National Historical Park.

Kennedy, John (SWCA Environmental Consultants)

[12] *Metal Projectile Points of the Interior West: A Synthetic Overview*

Metal projectile points of the Protohistoric and early Historic periods are a somewhat rare, yet ubiquitous artifact type that has received little attention regarding synthetic research. Their roughly 300 years of use across the interior west coincided with perhaps the most profound and rapid culture changes experienced by native groups of North America during the entirety of their prehistory and history. A survey of 14 states across the interior west is currently underway to gather data on all available metal projectile points. Current numbers from this ongoing data collection effort are presented along with preliminary results and goals for future research.

Kennedy, Ryan (Indiana University)

[45] *Plants, Animals, and Food Choice Within the Market Street Chinatown, San Jose, California*

The Market Street Chinatown was a major urban Chinese community in nineteenth century San

Jose, California. From 1866 to 1887, the community housed and served as a home base to several thousand Chinese residents and laborers. Excavated in the 1980s, the Market Street Chinatown yielded an incredibly rich collection of material culture as well as faunal and floral remains. This paper examines food consumption and food choice amongst Market Street's nineteenth century Chinese residents. The author draws upon botanical data from the site as well as recently collected faunal data. Ultimately, the data show that Market Street's residents utilized a combination of traditional and local plants and animals to construct their diet. This combination of both the familiar and the unfamiliar typifies Chinese dietary strategies in the United States. This paper ultimately explores how Chinese dietary flexibility with both plants and animals played out in the Market Street Chinatown.

[334] *Past and Present Human Response to Drought in the American West*

Multi-year droughts in the American west have major impacts on water resources and agricultural systems that sustain growing populations. Environmental engineering projects (e.g., California Aqueduct or Hoover Dam) were designed within the context of instrumental climate records and historical knowledge of the last century. Archaeological and climatological records now provide a longer-term perspective on the severity and longevity of droughts and the impact of these droughts on human populations. Paleoclimatological records for the last 2,000 years indicate that the multi-year droughts of concern today are modest compared to medieval droughts between A.D. 900 and 1300. Lessons embedded in the archaeological record of this interval provide context for managing water in the American west going into the future.

[31] *Investigations of Nasca-Wari Interaction and Imperial Expansion during the Middle Horizon: A View from the Las Trancas Valley, Nasca, Peru*

During the Middle Horizon (A.D. 750-1000) the Wari Empire established at least three colonies (Pacheco, Pataraya, and Inkawasi) in the Nasca Valley and its tributaries. Archaeological survey of the Southern Nasca Region conducted by Katharina Schreiber and students in previous decades observed dramatic changes to the local settlement patterns during this period (Edwards 2010, Schreiber 1999). The number and size of habitation sites in the Nasca and Taruga Valleys decreased but increased in the Las Trancas Valley, away from and perhaps in contention with the Wari. Sites in these valleys were established in more defensible locations. In addition, sites in Las Trancas formed a four-tiered site hierarchy in Las Trancas with Huaca del Loro as an administrative and ceremonial hub, a second-tier center (Zorropata), and smaller villages and hamlets (Schreiber 2005). The present research investigates the potential impact of Wari encroachment on the various economic, social, political, and quotidian practices of Nasca peoples living at the site of Zorropata in the Las Trancas Valley. This paper presents some of the preliminary findings of recently completed archaeological fieldwork and laboratory analysis at this site.

Kerdsap, Puangtip [49] see Yankowski, Andrea

Kerdsap, Puangtip**[407]** *Environmental Archaeology of Spinning, Weaving and Dyeing in Ancient Thailand*

This paper will address the question of “what impact would cultivation, and possible domestication, of native and introduced fiber plants have on the local environment and people’s lives in prehistoric Thailand?” This study begins by considering artifacts such as spindle whorls but will also discuss evidence of fiber plants. How many are native? Where do the introduced species come from and when do they first appear in Thailand? In addition to the cultivation of fiber plants, it is noted that other environmental impacts would result from subsequent processing, including dyeing and weaving. I argue that when considering the implications of agriculture, archaeologists often concentrate on the obvious crops (rice & millet for example), however, plant (and animal) products have clearly been important for reasons beyond subsistence. Thus, the larger aim of this paper is to broaden the conversation about human-environment relationships beyond subsistence practices to a wider social and cultural context. This paper will consider evidence from the site of Ban Non Wat (c. 4000-1000 BP) in Northeast Thailand initially, but also consider evidence from across Southeast Asia.

Kerry, Sagebiel [147] see Haines, Helen

Kersel, Morag (DePaul University)**[409]** *Landscapes of the Dead: Mapping, Survey, and Site Monitoring at Fīfa, Jordan*

Birds’ eye views of archaeological sites and landscapes provide excellent vantage points for our understanding of the past. Images from archives, balloons, drones, kites, poles, and satellites are changing the ways in which we carry out archaeological investigations. In cooperation with the Jordanian Department of Antiquities under the umbrella project of Follow the Pots, the Landscapes of the Dead Research Project is using Unmanned Aerial Vehicles (UAVs, ‘drones’) to monitor archaeological site looting at the Early Bronze Age site of Fīfa in Jordan. Drones, both fixed and rotary wing, are being deployed as part of a 5-year study of the scale and pace of looting at the site. By constructing high-resolution digital elevation models (DEMs) across multiple years, we are able to both map the site and identify new looting events from year to year. This change-over-time data, in conjunction with pedestrian surveys and ethnographic interviews, is particularly valuable for identifying looting events in an already heavily disturbed site. Unfortunately findings from the first two years of the project document significant, on-going damage. These early outcomes are currently being used to develop site protection strategies and local community outreach programs to protect the cultural heritage of this landscape.

[279] *Discussant***Kessler, Nicholas (University of Arizona)****[311]** *Documenting the Legendary 1844 Flood from a Kaw Village in the Kansas River Valley*

Geoarchaeological fieldwork has documented an alluvial deposit associated with a flood event which overtopped a relatively high terrace in the Kansas River Valley near present day Topeka, Kansas. The deposit, defined as an overwash phase, exhibits structures indicative of flowing water. The overwash phase’s position, overlying a historic Kaw Village, corroborates second hand historic accounts which date its origin to a flood in the year A.D. 1844. This flood event probably resulted in the rapid abandonment of the village and thus presents archaeologists with a “strong case” for reconstructing the systematic context of this village. This fact is significant because of the paucity of well-preserved stratigraphically defined contexts for early historic period sites. These findings are also notable as they provide a geologic marker recording the height of this legendary flood event.

Keyser, James (US Forest Service-Retired)**[353]** *The Hunter's Revenge: Magical Use of a Petroglyph*

A petroglyph panel at 48SW85 in southwestern Wyoming presents a convincing case for the use of rock art imagery in hunting magic rituals. Based on differential weathering and revarnishing of the

petroglyphs, different stylistic signatures of artists carving various animals and humans, and key superimpositions, the panel can be confidently identified as the product of at least half a dozen artists reusing the site for more than a century, and possibly much longer. The panel's basic structure shows a communal big game hunt whose components show a corral (that incorporates the panel's natural surface features), several animals, and several humans in different roles as participants.

Khaksar, Somayeh and Grant McCall (Tulane university)

[53] *Delazian: An Open-Air Upper Paleolithic Site in Central Iran*

Most Paleolithic research in Iran has been focused on the caves and rock shelters of Zagros Mountains. Only in recent years has this focus shifted to other parts of the country, leading to the discovery and study of additional Paleolithic sites. Delazian is one such newly-discovered site with an assemblage of lithic artifacts indicating the presence of Paleolithic societies in central Iran during more hospitable periods of climate. In 2009, a systematic survey was conducted at this arid open-air site, which recovered an assemblage of 1344 artifacts. In this poster, we present a techno-typological analysis of this assemblage showing that Delazian was probably used as a residential camp at which tool production occurred as part of daily activities. We also find a general lack of evidence for the intensive reduction cores, which we consider to be a sign of easy access to local lithic raw materials. This conclusion is also supported by the presence of many unused blanks in the assemblage. This flake-based assemblage is characterized by the presence of some tool types common to the Upper Paleolithic and Epi-Paleolithic periods but the small sample size prohibits a definitive assignment to one particular time period.

Khalidi, Lamya (CNRS - Archéorient - University of Lyon 2), Clément Ménard (TRACES - University of Toulouse), Bernard Gratuze (CNRS - IRAMAT - University of Orléans), Amélie Diaz (University Paul Valéry Montpellier III) and Edward Keall (University of Toronto - Royal Ontario Museum)

[401] *Obsidian Value and Exchange in the Southern Red Sea Region and Its Role in the Establishment of Prehistoric Complex Societies: New Data from South Arabia and the African Horn*

The Red Sea is renowned as a locus of maritime activity during the early historic periods. As a result of systematic obsidian analyses of sources and artifacts, maritime interaction in South Arabia can now be traced back to the beginning of the Neolithic period. Its increased intensity is echoed in the cultural sphere that eventually formed on opposing shores of the two continents by at least the third millennium B.C. New geochemical, archaeological, and technological data from South Arabia, Ethiopia and Djibouti illustrate the current state of research on Afro-Arabian prehistoric interactions, highlighting variabilities and relationships between two mirroring regions either bound or separated by the Red Sea. While major chronological gaps remain regarding the transition from the LSA to the Neolithic, the study of lithic and faunal material from several sites allows us to note major technological and subsistence shifts that occurred independently in each region, but also early links, such as maritime interaction, that may have affected the nature of the process of neolithization. Finally, we discuss obsidian circulation in light of elements of cultural convergence that make up the Red Sea cultural sphere and that occur sometime in the late 4th millennium B.C.

Khatchadourian, Lori (Cornell University) and Ian Lindsay (Purdue University)

[285] *The Fortress Refigured: Authority and Community in the South Caucasus (ca. 1500-300 B.C.)*

In many world regions, the mountain fortress has long stood as little more than a practical instrument of institutionalized force. Such reductionism obscures more than it reveals, for fortresses are equally salient as projects of communal labor, mediators in the making of subjects and authorities, and objects of contestation, curation, and commemoration. In the South Caucasus, fortresses played a

crucial role in the reproduction of polities from the Late Bronze Age to the mid-first millennium B.C. Based on research in Armenia, this paper tracks the shifting role of the fortress in forging political associations from the earliest complex polities to the age of empires. For centuries, authorities of southern Caucasia relied upon fortresses and the range of esoteric and governmental practices they hosted to bind seasonably mobile communities in a shared sense of identity and obligation. However, with the collapse of the Urartian Empire, communities living under Persian rule brought about a transformation in the logics of political order. Opting out of a politics premised on steep social asymmetries, they recast this once pivotal apparatus of sovereignty into an object of ambivalence—at once indispensable to the reorganization of social life but also a focus of collective repudiation and redefinition.

Khreisheh, Nada (Emory University)

[33] *Learning to Think: Using Experimental Flintknapping to Interpret Prehistoric Cognition*

The analysis of stone tools has long been a technique used when addressing prehistoric cognition. While experimental studies have been used extensively as a tool that can give information on these technologies, these studies have often been short term and involved a small number of participants. This paper uses the examples of two longer term multi-disciplinary studies of experimental flintknapping, involving the teaching of early knapping technologies, to demonstrate the value of experimental archaeology in providing information that can be related to hominin cognition. In these studies volunteers without previous knapping experience were taught skills in some of the earliest known technologies with the aim that they would achieve expert levels of ability. Through careful mapping and assessment of skill level together with analysis of materials produced, a picture of learning in different technologies could be constructed. This information has been related to hominin cognition and the evolution of modern human brains and intelligence to build a picture of the different cognitive requirements of the technologies assessed. Analysis of materials allow this experimental work to be tied in with the archaeological record, indicating aspects of this that can be analyzed when seeking evidence of early hominin cognitive processes.

[24] *Great Expectations: Negotiating Community at Ucanha, Yucatán, Mexico*

Activities of all actors should be considered collectively given that communities were likely forged through a negotiation of needs and wants from the perspectives of rulers and subjects. Successful elite institutions would need to closely monitor these negotiations. If the needs of the general public were not met, elite institutions could be undermined. During the Terminal Preclassic, Ucanha, a secondary center connected to other monumental centers via an 18-km long causeway in the Northern Lowlands, experienced significant population growth and large-scale monumental construction, from mobilizing regional support. Ceramic and architectural evidence shows larger structures near the ceremonial center likely served as nodes that galvanized the community on a more intimate local scale, while monumental contexts integrated the community at large. The presence of an elite structure with pop motifs suggests the presence of formal rulership by the end of the Preclassic. By the Middle Classic, however, many houses were abandoned, and the hinterlands along the causeway experienced a florescence. Nonetheless, Late Classic monumental construction and residential reoccupation evidences that local elites were successful in coaxing people back to Ucanha. Tacking between elite and nonelite structures across time enables us to present a better picture of the social dynamics at Ucanha.

[288] *The Roots of the Modern Anthropocene: The Yellow River Valley, China, 5000-2000 BP*

Using geoarchaeological data I argue that human activity in the late Holocene transformed the environments of the Yellow River, China, into an anthropogenic landscape and that these changes altered China's history. Ancient China provides a critical case study for understanding how economic intensification, demographic change, technological innovation, and political centralization combine to create the roots of the modern Anthropocene. The Yellow River-- known as "China's Sorrow"—is seen as a natural scourge that afflicts the inhabitants of North China. However, when viewed over the long term, China's Sorrow is clearly the result of human manipulation of the environment. These data provide an archaeological perspective on contemporary transformations in China. Today, China is developing economically at a stunning pace; it is not clear that this rate of change is environmentally sustainable. Many of the environmental issues facing contemporary China, however, have been experienced in the past—albeit at a different scale—and it is instructive to understand how Chinese society has grappled with these issues and which approaches and strategies have been successful and which have failed.

[248] *Analysis of Faunal Material from Sacred Spaces at Agua Lluvia and along the Dos Hombres to Gran Cacao Archaeology Project in Northwestern Belize.*

This research focuses on the faunal material from the caves and sacred deposits at Agua Lluvia and along the Dos Hombres to Gran Cacao Archaeology Project in northwestern Belize. The analysis and interpretation of faunal material in caves can be problematic for zooarchaeologists. Unlike other archaeological features, caves have the added complexity of bioturbation, irregular stratigraphy, and inconsistent preservation. Similarly, faunal remains found within caves can easily be disregarded on the grounds that preservation conditions allow for invasive species to enter the archaeological record. This research bears these factors in mind while comparing the new data with existing cave faunal studies in Central America. Due to the quantity of jute (*pachychilus* spp.) found throughout the sites, special attention was paid to contexts in which the jute was discovered and how it was modified. This study also stresses the importance of analyzing species utilization through time, as well as spatial deposition on the sacred landscape to gain a better understanding of the exploitation of and reliance on ritual resources. Ultimately, the data reflects an assemblage that was not completely environmentally driven or accumulated by natural means. Rather, these assemblages demonstrate a purposeful deposition of faunal remains by human activity in a ritualized manner.

[360] *New Carbon-14 (14C) Dates on "Old" Cultural Components near Quartz Lake, Interior Alaska*

As part of the Quartz Lake/Shaw Creek Flats research initiative, excavations took place in 2014 at the Cook, Keystone Dune and Klein sites in the middle Tanana Valley, interior Alaska. Although these sites were previously tested, continued excavation was vital to expand the 14C chronology and enhance understanding of prehistoric subarctic foraging behavior and paleoecology. At the Klein site, our goal was to gather more geochronological information on a component previously dated ~3700-5100 cal. B.P. New excavations revealed additional datable cultural remains from this underrepresented period. Excavation at the Keystone Dune site (KDS) exposed a hearth and the first in situ artifacts and faunal remains (extinct elk [wapiti]) found at this locale, despite more than ten years of intensive inspection. The KDS remains are located on a soil dated to ~12,600 cal. B.P. Finally, Cook site excavations revealed a deeper component and older soils (thought to date to >9000 cal. B.P.). Closely associated animal bone and charcoal samples provide the initial 14C chronology for this deeper component. These findings add to a growing body of archaeological data in the region that dates back ~14,000 years, allowing for a refined chronology of human land use in this subarctic lowland setting.

[150] *New Investigations into a Late Paleoindian Bison Kill and Terminal Pleistocene Environmental Change at Blackwater Draw Locality 1*

Intensive investigation of an area of Blackwater Draw Locality 1 known as "Isequilla's Pit" has revealed a well-preserved stratigraphic sequence and the remains of a Late Paleoindian bison kill. The work constitutes a resumption of excavation in this area of the South Bank. Alberto Isequilla abruptly abandoned his fieldwork in 1969, leaving behind an open excavation pit and few field records. Over the past 6 years, the ENMU Archaeological Field School has successfully relocated and mapped Alberto Isequilla's excavation grid and carried out excavations of Unit E (Carbonaceous silt/Late Paleoindian) and Unit D (Diatomite/Folsom) sediments. Both stratigraphic units contain faunal remains and sparse cultural material, but the concentration of bison remains in Unit E appears to represent a portion of an extensive Late Paleoindian (presumably Cody) bison kill. Paleoenvironmental investigations indicate that this kill was made near the outlet channel of a prehistoric body of water that was in transition from a Younger Dryas-age freshwater pond to an increasingly alkaline early Holocene marsh. This paper presents the results of an integrated series of archaeological, faunal, geomorphic, and paleoenvironmental investigations, and attempts to shed additional light on a relatively poorly known time period in the Southwest and Southern High Plains.

[25] *Petrography and Chemistry Live Together in Perfect Harmony*

Historically, pottery provenance studies in the Aegean were conducted by the application of chemical techniques for element determination. The underlying principle was that ceramics made with the same clay paste should exhibit lower chemical variability than those with different pastes. Although this principle has not changed over the years, pottery studies have undergone serious analytical and most importantly, methodological developments. The main reason for the methodological developments was the systematic introduction of petrography, which related pottery objects to their geological environments and the technology of manufacture. This had a positive effect on the use and interpretation of elemental analysis data, especially in the way that variability was explained.

Here complex chemical data sets of Mycenaean pottery are interpreted with the integration of petrography. These represent areas with long potting traditions, as well as consumption sites. We suggest that maximum information can be extracted by the stepwise isolation of petrographic groups and consequent study of their chemical variability. This amplifies the advantage of the high sensitivity of chemistry, by considering the petrographic variation of specific ceramic fabrics. Incidental chemical similarities can be identified and accordingly treated in the statistical evaluation as well as increased chemical variability due to variations fabrics.

Killgrove, Kristina (University of West Florida)

[124] *Giving 3D Scanning a Porpoise: Digitizing the Zooarchaeological Type Collection at the University of West Florida*

The faunal type collection at the University of West Florida's Department of Anthropology, used for zooarchaeological reference, is composed primarily of specimens of local fauna donated by students, staff, and faculty. These crowdsourced contributions are stored in a lab facility and therefore are not readily available to archaeologists needing to make IDs in the field or to researchers working from afar. Using the department's NextEngine Desktop 3D scanner and hand-held Sense 3D scanner, we have created digital models of common fauna found on archaeological sites in the greater Pensacola area, including dolphin/porpoise (*Delphinidae* sp.), turtles (*Cheloniidae* and *Pseudemys* sp.), great blue heron (*Ardea herodias*), alligator (*Alligator mississippiensis*), and shell (*Rangia cuneata* and *Crassostrea virginica*). This presentation will discuss how digitally preserving animal bone can solve problems such as access to collections, space management

issues, lack of funding, and biological hazards. The models will be made publicly available for download and printing.

[79] *Ceramic Petrography, Historical Linguistics and the Bantu Expansion: Tracking the Arrival of the First Pottery-Using Peoples in Northern Botswana*

It may seem counterintuitive that colonists travelling substantial distances on foot into new territory should have carried ceramic vessels with them, but in some cases the evidence from ceramic petrography shows that they did. This case study examines the movements of the first pottery-using migrants into northern Botswana between the first and the fourth centuries CE. Southern Africa was the terminus of the long expansion of Bantu languages from their region of origin in present eastern Nigeria, and we will tentatively suggest that the petrographic and stylistic analysis of pottery may provide material evidence for the convergence in Botswana of the Western and Eastern streams of the Bantu languages. We will also present our current thoughts on the status of Bambata pottery, which some archaeologists have argued was brought into this region by a separate and slightly earlier migration of sheep and cattle pastoralists.

Kim, Lynn (University of Texas at San Antonio)

[11] *A Glance at Camata: GIS Analyses of Camata Valley, Bolivia*

Although significant research has been accomplished on the Inka Empire, there are still questions about how the Inka integrated diverse people and lands, especially those regions near their imperial frontier, such as the Camata Valley. Understanding how the valley became part of the Inka imperial frontier will shed light into studies of colonialism, borderlands, landscapes, and imperialism. The goal of this poster is to explore patterns across the landscape of the Camata Valley. More specifically, I will investigate the landscape patterns in the valley from the time of the Inka to early Spanish colonialism with Geographical Information System (GIS), through the examination of (a) the environment, (b) agricultural terraces, and (c) site location. In the future, the research will expand on these analyses and focus on agrarian practices, the road system, and site function, so I may evaluate whether the inhabitants of the valley experienced a colonial or indigenous landscape during the Inka reign.

Kim, Ha Beom (University of Oregon)

[49] *A Study on the Mid-to-Late Neolithic and the Early Bronze Age Agricultural Economies and their Development at Huizui Site, Yiluo Valley Region, China*

In order to gain procedural understanding of early agricultural economies, researches have much to gain from in-depth, diachronic study of agricultural development in a single region. This study focuses on the changes in agricultural plant-use over time in the Yiluo Valley, North-Central China by using archaeobotanical data from the Mid-to-Late Neolithic and the Early Bronze Age occupations (c 3500 – 1500 B.C.) at Huizui. The study's analysis confirms that changing plant-use patterns at Huizui were a part of larger agricultural development in the Yiluo Valley region. The Huizui inhabitants relied heavily on millets as their primary means of subsistence, while beginning to include broader range of crops such as wheat and rice toward the Late Neolithic period. The study also finds the presence of statistically significant differential crop and associated weed species inclusions between Mid-to-Late Neolithic and Early Bronze Age deposits at Huizui. These results suggest an interesting hypothesis, one where crop consumption at Huizui toward the Early Bronze Age may have involved more trade and importation of processed crop goods than earlier periods. This hypothesis highlights the dynamics of early agricultural development occurring at the Yiluo Valley during the Mid-to-Late Neolithic and Early Bronze Age.

Kim, Jangsuk (Seoul National University)

[80] *Demographic Dynamics Inferred from Radiocarbon Dates and Sampling Biases*

Using the number of uncalibrated BP dates or summed probabilistic density of calibrated dates, many studies attempt to monitor demographic dynamics of the past. However, some practical factors including differences in intensity and density of archaeological investigations and the preservation of datable materials, natural decay, and even different financial situations of investigations can cause sampling biases, eventually leading to distorted distributions of radiocarbon dates. Thus, database control to remove sampling biases is critical. The temporal distribution of South Korean radiocarbon dates from houses (approximately 10,000 in number) reveals extremely unusual fluctuations over time. Although this may suggest an abrupt population decline and re-growth or result from 'cultural sampling biases' such as change in duration of houses and destruction of earlier houses by later houses, the first thing to check is whether it is caused by practical sampling biases such as inter-investigation difference in intensity of material sampling. I propose some methods that can mitigate over- and underestimation of population, by analyzing the number of radiocarbon dates and the total area of archaeological features from which materials for dating were sampled. Then, I compare the controlled database with original database to see how much sampling biases affect the pattern.

[273] *Cut Marks and Fragments: Piecing Together Possible Explanations for Variation of Processed Human Remains among Neighboring Villages in Pre-Contact Southwest*

The discovery of disarticulated and processed human remains at several archaeological sites has provided evidence of extreme violence in the pre-contact American Southwest. Several theories have been presented to explain the presence of these traumatic injuries, including witchcraft executions, ancestor veneration, and cannibalism. The research being presented consists of a detailed reexamination of a small sample of human remains recovered from two neighboring Fremont sites and one nearby Ancestral Pueblo. Novak and Kollman, who previously analyzed the Fremont remains, suggest that the patterning of trauma resembles episodes of extreme violence in the American Southwest. The trauma was analyzed using cutmark analysis techniques described by Ventura Pérez. The reconstructions of cutmark morphology and distribution were compared by site and also to data published on other archaeological examples of disarticulated and processed human remains. The goal of this research is to provide insight into the possible motivation behind the disarticulation and modification of human remains seen by Fremont and Ancestral Pueblo groups. Our results suggest that the patterns and variation of cut marks and fragmentation between these sites may demonstrate different behaviors between these neighboring villages.

[236] *Where Are We Going? The Impact of Project Archaeology on the Profession, Past and Future*

Over its 25 years, Project Archaeology has helped revolutionize not only how we teach archaeology in pre-collegiate and other settings, but also how professional archaeologists look at public engagement. The program's original objective was to prevent looting by inculcating a sense of stewardship in children. Its initial success made it the profession's premier outreach instrument. As various states adapted Project Archaeology to different regional audiences, it became clear that the deep cultural knowledge that brings archaeology to life promotes a sense of protectiveness toward the archaeological record. Even more importantly, it can give children a thrilling connection to their own identities. Project Archaeology thus helps develop a public that values cultural heritage. As economic stresses continue to threaten disciplines with no obvious connection to jobs, archaeology

will need broad public support to remain healthy. That public includes members of groups currently underrepresented in the profession, such as African Americans and Native Americans. The multicultural Project Archaeology lessons, tailored to national and educational standards, can attract a wider range of students to study their cultural heritage and pursue archaeological careers. We need their voices if we are to enrich archaeological understanding and foster a public that cares about what we do.

[289] *Enter the Void: A GIS Analysis of the Visibility of Empty Spaces at Copan, Honduras*

The concept of visibility: what or who is visible and who can see what, provides archaeologists with information about power, ideology, and interaction. Geographic Information Systems (GIS) allow us to quantify the visibility of archaeological features in landscapes and 3D visualizations and gives us a way to experience these past landscapes. In Maya archaeology, most visibility studies measure the visibility of monuments as a means to understand the role of architecture within ancient Maya society. In this paper, we reverse our approach—measuring the visibility of “empty” spaces at the ancient city of Copan in Honduras—in order to interpret the role they may have played in conveying messages and shaping daily life. Using GIS we identify “empty” spaces across the city and begin to interpret their potential significance. These spaces that appear “empty” today could have been agricultural fields, household gardens, or ritual stages, which each have different implications in terms of visibility. We focus particularly at “empty” spaces in San Lucas—a neighborhood overlooking Copan’s main civic-ceremonial complex.

[331] *Ground-penetrating Radar Survey and Excavation of the Golden Eagle (11C120) Embankment*

The Golden Eagle site (11C120), located near the confluence of the Mississippi and Illinois Rivers, in Calhoun County, Illinois, is the only known Lower Illinois Valley mound site that includes an earthen enclosure. The site is frequently discussed in regional interpretations of moundbuilding traditions, though little is directly known about the site, particularly the embankment. Archaeological investigations have been limited to topographic mapping, pedestrian surveys, and limited inspection of an erosional cross-section on the eastern side of the embankment. In 2013, the Center for American Archeology (CAA) began geophysical prospection of the site, followed by excavations conducted by the CAA and the Arizona State University Field School in 2014. In this paper, we report results from ground-penetrating radar (GPR) survey and groundtruthing in the northwestern portion of the embankment. GPR and excavation results are used to characterize the structure of the embankment, and evaluate evidence from the eastern erosional profile.

King, Adam (SC Institute of Archaeology and Anthropology)

[335] *Exploring Community Creation at the Mississippian site of Etowah (9Br1)*

Etowah was the locus of a prehistoric community for 550 years. After its founding, the site was abandoned and re-occupied twice, meaning Etowah’s communities were created three separate times. Periods of abandonment create points in the life of a community where it is possible to question and modify local tradition. Re-establishment after abandonment can lead to novel ways of casting identity, social relations, and history. Data collected at Etowah and the wider region reveal this process and allow me to explore how the built environment and material culture of Etowah were transformed with the creation of each new community.

King, Stacie (Indiana University) and Ricardo Higelin Ponce de Leon (Indiana University)

[410] Mortuary Practices in the Nejapa region of Oaxaca, Mexico

To date, we have documented or recovered the remains of over 15 individuals in the Nejapa region of Oaxaca. This paper summarizes these finds and takes a first step in comparing the mortuary practices of Nejapa to those in other regions of Oaxaca. Eight individuals were found buried nearby one another at the site of Majaltepec, an early Colonial period town in the mountains surrounding Nejapa. Morphoscopic dental analyses indicate the presence of at least 4 younger individuals between 15 and 21 years old, 3 infants, and 1 individual of undetermined age. Though poorly preserved, the burials provide us clear examples of early Colonial indigenous mortuary practices. Notably, residents of Majaltepec buried their dead below floors of buildings with grave offerings, similar to practices in Prehispanic Oaxaca. The persistence of these practices alongside Dominican presence and Catholicism suggests that there were limits to Spanish oversight. Prehispanic burials in Nejapa, by comparison, are uncommon in spite of extensive excavation. The lack of sub-floor burial in Nejapa, in particular, might signal a difference in identity between the Prehispanic residents of Nejapa and the residents of Majaltepec in the late sixteenth century.

Kingwell-Banham, Eleanor (Institute of Archaeology, UCL)**[414] From Wild Rice Harvesting to Domestic Rice Agriculture in South Asia**

It is still unclear if India saw an independent domestication of rice, and so the origins of *Oryza sativa indica*, as distinct from the Chinese rice *O. s. japonica*, are shrouded in mystery. However, there is very early evidence dating to ca. 9000 BP of wild rice exploitation, and perhaps of crop management, from Northern India. Once rice becomes widely reported within the archaeobotanic record, there is long term evidence for low impact agrarian practices across the subcontinent, including shifting cultivation, lasting up to 5000 years until domestic rice agriculture became widely adopted. This presentation will sum up archaeological and genetic evidence for rice domestication in India and outline the pathway to domestic rice agriculture that the current data supports, a pathway which is almost uniquely protracted and muddled.

Kinkopf, Katherine (University of California, Berkeley) and Jess Beck (University of Michigan)**[205] Bioarchaeology and Looting: A Case Study from Sudan**

Disturbing the dead has been considered a criminal activity in the Nile Valley since the trial of Egyptian tomb robbers in 1100 B.C.E. Looting is one of the most destructive forces at archaeological sites; grave robbing, in particular, leaves human remains and cultural heritage irreparably damaged. During 2007-2008, the Oriental Institute Nubian Expedition (OINE) worked to identify, record, and preserve important archaeological sites that have since been destroyed by the Merowe Dam. Al-Widay, a cemetery that was excavated by the OINE near the Fourth Cataract region of the Nile River in northern Sudan, is a site with important implications for understanding the taphonomy of archaeological looting. Over 60% of the tumuli excavated at Al-Widay were disturbed in antiquity, making it an ideal case study for examining the effects of looting on the recovered human skeletal remains. Our research applies bioarchaeological methods of quantifying fragmentation to an assessment of culturally significant anatomical regions in order to evaluate the nature and degree of human disturbance activity at Al-Widay. Studying the preservational patterning of looting makes it possible to access aspects of looting behavior in the past, as well as to reconstruct the original archaeological context of disturbed remains.

[240] *A Tale of Two Tombs: The Relationship between Khonsu's Funerary Monument and that of Userhat*

Egypt is well known for its long-running funerary traditions, and one of the most fruitful avenues of research on the topic is the study of decorated tombs at the ancient site of Thebes (modern Luxor). The cemetery complex that served this large settlement and religious center during the New Kingdom (ca. 1550-1070 B.C.E.) contains thousands of graves. This paper examines two nearly contemporaneous tombs that although commissioned to hold the burials of different men, have a great deal in common—professionally, iconographically and perhaps even personally. Indeed, the more complete of the pair is useful in reconstructing damaged portions of the other monument. The tombs lie a short distance from one another and their imagery follows a similar decorative program. Both of the officials memorialized and interred in Theban Tombs 31 and 51—Khonsu and Userhat, respectively—were high-ranking priests in the mortuary cults of deceased pharaohs. I will briefly discuss the tombs' location and their decoration before turning to the manner in which the occupations of their owners is likely connected to administrative protocol in a tightly controlled realm of Egyptian society: tomb preparation and site assignment.

[53] *The Evolution of a Distinctive Human Niche: Assessing and Describing the Development of Wisdom in the Pleistocene the Archaeological Record*

How can anthropologists assess the pattern of complex decision-making that early humans undertook when navigating social networks and what role does this ability, which we might call wisdom, play in the origin & development of the cultural human experience? While it is clear that there are behaviors unique to humans such as the creation of complex lithic artifacts, unaddressed for the most part has been how behaviors such as collaboration, land use patterns/long-distance raw material transport, symbolic thinking, aesthetic preferences, ritual behavior, and stigmergy (self-

organization) are expressions of wisdom itself. We suggest that specific changes occurred in the material record between 500-100 kya that engendered substantial changes in the human niche. Here, we report on a large-scale comparative database of archaeological and fossil sites, which includes behavioral patterns, materials used, types of representation produced, possible uses for these items, and, where available, local ecological and demographic parameters. This allows focus on the feedback loop between social and material complexity in order to examine how these experiences shaped other evolutionary processes. These data will then be used to develop a model to determine patterns that can provide insight into the creation and use of the distinctive human niche.

Kistler, Logan (The University of Warwick)

[226] *Molecular Archaeobotany from Its Early Foundations Onward: New Questions and Perspectives for the Genomic Era*

Following the inception of ancient DNA-based research in the mid 1980's, researchers began applying the new toolkit of archaeogenetics to a diverse range of questions surrounding human-plant interactions. These early studies laid the groundwork for the field of molecular archaeobotany, exploring aspects of selection and domestication, movement of crop plants alongside humans, and human impacts on ancient ecosystems. Some two decades later, ancient DNA researchers began experimenting with next-generation sequencing technologies, and recent years have seen the high-profile fluorescence of genome-scale ancient DNA research with the publication of a number of complete genomes from ancient humans and archaic hominins. These technological developments have allowed researchers to mitigate—though certainly not eliminate entirely—the perennial challenges of ancient DNA-based research, such as severe limitations of sample size, molecular marker choice, and accessible DNA fragment length. The same new methods are beginning to gain more widespread usage in anthropologically motivated plant archaeogenomics, dramatically increasing the breadth and resolution of approachable research using ancient plant DNA. Several recent studies begin to illustrate the utility of molecular archaeobotany in the age of genomics, but the full potential lies ahead.

[377] *Seeing Prehistory in Color: Interpreting the Use of Colored Pigments at the Tiwanaku Omo Temple, Moquegua, Peru*

Although color is often at the background of our lived experience, colors also have the power to demand our attention. In this paper we explore how color was a meaningful component of the built environment in prehistoric South America and specifically the ways it demanded the attention of the Tiwanaku (A.D. 500-1100) of the south-central Andes. Extensive excavations at the Tiwanaku Omo ceremonial temple (M10A) in Moquegua, Peru have revealed the use of red and green pigments on selective walls and doorways throughout the structure. Using ethnographic, ethnohistoric, and archaeological data, we argue that the colors of Omo's built environment symbolized circulating liquids and guided temple supplicants along a ceremonial procession pathway. We suggest that attention to color is an important avenue for understanding the significance of the built environment and other materials from prehistory.

Klaric, Laurent (CNRS UMR-7055 PRETEC)

[181] *Palethnographic Interpretation of the Gravettian Site of La Picardie (Indre-et-Loire, France): A Difficult Path*

After nine years of excavations (1998-2008) the site of La Picardie has delivered a major lithic collection (more than 13 000 artifacts piece plotted) chronologically related to the "Raysse burin" Gravettian (second phase of Middle Gravettian ca. 24 ky BP uncalibrated). Through the study of lithic material several major results have been brought to light (chronological attribution, description of a new retouched bladelet type, reconstruction of the flint knapping process for blade and bladelet production). However, palethnographic study and interpretation of the site have yet to be broached.

In spite of some taphonomic problems, different studies can be combined in order to push our understanding of the site further: functional analysis of stone tools; assessment of skill level in flint-knapping; vertical and horizontal distributions of artifacts and tools; and observation of the organization of the different "structures" made of limestone blocks. Through several illustrative examples we will try to expose, step by step, the various elements that help us to rebuild the probable function of the site. Finally, making quick comparisons with other "synchronous" Gravettian sites (Solvieux, Plasenn-al-Lomm), we will see why La Picardie is quite unique for this peculiar phase of French Middle Gravettian.

[286] *Evaluating the Sustainability of an Angkor-Period Engineered Landscape at Koh Ker, Cambodia*

Several studies have argued that the collapse of an unsustainable hydraulic network was a major factor in the abandonment of medieval Angkor (~9th to 15th centuries A.D.) as the capital of the Khmer civilization. However, Angkor presents us with a great deal of uncertainty due to the spatial and temporal complexity of the archaeological remains. The Angkor-period city of Koh Ker, in contrast, provides the opportunity to study a medieval water management system whose structure and functioning can be discerned with relative clarity. Here we present the results of an investigation into the archaeological landscape of Koh Ker, including the use of airborne laser scanning (lidar). We argue that the system at Koh Ker was a hybrid one, combining elements of a 'highland system' of damming river valleys (as in Phnom Kulen) with elements of the classical 'lowland system' of reservoirs, canals and bunded fields (as at Angkor). We assess the strengths and weaknesses of this engineered landscape in the context of different hydrological, hydraulic, agricultural, social and demographic models; present evidence for the catastrophic failure of the system during the Angkor period; and assess the implications of these data for our understanding of the sustainability of medieval Khmer cities.

[7] *Bosutswe Landscapes: Defining African Complexity through Spatial Archaeometry*

This multi-component project addresses how societies in Iron-Age Botswana (550-1650 CE) experienced the change from small, rural-centered life to centralized power based on increasing involvement in trade across the Indian Ocean. How this change occurred remains a central focus, with increasing pressures on the environment in this desert-margin landscape a likely contributing factor. It features the Bosutswe region, situated on the eastern edge of the Kalahari Desert, where the site of Bosutswe has been well studied but surrounding sites are almost entirely unknown. These smaller, even ephemeral sites were drawn to the magnet of opportunity that Bosutswe provided: temporary camps for traders and hunter-gatherers, and smaller homesteads inhabited for a few years or possibly generations. The project includes low-altitude aerial and geophysical survey of two small ground sites and a hilltop site, Mmadipudi Hill, located within 4km of Bosutswe associated with the beginning of this transition period. The data from the drone-based platform, including thermography and a photogrammetrically-produced digital elevation model was compared to on-the-ground geophysical surveys including electromagnetic induction (EMI), ground-penetrating radar (GPR) and magnetometry and targeted test excavations.

[296] *Archaeological Shellfish Size and Later Human Evolution in Africa*

About 50,000 years ago, modern humans expanded from Africa to Eurasia. Significant behavioral change accompanied this expansion, and archaeologists commonly seek its roots in the African Middle Stone Age (MSA) before 50,000 years ago. Easily recognizable art objects and “jewelry” become common only in sites that postdate the MSA in Africa and Eurasia, but some MSA sites contain possible precursors. Population growth is the most popular explanation for these precursors and for the post-MSA florescence of art. Economically important gastropods from coastal sites in South Africa allow a test this idea, since the number of human collectors is probably the principal determinant of average gastropod size. In every examined gastropod species, average size is similar in MSA layers with precocious artifacts and those without, and MSA gastropods are always substantially larger on average than those in succeeding Later Stone Age (LSA) layers that formed under equivalent environmental conditions. The sum suggests that whatever the cognitive implications of precocious MSA artifacts, they were not associated with population growth. MSA populations remained consistently small by LSA standards, and a substantial increase in population size is obvious only at the MSA/LSA transition, when it is dramatically reflected in the Out-of-Africa expansion.

[152] *Fish Heads that Turn Heads: Catfish from Cabeçuda Shell Mound*

Zooarchaeological analysis of the Cabeçuda shell mound identified a number of Ariidae (Genidens barbus, G. genidens) neurocrania with exceptional preservation. This site is a large mound located in southern Brazil, and the faunal collection was sampled during archaeological interventions done in the 1950s. Generally, Ariidae specimens are a common find in Brazilian shell mounds. However, Cabeçuda is the only site that presents elements with this level of preservation. Catfish neurocrania are composed of several bones that easily disconnect from each other and their presence at the site in such condition leads to some questions. This paper explores the importance of catfish and its decline throughout the occupation. Is it due to changes in preferences or environmental shifts, site formation processes and their influence on differential preservation, or site function?

[415] *PaleoNutrition, Coprolites, and Hemachromatosis: What is the Connection?*

Evidence of cribra orbitalia in the physical anthropology record has long been interpreted to represent inadequate sources of iron in the diet. Pairing coprolites with naturally mummified bodies from Nubia allowed examination of the diet and correlation with physical evidence retained by the bones at both the population and individual levels. Although the diet included foods sufficiently rich in iron, it also contained foods heavy in phytates, which block the absorption of iron. In this population, iron deficiency anemia was more likely related to eating foods rich in phytates than to not having access to sufficient iron in the diet. Hemachromatosis, commonly referred to as iron overload, is genetically controlled. To many it is the opposite of iron deficiency anemia. How might examination of prehistoric diet shed light on the origins of hemachromatosis? Hemachromatosis is more common in people of northern European origin than in people and then from other areas of the world. Can a correlation be shown through time between dietary adaptation and genetic mutation? How does nutritional analysis of coprolite evidence of diet contribute to a better understanding of health?

Knab, Timothy (Universidad de las Américas Puebla) and John Pohl (UCLA)

[259] *Round and Round We Go: Cholula, Rotating Power Structures and Social Stability in Mesoamerica*

Rotating power structures of the mayordomías circulares in Cholula show extreme stability through time. We will analyze how these systems work and why they are so effective using notions of social capital to show how these and other organizations in Cholula build up social capital needed to keep

Cholula's baroquely complicated system of ritual festivals running. In so doing, we will show that the system can be sourced to the early post conquest period when it was maintained by the city's merchants, and further propose that it was rooted in Postclassic structures that maintained Cholula as a coherent urban entity at the apex of a vast trade network. The extreme social stability of rotating power structures make them a much better model for looking at Mesoamerica's past than the linear Aztec models so often used for the comparative analysis of ceremonial centers.

[321] *Rethinking The Cultural and Natural Dimensions of Landscape Pollution in the Faynan Valley, Southern Jordan*

The human impact on marginal environments is an issue that has especially affected societies in the Middle East during the past 8,000 years, a time when some of the most significant political and economic developments in the history of human societies took place. Such development often permanently altered the character of these fragile ecosystems. Landscape degradation, especially heavy metal pollution, is a poignant example of the deleterious effects that humans can have on the environment. We conducted a study of ancient pollution in the Faynan valley of southern Jordan – an area rich in copper ores – during the most intensive episodes of production: the Iron Age and Roman period. Based on the results of excavation and survey, geochemical analysis, and OSL dating, we created a GIS model of the spread of ancient metal ions through biophysical processes. This information has allowed us to simulate the ways in which potential pollutants would have moved across the landscape, and hypothesize the effects on the landscape. We argue that intensive copper production did not directly lead to environmental degradation, but instead, was probably the result of a combination of post-abandonment factors, including erosion and the collapse of supportive infrastructure.

[207] *Exhumation vs. Excavation: The Armenian Genocide and Our Ethical Responsibilities*

Records of human rights violations precede biblical times and have shown no signs of decelerating despite the contemporary measures taken to clearly define such atrocities. In the case of the Armenian Genocide, committed by the Ottoman Empire during WWI, the Young Turk government took great care as to restrict the publication of photographs and reports that would expose the widely condoned practice and to this day claim to have no responsibility or knowledge of such occurrences. The physical evidence obtained from the remains of victims that are exhumed from mass graves is delicate and controversial. We will discuss the various ways that archaeologists and physical anthropologists attempting to recover and restore historic memories that had been selectively recalled have undertaken a twofold endeavor; the exhumation as well as the excavation of mass graves. The initial and unarguably integral mission of these specialists is to identify the remains of individuals associated with human rights violations so as to be repatriated to family members. Secondly, the obligation towards collecting scientific evidence that is unable to be dismissed so that historic acknowledgement of the enormous human and material loss occurs. We will examine the nuanced process in which these endeavors are undertaken.

Knecht, Rick

[337] *Prehistory and Climate Change in Southwest Alaska*

Significant elements of the artifact assemblage, architectural features as well as recent DNA analysis of human hair recovered from the Nunalleq site (GDN-248), all support the idea of Thule cultural expansion onto the Yukon-Kuskokwim Delta region of Alaska. Other evidence points to strong links

with the Alutiiq (a dialect of Yup'ik) speaking peoples on the Kodiak Archipelago, Alaska Peninsula and Prince William Sound. There are clear similarities between late prehistoric Yup'ik and Alutiiq religious and ceremonial artifacts, game pieces, and hunting technologies. This paper compares two large and well-preserved late prehistoric assemblages: the Nunalleq site now being excavated near Quinhagak, south of the Kuskokwim River and the Karluk One site on Kodiak Island. Both are wet sites that have yielded more than 20,000 artifacts, many of rarely preserved wood and other organic materials and both were occupied during the Little Ice Age. Comparison of these sites reveals telling similarities and differences in the way coastal Yup'ik and Alutiiq peoples may have responded to climate change.

[90] *Fuel Treatment Guidelines to Reduce Wildfire Damages to Ceramic Artifacts in the American Southwest*

Artifact assemblages in the American southwest are currently subjected to periodic wildfires and prescribed burns, and have been exposed to fires in the past. Ceramics are a key constituent of these assemblages, leading to questions regarding effects of post-depositional heat and flame exposure on pottery. Alterations of ceramic pattern, form, and chemistry have been observed following wildfires, and such changes are significant because intact ceramics provide temporal context and other social information. Over the past 150 years, southwestern wildfires have shifted away from the historical high-frequency, low-severity regime; thus, cultural resources can be exposed to fires that are potentially more damaging than have occurred in the past. The wide range of fire environments and the duration and intensity of heating that result in damages to ceramic artifacts has not previously been systematically assessed. We report on results from laboratory tests conducted as part of the Joint Fire Science Program-funded ArcBurn project. Our results demonstrate that the type of fire environment and sustained dose determine patterns of alteration. Results can be used to identify fire environments that cause loss of information from artifact assemblages, and to develop management treatments and procedures to guide archaeological preservation in fire-prone landscapes.

Knell, Edward (California State University, Fullerton)

[386] *Terminal-Pleistocene through Late Prehistoric Settlement Strategies around Pluvial Lake Mojave (Soda and Silver Lake Playas), California*

Multiple lines of evidence are used to establish terminal Pleistocene-early Holocene (TP-EH) through Late Prehistoric spatio-temporal patterns and settlement strategies around pluvial Lake Mojave (more recently Soda and Silver Lake playas), California. Data from pedestrian survey and in-field analysis of lithic artifacts at four survey areas along the eastern shoreline of Soda and Silver Lake are analyzed using GIS to establish whether settlement strategies changed in accordance with variations in the lake water-level. Prior analysis of the Little Cowhole survey area identified three spatially separated, dense bands of artifacts that follow the TP-EH shorelines and reflect a gradual, time transgressive shift in TP-EH habitation closer to the receding water-level (Knell et al. 2014). Other survey areas at Soda and Silver Lake have sites dating from the TP-EH to Late Prehistoric, providing the opportunity to evaluate whether post-TP-EH peoples continued shifting towards the receding water-level. The analyses indicate that the Middle and the Late Holocene sites are at sequentially lower elevations than the TP-EH sites, ultimately providing temporal and spatial context for the TP-EH sites (the focus of my research) and key insights regarding Lake Mojave's or Soda and Silver Lake playas role in the regional settlement system.

Knight, Charles (University of Vermont)

[172] *The Middle to Late Formative Olmec Chipped-Stone Assemblage from Los Soldados, Veracruz, Mexico*

The use of chipped-stone in domestic Olmec contexts has only recently become a focus of archaeological investigation. With the publication of data on the chipped-stone assemblages from the Olmec centers of San Lorenzo and Tres Zapotes in the last few years, a picture emerges of great diversity in materials consumed and technologies used by commoners and non-commoners alike. The Middle to Late Formative household chipped-stone assemblage from the 2010 excavations at Los Soldados, in the hinterland of the Olmec center of La Venta, adds to this picture of regional diversity. Unlike other Olmec period sites where obsidian from numerous sources was the principal chipped-stone material consumed, the Los Soldados assemblage reflects the utilization of a wide variety of microcrystalline materials, the most common being chert. While obsidian also is common, it appears to have been used in ways that differ from other materials. What this variation suggests about the participation of the Los Soldados inhabitants in a region-wide obsidian exchange network is addressed through regional comparison.

[396] *Biogeography of Neandertals: The Southern Italian Middle Paleolithic*

Most research on the Middle Paleolithic in southern Italy has focused on the region of Apulia. This research has been extensive and productive, and so it stands to reason that other less researched regions of southern Italy hold similar potential. This paper uses predictive niche modeling to identify Neandertal niche from site location and environmental variables in Apulia, and applies the modeled niche to under researched regions to predict locations of new Middle Paleolithic sites. The model will also be tested against locations of recent site discoveries in the regions, allowing a reflexive look at both where researchers choose to look for sites as well as the accuracy of the predictive models as derived from Apulia and applied elsewhere in southern Italy. Results will help call attention to the potential of the area while guiding future research.

[354] *An Examination of Gallina Utility Ware: Vessel Morphology and Function*

The morphology of a ceramic vessel is directly related to intended use, and potters consider function during manufacture. Functional types such as cooking vessels, ollas, water jars, seed jars, bowls, and pitchers, are common in our ceramic lexicon. However, the relationship between morphology and function is not always intuitive, especially when considering secondary function and special use. The Gallina (A.D. 1050-1300) produced a wide variety of utility wares, but archaeologists have conducted almost no research on the ceramic style, use-wear and function of these non-decorative vessels. How many different shapes of utility ware were utilized in Gallina country? How did the Gallina use these different morphological types? Do interpretations based on shape indicate something different than use-wear and residues? I examine whole vessels from the Gallina culture area and categorize them into morphological classes. I also compare sooting on these different

morphological classes to evaluate actual use. I test whether or not vessels in the identified morphological classes were positioned over the fire in the same manner as evidenced by sooting patterns. Finally, a qualitative discussion of individual vessels allows for further interpretations about vessel use.

Koenig, Charles (Texas State University - San Marcos, Texas)

[256] *Floods, Muds, and Plant Baking: ASWT Excavations at Skiles Shelter*

Skiles Shelter (41VV165) is a "wet" rockshelter situated approximately ½ kilometer upstream from the confluence of Eagle Nest Canyon and the Rio Grande in the Lower Pecos Canyonlands of Texas. Due to the threat of inundation and damage due to extreme flooding events when Rio Grande flooding backs up from Amistad Reservoir, Skiles Shelter is the most-threatened site within Eagle Nest Canyon. Initial testing of Skiles was conducted during the 2013 Texas State field school. In 2014, the Ancient Southwest Texas (ASWT) Project greatly expanded on these preliminary excavations, focusing on four main research objectives: 1) understanding the site's depositional history; 2) quantifying how much earth oven baking occurred there; 3) using ground based (e.g., hand-held digital cameras) Structure from Motion (SfM) photogrammetry to document every excavation unit, layer, profile, or exposure; and 4) relating the prehistoric record at Skiles to the other sites within Eagle Nest Canyon. Combining the SfM data with Total Data Station shots, we have created an unparalleled 3D record of the site, as well as high resolution documentation of every sample collected for radiocarbon dating, geoarchaeology, archaeobotany, and zooarchaeology. This presentation will highlight the investigative methodology and preliminary results of the ongoing analyses.

Kohl, Philip (Wellesley College)

[340] *Silence and Noise in the Archaeological Record: Are Archaeological Understandings Always Underdetermined?*

In his seminal critique on the practice of history: *Silencing the Past: Power and the Production of History*, Michel-Rolph Trouillot persuasively argues that historians often cannot understand or even recognize major historical events, such as the slave organized and directed rebellion in Haiti (1791-1804) that led to the end of slavery and the establishment of the Republic of Haiti. It was simply inconceivable that slaves could plan and lead a successful revolt against their French masters. If historians with such a rich textual record can overlook or largely ignore this past, what chance do we have as archaeologists to recognize and interpret the silences of the material cultural record that are so fundamental to the discipline? This paper addresses the acute archaeological problem of interpreting "the absence of evidence" through the development of international collaborative research programs that foster a more robust understanding of the archaeological record; more dissonance undercuts the refractory silences of the past.

Kohler, Tim (WSU/SFI/CCAC)

[348] *The Effects of Temporal Coarse-Graining on Inferred Networks of Human Movement*

Analyses using tree-ring dates provide an attractive test-bed for examining effects of temporal coarse-graining in archaeological contexts, due to the high-resolution of dendrochronology. After compiling a database of every known tree-ring date in the U.S. Southwest, we use tree-ring-date counts and locations as proxies for gridded human population estimates in the upland portions of the SW US. Grid-squares that lose dates are connected to nearby grid squares that gain dates as we move from one time slice to the next, thus forming spatial networks of (putative) population flow. We progressively coarse-grain the cutting dates (e.g., bin them first by decade, then by 20 years, etc.) and we quantitatively monitor the effects that this coarse-graining has on the statistics calculated on the networks. These spatial networks, which we call spatial genealogies, tend to show that areas developing distinctive ceramic types and wares emerge as more-or-less separate components in a network sense. Thus, the implication is that style zones emerge because of relatively dense circulation within them, compared to sparser movement between them. In this paper we ask, At what temporal coarse-graining does this effect disappear?

Kohut, Lauren (Vanderbilt University)

[11] *Fortified Lookouts and Border Patrol in the Late Intermediate Period Colca Valley, Peru*
During the Late Intermediate Period (A.D. 1000-1450), the Colca Valley in the southern Peruvian highlands was heavily fortified. Survey of hilltop fortifications (pukaras) identified a class of large non-habitational pukaras located along the rim of the valley that were perhaps designed to monitor the vast expanses of puna surrounding the valley. Additionally, a prehispanic road which leads into the valley from the south passes through a primary defensive wall at one of the sites—further suggesting access into and out of the valley was a central concern for local groups. In this paper, I use spatial modeling of ideal regional routes (least-cost paths) along with known prehispanic roads to examine the relationship between the location of this class of fortifications and access points to the valley. The results show that the number of ideal access points is limited by the geography of the valley. The proximity of these fortifications to these access points indicates they likely functioned as monitoring outposts and were strategically placed to monitor access into and out of the valley. This pattern suggests that communities in the Colca Valley were organized against external threats, rather than local raiding within the valley during the Late Intermediate Period.

Kolar, Miriam

[59] *DIY Digital Archaeoacoustics: Sensory-Spatial Mapping*

An experiential link to past life, sound is a medium for engaging questions of ancient emplacement and human activity. Spatial sonics can be linked to a dynamic sensory map of one's surroundings; beyond conveying information about structural boundaries and environmental events, architectural and landform acoustics can help or hinder communication. Although acoustics and audio digital signal processing are specialist disciplines, consumer audio technologies can enable the extraction of sonic characteristics from the objects that produce sound and the structures that shape it. Inexpensive, free, and/or open source audio computing tools can be leveraged for non-invasive research methods, important to site conservation. Integrative archaeoacoustics fieldwork at the Andean Formative ceremonial center at Chavín de Huántar, Peru has relied upon customized digital audio research tools and methods, frequently developed in the field DIY-style, in response to site features and logistical challenges. New research connects acoustic data with coincident auditory perceptual responses to generate sensory spatial maps, informed by DIY archaeoacoustics, to engage sonic questions.

[35] *Tales from Three Caves and a Rockshelter in Balkh Province, Northern Afghanistan*

The geomorphology and archaeology of four Balkh River Valley sites near the bazaar town of Aq Kupruk (36°05'0"N 66°50'0"E) spanning the Upper Paleolithic through Contemporary Nomadic cultures are detailed and compared. This valley served as a significant north-south corridor through the Hindu Kush Mountains, a western extension of the Himalayas, and a caravan route from the Turkestan Plain to the Bamiyan Valley and on to the Kabul River Valley, Indus and the Subcontinent. Major excavations were conducted at Aq Kupruk I (Ghar-i-Mar/"Snake" Cave), a rockshelter with a slight overhang and highly complex stratigraphy located on the east side of the river, and Aq Kupruk II (Ghar-i-Asb/"Horse" Cave), a true cave situated on the west side. Aq Kupruk III, an open-air Upper Paleolithic campsite, was also tested and a small sondage excavated in Aq Kupruk IV, a shallow cave, which yielded ten disarticulated secondary burials and grave goods dating to the late Early to Late Iron Age. Chronologically, the longest stratified archaeological sequence anywhere in Afghanistan occurs at Aq Kupruk I: Upper Paleolithic, Epi-Paleolithic, Neolithic, Bronze Age, Iron Age, Achaemenid, Early Kushan, Great Kushan, Early Sasanian, Kushano-Sasanian, Hephthalites, "Early" and "Late" Islamic, and Contemporary Nomadic.

[363] *"Got Data, Now What?": Fort Carson's Steps Toward Addressing Data Gaps in Archaeological Research*

For several decades, the U.S. Army Garrison (USAG) Fort Carson, Colorado, has had an active cultural resources management program, resulting in the documentation of over 8,000 archaeological resources. The known archaeological resources represent every period of human occupation from the Paleoindian period to the present. Site types include cache sites, open/sheltered camps, village sites, game drive sites, rock art panels, quarries, historical ranch complexes, historical trails, historical trash scatters, and cairns. In support of the Army's training mission, the Fort Carson Cultural Resources Management Program has focused their most recent efforts on the identification, protection and monitoring of significant resources. Through the execution of programmatic agreements (PAs) that allow for creative mitigation opportunities, the accumulated data is now being analyzed and synthesized to address gaps in the prehistory and history of southeastern Colorado. This poster will discuss current and future archaeological research and management goals and objectives.

Koller, Jared (Boston University) and Kaoru Ueda (Boston University)

[238] *In Search of Southeast Asia's Trade Network: Comparative Ceramic Analysis*

Southeast Asia is a region whose inhabitants have long been engaged in long-distance trade connected through ocean and river systems. This paper presents the preliminary results of a petrographic study on earthenware samples from archaeological sites in Singapore, Indonesia, and Thailand in order to scientifically investigate the putative trade networks. The preliminary results show a complex picture of local production and imported ceramics, one that changes depending on the location and the specific socio-political of each site. This paper argues that fine-paste ware analysis is crucial to understanding the region's trade networks, and is an essential step toward building a baseline database of Southeast Asian ceramics.

Kollmann, Dana

[19] *Put 'em to Work! The Transition from the Classroom to the Field*

Many students eager to begin a career in the forensic sciences have never been on a crime scene and it is even more unlikely that they have ever had the opportunity to process one. This paper details the unusual circumstances that enabled Towson University students to partner with law enforcement and work on both active and cold cases that have necessitated the search for human remains and associated evidence.

[368] *The Ancient Methone Intensive Survey Project: New Research at a Harbor City in the North Aegean*

Methone (located in Pieria, Greece) was a key trading hub in the prehistoric and historic North Aegean, visible in the discovery of an array of workshops, production tools, and imported artifacts, and by some of the earliest evidence for the Greek alphabet in the Mediterranean. The 2014-2016 Ancient Methone Archaeological Project aims to enrich our understanding of the settlement and situate it within the wider Mediterranean world. The principal components of the project—intensive surface survey, excavation, and geophysical and geomorphological survey—work together in interdisciplinary collaboration to enhance our current understanding of this significant site. This

presentation outlines the initial findings of the 2014 survey, focusing on critical information concerning the surrounding natural and cultural landscapes of the settlement. Over six weeks in summer 2014, a total of 80 hectares was surveyed via intensive pedestrian survey methods. Geographically-linked data was digitized and visually presented in ESRI's ArcMap 10.2. General trends show a rich material assemblage ranging from the Late Neolithic (ca. 3500 B.C.E.) onwards, with a number of individual finds attesting to the industrial manufacturing and trade that took place at this center. Other materials represent military, cultural, and economic spheres of Methone throughout its rich occupational history.

Konwest, Elizabeth (Indiana University, Bloomington)

[335] *Where We Live: Houses, Households, Barrios, and Towns in Postclassic Oaxaca*

Greater La Amontonada, a cluster of Postclassic period sites in the Nejapa region of Oaxaca, Mexico, is an ideal location for investigating the ways in which people would have negotiated their roles as members of households, neighborhoods, and larger communities. Group members enact their relationships through everyday choices, habits, and routines that are materialized through daily action. The practices enacted in one community, the learning and doing, may be materialized differently than those learned in other communities. These practices are physically manifested in the learned methods of production that are passed down from generation to generation, and can be seen in technological choices, production methods, and raw materials. Through an analysis of the production technologies of artifacts recovered from excavated residential structures, primarily ceramics and lithics, this paper will consider how the residents of greater La Amontonada would have been linked to various spatially defined groups including, but not limited to, households and communities. Maintaining these group ties was important, as people of greater La Amontonada reacted to various foreigners traversing through Nejapa on trade and conquest campaigns between the politically powerful Oaxaca Valley and the resource rich Tehuantepec coast.

Kooiman, Susan (Michigan State University)

[280] *Pottery Function, Cooking, and Subsistence in the Upper Great Lakes: A View from the Middle Woodland Winter Site in Northern Michigan*

The relationship between subsistence and food-processing technology is a burgeoning topic in archaeology and has the potential to yield new perspectives on resource choice and cuisine in the Upper Great Lakes. This paper presents the results of exploratory functional pottery analysis from the well-dated Winter site, a Middle Woodland habitation in the western Upper Peninsula of Michigan. The analytic data discussed includes those physical properties affecting ceramic vessel performance, as well as use-alteration traces, particularly those indicative of cooking and food processing techniques. The analytic results are compared to similar data from the Naomikong Point site, another northern Michigan Middle Woodland site. Both sites are then contrasted with data from the nearby Late Woodland Sand Point site in order to explore possible temporal changes in subsistence practices, which could be linked to a broader suite of behavioral changes taking place during the late prehistoric period in this region. Together, the comparative application of functional pottery analysis to these assemblages could serve as the foundation for a more refined regional understanding of prehistoric vessel function, cooking techniques, and diet.

Koons, Michele (Denver Museum of Nature & Science)

[404] *Southern Moche Politics Reevaluated: The Reconciliation of Relative (Ceramic Chronologies) and Absolute (Radiocarbon) Dates*

Recently I performed a reevaluation of published radiocarbon dates for the Moche culture (200-900 A.D.). I only considered ^{14}C samples obtained from short-lived plant materials found in association with "datable" ceramics (Moche I-V, and Early, Middle, and Late Moche). The purpose was to test the validity of the relative ceramic chronologies in each valley against absolute dates. For this paper,

using Bayesian analysis I compare the well contextualized Moche dates from the Chicama Valley to those from the Moche and Viru Valleys to demonstrate that ceramic style does not strictly follow time and that there are marked differences in the dates when each ceramic style was in use in the different valleys. This has major implications on our understanding of Moche politics in the Southern Moche region. The reevaluation of the Moche 14C record demonstrates that ceramic phases are insufficient for understanding Moche chronology. However, by careful analysis of the absolute dates associated with ceramic styles at different sites, we can begin to reconstruct Moche political dynamics and site affiliations through time.

Koontz, Rex (University of Houston)

[39] *Patterns of Elite Self-Presentation in North-Central Veracruz, Middle to Epiclassic Periods*

Elite public imagery in north-central Veracruz during the Cacahuatal phase (c. 350-600) focused on frontal presentations of single figures and a restricted iconography. The Late Classic brought considerable changes to elite self-presentation in the region, including a more complex multi-figure narrative format and the palma, a new costume object. Both of these changes were directly related to changes in the visual patterns of public sculpture and the performance of public rites. This essay looks at the changes in patterns of elite self-presentation from the iconic, earlier Cacahuatal through the complex narrativity of the Late and Terminal Classic periods (Isla A and B) against the backdrop of the growing importance of the urban center of El Tajín.

Koontz, Cassandra [208] see Birge, Adam

Koontz, Cassandra

[208] *Landscapes of Violence: Trophy Head Production and Interpersonal Violence during the Wari era in the Middle Majes Valley, Arequipa, Peru*

The Middle Horizon (600 - 1000 A.D.) is known as a period of increased social hierarchization, changing mortuary customs, and high rates of interpersonal violence in many regions of the prehistoric Peruvian Andes. This project compares rates and types of violent practices (antemortem, perimortem, and postmortem violent dismemberment) between the northern and southern sectors at the recently excavated Middle Horizon cemetery site of Uraca in the middle Majes Valley to skeletal data from the early and late Middle Horizon excavated by Tung in the upper Majes Valley in order to determine whether violence types and rates are different near the ritual center of Toro Muerto than at other mortuary and residential sites in the upper valley. Spatial distributions of violence types and rates from the present project and published data are also explored in order to determine whether local geography predicts the type of violence practiced. Differences observed in violence rates and types can be explained by two alternate hypotheses. The northern and southern sectors at Uraca may have been used for interment during different time periods, or for interment of individuals from different social classes, ethnic identities, or occupational groups.

[360] *New perspectives on Native American occupation of the Puget Lowlands of Washington during the Late Pleistocene-Holocene transition from the Bear Creek Site (45Kl839)*

The Bear Creek site (45Kl839) in Redmond, Washington has yielded important information about Native American settlement, subsistence, and technology in the Puget Lowlands during the Late Pleistocene-Holocene transition. This poster presents new data on radiocarbon and optically-stimulated luminescence dating, paleoenvironmental reconstruction, and lithic analysis conducted as part of the 2013 data recovery investigation. New dates contribute to an age model that places the initial archaeological component prior to 10,000 cal BP. Occupation of this lacustrine shoreline ended by the early Holocene as the position of the shoreline shifted and the local environment became a wetland. The lithic assemblage, comprising over 5,000 artifacts in all, is dominated by an expedient flake technology, but also contains bifaces, retouched tools, and associated debitage. Analysis

focuses on procurement strategies of local volcanic and metasedimentary cobbles and extra-local materials, production sequence of flake tools, and technological comparisons of the Bear Creek stemmed and concave-base points with Paleoarchaic technologies of Western North America including Clovis, Western-Stemmed, and Olcott traditions. Microwear and residue analysis of a portion of the assemblage suggest potential functions of the site occupants' toolkits.

Kornfeld, Marcel (PiRL - University of Wyoming) and George Frison (University of Wyoming)

[138] *Paleoindians and Rockshelters in the Middle Rocky Mountains*

Since at least the 1980s the University of Wyoming has conducted Paleoindian and rockshelter studies on BLM administered properties from northern Colorado to southern Montana. The cooperative and assistance agreements have benefited both the agency and the University. An enormous amount of research effort contributed by the faculty, and enhanced by volunteers and avocationalists, have produced results far beyond what could have been accomplished without the cooperation. The results include students training (many becoming federal archaeologists), student and faculty conference presentations, publications including MA and PhD thesis, and public education. We highlight some of our research results including excavations at Mill Iron, Upper Twin Mountain, Krmpotich, Two Moon Shelter, Last Canyon Cave, and others.

[184] *On the Absolute Chronology of Late Tiwanaku / Early Late Intermediate Period Ceramic Traditions: Case Studies from the Bolivian Altiplano and North Chile*

Although the timing of the Tiwanaku collapse is debated and probably varied somewhat from one region to another, this process probably took place in the 10th and 11th centuries A.D. In 1998-2006, I worked at two Tiwanaku heartland sites which produced long series of radiocarbon dates corresponding to this critical period. At the cemetery site of Tiraska, ceramic grave goods in a style closely resembling Tiwanaku V were present from the early 10th until the mid-13th century A.D. On the island of Pariti, our investigations uncovered the remains of a probable closing offering: huge quantities of "Classic" Tiwanaku pottery in two contexts securely dated to circa A.D. 1000. As for North Chile, many of the 16 radiocarbon dates I obtained in 2013-2014 for four "Middle Horizon" cemetery sites of the Azapa Valley are surprisingly late; this is especially true for the dates related to the Cabuza ceramic tradition, all of which post-date A.D. 1000. In light of the abovementioned case studies I shall discuss the use-life of the "Classic" and "Decadent" ceramic styles in the Tiwanaku heartland and the possibility that the spread of the Cabuza pottery into North Chile was largely related to the collapse of the Tiwanaku state.

[180] *Agriculture Roles in Landscapes and Taskscapes: An Interdisciplinary Approach from Northwestern Argentina*

Traditionally, the Agriculture of the Formative Period (1000 B.C.-100 A.D.), was conceived as technologically simple and spatially reduced. However, this simplicity is reconsidered when we take into account that these technologies made possible the practice of agriculture in desert environments with eroded and underdeveloped soils, during millennia. Our research in El Bolsón valley, which is a high basin in western Catamarca, allowed us to know in detail some peasant practice as the irrigation technologies, the field preparation and other agronomic techniques as well as how the agrarian landscapes were structured in the past. In this presentation we summarize the results obtained through multiple lines of work (including landscape archaeology, archaeobotany), that allowed us to discuss the idea of agriculture perpetuated from traditional models, and also rethink it from a perspective that considers the complexity of the relationship between plants, soil, water, agricultural knowledge and ways of labor organization. Thus, we have recognized a significant

variability of peasant practices through which agriculture was configured during the Formative period. We have also recognized the persistence of certain aspects of this agriculture during Regional Development Period (1000 - 1500 A.D.), for which it has been assumed a re-articulation of production and power structures.

[295] *Remembrances of Things Past: Peter D. Harrison and Maya Archaeology*

After Peter Harrison's forays at Tikal, Guatemala and in Quintana Roo, Mexico, he turned his attentions to archaeological research in Belize in the late 1970s. Thus began his multi-year project at Pulltrouser Swamp, with his colleague Billie Lee Turner, which resulted in a series of foundational publications on Prehispanic Maya agriculture. In this paper we reflect on Peter's contributions to Belize archaeology and to the discipline as a whole, as we celebrate his many interests in Maya settlement patterns, agriculture, architecture and hieroglyphs.

[305] *Killing Time, Becoming Inca: Subject Creation and Monument Construction in Ancient Cuzco*

The Incas built the largest indigenous empire in the Americas, and though they lacked a written history, they were keen to tell Spanish scribes how they assembled their domain. Inca nobles explained that their ancestors vanquished anyone who dared challenge Inca claims to authority. Like the boasts of other conquerors, these stories cast only particular people as the subjects of history and the cultivators of "civilization." But they also conceal another side of Inca history: For, it was precisely during these violent encounters that the places and people of the Andes became Inca—essential members of an Inca polity.

This paper challenges Inca and archaeological tales of domination by focusing on the negotiated sites and violent practices that created Inca subjects and constructed official histories in Inca and Spanish Cuzco. It presents recent archaeological and ethnohistorical data to trace the social life of the Inca deity and shrine at Huanacauri, a contested monument that first served to support Inca absolute authority and later came to embody a generalized Andean identity. Over the past six centuries, Cuzco's people have built, revered, and demolished this monument, thereby collapsing Inca myth and history while giving rise to different understandings of the concept "Inca."

[172] *An Olmec Cylinder Seal from Los Soldados*

In 2010, a young man from the Ejido Diaz Ordáz found a Prehispanic clay cylinder eroding out of a road cut in the Olmec site of Los Soldados. Although the exact archaeological provenience is not secure, we consider the object belonging to the Olmec culture through other data obtained by the Proyecto Arqueológico Arroyo Pesquero-Los Soldados. The artifact is of particular importance because of the unique images presented on this artifact, which appears to constitute a domestic scene. We know of no comparable Olmec or other Mesoamerican cylinder seals. In this study we develop an iconographic comparison between similar Mesoamerican images to clarify unique and common characteristics. And we argue that the scene represented on this clay cylinder seal has much to do with the activities engaged by the residents of the site. We consider the potential that this archaeological piece has in helping to reconstruct the daily life of the Ancient Olmec.

[52] *Spatial Analysis of Prehistoric Garden Features on Rapa Nui (Easter Island, Chile)*

Manavai are circular walled stone gardens used for cultivation by the prehistoric populations of Rapa Nui (Easter Island, Chile). Though not fully mapped, over 1000 manavai are known across the island in a distribution that reflects dispersed settlement patterns. Object-based image analysis of newly available high-resolution imagery of the island offers a means of systematically identifying manavai features. Using the results of these analyses, we examine the spatial patterns of manavai and their association with topography and other environmental resources to test hypotheses about the role that these gardens played in past communities.

[86] *The Materiality and Mobility of Jade in the Upper Usumacinta Basin*

Distributions of jade in the Upper Usumacinta basin suggest that the movement of jade followed political connections and were not purely instances of down-the-line trade motivated by economic gain. Jade objects were likely gifted between elites to solidify political relationships. Some sites along the Usumacinta River received a wealth of jade, while others were relatively impoverished and turned to replicas or other forms of symbolic capital. The materiality of jade during the Classic period gave it a unique role within Maya society in the constitution of social identity and social connections.

Kovacik, Peter (PaleoResearch Institute)

[176] *New Perspectives on the Use of Yucca in the Arid Southwest: Archaeobotany and Experiment*

Macrofloral analysis conducted on sites concentrated in the northwestern Permian Basin (southeastern New Mexico) recovered evidence of charred yucca (*Yucca* sp.) leaf bases in numerous features. Ethnographically various yucca plant parts are mainly associated with fiber and food processing. The presence of these remains in solitary hearth features distributed on the arid landscape of southeastern New Mexico suggests use of these plants simply as tinder. Yucca plants represent a natural and easily accessible element in this environment. Experimental burning of whole yucca plants was carried out to better understand the ignition properties of dry yuccas and to identify charred plant remains that would be common in the archaeological record. In addition, scanning electron microscope imagery was used to compare the microscopic anatomy of archaeological and modern yucca reference materials. Results of this study were plotted, using GIS, on the landscape to show distribution of these remains compared to all of the feature samples examined within the project area. In addition, hundreds of AMS radiocarbon dates on charred yucca leaf bases and other remains from features that contained charred yucca also were obtained, indicating burning this common native plant by people crossing this landscape consistently for a few thousand years.

[370] *Calcite Rafts as a Proxy for Reconstructing Holocene Surface Water Conditions of Hoyo Negro: A Phreatic Coastal Karst Basin in Quintana Roo, Mexico*

Located in the Sac Actun cave system on the eastern coast of the Yucatán Peninsula, Hoyo Negro pit (HN) has proven to be a very important pre-Maya archaeological site as human (Naia, dated between approx. 13 000 - 12 000 calendar years ago) and faunal remains have been discovered

(Chatters et al., 2014). Reconstructing the flooding history (accessibly when the cave system was dry) and water chemistry of HN is critical to our understanding of the movement of humans and fauna into and through the cave over time. To accomplish this, cores of calcite raft piles from the upper cave passage connecting HN to Ich Balam Cenote (IB) and the base of the HN pit were analyzed for stable isotope composition ($\delta^{13}\text{C}$, $\delta^{18}\text{O}$ and $87\text{Sr}/86\text{Sr}$) and trace element concentration. This study identifies the long-term paleohydrochemical conditions in IB and HN while comparing/contrasting independent climate records within the circum-Caribbean region. Furthermore, this will represent an innovative proxy that will reconstruct surface groundwater salinity and its potability during the Holocene.

[87] *Towards a Multivariate Model for Accurately Identifying Cutmarks*

The identification of cutmarks has been integral to expanding the understanding of hominin behavior ranging from the origins of meat eating to megafaunal extinctions and the peopling of Australia and the Americas. However, paleoanthropological and archaeological research has demonstrated that while cutmark placement may be indicative of activity, cutmark morphology is more complex and influenced by multiple variables such as raw material, tool shape, and bone density. Further, significant overlap in the classic features of cutmarks, such as the standard V-shaped cross-section, has also been recognized in numerous processes including carnivore gnawing and trampling. This presentation establishes an empirical, probabilistic, and multivariate approach through logistic regression for differentiating raw materials (lithics, steel, and teeth) as well as actors which produce modifications commonly identified as evidence for butchering in the archaeological record. The results demonstrate that no diagnostic attribute of cutmarks produced by lithics was identified. Therefore, single attributes are insufficient for accurate cutmark identification. However, an approach which includes excavation history, stratigraphic context, location, orientation, and color of mark improve the likelihood with which cutmarks are identified accurately.

[350] *Maya Wetlands: Natural and Anthropogenic*

In our continuing endeavors to better understand Maya wetland formation and agricultural systems across the Maya Lowlands, we now compare natural and anthropogenic wetland field formation. Natural wetland processes can form patterned environments that may be similar visually to intensive, culturally modified, wetland systems. This paper will consider natural factors that can produce similar topography to Maya wetland fields. We will also present aerial photography, GIS, soil stratigraphy, and wetland chemistry to clarify the differences between natural wetland features, such as hogwallow, tree islands, ant mounds, and gilgai patterns, and intentional ancient canal and field systems. By developing new techniques to better quantify wetlands that have been culturally

modified, it will be possible to improve upon previous models of identifying and mapping Maya agricultural systems and understanding other earth surface processes and forms.

[396] *Ancient Human Genomes Suggest Three Ancestral Populations for Present-Day Europeans*

Ancient DNA can reveal historical events that are difficult to discern through the study of present-day individuals. To investigate European population history around the agricultural transition, we sequenced complete genomes from a ~7,000 year old early farmer from the Linearbandkeramik (LBK) from Germany and an ~8,000 year old hunter-gatherer from Luxembourg. We also generated genome wide data from seven ~8,000 year old hunter-gatherers from Sweden. We compared these genomes and published ancient DNA to genome wide data from 2345 present-day individuals from 185 diverse populations to show that at least three ancestral groups contributed genetic material to present-day Europeans. The first are Ancient North Eurasians (ANE), who are more closely related to Upper Paleolithic Siberians than to any present-day population. The second are West European Hunter-Gatherers (WHG), related to the Loschbour individual, who contributed to all Europeans but not to Near Easterners. The third are Early European Farmers (EEF), who were mainly of Near Eastern origin but also harbored WHG-related ancestry. We model the deep relationships of these populations and show that about ~44% of the ancestry of EEF derived from a basal Eurasian lineage that split prior to the separation of all other non-African lineages.

[200] *Grand Challenges vs Actual Challenges: Text Mining Small and Big Data for Quantitative Insights*

Kintigh et al (2014) recently published a survey of archaeologists that claimed to identify 'archaeology's most important scientific challenges'. Numerous commentators have critiqued the small sample size of this survey (181 respondents) and the subjective reading of the responses. We use quantitative methods to analyze the full text of the survey responses and discover different challenges to those highlighted by Kintigh et al. We also analyze over 6000 archaeology journal articles in JSTOR to investigate the importance of the 'grand challenges' over time. We show how quantitative analysis of text reveals the diversity and dynamism of archaeological topics.

[164] *Strontium and Lead Isotope Evidence for Paleomobility of Introduced Fauna in the Southern Caribbean*

Increasingly, studies seeking to understand the interconnectivity of precolumbian Caribbean island societies have employed isotopic approaches to identify the movement of peoples and goods between islands and continents. These investigations advance reconstructions of mobility and exchange, and their social context, by providing robust data on the non-local status of archaeological remains and their ultimate origins. Here we report on the results of strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) and lead isotope ($^{206}\text{Pb}/^{204}\text{Pb}$, $^{207}\text{Pb}/^{204}\text{Pb}$, and $^{208}\text{Pb}/^{204}\text{Pb}$) analyses of introduced South American mammals, agouti (*Dasyprocta* sp.), opossum (*Didelphis marsupialis*), and dog (*Canis lupus familiaris*), in the southern Lesser Antilles during the Ceramic Age, ca. 2500-500 BP. Importantly, we report new data for bioavailable strontium and lead for four islands with variable volcanic and carbonate geologies: Grenada, Carriacou, Mustique, and Barbados. When incorporated with zooarchaeological findings, these data inform on Amerindian exchange, socio-economic networks,

faunal exploitation, and the potential captive management of introduced animals and their possible ecological impacts.

[88] *The Form and Function of Lineage: Council Houses in Epiclassic Mesoamerica*

The council house (popol nah or nim ja in Maya languages) is found from North Mexico to southern Mesoamerica. With roots in Classic-period architecture and enduring until after the Conquest in some regions, the council house typically was located in central areas of civic-ceremonial centers and featured a rectangular colonnade and built-in benches. In situ glyphs and ethnohistory indicate that lineages used these buildings for ritual-administrative purposes, and perhaps also as dwellings. This paper analyzes the proliferation of the council house during the Epiclassic period and queries whether it can be considered diagnostic of Epiclassic architecture, and how its consistent form came to be spread over a wide geographic area.

[401] *Understanding Temporal Patterns of Occupation at Small Sites: The Case of Early Neolithic al-Khayran, west-central Jordan*

Beyond their identification and recording during survey, small sites have only occasionally and sporadically been the object of significant research in archaeology. Yet, such sites can be of great significance when trying to understand a wide variety of social systems and practices. While the potential practices associated with small sites in the past are virtually limitless, some patterns are commonly found within specific forms of settlement systems. Within autonomous village-based settlement systems, such sites can often play central roles in subsistence production and the exercise of land tenure. One aspect of the occupations at small sites within such systems that is especially important is the temporal dimension. Typically, small sites within autonomous village-based settlement systems are only occupied during a portion of the annual cycle. However, understanding the temporal patterns of occupation at such sites is often quite difficult, given the frequent paucity of materials available for analysis. This paper examines evidence for temporal patterns of occupation at the Pre-Pottery Neolithic B small site of al-Khayran. Because al-Khayran is the first such site excavated from this time period, understanding the role of the site within broader settlement systems is potentially of great significance.

[245] *There And Back Again: A Geochemical Analysis of Casas Grandes Shell Procurement and Exchange*

Previous studies of shell exchange in the Southwest have supported archaeological interpretations of competing regional networks in which the Hohokam, Sinagua, and Anasazi acquired shell from the Gulf of California, while the Casas Grandes, Mimbres, and Western Puebloan groups acquired shell from West Mexico. This study will build on previous analyses by integrating stylistic analysis with an expanded compositional database to further examine the role of shell exchange in the Animas phase region of New Mexico and Arizona. ICP-MS analyses of shell artifacts from 76 Draw will be combined with modern shell and an expanded Casas Grandes geochemical dataset to investigate potential regional sources for shell procurement. The geochemical analysis of shells from 76 Draw, as well as other Animas phase and Casas Grandes samples, will provide a clearer picture of exchange and interactions between the Casas Grandes core and sites in the borderlands.

Krummel, Jordan

[408] *A Bioarchaeological Analysis of Human Remains on the Summit of Tigre Pyramid, El Mirador, Guatemala*

On the platform between the triadic group on the Tigre pyramid at the site of El Mirador, Guatemala, the Mirador Basin Project discovered human remains scattered over the upper platform of this pyramid associated with hundreds of projectile points, in both local chert and obsidian from Central Mexico. Additional artifacts included shell, bone, and large quantities of Early Classic ceramics. This presentation will focus on the osteological remains from this deposit. Skeletal analyses of the remains will be considered with artifacts recovered in their proximity in order to reconstruct who these individuals were and the events that led to their deaths.

[285] *Fortified Settlements as Forces of Social Change Among the Ancestral Pueblo Peoples of the Northern San Juan Region*

The sociopolitical landscape of the ancestral Pueblo peoples residing in the northern San Juan region of the American Southwest was influenced and shaped in significant ways by a variety of pressures associated with the construction and habitation of fortified communities during periods of heightened social tensions and increased violence. Evidence of the formation of fortified communities and the implementation of various defensive strategies dates from at least three major periods of occupation within this region: the Basketmaker III period (A.D. 500–750), the Pueblo II period (A.D. 900–1150), and the Pueblo III period (A.D. 1150–the early A.D. 1280s). This paper explores the societal effects of defensive strategies employed during these periods, which, during the earlier periods, included the construction of wooden stockades that surrounded individual farmsteads or hamlets and, during the final period, included the aggregation of populous communities and the construction of fortified villages near springs in protective alcoves and on canyon rims. Among ancestral Pueblo communities of this region, diverse environmental and societal pressures necessitated the construction and habitation of fortified settlements, an adaptation that, in turn, strained existing social systems and forced the development of more complex and integrated sociopolitical organization.

Kuhn, Steven (University of Arizona) and Mary Stiner (University of Arizona)

[135] *The Antiquity of Hunter-Gatherers Revisited*

One of the challenges of Paleoanthropology is developing coherent models for ancient social and economic systems that have no close analogues in the recent archaeological and historical records. Systematic observations of variability among recent foragers produced by Binford, Kelly and others, are vital tools for understanding early humans. They provide necessary frames of reference for predicting variation, and for understanding why observations may not fit predictions. In a 2001 paper we argued that Middle Paleolithic hominins were very different kinds of hunter-gatherers than recent humans. Data accumulated over the past decade provide an opportunity to refine and reshape these arguments. Both theoretical and empirical findings highlight the importance of demographic factors in explaining the anomalous features of the Middle Paleolithic record. However, this begs the question of what might account for differences in the demographic potentials of hominin populations.

[82] *Where We Sleep: Ethnoarchaeological Perspectives on the Near Eastern Neolithic House and Households*

How many people lived in individual buildings within early food producing communities? Be it as an explicit driver or as an implicit background landscape, all modeling of small-scale household life, developing Neolithic villages, and the evolutionary trajectory towards the full-blown domestication is linked on some level to demography and the increasing scale of human communities through time. The reconstruction of the scale of Neolithic house, including our engagement with what may represent the shape and materialization of what can be called nuclear and extended households, is both complex and in need of further research. Ethnographic and archaeological studies demonstrate that the number of people living in early food producing houses, farms and villages varies depending upon household life-history, and that in many cases there is significant out migration of household members to other households or neighboring communities. Drawing upon comparative ethnoarchaeological research on 19th century houses and households from the fishing village of Inishark, Co. Galway, western Ireland, I explore how this comparative context reframes discussion of how we model social relations and connections within and between houses in specific, and Near Eastern Neolithic settlements in general.

Kukekova, Anna, Jennifer Johnson (University of Illinois at Urbana-Champaign), Anastasiya Kharlamova (Institute of Cytology and Genetics of the Russian), Rimma Gulevich (Institute of Cytology and Genetics of the Russian) and Lyudmila Trut (Institute of Cytology and Genetics of the Russian)

[28] *Genetics of Behavior in Fox Model of Animal Domestication*

Domestication as a special form of evolution offers valuable insight into how genomic variation contributes to complex differences in behavioral and morphological phenotypes. The silver fox (*Vulpes vulpes*) is taxonomically close to the dog but normally exhibit distinct patterns of aggressive and fear-aggressive behavior to humans. At the Institute of Cytology and Genetics (ICG) in Novosibirsk, Russia the process of animal domestication has been experimentally reconstructed and a strain of domesticated fox with behavioral patterns extremely similar to those of domestic dogs has been produced. The research program aimed to identify genetic regulation of these behaviors is under way. The Fox Experiment provides a strong support for genetics-centered view of animal domestication.

Kulaga, Nicole

[364] *When in the World? A Comparative Debitage Analysis of Single-component Sites through Time at Petrified Forest National Park*

Both Paleoindian and Archaic sites hold valuable information concerning some of the first people in North America, yet these sites remain to be some of the most difficult to identify. Without diagnostics like architecture and ceramics to turn to, projectile points are what are most commonly depended on when trying to date these locales. However,debitage makes up the bulk of the artifacts found on these sites and sites of later dates, and it is highly plausible thatdebitage characteristics will follow a pattern based on the technological changes that occur over time. Takingdebitage and the associated patterns into greater consideration allows for more accurate dating and data. In-fielddebitage analyses on single-component sites paired with analyses done in the past at sites spanning from the Paleoindian to Pueblo IV in the Petrified Forest is presented here. I will be looking at a variety of variables, including size, platform types and sizes, proportions of raw materials,debitage types, and other morphological characteristics. By doing so, I hope to find lithic assemblage signatures that correspond with specific time periods which would allow for Paleoindian and Archaic sites, as well as later sites, to become more distinguishable in the archaeological record.

[395] *Social Geoarchaeology: A Case Study of Structural Organization at Peyre Blanque, Ariège*
Recent studies of structural remains at Magdalenian open-air sites have provided valuable insights into patterns of occupation and intra-site spatial organization. However, interpretations of activities that may have occurred within the structures have primarily been limited to understandings of the repetition and duration of such activities. Determining more detailed use-of-space within the structures has been challenging at many sites due to site disturbance, not only from natural and anthropogenic post-depositional processes, but also from difficulties in amalgamating structural data from recent studies with those of previous excavations (e.g., at Oelknitz, Andernach-Martinsberg, and Gönnersdorf). Current excavations at the site of Peyre Blanque, Fabas, Ariège, have revealed a possible Magdalenian stone structure, and spatial analyses of the archaeological finds and structural remains have been implemented. For the first time at a Magdalenian open-air site, a systematic geoarchaeological analysis of the potential structure has been conducted to better understand the use-of-space within the structure, and the post-depositional and soil formation processes that have affected the structure and overall site. This study demonstrates how soil micromorphological and geochemical analyses provide a high-resolution record of human activities and environmental processes that can enhance our understanding of Magdalenian site occupation and social organization.

[335] *Discordant Relationships: Household and Community at Callar Creek, Belize*
From the Late Preclassic to the Late Classic period (400 B.C.E. to 900 CE), the Mopan Valley of Belize was a complex political landscape and an arena of intense political competition. During this time, the Valley witnessed the sequential rise of three, closely-spaced, major centers – centers likely in direct competition with one another – as well as the establishment and abandonment of minor centers and settlement clusters. The Mopan Valley Archaeology Project recently completed excavations and analyses of the minor center of Callar Creek. Located approximately halfway between the contemporaneous major centers of Buenavista and Xunantunich, Callar Creek was likely the home and administrative center for a low-level elite family. This paper will examine the relationships between members of the Callar Creek household and those living in both larger centers and small settlements. Excavations elsewhere in the Valley have suggested that individuals living at both major and minor centers actively cultivated relationships with those in adjacent hinterland settlements. Those living at Callar Creek, however, appear not to have engaged directly with those living in nearby settlements, and the Callar Creek household appears to have prospered while the surrounding households declined and were abandoned.

[20] *Some "Muse"ings on Past and Recent Encounters with Lutins, Naiads, and Non-Anthropomorphic Forces: Reconsidering Vocabulary and Questions Concerning "Religion" and "Belief" in the Face of Ethno-Archaeological Experiences in Madagascar*

This contribution involves a re-examination of assertions we have made in the past concerning “religion”, “belief” and “ideology: jettisoning some, reasserting others, and offering “refinements” where appropriate. Often limited cultural exposure to a circumscribed terrain of contemporary religions in service of the state contributes significantly to the initial framing of our questions (and attendant expectation of answers). One of our lives, embedded in context in rural and urban Madagascar, and our shared professional experiences in the field as ethno-archaeologists, have offered us some “alternative” insights because of a number of “grounded” and material encounters: with “imps”, “mermaids”, and “things; with others who have had such encounters; and with individuals capable of cajoling a range of quasi-anthropomorphic and non-anthropomorphic forces. On this edge between “religion” and “magic”, we focus attention on the audacious stance of specialists in a “lifeworld” (à la Jackson) where humans are sometimes ephemeral features among amoral autochthonous and immanent forces. We continue to argue that the inscrutability of some concrete material (syncretic) tropes of word, object, and deed in such lifeworlds might prove more challenging than the assumed insubstantiality of (orthodox) beliefs that may be deliberate artifacts of the calculated abstractions of ideologues (and later, social theoreticians).

[357] *Cranial Morphological Variation among Paleoamerican Skeletons: A Test of the Coastal Migration Hypothesis*

Although the origin of the first Americans has been resolved through genetics, the routes that early humans traveled from Asia into North and South America are still the subject of intense scholarly debate. Recent genetic and archaeological data suggest an early migration may have occurred along the Pacific coast of the Americas. Based on these lines of evidence, it is hypothesized that Paleoamericans may show morphological affinities to prehistoric skeletons from coastal sites if an early Pacific migration occurred. To test this hypothesis, I compared Paleoamerican crania (>8,000 years BP) to samples from 30 coastal and interior sites in North and South America (7,500 - 1,000 years BP). High-resolution digital models were created with a 3D surface scanner and used to record standard craniofacial landmarks. A suite of 3D geometric morphometric analyses was conducted with the coordinate data to assess similarities among the coastal and interior groups. The results indicate close affinities between nearly all Paleoamerican and coastal samples, but do not exclude the possibility of an interior migration during the initial peopling of the Americas. This research is in accordance with recent genetic, archaeological, and skeletal analyses addressing the possible migration routes and biological affinities of the first Americans.

Kvamme, Kenneth

[284] *NCPTT and the Growth of American Archeogeophysics*

Before the turn of the millennium there were few practitioners of geophysical prospecting in American archaeology. In this relative vacuum NCPTT came into being at the right time, situated to support and promote these methods for site exploration, documentation and, in effect, preservation of site structural information because vast areas of the subsurface and its archaeological content could finally be mapped. In the late 1990s NCPTT was an early supporter of research into the integration or “fusion” of multiple geophysical data sets as means to build on relationships between complementary information and to provide a fuller picture of the subsurface. Since that time these approaches have risen to the forefront and occupy a central focus of contemporary research. By the early 2000s NCPTT also funded website development to promote knowledge of archaeological geophysics among American archaeologists and to share information about results across the country. In more recent years the NCPTT realized the importance of expanding knowledge of instrument capabilities and theoretical knowledge of the geophysical responses to archaeological

phenomena. Through these efforts NCPTT has been a constant promoter and support of geophysical prospecting in archaeology.

Kvamme, Emily (Four Corners Research)

[364] *Tree-Ring Analysis at Petrified Forest National Park, Arizona*

Samples of ponderosa pine and juniper have been collected from various historic sites at the Petrified Forest National Park. Historic sites include several structures that were built by the Civilian Conservation Corps in the 1930s, old fences and sign posts, as well as Navajo hogans. The CCC structures were constructed with ponderosa pine beams that were imported to the park from sources not too far from the Petrified Forest. From tree-ring analysis, climatic variations in the past can be inferred from these CCC structures. Old fences, sign posts and Navajo hogan roof beam samples of juniper are also being analyzed. The presence of cut old growth juniper is apparent and will provide an interesting perspective on past structures in the Petrified Forest.

[407] *Farming as a Dominant Subsistence Strategy? Organic Geochemical Analyses on Potsherds from Prehistoric Korean Peninsula*

This study attempts to understand prehistoric human subsistence in Korean peninsula using organic geochemical analyses on potsherds. Organic geochemical analyses strive to be precise about the types of food groups that were processed within a pot by attempting to isolate and identify the specific organic compounds trapped in the fabric of its wall or adhering to its surface in residues. Traditionally, the transition from foragers to farmers in the central part of the Korean peninsula has been described as the subsistence change from hunter gathering to intensive rice farming around 3400 BP. However, due to the limited paleobotanical evidence in this region and high acidity of the sediment, detailed information about the subsistence is not yet known. Organic compounds have the advantage in that they are often preserved directly within archaeological ceramics. Studies have showed that high-temperature boiling using pottery is particularly effective in the preparation of various resources. In this regard, the methods have potential to become important tools of investigation to better understand the subsistence of ancient Korean people. This research provides a unique opportunity to reveal the characteristics of the transition from foragers to farmers in the central part of the Korean peninsula.

[11] *Macro-Scale History of the Lake Titicaca Region, Peru and Bolivia: A Synthesis and Comparative Analysis of Settlement Patterns*

The Lake Titicaca region of Peru and Bolivia has been extensively surveyed by a number of archaeologists over the past 3 decades, but the accumulated data await systematic synthesis and comparative analysis. This study places the settlement pattern data from a dozen different surveys into a uniform analytic framework that focuses on demographic dynamics and their relationship to political change. Substantial regional variation is apparent in characteristics such as the variability of total population size through time, whereas trends such as changes in rank-size relationships display greater inter-regional synchrony of sometimes surprising patterns.

La Motta, Vincent M. [343] see Estes, Byron

La Salle, Marina (Vancouver Island University)**[13]** *The Institution of Archaeology*

Archaeology is perhaps now, more than ever before, a viable career choice for university students. Although academic positions seem to be dwindling, opportunities in contract, commercial, or compliance archaeology are skyrocketing as the development ethic of North American capitalism continues to expand. Armed with a field school and a handful of undergraduate courses, these new graduates represent the dominant practice of archaeology today. The question is, what are they practicing? Who has been teaching them, and what are they learning in their archaeological education? In this paper, I take a critical approach to the who, what, where, when, how, and why's of the institution of archaeology. In the gap between theory and practice -- between what is said versus what is done -- the unspoken power of archaeology as an ideological tool of the state is exposed. While this conclusion has been long-established, archaeological educators remain reticent to directly confront this "negative reality" in their classrooms, pressured by both within and without. The result is that the institution of archaeology remains complicit in what is ultimately a hegemonic project of imperialist violence.

Lack, Andrew and Todd Bostwick**[209]** *Games, Feasting, and Trade Fairs: Assessing the Relationship between Ball Courts and Exchange at the Ironwood Village Site*

A significant amount of research in Hohokam archaeology has been dedicated to understanding the structure of interaction and exchange. One particular model that has gained recent momentum is that of a marketplace economy revolving around ball court events that served as gathering points for social and economic interaction. These markets, or trade fairs, would have provided a reliable mechanism for the exchange of goods to spatially and socially disparate populations. Feasting also may have been associated with the ballgames. Villages possessing a ball court may have achieved a socially and economically prominent status within their communities, and likely had greater access to non-local and other socially-significant goods. Recent excavations at the Ironwood Village Site in the northern Tucson Basin have revealed a previously unknown early ball court. In this study, we assess the relative proportions of local and non-local artifact classes, along with socially valuable goods, from deposits that immediately preceded and followed the construction of the ball court. Spatial relationships of features adjacent to the ball court are also examined. The results are then compared to other ball court and non-ball-court villages in the vicinity to better understand the strength of association between ball courts and exchange.

Lacombe, Sebastien (Binghamton University)**[395]** *Investigating the Symbolic Aspects of Flint in the Making of Prehistoric Cultures: The Case of the Middle Magdalenian of Southwestern France*

Recent research on Magdalenian flint provisioning strategies in southwestern France, particularly from sites associated with decorated caves, have opened doors to new interpretations regarding the role that these materials played in the construction and maintenance of Magdalenian society. Beyond the traditional typological and technological factors that seem to mainly fluctuate according to circumstances, more consistent symbolic functions appear to have been imbedded in most of these materials, and in close connection to the area from which they originate. Echoing similar behaviors noted in other prehistoric contexts, these observations offer a genuinely renewed vision of Magdalenian culture.

Lacy, Sarah (University of Missouri-St. Louis)**[40]** *Using Oral Health Indicators as Evidence of Environmental Instability and Subsistence Shifts in the Late Upper Paleolithic of Western Eurasia*

Oral pathology prevalence can be used to make inferences about the behavioral and environmental factors that contribute to individual and population health. Late Upper Paleolithic Western Eurasian human groups were expanding geographically as well as increasing in density, and the major climatic oscillations that define this period stressed these pioneering humans. Evidence of this strain includes temporal differences in oral pathology prevalence, namely caries, periodontal disease, tooth

loss, and evidence of oral infection, taken from 124 Upper Paleolithic individuals. Relative to the Early Upper Paleolithic, these Late Upper Paleolithic peoples show increased caries and periodontal disease prevalence, likely reflecting a shift towards carbohydrates from fats as the major nutritional supplement to an otherwise high protein diet. This would be an adaptation to increasing food resource pressures and reflect shifting ecozones. Though the severity of periodontal disease and percentage of teeth affected by alveolar lesions actually decreases in the Late Upper Paleolithic, more individuals are affected and tooth loss prevalence increases dramatically. This may indicate increasing cultural buffering of the effects of poor oral health and ultimately subsistence and environmental change. These trajectories continue into the Mesolithic. Terminal Pleistocene oral health reflects changing environmental conditions relative to the earlier Upper Paleolithic.

LaDu, Daniel (the University of Alabama) and Ian W. Brown (the University of Alabama)

[220] *The View from Mazique (22Ad502): Reconsidering the Coles Creek / Plaquemine Cultural Transition from the Perspective of the Natchez Bluffs Region of the Lower Mississippi Valley*
Around A.D. 1000 Mississippian culture emerged in the Eastern Woodlands of North America. Originating around the confluence of the Missouri and Mississippi rivers, Mississippian culture rapidly spread south and east, radically transforming Late Woodland societies in its wake. Although Mississippian culture had come to dominate much of the interior of the Southeast by A.D. 1100, its advance into the Lower Mississippi Valley was impeded. Here, Mississippian societies encountered the Late Woodland Coles Creek culture that resisted replacement or transformation for the better part of a century, and it was not until A.D. 1200 that the Lower Mississippi Valley experienced a major reorganization of lifeways. Through the selective adoption of new forms of socio-political organization, settlement, and subsistence, Coles Creek culture gave way to Plaquemine culture. Current perceptions of this transition rely heavily on studies conducted in the Lower Yazoo and Tensas basins, and have produced conflicting interpretations regarding Plaquemine origins. Drawing on the results of excavations conducted during 2012 and 2013, this paper examines how this important transition manifested at the Mazique site and reconsiders Plaquemine culture from the perspective of the Natchez Bluffs region.

Laffey, Ann (University of Florida)

[153] *What's in your Ancient Chicha? Ethnoarchaeology and Organic Residue Analysis*
Ethnoarchaeological chicha brewing was conducted on modern ceramic sherd samples for organic residue analysis. The goal was to identify botanical biomarkers that can evidence the use of *Schinus molle* L., Erythroxylaceae coca, and *Echinopsis pachanoi* (San Pedro cactus) for ancient brewing in the Middle Horizon (MH) era (c. 600-1100 CE). There is strong evidence that during this period socio-political influence was inexorably linked to the ability to provide chicha in exchange for labor, goods, and during competitive hosting. Oversized vessels, likely used for boiling and fermentation, as well as fineware and plainware serving and drinking vessels suggest that both the MH Wari and the Tiwanaku secured their interests by serving large amounts of chicha. All three botanicals have been identified in MH paleobotanical assemblages. However, whether they were used in chicha recipes remains unknown. This research is designed to identify these ingredients in archaeological ceramic assemblages in an effort to refine our understanding of large-scale Middle Horizon chicha production. By tracing these ingredients it may be possible to identify chichas that were restricted to ritual use, seasonally limited chichas, and chichas that were used for mass consumption. Pressurized liquid extraction and gas chromatography-mass spectrometry were employed to qualify chemical biomarkers.

Lafrenz Samuels, Kathryn (University of Maryland, College Park)

[405] *Parsing 'Public' for Heritage Management in the Transnational Sphere*
Engaging local communities and the many publics has become responsible practice for archaeologists and heritage managers. However, the character of the public sphere is changing. Neoliberal reforms around the world have seen private and commercial actors increasingly fill the vacuum left in the wake of state withdrawal from social services provisioning. This withdrawal has meant the blurring of public and private interests and opening of new governance mechanisms

beyond those of the nation-state. Therefore, the landscape of archaeological heritage in the 21st century is increasingly shaped not simply by local and national frameworks for heritage management but also transnational ones driven by private, commercial, and non-governmental entities. In this talk I discuss the significance of these reformulations of 'public' activity in the transnational sphere for archaeologists seeking to collaborate with public partners. Focusing on issues of particular transnational import helps draw out in sharp relief the opportunities and challenges posed by the diverse publics of archaeology in the transnational sphere. I therefore situate my discussion within the unfolding crisis of global climate change, around which a suite of key markers of transnational heritage management may be found, including economic development, corporate social responsibility, public-private partnerships, human rights, and deliberative democracy.

Lake, Mark (University College London)

[191] *Is Wright-Fisher Reproduction an Appropriate Null Model for Cultural Transmission via Objects?*

For various reasons many archaeologists are interested in identifying what kinds of social learning operated in past societies. One approach to this problem that has proved increasingly popular since it was pioneered by Neiman in the 1990s is use of the Wright-Fisher population genetics model of reproduction as a null model for human cultural transmission. The basic idea is that a mismatch between the amount of cultural diversity predicted by the neutral allele theory and that actually observed (e.g. artifact types) provides evidence for interesting biases in social learning, such as conformism or anticonformism. Archaeological applications of this null hypothesis have to date produced a variety of results, but it has recently been demonstrated by Premo that the time-averaged nature of many archaeological assemblages may lead to false inferences about the presence of biases in social learning. In this paper we investigate a further concern, which is that disanalogies between biological and cultural reproduction may similarly result in false inferences. In particular, cultural transmission via material objects may produce levels of diversity that do not match those predicted by the Wright-Fisher model even if social learning was unbiased.

[90] *Archaeological Collaboration in North America: Are "Benefits" to American Indian Communities Truly Being Maximized?*

With the continued evolution of collaborative archaeological projects between American Indian communities and archaeologists in North America archaeologists are constantly speculating ways in which their research will benefit American Indian communities. However, do archaeological research goals and agendas truly and positively contribute to the wants and needs of tribal communities involved? This paper examines various case studies in reference to collaborative archaeological projects in North America. The authors conducted a literature review of published deliverables from collaborative archaeological field projects to gain a better understanding of the continued disconnect between archaeological research goals and the utilization of collected data for "mutual benefit." Ranging from continued paternalistic notions to discrepancies in access to funding and social capital, various issues in the archaeological collaborative context need to be further critically examined.

[75] *Within and Between: A Comparative Discussion of Intra-site Variability and Hinterland Complexity at the Sites of Yaxché, Yucatan and Cerén, El Salvador*

Long-standing research at sites like Cerén exemplifies the increased interest in rural households and settlements and the shift away from the elite-centric nature of many earlier projects in Maya archaeology. Our expanding knowledge of ancient Maya hinterlands has allowed us to consider the heterogeneity that these smaller settlements displayed and revise our western binary perspective of “urban versus rural”. Recent investigations by members of the Ucí-Cansahcab Regional Integration Project (UCRIP) have revealed a range of variability among Yaxché households, including wealth, economic specialization, ritual activity, access to non-local goods, and occupation histories. In this paper, we discuss the intra-site variability found at Yaxché in an attempt to glean insights on social organization and socioeconomic integration of this hinterland. Comparing household behaviors and supra-household interactions at the ancient Maya sites of Yaxché and Cerén allows us to underline the diversity found within and between hinterland occupations. Ultimately, we wish to contribute to our understandings of ancient Mesoamerican communities and underscore the plurality and complexity of “rural” occupations.

[3] *Locally-Made or Transported Heirlooms?: XRF Source Analysis of Post-Removal Choctaw Ceramics from Southeastern Oklahoma*

This paper explores the benefits of using compositional analysis in order to investigate whether post-removal Choctaw-made ceramics were locally made in southeastern Oklahoma and/or were transported from their original homeland in east-central Mississippi. A total of 20 sherds were analyzed using X-ray fluorescence spectroscopy (XRF) to determine their chemical composition. 10 sherds are from two post-removal Choctaw sites, 34MC544 and 34MC399 and were compared with 10 sherds from the Pevey site, 22LW510. Similarities and/or variations in chemical composition of Choctaw-made sherds may shed light on the symbolic importance of why and how the Choctaw chose to maintain traditional pottery manufacturing practices during the post-removal period.

[150] *Paleoindians on the Postglacial Margin: Early Holocene Hunter-Gatherer Mobility in Northern Wisconsin*

The area south Lake Superior was first colonized by Late Paleoindian groups during the Early Holocene after the final retreat of the Laurentide ice sheet from the region. As a result, Paleoindian sites in the area are ideal for testing ideas about the nature of hunter-gatherer adaptive responses to early postglacial environments. This project presents data from reanalysis of the lithic assemblages from a number of sites spread across northern Wisconsin and Michigan's Upper Peninsula. The first hunter-gatherer groups to occupy the region would have encountered a rapidly changing boreal forest environment with no clear modern analog. Long-distance transport of high quality raw materials and the composition of lithic toolkits both indicate that high residential mobility, investment in key organic technology (i.e., watercraft and tailored leather clothing), and seasonal use of emerging wetland environments were important strategies used to cope with the unique ecological challenges presented by this recently deglaciated landscape.

[152] *Investigating Resource Sustainability during Two Millennia of Occupation on Ebon Atoll, Marshall Islands: The Ichthyoarchaeological Evidence*

Low coral atolls, consisting predominately of unconsolidated sand and gravel, are commonly less than 2 m above sea level; consequently, atolls are amongst the most precarious landscapes for sustained human occupation in Oceania. Constraints encountered by colonizers include nutrient-

poor soils and salt laden winds which hindered plant growth, the absence of perennial surface freshwater, limited terrestrial biodiversity, and an inherent vulnerability to extreme weather events. Conversely, the marine ecosystem is exceedingly rich and diverse. Recent excavations have documented two millennia of continuous occupation on Ebon Atoll where fish remains are ubiquitous throughout the sequence. Ecological measures of diversity and trophic level analysis were applied to assess resource sustainability over time. This diverse range of analytical methods provides a more comprehensive understanding of the dialogue between humans and their environment.

[73] *Climate, Resources and Strategies: Simulating Prehistoric Populations in Semi-Arid Environments*

The aim of this study is to model resource management and decision making among hunter-gatherer and agro-pastoral groups in semi-arid zones in order to explore evolutionary trajectories in relation to (a) the appearance of other specialized groups during the mid-Holocene and (b) environmental variability. The study of coexistence and interaction between groups with different subsistence strategies and land-use behaviors represents an interesting research challenge to understand socio-ecological dynamics. This study deeply depends on the appreciation of past settlement dynamics and resource management and the approach is through Agent-Based Simulation. Our case study focuses in Northern Gujarat (India), a marginal environment between the Thar Desert and the more fertile area of Saurashtra. This region is an ecotone characterized by the seasonal influence of the monsoon, where contrasting ecological niches are in tension and small climatic shifts can generate significant environmental changes. Archaeological evidence points to the presence and possible coexistence in the area of groups of people with different resource management strategies and mobility behaviors during the mid-Holocene: hunter-gatherers (HG) and agropastoralists (AP).

[366] *Engaged Investigation: Archaeology within Copán's Past and Contemporary Neighborhoods*

Generations of Copán archaeologists have revealed the secrets of royal tombs and hieroglyphic inscriptions, as well as explored humble households of the rural periphery. A new project brings together these two initiatives to study the diversity of settlement within one particular neighborhood of the ancient city. Growth and change in the San Lucas neighborhood are articulated with major political events at Copán's center to assess the degree of state integration, and more importantly, when, how, and why this degree fluctuated over time. Simultaneously, the project prioritized community integration with the indigenous people residing in today's San Lucas. We collaborated with a local high school to teach a year-long introductory anthropology course and directly involved students in the excavations. This talk highlights how typical academic archaeological investigation may be productively coupled with high school education through a focus on neighborhoods and a blurring of the arbitrary distinction between past and present.

[212] *Zooarchaeology in the Southwest: Ritual Consumption and Faunal Resources at Ridge Ruin Pueblo*

The greater Sinagua region spans a distinct convergent geographical and cultural setting which provides a range of resources. Ridge Ruin is a prominent Sinaguan site occupied during the

transition from the Pueblo II to Pueblo III period. In 1941, John MacGregor published a bulletin summarizing the results of his Winona Village and Ridge Ruin excavations. In MacGregor's report and in the few publications on Ridge Ruin since, the majority of research has concentrated on the famous burial of the Magician. MacGregor's lengthy bulletin includes only a brief summary of the faunal analysis, which combined a small sample of faunal data from both Ridge Ruin and Winona Village excavations and provides minimal detail about faunal use in the sites. In this paper, I summarize and interpret the results of a recent analysis conducted on the long curated Ridge Ruin faunal assemblage from the Museum of Northern Arizona. Additionally, this analysis provides a preliminary discussion regarding whether the faunal remains reflect the previously established interpretation that Ridge Ruin was a ritual site, as evidenced by the focus on the Magician burial.

[31] *Investigations at the Mouth of the Río Ica, Peru: A Preceramic Record of Rich Seas, Fog Meadows, Incipient Agriculture and Shorelines*

The earliest evidence of human occupation on the Río Ica, south coast Peru are middens at the river's mouth, accumulated through episodic fisher-hunter-gatherer occupations during the Middle Preceramic Period. We present results of ongoing investigations and dating of these sites to between 7,000 and 6,000 cal yr BP. Apart from a variety of rich marine resources, the occupants of these middens also exploited the river estuary, riparian woodlands in the river floodplain and lomas (or 'fog meadow'). The long Middle Preceramic is a period critical in three respects: (1) the onset of modern El Niño (ENSO) conditions after millennia of apparent quiescence; (2) eustatic sea-level stabilization, and (3) the gradual transition to sedentism and agriculture here. Interplay between these factors determined the availability of resources to prehistoric populations through, for instance, drinking water, the size of the estuary, beach formation, the extent and composition of adjacent lomas vegetation and indeed, the technologies developed to exploit them. We seek to understand and date these processes of environmental and social change because they are essential to understanding early human trajectories here, not least the transition from fishing and gathering to agriculture.

Lane, Rachael (University of Sydney)

[36] *Difference Theory and the Relevance of the Archaeological Past to the Present*

The relevance of the archaeological past to the present is not usually considered an ethical or moral issue, except in the context of western heritage and conservation values. There appears to be both internal conditions to archaeology, as well as external conditions, that prevent the relevance and use of archaeological knowledge. The notion of relevance is frequently embedded in presentist discourses in the humanities and social sciences with an emphasis on sociality, and social recursive methodology. Materiality is viewed as an epiphenomenon of the social and 'the individual' is placed as a prescriber of materiality. This is also an anthropocentric view elevating 'the category of the human' to a platform from which all else is subjugated. Difference theory attempts to get away from presentism and social-centricism within archaeological theory and interpretation, and public perception. The theory proposes that social rates of change will be at odds with material rates of change, causing productive dissonance. We have an impetus to study the past from the long-term material perspective if we know it can provide useful insight into the present, particularly if what can be observed holds relevance to the sustainability of human communities in modernity.

Lane, Brian (University of Oregon)

[233] *The View from Rapa: Behavioral Ecology and Fortifications in Polynesia*

Fortifications are found in the archaeological record around the world. Studies of fortifications on the landscape tend to focus on aspects of human territoriality, especially in relation to conflict,

economics, and resources. This paper takes a Human Behavioral Ecology approach to territoriality and applies the use of viewsheds, as derived from a GIS database, to the examination of a central resource. Rapa, Austral Islands, French Polynesia, is often cited as a classic example of an island that was divided by territorial groups, as exemplified by the prominent fortified hilltop villages (pare). Enough work has been conducted on Rapa to provide an understanding of the island's culture history, and new geographic data are available that allows for expanded investigations. The objective of this paper is to quantitatively test the relationship between pare and the visibility of the most likely resource linked to territorial behavior, irrigated agricultural terrace systems. This work utilizes methods similar to those used in previous work in Fiji in order to test the strength of relationship between views between fortification and views of resource areas (Smith & Cochrane 2011).

Lange, Christine

[55] *The Use of Shell Ornaments at Las Capas, an Early Agricultural Site in Southern Arizona*

Recent excavations at the site of Las Capas, located along the Santa Cruz River in the Tucson Basin in southern Arizona, have given us an opportunity to examine an Early Agricultural period site in this area. Along with other pieces of material culture such as flaked stone and ground stone tools, ornaments manufactured from marine shell were also part of the lifeway of the local inhabitants. Deriving from locales in California and northern Mexico, where established marine shell ornament manufacturing industries were thriving, the shell ornaments of personal adornment recovered from this Early Agricultural site suggests that the local inhabitants were active participants in maintaining social and economic networks outside of the immediate surroundings. They also reveal that Early Agricultural period populations placed a high value on their shell ornaments. The study of shell ornaments recovered from Early Agricultural sites gives us a glimpse into the past as we attempt to understand the social, economic and cultural ways of earlier populations.

[347] *Parsing out Differential Plant Use among Households during a Period of War in Puno, Peru*

In the Peruvian altiplano near Lake Titicaca during the Late Intermediate period (LIP; A.D. 1100 to 1450) peoples' lives were overwhelmingly structured by warfare. Martial conflict between competing ethnic groups incited people to live defensively in fortified hilltop villages during the LIP. However, little is known about the agricultural practices and the internal sociopolitical dynamics of these fighting communities. Drawing on recent excavations and macrobotanical data collected from Ayawiri, one of the largest hillforts in the northern Lake Titicaca basin, I present information about the community's agricultural food products and intracommunity relations during this violent time period. Ayawiri is organized into household compounds. By comparing paleoethnobotanical remains recovered from various compounds throughout the site I identify the distribution of resources and possibly wealth allotment across the Ayawiri community during the LIP. This research also elicits a picture of differential landscape exploitation by various households during the LIP. By comparing household plant use to the landscape ecology surrounding the site, the data will shed light on which households had access to and utilized various microenvironments. These paleoethnobotanical results offer a more nuanced picture of household community relations during the altiplano LIP.

[188] *Keeping Up with the Times: Evolving Programs and Publics*

As an organization for both professional archaeologists and laypersons the Archaeological Institute of America's role in archaeological outreach and education has evolved and expanded over the course of its 136 year history. The Institute has launched a number of initiatives in response to perceived needs and strategic plans to promote the understanding of archaeology. Since 2004, the AIA has expanded its efforts locally and globally through Local Societies, International Archaeology Day, and the Site Preservation Program.

Today the AIA is calling for a more concerted effort to collaborate and to establish a network of committed professionals. To stimulate this cooperative endeavor, the AIA hosted a conference entitled Building a Strong Future for Archaeological Outreach and Education in January 2015. Program topics included ethics in archaeological outreach and education, state and regional approaches to outreach and archaeology, high school archaeology courses, teaching with archaeology, metrics, and promoting archaeological outreach. The AIA sees this as the first in a series of programs that will allow archaeologists and heritage educators to define best practices and develop effective ways to increase public awareness of archaeology.

[360] *A Winter at Akulivik: Faunal Analysis of a Thulean House at the Site of Kangiakallak-1 (Nunavik, Québec)*

The site of Kangiakallak-1 (JeGn-2 – AKU-10-018), located near Akulivik (Nunavik, Québec), has yielded several occupations attributed to the Dorset and Thule periods. Level A corresponds to a Thulean winter house for which collapse and preservation in permafrost provides an excellent and undisturbed record of Thulean lifeway. This paper presents the results of a faunal analysis conducted on animal remains found within the Level A house. The dominant species recovered were caribou Rangifer tarandus, ringed seal Pusa hispida, and bearded seal Erignathus barbatus. Faunal materials were extremely well preserved, enabling an accurate taphonomic reconstruction of human butchery and consumption patterns. Butchery practices particularly differ between species of terrestrial mammals (caribou), for which emphasis was put on marrow was systematically exploited, and species of marine mammals, for which soft tissues were predominantly utilized. The Level A house at Kangiakallak-1 reflects the range of economic activities conducted by Thulean people, but also how people's mobility related with the distribution of resources across the landscape.

Lapeña, Queeny (California State University, Los Angeles), Jessica Morales (California State University, Los Angeles) and René Vellanoweth (California State University, Los Angeles)

[32] *The Distribution and Chronology of Abalone Middens on the California Channel Islands*

The California Channel Islands contain one of the most productive coastlines in the world. Despite the perceived marginality of available resources on the islands, they encompass approximately 428 linear kilometers of rocky and sandy bottom habitats that have abundant shellfish beds. Thousands of shell middens dated to the past 12,000 years attest to the importance of these resources to native islanders. In this paper, we define the ecology and biogeography of intertidal shellfish communities and summarize the paleoenvironmental conditions that directly affected the productivity of past marine environments. Abalone middens provide an ideal example to examine past human/environmental dynamics through time. For this paper, we provide a summary of the distribution and chronology of abalone middens across the Channel Islands. Although typically referred to as red abalone middens, they exhibit variability in the species of abalones and other

faunal remains present, as well as in the types of artifacts and features that occur at these sites. The diversity of abalone middens suggests island-specific differences in shellfish communities, harvesting patterns, as well as the type of behavioral activities that took place at each site and on each island.

Lapeyre-Montrose, Stephanie (Simi Strathearn Historical Museum)

[27] *Forget Me Nots: Smaller Collections Need Archaeologists Too*

From Native Americans to Spanish and European settlers, Southern California has a rich history. One town in particular, Simi Valley, incorporated in 1969, was home to several Chumash villages, part of the Santiago Pico 1795 Land Grant, and attracted European settlers. CA-VEN-346, the El Rancho Simi Adobe, was occupied during all three eras. It was a Chumash village, home to Santiago Pico, and home to European settler Robert Strathearn and family. When Robert Strathearn purchased the El Rancho Simi Adobe in the 1890s, he added onto the Adobe rather than destroying it, preserving both Spanish and European history. Upon Strathearn's death, he willed the property to become a historical park and museum, thus preserving and educating others about Simi Valley history. In addition to the El Rancho Simi Adobe collection, the museum houses several other Chumash collections from multiple sites throughout Simi Valley. Unfortunately, all of these collections have remained in storage untouched. In fact, many researchers are unaware of their existence and need for attention. Recent interest in the collection has prompted the museum to look for additional ways to attract researcher's interest to study the forgotten and long overlooked shelved collections.

Lapp, Jennifer (SUNY at Buffalo)

[133] *The Lithics of Conchal, Nicaragua and the Story They Tell*

During the excavations of Conchal, Department of Rivas, Nicaragua relatively few lithic materials were encountered. While there were only 315 lithic pieces found, much can be learned from these pieces; this includes the daily activities that the prehistoric population conducted. By examining the data from the excavations, it was determined that the population began as a semi-nomadic one that eventually permanently inhabited the area. The formal and informal tools, along with the site furniture allow us a glimpse of how the original population survived and then began to thrive along the coast of Pacific Nicaragua during the Sapoa Period. Flakes were found most frequently, followed by metates and metate pieces. Other tools found include: points, scrapers, celts, hammerstones, manos, pestles and hand axes.

[65] *Backed Knives and Subsistence Strategies at the Hurdy Gurdy Bridge Site*

Excavations conducted near the ancestral Tolowa village of Naa-k'vt-'at on the South Fork of the Smith River produced unexpected results in terms of the apparent absence of tools, such as harpoon tips and fishing weights, related to salmon fishing. Rather, an unusual lithic tool was identified, described as a "backed" knife produced from splitting a biface or uniface longitudinally to facilitate hand-held use. This paper will explore the possible function(s) of this tool in ancestral Tolowa assemblages and then compare the overall lithic assemblage of CA-DNO-1028 with the results from limited testing conducted at the ancestral village of Lhch'aa-ghii-li~ (CA-DNO-34) located downriver at the confluence of the middle and south forks of the Smith River. The clear identification of salmon fishing implements at CA-DNO-34 and the absence of these tools at CA-DNO-1028 suggest that the backed knives must have functioned in a capacity other than salmon processing and that upriver settlement was the focus of subsistence activities other than salmon fishing despite their availability.

[168] *Anthropogenic Thermal Alteration of Marine Bivalves, Recrystallization, and Isotope Integrity*

Archaeologists have given little direct attention to the taphonomic effects of cooking methods for

marine invertebrates, particularly the effect on shell mineralogy. Various methods of heating and steaming shellfish directly in the shell are recorded as traditional for Northwest Coast peoples and the shell samples at the Tse-Whit-Zen Village site in Port Angeles, Washington State, contain many specimens that visually appear to be thermally altered. This type of heat exposure has been shown experimentally to cause aragonitic fish otoliths to convert to calcite and become depleted in ^{18}O and ^{13}C , and thus become unsuitable as a source of isotope ratios for paleoenvironmental reconstruction. Biogenic aragonite in marine molluscs is known to alter in the same way, but at lower than expected temperatures. I conducted controlled heating experiments of modern specimens of four taxa of molluscs common in the site assemblage (*Clinocardium*, *Saxidomus*, *Leukoma*, and *Ostrea*) to determine the conditions (temperature, time) at which isotopic integrity was lost.

Larsen, Clark (Ohio State University)

[178] *Lives in Transition: Impacts and Adaptations in the Georgia Bight*

The St. Catherines Island Archaeological Project, now more than 40 years in duration, has provided a wealth of data for addressing questions and hypotheses about native adaptations in the Georgia bight. Owing to the rich archaeological context and robust research design, the project has provided opportunities to document and interpret key developments and adaptive transitions in ways not dreamed of when fieldwork began in 1975. The bioarchaeological arm of the investigation, viewed in its rich social, cultural, and natural contexts, focusses on the pre- and post-contact populations inhabiting the island and the Georgia bight generally. This paper discusses the long-term study of two key adaptive transitions, the foraging-to-farming transition in late prehistory and the impacts of exploration and colonization by Spain. The research provides a comprehensive record of time transgressive changes in health, lifestyle, and adaptations that forever altered the landscape and the people inhabiting it. Although the results of this study focus on one region, the implications are global in scope.

[28] *Paleo-Population Genomics as a Means to Understand the History of Dog Domestication*

Dogs were unquestionably the first domestic animal and the only animal domesticated within a hunter-gatherer context prior to the advent of agriculture. Understanding the precise temporal and geographic origins of domestic dogs has proven difficult for several reasons including: the widespread distribution of wolves and the lack of easily interpretable phylogeographic signatures among modern dog populations. More recently, studies making use of high-coverage genomes of dogs and wolves have demonstrated that the wolf population from which all dogs descend is likely extinct, only exacerbating the difficulty in identifying the wolves which gave rise to dogs. In addition, the history of both domestic plants and animals has incorporate significant degrees of admixture between domestic animals and wild populations that were never involved in the original domestication process. Here, I present an empirical demonstration of long-term admixture and how that limits our ability to understand the origins of dogs. In addition, I will present case studies of how we can overcome these limitations by generating nuclear sequences from global samples of ancient dogs and wolves, and how the results may provide answers to where, when and how many times dogs were domesticated.

Larson, Katherine (University of Michigan)

[101] *Raise a Glass: The Late Hellenistic Origins of Domestic Glass Tableware*

For over three millennia after its discovery in the early Bronze Age, glass in the Near East was used almost exclusively in palatial, religious, and funerary contexts, ascribed with high status reflecting the intrinsic or perceived value of the material. But during the last few centuries B.C.E. this pattern changed, as glass cups and bowls began to appear in domestic and other urban areas in greater quantities. This transition occurs before the discovery and diffusion of glass blowing in the first

century B.C.E., which has largely been credited for the democratization of glassware. Instead, sagging and molding technologies, already practiced by the fourth century B.C.E., became utilized on a wider scale and were effective enough so as not to be supplanted by blowing for almost two centuries after its invention. At the same time, elite, cosmopolitan customers began to demand a supply of glass skeuomorphs of metal, ceramic, and wooden drinking vessels. I argue that two major factors contributed to this new function and market for glass: a decrease in the price of the raw material which enabled it to be manufactured and sold more affordably, and an aspirational economic and social class which emulated palatial consumption practices.

Larson, Mary Lou (University of Wyoming), Marcel Kornfeld (University of Wyoming) and George Frison (University of Wyoming)

[166] *Mammoth Bone from Hell Gap*

Mammoths and thus mammoth bones are associated with Clovis occupation of North America, while subsequent cultures are associated with *Bison antiquus* (Paleoindians) or various Holocene faunal species. However, this simple scenario is complicated by occasional occurrences of extinct species in later period assemblages. The Hell Gap site joins this exclusive club with a recent discovery of a mammoth tusk in deposits at Locality I. The Hell Gap site in eastern Wyoming is a stratified Paleoindian multilocality in the midst of mammoth finds, but without a well-defined Clovis component. The purpose of this presentation is to evaluate the context of the tusk object, describe its features and consider its place in our understanding of early Paleoindian existence in North America.

[315] *A Pilgrimage Lost and Found: Cultivation and the Cult of Saint Leo on Inishark, Co. Galway*

Pilgrimage traditions on islands along the coast of Connemara in western Ireland provide a valuable context for exploring the relationship between ritual practice, identity, and political economic change from a long-term perspective. The island of Inishark, Co. Galway, contains a number of ritual remains dating from the 9th-13th centuries, including a church, a holy well, cross-slabs, one or more burial grounds, as well as a number of penitential stone platforms known as leachta. Islanders in the 19th and 20th century incorporated some of these monuments into processional circuits associated with the veneration of St Leo. The origin of St Leo's cult remains obscure, but new research suggests how islanders adapted a medieval liturgical landscape to confront new ecological and political economic circumstances. Using excavation data alongside LiDAR survey, antiquarian accounts, census records, ordnance survey maps, and local folklore, this poster traces the development and re-use of the pilgrimage landscape on Inishark in relation to shifting patterns of settlement, subsistence, and political economy. Changing spatial relationships between foci of communal worship and places of everyday household labor suggests how islanders adapted an inherited tradition to negotiate new relationships between themselves, their ecology, and their past.

[148] *Making Sense of the Variation in Folsom Projectile Point Technology*

Analyses of Folsom projectile point technology generally focus on the making and use of the classic bifacially fluted form. Often some mention is made of Midland or unfluted points, but formal technological analyses of these types are rare. Utilizing a sample of 989 points and preforms from Folsom and closely related technologies, this research explores the variation that is present in Folsom point production. Points from Folsom contexts are divided into five types: Folsom, Midland, unifacially fluted, pseudo-fluted, and miniature. These types are then compared based on the following variables: width, thickness, basal width, and edge grinding to determine whether they share

similar hafting characteristics. Flaking technology is also compared to explore overlaps in production techniques between the point types. Results indicate that overlapping reduction techniques do occur between all the point types, reinforcing the idea that Folsom, Midland, and the other forms were made and used by the same groups. However, slight differences in morphology between Folsom and Midland points may indicate that they were hafted differently.

[401] *Cooperation and Feasting at Late Neolithic Domuztepe: Assessing Emergent Political Complexity through Faunal Remains*

Cooperation occurs at all scales of social life: among individuals, among households, and among groups that supersede the household level. In some cases, such cooperation precipitates the formation of complex social structures and institutions and perpetuates their endurance. The variability of forms such cooperation can take at all scales of social complexity is broad, but an increasing degree of scalar cooperation correlates with increasing social complexity. This study uses zooarchaeological data from the Late Neolithic site of Domuztepe (ca. 6000-5450 cal. B.C.E.) in Southeastern Turkey as a proxy for assessing increasing scales of cooperative behavior at the site over time. Faunal data from the site's three feasting assemblages, when compared to the quotidian subsistence system, provide a means to assessing resource and labor coordination among inhabitants by elucidating the different animal management strategies employed by Neolithic agropastoralists in these different consumption settings. Such coordination has implications for reconstructing the political economy and emerging political complexity of the wider region during the Late Neolithic. While cooperation in resource exploitation and labor in any context elucidates socioeconomic and political organization, this study focuses specifically on feasts because feasting by its nature entails explicit cooperation among participants.

Lau, George (Sainsbury Research Unit, UNIV OF EAST ANGLIA)

[285] *Life, Land, and Labor at Yayno (A.D. 400-800), a Recuay Fort in the North Highlands of Peru*

This presentation examines the domain of work as part of the social life of fortified settlements. In particular, it focuses on the gargantuan commitment – physical and symbolic – evidenced in defensive architecture. Using data from Yayno, a large mountaintop citadel in the north highlands of Peru (Recuay culture, A.D. 200-700), work estimates are presented to demonstrate the great labor expenditure in stonemasonry construction. Builders combined massive stone blocks (local granites, imported limestones) to construct fortifications and defensible, multistorey residential compounds. The buildings ranged from small to monumental, and from low-quality to extremely fine-quality construction. The variability is attributable to changing construction styles by phase, defensive strategy, differential labor access and social inequalities. The paper concludes that making walls was indispensable work in the high Andes, both in terms of sheer effort and in terms of embodying group cooperation at different scales. While the compounds cloistered internal groups (segregating competing factions within Yayno), there was also a larger project of protecting the overall settlement that demanded intersubjective work, but located in a greater notion of collectivity. Aptly, then, the labor of defensive walls was to build subjects and community.

[149] *Exploring Regionality: A Chaîne Opératoire Approach to "Style" in the Rock Art of the Eastern Cape Province, South Africa*

Regional differences in southern African hunter-gatherer rock art have long been noted, but methods towards a rigorous definition of these regions have not been developed. Addressing a recent call for the use of style in defining rock art regions I propose a chaîne opératoire approach. Rather than focusing only on the finished product I will consider multiple factors in the production and

consumption of rock art images. Instead of relying on vague notions of style, the component parts and different elements that comprise the art can be investigated. Case studies from two sites, in different regions of the Eastern Cape Province, South Africa, illustrate this approach and how it can be used to elucidate ideas around regionality.

[238] *Infant Health and Burial Practices in Late Prehistoric and Contact Period Kiiyangan, Ifugao*
Infant death in Ifugao villages has only been viewed through a lens of modern ethnography. Recent excavations at the Old Kiiyangan Village site have revealed new information on the resource base, trade networks and impact of outside groups on the prehistoric and early historic Ifugao. This work has produced a small sample (16) of individuals who died at, or around, full term to the age of two years. The age, health, and mortuary profiles of these skeletons will be presented and placed into context. These skeletal remains appear to be the product of cemetery subdivision that places adults and juveniles in one location and fetal and infant remains in another. The age-at-death estimates for these individuals range from 26 weeks in utero to 1.5 years. Fetal and infant remains are subjected to either jar or open interment in a pattern that may reflect ritualized beliefs, health status or both. Skeletal lesions were recorded from all infant skeletons. These lesions are most likely caused by nutrition-related diseases. This study establishes new information for Cordillera prehistoric and colonial period burial practices and fits into the larger Southeast Asian sample of high mortality in the late period of gestation and early infancy.

[278] *The Salado Preservation Initiative: Combining Research Investigations with Regional Preservation Planning*

Regional planning is an essential element of comprehensive archaeological management programs. The Salado Preservation Initiative at Archaeology Southwest is linked to our research agenda focused on Salado and related developments across the Southwest in the late precontact period. Working exclusively within a temporally defined period of record (1250-1450) and conscribed geographically by the distribution of Roosevelt redware, Archaeology Southwest conducted a series of expert workshops and interviews using a geographic information system and archaeological site databases to collectively identify high-priority archaeological resources (sites, site complexes and in some instance landscapes). This project demonstrates the potential advantages of using research to complement assessments of individual site eligibility for purposes of listing on the National Register of Historic Places by providing an added layer of regionally contextualized information at larger geographic scales. By establishing spatially explicit priority areas, this information assists Archaeology Southwest in focusing its cultural resource protection efforts and can also enhance cultural resource considerations in local, state, and federal land use planning.

[128] *Who Are the Martinez? A Report on and Examination of High Elevation Aspen Dendroglyphs in the Sangre de Cristo Mountains, New Mexico*

This paper reports on mid-20th century aspen dendroglyphs from the Sangre de Cristo Mountains in extreme north-central New Mexico. A class III archaeological survey conducted by EnviroSystems Management, Inc. in July 2014 recorded ten previously unknown historic sites between 10,400 and 11,000 feet in elevation on the Carson National Forest. Each contains at least two and up to twenty-one carved aspens that date from the 1930s to the 1950s. Upon initial assessment, these sites appear to have been part of a summer grazing rotation by members of the same family, Martinez, and/or ranch hands of an outfit from Arroyo Secco, New Mexico. The dendroglyphs include names,

dates, hometowns, and art. These sites, along with other previously recorded and contemporary dendroglyph sites nearby are examined for spatial and temporal patterns to illicit a better understanding of how, when, and for what purpose these high elevation areas were occupied. A records search provides critical information as to the people and/or ranch that utilized these lands. Lastly, these practices and dendroglyphs are cross-examined with similar sites throughout the Sangre de Cristo Mountains to gain a greater context and draw comparisons.

LaViolette, Adria (University of Virginia, Dept. of Anthropology)

[285] *The Fortified Settlement of Pujini and Implications for a Swahili Urban Landscape*

During its lifespan from the mid-fifteenth to early sixteenth century A.D., the fortified settlement of Pujini shared Pemba Island, Tanzania with numerous, undefended, more typical Swahili settlements ranging from earth-and-thatch hamlets to stone-built urban centers. The site expresses a unique combination of qualities on the Eastern African coast: complex ramparts around nearly two hectares of space, in which stood some dozen domestic and special-purpose features. Archaeological evidence from the site shows that its builders invoked multiple architectural tropes used widely in Swahili stonehouses and stonetowns, markers of Swahili urbanism and cosmopolitanism. This paper provides an analysis of the archaeology of this settlement by identifying a series of nested socially constructed contexts, from the most intimate spaces in building interiors outward to the Swahili coast itself. I argue that the combination of qualities that makes the fortified site appear singular can also be used to illuminate meaningful networks of social, economic, and political interactions and tensions: locally; in the urban landscape of Pemba Island; and in the tumultuous Swahili world of the fifteenth-sixteenth centuries that includes early incursions of Portuguese sailors, merchants, and soldiers into the region.

Lavris Makovics, Jennifer

[267] *A Perfect Pothunting Day - An Examination of Vandalism to the Cultural Resources of Canyon de Chelly National Monument*

It has been postulated that one-third to one-half of all known archaeological sites in the US Southwest have been vandalized; however there are few accurate and complete datasets available to prove this assumption, or to determine exactly which factors encourage illicit activity. In fact, in 1987 the Government Accounting Office identified this lack of data as a major reason for not fully comprehending the archaeological vandalism problem on public lands in the United States. For over 20 years, archaeologists at Canyon de Chelly National Monument in Arizona have been collecting detailed standardized data on archaeological site condition and the natural and human-caused agents of destruction that affect the Park's cultural resources. This allowed a detailed statistical analysis of the site-specific factors which have been declared to encourage illicit activity such as illegal visitation, defacement, and "pothunting", and the development of a Site Vulnerability Assessment (SVA) which was utilized to produce an "At Risk" list of cultural resources to be targeted for protective measures. Regional and local factors thought to be influential were also considered.

[79] *Preliminary Petrographic Analysis of Ceramics from the Bocas del Toro Archipelago, Panama*

Petrographic analysis of ceramic sherds can elucidate manufacturing techniques and exchange systems. We present the first mineralogical assessment via thin-section petrography of archaeological ceramics collected from the Bocas del Toro province on the Caribbean coast of

Panama. Examined sherds include surface finds collected from archaeological sites on Bastimentos Island and at Cerro Brujo on the mainland, and excavated samples from Sitio Drago, Isla Colon. Thin-section petrography of the surface-find sherds indicates that seven different types of temper were used. Compositions of representative sherds from each group were determined by counting and classifying 200 points per thin section, into 14 mineral and rock fragment categories (temper), grog (temper), and two matrix categories (silt and clay). One group contains mainly clay rich (purpose-made?) grog temper, whereas the others contain mainly rock temper with different proportions of quartz, feldspar, dense minerals, and various varieties of volcanic lithic fragments. The latter are consistent with derivation from local Panamanian geologic units including one, with pyroclastic temper, from a more volcanically active region (El Baru volcano?). Additional sherds are being processed from Sitio Drago in order to understand how the ceramics from the largest known site in Bocas del Toro relate to the previously examined specimens.

[403] *Grazing Herds on a Modern Jordanian Landscape: $\delta^{13}C$ and $\delta^{15}N$ Analysis of Plants and Caprine Hair Keratin along an Altitudinal Cline*

The topography of Jordan is uniquely characterized by dramatic shifts in altitude from -300 b.s.l. to +1300 a.s.l. over extremely short distances, which results in sharp differences in precipitation levels and the composition of vegetation communities along altitudinal gradients. Graze species favored by sheep and goats collected along an altitudinal gradient indicate predictable shifts in floral $\delta^{13}C$ values, influenced by altitudinal differences in water availability, while nitrogen isotope values are determined by a complex host of factors. In contrast, the carbon isotopic composition of sheep and goat hair keratin indicate heavy anthropogenic inputs that obscure spatially defined isotopic patterning visible in plants. These modern data provide a point of entry into understanding the range of isotopic variability visible in ancient herd animals, and the extent to which we can identify herding practices that involve vertical transhumance over large altitudinal clines through carbon and nitrogen isotope analyses.

[12] *Analysis of the State of Preservation and Determination of Raw Material of Gravettian Mammoth Ivory Personal Ornaments (Dolní Věstonice, Czech Republic) Using Micro Computed Tomography*

This poster examines the utilization of non-destructive and non-invasive microCT analysis to identify raw materials used to fabricate Gravettian artifacts, assess their current state of conservation and work out a procedure for treatment of artifacts in a problematic state of preservation.

Raw materials and manufacturing technology of Gravettian personal ornaments from Dolní Věstonice (Czech Republic) made from hard animal tissues, such as mammoth ivory, can only be identified using the microCT analysis non-destructive analyses because these objects represent rare and unique cultural relics protected by the state. The preserved mammoth ivory objects from this period, both mammoth tusks as the primary raw material for products and the products themselves, are often found in a very problematic state of conservation. The current final form of artifacts, which differs from the original one due to modifications performed, has stereotypically been borrowed by authors of individual publications. The objects discovered thus live their second life. In order to analyze how they were manufactured, what was their purpose and how they were possibly used in past societies it is necessary to reconstruct the original form of the artifacts.

[412] *Weaving People and Places: A Long-Term Perspective on Obsidian Circulation and Social Value in NW Argentina*

The south-central Andes have a very rich record of long-distance circulation of things, animals, and people, the origins of which can be traced to the earliest hunting-gathering societies that occupied the territory ca 9600BP. We summarize the available information on obsidian circulation resulting from nearly three decades of research in the area, with a particular focus on the Calchaquí valleys area of north western Argentina (NWA) from early sedentary settlements until the Inca occupation. Understanding “social landscapes” as deep-time regionalities—regional worlds of social experience built over the long-term—, we discuss the creative transformation of NW Argentina’s landscape in relationship to the transfer of raw materials and artifacts across the region since the beginnings of settled life. Combining geochemical, contextual and artifact analysis we propose that, while obsidian was generally used as raw material for everyday tools, it had varying performative social capacities across time and space. The physical properties and limited geographical availability of obsidian are indeed important to understand its social value, yet these are not seen as essential characteristics but rather as elements in a relational field of social, material and semiotic connections that both drew upon, as well as exceeded, subsistence practices and economic calculation.

[243] *The Suitability of Ground-Penetrating Radar for Mapping Sub-Marsh Paleogeography and Implications for Large-Scale Archaeological Surveys of Wetlands and Marshes*

Prehistoric sites beneath modern marshes are uncommon and valuable cultural resources with superior organic preservation potential. Such sites generally offer greater stratigraphic integrity than their terrestrial counterparts as they were not historically plowed. However, these sites are overlooked and understudied in eastern North America due to low visibility, disagreement on surveying strategies, and misperceptions regarding the high costs of investigation and low potential for site preservation. A recent large-scale coring survey (>3000 augers) in Delaware, USA, identified four prehistoric sites beneath 50cm to 2m of tidal freshwater marsh sediments. Coring revealed well-

preserved paleosols with debitage and formal tools within upper soil horizons, and demonstrated that these sites were preserved due to indirect armoring from locally-outcropping, discontinuous conglomerates or lithified sediments of the Columbia Formation. While successful and informative, the field strategy comprised a brute-force, 8m grid of cores across the expansive project area. This paper describes attempts to refine wetland survey methods on two of the previously discovered sites through ground-penetrating radar mapping of sub-marsh paleogeography. Given the completeness of the existing coring data, as well as low-salinity sediments more suitable for GPR, this project area presents an ideal case study for refining archaeological prospection methods in wetland/marsh settings.

[244] *Between Earth and Sky: The Social and Political Construction of Ancient Lowland Maya Territories*

This paper introduces the Lowland Maya Territories: Local Dynamics in Regional Landscapes symposium that critiques the current model of territories as stable geo-political entities. We use data from the Actuncan Archaeological Project and other upper Belize River valley projects to suggest

that territories were in flux, reacting and changing to social and political relationships. Territorial dynamism is driven by at least two processes: the social construction of place and the political construction of territories. We suggest that a territory is defined by the geographic extent of political authority as established through alliances, voluntary subjugation, coercion, or other integrative practices that bound centers and hinterland communities to capitals. Rather than bounded entities, territories are conceptualized as networks of politically connected sites. Their long-term stability was dependent on the social construction of place that imbued meaning and emotional attachments to people, land, and spaces over time. However, social and political constructions were often in conflict when political competition over homelands reshaped territories. The inherent tensions between dynamism and stability are exemplified at Actuncan and other sites in the upper Belize River valley through shifting political capitals, settlement patterns, architectural and pottery styles, and veneration practices through time.

[337] *What Can Archaeobotanical Remains from Exceptionally Well Preserved Contexts Tell Us about Past Arctic Life-Ways?*

Anthropological studies of western Alaska consistently remark upon the substantial knowledge of the regional flora by local Eskimo groups. Despite the attritional impact of Western lifestyles on traditional ecological knowledge, the indigenous peoples of the region maintain a rich appreciation of the plant resources available in their local environment. Yet, archaeobotanical analyses from the region remain scarce and there rests a general opinion that plants did not play an important role in past Eskimo subsistence. Faunal analyses and isotopic studies which indicate a predominately marine diet entrench this assumption, but they do not present the whole picture. Ethnography demonstrates that plants were not only integral to Eskimo diets, but they also served ceremonial and utilitarian functions. Using the exceptionally well-preserved botanical macro-remains from 14th to 17th century sod structures at Nunalleq in southwestern Alaska, this paper aims to establish the role of plants in past Arctic life-ways.

[18] *Weaving Identities*

My paper will look at textiles as marker of identity in the Viking Diaspora in Britain and Ireland. While oval brooches and metal work have been given prominent roles in the discussion of identity, the textiles they adorned are often only mentioned in passing. However, techniques and fabrics may tell us something about connections with the homelands, as well as identities which are maintained in the areas of the Viking diaspora.

Lee, Christine

[37] *Preliminary Bioarchaeological Analysis of the Qijia Culture Mogou Site (2400-1900 B.C.E.), Gansu Province, China*

At the Mogou site 1000 graves were excavated from 2008-2011. A preliminary bioarchaeological analysis was done on 154 individuals. The male to female sex ratio is the same as other Qijia sites, with more males than females. The sample population was heterogeneous with 8% of the individuals originating from the west (Xinjiang), north (Mongolia), and east (China) of the region. This may be a result of the site being situated on trade routes from the West into China. Analysis was done on trauma patterns, infection rates, anemia, enamel defects, infectious diseases, and congenital defects. The individuals buried at Mogou are from very closely related family groups. Six individuals suffered from one to three periods of starvation starting at 2 years of age until 5 years of age. All of these individuals died young. Trauma patterns were concentrated in males as opposed to females or children. The majority of the injuries appear to be warfare related. There is a high percentage of infectious disease at Mogou, which suggests continual contact with outsiders (trade route),

domesticated animals, and a large enough population for endemic diseases.

Lee, Cheng-Yi (Department of Geosciences, National Taiwan University), Maa-Ling Chen (Department of Anthropology, National Taiwan University), Peter Ditchfield (Research Laboratory for Archaeology and the History), Mark Pollard (Research Laboratory for Archaeology and the History) and Ching-Hua Lo (Department of Geosciences, National Taiwan University)

[49] *The Diet and Subsistence System of Yuan-Shan People in Taiwan*

Carbon and nitrogen isotope compositions of human bone collagen (n=5) were analyzed to discover the paleodiet of Neolithic people of Yuan-Shan (YS) Culture, in northern Taiwan. A local isotope baseline was constructed by 71 faunal samples. Four inferences are drawn: (1) pigs share similar isotope compositions with deer, which indicates they were herbivores rather than omnivores. Pigs were likely raised by humans and we suggest that C3 plant was used as pig's feed based on their $\delta^{13}\text{C}$ values. (2) The main food resources consumed by YS people were local herbivores, which is revealed by the difference in $\delta^{15}\text{N}$ values between human and herbivores ($\Delta^{15}\text{N}$ human-herbivore). (3) Rice grain had previously been found in YS site, suggesting the rice as their main crop; however, the isotope data doesn't seem to support the suggestion ($\Delta^{15}\text{N}$ human-herbivore > 4‰). One possible explanation is that the cereal grains had intrinsic higher $\delta^{15}\text{N}$ value than that of herbivore's feeds or grasses, or the grain's $\delta^{15}\text{N}$ value was affected by manuring. (4) Aquatic resources were also consumed by YS people, though in small quantities. Middens indicated another aquatic food resource, but no isotopic compositions of shellfish soft tissue are available thus far.

Lee, Rachel (University of Michigan)

[49] *Mumun Period Households and the Rise of Inequality in Korea*

In the Jinju area of South Korea, social inequality first emerged during the Mumun Period (1060 – 340 cal. B.C.), during which permanent agricultural villages were also established. Excavations in the last two decades have uncovered close to 15 of these settlements, but the process of emergent inequality during the Mumun Period is just beginning to be understood. This poster provides results from the first systematic study of households from the Jinju area that intersects this important period. By doing so, the research moves away from top-down, elite-driven approaches to inequality, instead positioning the household as an active participant in the development of complex societies. Through spatial analysis and micromorphology, I provide evidence for significant changes in household composition, activity, and ideology that occurred due to the loss of egalitarian lifeways. I contend that this, in turn, further contributed to the development of social inequality that would be foundational for the formation of the first Korean states in the subsequent Samhan or Proto-Three Kingdoms Period.

[80] *Bayesian Analysis of the Uncertainty in Radiocarbon Dating Measurements*

The goal of the study is to investigate the uncertainty of radiocarbon dating measurements. To study the variability of the measurements, the samples from the same specimen were sent to different radiocarbon dating labs and the estimated dates from various labs were obtained as data for analysis. Through a Bayesian analysis of the data, we could estimate the variability of the labs as well as variability between labs.

[166] *Paleoenvironmental Reconstruction of the Northern Frontier of Mesoamerica: Stable Isotopic Analysis of Lagomorphs from La Ferrería, Durango, Mexico*

Central to understanding the social and economic dynamics of past societies is the reconstruction of the environment in which they developed. The marginal environmental region of Northwest Mexico,

in particular, has been a focus of debate concerning the importance of environmental change in the rise and decline of complex societies in the region. This study analyzes 49 Leporid (rabbit and hare) bones from the settlement of La Ferrería in modern Durango, Mexico for stable isotope ratios of $\delta^{13}\text{C}$ apatite, $\delta^{18}\text{O}$ apatite, $\delta^{13}\text{C}$ collagen, and $\delta^{15}\text{N}$ collagen. Ratios of these elements reflect different aspects of the diet and environment in which the animals lived. Results of this study demonstrate significant changes in isotope ratios across the occupational history of the settlement, indicating environmental changes through time. When considered in combination with the material culture from the site, it is possible to make inferences about social-environmental dynamics at La Ferrería. This study contributes towards a more comprehensive understanding of the culture history of La Ferrería and increases our understanding of the relationship between society and the environment in prehispanic Mexico.

[409] *Small Commercial Aerial Platforms for the Generation of Systematic, High-Resolution, Multi-Spectral Imagery and Photogrammetry: Trimble UX5 and X100*

In the last 5 years, the commercial availability of embedded computer systems and low-cost hardware has led to an explosion of lightweight aerial platforms for photography. Offering multispectral imaging with outstanding spatial resolutions, these platforms offer researchers an inexpensive means of systematically documenting the archaeological record on the scale of landscapes. Through our exploration of hobby-class vehicles and the Trimble X100 and UX5 aerial platforms, we learned that the quality of the products created strongly depends on the degree to which one can ensure systematic coverage and optimized flights. Our results point to an exciting future of archaeological remote sensing.

Lee, Gyoung-Ah (University of Oregon)

[414] *Niche Construction of Agricultural Communities in the Yiluo and Guanzhong Regions of Northern China in the Mid-Holocene*

Through a lens of niche construction perspective, this paper examines evolving enterprise of plant managements in different ecological and cultural contexts in Mid-Holocene China. Along a stretch of the Yellow River, bulging communities, facing different challenges of changing climates and ecological constraints, constructed agricultural and socially intertwined niches. Multiple Yangshao communities in the Yiluo valley and those in Guanzhong Plain are such examples. Drastically different from the earlier Neolithic cultures, the Middle Neolithic people in these regions laid a foundation for socially complex entities up to a state level in the subsequent periods. This paper will offer a window onto the unique effects of human niche construction through its examination of agricultural trajectories and social interactions in these regions.

[261] *Lessons Learned Along the Way: The Florida Public Archaeology Network after 10 Years*

The Florida Public Archaeology Network delivers programming through public outreach, assistance to local governments, and assistance to the Florida Division of Historical Resources. The general goal of FPAN is to achieve preservation gains through raising the awareness of Florida archaeology to the public and governmental officials. Authorized by statute in 2004, the Florida legislature funded FPAN in 2005. The program is administered by the University of West Florida but operates in a quasi-decentralized fashion through eight Regions operated with the assistance of other partner organizations. As a new statewide organization in 2005, FPAN's structure and goals were designed by a steering committee intent on avoiding certain potential pitfalls. Ten years of experience with this structure provides the opportunity to assess FPAN's success to date and to discuss broadly useful insights into the operation of regional public archaeology programs. Likewise, reconciliation of programming goals envisioned in 2005 with experience and with a new post-recession reality provides insights of general interest.

[294] *A Late Pleistocene Aridity and Vegetation Record from Stable Light Isotope Ratios of Ostrich Eggshell in Pinnacle Point*

Even when interior regions experienced depopulation during the last glacial, the Southern Cape apparently remained attractive to Middle Stone hunter-gatherers for millennia. The region's year-round rainfall and generally mesic conditions may have contributed to its attractiveness. Although seasonality and vegetation shifts have been observed in the nearby Crevise Cave stalagmite isotope record, indications for possible shifts in aridity are few. We apply oxygen ($\delta^{18}\text{O}$) and carbon ($\delta^{13}\text{C}$) isotope ratio analysis to a sequence of ostrich eggshell (OES) fragments from the PP5-6 site spanning a period from late OIS 5 to 3 to explore aridity changes. The OES $\delta^{13}\text{C}$ and $\delta^{18}\text{O}$ trends are broadly coherent but differ from the stalagmite. The $\delta^{18}\text{O}$ data follow similar, but more marked, trends, suggesting a positive shift to more arid conditions during the latter stages of OIS4 compared to early OIS4 (Unit SA.D.BS) and to today. The $\delta^{13}\text{C}$ record is more muted, and indicates that ostriches ingested mostly C3 vegetation although slightly higher proportions of C4 or CAM are reflected in moister Unit SA.D.BS. Since the presence of ^{13}C -enriched vegetation is indicated in the stalagmite record, the OES data suggest that ostriches found the taxa unattractive or they did not occur in the breeding season.

Lefebvre, Karine (CIGA - UNAM)

[50] *Using Archaeological Data and Historic Documents to Reconstruct a Colonial Landscape*

La conquista española conllevó importantes trastornos en el paisaje del antiguo México. En la región de Acámbaro (Guanajuato), estos cambios se reflejaron ya desde una fase muy precoz, puesto que la colonización fue temprana y los especies animales y vegetales introducidos por los europeos se adaptaron rápidamente. Por otro lado, el dominio de los conquistadores sobre el territorio se acompañó de una renovación del patrón de asentamiento, que tuvo por consecuencia liberar numerosas tierras fértiles, en beneficio de los nuevos colonos. Por consiguiente, la explotación de la zona inició rápidamente. Las intervenciones europeas permitieron establecer un sistema agropecuario intensivo destinado a proveer las minas y los centros urbanos emergentes. A través del acercamiento de datos arqueológicos recientes, de las fuentes coloniales escritas y de la documentación cartográfica del siglo XVI procesados en un sistema de Información Geográfica, presentaremos la metodología desarrollada para intentar reconstituir el terruño colonial. A partir de la modelación del nuevo patrón de asentamiento y de uso del suelo (agrícola, pecuaria, pero también drenaje, riego y deforestación) pretendemos reconstituir las dinámicas del paisaje en distintos puntos del espacio y del tiempo.

[328] *Precolumbian Human Mobility and Interaction in the Caribbean: A Zooarchaeological and Ancient DNA Study of Guinea Pigs*

Current zooarchaeological records indicate that humans introduced the domestic guinea pig from South America to the Caribbean around A.D. 600. Using zooarchaeological and ancient DNA datasets from domestic guinea pig remains from the Caribbean, we address human mobility and interaction between the islands of the Caribbean and South America during the second half of the Ceramic Age (ca. A.D. 600-1500). We present new data regarding the continental origins of precolumbian guinea pig, as well as the phylogenetic relationships among guinea pig remains from two sites located in different regions of Puerto Rico in the Greater Antilles (NCS-1 and Tibes) and from Carriacou located in the southern Lesser Antilles. The results indicate that all sampled guinea pig specimens share a common point of genetic origin based in the region that is modern Colombia, South America. The genetic data suggest that guinea pigs arrived in the Caribbean as a single introduction not multiple distinct introductions. The temporal associations of the Puerto Rican guinea pigs suggest that the animals were introduced there first and then relocated to other islands, including the Lesser Antilles.

Lehner, Mark

[237] *Neighborhood to National Network: Pyramid Settlements of Giza*

A twenty hectare swath of Old Kingdom 4th Dynasty settlement that began with the building of the Pyramids at the low southeastern base of the Giza Plateau shows distinct components that must have functioned as neighborhoods in the sense of geographically localized social networks within the larger conurbation. Correlation between architectural patterns and builders' graffiti with district signs suggests links to larger national networks. Flanking the major Nile port of its time, community members served in both ships crews and work gangs, linking them to broader interregional networks. Immigrants from source countries that specialized in procurement and transport of exotic products made for ethnic diversity in the distinct components of 'downtown Egypt.' It has been observed that as settlement size increases, social interactions per person increase in a predictable, 'superlinear' way, and that social clusters increase as networks with broader spatial ranges. That regardless of a city's size, we all live in villages, may have been true for downtown Egypt at the pyramids.

Lei, Yu

[349] *From Settlement to City: Two Issues Related to Phases I of the Site of Sanxingdui, Southwest China*

Since the first archaeological excavation in 1934, the site of Sanxingdui has been explored in 16 separate field projects, exploring an area of nearly 10000 m². Due to various reasons, only the data of 5 excavations (Yueliangwan in 1934 and 1963, Sanxingdui in 1980, the Sanxingdui sacrificial pits in 1986, and Rensheng cemetery in 1998) have been published, reporting only on 3000 m² of excavation surface containing mainly Bronze Age remains. Our understanding of the Neolithic period (Phase I) at Sanxingdui has therefore remained rather limited, comprising only some finds from Yueliangwan and settlement layers of the central portions of Sanxingdui. It was therefore generally assumed that the Neolithic remains were limited to a rather small area with shallow settlement layers and very few objects. Based on an evaluation of excavation records spanning the most recent excavation campaigns from 1980 to 2000, this paper argues that the distribution of the Phase I remains at Sanxingdui was actually substantial, both in surface extent and in depth of settlement layers, making Sanxingdui the most substantial settlement of the Neolithic Period not only on the Chengdu Plains but also along the whole upper Yangzi River.

[133] *The Art of Noise at Teotihuacan: The Conch Shell Motif in the Classic Period*

Teotihuacan was a major cosmopolitan city located in the Basin of Mexico during the Classic Period (100-700 CE). The artwork has long fascinated but bewildered scholars, and despite the emulation of Teotihuacan's recognizable artistic styles across Mesoamerica, we still understand relatively little about their artistic styles today. This paper aims to examine the conch shell motif from artwork at Teotihuacan, particularly visible in extant mural paintings. It will focus on investigating the appearance of conch shells, conchs used as trumpet devices, and cache burials of carved conchs. Many scholars have proposed the conch is most related to noise, the wind, and the underworld. In particular, scholars link Teotihuacan's Quetzalcoatl using a conch shell as a sounding device to best Mictlantecuhtli in the underworld and the American Southwest's Zuni culture's feathered serpent named Kolowiki, which was summoned by the conch shell trumpet. In these cases, there are strong ties to the underworld and emergence myths. In order to better understand these historically proposed relationships, this study will explore the conch shell as an isolated theme in Teotihuacan art.

[181] *Fireplace Variability in the Aurignacian: a Multiscale Analysis at the Open-air Campsite of Régismont-le-Haut (Hérault, France)*

Through the study of several contemporary fireplaces at the Aurignacian open-air site of Régismont-le-Haut we will distinguish differences in the function and operation of a common-place form of archaeological vestige. To achieve this goal we rely on multiscale examination of hearths, which consists of classic planimetric and stratigraphic observation coupled with both micromorphological and geochemical analyses. Results are also compared with experimental hearths analyzed using the same methodology.

Experimental data shows clear microscopic and geochemical variations that correlate with types of fuel used in fireplaces. These variations are equally seen in archaeological samples (while controlling for post-depositional processes), which highlight whether wood or bone were used as fuel. Regarding the question of rhythms of use, our observations of thermo-altered sediments highlight the maximal intensity of fire, but not fire length or possible reutilizations. The lack of in situ residues, such as charcoal or ash lenses, makes the study of rubefied sediment limited in regards to the chronology of fireplace use.

Along with technological and spatial analysis of artifacts, these results allow us to identify strong differences between areas organized around fireplaces. The complementarity of these areas has a structuring effect on their variability, demonstrating the complex nature of the site.

LeJeune, Colin (University of Illinois at Chicago)

[307] *Local Earthenware Ceramic Decoration and Cultural Transformation on Kenya's Swahili Coast, A.D. 700-1700*

Description of locally produced earthenware ceramic assemblages excavated from Swahili town sites on the Kenyan coast suggest that incised and impressed decoration became less common and less formally complex, particularly on cooking vessels, after A.D. 1200 (Chittick 1984; Horton 1996; Wilding 1989). This development appears to be contemporaneous with shifts in consumption practices, domestic architecture, religion, and the importance and expression of socio-economic identity within coast town society that began prior to A.D. 1000 and rapidly progressed and matured between A.D. 1200 and 1500. These shifts were associated with the formation of the cosmopolitan, hierarchical, Islamic, urban culture which has characterized Swahili town-life since the 13th century (LaViolette 2008). This paper integrates existing knowledge concerning social and cultural development experienced on the Swahili coast between A.D. 700 and 1700 and the character of local earthenware ceramic assemblages excavated from town settlements on the Kenyan coast to interrogate the meaning and function of incised and impressed decoration on these ceramics over-time. This effort will involve discussion of the utility of this variable for study querying how socio-cultural identification and its expression on the Swahili coast evolved in relation to the developmental trajectory this region experienced.

Lekson, Stephen (University of Colorado)

[354] *Architectural Wood Use in Chaco Kivas*

The architecture of Chacoan kivas was markedly unlike far more numerous non-Chacoan kivas. While Chaco is famous for its stone masonry, we focus here on wood use, and specifically on radial beam pilasters and wainscoting. Both are enigmatic and, consequently, both have often been overlooked during excavation and sometimes even removed in modern stabilization. But when the kivas were in use these features would have been dominant, eye-level aspects of kiva interiors. Using examples from Chaco Canyon, Bluff Great House, Aztec Ruins and Chimney Rock, we explore the construction, function, and symbolism of these distinctively Chacoan features.

[1] *Discussant*

Lemke, Ashley (University of Michigan)**[135]** *Hunter-Gatherers and Prehistory*

Robert Kelly's seminal work, *The Foraging Spectrum*, cataloged diversity among ethnographic foragers to demonstrate the tremendous range of cultural, economic, demographic, and political systems within the broad category, "hunter-gatherer." While we have a clear understanding that ethnographic foragers are diverse, archaeological interpretations of prehistoric hunter-gatherers still tend to be seen through the lens of ethnographic analogy. The creative and critical use of ethnographic data is difficult, and doing archaeology as Kelly tells us is like piecing together a jigsaw puzzle without a picture on the box. The question remains, what is the proper role of ethnographic data in archaeological research, particularly of prehistoric hunter-gatherers? In addition, how can we highlight diversity in prehistoric foragers and discover novel lifeways that extend beyond the ethnographic record? These are the central questions and goals of this symposium, and individual papers and participants will each contribute pieces to a prehistoric hunter-gatherer puzzle.

[183] *Between House and Site: Considering Intermediate Units in Classic Maya Lowlands Settlements*

Traditionally, settlement archaeology of the Classic Maya Lowlands recognizes several intermediate residential units between the house and the site. For over 50 years, the concept of neighborhood has been mentioned occasionally, but conclusive case studies are still rare. Yet the concept raises the important issue of the internal social structures of communities and their relationships. After briefly describing the methods that have helped identify intermediate units in the recently studied sites of La Joyanca (Peten, Guatemala) and Yaxché (Yucatan, Mexico), we consider the implications of such units within their larger social and political landscapes.

Lennen, Joel and Jamie Arjona (University of Illinois)**[269]** *Queering Historical Worlds: Disorienting Materialities in Archaeology*

This essay draws from contemporary strands of affect and materiality in queer theory to discuss approaches to queer materialities in archaeology. This attempts to move beyond privileging sexual acts and orientations as defining queerness (Blackmore 2011), towards vast assemblages of human and material convergences that queered social norms (Chen 2012). The provocative capacities of bodies, both human and non-human, to disorient social norms offers archaeologists alternative perspectives on queer world-making in historical communities. We will illustrate how spatial and material textures can create transgressive atmospheres that reciprocally stick to human bodies. By considering a set of historic relationships that altered bodily states physiologically and sensorially, we acclimate to a world of queer matter beyond representations of identity and being. We will offer examples of how substances, spaces, and bodies intersect in ways that transform and disrupt the movements of everyday life. These relationships, in turn, remind us of the spectrum of matter that has the potential to queer contemporary social networks and prompt new theoretical approaches to queer materialities in archaeology.

[75] *Common and Lima Beans (Phaseolus spp.) from Cerén: Wild and Domesticated Germplasm*
Archaeological investigations at Cerén, a Classic period Maya site in western El Salvador, have unearthed an abundance of carbonized bean remains, both *Phaseolus vulgaris* and *P. lunatus*. Surprisingly, the Cerén *P. vulgaris* bean remains were derived from both wild and domesticated populations. This find reveals that the Late Classic inhabitants continued to draw upon wild food sources even though they had clear access, as seen in the Cerén paleoethnobotanical record, to a full array of domesticated food crops. This discovery not only offers insights into human behavior patterns of the past, but also has implications for explaining the genetic interchange between wild types and cultivars. In turn, these data help elucidate the interpretation of the multiple origins of *Phaseolus* domestication and the proliferation of its varieties.

Lentz, David [75] see Sloten, Venicia

Lentz, Kari

[416] *Tokens of Travel: Material Culture of Transoceanic Journeys in San Francisco*
During the second half of the nineteenth century thousands of travelers embarked on voyages aboard steamships headed for San Francisco that could last weeks or months. In the past decade, William Self Associates has conducted multiple excavations within the vicinity of the original coastline of Yerba Buena Cove that have yielded an abundance of artifacts. This paper focuses on dinnerware pieces employed for meals aboard vessels of the Pacific Mail Steamship Company that were recovered from domestic privies dating to the 1870s. The paper examines the function of tableware utilized during maritime expeditions as well their potential purpose once collected by disembarked crew members or passengers. This paper posits that these artifacts may have operated as keepsakes or mementos that reminded migrants of their time spent aboard a ship in a “world between worlds” (Maddocks 1982) that served as a liminal space “between origin and destination” (Wenzlhuemer and Offermann 2012).

[106] *Cruising along the Coastline: Exploring the Possibilities of using LiDAR Data to Predict Climate Change Effects along the Southern Monterey Coast*

This paper presents the collaborative efforts of the Society for California Archaeology, the US Forest Service and the Cabrillo College Archaeological field school to document sites along the southern Monterey coastline. During the 2012 field season, a new generation of archaeologists documented sites along a 2-mile stretch of coastline in order to study how coastal erosion is affecting these sites. Part of the purpose of this presentation is to highlight the importance of these types of coastal surveys, and to illustrate how much data these efforts can collect. However, the primary focus of this presentation is to explore the possibility of using LiDAR to monitor the potential loss of this collected archaeological data. By examining previous LiDAR data, it may be possible to predict how the coastline will be affected by climate change. This information can assist with predicting at what rate this data might be lost at and can be used in making management decisions about these sites.

[38] *Fedick-ian Approaches to Wetland Studies: Rock Alignments, Resilience, and the Pulse-Based Ecosystem*

It was nearly ten years ago when Dr. Scott Fedick unleashed his graduate students Daniel Leonard and Jennifer Chmilar into the Yalahau wetlands. Upon their return, Scott asked what questions each had about the wetlands, and two projects were born. During the ensuing field seasons, and time in between, Scott helped to solidify and expand on background knowledge, encourage interdisciplinary collaborations, and offer much needed support. In time, both Dan and Jen emerged from the wetlands able to answer the questions that drew them in. This presentation will reflect on the intellectual legacy of Scott Fedick through the lens of two dissertations in the Yalahau wetlands. The first, carried out by Chmilar, focuses on the function of rock alignments in the context of detailed topography and paleoenvironmental change. The second, by Leonard, involves a regional survey to assess the nature and extent of wetland manipulation throughout the Yalahau physiographic zone. We will discuss how Scott's mentorship influenced our approach to the unique environmental archaeology of the Yalahau wetlands, and inspired the interpretations and conclusions we reached.

Leonard, Kevin (Archaeoconsulting Inc.)

[182] *Influences of Gaming on Mi'kmaq Culture during the Late Woodland Period*

About A.D. 1320, the bones of ten people were cremated in an ossuary on Canada's east coast. Grave offerings recovered from the eroding site in 1990-91 included fragments of tiny, calcined bone rods and charred plum pits with smoothed surfaces. They are interpreted as parts of a gaming set that probably included a shallow wooden bowl and a small bag to hold the dice, still used by members of the Mi'kmaq First Nation to play waltes. Although game sets were traditionally a woman's property, 17th century observers reported wives being wagered and lost in waltes matches. Overlap of the dice and bowl game with cord-wrapped stick decorated, shell tempered pottery in part of northeastern North America suggests waltes contributed to intergroup mobility for women. Consequently, their knowledge of plant management could spread in concert with certain plant species they carried with them. Intra-band waltes gambling fostered economic leveling, maintaining the status quo in an egalitarian society. At a personal level, the waltes bowl was imbued with magical powers and was used for divination by 19th century Mi'kmaqs. At the individual, group and intergroup levels, waltes helped to shape culture during the Late Woodland period in the Northeast.

[305] *The Spirit of Wye House*

The role of the supernatural in establishing subjectivity is well understood in Marxist terms, particularly through Althusser and Zizek. There are two parallel, complementary religions at Wye House near Easton, Maryland in the eighteenth, nineteenth, and twentieth centuries. Through archaeology, African and African American religions and their role in the cosmos, people's lives, and the maintenance of heritage is becoming well understood through African and African American material remains. The archaeological remains of Puritan Christianity and Anglican Christianity are different. There is ample evidence of both, but traditions, practices, and recorded beliefs show a role for parallel expressions of the supernatural in daily life.

Lercari, Nicola (University of California Merced)

[16] *Virtually Rebuilding Çatalhöyük History Houses*

3D technologies, remote sensing, geographic information systems, and virtual reality have changed the documentation and interpretation process of Çatalhöyük (Berggren et al. forthcoming 2015).

Work at Çatalhöyük Building 89 has allowed a new methodology of data capture, processing, visualization, and analysis of stratigraphic layers based on digital technologies (Forte et al. 2012). On the other hand, virtual reconstruction of Neolithic buildings rebuilt in the same place has been little discussed. Current visualization technologies allow us to simulate the tridimensional context, shared material culture, and experiential aspects of the unique urban environment at Çatalhöyük, but require archaeologists to address methodological questions such as: what is the significance of virtually rebuilding Çatalhöyük history houses? Can a scientific simulation of Neolithic buildings tell us more about the social and religious meanings of built space at Çatalhöyük? How can uncertainty, ambiguity, and different interpretations be conveyed in a tridimensional simulation? My contribution to the digital reconstruction of history houses aims to define a new approach to digital archaeology that integrates a plurality of data in a visual-analytical environment where advanced interactive techniques simulate the cosmology, shared space, material culture, and experiential aspects of Çatalhöyük cultural landscapes.

Lerner, Harry (Université Laval)

[17] *Scales of Analysis, Scales of Interpretation: Interpretive Scope and Analytical Precision in Lithic Use-wear Research, or 'Trees Are Great but Don't Forget about the Forest!'*

Ever since the inception of the New Archaeology back in the 1960s there has been an emphasis within the discipline on increasing analytical rigor through ever-more precise quantification of material culture variability. While striving to improve and expand our analytical arsenal is always a worthy pursuit, these efforts must be accompanied by critical reflection on how and why we use our increasingly refined analytical techniques to address larger behavioral and cultural questions. Precise and accurate measurement of physical artifact attributes is, of course, an essential component of any program of research, but an appropriate contextual rationale for the recording and evaluation of such data is equally fundamental. The proposed presentation will examine the use of GIS in characterizing changes in stone tool surface microtopography documented using both incident light and scanning electron microscopy and how the resulting specific quantitative data can be used to not only characterize the individual tool surfaces but also to explore broader patterns of tool using behavior and their possible cultural underpinnings.

Lerner, Shereen (Mesa College)

[197] *Applying the Principles of MATRIX in the Real World*

In 2001, the SAA received a National Science Foundation grant to revise undergraduate archaeology curriculum to reflect the needs of archaeologists in today's world. As part of this grant, seven principles were developed: (1) discuss the importance of stewardship, (2) take into account the diverse pasts of stakeholders, (3) articulate the social relevance of the past, (4) include a consideration of archaeological ethics and values, (5) teach effective written and oral communication, (6) provide fundamental archaeological skills, and (7) incorporate real-world problem solving. The question that now arises is whether these principles are being applied in the field of archaeology. Was this a purely academic exercise or do we see implementation in the real world?

[320] *A Refined Relative Sea Level Curve and Paleoshoreline Modelling for the Prince Rupert Harbour Region*

Deglaciation following the last glacial maximum caused dramatic coastline changes around the world. Locating and analyzing archaeological evidence of human settlement requires an understanding of the relative sea level (RSL) history and related changes to the landscape. On the Northwest Coast of North America RSL was affected by local glacial and tectonic conditions, and current research demonstrates that sea level histories are locally contingent and vary widely. This paper presents a refined sea level curve for the Prince Rupert Harbour (PRH) region reconstructed through diatom analysis of sediment isolation basin cores, geological survey, and geoarchaeological evidence. The sea level curve is used with high-resolution digital elevation models constructed from LiDAR data to construct an archaeological survey model that targets high-potential coastal landforms from times when the RSL differed. This study is significant given that the PRH and immediately surrounding area was one of the most densely occupied regions of the Northwest Coast and has been intensively surveyed, but lacks recorded sites dating older than 6000 cal. BP, arguably due to variable paleoshorelines. This research furthers our understanding of the paleolandscape that the first peoples would have encountered and how human settlement is affected by changing sea levels.

[293] *Shellmounds of the San Francisco Bay as Sacred Landscapes*

Prior to the time of European contact, ancestral Ohlone tribal groups of the San Francisco Bay region buried their dead within many "shellmound" sites located near the bayshore. Archaeological inquiry over the past century has revealed that many of these burials had rich grave associations. Even so, the prevailing assumptions held by the scientific community has been that these bayshore mounds were the result from the refuse of habitation/village activities focused around the exploitation of shellfish as an explanation of site formation process. The analysis of the mortuary complex from CA-ALA-329 has permitted the development of an alternative perspective. This alternative perspective suggests that the burial activities represented at many of these mounds were central to, rather than peripheral to, the function of these sites. Indeed, the resultant analyses support the position that many of these "shellmounds" served principally as formal ceremonial sites and mortuaries for high-ranking individuals over the centuries. It can therefore be postulated that the important socio-religious Funerary and Annual Mourning ceremonies also figured centrally in the lives of these ancestral Ohlone. Furthermore, not only were these mounds deliberately constructed over time, given this alternative perspective these sites can also be interpreted as "Sacred Landscapes."

[254] *Museums and the Destruction of Heritage*

What are museums to do during times of war and with the destruction of cultural heritage in conflict zones? This is a question that came into focus during World War II, and more recently in Afghanistan, Iraq, Syria and other parts of the Middle East. What are the professional and ethical responsibilities of museums in the United States, in western Europe, or in other parts of the world when destruction of cultural heritage is planned or occurring? Do museums in the West have additional responsibilities if museums in these conflict zones are being destroyed? In this paper, we argue that possible actions by museums and professional museum organizations, such as the AAM, AAMD, ICOM, include: 1) providing personnel and financial resources to provide training and help preserve the heritage in situ; 2) providing a safe haven for artifacts and movable heritage during times of conflict – with assurances that these artifacts are returned to the country of origin after the conflict; 3) making sure that artifacts and material from the conflict zone are not available for sale; and 4) working to create an international task force to implement these activities on a broad scale.

[249] *Ceramic Molds for Mixtec Gold: New Insights into Lost Wax-Casting Traditions of Late Postclassic Oaxaca*

Lost-wax casting in prehispanic Mesoamerica reached its apogee in Late Postclassic Oaxaca, Mexico. Nowhere is this artistry more evident than in the spectacular gold and silver offerings from Tomb 7 at Monte Albán. Researchers have long understood the general process of lost-wax casting, but have incompletely examined variability in techniques utilized through space and time. This poster presents new evidence of ceramic molds from Late Postclassic Tututepec that are believed to have been used to make casting cores—an important component of the lost-wax casting process in Oaxaca. To date, archaeometallurgical studies in Mesoamerica have overlooked the use of ceramic molds for making casting cores. The relatively large sample of molds from Tututepec suggests that this Mixtec capital was an important production center for making gold and silver jewelry that was consumed by local elites and possibly exported to distant centers, such as Monte Albán.

[187] *Intersecting Identities in Southeastern U.S. Prehistory*

Archaeological evidence from the southeastern and mid-south regions of the U.S. suggest that dress, personal ornamentation, and body modification were key strategies for presenting the self during later prehistory. These markers were apparently deployed to designate multiple and intersecting aspects of identity, including gender, age, community affiliation, and leadership status. Evidence comes from recovered artifacts, human burials, and representational images of humans. Some archaeologists have also examined patterns of architecture, food preparation, and artifact manufacture for evidence of group and personal identity. Ethnographic evidence has also been influential in scholarly attempts to understand the variability of social and individual identity. It is a complex task to integrate both multiple sources of evidence and multiple aspects of identity and life course without either oversimplifying or throwing up one's hands in despair at the complexity. This paper reviews research in the southeast with a focus on how gender identity intersects with other aspects of self-presentation.

[273] *Shifting North: Social Network Analysis and the Pithouse-to-Pueblo Transition in the Mogollon Highlands*

This poster examines the changes in the social networks of the Mogollon Highlands that accompanied the transition to pueblo architecture around A.D. 1000 using Social Network Analysis (SNA). SNA offers a set of formal methods in which ties and relations between sites can be examined. Using the proportions of decorated ceramics within a site's assemblage, social networks are created for 50-year intervals, allowing for changes in the networks to be observed before and after the pithouse-to-pueblo transition. This poster focuses on the relationship of the Mogollon Highlands to the Cibola region to the north, and the Mimbres region to the south and the social factors which accompanied the changing social networks.

[249] *Artifact Distribution Patterns among Aztec Period Households in the Coatlan del Rio Valley, Morelos, Mexico*

Using assemblages in over 4,000 4-x-4-m surface collection units from eight Aztec period sites in the

Coatlan del Rio Valley of western Morelos, Mexico, I analyze the valley-wide distribution of plain ceramics, decorated ceramics, lithic artifacts, spindle whorls, and figurines in over 300 household middens to define functional artifact sets analogous to the "bundles of goods and services" of economic geographers. Cluster analysis, multidimensional scaling, and network analysis quantify flow of ceramic classes and lithics among households and group ceramic and lithic functional classes into activity suites. Groups of functional classes reflect universal household maintenance activities as well as manufacturing of a variety of craft goods for both household use and market exchange. Distribution of plain and decorated ceramic classes and lithic materials and tools among households provides evidence of various provisioning mechanisms, including market exchange. Results contribute to the increasing corpus of research documenting complexity of Aztec period economic organization in the tributary provinces of the Aztec empire.

[360] *Holocene Site Assemblage Structure and Economic Organization In Admiralty Inlet and Puget Sound, Washington*

We compare 80 site components in Admiralty Inlet and Puget Sound, Washington, using component age, deposit thickness and complexity, feature type and diversity, portable artifact functional classes, and assemblage diversity to study the range of functional site types and diversification of tool kits through time. We previously (2011) analyzed 75 components using Thompson's (1978) 20-functional class system to code portable artifacts. We noted that most inland riverine and prairie sites did not have shell matrices that preserved bone and antler tool classes and we could not differentiate assemblages comprised primarily of lithic artifacts because variation was masked by the definition of Functional Class 9: utilized flakes and chipped stone tools. Here we use 49 functional classes generated by subdividing Thompson's original classes. Results of the new analyses suggest marine and riverine/prairie inland site assemblage patterns may be accounted for in part by differential preservation of bone or antler tools, recovery techniques, and sample size. We compare bone/antler and lithic assemblages separately to tease out functional patterns among sites not conditioned by recovery. Finer-grained analyses such as use-wear or technological studies are necessary to track functional organization of lithic assemblages.

[336] *Applying North American Approaches to Community Archaeology in Khirbet al-Mukhayyat, Jordan*

"Community based" archaeology programs are all the rage in North America, as both academic and consulting archaeologists respond to descendant communities' rights to management over their cultural heritage in the face of large-scale development and resource management. This movement is not yet applied in other regions facing similar challenges of economic development opportunities and access to heritage. The Khirbet al-Mukhayyat Community Archaeology Program (KMCAP) is inspired by North American approaches, while recognizing the unique socio-political and economic setting of Jordan. My paper presents the methods, findings, challenges, and futures from the (inaugural) 2014 season, within the larger Town of Nebo Archaeological Project (directed by Dr. Debra Foran of Wilfred Laurier University). The KMCAP is informed by my experience as a consulting archaeologist in British Columbia, and by my academic work in the southwestern United States.

Li, Yu Qi (Washington University in St. Louis)**[234] *Pastoral Communities Thrived in a Rocky Valley of the Tian-Shan Mountains--New Survey Results of the Dense Pastoralist Sites in the Mohuchahan Valley of Xinjiang, China***

Newly identified pastoral sites in the Mohuchahan Valley have the potential of preserving 3000 years of pastoral settlement history in the middle section of the Tian-Shan Mountains. Located between a rich high-elevation meadow and a low-elevation oasis, this seemingly barren valley might have served as an ideal residing place for numerous generations of local nomads. The scale and density of the burials and settlements they left suggest the communities once thrived here in ancient times probably were of much larger size than the current one. Considering that many of these sites are located in an apparently harsh environment, it becomes mysterious how these communities managed to survive and thrive here. Based on my ethnographic work and survey of some of sites, I suggest the success of ancient communities in the Mohuchahan Valley may partly be attributed to their connection with the meadow area and the oasis nearby. In other words, the harsh environment of the Mohuchahan Valley probably never supported local pastoral communities alone but always together with other eco zones such as the meadow and oases.

Li, Tao (University of Pittsburgh)**[283] *Economic Differentiation in Hongshan Core Zone Communities: A Geochemical Perspective***

It is proposed that a greater degree of differentiation between households in Hongshan villages (4500-3000 B.C.) in northeast China with regard to productive activities implies a greater degree of economic interdependence between households and a more complex economy, which possibly provides leaders with enhanced opportunities to mobilize labor toward such ends. Analysis of household artifact assemblages in the Hongshan periphery has indicated some very modest levels of productive differentiation in lithic production. If the Hongshan core zone showed stronger evidence of productive differentiation and thus a more complex village economy, it might help us to understand how the greater investment in public ritual spaces came to be. A combination of geochemical and mineralogical analyses was thus proposed to investigate productive differentiation between 50 individual artifact (pottery) concentrations of household scale in the Hongshan Core. By recognizing the compositional clusters represented in each household-scale analytical unit, we were able to understand the degree of compositional variety within household units in the Hongshan core zone and the degree of productive differentiation that characterized Hongshan pottery production. This study offers important insight to the role of production and distribution of utilitarian pottery to the economic foundations of early complex societies.

Li, Dongdong (University of Pittsburgh) and Wenjing Wang**[285] *Emergence of Walled Towns in the Neolithic Jiangnan Plain: Warfare or Flooding Control?***

The late Neolithic in the Jiangnan plain is characterized by the emergence of a new kind of settlement pattern. In this period, highly nucleated large local communities were walled as regional centers. In the past decades, the emergence of walled sites has caused hot debates about social dynamics, particularly with regard to function and causal factors. Most explanations for the emergence of walled sites fall into either a warfare model or flooding control model. To evaluate

those models, we investigate both archaeological data and historical records. Our holistic analysis of archaeological data and historical records indicates that the warfare model is more reasonable for explaining the emergence of local walled sites and the trajectory of local social complexity in the Neolithic period.

Li, Yongxian

[349] *Centers of Power and Ritual: Discussing the Archaeological Remains from Two Large Zhangzhung-Period Settlements on the Tibetan Plateau*

The two large settlement sites of Ka'erdong and Zebang which were radiocarbon-dated to 3000-1500 BP probably belong to the former Zhangzhung Kingdom (1500 B.C.–A.D. 645). These two sites are unusually large, covering an area of 130,000 m² and 500,000 m² respectively. Both sites have large cemeteries, residential areas, ritually-used spaces, and defensive structures. The largest structure observed is a large stone-mound tomb with a diameter of 60 m and a height of 6 m that can be attributed to a "king" or some other high-ranking individual. At some distance, there was an altar with stone pillars associated with a bronze statue that probably depicted a god; furthermore, one of the graves located in the vicinity of the altar contained a gold mask. Based on this evidence and the particularities of the object assemblages in graves and settlement layers, this paper argues that these are the remains of a stable society with a centralized power even though part of the manufacturing economy showing many characteristics of a self-regulating tribal system. The presence of the ritual installations and depictions associated both with altars and special graves indicate that this area was a regional center of worldly and religious power.

[81] *In the Shadow of the Moor: An Archaeology of Pueblo Resistance in Colonial New Mexico*

Historians and archaeologists often consider the Pueblo Revolt of 1680 to be the final chapter in the saga of early Spanish colonialism in New Mexico. Borderlands scholars endlessly debate the origins of the uprising, and in recent years their attention has turned toward proximate causes. In this paper I take a longer view, investigating how the events of early Spanish contact and colonialism created conditions ripe for Native insurrection. I pay particular attention to the differential responses of Pueblo groups to similar colonial circumstances. I also review the contributions of recent archaeological investigations into the Pueblo Revolt Era, which suggest that long-term intra- and inter-Pueblo politics had at least as great an effect on the outcomes of the Pueblo Revolt of 1680 as did Spanish colonial policies.

[86] *Territorial Attachments and Border Formation in the Upper Usumacinta River Basin: Discussing Ceramic Mobility within a Fractured Political and Geographical Landscape.*

To date, archaeologists working in the Northwestern Maya Lowlands, specifically in the Upper Usumacinta region have focused their attention to ceramic variability and regional distributions trying to "picture" the degree of variability in the role of local centers in regional ceramic exchange systems. Nevertheless, little attention has been paid to territorial variability-for example, the distinction between contiguous and non-contiguous territorial formations highlighted by recent regional archaeological studies for Piedras Negras, Yaxchilan and Palenque- and how the latter affects ceramic regional distributions. The existence of a fractured geographic and political landscape poses interesting questions for archaeological scholarship: what does the existence of political allegiance or tribute from non-contiguous populations imply for ceramic distributions? How does it differ from those among territorial contiguous populations? How are not only distributions of resources but also histories of migrations, genealogies, military conquest and alliance building implicated in these patterns?

Lilley, Ian (The University of Queensland)**[77] *Lapita - the Australian Connection***

Recent research in southern New Guinea, Torres Strait and northeastern Australia suggests that Lapita users and possibly makers may have been present in regions hitherto believed to be beyond their reach. In New Guinea, the discovery of late Lapita near Port Moresby has just been complemented by findings of late Lapita ceramics in the western Gulf of Papua. Southwest of the

Gulf, undiagnostic ceramics dating to perhaps 2500 years are now known in the Torres Strait. Bill Dickinson showed that some of this latter material is from New Guinea. In northern Australia, undiagnostic material has been found in surface contexts on Lizard Island off Cape York Peninsula. The Lizard sherds remain undated but are hypothesized to be pre-colonial. They were discovered after Dickinson suggested that late Lapita in the Solomons could originate from places such as Lizard. Ceramics have never been found before in pre-colonial contexts in either Torres Strait or mainland Australia and its offshore islands. The proximity of their find-spots to the new discoveries of Lapita in southern New Guinea, and the dating of at least some of the Torres Strait material, raise dramatic new possibilities regarding the course of prehistory in those areas.

[102] *Understanding the Production of Majiayao Painted Pottery in Gansu: New Data and New Thoughts*

This paper examines the evidence for local production of painted pottery of the Majiayao Culture in Gansu province based on their distinguishing characteristics in mineralogical, compositional and technological aspects, and on correlations of these features with the geographical source. We examined a database of painted pottery sherds from one Yangshao-period site and two Majiayao-period sites with comprehensive analytical methods such as petrological, grain-size, Raman microscopic analyses combined with XRF, ICP-MS, NAA, EPMA and SEM analyses, to assess factors enable diagnosing Majiayao pottery locally made in Gansu. We also examined the effects of raw materials on changes in compositions and inclusions of ceramics by studying a number of modern pottery vessels fired with local clays separately in Lintao and Linxia counties. The present case study suggests that we should be wary of linking all types of compositional and technological diversities to different provenances. However, some certain local technological characteristics of Majiayao painted pottery in Gansu might exist.

Lin, Kuei-chen (Institute of History and Philology, Academia Sinica)

[283] *Craft Production and Domestic Economies of the Prehistoric Chengdu Plain, Southwest China*

The Chengdu Plain has been home to several large walled settlements and many small villages since the late Neolithic era. Evidence from several sites suggests that multiple types of economic and subsistence production were usually coupled within a given community. Such activities might have mutually influenced one another while sharing or competing for resources, including labor and customers. Although some artisans possibly produced luxury goods or gifts used on special occasions, most of the products were everyday goods that only circulated among a village or community. It is curious and worth noting, however, that the counterparts or imitations of these local products, which followed the same prototypes but whose details were differently implemented, can be found in diverse contexts and many other far-off settlements. By comparing the manufacturing traditions of different working groups, we can discern the extent to which environments, settlement patterns and subsistence economies played an important role in shaping respective traditions. It is also clear that, to understand how these types of production were incorporated into domestic economies and perhaps also larger exchange networks, we need to further investigate users' social interests and strategies.

[304] *Settlement Structure at La Villa: A Preclassic Hohokam Village*

For roughly 400 years after La Villa was founded, around A.D. 500, the village would have been one of the largest in the Phoenix Basin, rivaling, perhaps, the great centers of Snaketown and Grewe on the Middle Gila River. Recent excavations at the site by Desert Archaeology Inc. combined with a series of previous investigations provide intriguing new information about the organization of settlement at Hohokam villages. The work at La Villa has resulted in the identification of two large plazas as well as occupation extending more than 120 m beyond the plaza edges. Our investigations at La Villa have identified multiple long-lived social units close to the plazas while occupations farther from the plazas are of shorter duration. We suggest that settlement along the perimeter of the plaza would have been by the village founders and their descendants, with these spaces curated for hundreds of years. A plaza proximate location would have served to display the historical relationship of the households to the founding of the village reinforcing social, political, and economic rights that are likely to have been derived from first-come status.

[376] *Searching for Continuity in the Hinterlands: Households at Rancho San Lorenzo's Floodplain North Settlement Cluster, Belize*

In this paper I will summarize the results of the 2013 and 2014 field seasons at the Floodplain North settlement cluster, located within the Rancho San Lorenzo Survey Area in the Mopan River Valley, Belize. Investigations sought to identify continuous occupation from the Late Classic to Postclassic periods. Maya occupation at Rancho San Lorenzo peaked in the Late Classic, followed by a drastic decrease in population levels. However, pedestrian survey undertaken in 2013 revealed Postclassic ceramics at the Floodplain North settlement cluster, one of five distinct clusters within Rancho San Lorenzo. The 2013 season also included test excavations at five house-mounds with the primary goal of identifying more Postclassic ceramic data. Based on the 2013 data, the primary objectives of the 2014 field season were to continue testing house-mounds throughout the Floodplain North cluster and, using ceramic data, identify a chronology of occupation. A total of six house-mounds were tested. Excavations revealed a strong Late Classic to Terminal Classic presence, with possible continuity into the Postclassic.

[149] *High Tide in the Lower Pecos: Digital Documentation of the Threatened Rattlesnake Canyon Mural*

Rockshelters of the Lower Pecos Canyonlands display visually striking and compositionally complex Pecos River style murals painted by hunter-gatherers during the Late Archaic. The Rattlesnake Canyon mural (41VV180) is regarded as one of the six finest surviving examples of this world-renowned pictograph style. However, the site is severely threatened by repeated flooding episodes along the Rio Grande, exacerbated in recent years by siltation of Amistad Reservoir. Three known flooding episodes have impacted the paintings since 2008. Building upon the recording project conducted by the TAS Rock Art Recording Task Force during the 1990s, Shumla is collaborating with the National Park Service and Texas Tech University to record the Rattlesnake Canyon mural using state-of-the-art, digital documentation techniques before it is damaged further and eventually lost. Fieldwork sessions in June and September 2014 collected comprehensive baseline data facilitating current and future research, conservation, and public education for this threatened cultural legacy.

Lindsay, Ian (Purdue University)

[334] *Shifting Human-Environmental Interactions in the Late Prehistoric Periods of Southern Caucasia*

The Caucasus Mountain range is an exceptionally dynamic landscape whose diverse topographic, tectonic, hydrological, climatic, and pedological dimensions provided the backdrop to equally vibrant social transitions from the Neolithic through the Iron Age. The past two decades of intensive excavations and radiocarbon dates in the South Caucasus (particularly Armenia and Georgia) have resulted in important refinements to material culture sequences from the first farmers to the earliest political hierarchies and empires. A long-standing tradition has persisted in the region to uncritically invoke "the environment" as a driver of important historical transitions—from determinative access to vital highland resources like obsidian and metals, to the adoption of pastoral transhumance—despite a lack of concrete paleo-environmental data. Indeed, until recently very few data have existed to reconstruct the daily challenges and affordances of highland climatic and hydrological regimes that effected daily life for ancient populations, and how these may have precipitated settlement and subsistence change over the *longue durée*. This paper will discuss the current state of knowledge of how ancient societies (including the region's earliest complex polities) in Southern Caucasia engaged with their natural environment from the 6th through 2nd millennium B.C.

[364] *Clay Reconnaissance and Suitability Testing within Petrified Forest National Park*

The likelihood of endemic clays both suitable and used for local ceramic production within the Petrified Forest National Park, Arizona is disputed. Researchers imply clays within the park are unsuitable for ceramic production. Ethno-archaeological studies, though, document that most traditional potting communities procure clay for ceramic production within a three to five kilometer radius of their residence (Arnold 1985). In this case, past individuals residing within the current park boundaries must have located and obtained clay from a reliable source, as large amounts of utility ware is present within the park. I will ascertain the utility of naturally forming clays within the Petrified Forest National Park through the collection and firing of naturally forming geologic and alluvial clays. This study examines clay sources within three to five kilometers of five archaeological sites: AZ K:13:114, Puerco Pueblo (AZ Q:01:022), Pottery Mound (AZ Q:01:281), Sivu'ovi (AZ Q:01:114), and Twin Buttes (AZ Q:01:2), serving as a base study for sourcing ceramics within Petrified Forest National Park and contributing to specific questions regarding ceramic production. Determining the source of ceramic production within Petrified Forest National Park can shed light on trade patterns as well as cultural preferences for material and design.

Ling, Johan

[137] *War Related Social and Ritual Traits in Rock Art*

War related social and ritual traits are common features in European Bronze Age and Native North American rock art. There are some general similarities in the material that needs to be stressed between the North American images and those from Bronze Age Europe, fighters depicted with spears and shields etc. This resemblance speaks of how distant un-connected human groups may create similar imageries, given only a set of rather superficial social similarities in general terms. Moreover, the striking resemblance between the figurative depictions of armed humans and weaponry on the stelae of Iberia, dated to Late Bronze Age, and Scandinavian rock art is also important in this context. Most scholars seems to agree about that the Bronze Age in parts of Europe was an unstable period characterized by conflicts and constraints and that small-scale raiding and warfare was a common feature. This is also the case for some of the societies that produced North American Rock art. This indicates that rock art was neither a mere depiction of an ideal cosmology nor a mere religious declaration, but also a vehicle for projections and conceptions arising from tensions in the real social world.

[72] *Archaeology as Heritage Resource: Foundations for Successful Archaeological Tourism, Achievements and Challenges from Petra to Angkor*

Global heritage tourism is at an all-time high with tourism numbers expected to increase in the coming years. The challenges associated with managing heritage sites are as countless as they are complex. Heritage resources are finite non-renewal assets that provide critical links to the past, a source of identity, knowledge, and cultural values that enable communities and individuals to better understand and navigate the present. The management of archaeological resources, as part of heritage tourism, offers a unique set of challenges associated with their multifaceted use and fragility. Despite the difficulties in navigating the delicate balance between archaeology as academic resource, archaeology as a commodity, and archaeology as cultural heritage, numerous projects around the world are developing innovative approaches to heritage tourism management at archaeological sites. This paper will examine heritage management programs, including past and present initiatives, at heritage sites in Jordan, Cambodia, and Turkey to identify strategic successes and ongoing challenges of managing archaeological tourism at heritage sites. In particular, this paper will highlight the critical importance of community and stakeholder engagement in the creation and implementation of heritage tourism management plans and the need for educational outreach programs to establish long-term success at these dynamic sites.

Lints, Andrew (University of Alberta)**[373]** *Reconstructing a 600 Year Old Ceremonial Event from the Northern Plains: Analysis of Phytoliths from within a Modified Bison Skull*

While numerous ethnographic accounts indicate the use of plants in the creation of ceremonial bison skull altars within many areas of the Great Plains, few examples of this practice has been identified from archaeological contexts. Analysis of phytoliths from soils (n=2) obtained from within and beneath a ceremonial bison skull (A.D. 1339 and 1397) recovered from the Crepeelee site (DiMe-29), southwestern Manitoba, led to the identification of phytolith assemblages dominated by C4 grasses. Samples obtained from stratigraphic control samples (n = 24) produced phytolith assemblages composed primarily of C3 grasses, more common to Northern Plains environments. Contradictions between phytolith types found within and beneath the bison skull feature and surrounding soil profile suggest that C4 plant materials were placed beneath the ceremonial bison skull during the creation of this altar. Results of this research indicate that bison and maize (*Zea mays* spp. *mays*) played both a dietary and spiritual role within pre-contact foraging societies inhabiting the Northern Great Plains approximately 600 years ago.

[373] *Chair***Lione, Brian Michael (Iraqi Institute for the Conservation of Antiquities and Heritage) and Jessica Johnson (Museum Conservation Institute, Smithsonian Institution)****[254]** *Coursework in Disaster Preparedness and Emergency Response in Iraq: Meeting Immediate Training Needs at the Iraqi Institute*

Decades of regime rule, war and economic sanctions resulted in reductions in professional staff, isolation from the international community, and ultimately; neglect and deterioration of Iraqi cultural heritage. During a period of relative stability, the Iraqi Institute for the Conservation of Antiquities and Heritage (established through US funding in 2008) began offering academic programs in architectural conservation, artifact / object conservation, and archaeological site preservation to Iraqi professionals in 2009. Since its first courses, the Institute has educated over 250 Iraqis, most in courses delivered by the University of Delaware.

Managed by an Iraqi board of directors and an international Advisory Council, the Institute is a model of successful international collaboration. It is also noteworthy for its balanced approach to conservation education: graduates immediately apply their updated skills –and international connections– to improving the management of Iraqi sites and collections. This successful model was modified in 2014, when the University of Delaware temporarily suspended longer academic courses in favor of tailored training events in disaster preparedness and emergency response. This paper will discuss the intent, goals and content of these courses, and how graduates of the courses are applying new skills to protect and preserve cultural heritage in uncertain times.

[191] *An Approach to Fitting Transmission Models to Seriations for Regional-Scale Analysis*

At scales where individual copying events are not measurable but the regional archaeological record is rich enough to support models more detailed than phylogenies, seriation can play a unique role as a diachronic measurement tool for linking cultural transmission models to data composed of assemblages of artifact class frequencies. As a first step towards fitting cultural transmission models to regional-scale transmission scenarios, we develop an iterative deterministic seriation algorithm. We then implement summary statistics suitable for fitting models to seriations using an Approximate Bayesian Computation (AB.C.) approach.

In 2010 the Palmitopamba Archaeology Project in northwestern Pichincha province, Ecuador, was expanded to include excavations in a rectangular platform mound (Tola Rivadeneira, NL-30) 2 km north of the monumental Yumbo and Inca site of Palmitopamba. Earthen mounds (tolas) widely distributed throughout the region, constituted a significant element in the construction of the Yumbo landscape. While recent agricultural work removed the latest occupation of the mound, excavations reveal a history of overlapping occupations that included possible feasting and mortuary functions. The entire mound was built over a Formative Period site that predated the eruption of Pululagua Volcano. Work at the site will continue, but preliminary research so far adds much to our understanding of Yumbo culture.

Lira-Lopez, Yamile**[198] *Distribución temporal de la cerámica teotihuacana en el valle intermontano de Maltrata, Veracruz***

Entre Teotihuacán y la Costa del Golfo, bajando el Altiplano Central y el valle Puebla-Tlaxcala, existe un pequeño valle enclavado en la Sierra Madre Oriental, habitado desde el 800 aC hasta la actualidad. Su ubicación geográfica permitió formar parte de una ruta de tránsito, comunicación e intercambio, entrelazando la Costa del Golfo de México y el Altiplano Central, permitiendo la interacción entre grupos olmecas, zapotecos, teotihuacanos, mixteco-poblanos, aztecas y habitantes locales, quienes permanecieron a lo largo del tiempo mientras que las "grandes culturas" florecían, se dispersaban o decaían. Particularmente durante el Clásico mesoamericano el valle de Maltrata formó parte del "corredor teotihuacano", siendo utilizado desde la fase Tzacualli como ruta comercial, enclave y posiblemente como colonia, dada la gran cantidad de cerámica de estilo y comercio teotihuacano (vasijas cilíndricas, Anaranjada delgada). Hasta el momento no hay reportado otro asentamiento, en el tramo hacia la Costa del Golfo, con tal evidencia. El material que se presenta proviene de excavaciones realizadas por el Proyecto Arqueología del valle de Maltrata (Instituto de Antropología-Universidad Veracruzana-IIA-UNAM), permitiendo profundizar en el análisis de la expansión de la cultura teotihuacana en el tiempo, cuya expansión o influencia hacia la Costa del Golfo alcanzó sitios como Matacapán.

[345] *West to East: The Spread of Wheat and Barley Cultivation across Eurasia*

By the end of the 2nd millennium B.C., the South-west Asian crops wheat (*Triticum* spp.) and barley (*Hordeum vulgare*) are being cultivated in much of Central, South and East Asia. How did these crops spread from west to east? Can we find evidence of the routes of spread through the archaeogenetic analysis of these South-west Asian cereals? We describe our analyses of Eurasian barley and wheat using microsatellite and Single Nucleotide Polymorphisms (SNPs); this data is enabling us to elucidate possible routes of spread across Eurasia. We are primarily studying extant cereal landraces, with the inclusion of some historic and archaeobotanical material. Analysis of SNPs involved in flowering time genes is revealing the role environmental adaptation has in the establishment of cereal cultivation in new areas. We also present our analyses of the relationship between wild and cultivated barleys, and draw conclusions about the origins of wild barleys in the Tibetan Plateau.

Litschi, Melissa (Southern Illinois University, Carbondale) and Kayeleigh Sharp (Southern Illinois University, Carbondale)**[11] *pXRF Meets GIS: A Preliminary Investigation of Spatial Variability in Domestic Ceramics at Songoy-Cojal, North Coast, Peru***

Archaeometric approaches to ceramic analysis allow us to critically examine differences in ceramic manufacture and use. By integrating pXRF methods with spatial analysis, it becomes possible to contextualize such differences. Do elemental and technological differences correspond to distinct ceramic styles? Are these differences spatially meaningful? Attendant to our broader objective investigating Mochica-Gallinazo identity and coexistence at the Songoy-Cojal site complex, Zaña Valley north coast, Peru, the current work explores these two questions through data obtained during our short-term lab season in 2014. We collected elemental data, using a pXRF analyzer, on a sample of Gallinazo and Mochica ceramics to test for differences in chemical composition between the two ceramic styles. We then mapped the results alongside data collected in previous seasons. Our geospatial analysis uses three lines of evidence, stylistic, technological, and elemental, to explore intra-site spatial variability. We present the results of this preliminary analysis that tested our original questions of material and technological differentiation, and highlight the best areas to target in future investigations.

Little, Aimee (University of York, UK), Shannon Croft (University of York), Charlotte Rowley (University of York), Oliver Craig (University of York) and Nicky Milner (University of York)**[17] *Taken to Task at Star Carr: Integrating Scientific Approaches to Artifacts and Their Archaeological Contexts***

New research on microwear and micro-residue traces on flint and organic artifacts from Star Carr is currently underway. Extensive 3D recording of thousands of artifacts spanning several excavation seasons using GIS has provided an excellent high-resolution spatial record. As well as low/high power approaches to microwear analysis, microresidues are being analyzed using the contextual approach. Flint tools displaying residues of particular interest are being flagged for more detailed imaging by Scanning Electron Microscopy (SEM) and BIOchemical characterization. Results from these analyses are being integrated with technology and refitting studies, experimental archaeological research, geochemical survey, and a study of the micromorphology of the sediments. Integrating these datasets is enabling discrete episodes of human activity at Star Carr to be distinguished. Concentrations of tools in association with features, including structures, are revealing microscopic evidence for subsistence and craft-related activities. Some tasks were conducted in the wet, others were conducted on dry land. This presentation will outline the methods applied, before offering an interpretation of the social significance of these findings.

[67] *Casting Technology and Craft Production of Bronze Wares in the Central Plains of China in Late Shang Dynasty (13th B.C.-11th B.C.)*

Casting technology played a more significant role in the formation of Chinese ancient civilization than any other early civilizations. Accompanying with the appearance of bronze vessels in Erlitou period (1800B.C.-1500B.C.), the piece-mold casting technology was first established and then became a prolonged thousand-year manufacturing tradition after the Shang Dynasty. The formation of piece-mold casting technology tradition, which is very different from forging and lost-wax method in the west Asia, is closely related to the craftsman's technological choice.

Therefore, based on the scientific analysis of bronze vessels and foundry remains from Yinxu, the sequence of bronze casting, and the origin and evolution of casting technology in late Shang dynasty was discussed. By carefully analyzing casting technology and production procedure of bronzes in late Shang Dynasty, the relationship between technological styles, the evolution of bronze production technology, and the effect of mass production can better contribute to an understanding of ancient state development in Bronze Age

[234] *Why Moving Starch? Trans-Eurasian Exchange of Starchy Crops in Prehistory*

Scholarly interest has increasingly focused on an episode of Old World globalization of food resources that significantly predates the 'Silk Road'. The impetus behind this growth of interest has been the expansion of bio-archaeological research in Central and East Asia over the past decade. This paper considers the agents responsible for the food globalization process in prehistory and the forms they took. One of the key aspects of the Trans-Eurasian movements of crops in prehistory was that the movements were not to regions devoid of existing starch-based agriculture, but instead constituted an addition to that agricultural system. Other economic plants, such as grapes, dates and peas, also moved significant distances. However, the novel starchy crops held a particular significance; they went on to become significant staple foods in many of their new destinations. Drawn from recent discovery from western China, we will take into consideration differences in the projected archaeological signatures of different potential agents involved in transmission of the crops.

[407] *Human Dietary Responses to the Ecological Instability of Prehistoric Khao Wong Prachan Valley, Thailand: Corroboration between Paleobotany and Skeletal Chemistry*

In Mainland Southeast Asia, rice agriculture and consumption has been a factor frequently tested for changes in population, biological and socio-cultural dynamics in prehistory. For Khao Wong Prachan Valley (KWPV) in central Thailand, Weber et al. (2010) indicated that rice did not enter the stratigraphy until the 1st millennium B.C., while millet seeds were encountered as early as the 3rd millennium B.C. and persisted throughout. Factors such as climate fluctuation, population expansion, and diminishing wild plants due to deforestation could stimulate the incorporation of newly available plant food resources, in this case rice. A KWPV site occupied during the late Neolithic to the early Bronze Age, human skeletal remains from Non Mak La are isotopically analyzed to examine the relationship between botanical evidence and human dietary responses. Results from enamel apatite demonstrate a clear trend chronologically from a C4-oriented diet (mainly millet) to the increasing

contribution of C3 foods (rice), echoing the botanical findings. The consumption of C4 plants, however, remained evident over time, suggesting a continuous C3-C4 mixed diet. Data from other prehistoric central Thai sites also suggest that locally-sourced wide spectrum diets were maintained over time despite ecological and cultural variability.

[276] *Inscribed Places: Examining Rock Art Sites on the Pajarito Plateau*

At Los Alamos National Laboratory (LANL), one constantly encounters cultural remains of the past, whether they are of research buildings utilized during the Manhattan Era, or the remnants of dwellings of Precolumbian farmers on the Pajarito Plateau. Rock art sites are often encountered places where images of various meanings have been physically pecked and scratched out by people inscribing their identities and worldviews onto the surrounding landscape. Because a landscape can persist in form and memory in various states of visitation, deterioration, and commemoration, we need to view rock art in relation to surrounding habitation and activity sites, as well as natural resources at various scales. I take a landscape approach combining Puebloan ethnography and GIS applications to examine approximately 150 rock art sites in the LANL cultural resources database dating from A.D. 600 - 1600. This approach allows for recognition of robust spatial and temporal patterns, such as the range of variation in topographic settings through time. Are there differences in where certain motifs can be seen and accessed, and conversely, are there places where certain images are not depicted and cannot be viewed? Can we identify differences between interior cavate or kiva art and isolated petroglyph panels?

[362] *Rock Art Resonance: Preliminary Results of an Experimental Acoustic Study*

Pecked petroglyphs of a prehistoric Mojave Desert slot canyon hint at experience crafting processes in rock image production. The unique qualities here not shared by other area petroglyph sites support the need to consider archaeological and geographic context of these sites as a critical variable, rather than an assumed constant. With narrow passages, dry falls, and towering vertical walls, the slot's metamorphosed limestone substrate yields the potential for sound characteristics not found at many other petroglyph sites in the region. A summer 2014 expedition undertook experimentation with percussive sounds in the highest density concentrations of rock art within the slot. This research aims to identify novel acoustic properties brought about by both the unique landform and curious continuity of the use of a pecking strategy in image production. Weathering suggests continuity in pecked engraving technique over a substantial time depth – likely spanning through both the Numic and part of the Archaic Periods. This study adds depth to the range of variables to consider relevant in recording rock art sites. More broadly, it demonstrates the capacity of experimental archaeology to push the limits of interpretation by expanding the range of inferences which can be reasonably drawn from even faint traces.

[147] *Place Making, Authority, and Ancestors: New Evidence of Developing Middle Formative Socio-Political Complexity from Ka'Kabish, Northern Belize*

Northern Belize during the Middle Formative Period (1000-300 B.C.E.) has increasingly become recognized as a critical locus in the development of Lowland Maya socio-political complexity. This

period witnessed the founding of numerous ceremonial centers, substantial material cultural innovation, and the advent of mortuary practices indicating developing social differentiation in Northern Belize. Recent excavations at the site of Ka'Kabish in Northern Belize have uncovered evidence significantly strengthening this view. Excavations underlying Plaza D-South at Ka'Kabish have revealed a series of bedrock-hewn offering pits housing thousands of shell beads, forty-seven greenstone objects and debitage, and extensive ceramic evidence indicating communal ritual and feasting. Significantly, this elaborate series of offering caches appears to center on the secondary, bundled bedrock-cist burial of an important personage and/or ancestor. Comparable contemporary evidence from Northern Belize has been interpreted through models foregrounding site-founding, place-making, ancestor veneration, and aggrandizer driven social differentiation. By integrating and contrasting these existing models with new evidence from Ka'Kabish, this paper argues that the mortuary, caching, and architectural practices evidenced at Middle Formative Ka'Kabish represent a glimpse of the incipience of the ideological complex, the socio-cultural processes, and the material manifestations propagating the development of subsequent Maya socio-political complexity.

Lodge, Spencer

[229] *Earth Oven Facilities of the Sheep Range in Southern Nevada*

Since 2012, nearly 200 earth oven facilities have been recorded within the Sheep Range on the Desert National Wildlife Refuge in southern Nevada. The identification of these features was aided by the use of Google Earth due to a chemical reaction that occurs in the local limestone when exposed to extended periods of heat. Also known as roasting pits, the widespread use of these features in southern Nevada has not been previously addressed, resulting in a dearth of knowledge regarding their prehistoric role in the region. Roasting pits mark the focused exploitation of previously underutilized resources, such as desert succulents like agave and yucca, which require long baking periods to be rendered edible. A substantial increase in the use of similar features has been noted elsewhere within the American Southwest from 4,000 - 2,000 B.C., and has also been attributed to increasing population densities. This presentation highlights my interpretations of the earth oven facilities of the Sheep Range.

[239] *Modeling Ecological Resilience and Human-Environment Interactions in Engineered Landscapes of the Prehistoric American Southwest*

The prehistoric human footprint in the American southwest is extensive and includes large and small structures, agricultural features, and other signatures of long and variably intensive landscape use. The southwest Jemez Mountains, focus of the current study, have been occupied continuously for the past 2,000 years, and by circa 1300 CE were densely settled in a network of large village sites and fieldhouses. Evidence from tree-rings and fire scars suggests that prior to ca. 1900 Jemez ponderosa pine forests sustained frequent, low-severity surface fires that maintained open-canopy conditions with park-like understory plant communities, a fire regime that has been significantly altered in the past 150 years by changes in climate and human activities. Prehistoric peoples in the Jemez region likely significantly influenced forest structure, fuel properties, ignitions, and thus landscape fire dynamics, but did not appear to erode the long-term persistence of ponderosa pine forests. We use a coupled natural-human systems process model, informed by rich archaeological, ethnographic, and dendrochronology data sets, to assess the magnitude and importance of human influence on fire regimes and ecological resilience. Results highlight the complexity and extent of prehistoric engineered landscapes, and identify future human activities and climate conditions likely to trigger ecosystem instability.

[225] *Akimel O'odham Projectile Point Design and P-MIP Archaeological Research*

This presentation summarizes a Gila River Indian Community research program that is designed to provide quantified projectile point data, which are used to address significant research questions for the Pima-Maricopa Irrigation Project data recovery investigations. In contrast to people from most other regions of the world, the Akimel O'odham continued to extensively employ flaked stone points until the late 1800s. Consequently, considerable ethnographic and ethnohistorical data are available regarding lithic design and use. This information has been used to generate hypotheses regarding point style and function that have been tested through carefully controlled experiments. Specifically, it has been theorized that serration of the point blade margins was largely done for stylistic purposes, and controlled experiments were conducted that tested the effects of this practice on performance. The projectile experiments employed a fixed stand that consistently fired projectiles. Serrated and unserrated points were alternately launched into a variety of target media, and multiple aspects of performance were measured and recorded. The incidence of serration varies dramatically among different locations in southern Arizona, and this practice even varied between some nearby contemporaneous settlements, which supports the suggestion that it was done for stylistic purposes.

[250] *Research on a Dog Burial from Rio Muerto, Peru*

This poster presentation examines the place of the dog in the ancient Andean society of Tiwanaku. The mummified remains of a small dog were recovered from a domestic context at the Rio Muerto site, located in the Osmore River drainage of far southern Peru. Although dog burials in Peru are not unusual, they appear mostly in high-status contexts in art and in mortuary practice. Offerings of young camelids and dogs have been found buried beneath floors and entryways of houses at Rio Muerto M43 and at other Tiwanaku sites in the Moquegua colony. A 2014 SAA paper provided an initial overview of the history of canids in pre-contact Peru as it relates to this individual burial, offering preliminary information from the archaeological and ethnographic records to suggest possible avenues of study focused on the ancient dogs of Peru. The isotopic study of the individual presented here will examine strontium signatures and carbon values to glean information relating to possible place of origin and dietary practices to further the hypothesis that dogs in ancient Peru were symbols of social rank and status.

Loftis, Kathy, Alex Cherkinski (Center for Applied Isotope Studies, University of) and Robert Speakman (Center for Applied Isotope Studies, University of)

[121] *Application of Compound-Specific Radiocarbon Dating of Hydroxyproline from Bone Collagen*

The ability to generate accurate and reliable radiocarbon dates for bone is of great importance in archaeology. Routinely, the age of bones is determined by radiocarbon dating of hydrolyzed bone extract. However, this method does not isolate collagen-derived organic matter, and contaminant organic carbon may be present in the extract. Exogenous organic matter, introduced during burial or post-excavation treatment, can affect the estimated radiocarbon dates. Pre-treatment methods can minimize contamination, but isolation of endogenous carbon is not guaranteed. More recently a compound-specific radiocarbon dating method was developed. This method targets amino acids that originate in the bone sample, such as hydroxyproline. Hydroxyproline is present in limited animal proteins, but is a major amino acid of collagen. As such, this compound serves as a biomarker for bone collagen, thereby yielding more accurate radiocarbon dates. We present our findings of the application of hydroxyproline radiocarbon dating to archaeological bone.

Loftus, Emma [294] see Sealy, Judith

Logan, Amanda (Northwestern University)**[258]** *Excavating Slow Violence Across the Modern/Premodern Divide*

Archaeology as a technique allows us to make visible processes of "slow violence" (Nixon 2011) that unfold over time, providing a critical temporal dimension to understanding how and why modern inequalities come to be. In this paper I attempt to reconcile why "prehistory" matters to understanding structural violence in recent times. While archaeologists of the contemporary and recent past have long used archaeology to make visible the experiences of structural violence among subaltern groups, their gaze rarely extends into deeper pasts. Yet comparison of pasts and presents can coax alternate potentialities to the surface, such as the economic potential of various regions in very different economic settings. For example, in Banda, Ghana, archaeology reveals a greater degree of food security and economic well-being prior to European expansion, suggesting a much higher potential standard of living than observed at present. This comparative project sets the stage for an archaeology of slow violence that embraces the study of long-term processes across the modern/premodern divide.

Lohman, Nicole (Northern Arizona University)**[149]** *New Methods for Rock Art Recording at Petrified Forest National Park*

Researchers and park staff recorded rock art at Petrified Forest National Park with a number of different and disparate approaches over the past half-century. As part of a graduate research project a standardized multi-scalar approach for recording rock art at the park was developed. The development process examined the efficacy of four different approaches for creating panel sketches. A comparison of the variables of time to complete, accuracy, and perceived ease for each method revealed the strengths and weaknesses of each approach. A series of forms to record rock art used by agencies and organizations in the Southwest were also examined and used to compile a park specific recording form. The results of the study permitted the development of a multi-scalar adaptive approach, which permits the collection of data appropriate for both research and management needs.

Lohse, Jon (Coastal Environments, Inc.)**[130]** *A Record of Late Holocene Volcanic Activity from Highland Guatemala*

A record of late Holocene volcanic activity in highland Guatemala was inferred from sediment and tephra stratigraphy in two cores from Lake Amatitlan. Electron microprobe analysis of glass from the tephra samples suggests most eruption deposits are of local origin, coming from nearby Volcanoes Pacaya and Fuego. The 6th-century Ilopango ash is clearly visible, and a few tephra samples have not been correlated to particular volcanoes or eruption events. Using dates from this sequence with others from regional studies of eruptive histories from Fuego and Pacaya, we present a constrained age model spanning from about ~2.7 to .6 kbp to understand the timing and frequency of volcanic history. We find that volcanism was episodic, with periods of high-frequency eruptions followed by periods of relative quiescence. This model is relevant to our understanding of regional patterns of urbanization, population growth, and political centralization.

[75] *Discussant***Loney, Helen (University of Worcester, UK)****[50]** *Gender and Age in the 18th–19th Century Worcester Porcelain Industries: Relating the Results of Archaeological Research to Social History*

This poster will present some of the finds analysis from the Worcester Porcelain Project, which is conducting fieldwork in the suburbs and agricultural zones around the City of Worcester, in order to better understand the processes of industrial waste management prior to World War II. The study of industrial archaeology in Britain since the 1960s has emphasized monument and landscape studies, with emphasis on preservation and conservation of iconic factories and installations. In parallel to this work, a number of social historians and scholars have been recording production methods and exploring company archives, in order to critically evaluate the history of industry during the 17th, 18th

and 19th centuries, in particular. These studies have contributed to our understanding of the nature of industrialization, including the roles and contributions of women and children. These results shed light on the stages of the industrial process, leading up to the production of marketable items. Importantly, the results have revealed artifacts which when seen in conjunction with local social and industrial histories can be confidently assigned to specific age and gender groups, most importantly male and female children. This offers the archaeologist an unusual opportunity to develop the link between artifact and gender studies.

Long, Emily (Sequoia and Kings Canyon National Parks)

[310] *Elevation, What's the Point?: A Preliminary Study of Selected Obsidian Projectile Points Collected From Varying Elevations at Sequoia and Kings Canyon National Parks*

Sequoia and Kings Canyon National Parks (SEKI) has evidence of a well-established trade network for raw lithic material, specifically obsidian. Obsidian was widely traded throughout the central and southern Sierra, since local material was unsuitable for tool manufacture. High elevation archaeological sites, such as those observed at Taboose Pass (11,400 feet in elevation), consist of high density obsidian lithic scatters with tools, blanks, and diagnostic projectile points. Low density obsidian scatters are observed at lower elevations in the foothills, indicating a wide dispersal of material. Is there an evident transmission of projectile point styles with the dispersal of material? Is there a correlation between projectile point types from higher to lower elevations? As a preliminary study, I selected SEKI archaeological sites with collected diagnostic projectile points from various elevations (15-20 sites per zone) and conducted a basic comparative analysis of material and form. This poster summarizes the results of the projectile point investigation.

Longhurst, Peta (University of Sydney)

[36] *Difference in the Archaeology of Institutions*

Historical archaeology has recently been concerned with the study of a diverse range of institutions – of confinement, of education, of religion, of punishment, and of reform. Disjunctions between the social ideals on which these institutions were founded and the material realities permeate much of this literature, often interpreted through a framework of resistance to institutional power. Lu Ann De Cunzo (2006) has characterized institutions as trialectical spaces -simultaneously conceived, perceived and lived. This paper explores the ways in which these disjunctions can be understood through a framework of archaeological difference. Through a consideration of a number of institutional forms, this study reflects on the extent to which De Cunzo's trialectic can be described as a form of non-correspondence between the institutions' sociality and materiality. What impact has the resultant friction had on the way in which institutions operated and were experienced? How might 'difference' inform future archaeological inquiries into the process of institutionalization?

[11] *Modern Settlement Patterns and Site Preservation in the Middle Moche Valley*

During the July field season of 2014, the authors conducted a survey of sites within the proposed reserves of Ciudad de Dios and Bello Horizonte in the Middle Moche Valley of Peru. GPS data was collected for comparison with previously recorded site boundaries to offer insight into the threat of modern encroachment on archaeological sites. Using GIS and statistical analysis, the authors identified areas of site degradation and loss, categorized each site on a sliding scale of endangerment, and determined patterns of modern encroachment. Furthermore, the authors assessed how modern settlement patterns in the area compared to those of the precolumbian era. Topography and geographical location, time period, site type, and number of recorded reoccupations were all factors in determining patterns of encroachment of past and present. The insight gained

through the authors' analysis of modern and prehistoric settlement patterns shows potential for the use of such studies in effective prioritization of endangered areas and future site preservation efforts.

Look, Cory (The Graduate Center City University of New York), Erin Friedman (The Graduate Center City University of New York), Matthew Brown (Brooklyn College City University of New York) and Reg Murphy (National Parks of Antigua and Barbuda)

[56] *Indian Creek Revisited: The Use of Portable X-ray Fluorescence (pXRF) Soil Analysis to Characterize Areas without Artifacts*

This paper reports on a preliminary study assessing the applicability for pXRF analysis of soils within a Precolumbian context. The data generated for this discussion comes from the site of Indian Creek, Antigua; an Amerindian site bound by a series of middens forming a concentric ring around the perimeter of the site. This settlement is the result of over 1300 years of continuous occupation, before it was abandoned just prior to contact in the New World. Aside from the excavations conducted by Irving Rouse along the outer middens, little research studying this 'bounded' space has been conducted in part due to the lack of artifacts in these areas. During the summer of 2012-2013 archaeological soils and samples were taken from this space and were characterized using multi-element soil pattern analysis. These findings were then compared to the archaeological record generating new datasets and discussions regarding the nature of human behavior and the soils capacity to characterize them.

[248] *Patterns of Grapheme Innovation in the Classic Maya Script*

The ancient Maya script evolved over the course of about 1800 years, during which hundreds of distinctive functional graphic units (graphemes) were employed. Previous studies have shown that only a small subset of these graphemes was used at any given time, with bursts of innovation in certain epochs, particularly when the production of monuments spiked. This study revisits the question of the historical development of the Maya script, using the Maya Hieroglyphic Database, a comprehensive archive of Maya inscriptions, organized by glyph block. Selecting provenienced monuments only and controlling for time, region, and number of glyph blocks, the database allows us to chronicle innovations in the graphemes employed in the script, from the Early through Terminal Classic periods. This poster summarizes the results of this analysis, showing that not only was grapheme usage temporally patterned, but exhibited distinctive spatial texture as well.

[100] *MayaArch3D: 2D and 3D Visualization and Analysis Platform*

A central goal of the MayaArch3D project is to provide archaeologists with a research platform for the spatio-temporal visualization and analysis of 2D and 3D data over the World Wide Web. To do this we are developing a web-based Geographic Information System (GIS). The client side of our application builds on top of the open-source geomajas 2D web GIS framework and consists of three central components. First, an interface for working with 2D data from different sources and formats exists. Second, a georeferenced 3D scene to explore landscapes, settlements and buildings is a component. The georeferenced coordinate system in this scene allows the combination of additional geodata (e.g., raster overlays, user defined vector data or map services). And third, a viewer which allows for the study of single 3D objects in higher resolutions exists. For the 3D components we have built a spatially enabled 3D framework "GIScene" developed by GIScience Research Group at Heidelberg University using WebGL technology and the open-source Three.js JavaScript library. Both 3D components support the user's interaction with models and provide an analysis tool-set and access to the attribute information from the databases.

[290] *La arqueología latente: educación informal como inspiración para preparación profesional*
El Programa Ciudadano Científico de Para la Naturaleza es un proyecto que da al ciudadano común la oportunidad de conocer, guiados por expertos, las huellas del pasado analizadas con técnicas del presente. Esto no sólo da una idea de cómo se vivía en aquel entonces sino permite conocer y entender las costumbres y estilo de vida del humano en el pasado. Comencé a participar de este Proyecto antes de finalizar mis estudios de escuela secundaria. Cuando formas parte de este proyecto aprendes procedimientos nuevos, el uso correcto de herramientas, obtener y clasificar datos y te conviertes en parte del equipo investigativo. Los líderes guían el trabajo diario y asignan las tareas de cada individuo. Haber participado en este Proyecto despertó un profundo deseo de ser Ciudadana Científica. De participar en programas que incentiven la ciudadanía, en particular a los jóvenes, para fomentar el interés, entusiasmo y compromiso en investigaciones de campo y así entender el pasado, comprender presente y mejorar el futuro. El trabajo comunitario y de campo no sólo son horas de experiencias acumuladas. Fueron mi mayor impulso y lo más determinante para que decidiera estudiar Arqueología en la Universidad de Puerto Rico.

[360] *Three Dimensional Modeling in Archaeological Interpretation: A Case Study from the Pacific Northwest*

Virtual reconstructions are becoming increasingly commonplace in archaeological vernacular and cultural heritage initiatives. As with any emergent technology however, the advantages, limits and drawbacks of such an approach are not well defined. This study assesses and contextualizes the validity and usefulness of virtual reconstructions in archaeological interpretation and academic publication and explores how such technologies are utilized in the field as a whole. In addition to a survey of the growing body of literature on the subject, and an exploration of the intersection between archaeology and computer science, findings from our own virtual reconstruction of a pithouse from the Slocan Narrows Village in the Upper Columbia River system are extrapolated upon.

Lopez, Oscar (discertante) and Stanley Guenter

[408] *Patrons and Artists: New Information on the Producers of Codex-Style Ceramics of the Mirador Basin*

Codex-style ceramics are a distinctive product of the Late Classic Mirador Basin of north-central Peten, Guatemala. Through the archaeological work of the Mirador Basin Project and the chemical analyses of affiliated scholars we now have a considerable amount of information on the physical production of these vessels. In this presentation we present new evidence on the artists who produced these vessels, as well as the nobles for whom they were painting. These data provide much needed new information to re-evaluate the sociopolitical system that gave rise to these ceramics.

Lopez Bravo, Roberto (Universidad de Ciencias y Artes de Chiapas) and Elizabeth H. Paris

[291] *Collapse from the Outside In: A View from the Western Maya Periphery*

Despite the sociopolitical instability and depopulation observed at numerous sites in the Southern Maya Lowlands during the 9th century A.D., often referred to as the "Maya Collapse," numerous politically and geographically peripheral sites do not show evidence of these characteristics. Many of the small cities and towns of the Central Highlands of Chiapas maintained their roles as political centers throughout the Late Classic-Early Postclassic period transition, and also experienced demographic expansion. Excavations at Moxviquil and Huitepec, two small hilltop sites in the Jovel Valley, suggest their durability in the face of the instability and collapse experienced by their lowland

counterparts was in part due to highly diversified local economies and relatively flexible and shifting participation in long-distance trade networks. We specifically examine the degree to which highland sites shifted exchange networks towards the periphery, to the Ixtapa Valley and Central Depression, and the degree to which such shifts provided economic and political stability. A periphery-centered perspective highlights the complex relationships between periphery polities and core centers, and challenges the assumptions of traditional core-periphery economic models.

Lopez Corral, Aurelio (Instituto Nacional de Antropología e Historia)

[180] *Strengthening the State: Intensification and Mixed Agricultural Strategies in Late Postclassic Puebla-Tlaxcala*

The development of agricultural technologies is a key element in theory concerning the growth of Mesoamerican state societies. Cultivation of species under improved environmental conditions suggests intensification oriented strategies for the finance of political institutions, and to attend auto-consumption needs of households at the subsistence level. During the Late Postclassic, the Puebla-Tlaxcala region witnessed the rise and consolidation of various rival state-level polities known locally as altepeme. Recent archaeological research indicates that, parallel to this phenomenon, there is a widespread use of different agricultural technologies, such as terraces, drained fields and canals, to intensively exploit crucial ecological areas. This paper explores the role of large-scale staple food production in relation to the strengthening of institutional apparatus and its implications for the expansion of indigenous state societies.

[194] *Templo Mayor's Gold*

Mexico is not a country rich in native gold deposits, especially compared to Colombia, Peru, or Bolivia. This would explain why the precious metal was always used rather sparingly in Mesoamerican civilizations. A good example is Tenochtitlan (1325–1521 A.D.): after thirty-seven years of archaeological exploration in the city's sacred precinct, the Templo Mayor Project (1978–2015) has recovered only a meager set of gold artifacts, in contrast to the tens of thousands of metamorphic greenstone, copper, flint, travertine, obsidian, and ceramic objects contained in the same offerings. This paper will analyze the entire collection of gold pieces from the Templo Mayor Project in light of various historical, archaeological, and chemical data, and offer new insights about the chronology, typology, function, meaning, manufacturing tradition, and "geographical area of use" of gold in Late Postclassic Central Mexico.

[176] *Reading Memories of Past Practices in the Landscapes of Poverty Domination: An Ethnoarchaeological Study in Morelos, Mexico*

In eradicating poverty through infrastructure building and welfare policies in the State of Morelos, the commodification of the landscape is causing people to forget the social practices of distant pasts. Memory is intimately linked with the landscape, as it creates a sense of place that legitimizes the many identities and social worlds that have existed through time. By exploring current human practices in the landscape, this study illustrates how habit memory translates and maps fragmented pieces of collectively lived histories since the XVI century and explains how economic growth and development interfere with the possibility of identifying and connecting anthropic activity markers to understand past human behavior.

Lopez-Finn, Elliot (University of Texas at Austin)

[307] *Defining the Red Background Style: The Production of Object and Identity in an Ancient Maya Court*

While many collections today exhibit Red Background vessels for their vibrant colors, supernatural content, and elegant hieroglyphic texts, recent scholarship has embedded these works in the greater social culture of the Late Classic Period. As highly mobile art objects, the vases appeared alongside works with other distinct painting styles in feasts throughout the Guatemalan Lowlands, where the vases would display the prestigious affiliations of the owners. The diverse narrative content on these vessels reveals the importance of mytho-historic origin stories and supernatural identities to the prevailing order, while the unique hieroglyphic texts link the painted style to the royal court of Pa' Chan. What identities and connotations would the Red Background style communicate as a representative of this geographic or political region? Refocusing the question of agency through the final product reveals that these works acted as part of a larger campaign for the typical courtly trappings of master artisan production and public feasting with representatives of other polities. This paper expands upon themes of my Master's Thesis to explore how the surface decoration of the Red Background style communicated prestige and the elite identity of a specific place to the larger landscape of competitive and collaborative Maya city-states.

[193] *An Analysis of Architectural Form and Function at Cahal Pech, Belize: The Case of Structure B7*

Recent archaeological investigations at Cahal Pech, Belize have focused considerable attention on understanding the form and function of monumental architecture in the site's largest public courtyard. Designated as Plaza B, the courtyard contains an eastern triadic shrine or "E-Group", and three large range-type or palace-like buildings that are located on the north, west and south flanks of the plaza. Our investigations of these buildings, particularly on Structure 7, have revealed important architectural data that can be used to examine questions relating to architectural form and function, and that provide important clues for understanding activities conducted in buildings that border public courtyards at lowland Maya sites.

Lopiparo, Jeanne (Rhodes College)

[412] *Crafting Houses for the Living and the Dead: Obsidian Production, Multicrafting, and Household Identities at a Classic Maya Center, Chinikihá, Mexico*

Craft production in the Classic Maya world was often carried out within multi-household groups, whose shared practices were passed on from generation to generation and whose social identities were strongly tied to the products they created. Investigations of a residential zone at Chinikihá, a Classic Maya center in the Palenque region, recovered a quantity of obsidian artifacts and evidence for production that is unusual not just at the site, but across the region. Fine-grained excavations have identified contexts of obsidian production as part of a multicrafting industry among household groups in this zone. Lithic materials from all stages of production were recovered from a wide variety of contexts. The elaboration of tool types and widespread evidence for use-wear and retouch indicate both that lithic production was a primary medium for technological mastery, and that we have only begun to understand how these tools were utilized in other activities. A sequence of

burials associated with dense lithic debitage suggests that mortuary practices incorporated the performance of producing the beautiful objects that shaped household identities and socioeconomic relations in life, thus commemorating the mutually sustaining relationship of the living and the dead.

Loren, Diana (Peabody Museum, Harvard University)

[305] *Defining and Divining the Healthy Body: Materialities of Body and Wellness in the 18th-Century Spanish New World*

This paper explores the intersections of health, religion, race, and dress; how theories of disease and illness in the eighteenth century intersected with Spanish imperial understandings regarding race and dress of colonizer and colonized and culturally-distinct medicinal practices for treating physical and spiritual sicknesses. Colonial empires reshaped and redefined colonial bodies: physical and spiritual care, social and sexual interactions, and dress and language were just a few of the concerns of imperial powers who strove to maintain hierarchies of inclusion and exclusion. For the colonial individual, practices of adorning and protecting body and soul (with medicine, amulets, and religious items) were integral to constructing identities and safeguarding spiritual well-being. Using archival and material sources, I explore how colonial peoples living in New Spanish treated, mended, and covered their bodies through dress, practices of faith, and medicine.

[355] *The Sinkhole as Ch'een: A Closer Look at Ancient Maya Sacred Geography*

During the 2014 field season, the California State University, Los Angeles Cave Research Project focused its investigation on a sinkhole at the site of La Milpa that had been given a cursory examination by the TRAP in 2012. An initial inspection suggested that the feature might well have been considered a ch'een by the ancient Maya. Ch'een is generally translated as cave but the indigenous term includes a large number of earth openings that were recognized as sacred landmarks. Excavations along the lip on three sides of the sinkhole documented the existence of a rubble cored platform that appears to have encircled the feature. The platform formalized and bounded the space leaving no doubt of the special function of the sinkhole. Excavations around and within the sinkhole recovered a large assemblage of ceramic and other artifacts that suggested a fairly heavy utilization. At the close of the season, the excavation unit in the sinkhole was yielding Early Classic ceramics that predated the major utilization of the site. Evidence suggests that the unit may be a meter or more above bedrock so that an even earlier date of the initial utilization is likely.

Lorenzo, Cristina (University of Valencia Spain) and Gaspar Muñoz (Polytechnic University of Valencia)

[242] *Material Manifestation of Ritual Survival after Abandonment*

The presence of burials placed on the floor of the palaces and private patios within elite complexes but without offerings is truthful testimony about the time of the Mayan settlements' abandonment at the end of the Classical Terminal period. Such burials have been found at the Acropolis of La Blanca (Petén, Guatemala). Years later, during the Early Postclassic period, when those buildings had already partially collapsed and debris covered Terminal Classic material vestiges, other individuals were buried in this debris. Big Postclassic pots were also found near them. Thinking about death rituals that took place in both periods is the purpose of this presentation.

Losey, Robert (University of Alberta)

[28] *Living with People Can Be Bad for Your Health: Tooth Loss and Trauma in Northern Wolves and Dogs*

Humans and dogs have long engaged in complex relationships, ranging from loving and intimate, to extremely violent and exploitive. Archaeology has tended to focus on the former, mostly ignoring the sometimes-ample evidence for trauma and tooth loss in remains of ancient dogs. Inferring the causes of such lesions on ancient dog remains has proven difficult, in part because of the lack of comparative data for canids living outside of the human niche. This paper compares patterns of cranial trauma and tooth loss in a large sample of modern wolves and dogs from northern parts of North America and Russia. Our data demonstrate that tooth loss and fracture are far more common in the dogs than among the wolves. These patterns seem to be related to a high degree of self-provisioning among the dogs, which included scavenging on hard food items. Cranial fractures also are far more common in the dogs than the wolves. The etiologies of these lesions are numerous, but many are entirely consistent with blows to the head from humans. Dogs' abilities to self-provision and sustain injuries were likely important to both their original domestication and their long-term continued use in harsh northern environments.

Loten, H

[295] *Compiling Tikal Report 15*

Two issues arise in compiling Tikal Report 15 posthumously. Between 1960s fieldwork and current museum policy, illustration formats have changed so that drawings previously inked for photo-reduction are now useless. Secondly, Tikal Report 15 presents data collected under Peter Harrison's direction, but all figure items have been redrawn digitally with inescapable interpretation, so a question of authorship cannot be avoided.

Loubser, Johannes (Stratum Unlimited, LLC)

[34] *More than Mere Dots on a Map: Archaeological Sites among Venda-Speaking Communities of the Soutpansberg*

This presentation deals with fieldwork conducted between 1983 and 1985 to reconstruct the early history and political-economy of Venda-speaking communities in the Soutpansberg region of South Africa. In order to visit, locate, identify, map, excavate, and interpret ancestral stone-walled sites, the permission, guidance, background information, physical labor, and orally transmitted information of local Venda-speaking people were essential. In most instances, permission and guidance to sites were obtained fairly easily, whereas in a few cases it was a protracted process of negotiation and false leads. Information gathered during the difficult times turned out to be valuable, as the indigenous significance of the sites under question became apparent. The results of the ethnographically-informed archaeological work appear to have had mixed responses among various Venda, revealing information about divisions within society that would not have been obvious otherwise. Whereas members of the politically dominant Singo clan benefited from the exposure that the archaeological research generated concerning Venda-speaking people in general, numerous non-Singo clans appreciated the additional recognition that research into their ancestral settlements awakened among both Venda speakers and the wider southern African society.

Loubser, Johannes [353] see Pritchard, Erin

Loucks, Jordon (University at Albany)

[381] *Irish Built Arteries: Ethnic Identification along the Canals and Railroads of New York*

This study explores the materiality of cultural boundaries manufactured around immigrant communities in industrial localities in New York State. The immigration of thousands of Irish to the United States throughout the eighteenth and nineteenth centuries was met with an intense animosity. Religious and economic differences combined with an anti-immigrant sentiment to provide the Irish-American with a continuation of the racist attitudes similar to the ones that plagued English Improvement. Using artifact data provided by the New York State Museum and documentary evidence, this study hopes to examine the trace materiality left by the actions of racialization. The material evidence left behind by actions inspired through racism may be able to indicate, more

accurately than previous ethnicity-based studies, the defined social groups and their resistance to outside influences. The Irish immigrants who flocked to the sites of industry across New York helped build the infrastructure of the Empire State. As a result of their contribution to the success of New York, the history of Irish presence at sites along railroads and canals is incredibly important, and deserves thorough archaeological study to add to our understanding of their experiences beyond the documentary record.

[375] *Categorical Imperatives: Re-imagining the Classificatory Schema for Mayan Ceramic Vessels*

Various systems of vessel classification have evolved through the need to address specific research questions from disparate sub-fields within Maya studies. Recent work, however, has shown that these classificatory categories may be inadvertently biasing the interpretation of Maya ceramics by presupposing aspects of use, function, and social context. Instead, these aspects should be matters of empirical study and validation derived from the vessels and their contexts rather than imposition by categorical lenses.

Lovata, Troy (University of New Mexico)

[394] *An Archaeology of Skiing*

Archaeologists have explored the prehistoric development of skiing, but its study as a modern recreational activity, lifestyle, and commercial practice has generally been left to historians. Yet snow sports entail a unique material culture, are a vibrant link between past and present, and leave a visible environmental impact. Recent consolidation of ownership and demographic shifts has spurred the closure of numerous ski areas in North America. This has led to both the abandonment of slopes and an active community who ski these areas as a link to customary and traditional snow sport and landscape use. Thus, skiing is ripe for study thru the lens of contemporary and historic archaeology. This paper outlines an archaeology of skiing. First, it examines how recreational activities have lasting impacts on the environment. Second, it outlines the large community who continue to ski closed slopes in North America and how recreational activities have long term culture impacts and function as preservation of traditional culture. Third, it discusses preliminary archaeological surveys undertaken at abandoned slopes in the Rocky Mountain states of Colorado and New Mexico. These include skiing slopes as part of phenomenological approach to understanding landscape, its use, and cultural preservation.

Love, Michael (Calif State Univ-Northridge)

[151] *El Triangulo del Sur: Izapa, Takalik Abaj, and El Ujuxte*

The Pacific Coast borderlands of Chiapas and Guatemala were home to at least three major urban centers in the Late Preclassic Period: Izapa, Takalik Abaj, and El Ujuxte. How these sites were related to one another through intellectual exchanges and commerce tells us a great deal about the nature of urbanism in Mesomamerica during the Late Preclassic Period. These three sites were part of a broader southern "City-State Culture" that included Kaminaljuyu, Chalchuapa, and other early urban centers. The City-State Culture cuts across ethnic boundaries, making a distinction between "Maya" and "Mixe-Zoquean" zones moot. Shared elite elements, such as ruler stelae, texts, calendrics, and ritual performance were present in most of the zone, indicating a strong class-based identity. However, economic patterns, including a multiplicity of long and short distance trade routes, show the complex nature of interactions. The regional political systems indicate a highly competitive and fragmented landscape.

[172] *Discussant*

Love, Sarah (Georgia State University) and Andrew Vaughan (Georgia State University)**[201]** *3D Modeling of Archaeological Collections: A Case Study in Archaeometry*

Artifact collections and skeletal remains curated in multiple facilities and stored in variable conditions across the globe contain a wealth of archaeological knowledge. Access to data about these collections, much less the collections themselves, can be restricted both by policy concerns and practical considerations. Recent technological advancements have made creating high quality digital representations of both artifact and skeletal material possible. In this paper we compare two methods of 3D reconstruction, (software based photographic/photogrammetric 3D reconstruction and laser scanning), for the purpose of research in Archaeology and Bio-Archaeology. Using these methods, digital measurements taken from the models are compared with the same measurements obtained with precision instruments. By comparing 3D representations with manually obtained measurements, a quality baseline of what is currently possible in 3D digitization of archaeological materials can be established.

Loveless, Erana**[291]** *The Invisibility of Reactive Foragers and its Implications for Traditional Ecological Knowledge*

"Reactive foragers" are people who switched to intensive foraging in reaction to crises. They are largely a people without history because their turn to foraging decreased their archaeological visibility and increased their remoteness from the centers of civilization where written history is concentrated. Ironically, while colonialism was often a driver for reactive foraging it also introduced the keys for reactive foragers to succeed in some cases. Reactive foraging can explain the loss of technologies among dispersing groups, ethnographically and perhaps archaeologically. This work explores past and present examples of reactive foraging globally, as well as conditions in which reactive foraging is most likely to have developed. Reactive foragers often succeeded when able to learn subsistence skills from marginal groups that maintained traditional ecological knowledge (TEK). Thus, while reactive foragers became more marginalized themselves, it was often pre-existing marginal groups that made this survival tactic possible. Preservation issues and archaeological biases have resulted in an invisibility of reactive foragers which diminishes our understanding of the historical utility of TEK. The ability to cycle adaptively through subsistence strategies can improve the resilience of a group facing adversity. However, for this ability to persist, both ecological resources and TEK must also survive.

Loven, Jeremy (Eastern New Mexico University)**[245]** *Ritual Use of Fauna in the Casas Grandes Region*

The use of faunal remains for ritual purposes was an important part of Casas Grandes society throughout the Medio period (1200–1450 A.D.). The past inhabitants of this region utilized the bones of numerous animals for ritual and symbolic functions, as well as for personal adornment. Past archaeological and zooarchaeological research conducted within this region has focused significantly on the site of Paquimé and the artifacts/remains recovered from that site. This paper, although considering the importance of Paquimé and the utilization of faunal remains at that site, examines the ritual use of fauna at several small sites recently excavated throughout the core Casas Grandes region and incorporates recent faunal analyses into our understanding of animal bone usage by the prehistoric inhabitants of this area.

Lowe, Lynne (Centro de Estudios Mayas, UNAM)**[242]** *La tradición de los incensarios en el centro de Chiapas*

La utilización de incensarios cerámicos con el fin de quemar ofrendas durante las ceremonias, que podrían ser resinas aromáticas, papel, semillas, flores u otros elementos, constituyó una tradición milenaria en el centro de Chiapas, como lo han demostrado las evidencias arqueológicas. Las excavaciones realizadas en Chiapa de Corzo y otros sitios de la Depresión Central, como Mirador o Vistahermosa, aportan información de gran interés sobre los orígenes, formas de uso y desarrollo estilístico de estos importantes objetos rituales, así como sus relaciones con otras zonas del sur de Mesoamérica.

Lowery, Darrin**[243]** *Geoarchaeological Proxies of Late Holocene Sea Level Rise: Marine Transgression and the Archaeological Record of the Delmarva Peninsula*

Understanding the magnitude of sea level rise over the past century is a hot topic in the Chesapeake Bay region. The research presented in this paper combines 20th-century aerial imagery, 19th-century land use data, and geoarchaeological information associated with various coastal archaeological sites to provide a high-resolution marine transgression record spanning the past two centuries. Tide gauge models have suggested that there has been ~1 foot (30cm) to ~1.5 feet (49cm) of sea level rise in the Chesapeake Bay over the past century. Some researchers have even stated that the rate of sea level rise in the Middle Atlantic region over the past century is greater than at any moment during the past 2,000 years. The geoarchaeological research in this presentation shows how tide gauge models for the Chesapeake Bay region have greatly overestimated the amount of historic relative marine transgression. This research also focuses on understanding the geological parameters of sea level rise during the Holocene and provides a geoarchaeological calibration tool to better understand recent sea level change.

Lowman, Christopher**[15]** *Marking Ainu Objects*

Close examination of Ainu objects in American museums reveals patterns of use-wear, re-use, and intentional marking. These marks draw attention to the life of the object, an avenue of research when depositional data or documents are absent. In colonial contexts, modification as a form of individual or cultural ownership can be used to oppose assumptions of assimilation by revealing ways materials were appropriated or were part of cultural hybridization. Ainu artifacts drawn from multiple collections provide evidence of how "Ainu-ness" continued to be created in the face of Meiji-era internal colonialism in Japan, and how it changed in conjunction with increased tourism and cultural recognition efforts. I use ethnographic objects to examine endurance of Ainu design in material and motif, as well as signs of use and modification. Presence and absence of foreign materials, the re-application of decorative elements, and wear-patterns together mark ways the Ainu maintained, and modified, cultural ownership.

Lowry, K. Bryce [20] see Beach, Jeremy

Lowry, Justin (George Mason University), Jason Paling (Plymouth State University) and Colin Quinn (Dartmouth College)**[246]** *Obsidian Trade from the Perspective of Chiquilistagua, Managua, Nicaragua*

The 2013 and 2014 seasons at the site of Chiquilistagua, located west of Managua, Nicaragua, included survey, excavations, and descriptions of archaeological remains. Chiquilistagua was chosen because of its proximity to potential trade networks. Lithic and ceramic materials found in the excavations point to production and trade. This paper will discuss the trade networks connecting Nicaragua with southern Honduras and contextualize them within the larger context of Central America interaction.

The goal of this research is to describe the early trade networks that existed during the transition between the Tempisque and Bagaces periods.

Lozano-Garía, Socorro [129] see Caballero, Margarita

Lu, Enguo (Xinjiang Institut for Cultural Relics and Archaeology)**[102]** *Prehistoric Painted Pottery of Xinjiang*

Ever since the 1970s, painted pottery has been discovered in large quantities at cemeteries and occasionally settlements on the southern and northern foothills of the Tianshan Mountain. Organizing

them into four Early Iron Age (ca. 1300-200B.C.) regional cultures: Yanbulake in the Hami region, Subeixi in the Turfan region, Chawuhu in the Kaidu Valley, and Yili Valley in the eponymous region, this paper characterizes the stylistic distinctions of the painted pottery of them. The Yanbulake culture, for instance, features the ware types of jars and bottles with double handles as well as the motifs of rhombi and triangles, whereas the Chawuhu culture features those of spouted jars and chessboard and thunder designs. Furthermore, this paper considers the possible origins of the painted pottery: while some motifs seem to derive from local textiles, some ware types are reminiscent of leather-made vessels. The painted pottery of Xinjiang, as a whole, manifests intimate connections with the Hexi Corridor. This paper sees no impact of the Harappa culture in Indian Subcontinent and Tripoli'e in the Black Sea coast, but it acknowledges inspiration from the Namazga and Chust cultures of Central Asia.

[293] *Diachronic Changes in the Shell Mounds of the San Francisco Bay: A Case Study of Ellis Landing (CA-CCO-295)*

The purpose of this paper is to examine diachronic changes in the long-term use of the Ellis Landing site (CA-CCO-295), a large shell mound on the San Francisco Bay whose chronology spans more than 3000 years. Originally excavated in 1906-1908 by Nels Nelson, recent investigations of museum materials housed in the Hearst Museum of Anthropology at UC Berkeley are providing new insights into the harvesting practices, mortuary patterns, and community dynamics of the people who resided at Ellis Landing in Late Holocene times. This paper will summarize the findings and discuss interpretations about the long-term use of the Ellis Landing site.

Lucarelli, Rita (UC Berkeley)

[240] *The Ancient Egyptian Book of the Dead on Coffins: Ritual Protection and Justification of the Deceased.*

The collection of texts and illustrations known as the ancient Egyptian "Book of the Dead" was especially en vogue on papyrus from the beginning of the New Kingdom through the Graeco-Roman period. However, abridged versions of Book of the Dead texts and vignettes have also been widely used to decorate a number of other funerary and magical objects. Among others, the anthropoid coffins produced during the Third Intermediate Period and the 25th Dynasty present a few intriguing features in relation to the role that the Book of the Dead plays in their decorative program. In this paper it is argued that most of the extracts from the Book of the Dead occurring on coffins of the late New Kingdom and later periods have a specific ritual character concerning the protection, purification and justification of the deceased. Compared to the papyri of the Book of the Dead, coffins show a shorter but more distinctive selection of texts and vignettes from the same collection, whose analysis may deepen our understanding of mortuary rituals in the late New Kingdom and later.

Lucas, Virginia (University of Alabama at Birmingham)

[202] *A Reexamination of Human Remains from Late Prehistory in the Alabama River Valley*

The late prehistory of central Alabama is not yet well understood, particularly when compared to contemporaneous occupations elsewhere in the Southeast. Previous excavations of Durant Bend (1Ds1), a late Mississippian/Proto-historic, single mound site in Dallas County on the Alabama River, resulted in a number of artifacts, including lithics, pottery, faunal remains, and human remains that enhance our understanding of late prehistoric and protohistoric occupations in the Alabama River Valley. One such excavation in the early 1970s, yielded five sets of subadult human remains as well as one single element from an adult individual, all of which are currently curated at the University of Alabama at Birmingham. These remains originally were examined and included in a 1976 report of the site. A recent reexamination of these remains by the author employing modern analytical

methodologies allows for increased insight into the age and health of individuals occupying the Alabama River Valley during this time period. Utilizing extant collections such as these also allows researchers to apply modern methods to older data in order to gain a better understanding of past individuals. Examining these individuals from Durant Bend allows us to gain a better understanding of this time period in central Alabama's history.

Lucas, Leilani (University College London) and Dorian Fuller (Institute of Archaeology)

[414] *De-centering the Fertile Crescent: Multiple Pathways to Food Production*

Southwest Asia is one of the earliest and most documented centers of agricultural origins. With the expansion of archaeobotanical and zooarchaeological datasets within this region it is now more possible to unravel the evidence on a broader regional scale revealing a more complex picture with multiple centers and pathways of plant and animal domestication. Through a comparison of recent evidence this paper examines the multiple pathways towards domestication and the transition to agricultural economies in the Near East, suggesting four distinct subsistence trajectories. The different regional packages of both plant and also animal data are characterized and the development and diversification of these packages over time is discussed. With the addition of recent evidence from Jarmo an eastern route is established and contrasted with an Upper Euphrates trajectory that leads to Cyprus, the evidence from sites in the southern Levant, and the possible Anatolian path that feeds into the pulse-free Iranian zone represented by the evidence from Chakmak. Further, the differing rates of change within each of the crops is presented and situated within the regionally specific social contexts.

Lucero, Lisa (University of Illinois at Urbana-Champaign)

[36] *Climate Change, Dissonance and Urban Diaspora in the Southern Maya Lowlands*

In response to growing needs for dry-season water, the southern lowland Maya constructed increasingly larger and more complex reservoirs at major centers throughout the Late Classic period (550-850 C.E.). Annual rainfall replenished reservoirs and nourished rainfall-dependent crops. In exchange for access to reservoirs during the annual dry season, farmers contributed goods, services and labor to kings and their administrators. When several multiyear droughts struck between 800 and 900 C.E., the effect on reservoirs was noticeable, impacting the basis of royal power. This set in motion a series of events that ultimately resulted in an urban diaspora where farmers abandoned kings and centers for areas with more reliable sources of water and new economic opportunities. Maya kings did not adapt, whereas farmers did. I discuss how the same material infrastructure impacted kings and farmers differently, and how this dissonance bears on present concerns relating to climate change.

[10] *The Geoarchaeology of Late Prehistoric Irrigation in Central Utah*

In 1928, Harvard archaeologist Noel Morss observed ancient irrigation systems in central Utah during fieldwork that first defined the Fremont culture. Instances of Fremont irrigation are known, but perceptions of the Fremont as a small-scale society of indigenous mixed foragers and farmers delayed empirical evaluation of Morss's report. Fieldwork, beginning in 2010 and continuing, now identifies a complete irrigation system 4.5 miles long bringing water from 8,500' to a 90-acre field at 7,100' on the east slopes of Boulder Mountain, overlooking Capitol Reef National Park. Fieldwork includes excavations exposing subsurface canals, experimental archaeology on the costs of system construction and maintenance, magnetometer imaging, and dating of ditch sediments using optically stimulated luminescence (OSL). Exposures dated thus far identify irrigation and construction episodes from A.D. 1500 – 1700 during the Late Prehistoric period, well after the presumed demise of the Fremont. No Spanish entered Utah until A.D. 1776, and our research area did not see Euro-American settlement until A.D. 1880. The implications of our findings offer support for Fremont - Late

Prehistoric continuity, and perhaps post-Fremont integration among Fremont and Puebloan histories and peoples: the Fremont of the Southwest.

[234] *Beauty and Adornment in Fertile Lands and Desert: Toiletries from burials of Han China and her Western Neighbors*

This paper presents preliminary research that compares toiletry sets and other items of personal adornment from burials within the political boundaries of Han dynasty China (206 B.C.E.-220 C.E.) to those found at contemporaneous sites near the westernmost periphery of the empire. Toiletry sets of the Han elite are commonly enclosed in rounded lacquer cases and include items such as bronze mirrors, combs, boxes with cosmetic powders, hair accessories, and other personal possessions. Comparison of these sets with similar items from richly furnished and well-preserved burials found at sites such as Shanpula (Khotan) and Niya, located along the southern rim of the Tarim Basin in present day Xinjiang province, reveals notable similarities in type and style. This study explores the significance of toiletries and items of adornment to Han and non-Han burial practices, and the extent to which the Han's presence near the arid Tarim basin impacted—and, perhaps more interestingly, had little effect on—even the more mundane dimensions of everyday life, such as beautification, adornment, and bodily maintenance.

[180] *Producers on the Lake: Late Aztec Lakebed Chinampa Communities of Lake Xochimilco*
Recent historic imagery analysis combined with 1960-70s archaeological surface survey data in a geographic information system (GIS) has generated a detailed spatial model of chinampa beds, canals, and settlement mounds for a 1,010 hectare area of Lake Xochimilco distinct from remnant Xochimilco chinampas that persisted into historic and modern times. The delineated agricultural waterscape was characterized by an approximately 1:1 land to water ratio with narrow raised agricultural beds (3.75 x 49.4 meters). The estimated lakebed population for the study area was 2,525 (2.5 persons/hectare) including 2,000 full-time tenant farmers. In this paper, I continue my spatial analysis of the Xochimilco lakebed chinampa GIS focusing on lakebed settlement. Two types of settlement – chinampa households/hamlets and village wharves – have been identified. Using network and least cost path analyses I define lakebed chinampa communities associated with particular lakebed village wharves – hubs of social and economic activity for tenant chinampa farmers who existed outside the traditional calpolli system of shoreline chinampa communities with pre-Aztec origins. Additionally, transport routes from fields, to lakebed wharves, to the docks of Tenochtitlan-Tlatelolco and other shoreline centers will be modeled. This project creates the first detailed spatially referenced system of lakebed chinampas and producers.

[406] *On Why We Still Need Ethnoarchaeology*

Although ethnoarchaeology is viewed as an important tool of analogy for the archaeological record, it

has been criticized as being too descriptive, context bound, and limited by the generation of cautionary tales. These and other criticisms have inadvertently led to a sharp decline in ethnoarchaeological research in recent times. In this paper I argue that ethnoarchaeology is an underutilized methodology that can be expanded with new technologies to test and shed light on the nature of important factors that are often identified as prime catalysts of sociocultural change. Here I demonstrate this potential by presenting ethnoarchaeological data on the changes the nature of food sharing- an often cited "leveling mechanism" that sustains egalitarianism in small scale societies. Disruption of sharing and egalitarian ideals is often viewed as one of the pressures giving rise to social inequalities. Comparative analyses of these data show when and how food sharing dissolves in response to different external pressures, including ecological degradation.

[303] *Painting Ourselves out of a Corner: Considerations on the Medium*

While the connections between ancient mural paintings and twentieth-century urban mural programs may seem tenuous, certain technical, structural and physical considerations of the medium itself link exemplars from past and present. The inextricable relationship between murals and their architectural supports, as well as its scale, can compel a type of viewing and visceral engagement different from that of other types of two-dimensional media; it forces a relatedness that must be unpacked. In this paper, I will consider the medium of painting in both ancient and contemporary contexts and frame the other papers in the session.

[397] *The History of "Laundry Lists" in North American Zooarchaeology*

North American zooarchaeologists believe that prior to 1970, most zooarchaeological reports were laundry lists—lists of taxa identified, perhaps with abundance data. Laundry lists make up 68 percent of titles published between 1900 and 1959; 24 percent of titles published between 1960 and 1979 are laundry lists. Some laundry lists concern samples so small that one should not expect more than a list of identified species; other laundry lists were produced by zoologists who had no knowledge of archaeological research. Ironically, the originator of the term laundry list and its derogatory implications (Stanley J. Olsen) produced only laundry lists.

Lynch, Sally (McMaster University)

[60] *A Study of Fineline Iconographic Depictions at the Late Moche Site of Huaca Colorada, in the Jequetepeque Valley, Peru*

The Late Moche Period (A.D. 500-800) of the North Coast of Peru is marked by significant alterations to the iconography of elite fineline ceramics. In particular, the earlier imagery, depicting conventionalized narratives of ritual performances and exploits of male Moche divinites or their mortal avatars disappears in certain locales. In southern valleys, at sites such as Galindo, Late Moche elite ceramics largely depicted abstract geometrical imagery including the widespread step-and-mountain motif that overlapped chronologically with the earlier Moche IV style at Huacas de Moche. Scholars have argued this abandonment of established iconographic themes and re-invigoration of Pan-Andean abstract motifs signifies a rejection of a discredited ideology in specific

sites and zones of the North Coast. However, prominent sites in the Jequetepeque Valley, including Huaca Colorada and San Jose de Moro, witnessed a continuation of narrative depictions alongside the abstract imagery so prominent in the south and at Pampa Grande to the north. In this study, I explore the social and political significance of the coexistence of these two styles at Huaca Colorada, to question whether they index disparate ideologies to argue the southern Jequetepeque was a place of less stringent political centralization, where ideas, people, and things, were more freely exchanged.

[192] *New England's Submerged Pre-Contact History: Identifying an Intact Archaic Site in Salem, Massachusetts*

A portion of Salem Harbor in Massachusetts was investigated during a cultural resource management project in 2009/2010. The underwater reconnaissance included a remote sensing survey using a Klein 3.5 kHz sub-bottom profiler. An acoustic basement was recognized at approximately two meters below the sea bed, and was hypothesized to be an organic layer potentially representative of a buried land surface below marine sediment. Vibratory cores were used to ground truth the potential buried land surface. Interestingly, the testing identified three different horizons representing unique micro-environments around the two meter mark. One horizon was an intact, buried land surface that had been aerially exposed prior to post-glacial sea level rise. The stratigraphic profile of the land surface showed a layer of salt marsh peat with underlying terrestrial A and B horizons. Two horizons were AMS dated, the overlying peat and a B deposit containing lithic debitage, charcoal, and botanicals. The peat was dated to 4490 +/- 40 rc B.P. and charcoal from the B horizon was dated to 5750 +/- 40 rc B.P. This presentation will include an analysis of the intact site and the surrounding micro-environments. Additional work is planned, and schedule permitting, the preliminary results will be discussed.

Lynch, Elizabeth

[261] *#arrowheads: Instagram as a Creative, Social Media-Based Approach to Public Archaeology*

Social media is a hot topic of discussion and innovation among archaeologists. Although we've improved our ability to digitally reach wider audiences, "social media" is not a single entity. Each platform is different: purposes, user bases, and means of connection vary widely. As archaeologists, we must be proactive about fully understanding these differences, in order to find the most effective ways use each platform and reach a greater public. This paper provides an example of one way to accomplish these goals. Instagram is a mobile device-based image sharing social media platform; users connect with hashtags: pound signs followed by a word or phrase of interest. I surveyed American Instagram users who self-identify as "artifact collectors" to understand their demographics, how they use Instagram, how and why they collect, and their thoughts on archaeologists, collaboration, and cultural resources. This allows me to holistically understand the community that I hope to interact and collaborate with, and how best to reach them. By conducting similar surveys of users on other social media platforms, professionals and groups working in public archaeology can expand the depth and breadth of their outreach efforts, and be more aware of the needs and interests of their audiences.

Lynch, Elizabeth (University of Wyoming)

[342] *Socialized Landscapes of the Southern Plains: Bedrock Ground Stone Surfaces on the Chaquagua Plateau, Colorado*

Prehistoric peoples of the Southern Plains created bedrock ground stone surfaces in rockshelters along upper canyon rims on exposed Dakota Sandstone. These bedrock milling features became centers for the reproduction of food and other resources but also developed into anchored places that facilitated the reproduction of socio-cultural values and norms. The socialization of the Southern Plains prehistoric landscape is most visible in the material culture remains of bedrock milling features that are ubiquitous in the canyon systems of the Purgatoire watershed in southeastern Colorado. Analysis of the milling surface morphology, differences in their organization on bedrock features, and

their distribution across the landscape suggest that site activities vary from quotidian and seasonal group milling of local food resources (pinon, oak, juniper and other berries and grasses) to specialized grinding for ceremonial or ritual events. Bedrock milling surfaces were divided into sub-features based on surface proximity and abrasion between ground stone surfaces on each boulder feature. This paper uses 3D modeling called close range photogrammetry to test whether the recognition of group milling activities, through the sub-division of bedrock milling features into sub-features, is a viable method to understand how prehistoric peoples organized and socialized their milling material culture.

[12] *Iron Grinding Technology in the Kofun Period: New Evidence and Research Techniques*

Due to both a lack of direct evidence and lack of well-defined investigative methods, iron polishing and grinding technologies in the prehistoric Japanese archipelago remain poorly understood. Following the recent foundational research by Lyons, Kawano, and Suzuki, this project seeks to clarify the tools and gestures used to finish iron objects during the Kofun period. Photogrammetric techniques and 3D laser scanning were used to record and analyze striations left by original grinding on iron objects unearthed from Omuro Tsumi-ishi Kofun 165 and Marozuka Kofun in comparison to measurements similarly collected from bronze objects from Omuro Tsumi-ishi Kofun 200, Nukudani Minamizuka Kofun and a recently polished 6th century sword of unknown provenance. Based on these analyses, the use of metal files as well as multiple grinding stones of differing grit is postulated in the manufacture of a single object. Additionally, these analyses find elements of continuity in technique with extant traditional polishing practices in Japan.

[100] *A Transparent 3D Model of Temple 18 at Copán for Visualization and Research*

The development of a clear approach to creating highly “transparent” (effectively displaying the argument behind a reconstruction) 3D models for visualization and research in archaeology is an ongoing process. The goal of this presentation is to address this problem with a use-case example of a 3D model of Structure 10L-18 (Temple 18, ca. A.D. 800) on the acropolis at Copán in Honduras. How can data be structured and applied to this 3D model in order to provide a user with a clear understanding of where this data is coming from, and thus provide a 3D model with greater uses and applications in academic research? In discussing this question, an overview of the process will be explored covering the topics of data collection, storage and processing, the implementation and finalization of data into a usable platform, and questions about future management of this data.

[278] *Temporal and Spatial Variability in Roosevelt Red Ware Painted Decoration*

Recent research in the southern US Southwest has revealed patterns useful in refining ceramic chronology and investigating communities of practice among 14th and 15th century potters producing Roosevelt Red Ware (Salado polychromes). Analyses of whole and partially reconstructible vessels recovered from stratified contexts in the San Pedro Valley of southeastern Arizona confirm the Roosevelt Red Ware stylistic seriation presented by Patricia Crown in 1994. Combining these results with recent typological revisions leads to refined dating at the regional, settlement cluster, and intrasite level. A related study of geographical variability in the bands of painted decoration on the rims of late Roosevelt Red Ware bowls (Cliff Polychrome and Nine Mile Polychrome) illuminates stylistic trends bearing on models of the spread, the persistence, and the eventual disappearance of the Roosevelt Red Ware tradition. These data, juxtaposed with

typological patterns related to geography, in turn, allow us to address the evolution, operation, and decline of social networks born of the Kayenta diaspora.

[312] *Plant Use Practices of an Ancient St'át'imc Household, Bridge River, British Columbia*

This poster focuses on the interpretation of archaeobotanical macroremains from Housepit 54 occupations at the Bridge River site, on the British Columbia Plateau, dating 1100-1500 cal. B.P. Recent excavations have revealed living floors spanning a critical period when this village reached peak size and then began to decline during a period of climate transition. Previous research at Bridge River suggests that access to salmon and deer may have declined after ca. 1200-1300 cal. B.P., triggering heightened socioeconomic competition between households. Very little is known, by corollary, regarding the role of plant foods in the site economy during this time. This poster draws on paleoethnobotanical studies which investigate what the plant remains can tell us about harvesting, subsistence, consumption and cooking practices by Housepit 54's residents. The analysis allows us to determine which plant resources were being utilized in which seasons and at what distance from the site, as well as diet breadth, technological activities, and spatial use of the pithouse. The plant data also allow us to consider the relative involvement of Housepit 54 residents in local and regional networks of trade and interaction, and patterns of continuity and change amongst ancient St'át'imc communities.

Lytle, Whitney

[24] *Same Space Different Face: Recent Investigations at Xunantunich, Group D*

Xunantunich Group D, an elite residential unit, has a fascinating history of construction and reuse between two temporally separated occupations. The group is set apart from other Xunantunich residential units by a sacbe connecting it to the site core and a large ancestor shrine acting as the architectural focal point of the group. The past three years of research at Group D has focused on the Late Classic ancestor shrine and the open courtyard directly in front of the structure with the goal of gaining insight to the earliest construction and changing use of this ritual space. Recent investigations have revealed Late/Terminal Preclassic constructions including a large courtyard platform and an early structure beneath the later ancestor shrine. This paper will discuss Group D's reoccupation, the drastic alteration of the courtyard construction which took place during Xunantunich's florescence in the Late Classic, and how this reuse and modification potentially served sociopolitical functions at Xunantunich.

[37] *Dietary Shift and Cultural Evolution Relation to Intercontinental Cultural Exchanges and Climate Change in the Hehuang and Contiguous Regions, Northwest China ~3600 Years Ago: Evidence from Carbon and Nitrogen Stable Isotopic Analysis*

This study traces the extent to which dietary change coincides with intercontinental cultural exchanges in Eurasia and to enhance understanding of the effects of long-distance exchanges on the human diets. Through stable carbon and nitrogen isotope analysis of late Neolithic and early Bronze Age human and animal bone collagen, we find that intercontinental cultural exchanges in Eurasia led to significant changes in diet in the Hehuang and contiguous regions of northwest China. The isotopic evidence indicates that human diets mainly consisted of C4 foodstuffs (most probably millet) pre-3600 Cal yr BP. With the increasing intensity of long-distance exchange, enough C3 foods (probably wheat and barley) were added to human diets post-3600 Cal yr BP, which strongly influenced isotopic value of bone collagen. The dietary shift speaks to a transition to more complete cultures in the Bronze Age, around 3600 Cal yr BP in Gansu and Qinghai provinces. This occurred

through the differentiation of subsistence strategies, reorganization of social relationship in response to climate change and culture exchange in different parts of the area. In the transition it is likely that dietary changes were related to dryer and cooler climate and/or population growth.

Maas, Lauren

[44] *A Comparative Analysis of Decorative Ceramics and Choice at the Gregory Lincoln/Hspva Site and the Levi Jordan Plantation Site*

The purpose of this research was to investigate questions of aesthetic preference or choice and other driving factors that influenced the ceramic selection by people who resided at two sites: the Gregory Lincoln/HSPVA Site in Houston, TX and the Levi Jordan Plantation Site in Brazoria County, TX as well as to compare the assemblages from these two African American sites from differing environments. These ceramics assemblages, with the exception of one context, had been previously analyzed, but a re-classification of some of the assemblages was conducted. Through a set of hypotheses, the capacity of the archaeological record to reflect the driving forces behind the consumption patterns of segments of the population at these two sites was tested. Personal preference is rarely examined in archaeological literature where the assemblages from "lower status" groups, including African Americans, are often reduced to explanations of emulation or restricted access to resources. Aesthetic preference was reflected as a consumption factor in one of the four contexts examined, and was not ruled out in the other cases. One of the significant contributions of this thesis is its suggestion that aesthetic preference and choice are indeed viable avenues of inquiry for historic archaeological sites of all populations.

Macario, Raquel (Universidad de San Carlos de Guatemala)

[183] *Elite Residences of the K'iche at Q'umarkaj, El Quiche', Guatemala*

When one visits the archaeological site of Q'umarkaj, they enter through a large open space covered by numerous platforms of different shapes from 1 to 2 m high. Closer to the Main Plaza are larger mounds, some over 40 m in length. At the edges of the plateau, beyond the cliffs that surround and limit access to the site, one is able to see three settlements, also on promontories, a few hundred meters from Q'umarkaj: to the north the site Mukwits Pa 'llokab-Chisalin, to the south Pa'Ismach, and El Resguardo Chajnel to the east. They form the area of greater Q'umarkaj.

Thus far, a total of 120 structures have been identified in Q'umarkaj, with functions ranging from, religious, socio-political and residential. Less than 15% of the structures at the site have been excavated. This paper mainly presents the results of excavations and comparative studies of residential structures conducted at the site between 2003 and 2007. This research has contributed to better understand not only the architectural morphology of the site, but has aided in a better understanding of the chronology of occupation and forms a comparative basis for other sites excavated in the K'iche' area.

Macdonald, Danielle (University of Bradford)

[17] *Exploring Domestic Tasks at Kharaneh IV using Lithic Microwear Analysis*

The use and division of space in the Early Epipaleolithic gives insights into the nature of social interaction in the Southern Levant prior to the advent of permanent architecture. This presentation presents preliminary results from the microwear analysis of the Jordanian Epipaleolithic site Kharaneh IV to explore the nature of domestic tasks within a hut structure. Kharaneh IV is located in the Azraq basin, Eastern Jordan, dating to the Early and Middle Epipaleolithic periods. The site's large size and dense artifact deposits indicate that it may have been a hunter-gatherer aggregation locale during occupation and a focal point for interaction. Recent excavations at the site uncovered several hut deposits containing lithic and faunal material. Microwear analysis was conducted on a sample of lithic artifacts recovered from the occupation surfaces of one of these structures. The distribution of these artifacts, linked with their function, provides a mechanism for understanding the organization of domestic space during the Early Epipaleolithic. How the inhabitants of Kharaneh IV structured their activities in association with the built environment will help illuminate how people

organized space in an aggregated community prior to the advent of permanent architecture.

[212] *Problems at the Peaks: A Zooarchaeological Analysis of Subsistence Stress at Elden Pueblo*

When past populations experienced extended periods of resource shortages, acquisition and processing strategies changed to secure enough food. Understanding how faunal materials reflect those prehistoric reactions to subsistence stress remains a relatively unexplored topic in Southwest archaeology. Elden Pueblo, located in Northern Arizona, provides insight into this topic. As one of the final Sinagua occupation sites in the San Francisco Peaks region, the site's abandonment during a cool and dry period suggests that the occupants may have left the area because of resource shortages. In this paper, I analyze a sample of the faunal materials from pit houses, kivas, and a satellite pueblo associated with the site to identify if the population struggled to cope with dramatic climate changes. Residents used the selected structures during separate, consecutive periods of the Elden Pueblo's occupation, which may reveal increasing subsistence stress over time. Evidence of subsistence stress over time in the site's faunal assemblage includes a decrease in larger taxa, an increase in limb elements, and an increase in fragmentary elements. This paper presents the preliminary results of this research.

MacDonald, Douglas (The University of Montana)

[300] *Geographic and Chronological Differences in Lithic Raw Material Use by Hunter-Gatherers in the Greater Yellowstone Ecosystem*

Over the last eight years, the University of Montana has conducted archaeological research at various sites in Yellowstone National Park and vicinity. One aspect of our research is to study variation in hunter-gatherer lithic raw material procurement and use. From north to south and east to west within the region, there are extreme variations in hunter-gatherer use of a number of distinct volcanic and non-volcanic lithic raw materials. This variation can be used to evaluate geographic differences in land-use across the region. The lithic raw material data are useful in the evaluation of whether one group (single-user model) or many groups (multi-user model) of hunter-gatherers used the region in prehistory. We can also evaluate how land and material use may have changed (or not changed) over the last 11,000 years. Ultimately, answers to these questions allow for a better understanding of how hunter-gatherers incorporated Yellowstone into their land-use systems in the past.

MacEachern, Scott (Bowdoin College)

[23] *Boko Haram, Coupeurs de Route and Slave-Raiding: Identities and Violence in a Central African Borderland*

To this point, most analyses of Boko Haram have stressed its origins in Salafi/Wahhabi radicalism in Maiduguri, the capital of Borno State in northeastern Nigeria. Equally important to the development of this organization, however, has been its utilization of frontier zones in the Lake Chad Basin, as refuges and areas for the development of political and military power. In this paper, I will argue that aspects of Boko Haram activities can be profitably understood through the deep-time examination of frontier phenomena in this region, phenomena that stretch back into the period of predatory state formation in the early-/mid-second millennium A.D. These include particularly the slave raiding that played so central a role in the formation of regional cultural landscapes, but also the banditry – a closely related phenomenon, but involving non-state-sanctioned violence – that is equally attested in early historical sources. Igor Kopytoff's 'internal frontier' model saw such interstices between states as laboratories for the creation of new social and political forms. The horrific violence being played out in northeastern Nigeria today vividly illustrates the kinds of social disruptions that accompanied those processes in the last prehistoric period.

MacFarland, Kathryn (School of Anthropology, University of Arizona)

[20] *Religious and Ritualized Landscapes of Iron Age Central Eurasia*

Culturally diverse peoples variously glossed as Scythian, Saka, and Xiongnu lived in northern central Eurasia throughout the Iron Age (ca. 1,000-100 B.C.E.). Archaeological sites of this time period range from kurgans (burial tumuli), mortuary complexes called khirigsuur, standing stelae termed "deer stones," settlements, and metallurgical centers. There is a long-term life history within the places in which these structures and monuments were built, general patterns in their spatial distribution. Placement of these monuments and structures were intentionally and meaningfully utilized, people journeyed between locations, and interacted with their built and natural environment. These places are further linked together by the presence of a distinctive iconographic style, termed Animal Style Art. Patterned usage of this iconography is representative of widespread religious ideas and beliefs; physical representations of conceptual metaphors and symbolic systems. A complementary relationship between places that are meaningful and the symbols depicted within, and those depicted on artifacts and as tattoos on individuals buried within highly ritualized locations, such as the Altai Mountains, are further expressions of religious conceptual metaphors. These concepts are demonstrated by conducting spatial analysis on distributions of symbols depicted on Scythian, Saka, and Xiongnu material culture, monuments and structures throughout central Eurasia.

[157] *Plants, Paths and Place-Making: Examples from the Ribeirinhos and the Xokleng/Laklãnõ in Brazil*

The environmental management practiced by traditional societies has already been presented as a model of sustainability and an example of economic flexibility. However, little is said of its meaning for that population, to whom it certainly exceeds its economic importance. Land is constantly transformed by human action through selective cuttings, extraction of weeds, fertilization and planting. In this paper I will present two different examples from Brazil, one focusing on a ribeirinho community of the delta of the Amazon river and the other, the Xokleng/Laklãnõ indigenous land on the southern part of Brazil. In the first case, I attempt to emphasize the environmental transformation that begins with few visible gestures practiced daily by women in their houses, while bringing seeds and cuttings from the forest and from houses of kin's and friends and planting them in their canteiros (suspended gardens). Planting here is understood as an act of care, which is made individually and its result is afterward socialized through a plant exchange network. In the second case, I will focus on how a hunter-gatherer society known for its high mobility pattern, the Xokleng/Laklãnõ, conceive and engage with their territory.

[151] *Volcanic Hazards Posed by Tacaná to the Soconusco Region*

The Tacaná Volcanic Complex consists of four volcanic edifices: Chichuj, Tacaná, and San Antonio volcanoes, and Las Ardillas dome. It began its formation ~225 ka yr ago at Chichuj, followed by Tacaná ~50 ka, and San Antonio volcano and Las Ardillas Dome during late Pleistocene. Its volcanic history recorded during the past 50 ka yr indicates that the complex has experienced major flank failures at Tacaná (~15 ka) and San Antonio (~2 ka). The latter destroyed the southern flank of San Antonio producing a pyroclastic density current and subsequent lahars that caused the abandonment of Izapa. Recent studies indicate that the complex has experienced at least four Plinian-Subplinian eruptions, two of which rank ~5 on the Volcanic Explosivity Index, dispersing ash towards Guatemala. The complex has also had at least nine other smaller explosive eruptions during the Holocene. The largest of them took place ~10 ka affecting locations up to 6 km from the main summit. The youngest of these eruptions surprisingly occurred ~150 years BP disrupting the Tacaná's summit area. Therefore, the 1949 and 1986 phreatic explosions of Tacaná are only a small reminder of its potential threat to the surrounding populations.

[364] *Space and Settlement across the Painted Desert: Comparing the Land Use Patterns of Preceramic Groups at Petrified Forest National Park*

Although preceramic archaeological sites containing evidence of maize farming were first identified at Petrified Forest National Park (PEFO) in the 1980s, archaeologists have conducted little research on preceramic Basketmaker sites at PEFO. Several radiocarbon dates on maize falling in the first millennium B.C. from preceramic habitation sites have shifted researchers' perspectives on the preceramic occupation Petrified Forest. Recent archaeological survey on Petrified Forest National Park expansion lands identified several preceramic Basketmaker II habitation sites (1000-200 B.C.). The expansion lands survey also identified several single component Archaic sites. Archaic hunter-gatherers were nomadic people who made seasonal rounds between highly productive territorial ranges therefore; their camps were moved to areas with accessible resources, such as game, plants, and water. Contrastingly, a pre-ceramic village site suggests that the people would exploit nearby resources from a more centralized area. This poster places the preceramic farming villages and Archaic sites identified at PEFO in a regional context and compares them using geographic information systems (GIS) to look at differences in settlement patterns, available resources, and site usage.

Mack, Joanne (University of Notre Dame)

[383] *The Potential Influence of Fish and Obsidian Resources on Shasta Cultural Complexity*

The geology of Shasta Valley, California provides an extremely rich food resource for fish and shellfish, which produces abundant fish resources in the Shasta River and its tributaries, well documented by fishery biologists and historical records. The geographical location of the valley and the Upper Klamath River allows relatively easy access to high quality obsidian sources to the east, providing a valuable item for trade to the west. Consideration of the geology and geography allows for a better understanding of pre-contact Shasta villages within the valley along the Shasta River and its tributaries and along the Upper Klamath River, including their size and evidence of cultural complexity, revealed by archaeological investigations completed within the past 55 years.

[279] *Antiquities, Drugs, Guns, Diamonds, Wildlife: Toward a theory Of Transnational Criminal Markets in Illicit Goods*

The illicit trade in looted cultural property has been observed to be an example of a 'transnational criminal market'. Other examples of transnational criminal markets are given in the non-exhaustive list in the title. These markets function in respect of a variety of goods – some are 'collectibles' markets (e.g., antiquities; wildlife), some trade 'consumables' (e.g., drugs; diamonds; counterfeit/pirated goods), while others move non-consumer goods that are not collectibles (e.g., guns; radiological material; human traffic). Trafficking therefore supplies various types of demand. Each transnational criminal market is governed by a different regulatory strategy, and we can compare and contrast the philosophies and practices involved in the types of control used to try to reduce the various cross-border flows of criminal goods. With a view to developing more effective regulation to prevent trafficking in cultural objects looted from archaeological sites, this paper will build on these preliminary observations about different types of transnational criminal markets and regulatory strategies. The aim is to engage in an analysis of the similarities and differences in criminal practices and official control programs in order to be clear about the range of policy futures applicable to the illicit trade in cultural objects.

[192] *Survey for Stone Wall Fish Weirs on the Continental Shelf near Haida Gwaii, British Columbia Using an Autonomous Underwater Vehicle (AUV).*

The search for early human occupation on drowned continental shelves is hampered by the low archaeological visibility of typical hunter-gatherer sites. Predictive modelling for site locations can produce polygons of potential, but these need to be tested both to evaluate the model and to recover material remains. Sampling of underwater predictive model potential polygons is difficult, expensive and usually low-return. However, some sites, such as stone-wall fish weirs, may be directly visible to imaging technologies such as sidescan sonar and also tend to be in relatively predictable locations. Guided by high-resolution swath bathymetry showing terrestrial landforms on the seafloor, we conducted a short survey program for fish weirs using a Bluefin-12 Autonomous Underwater Vehicle equipped with sidescan sonar. The study area includes paleo-river channels on the continental shelf adjacent to Haida Gwaii at depths up to 140 meters. In the immediate area, the Gaadu Din caves contain artifacts dated to 12,500 cal BP and salmon remains to 14,000 cal BP, putting both people and salmon on this drowned landscape. This paper reviews the rationale and methodology of this 2014 program.

[332] *Asturias across Time and Space: An Exploration of Medieval and Early Modern Spain Using Stable Isotopes*

Stable carbon and nitrogen isotope data from 104 individuals from eight sites were used to reconstruct the diets of Medieval and Early Modern (A.D. 600-1750) individuals from Asturias, Spain. Asturias is a coastal region located in northern Spain that remained one of the last Catholic kingdoms when the Moors ruled Iberia. Asturian society was structured hierarchically and divided into clergy, nobility, and peasant classes. Each socioeconomic group buried their own according to

status and wealth. The most privileged burial locations were within the church near the altar (ad sanctos burials) and reserved for high-ranking clergy and wealthy patrons. Peasants in good standing with the church were buried in the surrounding cemetery. Dietary resources consumed by the clergy and nobility differ from those available to peasants and are revealed through the stable isotope analysis. Individuals interred in high status ad sanctos burial locations have lower $\delta^{13}\text{C}$ and elevated $\delta^{15}\text{N}$ values. Possible explanations for this pattern may be the consumption of fish or weanling animals (e.g. suckling pig). In contrast, individuals buried in the cemetery have lower $\delta^{15}\text{N}$ values. Over time, all individuals exhibit elevated $\delta^{13}\text{C}$ indicating a greater dependence on C4 plants (sugarcane, maize) after European colonization of the Americas.

MacLean, Jessica (Boston University)

[34] *Community Entanglements: Archaeology, Heritage, and Community Partnership at the Little Bay Plantation, Montserrat, West Indies*

Tourism has replaced sugar as the Caribbean's economic engine. The ruins of sugar mills incorporated into resorts create cultural experiences rooted in romanticized notions of colonialism. Paradoxically the labor structure of this externally driven model replicates the racial, economic, and social divisions of the plantation structure. Promoted as "sustainable," the recent shift to heritage tourism, while advantageous to archaeology, is rife with the colonizing potential of Eurocentric tourism and interpretive strategies that trap the present in the historical narrative of sugar and enslavement. This paper discusses the challenges and successes associated with the implementation of an AIA Site Preservation Grant to further develop, in association with the Montserrat National Trust and the new national museum, a community based archaeological, interpretative, and educational program at Little Bay Plantation, a small-scale 18th-century Montserratian sugar plantation situated within a large-scale capital redevelopment project. Ultimately good and necessary, this paper explores the welter and complexity of community entanglements associated with the efforts of the Little Bay project to create a sustainable community partnership rooted in collaborative research and interpretation.

MacLellan, Jessica (University of Arizona)

[22] *Preclassic Maya Households and Ritual at the Karinel Group, Ceibal, Guatemala*

Founded around 1000 B.C., the Maya site of Ceibal has yielded important insights into the development of public rituals and spaces in Preclassic Mesoamerica. Recent excavations at the Karinel Group, located just outside the ceremonial core of Ceibal, have complemented this knowledge with data from domestic contexts. By making detailed comparisons of public and household ritual practices, we seek to understand the social processes through which the community of Ceibal changed over time. Some foci of the investigations include: 1) at what point Ceibal's residents first began living in permanent, formalized groups of residential platforms; 2) whether ancestor veneration played a major role in the development of social complexity at Ceibal; and 3) how an open, circular platform functioned within the Middle Preclassic Karinel Group. Work at the Karinel Group should enhance our understanding of the dynamic, reflexive relationships between public and domestic practices and spaces in Preclassic Mesoamerica.

[154] *Applying Adaptive Cycles to the Life History of Ancient Maya Agricultural Systems*

Archaeologists often struggled with understanding the life-cycles of relic agricultural field systems. By incorporating the multi-variable approach of the adaptive cycle, complex relationship dynamics can be identified and applied to understanding the historical sequences of specific cases studies. Demonstrating this is the intensive terrace systems and settlement within the Contreras Valley and the associated ancient Maya center of Minanha, Belize. The variables identified include the relationships between intensive agricultural terracing, climatic change, social pressures, and populations. Results present a multi-faceted understanding of the development, maintenance, and eventually collapse of the field systems and community. This study follows the trajectory of the Contreras Valley starting with kin-based social groups practicing small-scale, decentralized,

agricultural production. The succeeding rise of the Minanha royal court with new social and population pressures which in addition to climatic stresses drove the inhabitants to develop a hierarchically organized social structure with large-scale intensive terrace systems. The consequent collapse of many field systems and the royal court relieved population and social pressure while returning social organization to an emphasis on kinship. Results describe the advantages of using the adaptive cycle for understanding how the dynamic variables interacted to create unique circumstances that initiated changes in the Contreras Valley.

[176] *Past Human Activities: Ethnographic and Geostatistical Models from North Gujarat (India)*

The main aim of archaeological research is the reconstruction of past human activities. So far this has been achieved mostly through the study of material culture. However, activities related to food production and consumption represent an important part of human life and leave microscopic and chemical traces. The use of ethnography and geostatistical approaches can help in unlock the patterns and identify activity areas in a controlled environment. We present here results from a multidisciplinary study in carried out in north-west India where domestic structures and activities can represent good proxies for prehistoric life-ways. Our experiment is not intended to create direct parallelisms between present and past-times, but to test the reliability of our methodology against known activities. We combined multi-element geochemistry, spot tests and phytolith analyses with a geostatistical approach to identify activities areas in a domestic compound (house and courtyard). Results show the validity of the methodology proposed and the potential of a multi-proxy approach to the study of human activities.

[154] *Pigs and Power Centers in Late Neolithic Britain*

This paper explores the interplay between food provision, landscape, and power centers in late Neolithic Britain. This period is characterized by iconic megalithic ceremonial complexes, the most famous of which is Stonehenge. These centers represent a new scale of labor mobilization, not previously seen in Britain. Evidence for feasting, invariably focusing on pork, is rife in the environs of these monuments, yet settlement evidence is generally sparse. It is likely that these feasting events sustained inter- and intra-community relations, but the character and scale of connectivity remains unclear. This paper presents results from a multi-isotope ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$, $\delta^{18}\text{O}$, $\delta^{34}\text{S}$, $^{87}\text{Sr}/^{86}\text{Sr}$) research project that investigates how these feasts were provisioned, from which areas of the landscape animals derived, and the social networks that were sustained through these feasts. Four sites are investigated to assess whether they may have represented competing power bases, sustaining different networks or whether their function was more ceremonial, supporting the same networks but perhaps at different times in the calendrical cycle. Isotope analysis also addresses issues of how the landscape was exploited in raising large numbers of pigs for these vast feasting events.

[221] *Tools for Transparency and Replicability of Simulation in Archaeology*

Simulation is an increasingly central tool across many theoretical frameworks but especially in evolutionary archaeology. Simulation and numerical analysis is routinely employed in hypothesis tests and model development. Simulations, however, have a well-deserved reputation as difficult to replicate and test, and it is rare that researchers beyond the authors can build upon a previously published simulation study. To improve replicability, and to make our work accessible, we employ standard tools and scripted analyses, and engage a standard software development toolchain. We describe our workflow as a contribution to best practices for simulation in archaeology.

Madsen, Christian (The National Museum of Denmark)

[351] *Hierarchy and Human Securities in Norse Vatnahverfi, South Greenland - A Case Study*

Greenland was settled by Norse hunter-farmers at approximately A.D. 1000. Two fjord systems were populated: South Greenland formed the largest settlement area that lasted until c. A.D. 1450, the smaller Norse settlement area in present day Nuuk fjord being abandoned c. 100 years earlier. New detailed archaeological settlement evidence from the Vatnahverfi-a core settlement area in the Norse Eastern Settlement-is explored in terms of its environment, food securities relating to community level social hierarchy, labor access, and farming practices. The Vatnahverfi evidence suggests that increasing social stratification may initially have fortified food- and environmental securities in the upper societal stratum, and thereby boosted short-term resilience. Long-term, however, negative effects of tapping into and reducing the resilience and adaptive capacity of lower societal strata may ultimately have cascaded up through the system to undermine or affect the adaptive choices available to all social strata and the settlements as a whole. This could have exacerbated the negative effects of a climatic and environmental deterioration preluding the 'Little Ice Age' that may otherwise have been endured.

Maestri, Nicoletta

[86] *Any Port in a Storm: Identifying Port Infrastructure and Architecture in the Upper Usumacinta*

For the Classic period, recent regional studies in the Usumacinta basin have proposed a mixed system of communication involving both waterborne and inland routes. Circulation of people and things along these routes depended on physiographic features as well as political boundaries. Several settlements located on strategic points along these itineraries could have controlled and/or facilitated the transit. Some of these sites, due to their proximity to the river course, might have been ports and functioned as head of navigation or simple transit points. In this presentation we will analyze the formal architectonic features that could support these functions. Specifically, we will focus on urban layouts, the position of possible landing areas with respect to the settlement, along with the circulation paths (formal and informal) that connected them, and, finally, on the presence and typology of architectural compounds and infrastructures associated with these areas in order to support the existence of a port zone. We will explore these lines of evidence in the site of Boca Chinikihá, Tabasco, comparing it with other sites of the Upper Usumacinta, as well as with examples from the Petexbatún and Pasión regions.

[119] *Fetching Firewood: Access to Fuels as a Constraint for Prehistoric Settlement*

In arid, topographically variable desert environments, resources important to humans are typically distributed heterogeneously. This variability required prehistoric humans to evaluate trade-offs over accessing spatially distinct patches. A potentially important and largely unexplored resource in these

trade-offs is firewood. This work examines the distribution of archaeological sites along the watershed of the Dolores River of southwestern Colorado and southeastern Utah. With new archaeological survey data, I offer an analysis examining the distribution of sites against different types of vegetation communities to explore the importance of access to firewood, paying particular attention to the potential multiple uses of plants and other factors that may strongly influence prehistoric site choice.

[332] *Osteobiographies of Two Peculiar Women from Early Medieval Poland*

The aim of this paper is to analyze the biographies of two peculiar women from early medieval Poland, one from Ostrow Lednicki and the other from Kaldus, both of which were the capitals of the Polish state. This paper presents the most representative and interesting biographies of the ill and the disabled from these sites. The very best example for such a study is the giant woman whose skeleton was discovered in the cemetery of Ostrow Lednicki. Her height was 215.5 cm. Osteoma of skull and femur, extensive degenerative joint disease, scoliosis, fracture of tibia and Harris lines were identified on her skeleton. Her body was not buried carefully, which might indicate her different treatment in the society. The other example is a female skeleton with paleopathological lesions that indicate leprosy which was discovered in Kaldus. The location of the grave and the grave goods indicate that the individual buried there could not have belonged to the lowest social layer, although her advanced stage of leprosy with facies leonia could indicate otherwise. Their osteobiographies are a bio-cultural history of their lives that answers whether illnesses or disabilities could have affected the way people were treated in their societies.

Magnani, Matthew (Harvard University), Matthew Douglas (University of Nebraska-Lincoln) and Samantha Porter (University of Minnesota)

[94] *Low-Cost Collection Digitization: Streamlining Photogrammetric Methodologies*

In recent years, it has become possible to rapidly digitize artifacts into three-dimensional (3D) form. The creation of sharable 3D datasets has the potential to increase collaborative efforts and collection access on a large scale. Despite this, archaeologists have struggled to employ an accurate, quick, and transportable solution to collecting data for model generation in field contexts. Photogrammetric modeling is an ideal low-cost solution to be explored, requiring minimal equipment, and inexpensive processing software. This project first establishes the accuracy of photogrammetric modeling, including both in terms of inter-observer variability, and between data collection protocols. We propose a standardized procedure to maximize accuracy, and minimize the time required for data collection. Machine-made objects of known dimensions are modeled and used to verify techniques, and establish error and variability associated with various procedures. Variations between measurements of photogrammetric models, caliper based measurements, and laser-scanned models are established.

Mahaney, Robert (Indiana University)

[33] *Finding the Cognitive Neurocognitive Core of Paleolithic Stoneknapping: an ALE Meta-Analysis*

Pioneering neuroimaging studies have allowed the analysis of the cognitive basis of stoneknapping and lithic technology to develop rapidly over the past 40 years. While these studies have helped identify the neuroanatomy of stoneknapping, interpretation of the cognitive significance of these results is still in its early days. To provide a comparative baseline between brain activity in stoneknapping and the rest of cognitive neuroscience, I performed an Activation Likelihood Estimate (ALE) Meta-analysis of Stout's (2000, 2007, 2008, 2011) PET and fMRI studies of knappers replicating Early Stone Age (ESA) technologies with 322 neuroimaging studies. I also compared the identified networks with 9721 studies in the Neurosynth database. The ALE meta-analysis identified

two networks involved in the replication of ESA technology. The first, including regions of the left and right frontal, parietal, and occipital lobes is involved in reaching, grasping, and low level action planning. Evolutionarily, this region plays an important role in extractive foraging abilities amongst primates. The second network, involving areas of the frontal and temporal lobes, is involved in social cognition. The interaction between these two regions may have altered the computational capacities of the core reaching/grasping system, enhancing social learning abilities necessary for Late Acheulean technology.

Mahar, Ginessa (University of Florida)

[163] *Evaluating Mass Capture Fishing Techniques*

The term “mass capture” is widely used in archaeological and zooarchaeological discourse to connote any form of fish capture besides active, individual procurement of a single fish such as hook and line or spear fishing. Unfortunately, this blanket term obscures the diversity and range of mass capture techniques and other critical factors that have implications for archaeological and anthropological interpretation such as materials, technology, ecology, and labor, among other variables. To begin to address this issue a series of experiments were undertaken involving one particular type of mass capture—fish weirs. Long shore and tidal weirs were modeled based on archaeological data from fish weirs in the Eastern United States. This poster details the preliminary results of this study via the quantification of fish species captured per weir configuration, juxtaposed against baseline fisheries monitoring data from the Florida Fish and Wildlife Conservation Commission. Variation between the weirs exists primarily in terms of labor invested in weir construction and behavioral patterns of fish species caught. These results show the need for considering particular types of mass capture fishing when addressing ichthyological remains at archaeological sites. All research presented herein was conducted at the Seahorse Key Marine Laboratory, Gulf Coast, Florida.

Maher, Lisa (University of California Berkeley), Tobias Richter (University of Copenhagen) and Danielle Macdonald (University of Bradford)

[210] *(Re)Constructing and Using Space in the Epipaleolithic: Exploring Technologies, Domestic Activities and Communal Living in Eastern Jordan*

In the 10,000 or so years that make up the Epipaleolithic period, we witness several dramatic social, economic and technological changes documented in the archaeological record, including the appearance of aggregation sites and sedentary villages, intensified use of particular plants and animals, and the movements of people and objects over long distances. While it is easy to track these changes over this large time span, we rarely catch a glimpse of the daily activities and day-to-day interactions in which Epipaleolithic people participated. Here, with evidence from two Epipaleolithic sites in eastern Jordan, we attempt to get at these elusive past behaviors as evidenced by reconstructing the macro- and micro-scale activities within and between Epipaleolithic structures. At the Early and Middle Epipaleolithic site of Kharaneh IV and Late Epipaleolithic site of Shubayqa I aggregations of people congregated repeatedly and lived together for prolonged periods of time. Both sites prompt many questions about how people may have interacted at the site, what activities they performed, and how they lived. Geoarchaeological analyses of the spaces within and between structures is employed alongside other lines of evidence to reconstruct how space was used and activities negotiated at these substantial, archaeologically-dense sites.

Maher, Ruth (William Paterson University), Julie Bond (Bradford University), Stephen Dockrill (Bradford University), Julie Gibson (County Archaeologist of the Orkney Islands and UHI) and Jane Downes (UHI Archaeology Department)

[351] *The Orkney Islands: Long-Term Human Ecodynamics and Enduring Culture*

The Orkney Isles of Scotland, though greatly impacted by environmental shifts, are remarkably resilient and have a long-term occupation sequence of more than 5,000 years. There has been a concerted effort by many researchers to study Orkney's past in order to help Orkney move forward in

the face of current sea-level rise and changing social identities. Current archaeological research sheds light on land and seascapes of power, monuments of control, social identity through burials & settlement landscapes. The Gateway to the Atlantic Project is taking steps to expand research, train university students of all levels, and to bring the past to the local community in the form of community archaeology programs, public outreach, and integrated educational programs. Our research illustrates not only a successful and resilient society in the past, but we hope that our community efforts will create a society of endurance as we move towards the future.

Mahoney, Nancy (Montana State University) and Crystal Alegria (Project Archaeology)

[98] *Montana Project Archaeology: Best Practices from a Teacher--Student Field School Collaboration in Virginia City, Montana*

Located in the Department of Sociology and Anthropology at Montana State University (MSU), Bozeman, the Montana Project Archaeology (MPA) program has hosted a variety of professional development courses, institutes and workshops for teachers in Montana, Wyoming, South Dakota and Idaho since 2003. In 2013, MPA collaborated with MSU's Department of Anthropology, the private archaeological firm InteResources, Inc., the Montana Heritage Commission and private landowners to conduct an archaeological field school in Virginia City, Montana. The field school conducted test excavation within an historic city block dating from 1863. The project provided field experience for all participants, academic credit for MSU students, professional development credit for teachers, and archaeological information vital for a proposed land swap. This collaborative enterprise, with a strong component of public outreach during the field season (blogs, newspaper interviews, daily public tours, etc.), amplified the overall impact of the learning environment and benefited both the MSU students and the elementary school teachers. By contextualizing the field experience within a framework that involved local residents, elementary school students, teachers and the general public, all of the field school participants reported a more meaningful experience that left them with a better understanding of archaeology and its relevance.

[403] *Scales of Mobility: Oxygen ($\delta^{18}O$) and Carbon ($\delta^{13}C$) Isotopic Insights into Xiongnu Herding Practice*

Herding strategies involving the regular movement of domesticates to new pastures is a critical feature of pastoralist subsistence strategies. However, the utility of strontium isotope analysis as a proxy for mobility becomes complicated in regions where geological substrates are either homogenous over a wide area or are heterogeneous over small distances. Taking advantage of the geographic sensitivity of carbon and oxygen isotopes to precipitation levels, altitude, and latitude, we explore the utility of $\delta^{13}C$ and $\delta^{18}O$ in tooth enamel to record animal mobility in the Gobi steppe-desert. Here, we establish the seasonal range of isotopic variation in wild caprines and domestic sheep that grazed solely in one location - Baga Gazaryn Chuluu, Mongolia- through carbon ($\delta^{13}C$) and oxygen ($\delta^{18}O$) isotopic analyses of incrementally sampled mandibular molars. Building on these data, we then explore Xiongnu herding strategies involving small-scale mobility in Baga Gazaryn Chuluu.

[103] *Mapping Abydos: Bridging the Gap Between Legacy Data and Modern GPS Survey Methods in Egypt*

The Greater-Abydos Mapping Project began with the goal of creating a highly accurate, integrated GIS system for the entire 35km² site. This included incorporating all topographic and modern features, the translation and importation of previously utilized site coordinate systems, and all known archaeological data, including legacy data from historic excavations which started in the 1920s. Constraints in past cartographic and surveying methods, compounded by the scale of the Abydos site, over time caused a fracturing of spatial geodetic control. Different projects, working in separate locations, created independent reference grids that could not accurately be related to each other, and were often based upon easily damaged or destroyed survey monuments. GPS reference stations in Egypt are non-existent, inaccessible, or lack the required accuracy for establishing geodetic control monuments for baselines using post-processed GPS data. Utilizing very precise (RTK) GPS data collection was impossible without creating a local reference station. In conjunction with static GPS data collection, the project established an accurate base station monument, allowing for previous project grid coordinate systems to be readily translated into the new site-wide spatial control system, and all legacy data to be imported into GIS, allowing for continuity of ongoing excavations and mapping.

[4] *Addressing the Challenges of Developing a Standardized System for the Morphological and Functional Analysis of Archaeological Pottery*

Our study of precontact Aboriginal pottery from Western Canada involves morphological, use-alteration and stylistic analyses of individual vessels and the creation of precise three-dimensional vessel models using computer-assisted design (C.A.D.) software that is free-of-charge to students and educators. "Whole vessel" morphological analysis is then performed on the models using the C.A.D. program. Manuals on how to generate and analyze accurate C.A.D. models of whole or partially reconstructed vessels using the software are finished. Manuals outlining how to collect baseline morphological data from vessels or fragments thereof, take the necessary high-resolution digital images and perform detailed descriptive and use-alteration analyses have been developed. Students from Illinois State University will test these procedures on pottery collections from the American Midwest. By producing a standardized system of pottery analysis that is applicable to sites across North America, the data collected will be ready for incorporation into a web-based, interactive searchable database. The proposed database will not only allow us to share our results, but permit others to contribute new vessels, analyze the pottery themselves and conduct intra- and inter-site comparisons. As the database expands, the need to access institutional pottery collections, which can be difficult, expensive and time-consuming, will be reduced.

[259] *Metal Trade and Interregional Dynamics of the Mesoamerican Late Postclassic Period*

The way people were placed in relation to each other was fundamental to the distinctive character of Mesoamerica, as a historically linked series of socially stratified, economically differentiated, complex societies. Long-distance exchange, one of the practices through which intensive interaction between different peoples was fostered, was centrally concerned with obtaining materials used for marking distinctions between commoners and nobles. Costume was a major means of marking distinctions between different kinds of people in Mesoamerica, and for signaling their position in society.

Feathers, polished mirrors, and carved greenstone ornaments were all important components of costumes, indicating special status and rank. The Mesoamerican world as a social system was thus formed by its elite prestige system. Sometime during the Epiclassic/Postclassic Period, a new kind of prestige good emerged and was introduced into the trade system: metal. Copper, silver and gold came to be extensively used in the manufacture of a considerable array of adornments and artifacts for elite use and exchange. This paper explores the role of the production and distribution of metal goods in the sociopolitical structure of Mesoamerican societies during the Late Postclassic Period.

[389] *The Lower-Middle Paleolithic Transition(s) – Between Southern and Northern France a Look from the Bifacial Technologies Perspective*

The division of the Paleolithic era into the Lower, Middle, and Upper Paleolithic is an arbitrary research construct that confounds chronological, behavioral, and evolutionary aspects. The Lower/Middle Paleolithic transition has received less attention. This transition is depicted as a worldwide change from biface production to flake production through Levallois flaking systems, similar to the way it has been perceived in the initial stages of research. Yet, in some European Middle Paleolithic assemblages biface production prevailed. Some key questions that remain unsolved are: What is the geographical variation of this global change(s)? Did changes occur as a result of autochthonous developments or by a diffusion wave (s)? What changed technologically and typologically beyond those guide fossils? In this paper, I explore the variations in biface production, maintenance, and transport across the landscape in Western Europe. Those technological variants will be presented in relation to their geographical patterning (Northern and southern France) as well as their chronological changes during MIS 9-7. Those modes of bifacial production will be integrated together with the general techno-typological makeup. The observed patterns do not exhibit a linear progression, but rather reflect segmented local histories. These bear important implications for the way this global transition(s) should be perceived.

[381] *Architectural Features versus Historic Maps of Fort St. Pierre, 1719-1729, Vicksburg, Mississippi.*

Fort St. Pierre (1719-1729), located near present-day Vicksburg, Mississippi, was a short-lived French fort on the periphery of colonial Louisiane. Data from the 1974 through 1976 excavations have recently been collated with unreported excavation data acquired in 1977; and now provides a more complete picture of the perimeter of the fort (the palisade and dry moat) and the structural remains within this perimeter. Historical maps of this fort depict an orderly layout of fort structures; but the archaeological features reveal a crowded and confusing arrangement, use and abandonment of buildings within the fort. This presentation will briefly discuss the fort, its history, and will discuss in depth how aspects of daily life and the environment influenced and affected the reality of the fort's architecture.

[190] *Insights into Site Formation Processes at La-Roche-à-Pierrot, Saint Césaire (Charente-Maritime, France): A Microstratigraphic Perspective*

The extinction of the Neanderthals remains an open question and the current chronological, archaeological and paleoclimatic evidence reflects complex scenarios. In this context, southwestern Europe is an interesting region because as it represents not only a "dead end" for the east-to-west migration of anatomically modern humans but may have acted as a potential 'refugium' for local

Neanderthal populations. Several sites in the region play a key role in ongoing debates concerning the Middle-to-Upper Paleolithic transition. Some of these have been studied from a geoarchaeological perspective but others not. Therefore, there are still uncertainties in certain archaeo-stratigraphic sequences and gaps in our knowledge of regional paleoenvironments. Here we present the first results of a microstratigraphic study of La Roche à Pierrot, Saint-Césaire. Discovered in 1976 and excavated for 10 years (1977-1987) by François Lévêque. This small rockshelter yielded a stratified deposit containing the complete Middle-to-Paleolithic transition, as well as a relatively complete Neanderthal skeleton purportedly associated with an Upper Paleolithic lithic assemblage. Micromorphological analysis of 12 sediment blocks collected from different profiles exposed during renewed excavations at the site provide important new information for discussing the changing configuration of the site and associated site formation processes.

[47] *Paisajes agrarios en la montaña costera del reino de Granada*

En la misma costa del reino de Granada, situada al sur de la Península Ibérica, existen unos asentamientos conformados en época andalusí en los que la agricultura tiene unas características específicas. Ha de tenerse en cuenta que las condiciones geomorfológicas y climáticas no favorecen especialmente la creación de paisajes agrarios. Sin embargo, la disponibilidad de agua, que no siempre se concentra en un único punto, sino que se distribuye por todo el conjunto territorial, permite que haya asentamientos dedicados a la vida agraria con una especial relación con el medio. Todos ellos parten de la utilización del agua para regar los campos. Este modelo agrícola es propio de otras partes del Mediterráneo y puede ser contrastado con ellas.

[298] *Wooden Scepters in the Offerings of Tenochtitlan's Great Temple: A Symbolic Interpretation*

The excavation of the Great Temple, one of the most important precincts in Mexica society, began more than thirty years ago. Since then, the examination of thousands of artifacts and organic materials has greatly increased our knowledge about Mexica cosmovision. During its seventh field season, the Templo Mayor Project has excavated thirty-six offerings. The flooded context of these oblatory deposits enabled the conservation of various organic materials that commonly degrade with the passage of time, especially wood. In the last seven years, more than a thousand wooden artifacts have been discovered: among them, we can mention numerous scepters. Most of these artifacts were found intact with remnants of their original polychromy, thus allowing an interpretation of their symbolism and the identification of nine different types of scepters: deer head, Techalotl's, Mictlaltecuhli's or closed fist, chichahuatzli (sun ray), ehēcahuictli (curved), serpentiform, xiuhcoatl (fire serpent), double volute, and tahuitimetl.

[190] *Unraveling the Site Formation Process at Finch (47JE0902): A Multicomponent Habitation in Southeastern Wisconsin*

The Finch site is a multicomponent open-air habitation located in southeastern Wisconsin. Archaeological excavations conducted at the site yielded numerous artifacts and cultural features

indicating recurrent and/or continuous occupation (or use) spanning twelve thousand years, from the Early Paleoindian through Late Woodland periods. The site is situated on the rim and side slopes of a kettle basin formed in matrix-supported glacial till overlying outwash and glaciolacustrine deposits. The till was deposited about 16,000 years ago, yet the cultural deposits, including burned-rock features, typically occur 15-45 cm below the surface, and some are as deep as 70 cm below surface. Intra-site spatial analysis of temporally diagnostic artifacts has demonstrated significant horizontal patterning across the site as well as some stratification in certain areas of the site. The results of the geoarchaeological investigation, which included detailed sedimentological and micromorphological analyses, indicate that burial of artifacts and features on the rim of the kettle basin occurred through pedoturbation and bioturbation (soil up-building), respectively. These site formation processes also account for the burial of cultural deposits on the side slopes of the basin, but it is likely that colluvial processes contributed to the temporally stratified trends in the archaeological record on the slopes.

[156] *La Pintura Rupestre en los Sitios Arqueológicos de la Sierra de la Giganta, Baja California Sur*

Uno de los objetivos del proyecto Arqueológico Sierra de la Giganta, es localizar y registrar la gran variedad de sitios arqueológicos en la sierra que lleva el mismo nombre. Dentro de la clasificación de los sitios arqueológicos, encontramos campamentos tanto al aire libre como en cuevas, concheros y sitios con arte rupestre, dentro de los que se incluyen los petroglifos y los sitios con pintura rupestre. En estos últimos sitios, pondremos particular interés en esta presentación, en donde haremos un recorrido por cada uno de ellos en donde se presentarán las características particulares de cada uno de ellos así como sus componentes y asociaciones con el paisaje. Otro punto importante que se considerará, son los factores de riesgo latente en cuanto a conservación y protección de los sitios se refiere y se hará mención de un programa piloto de monitoreo en dos de estos sitios en donde se ha involucrado a la comunidad del entorno cercano a estos sitios.

Maniery, Andrea (University of Nevada, Reno)

[6] *The Alluvial Geochronology of Pharo Village and Implications for Cycles of Site Occupation and Abandonment*

The results of geoarchaeological investigations at Pharo Village, a Fremont hamlet situated on an alluvial fan in central Utah, are reported in order to reveal how changes in alluvial dynamics contributed to the rise of Fremont farming there as well as the site's eventual abandonment. Cutbanks along Pharo Creek, the meandering stream adjacent to Pharo Village, were mapped and sampled during fieldwork. Field and subsequent laboratory analysis allowed reconstruction of the alluvial geochronology at the site. Carbon samples from mapped sections and buried paleosols were radiocarbon dated and correlated to additional dates generated from the site's archaeological collection housed at the Natural History Museum of Utah, both from hearths and artifact typologies. Buried soils examined in mapped sections indicate a period of stability on the landform where Pharo Village is located, and this could explain when and why the Fremont utilized this and similar locations. The relationship of a high energy flood deposit above the buried soil sections contributes to the discussion concerning site abandonment. From these data, interpretations are made regarding the contributions of local alluvial shifts to the overall termination of Pharo Village occupations, and related hypotheses are posited concerning the end of the Fremont Complex around 600 BP.

Maniery, Mary (Par Environmental Svc Inc)

[45] *Scraping Our Way To The Past: A Methodological Approach for Chinese Rural Work Camps*

Recovering meaningful information from ephemeral, short-term work camps in the west is

challenging, given the brief occupation time, absence of shelters other than tents or portable structures, and informal layout and design. One methodological approach that has proved effective for research at camps with shallow or no subsurface deposits focuses on exposing and investigating the horizontal deposits across the sites. Archaeological studies of Chinese occupied camps related to mining, railroad construction, fishing, and other activities have identified discrete functional areas within a site, subtle features and spatial layout by using broad surface exposures and detailed mapping. This presentation summarizes past archaeological work at these types of sites and outlines an effective methodological approach for Chinese work camps.

[170] *As Good as it Sounds: Archaeology of Las Delicias, Managua, Nicaragua*

In 2008, housing development on the shore of Lake Xolotlan in a suburb of Managua discovered an extensive cemetery dating to the Late Tempisque period, ca. 1300 CE. Dozens of individuals were recovered, along with a rich array of grave goods. A new phase of development in 2014 has been closely monitored by the Nicaraguan Institute of Culture. In July heavy machinery exposed a number of additional skeletons and a team from the University of Calgary volunteered to assist in the excavation and analysis of the remains. This paper presents results of archaeological and osteological analyses of the recent finds, integrating them with those of the previous field season. Of interest to participants in this symposium is the abundance of Usulután-like negative resist pottery, diagnostic of El Salvador and Honduras but including locally manufactured varieties. The wide distribution of this ceramic style implies extensive geographic interaction, while the general wealth of the burials indicates complex social hierarchy. Ongoing stable isotope and ancient DNA analyses of the remains promise important insights into the biological profile of the ancient inhabitants of Las Delicias.

[288] *Long-term Trends and the Sustainability of Early Agriculture in Neolithic Europe*

The domestication of plants and animals facilitated major changes in human ecology, demography, and social organization. Despite the seeming advantages of domestication, however, new analysis reveals major episodes of collapse in the early agricultural systems in Neolithic Europe. In this paper we present evidence for a progressive deterioration in arable farming conditions, alongside a reversion to wild resource exploitation across different regions in Europe. These apparent failures in the agricultural system correspond with other socio-economic phenomena, such as increasing population pressures and social conflict. These results shed new light on the origins of sustainable subsistence, and provide an historic context to the debate concerning Malthusian limits of the planet.

[95] *Zoning Regulations and Comprehensive Plans: Bringing Historic Preservation Home*

Archaeologists often wring their hands and bemoan the lack of regulations or guidelines designed to protect archaeological sites from destruction during development. Section 106 of the NHPA applies only to projects receiving federal funding, licenses, or permits. ARPA applies only to federal and Indian lands. Several states have State Historic Preservation Acts that apply Section 106-like regulations to state projects. Some cities have adopted legislation to protect cultural resources. However, much development today occurs in unincorporated townships where legislation is not an option and there is no federal/state/municipal connection. What can be done to introduce a measure of protection for historic properties during development in these areas? Zoning Regulations and

Comprehensive (Master) Plans are two local land use tools where such measures can be both effective and appropriate. Zoning Codes and Plans from Ohio townships were sampled to see if they included consideration of cultural resources. Results indicate that while relatively few townships now include preservation in their codes and plans, a number indicated that they would consider adding such protections if they had more information about the issue. Archaeologists must become involved with their local land use groups to be an effective voice for preservation.

[348] *Early farmers' house and household. Interpreting a Bayesian chronology for the Anatolian and Central European Neolithic*

The Anatolian and Central European Neolithic reveal some striking parallels in social developments. Different communal arrangements appear to be predominant in the Early Neolithic and autonomous households occupying discrete residences and performing most domestic activities in the house became clearly bonded entity only towards the end of this period and beyond. Recently conducted Bayesian analysis of a large number of AMS radiocarbon dates from both areas allow the pace of changes of the domestic domain to be established in detail and prove to be fundamental to recognizing the very nature of the transformation from the communal to more individualized social arrangements. By directly referring to these results, the paper aims to present the minutiae of the social process in both regions. It also intends to discuss a number of significant implications of the Bayesian chronological modeling for understanding of different facets of the Neolithic including village microhistory and geography. This will be exemplified by the results of Bayesian modeling of the upper Late Neolithic strata at Çatalhöyük East and early Neolithic sites from the Polish part of the North European Plain.

[134] *Qhapaq Ñan Project's Research at the Guarco Site, Cañete Peru*

The accounts of Inca domination of the Cañete valley have been proposed as an example of Inca military strategies. The El Guarco site was proposed by these accounts as the head of a kingdom that established a fierce resistance to the Incas that was later overwhelmed by an unmerciful repression. Although it is present in the ethnohistoric accounts, we know little about the political and social organization of this kingdom and the functions that El Guarco had inside this society. In the year 2014 the Qhapaq Ñan Project started a research project at this site. In this first season we have a goal to establish the chronological and spatial organization of the site. In light of early results, we want to discuss what is known of the Guarco Kingdom's social and political organization, and the possible roles that the El Guarco site had. In addition, we seek to understand what changed at the site when the Inca conquered the valley. The goal is to inform us about the political strategies that

local groups deployed when dealing with the expansion of regional political formation.

Marcum, Jill (Hunter College)

[377] *A Peircean Analysis of Bucrania at Catalhoyuk*

This paper attempts an analysis of the bucrania at Catalhoyuk from the perspective of Peirce's semiotic. The spatial situation of bucrania is one of entanglement. Peirce's triadic relation emphasizes the being-in-the-world-ness of the sign, and his synechism, the continuum of signs. Using this multidirectionality, the indexical nature of the skulls is explored, including the immediate contiguity of man and beast, the various interpretants and intersubjective effects of structural space, and the distribution of agency. Spatial perception, phenomenology of place, and capacity for Firstness, are taken as valid referents of inference and abductive suggestion.

[300] *Exploring Prehistoric Resource Distribution in the Black Mesa Region: A Plains- Montane Ecotone in Cimarron County, Oklahoma*

The Black Mesa region of Oklahoma is located in northwestern Cimarron County, and constitutes the edge of the Chaquagua Plateau. It is the easternmost finger of Colorado's Mesa de Maya. Situated along Oklahoma's western border, Black Mesa is the highest and largest in a system of mesas and valleys that extend westward to merge with the foothills of the Rocky Mountains. The relief of this landscape is exaggerated by its juxtaposition with the high plains to the north, south, and east – it is thus referred to as the gateway to the Rockies. This ecotone contains a unique array of resources that have been exploited from the Paleoindian through historic periods. This paper focuses on the prehistoric utilization of these resources and the current state of archaeological knowledge of this transitional landscape. We synthesize the prehistoric record as documented principally in Oklahoma Archaeological Survey project reports. We highlight in particular the high quality quartzite that outcrop in the area and have been reported at sites both in and far from the Black Mesa region.

[190] *Cave Life Histories of Non-Anthropogenic Sediments Helps Us "Raise the Bar" in Our Understandings of Anthropogenic Sediments*

A series of sea caves and rock shelters with strong anthropogenic contributions are found at Pinnacle Point (PP) near Mossel Bay in the Western Cape Province, South Africa. Two of these (PP13B and PP5-6) have been the target of extensive archaeological excavation and both document anthropogenic and geogenic contributions waxing and waning over time. A variety of caves at PP do not bear anthropogenic remains, such as Staircase Cave and Crevice Cave. A third, PP29, is filled with sediment but there are no archaeological remains visible on the surface and it has not been excavated. However, all three (as do most caves at PP) have extensive remnant and extensive sediments that provide clues to the "life history" of caves in the region. These caves offer the opportunity to understand the purely geogenic signature of the locality under the same geologic and sedimentary conditions as those caves with anthropogenic contributions, and thus offer a geogenic baseline for the PP locality. Archaeologists normally focus only on sites with strong anthropogenic signals, but by building cave life histories we enrich our knowledge of the baseline geogenic signal and "raise the bar" on our contextual knowledge.

[34] *Archaeology?! Yadiilah! Collaborative Archaeology and Lessons from the Navajo Nation*

For many Native American tribes, archaeology has been a tool used to dismantle and displace tribal

narratives of the past. However, with the development of such approaches as Indigenous archaeology and community based participatory approaches, innovative collaborative projects have emerged, which have changed the way tribes view archaeology and how they engage with archaeological practice. My experiences working with Navajo communities have changed my approach and assumptions when engaging with tribal communities in archaeological projects. The successful partnerships and projects that I have undertaken while working for the Navajo Nation Archaeology Department have outweighed perceived failures. In the years that I have worked on the Navajo Nation, I have learned several tips that I would like to address in this paper that may assist other archaeologists in engaging with tribal communities.

[311] *The Archaeology of a Russian Period Alutiiq Work Camp on Kodiak Island, Alaska*

The site of Mikt'sqaq Angayuk (KOD-014) on eastern Kodiak Island provides an intimate view of Native Alutiiq responses to the colonial labor regime imposed by 19th century Russians in Alaska. Recent excavation of KOD-014 through the Alutiiq Museum's Community Archaeology Program revealed a well-preserved Alutiiq style sod house and associated faunal midden dating to the 1830s. The midden was rich in cod remains, and the artifacts comprised mostly colonially-introduced products including metal hunting and trapping gear and European ceramics. These finds dovetail with Russian historical evidence to suggest the site's use as an *odinochka*: a small seasonal encampment where Alutiiq workers were conscripted to fish, hunt, and trap on behalf of the Russian-American Company. Yet the workers' economic strategies likewise involved a measure of individual autonomy as revealed in the distinctly Alutiiq ways some imported products were used, and evidence that residents also pursued subsistence aims of their own.

[316] *Investigating Landscapes in the Maya Lowlands: Integrating Geospatial and Environmental Sciences to Identify Archaeological Features in Northwestern Belize*

Satellite imagery and Geographic Information Systems (GIS) are invaluable noninvasive archaeological tools. The combination of remotely sensed datasets with GIS, geomorphological and ecological factors, and environmental variables associated with known archaeological features can produce a multivariate statistical predictive model. The authors will test the utility of integrating high resolution multispectral satellite imagery, lower resolution multitemporal satellite imagery,

georeferenced archaeological survey maps, and ecological land cover classifications within a GIS, to identify linear and agricultural features under continuous canopy in northwestern Belize. Various enhancement and processing techniques, such as image band transformations and vegetation indices, will be utilized to classify geomorphological and ecological factors. The results of these analyses will be compared to environmental variables associated with known archaeological features situated under similar canopy conditions. This will enhance statistical validity and serve as a baseline to determine probable areas of interest which will be ground truthed in the upcoming field season.

[409] *Low Altitude Unmanned Aerial Photography To Assist in Rock Art Studies*

A radio-controlled DJI Phantom quadcopter with GoPro or built-in camera can help document archaeological features best seen from the air, such as geoglyphs, rock alignments, and some rock art panels. The camera can be set for interval photography, or monitored and triggered in real-time. The fisheye image distortion can be reasonably corrected with software such as Photoshop or DxO. This portable and relatively inexpensive method of flying a pattern and hovering directly above a site (now limited by the FAA to less than 122 m above ground level) has potential for detailed mapping and understanding features difficult to photograph or map from the ground. The archaeological community is awaiting forthcoming regulations.

Marken, Damien (Bloomsburg University)

[344] *Revisiting the Archaeology of Palenque: 25 Years after "The Children of the First Mother"*

As the site of many of the epigraphic breakthroughs that fully brought the Classic Maya into realm of history, Palenque, Chiapas, Mexico holds an important place in Maya studies. In the Forest of Kings, Linda Schele and David Freidel brought together one of the first truly comprehensive descriptions of the history of a Classic period royal family. Perhaps more significantly, they put forth a narrative of dynastic legitimization through writing and monumental construction that has endured and been applied across the Maya lowlands. This paper will briefly review the impact of subsequent investigations and discoveries at the site on how archaeologists today interpret this narrative. While little was known about the archaeology of Palenque beyond the monumental core in 1990, research by several Mexican and foreign projects over the past 20 years has greatly expanded the scope of our understanding of the ancient city's development and organization.

[216] *Ceramic Production and Distribution in Classic Period Monte Albán, El Trapiche and Lambityeco*

This paper explores the organization of ceramic production and distribution in the Valley of Oaxaca during the Late Classic period (650-850 CE) by considering the evidence for pottery manufacture as well as the results of neutron activation analysis of pottery samples at three valley sites: Monte Albán in the central part of the valley, El Trapiche in the Etla arm and Lambityeco in the Tlacolula arm. More specifically, we examine evidence bearing on the intensity and scale of pottery production at each site and the results of neutron activation analyses that relate pottery samples to the clay sources in the valley from which they derive. This study helps decide between competing models that purport to explain the organization of the ceramic craft industry in the valley during the Late Classic period.

[35] *Two Rockshelters in the Namib: Land Use, Site Use, and Risk over the Middle to Later Stone Age Transition in Southwestern Africa.*

The shifts in land and site use strategies that occurred over the Middle to Later Stone Age (MSA to LSA) transition remain poorly understood across the full diversity of environments in Southern Africa. In the Central Namib Desert of Namibia, two rockshelters, Erb Tanks and Mirabib, provide insights into these dynamics within the context of a persistent arid to hyper-arid climate. Employing data from an ongoing lithic sourcing survey, we argue that groups equipped with MSA-type lithic technologies procured stone and occupied broadly similar ecological zones in the Namib Desert to their LSA counterparts thousands of years later. However, data from our test excavations and technological analyses suggest that MSA patterns of occupation of discrete, attractive points on the Namib landscape, such as prominent rockshelters, shifted markedly in the context of the LSA. We argue that shifts over time in rockshelter occupational intensity and foraging technological strategies differed as a result of environmentally-driven shifts in subsistence risks as well as possible changes in the Namib's population density.

[410] *Children as Social Actors within the Domestic Group at Monte Albán, Oaxaca. Mexico*

This paper starts from a micro and qualitative approach to describe and analyze the social position of individuals: children, women and men within various domestic units in Monte Alban, Oaxaca, through archaeological indicators of prestige, power and wealth. The methodology uses funerary practices and its meaning in social terms within the domestic group, to identify the social role, especially of children, a sector of the population rarely studied. The location of burials in the domestic unit -- rooms, the patio, in a tomb or outside the house—as well as the offerings are used as social status indicators. The skeletons of children under 15 years were classified by age groups (of three years). Adult men and women were separated into three groups: young adult 15-15, average 25 40, advanced 40+, and registered according to their spatial localization. In addition stress indicators were evaluated to estimate general health conditions.

[77] *From Sea to Shining Sea: The Influence of Bill Dickinson's Pacific Island Ceramic Petrography on Caribbean Research*

Bill Dickinson's research in the Pacific is widely known and considered to be one of the most exemplary cases of transdisciplinary research between archaeologists and the geosciences. The collaborative effort cultivated between Dickinson and the archaeological community over the last 50 years has led to new ways of understanding how and when peoples colonized islands, and the exchange systems that developed through time, among other important issues. One of the most significant outcomes of these partnerships has been the crossing over of Dickinson's petrographic techniques to other scholars and regions. In this paper, we highlight how Dickinson's analytical protocols and research questions have been applied to the Caribbean, which are pivotal to understanding how lithic and clay resources were used by Amerindian groups prehistorically. Ironically, while pottery often comprises more than 90% of the artifact assemblages found in Precolumbian Caribbean sites during the Ceramic Age (ca. 2500-500 BP), petrography is widely underused and underappreciated. Our research, some of the first of its kind in this region, focuses on the analysis of pottery assemblages from several islands in the southern Caribbean that provides a critical baseline for examining how peoples in the past acquired and used resources to manufacture pottery.

Marsaglia, Kathleen [79] see Lawrence, John

Marsh, Laura (Stanford University)

[379] *Examining Variability and Provenance through Ceramic Petrography at Chavín de Huántar*

The site of Chavín de Huántar, in the Peruvian Andes, exhibits an extraordinary amount of variability and complexity. In order to better understand this diversity ceramic fragments from different contexts within the site were sampled specifically for paste analysis. An initial macroscopic analysis suggested higher variability in pastes within the ceremonial center than within the residential area across the river. It also showed that the fragments from different contexts within the ceremonial center belonged largely to different paste groups. Of the fragments analyzed macroscopically 75 were chosen for thin sectioning and petrographic analysis in order to confirm the results of the macroscopic analysis and for sourcing the samples by comparison with geological samples from the area as well as with petrographic analyses from contemporaneous sites and previous studies of Chavín ceramics. This allowed for the distinction of local versus non-local raw materials among the various fragments and subsequent triangulation of this data with characteristics of the particular sherds, such as depositional context, vessel type, decoration, and other features. The results of this research provide insights into both the variability within the site of Chavín and the site's relationship with other areas and sites within the region.

Marshall, Lydia Wilson (DePauw University)

[335] *Household to Community, Community to Region: A Multiscalar Approach to Identity and Interaction at Two Fugitive Slave Villages In 19th-Century Kenya*

In 19th-century coastal Kenya, runaway slaves were known as watoro. This paper uses an expanding analytical framework to investigate watoro identity and interaction at three scales. First, I use artifact concentrations and domestic spatial dynamics to illustrate the daily lifeways and material preferences of individual households in two watoro villages, Koromio and Makoroboi. I then compare multiple households within each watoro community in order to investigate how these households interacted and how their consumption and production practices differed. At the broadest scale, I seek to place Koromio and Makoroboi within their respective regions. I consider how these fugitive slave villages engaged with the regional sociopolitical and economic landscape as well as how their economic and social practices compared to neighboring groups. My analysis questions the often-assumed link between cultural homogeneity and group identity. This paper also highlights the

potential for spatial approaches, particularly those enabled by GIS, to bridge multiple levels of analysis—situating households in their communities, and communities in their regions.

Marshall, Maureen (University of Chicago)

[403] *(Re)Articulating Ancient Lives: Diet and Movement in Late Bronze Age Societies in the South Caucasus*

The sudden appearance of hilltop citadels and vast cemeteries on the Late Bronze Age landscape of the South Caucasus suggests that it was a period of dynamic socio-political transformation as society shifted from highly mobile agropastoralism to a more settled lifestyle revolving around fortresses. Yet, within the Tsaghkahovit Plain, Armenia, there is little archaeological evidence of domestic architecture and activities, throwing into question people's residential and subsistence practices. This presentation discusses the results of biogeochemical analysis of human remains from Late Bronze Age and Iron I Period tombs excavated from the Tsaghkahovit Plain and comparative regions in Armenia. The results of carbon and oxygen ($\delta^{13}\text{C}$ and $\delta^{18}\text{O}$), carbon and nitrogen ($\delta^{13}\text{C}$ and $\delta^{15}\text{N}$), and radiogenic strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) analyses are used to reconstruct diet and assess movement. I suggest that generally Late Bronze Age peoples shared a common diet and 'lived' locally, possibly drawing on resources from multiple areas of the Tsaghkahovit Plain. Yet, at the individual level, the results indicate differences in dietary choices and practices of movement. The biogeochemical analysis thus holds significance for understanding the socio-economic connections within the plain and adds to a richer understanding of how people were living and moving within an early complex polity.

Marshall, Fiona (Washington University) and Jose Capriles (Instituto de Alta Investigación, Universidad de Ta)

[414] *Transport Animals and Distinctive Pathways to Domestication*

Animal behavior, diverse strategies of human management and environmental selection all contribute to domestication processes. Recent research suggests human control of breeding may have been less important than assumed and that breeding of captive animals with wild relatives significantly influenced domestication processes. Less social transport animals from extreme environments experience high levels of environmental selection and are especially likely to encounter wild relatives. Slow growth rates also lead to low culling levels. However, little research has focused on diverse practices of animal management and their role in reducing or increasing gene flow and influencing domestication pathways. This analysis suggests that diverse management practices relating to penning, foddering, political relations, hard winters, or poverty may all have affected the likelihood of gene flow and rates of domestication. More research is needed that identifies such processes in individual settlements and specific regions.

Marston, John (Boston University)

[226] *Reconstructing Agricultural Decision Making from Paleoethnobotanical Remains*

Paleoethnobotany has long been associated with the identification of crop plants and has led to important insights into domestication and the adoption of farming systems. New methods for the quantitative analysis of botanical remains, together with multiple allied datasets on human diet and environmental change, now allow paleoethnobotanists to generate empirical data on agricultural decision making in the archaeological record. The breadth of data now available to paleoethnobotanists includes macro- and micro-botanical remains from societies worldwide, isotopic proxies for human diet and fertilization of agricultural fields, genetic and phylogeographic histories of crops, and detailed local paleoenvironmental and paleoclimatic histories. Together with powerful new theoretical perspectives on human-environmental interaction, including behavioral ecology, niche construction theory, and resilience theory, it is now possible to test directly why farmers chose specific agricultural practices instead of others and to determine the environmental impacts of these agricultural strategies. I highlight several case studies from my own work and that of other panelists to elucidate the value of a theoretically rich, quantitatively driven, multiproxy analysis of ancient agricultural systems that asks how and why specific agricultural strategies were adopted and what the long-term implications of those decisions were for societies and environments.

[120] *The Late Bronze Age Thera Eruption: A Spatial Analysis Study of Permanent Abandonment Processes*

Societies have been responding to natural disasters through evacuation and abandonment for all of human history. The same forces of nature continue to threaten human societies today and trigger many of the same responses. By engaging in cross-cultural comparisons, a pattern of responses may be articulated, directed towards answering such questions as: how far do people flee? For temporary evacuation, do they stay in existing settlements or build impermanent refugee camps? If evacuation is permanent, do they establish new settlements or integrate into existing ones? What are the archaeological markers of refugee integration in existing communities?

This study focuses on what is likely one of the largest volcanic eruptions in the last few millennia – the 17th century B.C. eruption of Thera. The inhabitants of the island were warned of the impending disaster and staged a full evacuation. Using GIS and spatial analysis to model abandonment and resettlement across cultural and temporal boundaries, I investigate the immediate and long term processes of the abandonment of Thera, what neighboring settlements might have taken in refugees, and how refugees were integrated into these communities.

[170] *Chinina, Panama. First Evidence of Prehispanic Raised Fields in Central America*

Aerial photography has been known as an extremely useful tool of archaeological prospection for nearly one century. In recent years however it gained increasing importance by two reasons: First the availability of high quality aerial photographs via internet made it quite easy to start archaeological surveys even in remote areas. Second archaeological perspectives on past human societies changed in recent decades. Modern ecological problems caused an increasing interest in landscape archaeology. In Panama paleoecological studies were carried out by Dolores Piperno and her team, already since the 1980's. The results of this research contributed to understand American agricultural development especially related to the manipulation and domestication of plants. However, despite this important role of Panamanian data for the overall discussion of the development of agriculture in tropical environment, there has been not data on agricultural practice and land use pattern.

For the first time fossil fields structures have been identified in online aerial photographs in late 2010. This was a result of a systematic searching inspired by a previous project dealing with colonial period rising questions concerning the change in landscape dynamics.

Martin, Lana (University of California, Los Angeles)

[170] *Farming and Foraging in Late Ceramic Period Society at Sitio Drago, Western Caribbean Panama*

This paper examines patterns in plant and animal remains excavated from midden contexts at Sitio Drago, a 1400-year-old village site located on a Caribbean island in Panama. To date, most studies of farming and foraging in ancient Panama have focused on villages located in the central highlands and Pacific foothills – regions with a cooler, drier tropical climate that better facilitates agricultural productivity. Although highly informative, these studies alone do not provide us with a complete picture of food production in Lower Central American chiefdoms. Villages located in the warmer, wetter climate of the western Caribbean lowlands contribute an additional narrative of marginal landscape improvement, giving us more insight into sustainable adaptations possible in societies past and present. This paper presents the first integrative analysis of plant and animal remains from

Western Panama. Preliminary findings indicate people at Sitio Drago intensively processed staple plant food crops of either maize or manioc while relying heavily on tree fruits and palm nuts, suggesting a long-term investment in producing fertile agricultural fields and managing locally-available forest resources. Results of this project highlight the diverse array of subsistence economies and productive landscape modifications capable of supporting large-scale populations, particularly in marginal regions.

Martin, Lois

[187] *Cross-dressing to Complement the King: Eco-iconography of the Aztec Cihuacoatl's Costume*

Co-regents led the Aztec state: the principal Tlatoani, "supreme speaker," and his second, the Cihuacoatl, "Woman Snake," also the name of a fearsome goddess. The complementary rulers reflected Aztec notions of cosmic balance between opposites: while the male king directed external military campaigns during the dry season ("the day sun"), the Cihuacoatl managed internal affairs, especially agriculture, during the rainy season, or "night sun." A ruthless and visionary individual named Tlacaelel served as Cihuacoatl to a succession of Aztec kings, and cross-dressed in the goddess's clothes during state ceremonies. Many accounts suggest that Tlacaelel himself designed the splendid regalia, monumental settings, and extravagant spectacles that promoted the legitimacy of the royal couple. My research deconstructs the Cihuacoatl's outfit, and shows that its carefully crafted details serve to identify the Cihuacoatl as a perfect foil to the Aztec king—not simply his gendered opposite, but also his divine complement in ecological and technological arenas, including the maize cycle—a charter for rule in Mesoamerica since the time of the Olmecs. While the king's turquoise crown referenced a maize sprout, the Cihuacoatl's costume—in pattern, color, and style—referred to ripe corn seed, and the opposite end of the cycle.

Martin, Debra (University of Nevada/Las Vegas), John Crandall (University of Nevada, Las Vegas) and Ryan Harrod (University of Alaska, Anchorage)

[202] *No Better Angels Here: Bioarchaeology of Non-Lethal Head Wounds in the Greater Southwest (A.D. 900-1350)*

A survey of healed cranial depression fractures from Southwest collections revealed new information on the patterning of head wounds by age and sex. Head wounds demonstrate nuance and a non-linear trend over time. Thus suggests a much more complex picture than has been offered by recent scholarship that examined fracture rates based on published literature for select sites. This analysis is based on new data collected directly from Southwestern skeletal collections representing Ancestral Pueblo and Mogollon populations. Male and female rates of head wounds are tethered and co-occur in different frequencies across time and space, suggesting variable roles and implications for both males and females. Furthermore, based on the placement, size, shape and severity of the head wounds, this analysis was able to rule out accidental or occupational fractures using forensic and clinical standards. Wounds across time and between different groups suggest that nonlethal violence increased over time, and had different implications for the victims (and the perpetrators). It is possible that lethal violence due to warfare and raiding was only the tip of the iceberg, with many other forms of social control and coercion in place as well.

Martin, Richard (Knik Tribal Council), Kathryn E. Krasinski (Fordham University), Brian T. Wygal (Adelphi University) and Fran Seager-Boss (Matanuska-Susitna Borough)

[302] *Application of LIDAR in New Site Discoveries, Susitna Valley, Alaska*

Geographic Information Systems (GIS) have long been a standard tool for mapping or depicting archaeological features and sites in the circumpolar north. Recently, remote sensing techniques including Light Detection and Ranging (LIDAR) have provided extremely high resolution datasets for landscape level survey and site detection from the GIS platform. Initial applications have proven useful for identifying temple complexes and other large scale archaeological sites in the Central American rainforest where dense vegetation hinders traditional survey techniques. This paper highlights similar approaches in the subarctic boreal forest environment of Southcentral Alaska where the technique has successfully identified more subtle archaeological signatures. In collaboration with the Knik Tribal Council and Matanuska-Susitna Borough, LIDAR data were

analyzed and compared to field survey data for the identification of semi-subterranean storage and dwelling features. It has been a reliable methodology with few false positives at Montana Creek and Cottonwood Creek sites in Southcentral Alaska where short summers and dense boreal forest vegetation make ground survey challenging.

[361] *Modeling Middle Holocene Site Frequencies in Southeastern Wyoming: Exploring the Early Archaic through Probabilistic Models*

The lack of Middle Holocene sites on the Northwestern Plains provided grounds for further research on its source. A range of explanations have been proposed for the low frequency of archaeological sites dating between 8000 and 5000 BP in southeastern Wyoming, including geological, cultural, and researcher bias. Some suggest that human populations occupying the plains during this time were reduced. However, others point out that conditions during and following this time period may have destroyed sites or deeply buried them. Using quantitative and probabilistic models, this poster explores the likelihood of finding an Early Archaic period site given information concerning the history of research in the area, the chance of revealing buried cultural remains, and potential sources of geological bias. Further, it provides predictions of locations in Platte and Goshen Counties, Wyoming, that would benefit from further investigation; these areas will be subject to research attention in the future.

Martin, Erik (University of Utah), Joan Brenner Coltrain (University of Utah Department of Anthropology) and Brian F. Coddling (University of Utah Department of Anthropology)

[362] *Stratigraphic Integrity and Large Game Hunting at Hogup Cave, Utah*

Utah's Hogup Cave is an iconic example of the exceptional preservation and cultural depth present at Great Basin dry cave sites and has recently featured prominently in the debate related to the ascendancy of large game hunting in the late Holocene. However, concerns related to the stratigraphic integrity of the site have largely inhibited analysis of the cave's assemblage since the site's excavation and initial analysis in the late 1960's. We utilize 15 new radiocarbon dates in conjunction with excavation notes to examine the stratigraphic coherency and temporal range of the site. This is presented alongside new oxygen isotope data and a reanalysis of the site's artiodactyl faunal material to reconstruct trends in large-game hunting behavior stretching back to the early Holocene.

Martindale, Andrew (University of British Columbia)

[80] *The Revival of the Canadian Archaeological Radiocarbon Database (CARD)*

CARD was developed at the Canadian Museum of Civilization (now the Canadian Museum of History) by Richard Morlan as a text-based online tool to compile ^{14}C dates from archaeological and palaeontological contexts. Over the years it has compiled about 40,000 dates from across Canada and into the northern United States. The database has grown to the extent that it can now be used to answer critical continental-scale questions of demography and human-ecosystem interactions. In July 2014, the CMH and the Laboratory of Archaeology (LOA) at the University of British Columbia initiated a partnership to revise CARD. In this paper we review and showcase the new features of this foundational database (including spatialization, data field flexibility, batch up/downloading, dynamic searching). We also outline our plans for expanding the database's reach in area and subject as well as adding to its functionality. We also discuss CARD as an example of a new management system for 'big data' which decentralizes authority and develops comprehensiveness through crowdsourcing.

Martindale Johnson, Lucas (University of Florida)

[412] *Preliminary Interpretations of the Reduction Technology and Distribution of Obsidian Cores at Caracol, Belize: Learning to Reconsider Maya "Eccentrics" and Social Relations of Ritual Objects*

To the uninitiated, Maya "eccentrics" are vague archaeological labels applied to flaked obsidian objects placed in ritual caches during the Classic Period (A.D. 250-800). Although an unclear label of humanoid, deity, animal-like, or other shaped objects, lithics analysts have tried to define eccentrics based on technological attributes enabling comparisons between contexts, sites, and regions. Those studies that reconstruct a complex chaîne opératoire demonstrate many eccentrics had a dynamic socio-technological biography prior to their deposition in ritualized contexts. After 30 years of systematic investigation, the Caracol Archaeological Project has recovered many ritual cache deposits of Maya "eccentrics". Caracol eccentrics are typically terminated or disabled exhausted polyhedral blade cores, but can also be broadened to include (modified) macro-core shaping flakes/blades, platform preparation, and core rejuvenation debitage based on their context. Refits are present in many of these contexts demonstrating that exhausted cores were notched disabling further blade removal or rejuvenation. These objects may have then been used as tools in ritual just prior to their deposition. This paper defines these ritualized objects technologically and presents their distributions at households to understand the nuances of their performative production by obsidian crafters, their circulation to non-crafters, and their use during important household ritual events.

Martinez, Romina (Bureau of Land Management) and Tamara Whitley (Bureau of Land Management)

[103] *Predicting the Past: GIS Weighted Modeling on the Carrizo Plain National Monument*

The Carrizo Plain National Monument contains some of the most significant heritage resources in North America. Appropriate management is critical to the preservation of these sensitive resources. The results of GIS modeling can be directly applied toward a wide variety of historic preservation approaches. This presentation will describe the development of a site location predictive model for the CPNM and its direct application to resource management. The model identifies areas where culturally sensitive resources are likely to be based on determined criteria. Weighted overlay analysis was used to condense the output into five categories: most suitable, moderately suitable, suitable, somewhat suitable, and least suitable. The inputs to the model were numerous datasets, including: elevation, slope, aspect, distance to surface water, vegetation, and soil data based on drainage and texture. Development of the Carrizo Plain National Monument predictive model was a two-step process. The first step was to create the necessary layers for the area using a GIS. The second step was to create a predictive model of site location based on data contained in the layers. Protecting and locating these historical remains is highly important and of concern to archaeologists.

[197] *Caring for the Honuukvetam Pimuu've: Lessons from the Metropole Project, Avalon, Catalina Island, California*

While conducting necessary structural upgrades to the electrical system in the City of Avalon on Catalina Island, Southern California Edison (SCE) came upon Gabrielino (Tongva) ancestral remains. The ancestral remains were considered a possibility since the work was within the boundaries of a known village site (CA-SCAI-29) and the location had produced ancestral remains in the past. Prior to the start of the project, SCE consulted and worked with the Most Likely Descendant (MLD), as identified by the California Native American Heritage Commission, to create a treatment plan for the removal and care of ancestral remains and other items uncovered. Balancing Native American spirituality, respect for the ancestral remains, as well continuing to make forward movement on upgrades under a short time was not easy. From the view of the Gabrielino (Tongva) participants, this paper will discuss that even with a treatment plan in place, each day brought new challenges which required new assessments and directions to be made to ensure that the ancestral remains were honored and their story told.

[203] *New Evidences of Human Corpse Manipulation among Hunter-Gatherers Societies in North-Eastern Patagonia (Argentina)*

A salient feature of Northeastern Patagonia during the late Holocene is the abundant record of burials with evidences of a strong handling of human bodies. In the lower basin of the Colorado River, burials are usually found in contexts such as formal disposal areas and domestic sites. In this work the bioarchaeological characteristics and the chronology of the Zoko Andi 1 site are presented. The earliest evidence of human corpse manipulation (ca. 1400 years BP) for Northeastern Patagonia was registered at this site. In addition, for the first time at least two distinct forms of mortuary treatment are simultaneously represented in the same context: simple secondary burials and the so-called "disposiciones." A deliberate intention to select certain portions of the body in order to locate them in a patterned arrangement into the funerary bundles was recorded. Also, a notable feature is the contemporaneity between funerary and domestic activities in a base camp repeatedly occupied during the late Holocene. Mortuary patterns recorded on the site will be finally compared in a regional scale.

[217] *Burial Treatment in the Area of La Noria, Tamtoc, SLP, Mexico*

Archaeological information confirms that between the second and fifteenth centuries A.D. Tamtoc evolved into a complex urban society that left evidence of their cultural identity through the vestiges of their ancient city. Testimony to this is the architectural complex designed for the preparation of complex funeral rituals, currently known as La Noria. In this area we have 67 burial mounds dug Postclassic (900-1500 A.D.), recovering 92 graves with the remains of 147 individuals of different ages and sexes. This paper will discuss the bioarchaeological research we have done on this bygone burial treatment population gave some individuals who might be considered special and through rituals help them reach their final destination.

[39] *The Presence of Teotihuacan's Iconography at Cacaxtla, Tlaxcala: A Reflection on Its Interpretations*

The archaeological site of Cacaxtla, is located in the southwest of the modern state of Tlaxcala, Mexico. It has been explored uninterruptedly since 1975, and researchers agree that the site had a long occupation, reaching its height by A.D. 600-900, and was contemporary to other sites like Teotihuacan. Cacaxtla stands out for its mural paintings and, in particular, for its iconography that combines many pictorial traditions from different Mesoamerican sites. In particular, Cacaxtla's art

draws upon the styles of Teotihuacan and the Classic Maya. Studies that focus on the interpretation of Cacaxtla's iconography have revealed Teotihuacan's influence. Although studies have tended to focus on Maya influence in the art of Cacaxtla, relatively few have investigated the importance of themes from Teotihuacan that appear at the site. In this paper, my objective is to show what I think are the principal problems involved in finding those themes and to propose a new way to approach them.

[189] *Trading, Borrowing, Stealing, Fighting, Collaborating and Sharing: Comcáac Social Interactions with Their Neighbors*

The Comcáac (Seri) indigenous community provides a unique opportunity for community-based research in archaeological endeavors. Through a joint effort with several members from different families and of different age, the project constructed methodologies that integrate archaeological data with oral tradition and ethnographic information. In specific, we propose a distinct survey method with the recording of oral histories from landscape segments. This paper presents relevant results from this archaeological research and its associated historical and contemporary notions of past objects and places. With an emphasis on their relationship among agriculturalist neighbors (present day North Mexico and the US Southwest) as evidenced materially mainly by the presence of Trincheras pottery, Olivella shell beads, Glycimeris shell bracelets manufacture and landscape features; as well as by oral tradition evidence about territorial boundaries and relationships with Yaquis, Papagos and Apaches. Among important issues for collaboration endeavors, it also contributes to the general understanding of the region's history, the historic social interactions between coastal hunter-gatherers and agriculturalists, and the socioeconomics of raw material acquisition, manufacturing, and exchange.

Martínez Tuñón, Antonio (Zona Arqueológica de Monte Albán-INAH), Veronica Perez Rodriguez (University at Albany, SUNY) and Laura Stiver-Walsh (Metro Nashville Public Schools)

[26] *Cerro Jazmin and Its Changing Regional Context: Building upon Regional Survey Data*

Current work at the Mixtec urban site of Cerro Jazmín stems from a regional survey of the Central Mixteca Alta led by Stephen Kowalewski. As we refine Cerro Jazmin's chronology and know more about its history of occupation, we are building upon and sometimes correcting initial understandings of the site gained from that regional survey. We are able to contextualize the new information in relation to the entire Nochixtlan Valley and nearby areas thanks to the work and perspective offered by Steve's work in the Mixteca Alta and in the Valley of Oaxaca. In this paper we discuss the new chronological data that points to Cerro Jazmin as an important Early and Late Ramos urban center and we refine previous statements of its prominence in the Classic and Postclassic periods. We relate this information to the region's settlement patterns and to larger macro-regional socio-political and economic trends.

Martinez-Cruzado, Juan, Edna Tascon-Penaranda (University of Puerto Rico at Mayaguez), Francez Curbelo-Canabal (University of Puerto Rico at Mayaguez), Taras Oleksyk (University of Puerto Rico at Mayaguez) and Esteban Burchard (University of California at San Francisco)

[313] *Admixture in the Precolumbian Caribbean*

The biological origin of the Tainos is one of the most controversial issues regarding the population history of the Caribbean. The archaeological evidence suggests an early arrival from Mesoamerica and later arrivals of Arawak speaking groups from the Amazon to the Greater Antilles. We sequenced the control region of 171 Hondurans mtDNAs, 140 of which were of Native American origin, including 119 belonging to haplogroup A2, 20 to B2 and one to C1. We then chose Puerto

Rico and Dominican Republic sample pairs belonging to different mtDNA lineages, sequenced their complete mtDNA, and performed phylogenetic reconstruction using 105 continental sequences as reference. Ten out of 19 Caribbean complete mtDNA sequences showed deep roots and no strong association to any continental region. In addition, we found three Dominican and one Puerto Rican A2 lineages with strong association to Central America. We further identified two Dominican A2 and one Puerto Rican C1 lineage associated to South America. Evidence for strong population expansions in different continental regions were suggested but all Caribbean lineages with two exceptions had deeper roots. All data together suggest that Taino mtDNAs have both Central and South American origins.

Martínez-Muñiz, Isabelle

[379] *The Application of X-Ray Diffraction to the Characterization of Clay Samples from the Tuxtla Mountains, México*

In this project I applied X-ray diffraction (XRD) techniques to characterize the mineralogical composition of 11 clay samples collected from the Tuxtla Mountains, in the vicinity of Matacapán, Veracruz, México. These samples had already been analyzed through X-ray fluorescence (Pool 1990), and the data generated by XRD was compared to the already existing elemental analyses of these clays and of ceramics from the region. In this way, I attempt to distinguish minerals added to these clays in the form of temper during cultural processes of ceramic production, from naturally occurring inclusions. Also, through the mineralogical characterization of clay samples, I seek to more clearly define areas of resource procurement for ancient potters. Based on the XRD results, it was possible to identify a general mineralogical profile of the clay samples from the area surrounding Matacapán, as well as to highlight some intra and inter-group patterns and relationships in the mineralogical composition of these clays. Also, the XRD results support the findings obtained from XRF analyses of the clay samples. Future work will focus on comparing the data presented here to petrographic thin sections of these clay samples and on a comparison with XRD analyses of pottery produced at Matacapán.

[141] *Restos botánicos del sitio Precerámico de San Gregorio Atlapulco*

El sitio de San Gregorio Atlapulco (conocido como El Japón) se localiza al sureste de la Cuenca de México en la delegación Xochimilco. Su estudio se inició en la década de los 90s reportándose montículos ocupacionales y chinampas asociadas al Postclásico Tardío (1450-1521). En años recientes se retoma la investigación en el lugar en el marco del proyecto Poblamiento, Agricultura inicial y Sociedades Aldeanas en la Cuenca de México (PAPIIT IG400513-3). Uno de sus objetivos es aportar nuevos datos al estudio de las sociedades Precerámicas en la Cuenca, para lo cual se realizaron excavaciones extensivas en el sitio. Una de ellas la denominada Unidad A, se localizó en el límite sur de la plataforma habitacional y que por los materiales en superficie indicaban una ocupación más temprana (Precerámico Tardío ca. 4000-4200 a.n.e). En dicha unidad se tomaron muestras para análisis de materiales botánicos (macro y microrrestos). En este trabajo se presentan los resultados preliminares de los estratos IIIA y IIIB. Entre los taxa determinados hasta este momento se encuentran plantas de las familias: Cyperaceae, Chenopodiaceae, Poaceae, Pinaceae y Betulaceae, que son propias de cuerpos de agua y bosques templados.

[89] *Chemical Analyses and Copy-Errors: Technological Control and Artistic Behavior in the Making of China's Terracotta Army*

Built in the 3rd century B.C., the Terracotta Army constitutes an unprecedented investment of technological resources as well as a huge work of art. An icon of a much larger mausoleum, the

army of thousands of heavily armed warriors materialized in just a few decades under the command of the man who would become China's first emperor. This paper presents some aspects of an ongoing project that investigates this logistical feat, paying particular attention to craft organization, quality control and artisanal practice. Using metric, microscopic and chemical analyses of the weapons, together with geometric morphometric comparisons of digital 3D models of the warriors, we identify different patterns of artifact variability at micro and macro scales of analyses. These patterns are explained as resulting from various factors at play, including the organization of the labor force, structures for knowledge transmission and quality control, the use of standards and moulds, copy-errors and the intrinsic limitations of workers and materials. Using similar methods we attempt to explain both the materials engineering and the aesthetic or artistic constraints at play. We outline the problems and potentials of applying our methods elsewhere for comparative studies.

[91] *Provenance Study of Obsidian Artifacts from the Neolithic Settlement Masis Blur (Armenia) Using Portable X-ray Fluorescence Spectrometry*

Over the past two decades, provenance research on obsidian from Armenia has been on the rise, primarily for provenience purposes, however, with only few studies on obsidian archaeological artifacts. In these studies, the geochemical characterization of obsidian artifacts and geological sources was carried out using different laboratory-based techniques such as INAA, ICP-MS and XRF. The current project presents preliminary results obtained with a portable XRF (pXRF) on the chemical characterization and provenience of a selected obsidian assemblage from the aceramic Neolithic settlement of Masis Blur. This assemblage was used to assess the prevailing belief that the raw material for the majority of the artifacts was primarily coming from one of the two Arteni sources in Northwestern Armenia, this one being nearest to the settlement. The assemblage was analyzed to determine the number of geochemical groups present. Data are compared to geological samples from all known Armenian and one eastern Turkey source in an attempt to assign individual groups to specific obsidian sources. Thirteen distinct obsidian groups were identified and many of these were attributed to various sources in Armenia or eastern Turkey. The findings attest to a much wider obsidian source utilization network than previously thought for the Neolithic settlement.

Martisius, Naomi L. (University of California, Davis), Tamara Dogandžic (Max Plank Institute for Evolutionary Anthropology), Michel Lenoir (Université Bordeaux 1), Shannon P. [53] *Neandertal Subsistence at the Late Mousterian site of Abri Peyrony, France*

Beginning in 2009, the late Middle Paleolithic site of Abri Peyrony (also Haut de Combe-Capelle, as part of the Combe-Capelle sites, Dordogne, France) was reopened. Three seasons of fieldwork yielded rich lithic and faunal assemblages, as well as pieces of manganese dioxide, bone tools, and much needed information about the site's formation and antiquity. The site yielded only Mousterian levels. Level L-3A is attributed to the Mousterian of Acheulian Tradition (MTA). The remaining levels, including the underlying level L-3B, demonstrate similarities in blank production but are not MTA. Thus, the Abri Peyrony faunal assemblage provides an opportunity to study the relationship between changes in lithic technology and subsistence through a detailed zooarchaeological analysis of a highly-resolved faunal assemblage (well-preserved, finds >2.5 cm were individually provenienced and analyzed, all materials from 5 mm screens were analyzed, coding all identifiable material and recording burning on all pieces). Species diversity is high in L-3A (n=381), despite its smaller sample size. The fauna from L-3B is dominated by reindeer (n=1355), suggesting that changes in technology coincided with changes in local environments. The impact on prey selection and carcass processing is also investigated.

[221] *Reproducible Research in Archaeology: Basic Principles and Common Tools*

Scientific progress depends on the evaluation of findings through replication. While exact replication of results is often infeasible because of limitations of time and resources, a minimal standard of reproducibility is emerging as a norm of practice in contemporary computational and biological sciences. This standard refers to authors making available the data and code used to generate the key figures and tables of their publications. In this paper I review some approaches to reproducible research that have been emerging in other sciences. I describe how to use common open source software tools and services to improve the reproducibility of archaeological research. I also discuss barriers to their adoption, and suggest how we might foster reproducibility in archaeology

[352] *Western Message Petroglyphs: Esoterica in the Wild West*

A particularly enigmatic form of rock art referred to as "Western Message Petroglyphs" has been identified at thirty locations in the American West scattered between no fewer than eight western states. Relying on standard rock art research approaches, this body of work is assigned to the historic mining boom years of the mid to late nineteenth century based on geographic distribution, symbol typology, and style analysis. A significant number of the sites are associated with the Mormon Trail and early Mormon settlements in the Utah Territory. An incorporation of icons from Obibway/Sioux Indian pictographic writing and other esoteric symbol systems allows us to formulate a hypothesis about the themes and authorship of these rock art panels.

[79] *Petrography of "Nderit" pottery from Pastoral Neolithic Sites Surrounding Lake Turkana in Kenya*

"Nderit" pottery is associated with the earliest pastoralists in eastern Africa, c. 4000-4500 bp. and is found at both settlement sites and ritual "pillar sites" surrounding Lake Turkana in northwestern Kenya. Several of the known megalithic "pillar sites" are large communal cemeteries and contain very large numbers of Nderit sherds, yet little research has been carried out on these ceramics in terms of their technology or provenance. Primary research questions concerning the early pastoralists of the Turkana Basin relate to issues regarding mobility and craft production; for example, did mobile herders produce this pottery on a household level as they moved throughout the Turkana Basin, or was craft production for ritual purposes more centralized and/or specialized? In the first phase of this project's petrographic investigations, sherds from three sites – two pillar sites, Jarigole and Lothagam North, and one habitation site, Dongodien – were examined. Analysis demonstrates shared fabrics between domestic and mortuary sites, as well as fabric links between sites on both sides of Lake Turkana, providing important new information on pottery production and circulation, as well as the mobility of these early pastoralists.

[79] *The Microscopy and Macroscopy of Islamic Luster Wares*

Petrographic and SEM studies of the luster-painted glazed pottery of the Islamic world between c. 700 and 1400 have defined an elite, high-technology ware made in few centers, at times only one center for the entire Middle East; with a distribution network that spanned the Old World. Production centers such as Basra in Iraq, and al-Fustat in Egypt created some of the most advanced and influential ceramic types of the period, utilizing technologies developed locally. But scientific

laboratory work is almost meaningless unless it can be extended into the trench and field to fit those finds into a statistically significant understanding of how material culture can be used to understand the human behavior of the past. This paper will focus on the wares of 8th-10th century Basra and 10th-12th century al-Fustat, and explore how attributes derived from technological developments and provenance can be used to provide an origin and a date for pottery found around the old world.

Mason, Philip

[177] *Places of Power and Passage: Hillforts and Monumental Landscapes in the Early Iron Age of Central and South-Eastern Slovenia.*

The early Iron Age (EIA) landscape in central and south-eastern Slovenia is dominated by hillforts and barrow groups. These monumental structures express and symbolize elite power in the landscape. Despite traditional emphasis on outside agency in the formation of these landscapes, it will be shown that the EIA landscape incorporated and transformed many places of the preceding Late Bronze Age (LBA) landscape, often through monumentalization. The expansion of hillfort settlements coincides with the increasing emphasis on visible differentiation in burial rites and the increasing role of iron technology, providing evidence for major social reconfigurations during the LBA/EIA transition and the development of visible elites. This is also reflected in the expansion of extra regional exchange. The aim of this paper is to examine these social changes and the role of elite ideology in the creation of place in and passage through these cumulative monumental landscapes. They were the result of intense, formalized elite competition throughout the EIA, which is reflected in the processions and festivals of Situla art and ultimately in the structure of the hillforts and barrow cemeteries themselves.

[302] *Birnirk Expansion across Alaska during the Medieval Climate Anomaly: Causal or Coincidence?*

Around A.D. 1000, from near Barrow, the Birnirk culture expanded southward across northwest Alaska, with settlements arising at Point Hope, Cape Krusenstern and Cape Espenberg. The motivation and successful adaptations of Birnirk were furthered by the stormy weather associated with upwelling and glacial expansion, correlative with tree ring, beach ridge and varve sequences across northern Alaska. New interdisciplinary data sets, archaeological and paleoecological, from Cape Espenberg elucidate the colonization process and contextualize the climate forcing. The data sets include diatoms, plant macrofossils, as well as a 14C dated, floating tree ring chronology (A.D. 700-1000) from a multi-room house with harpoon heads and bronze that exhibit long distance affinities to western Chukotka and northern Alaska. The cultural landscape was relatively empty: the Old Bering Sea/Ipiutak oikumene was in eclipse, allowing Birnirk peoples to act on the offensive. Skeletal biology indicates a diverse population employing distinctive mortuary practices within houses. Long-distance maritime capabilities are in evidence from a dated umiaq; the vehicle for colonization and the larger crews that focused on walrus and on bowhead whales, with increasing success. Colonization and immigration theory provide useful indices to interpret the improving radiocarbon chronology of Birnirk.

[344] *Closing the Portal at Itzmal Ch'en: Termination Rituals at Mayapan*

The ceremonious destruction and abandonment of the Itzmal Ch'en group at Mayapán is symptomatic of ritual violence that marked this city's near collapse at least 50 years before its final abandonment around 1448 A.D. This new evidence revises Contact Period accounts about the

demise of this city, the last regional capital of the Maya realm prior to European arrival, and it also reveals the city's resilient (if brief) recovery. In the tradition of the interdisciplinary approach of the Forest of Kings to Maya political dynamics, we review the termination rites at Itzmal Ch'en in their larger cultural context. This group has represented sacred ground from pre-Mayapan periods until modern times, housing the second largest temple of the Postclassic Maya era, a major cenote, halls, shrines, and an oratory. It is located two kilometers distant from the site's epicenter and marks an eastern gate of Mayapan's city wall. Termination rites involved careful destruction and mixture of unique effigy censers and sculptures, now restored. These materials reflect pluralistic and idiosyncratic aspects of ritual and symbolism at an outlying political and religious facility.

[79] *Arybolas, Amphoras and Manteño Ordinario: The Production and Significance of Ecuadorian Transport Vessels*

The late prehispanic coastal Ecuadorian societies subsumed as Manteño -Guancavilca, are imagined as seafarers of the Andean region. On balsa rafts they plied a coast dotted with ports; participants in a trading empire. This traditional model of political-economic integration is being challenged with emphasis on regional autonomy and ethnic diversity. It is proposed that the analysis of the "ordinary" Manteño -Guancavilca vessels can contribute to this debate. Large, coarse paste, roughened exterior jars are ubiquitous at Manteño-Guancavilca sites and are believed to have been used on trading rafts. A narrow range of forms and surface treatment is matched by evidence from thin section petrography and elemental analysis of a standardized, unique fabric utilizing igneous materials. These materials have a limited range and are not used in other pottery production. Are these vessels, like European amphoras, a ubiquitous form of transport vessel so common they weren't even worth reusing for a return trip or like Inca arybolas, a ware which signaled control and integration? Do the vessels demonstrate that regions of the coast of Ecuador were integrated into a wider "empire" or did local elites benefit from participation in long distance trading organized through distant coastal centers?

[298] *The Polychromy of the Great Temple of Tenochtitlan "Standard Bearers"*

During the 1979 Templo Mayor Project excavations in the ruins of Tenochtitlan's main pyramid, eleven basalt sculptures, ritually buried in a hitherto unseen manner, were exhumed from the fill covering Construction Stage III (1427–1440 CE). Their complex forms and iconographic elements have made ascertaining their function within the sacred precinct of the Mexica capital difficult. After their discovery, it was surmised that they represented Huitzilopochtli's siblings, the centzonhuitznahuah, and that they functioned as standard bearers. Recent digital microscopy analysis, however, has yielded the recovery of polychromy that exhibits a combination of traits associated with centzonhuitznahuah, pulque, and rain deities, and thus strengthens the hypothesis concerning the relationships between these three groups of gods. The reconstruction of their complex iconography will reveal the identity and function of these personages.

Matarazzo, Tiziana (University of Connecticut)

[176] *Micromorphological Study of Concotto Surfaces Protected by the Avellino Eruption in 3,780 BP at the Afragola Village in Southern Italy*

The term concotto refers to fragments or patches of hard heated clay that derive from living surfaces, walls and ovens. Concotto fragments are found throughout the Italian peninsula and date from the Neolithic to the Iron Age. Current studies express contradictory opinions about whether or not the concottos found on living surfaces represent intentionally constructed surfaces or the secondary

products of the contact between hot embers and sediments. This study uses micromorphological analysis to investigate the function and composition of concotto surfaces from several domestic structures at the Early Bronze Age village of Afragola in southern Italy. Afragola is an exceptionally preserved agricultural village that was covered by almost 1 meter of ash during the Vesuvius eruption in 3,780 BP. The concottos at Afragola are hard, red surfaces that are typically associated with burned materials. Micromorphological analysis reveals that the concottos were intentionally made by laying down patches of clay and then heating them to create a hard, flat surface. This study explores the potential uses of the concotto as cooking surfaces during the Early Bronze Age of southern Italy.

Matchett, Ash (InterAmerican University of Puerto Rico)

[313] *Ancient DNA Prospecting in the Caribbean: Preliminary Findings and Future Perspectives*

Recent advancements in DNA sequencing have initiated a revolution in the field of Archaeogenetics. The results of these new studies have fundamentally affected our understanding of early human migration and peoples. Limitations, however, still exist, notably in tropical environments. These environments are believed to affect the preservation of DNA in human fossils, to the extent where DNA extraction and analysis is at the limit of even the newest technologies. A specialized facility has been setup in the Caribbean to maximize the extraction and sequencing chemistry, specifically, in order to redress this limitation. Ancient DNA recovery is optimized through a number of techniques, including samples selection, extraction, differential and selective DNA enrichment protocols, stringent biochemistry and improved chemistry. A brief outline of the initial results and successes will be investigated. Furthermore, preliminary results, both in decomposition studies and in Whole Genome Analysis (WGA) of Caribbean samples will be discussed. Finally, consideration will be given to the impact of these studies on our understanding, present and future, of the precolumbian peopling of the Caribbean.

[220] *A Multistage Model for Treponemal Disease Susceptibility*

There are numerous historical, bioarchaeological, and paleopathological studies of treponemal disease, but most have focused on the origin and antiquity of syphilis. Therefore, little is known about the evolution and ecology of the other treponematoses, such as yaws. In modern populations, research options are limited by difficulty in culturing the causal bacteria, lack of animal models, and ethical issues with human testing. Treatment with antibiotics has also limited clinical research into treponemal disease morbidity and manifestations, though the treponematoses remain major sources of morbidity in the developing world. Bioarchaeological materials can address this deficit by enabling assessment of the effects of ecological factors on treponemal disease expression. This study addresses relationships between the morbidity and ecology of yaws via a three stage ecological model of ultimate to proximate factors, including climate, subsistence, and overall health, in six southeastern United States skeletal samples. Population frequencies of treponemal lesions are statistically compared to risk factors including average yearly temperature and rainfall, subsistence strategies, and oral health indicators, a proxy for overall health, from each sample. Results indicate climate and subsistence have little impact on overall yaws morbidity; however, poor early life health experiences contribute to later life disease expressions.

Mathews, Darcy (University of Victoria)

[320] *Depositional Practice and Ancestral Presence at Edye Point*

On the southernmost tip of Vancouver Island, between 400–1500 cal A.D., the Straits Salish peoples built distinctive funerary petroforms for their ancestral dead. These above ground features, constructed in a patterned array of sizes and shapes, were the material and spatial outcome of ritualized depositional practices. The Edye Point Cemetery, the largest funerary petroform cemetery in the region, has more than 300 of these features concentrated in a three hectare area. There is a recursive and mutually constituting relationship between who and where one is at Edye Point. Point pattern analysis reveals a process in which specific places were selected for certain kinds of funerary petroforms, and a spatial disposition is evident in which smaller types of mostly circular and oval features cluster together at multiple scales, while the largest, mostly straight-sided burials spatially repel one another, and occur outside of these clusters. Triangulating these results with an ethnographic thematic analysis suggests that communities of ritual practice at Edye Point performed simultaneously inclusive and exclusive burial, promoting a sense of *communitas* while also distinguishing their most powerful dead as liminal actants existing at the threshold of both the communities of the living and the dead.

Mathiowetz, Michael (CSU Dominguez Hills)

[189] *Copper Back Mirrors (Tezcacuitlapilli) as Objects of Political and Religious Authority in the Casas Grandes World (A.D. 1200-1450)*

The rise of the Casas Grandes culture (A.D. 1200-1450) in Chihuahua, Mexico and the adoption of a new religion centered upon the Mesoamerican solar deity Xochipilli prefigured many of the social transformations that occurred among Pueblo cultures across the American Southwest by the fourteenth century. The appearance of new architecture of clear Mesoamerican derivation (e.g., I-shaped ball courts) and imported finished objects of shell and copper in the Casas Grandes world indicates heightened connections to West Mexico during this era. Among those imported items at Casas Grandes sites are complete and fragmentary tezcacuitlapilli—portable cold-hammered copper ornaments closely linked to the sun that were worn at the small of the back. Politics and religion intersect in these objects and their use in Mesoamerica provides a context for scholars to understand why these items appear in the archaeological record of far northern Mexico. This paper considers the role of the Postclassic West Mexican Aztatlán culture (A.D. 900-1350) in the rise of Paquimé and examines the use of West Mexican-derived objects of political and religious authority for Casas Grandes office-holders within the context of a Mesoamerican-inspired hierarchical social-religious organization.

[61] *Beyond the Mission Walls: Faunal Analysis of an Alta California Mission Ranchería Feature*

Mission Santa Clara de Asís, located in south San Francisco Bay, was one in a chain of Spanish Franciscan missions stretching from the south to the north of Alta California. Founded in 1777, Mission Santa Clara has been the subject of archaeological investigation for decades, but only in the past few years has the lens of research focused on native people's experiences and navigation of the mission system. This paper presents the results of a zooarchaeological analysis of a sampled pit feature (Feature 5) associated with one of Santa Clara's rancherías--adobe barracks constructed to house native peoples living at the mission. The results of the analysis provide additional evidence that native religious practices continued in parts of the "converted" population who lived and worked at the mission. The material remains from traditional religious practices were found discarded with other refuse. Alongside domesticated cattle, caprines, and chicken, native peoples ate seasonally available ducks, geese, and marine animals, suggesting continued movement and connection to the

traditional landscape. The faunal data offer deeper insights into how native peoples creatively negotiated the new resources and the new social limitations that characterized mission life.

Matisoo-Smith, Lisa (University of Otago)

[339] *The Complexities and Implications of Animal Translocations in Pacific Prehistory*

The Pacific region has some of the earliest evidence of animal translocation in the world. The use of transported landscapes – including the introduction of a range of plants and animals - was a major strategy for Pacific Island colonists, particularly in the settlement of Remote Oceania. We have been studying genetic variation in Pacific commensals for nearly 20 years and through these studies have had to constantly rethink our concepts of human and animal interactions generally and in regards to our understanding of Pacific settlement history. This paper will review this history and discuss some of the new questions that have been stimulated by our commensal animal studies thus far.

[24] *Lo ritual y lo doméstico: estudios químicos de suelos y paleoetnobotánicos en distintas esferas de actividad en la hacienda San Pedro Cholul, Yucatán*

Si bien existen registros escritos sobre aspectos económicos y productivos en contextos históricos mexicanos, haciendas específicamente, es importante subrayar que dichos registros hacen mención breve o nula acerca de la vida cotidiana y situación económica en la que los peones acasillados vivían. Ante la presente problemática, nos planteamos evaluar y discutir las actividades cotidianas realizadas en una vivienda de construcción humilde (Solar 30), por un lado, y en la capilla de la hacienda San Pedro Cholul, por otro lado. Propusimos un acercamiento interdisciplinario haciendo uso de análisis químicos de suelos y estudios paleoetnobotánicos - gránulos de almidón en este caso- con el fin de proporcionar una comprensión más detallada de las labores y acciones de los peones acasillados principalmente. Los resultados nos indicaron un patrón consistente en la disposición y delimitación de labores dentro de la casa del Solar 30 y los solares 1 y 15 estudiados en el 2009. La capilla exhibió un uso intensivo y variación en los tipos de ofrendas depuestas en su altar.

[415] *The Nutritional Context of the Pueblo III Depopulation of the Northern San Juan: Too Much Maize?*

The abandonment of the Four Corners area is a longstanding problem in archaeology. Recent work has shown that the terminal occupation was concentrated into a limited number of large defensive

sites. This resulted in an extreme emphasis on maize, which was nutritionally untenable because of maize's low amounts of Lysine and Tryptophan. I describe the processes that led to this settlement pattern and the evidence for this diet. I then explain how the combination of the settlement pattern and the extreme reliance on maize resulted in a nutritionally fragile situation that collapsed. I end with a few thoughts on the collapse.

[354] *The Social Value of Ornaments from Pueblo Bonito and Aztec Ruin*

Ornaments are generally considered to be items of wealth, luxury, and value, and are often used as one of several indicators of social inequality. However, the value and meaning of ornaments is often assumed rather than demonstrated. Aside from power and wealth, jewelry may also relate to various aspects of social identity. It has been proposed that ornaments, turquoise, and shell may have been important symbols of status and ritual (or socially valuable goods) in Chacoan society, as they form the majority of items associated with kiva offerings in niches and under benches, floors, and pilasters. In addition, ornaments appear in burials and in rooms with other distinctive and apparently valuable items. This paper explores the relationship between identity and demographic reorganization through an examination of the extent to which elements of Chacoan identity and practice, as demonstrated by the social values attributed to ornaments at Pueblo Bonito during the Chaco florescence, were maintained or transformed by the post-Chaco period inhabitants of Aztec Ruin. Specifically, this research identifies the physical characteristics that differentiated ornaments of varying social uses at Pueblo Bonito from A.D. 900 to 1130 and compares them to those from Aztec Ruin during the A.D. 1200s.

[166] *Fish Through Time at KIS-050, Kiska Island, Western Aleutians*

Test excavations at KIS-050 during the Rat Islands Research Project Summer 2014 season resulted in abundant faunal assemblages, including a well-preserved fish assemblage. The goals for this research project include the development of a history of human and environment interactions between humans and the land- and seascapes, and the contribution of regional data to broader scale environmental impact studies. Sites occupied over the long term, such as KIS-050, are invaluable to better understand trends over time and fish are particularly well suited to examining temporal trends in impact from climate and predation. An analysis of the fish assemblage from KIS-050 will help research about if, and how small societies can leave a lasting impact on the surrounding landscapes and environment. This poster will present the analysis of the KIS-050 fish remains and compare trends from this site to patterns in other sites in the island group.

Mayer, Aaron (University of South Dakota) and Matthew Sayre (University of South Dakota)**[347] *Exploring Macrobotanicals of Tenenhaha from the Cotahuasi Valley, Peru***

In this paper we present macrobotanical data from the Peruvian archaeological site of Tenenhaha in the Cotahuasi Valley. Soil samples from archaeological excavation areas were recovered by Justin Jennings and his field crew from the Tenenhaha site. These soil samples were floated in order to sieve out the botanical remains of the ancient past lives of Peruvians at a ritual and ceremonial burial site of Tenenhaha. Our analysis revealed new insights into site use and the distribution of botanical staples of the Andean past. The local plant staples of quinoa (*Chenopodium quinoa*) and corn (*Zea mays*) were found in high densities in concentrated areas of the site. Local plants such as *Echinocactus* (*Echinocactus* sp.), tubers, and the Peruvian Pepper Tree (*Schinus molle*) were also recovered in abundance. These remains provide insights into changing cultural practices, as they present in different densities throughout time. The occurrence of sprouted *Zea mays* and *Schinus molle* in certain areas of the site seems to indicate ritual and or ceremonial usage of chicha during the Middle Horizon (550-1000 CE). The analysis of these macrobotanical remains gives us a glimpse into the past economic and culinary practices of people in the Ancient Andes.

Mayes, Arion [410] see Joyce, Arthur

Mayes, Arion (San Diego State University), Sarah Barber (University of Central Florida), Arthur Joyce (University of Colorado, Boulder) and Christopher Morgan (Western Door Archaeological & Osteological Service)**[410] *Intra-and-inter Regional Variation of Dental Modification and Social Complexity: a Test Case from the Lower Río Verde Valley, Oaxaca***

Dental modifications are symbolic representations permanently etched into human dentition that can have different cultural interpretations. Often done for aesthetic purposes, these modifications may reflect status, represent social inclusion or exclusion, or display regional variation. Bioarchaeological analysis of skeletons from three sites (Yugüe, Loma Don Genaro, and Río Viejo) from the Lower Río Verde Region of Oaxaca, Mexico (100 CE-800 CE) shows an increase in the frequency of dental modifications as well as in the number of individuals whose burial practices suggest differing social position both in life and death. This study discusses dental modification among adult males and females from all three sites. Additionally, a range of variation in the types of modification may suggest both intra- and inter-regional influences. Previous studies have indicated that dental modification appears in early archaeological populations within Mexico, with some of the oldest examples found in Oaxaca at Monte Alban and Monte Negro. It should not be surprising then, that dental modification makes a somewhat early appearance in the lower Río Verde Valley on the Pacific Coast of Oaxaca, Mexico. However, the dental and archaeological evidence reveal changing patterns of social complexity across time.

Mayfield, Tracie (University of Arizona)**[76] *Mahogany and Sugar for Tobacco, Booze, and Salt-Pork: Consumerism and Consumption at 19th-Century Lamanai, Belize***

During the nineteenth-century, the Caribbean region was a hotbed of trade and commerce driven principally by extractive industries such as agriculture (principally sugar) and hardwood collection. Such ventures required large injections of capital into the creation and maintenance of discrete, productive landscapes as well as for hiring, housing, and feeding the workers who provided physical labor and management. The following presentation will explore a long-term residential area of one such space: Lamanai, Belize, excavated during the 2014 summer field season. Lamanai is located in what is now the Orange Walk District of northwestern Belize. During the nineteenth-century British colonists established a short-lived sugar plantation at the site, which had long been — and continued to be long after the demise of the sugar venture — an area exploited for logwood and mahogany. Along with wild fauna, chicken, beef, and bottled, canned, or barreled products such as soda water, salted pork, and potted meat, the residents of nineteenth-century Lamanai were also active consumers of tobacco and bottled alcoholic beverages. In addition, the monies paid to the individuals and groups were used to purchase bottled medicines, health and hygiene products (e.g. chamber pots), and wearable objects such as buttons and boot heels.

[197] *Getting Right with the Damage: Archaeological Value and Cost of Restoration and Repair Determinations Archaeological Damage Cases*

Criminal and civil prosecutions under ARPA require archaeological value and cost of restoration and repair determinations for unauthorized damage to archaeological resources on federal and Indian lands. These determinations also are necessary for archaeological damage cases prosecuted under other applicable federal and state statutes in order to provide monetary measures of the severity of harm. They must be done correctly to meet both the statutory requirements and the legal standards for expert witness testimony. This has resulted in the development of professional standards for the value and cost determination process. Examples of archaeological value and cost of restoration and repair determinations for recent important archaeological damage cases will be presented to illustrate the correct approach that will meet legal, professional, and ethical standards and that will also insure the damage is dealt with properly.

McAllister, Hannah (University of Wisconsin-La Crosse and PIARA), Rebecca Bria (Vanderbilt University and PIARA) and Elizabeth Katherine Cruzado Carranza (University of Memphis and PIARA)

[252] *Reconstructing a Recuay Feasting Event at Hualcayán, Peru through Ceramic Analysis*

Although research of the Recuay Culture has heavily focused on the practices and materials of Recuay feasts, these studies are limited to a few archaeological sites. Consequently, the variation of Recuay feasting practices between communities in highland Ancash is still unclear. This poster presents a typological and spatial analysis of Recuay ceramics excavated from the archaeological site of Hualcayán to reveal the local ritual practices of food preparation and consumption during the Early Intermediate Period (1-600 A.D.) in this ancient community. This ceramic assemblage was recovered from a large D-shaped patio group enclosure in which ceramics were burned, smashed in place, and associated with a variety of carbonized plants, suggesting they are the remains of feasting. The typology of the ceramic forms will be used to illustrate the range of food practices during a distinct feasting event in this D-shaped structure and the spatial arrangement of separate food preparation and consumption areas will be used to recreate the specific activities of feasting. Finally, these results will be compared with ceramic assemblages from other Recuay community sites in order to examine variation in Recuay feasting.

McAnany, Patricia (University of North Carolina, Chapel Hill)

[295] "He Entered the Water" ... Maya Wetlands and Their Caretakers

An epitaph for the death of Classic Maya rulers, "he entered the water" is an apt descriptor for a Maya archaeologist whose career spanned the royal and the watery. Peter D. Harrison—whose email address contained the word *ahau* (ruler, using a Colonial orthography)—was a master of scalar contrast. He attended to the small-scale details of a dynastic headquarters within the Tikal Central Acropolis and also theorized grandly about the role of wetlands in Classic Maya society. He became an advocate for the aesthetic beauty and utility of these watery portals that are ubiquitous in the southern lowlands. As a member of the 1981 Pulltrouser Swamp Project, I look back on Harrison's approach to wetlands, his impact on later scholarship and on the turbulent years that followed during which a science of Maya wetland utilization fitfully emerged.

McArthur, Dan (University of Central Lancashire) and David Robinson (University of Central Lancashire)**[143] *Cave Sticks? An Investigation into the Use and Purpose of Bifurcated Sticks Found in Cache Caves***

This study aims to explore the purpose and use of bifurcated sticks found in cache caves of Southern California. Known as 'witchsticks' or 'spirtsticks', little formal research has been undertaken on these enigmatic cave sticks. As suggested by their naming, interpretations presume a ritual connotation despite little evidence; alternately, a purely practical application has equally been poorly considered. With the discovery of new Cache cave comes the ability to observe well preserved cave sticks found in situ. By analyzing these new cave sticks concentrating on the differing metrics and observing the differing physical attributes, questions concerning their use and purpose may be posed. This study compares these metrics and physical attributes to, a) a sample of non-modified sticks from nearby vegetation; and b) accounts of stick usage in the ethnographic record. This investigation highlights the amount that can be learned by conducting in depth studies of individual aspects of material culture.

McCafferty, Geoffrey [170] see Manion, Jessica

McCafferty, Geoffrey (University of Calgary)**[246] *'Out of Mexico' 25 Years Later: A Reconsideration of Migration into Greater Nicoya***

In 1989, John Hoopes and I presented a paper at the SAA conference in which we attempted an archaeological evaluation of ethnohistorical models for Mexican migrations into the Greater Nicoya region of Central America. Although the paper was never published, it became the foundation for my current research in Pacific Nicaragua. Colonial chronicles describe 'Mexican' cultural practices of the Nahuatl-speaking Nicaraos and, to a lesser extent, the Oto-Manguean-speaking Chorotega. Linguists and art historians of the twentieth century have supported claims of Mesoamericans in the region beginning about 800 CE. After 15 years of excavating several major sites along the shore of Lake Cocibolca, specifically looking for the Mexican connection, we have amassed an excellent database for ancient Nicaraguan lifeways, but rather ambiguous evidence for Mexican colonies. This paper will outline the evidence for migration 'out of Mexico' and then critically evaluate the archaeological evidence as it relates to foreign influence as opposed to in situ development.

McCall, Grant (Tulane University)**[292] *Chert at Chalcatzingo: Implications of Knapping Strategies and Technological Organization for Formative Economics***

The site of Chalcatzingo, at the eastern edge of the state of Morelos, Mexico, has been an important source of information about shifting economic and social dynamics during the Formative period.

Lithic analyses focusing on the site's specialized obsidian knapping have played a significant role in showing Chalcatzingo's place as a trade hub situated at the boundary between the central highlands and Gulf Coast regions. This paper reports on the site's chert lithic assemblage and presents the results of a technological attribute analysis of a sample of 9,942 of the artifacts recovered during the 1996-1998 field seasons. Our analysis demonstrates that chert knapping at Chalcatzingo was expedient but also surprisingly intensive. We found that (1) retouched tools are quite rare; (2) core reduction strategies are universally informal; (3) cores are generally exhausted; (4) the sizes of both cores and flakes are very small; (5) the ratio of flakes to cores is high; (6) the assemblage shows a great deal of striking platform crushing, a high frequency of failed flake removals on cores, and general battering of all stone pieces. We conclude by discussing the implications of these findings for our understanding of Chalcatzingo's patterns of economic organization.

[245] *Bunny Or Bison: A Comparative Study of Faunal Material in the Casas Grandes World*

Faunal material has been recovered throughout the Casas Grandes world, from the cultural center of Paquime to the borderlands sites of Joyce Wells and 76 Draw. This study aims to compare the faunal assemblages of several Casas Grandes related sites to examine patterns of faunal utilization through time and space. Our results demonstrate that sites closer to Paquime (including Paquime itself) tend to have a more diverse faunal assemblage as well as having a higher percentage of high-ranked mammals than sites located in the periphery. Birds are also more common in the Casas Grandes core zone, which may indicate a higher focus on aviculture, a key characteristic of Paquime. Outlying Animas phase sites, such as 76 Draw, show a faunal assemblage more characteristic of local resource acquisition. We discuss the implications of our results for Casas Grandes ecology, subsistence, and human-environmental interactions.

McCleary, Alexandra (University of California, Berkeley)

[15] *New Insights at the Intersection of Historical Archaeology and the Archaeology of Religion*

An increasing number of archaeologists are arguing against the separation of ritual and religion as separate fields of study, favoring pragmatic combinations of theoretical criteria to advance more holistic understandings of the theory and practice of religion. Advancements in the archaeological study of religion have been spearheaded by archaeologists of ancient and pre-historic societies. In this paper, I will outline the potential contributions of historical archaeology to anthropological understandings of religion. This includes the robust use of multiples lines of evidence, community oriented archaeological practice, and post-colonially informed analyses of agentive practices and the formation of shared identities. In addition to examining recent interactions between historical archaeology and the study of religion, this talk will suggest a groundwork for developing a historical archaeology of religion, and in turn, what the study of religion can contribute to historical archaeology from the perspective of identity practice and social theory.

[141] *Geoarchaeological and Environmental Studies in the Basin of Mexico*

Environmental studies associated with prehispanic settlements in the Basin of Mexico were originally focused on studies of agricultural potential and productivity, based on ethnographic assessments of essentially modern conditions. However, archaeologists were limited in their access to techniques developed in earth and biological sciences. Niederberger's research at Zohapilco in the southern Basin represents one of the earliest "geoarchaeological" approaches in which a concerted effort was

made to combine diverse paleoenvironmental studies with traditional archaeological excavation. However, similar investigations are infrequent in the region. The urban sprawl of Mexico City and adjacent political entities threatens archaeological evidence, particularly related to preceramic and Formative period occupations. This presentation summarizes some of the early studies that provide the background to new approaches to the recovery of evidence for prehispanic environmental conditions in the Basin to set the stage for more recent work that builds on new methodological approaches and techniques.

[162] *Oxygen and Carbon Isotope Chemistry and Maize Beer Consumption in the Prehistoric Andes: An Experimental Pilot Study*

The consumption of alcohol in prehistory is a much-studied subject, largely because alcoholic beverages were often central to social engagement, and the organization of many political, economic and religious institutions. While the role of alcohol is known to have been an important component of many societies, the ability to recognize alcohol in prehistoric contexts has proven difficult. As a result of this, many authors investigating alcohol in prehistory have used indirect indicators such as ethnohistoric, ceramic, and dietary analyses to reconstruct consumption patterns. In an attempt to produce a more direct method, the authors conducted a series of stable isotope analyses with the goal of establishing whether certain isotope values indicate the existence of maize based alcohol. This poster describes the results of this pilot study, and reveals a potential oxygen isotope chemical signature for maize beer. Our data indicate that the light ^{16}O isotope is preferentially represented in the CO_2 formed during fermentation. Thus, the resulting beverage is more ^{18}O enriched than the local water source. While this method is geared towards recognizing maize beer, it may be that similar analyses can yield insights into the recognition of non-maize based alcoholic beverages from an array of global contexts.

McCormick, Sarah (New Mexico State University)

[139] *Manufacturing Basketmaker III Bone Objects*

Bone tools are an important component in the study of the archaeological record worldwide. They have become especially useful in the study of perishable objects. This is because they are one of the few preserved items left behind that were required for processes such as weaving, and leatherworking. This research seeks to identify and replicate the manufacturing techniques required to produce a selection of bone objects that were found at the Dillard and Switchback sites, which are from the Basketmaker III time period in the Mesa Verde region of the United States. The excavations at the Dillard and Switchback sites yielded a variety of sizes and styles of bone awls, scrapers, and tubes. I have chosen a selection of the most complete and identifiable specimens to replicate in this study. Duplication of these tools will be as close as possible to the archaeological sample. This will include decisions of size, shape, taxa, manufacturing technique and anatomical element. The goal of this replication experiment is to shed light on the manufacturing process that was used by the Basketmaker III people in this area.

[287] *Spatial Technology and the Search for Archaic State Society in the Hawaiian Islands*

Architecture holds a special place in archaeological reconstructions of past societies. I discuss how advances in the application of spatial technology in the study of architecture in the Hawaiian Islands

has put us in a better position to describe how the creation of an archaic state society shaped this all-important material indicator of social change. I draw upon forms that are commonplace – house complexes, fields, and small temples and shrines – as well as less common classes of architecture more likely to be found at royal centers, such as monumental scaled religious architecture, massive walls used to define specialized precincts, and public venues built for sports and ceremonies. Recording architectural remains continues to begin with traditional field survey, which has been joined by high precision GPS, laser scanning, and the use of spatial data from previous surveys and historic era maps, as well as increasing use of data derived from remote sensing and predictive modelling. The cumulative effects of the application of spatial technology are already being felt in how we look at emic classifications of architecture in archaeology, investigate cultural traditions first recorded at the time of European contact, and identify the pervasiveness of state power.

[325] *Pre-Conflict Planning for Cultural Property Protection in the Event of Armed Conflict*

One way to limit the amount of damage done to cultural property during armed conflict is to work within the international framework developed by the 1954 Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict. This international treaty requires its signatories to develop processes to protect cultural properties including significant archaeological sites and monuments. One way to lessen the likelihood of damage to cultural properties is to have the discussions about what is significant, what data would military planners need to add cultural property to a "No Strike list," and how would one get that data to the appropriate place in the military structure. In the recent past lists of cultural property were developed in an ad hoc manner. In my presentation, I will lay out the international framework created by the 1954 Hague Convention and discuss recent efforts of academics, heritage managers, and military members to lessen the effects of armed conflict on cultural property.

McDaniel, Heather

[27] *Ethical Consumption and Archaeological Ethics: A Case Study in the Responsible Treatment of Cultural Collections and the Resulting Lessons Learned*

The backlog of curated archaeological collections can be overwhelming; and the notion of taking on another's "work" can seem very daunting and at times, considering who the "other" might be, downright intimidating. So many variables add to the challenge of assuming the responsibility of a curated collection, but they also offer great potential for personal, academic and professional growth. It is the prospect, after all, of finding the missing piece to the puzzle and making sense of the conundrum of artifacts, field notes and the like that motivates us as archaeologists. This presentation will focus on one budding archaeologist's experience with a significant site, deliberated by an impressive assemblage of established archaeologists, and a resulting collection which had sat dormant for over 30 years – the Burton Mound collection of CA-SBA-28. In retrospect, the capabilities gleaned from conducting research on an existing collection have proven invaluable and stretch far past just the scholarly familiarity which would be expected. The opportunity to follow in the proverbial footsteps of an esteemed archaeologist and to employ his former research as a blueprint for future examination has provided invaluable lessons that the presenter hopes will inspire others to consider doing the same.

McDonald, Erin (University at Buffalo)

[63] *Re-use and Recycle: The Various Lives of Prehistoric Monuments*

There are innumerable examples throughout prehistory (and history) of ancient monuments repurposed for a variety of reasons, such as the legitimization of power, land ownership and ancestry,

among others. Today, many people, in particular Neo-Pagans, attempt to identify with past peoples and to incorporate ancient sites into their modern day religious beliefs. Although not inherently bad, interpretations of ancient sites through a Neo-Pagan lens tend to gloss over archaeological evidence and interpretations of sites. In recent years, a greater emphasis on multivocality has emerged, and the question of how to incorporate modern people's beliefs about prehistoric monuments into site interpretations and presentation to the public has arisen. If prehistoric communities reinterpreted and re-used monuments built by previous generations, then can Neo-Pagans' understanding of those same monuments be viewed as just another iteration of a practice that has existed for thousands of years? Using case studies from Britain and Ireland, this paper explores modern people's (including archaeologists') relationships with past peoples and monuments, how such relationships help and hurt the preservation of sites and knowledge, and what the implications are for how past societies may have used and understood the ancient monuments in their own landscape.

[138] *Volcanic Tableland Rock Art: Research and Management in the Western Great Basin*

The Volcanic Tableland north of Bishop, California has been the focus of significant previous research (e.g. Bettinger, Basgall, Giambastiani), which has been mobilized by proactive BLM Archaeologists (E. Levy, K. Halford, and G. Haverstock) to generate a predictive model for managing cultural sensitivity against recreational impacts. Further innovation has been the use of specialized rock art recorders (represented by Western Rock Art Research) to document the petroglyphs and petroglyphs of this important GB style province. This paper presents the results of collaborative research building on earlier research, modeling and intensive recording to present a new interpretive layer for rock art in the predictive model. It shows the importance of rock art researchers, specialists and land-managers working together to achieve a better understanding of the heritage resource.

McDougle, Alexandra (University of Hawaii at Manoa) and Adam Lauer (University of Hawaii at Manoa)

[205] *Ifugao Neonate and Infant Oral Health*

The Ifugao Archaeological Project (IAP) seeks to develop a holistic understanding of the peoples of the Philippine Cordillera, specifically the biocultural adaptations to colonizing forces and environmental change. Presently relatively little is known about dental development and its relationship to long bone growth given that current evidence regarding prehistoric Ifugao neonate and infant health is scarce. This study examines a dental sample from 15 neonate and infant skeletons excavated during the 2013 IAP field season and seeks to address the process, significance and methodological problems associated with the analysis of dental remains in an archaeological context. This research provides a better understanding of Ifugao sub-adult health and encourages future researchers to include sub-adult dental analysis as a basis for understanding population health in general. Subadult Dental analysis is of particular importance given the present day gaps in subadult focused research as well as our lack of understanding of health in during colonization and environmental transitions. This poster will examine neonate and infant dental health to address some of these underdeveloped research questions by providing information about the health of the Ifugao. This research contributes to a greater understanding of the bio-archaeological record of Island Southeast Asia.

[153] *Framing the "Ethnoarchaeological" Other: The Direct Historical Approach in Victorian Bible Customs Books*

One of the most popular genres of late-Victorian literature was the Bible Customs book. Often written by missionaries who had lived in Palestine for years, these books were intended to help illuminate the Bible based on observations of the flora, fauna, topography, and especially of the people living in the land in the 19th century. Organized according to subject or by Biblical verse, these books presupposed a connection between the people of Biblical times and 19th-century Palestine. In these books, a form of "ethnographic analogy" was used to better understand Biblical passages and reconstruct the ancient cultural practices of the region. This paper explores the ways that analogies derived from (amateur) ethnographic observation helped missionaries interpret a Biblical past. Whereas most Near Eastern ethnoarchaeologists were inspired by Jesse Fewkes's direct historical approach in the Americas, the widespread popularity of these Biblical studies (some of which were amongst the best-selling books of the 19th century) suggests that they may also have been influential antecedents for the analogical reasoning now used in archaeology. We compare the use of analogy in this Victorian literature with a sample of contemporary ethnoarchaeological approaches.

McGill, Kendall

[7] *Geospatial Analysis of Cedar Mesa Settlement Patterns*

Settlement pattern analyses published by Matson, Lipe, and Haase (1988) contributed basic understandings of the distribution of the many small dispersed sites in the Cedar Mesa area of SE Utah, and of the environmental factors that influenced these settlement behaviors. This project applies geographic information systems (GIS) and remote sensing techniques to supplement their settlement pattern study and gain additional insight into Ancestral Pueblo occupation of the region. Processing and analyzing satellite imagery produced maps of individual environmental characteristics believed to be influential in site selection. Overlaying resulting maps with archaeological site data discerned associations between environmental factors and site location. Using combinations of maps and locations of necessities (e.g. water source), a cost-path analysis identified favorable settlement regions. Future comparison of the cost-path output and recorded site locations will serve as the foundation for developing a predictive model of site locations on Cedar Mesa.

McGill, Dru (Indiana University)

[173] *Standardization and Variability of Decorated and Undecorated Pottery Vessels from Angel Mounds, Indiana*

At the Mississippian site of Angel Mounds (12Vg1), people crafted both plain, utilitarian-appearing vessels, and a variety of highly decorated wares, including Negative Painted plates that are frequently associated with the site. Previous researchers have suggested that Negative Painted vessels were made by ceramic or ritual specialists, who were perhaps sponsored by a chief or other elite individual. These decorated vessels are indeed rare at Angel Mounds, but no evidence has been found to suggest they were made in workshops or in elite-controlled areas such as on mound surfaces. Standardization (as seen in the lack of diversity of manufacturing attributes) is a form of indirect evidence archaeologists frequently use to evaluate production type and degree of specialization or skill of the producer, with the assumption that specialized potters develop skill over their lifetimes, and their products thus become more standardized in appearance than those made by non-specialists. In this paper, I present results of a recent study examining the variability of several vessel manufacturing variables across whole undecorated and decorated vessels from Angel Mounds. The goal of this research was to address the question: are decorated pots more standardized within and between vessels than undecorated pots at Angel Mounds?

McGillivray, Tegan and Nam Kim (University of Wisconsin-Madison)**[286]** *The Environmental History of Settlement at Co Loa, Vietnam: A Preliminary Pollen Sequence*

Co Loa is a 600ha Iron Age settlement located in the Red River Delta of northern Vietnam. Recent excavations of the three earthen ramparts at Co Loa are illuminating the processes of site construction begun during the Dongson cultural period (600 B.C.-A.D. 200). The scale and organization of these efforts reflect a highly centralized and institutionalized authority; however, little is known about the nature of settlement and urban form. Using preliminary palynological data from cores and excavation, this paper explores the environmental history of Co Loa at different phases of its construction. These data have implications for understanding the impact of settlement construction and associated changes in landscape transformation for activities such as agricultural production at the site through the first centuries A.D. The findings can also provide insights into patterns of urbanism within the wider region.

McGovern, Thomas**[351]** *Hard times at Hofstaðir Iceland: Medieval Climate Impact and Cultural Responses*

In 1257, a major volcanic eruption in modern Indonesia produced rapid cooling in the North Atlantic region, and multiple climate proxies indicate the onset of a summer sea ice in the Denmark Strait and northern Iceland. Zooarchaeological and paleoclimate research has documented the impacts of summer sea ice onset in the Norse Greenlandic settlements (Ogilvie et al. 2009), and documentary sources from Iceland report weather-related famine in the 1270's. An archaeofauna excavated in 2011 from the site of Hofstaðir in N Iceland dated to ca. 1275-1300 by artifacts, AMS C14, and volcanic tephra may reflect a "hard times" signature in the unusually complete processing of bone fragments and apparent slaughter of the farm's dog pack and cat. Despite its location 60 km inland, the same deposit showed a concentration of harp seal probably taken on the newly arrived sea ice. During later centuries, communal harp seal hunting on the sea ice in Northern Iceland provided a major supplement to farming and fishing, representing an adaptive response to climate impact. The Hofstaðir late 13th century archaeofauna may thus document both climate impact and ultimately successful human adaptive response to the onset of the LIA.

McGrath, James (University of Iowa)**[356]** *Late Holocene Occupations at the Pinnacle Point Shell Midden Complex*

Surveys identified a series of Holocene Later Stone Age shell middens along the westernmost extent of the Pinnacle Point estate near Mossel Bay, Western Cape, South Africa. Excavations during 2006 and 2007 revealed a well-preserved record of human activity ranging from 3000 ± 75 BP to 890 ± 30 BP across six spatially and temporally distinct shell middens. Dubbed Areas 1 - 4 of the Pinnacle Point Shell Midden Complex (PPSMC), each midden presents a picture of human subsistence patterns that varies through time. Area 3, the youngest and most extensively excavated of the middens, displays a stone-lined, heat-retaining earth oven, extensive spatial patterning, and the presence of pottery. When compared against the other, older, shell midden complex occupations, Area 3 provides a unique opportunity to examine changes in subsistence patterns through the introduction of pastoralism into the southern coast of Africa. As a whole, the PPSMC represents some of the youngest Stone Age occupations within the archaeological record of Pinnacle Point.

McGuire, Randall (Binghamton University)

- [348]** *Of Braudel & Beams: How Tree-ring Dating Enables the Study of Transformative Social Changes in the Ancient Southwest U.S.*

Fernand Braudel said, "History may be divided into three movements: what moves rapidly, what moves slowly and what appears not to move at all." Archaeologists gravitate towards the *longue durée*—cultural continuities and traditions—but our most important questions have traditionally focused on transformative changes such as the rise of the state, the collapse of empires, or the origins of agriculture. Armed with imprecise dating methods, archaeologists have tended to view transformative changes as events, for which we then struggle to identify prime movers or causes. Chronological precision, however, allows us to study the past at the scale of lifetimes and generations, allowing us to understand how qualitative transformations unfold in multiple dimensions. We illustrate our point with a case study from Aztec—a monumental Chacoan complex in the Southwest United States. Earl Morris originally used stratigraphic dating to argue for rapid change at Aztec—an early "Chacoan" followed by a later "Mesa Verdean" occupation. Today, hundreds of tree-ring dates allow archaeologists to see nuanced shifts over several generations at Aztec. Chacoan building ideas were initiated by colonists, carried forward by the next generation, and ultimately translated into the McElmo style as part of a qualitative social transformation.

- [397]** *A Comparative Study of the Barn Owl (Tyto Alba) Pellet Taphonomic Signature Across Regions: Implications for Paleoenvironmental Reconstructions in Archaeological Sites.*

Barn owls (*Tyto alba*) are the most common accumulators of micromammal assemblages in archaeological sites. These assemblages have been shown to be a good proxy for local environments and thus, for paleoecological reconstructions. Previous research assumed all comparative samples of micromammal assemblages from barn owl pellets have a taphonomically similar signature. Surprisingly, this has never been tested; thus, reducing the overall robusticity of current paleoenvironmental reconstructions. This study proposes to systematically test these assumptions by comparing the taphonomic signatures of micromammal assemblages accumulated by Barn Owls from northern Israel, South Africa, southwestern United States, and augmented with data from the literature. All bones were observed through an S8 APO Stereomicroscope and, a sample through a backscatter electron microscope (BSE). Variables included digestion and post regurgitation processes of weathering, fragmentation and abrasion. Preliminary results suggest that differences between barn owl assemblages from different regions are minimal. These results indicate that the taphonomic pattern of micromammal assemblages from barn owl pellets can be used as a modern comparison in archaeological studies regardless of their geographic origin and provide useful methodological information for conducting paleoecological studies in archaeological sites.

- [130]** *Bird and Fish Remains from Isla Cilvituk: Evidence of Ecological and Market Niche Construction in a Postclassic Maya Lacustrine Environment*

The archaeofauna of Isla Cilvituk, a Postclassic (A.D. 900-1520) Maya site in the state of Campeche, Mexico, offers a unique opportunity to understand differential subsistence and economic strategies across the Postclassic Yucatan. With significant ecological diversity found throughout the peninsula, the production of empirical data from the zooarchaeological record can provide a contextual framework through which the evolution of prehistoric human behavioral ecology may be interpreted in terms of resilience following the so called "Maya Collapse."

In this paper, the archaeofauna assemblage of the inland lacustrine site of Isla Cilvituk is compared to Mayapan and the Postclassic settlements on Cozumel Island. As these three sites are located in

various ecological regions, an account of relative taxonomic abundance across sites will provide context for how people at Isla Cilvituk, Mayapan, and Cozumel utilized their local environments and related faunal resources to sustain daily life and participate in market exchange. Such comparison can highlight differential market niche construction strategies across the Maya landscape. People across the Maya region likely extracted commodities specific to their local ecosystems as a way to remain socially, politically, and economically relevant during the Postclassic.

[350] *Living Systems of Raised-Field Agriculture in Africa: What Can They Tell Us About Precolumbian Systems in the Neotropics?*

The study of precolumbian raised-field agriculture is marked by several unresolved questions: How did raised fields function as agroecosystems? Were they cultivated continuously or were fallow periods incorporated? What population densities did they support? Did making and managing raised-field landscapes require top-down control in a hierarchical society (or supervision by specialists)? Can raised-field agriculture play any role in reconciling food production and ecosystem services in wetlands today? Attempts to answer these questions have drawn on three main kinds of data: geoarchaeological data; information on rare surviving systems such as the chinampas, probably atypical; and information from experiments in rehabilitated raised fields. Living African systems provide new kinds of data. Forty years ago Denevan and Turner drew attention to extant raised-field agricultural systems in the Old World tropics. However, there has been no sustained attempt to use these living systems as mirrors on the past. We present data from ongoing studies of extant raised-field agriculture in seasonal wetlands of the Bangweulu Basin in Zambia and the cuvette of the Congo. These studies are providing information pertinent to unresolved questions surrounding precolumbian raised-field agriculture in the neotropics and the agronomic potential of this technique in the past, now and in the future.

[413] *Wild Cane Cay, Southern Belize: Major Classic to Postclassic Maya Trading Port*

A natural harbor, strategic location in the mouth of a navigable river and opposite the Paynes Creek salt works, Wild Cane Cay developed from a fishing village in the Early Classic (A.D. 300-600) to a major trading port from the Late Classic (A.D. 600-900) through the Postclassic (A.D. 900-1500). As skilled mariners, the Wild Cane Cay Maya were familiar with the shoals, storms, and other hazards of the sea, as well as the endless opportunities for travel on the sea. During the Classic period, sea trade along the Yucatan brought jadeite and other greenstones, obsidian and pottery from the Maya highlands of Guatemala, the Rio Motagua, and from Honduras, visible on a clear day. Wild Cane Cay likely brokered the inland trade of marine resources, including salt from the Paynes Creek salt works, as well as jadeite, obsidian, and other resources from sea trade. With the abandonment of nearly all inland cities at the end of the Classic period, the Paynes Creek salt works were abandoned. The mercantile Maya on Wild Cane Cay took advantage of emerging polities in the northern Maya lowlands, the expansion of circum-Yucatan sea trade, and expanded their repertoire of goods from nearby and distant sources.

McLay, Eric (University of Victoria)**[152]** *Ancient Clam Gardens of the Southern Gulf Islands*

Clam Gardens of the Southern Gulf Islands and southeastern Vancouver Island, British Columbia

This paper describes a comprehensive, five-year archaeological project to identify and document the location of ancient intertidal clam garden features in the Southern Gulf Islands and southeastern Vancouver Island, British Columbia. It was discovered that clam gardens in the Southern Gulf Islands region were extensive, exhibited clear patterning in location and morphology, and were monumental in size, several reaching over a kilometer in length. These rock-walled landscapes, however, are visible only at the lowest zero tides of the year, which likely attests to their antiquity relative to regional sea level rise. Their location and size suggest large-scale community works. While current resource management literature emphasizes food scarcity, the sheer size and scale of clam gardens in this key archaeological region points towards economic interests in food production for surplus, regional trade and exchange. The discovery of these intertidal landscapes transforms our normative understanding of “seasonal” settlement activity in the Southern Gulf Islands to reframe the islands as a center for past shellfish and marine-oriented economic production on the Northwest Coast.

McLeod, Christopher (Toby) (Sacred Land Film Project)**[30]** *Standing on Sacred Ground*

In 40 years of filmmaking, I have explored indigenous peoples' relationship to sacred places threatened by extractive industries spawned by a culture that values profiting, owning and collecting material artifacts of great worth. Archaeology – like filmmaking – has evolved in the last 40 years to include the concerns and perspectives of cultures all over the world, including indigenous people. Previous methods labeled Euro-centric, racist or exclusionary have been intensively questioned. If the earth is sacred, if a place is sacred, if a burial is sacred, digging and extracting are considered desecration by many vocal critics. If a ceremony is sacred, many native people feel filming the ceremony is sacrilege. There are now many archaeologists and filmmakers raised in indigenous traditions, and many “outsiders” who have worked with indigenous communities and built trust over decades. The dialogue about what is sacred, what should be respected and left alone, is one of the most important conversations on the planet. Understanding sacred places, apologizing for past injustices, recognition of history and pursuit of reconciliation will heal, restore balance and move us all forward on a better path.

McManamon, Francis (Center for Digital Antiquity)**[123]** *Best Practices for Good Digital Curation*

Archaeology is awash in digital data. Archaeologists generate large numbers of digital files in their field, laboratory, and records investigations. We use digital mapping, digital photography, digital means of data analysis, and our reports are drafted and produced digitally. Good curation of digital data provides easy means by which it can be discovered and accessed, as well as ensuring that it is

preserved for future uses. In many ways the planning for and carrying out good digital involves similar steps as does good curation of artifacts, samples, and paper records, however, the digital techniques are different. We summarize best practices in this emerging part of archaeology with real world examples.

[186] *Signatures of Human Occupation in Amazonian Soils*

The extent and intensity of precolumbian human impacts on Amazonian forests have remained important topics of debate for decades. Traditional views of precolumbian Amazonia as a 'pristine forest' have recently been replaced by predictions of vibrant cultures frequently scattered across the Basin. A primary form of evidence for the latter includes the presence of terra preta soils, which are nutrient-enriched anthrosols that were formed in prehistory. Archaeological and paleoecological investigations are typically site-specific, but soil phytoliths and charcoal can be analyzed from any point across the ~6 million km² tract of Amazonian forest. Here, we use both proxies to reconstruct fire and vegetation changes from sites with known precolumbian human occupations (terra preta sites). We compare these data with previously published soil charcoal and phytolith data from sites with no known or unknown occupation histories. The terra preta sites contained large amounts of charcoal, and phytolith assemblages were dominated by palm taxa. These results corroborated previous findings in areas with lesser human impacts, which contained less charcoal and were dominated by forest taxa (not palms). These comparisons will allow us to calibrate charcoal and phytolith signatures along a gradient of ancient human impacts.

[90] *I Can See Clearly Now!: Successfully Implementing Visual Analysis into Cultural Resource Management Projects*

Visual analysis is one method used to assess indirect effects of an undertaking on cultural resources that are eligible or potentially eligible for the National Register. Viewshed analysis is commonly used to implement the visual analysis; however, to accurately assess the indirect effect, the overall scope of a project must be tied to the project activities. Perspective analysis can be used to determine the project's visibility distance, or the maximum distance at which project activities are discernible by the human eye. Using perspective analysis combined with viewshed analysis, it is possible to determine the extent to which project activities are visible more accurately than just calculating viewsheds. Data generated from viewshed and perspective analysis can then be used to in visual simulations to represent the indirect effects. This presentation will discuss several case studies where visual analysis was used to assess the indirect effects of a project on cultural resources.

[121] *Color Signature Analysis: A New Refitting Method*

Although the analytical worth of lithic refitting is rarely disputed, it is widely acknowledged that the technique is time- and labor- expensive. This project describes a new method aimed at improving the efficiency and efficacy of refitting studies by using color scanning technology to capture the discrete color signatures of individual lithic artifacts. This technique allows an assemblage to be digitally and objectively divided into small color-based raw material units (RMUs) that have a high probability of

containing potential refits. Two purpose-built software programs are employed within the project - an iOS application that works in conjunction with color scanning hardware to rapidly and accurately collect data, and a Windows.NET application built to test the viability of the technique. These applications are used in conjunction with a relatively inexpensive and portable chroma-meter (NODE+ Chroma 1.2). Whilst the technique aims primarily to facilitate refitting studies, this study also demonstrates the continuing value of incorporating new and innovative technologies within the archaeological analytical sphere.

McNeil, Cameron (Lehman College, CUNY)

[366] *Identity on the Edge of the Kingdom: The Artifacts, Residences, and Ritual Areas of Río Amarillo, Copan*

Excavations at the site of Río Amarillo, an ancient Maya town, reveal a community with complex affiliations influenced by the waxing and waning of Copan's power. While seemingly autonomous during the Early Classic period, the Late Classic inhabitants of Río Amarillo's ritual core from the time of Ruler 12 through the reign of Ruler 16 embraced important aspects of the ideology and identity of the Maya city of Copan. These affiliations extended to an elite residential sector where a censer with a lid in the form of K'inich Yax K'uk' Mo', the first Copan Maya king, was uncovered. The Late Classic contexts contain a mixture of Ulua polychrome and Copador ceramics echoing similar patterns found in Copan's ancient center. With the breakdown of the political structure of the southern Lowland Maya cities, including Copan, the inhabitants of Río Amarillo, concentrated their settlement in higher areas, and returned to a reliance on predominantly locally-produced ceramics while continuing to trade for goods from El Salvador, highland Mexico, and the interior of Honduras.

[105] *Increase Rituals and Risk Management on the Precarious Small Sandy Cays of Central Torres Strait*

The Kulkalgal of central Torres Strait are marine specialists who established a series of viable hunter-horticultural communities on small sandy cays highly vulnerable to seasonal drought and associated water and plant food shortages. Here risk management strategies focused on the well-known buffering mechanisms of high mobility, translocation, food and water storage, and plant food importation. However, for the Kulkalgal, risk management strategies for survival also involved a broad range of ritual practices aimed not only at increasing the material productivity of key terrestrial resources but also maintaining social organizational structures underpinning more secular buffering mechanisms. Many of these ritual practices centered on specialized shrines marked by clusters of human skulls, marine mammal bones, large marine shells, and imported cobbles. This paper documents these shrines and develops a theoretical and methodological framework to document the form, function and developmental history of these shrines.

[247] *Pre-Inka and Inka (A.D. 1000-1500) Agriculture in the Atacama Puna. Evidences through Microfossils Attached to Lithic Hoes*

This research is part of the ongoing Conicyt-NSF project "Water Management and Agrohydraulic Systems in Desert Environments: The Upper Loa from A.D. 1000–1500". Complex irrigation systems and extensive terraces are silent testimony to the outstanding achievement of these agricultural societies in a highly arid and extreme environment. Within an interdisciplinary framework, archaeobotanical analyses are providing preliminary and novel information about the crops that were

planted during Pre-Inka and Inka times in two sites: Panire and Topain. Residue analyses have been done for hoes collected on the surfaces of the terraces and farm fields. Pilot screenings reveal a dense presence of starch grains, whose characteristics resemble highland tubers: *Oxalis tuberosum*, *Tropaeolum tuberosum*, *Ullucus tuberosum* and/or potential varieties of *Solanum tuberosum*. The lack of non-indigenous evidence on these sites and their extreme isolation argues against contamination. Future work is aimed towards further discriminating the taxonomy of these archaeological starch grains. These findings contribute to a better understanding of the local prehistory, and the impact that the Inkas produced in the local economy. They also allow us to begin to understand local agroecological practices, which today have practically vanished due to desertification and urban migration.

Means, Bernard (Virtual Curation Laboratory)

[124] *Bring Out Your Dead: Pondering Passenger Pigeons (and Projectile Points) While Building Digital Type Collections at the Virtual Curation Laboratory*

With support from the Department of Defense's Legacy Program, I am working with undergraduate students in the Virtual Curation Laboratory to create digital type collections of chipped stone tools and zooarchaeological elements. These efforts include scanning stone tools from classic projectile point guides at the New York State Museum (Ritchie's "Typology and Nomenclature of New York Projectile Points") and the Research Laboratories of Archaeology at UNC-Chapel Hill (Coe's "Formative Cultures of the North Carolina Piedmont"). The zooarchaeological type collection includes a wide range of animals, with special attention paid to the passenger pigeon--a species that "celebrated" the 100th anniversary of its extinction in September 2014. Most of our zooarchaeological efforts have drawn on the extensive collections of the Virginia Museum of Natural History, with a few elements provided by the Smithsonian Institution's National Museum of Natural History. These 3D digital type collections enable more accurate and faster identification of archaeological items. 3D replicas printed from the digital models are well suited to creating physical type collections, for incorporation into K-12 and undergraduate education, and for integration into public outreach efforts. The generation of 3D models and printed replicas also encourages co-creation projects by undergraduates working in the Virtual Curation Laboratory.

Meanwell, Jennifer (MIT)

[25] *Function-Based Processing Decisions in the Middle Balsas Region of Guerrero, Mexico*

Petrography has long been recognized as a powerful way to understand pottery provenience and production decisions. Despite this, few studies focus on production decisions made by potters working in a single community, especially potters who practice household-level production. In this paper, I investigate decisions made by potters at the site of La Queseria, Guerrero, Mexico during the Classic Period (A.D. 200-900). Petrographic analysis of their vessels suggests that two major clay sources were utilized for production at this site and chemical sourcing techniques confirm that the fabrics identified in thin section are distinct enough to be distinguished using multi-variate statistics. Despite this, vessels of various shapes and functions were produced from both sources over at least 1000 years of occupation at the site, suggesting an enduring potting tradition. Data gleaned from ethnographic interviews of modern potters in the area, experimental reconstructions, and analysis of replica test bricks have allowed us to reconstruct many aspects of this ancient technology, including forming techniques, firing temperatures, and likely properties of the finished vessels. This case study demonstrates that the Middle Balsas potters developed a production tradition that performed adequately and was passed on practically unaltered for the next thousand years.

Medrano, Angélica María**[81]** *The Caxcans of Nueva Galicia, Nahuatl Warriors of the Northern Mesoamerican Frontier*

When the Spanish entered northwest Mexico in 1529 they confronted a bellicose people, the Caxcans, occupying numerous settlements in the southeastern drainages of the Sierra Madre Occidental, los Altos of Jalisco and Zacatecas. The Caxcans—ethnically and culturally related to Nahuatl-speaking groups of Central Mexico, including the Mexica—were one of the northernmost Mesoamerican cultures in sixteenth-century New Spain. Data from recent investigations are presented, clarifying the position of the Caxcan people in the cultural geography of Mexico before and during the Conquest era, and the significance of their interactions with the Spanish as the frontier rebellion known as the Mixtón War of 1541-42 erupted.

Meehan, Pascale (Université de Montréal) and Rachel Egan (University of Colorado-Boulder)**[153]** *Ethnohistory, Oral Tradition, and Archaeology: Examples from Oaxaca, Mexico and the Four Corners Region of the United States*

Increasingly, archaeologists recognize the value of oral tradition and ethnohistorical records in as sources of regional historical knowledge that can contribute to archaeological interpretation. This paper will combine examples from two regions, the Pueblo area of New Mexico and Colorado and the area of Santa Maria Zacatepec, Oaxaca. The section on the Pueblo area will examine how Pueblo oral migration stories and traditional knowledge have directed archaeological investigations and informed interpretations. The information from Oaxaca will discuss oral indigenous Tacuate migration stories in conjunction with 16th century ethnohistorical histories. Both these examples explore how oral tradition and ethnohistorical sources have the potential to add to our insight of indigenous understandings of the past as well as inform on potential avenues for future archaeological study.

The Shetland Islands are the northernmost part of Europe where farming was practiced in the Neolithic, between 3800 and 2500 B.C.E. The islands' isolated location coupled with distinct environmental factors resulted in distinctive and localized customs and economies. These are most clearly manifest in the production and distribution of felsite polished stone axes and Shetland knives sourced from linear grey-blue dykes in the elevated North Roe region of the islands. These artifacts are found throughout the islands but never further afield. This paper presents data and some preliminary findings from a project undertaken by University College Dublin School of Archaeology. Geographical information systems form the backbone for storing and viewing the many datasets used in the project. They also facilitate multi-scalar analysis allowing us to explore questions of landscape and environmental interaction at different scales from the regional sourcing of felsite to

individual quarry site morphologies and topographies. This paper will explore some of the work undertaken using GIS, remote sensing and more quantitative analytical techniques including site prediction, exploring economies of movement and transportation and understanding the role of the perceived environment in site situation.

[173] *Mound Summit Archaeology at the Carson Site, Coahoma County, Mississippi*

In 2014, the Carson Mounds Archaeological Project (CMAP) excavated a structure on the summit of Mound D. In addition to a cache of Mississippian chisels, or woodworking tools, excavations revealed several rebuilding episodes associated with this structure. Furthermore, a well-fired and compact earthen floor was discovered underneath the daub fall. This presentation focuses on excavations and findings, radiocarbon dates from the structure and Mound D, and also includes a discussion on thin-section analysis of the structure floor.

Meierhoff, James (University of Illinois at Chicago) and Joel Palka (University of Illinois at Chicago)

[76] *Close to the Edge: 19th Century Maya Refugees at Tikal, Guatemala*

In the second half of the nineteenth century, the ancient Maya city of Tikal, Guatemala, was briefly reoccupied by Yucatec refugees fleeing the Caste War of Yucatan. The Tikal village was poised on the confluence of the frontiers of Mexico, Guatemala and British Honduras, as well as the belligerent Santa Cruz Maya from Yucatan. Despite the limited presence of settled European diasporas in the northern Petén, colonial institutions were still able to reach indigenous communities seeking refuge within the frontier zone. However, due to the positioning of these remote communities, they were well equipped to interact and attempt a renegotiation to outside pressures and markets on their own terms. Communities in the frontier zone had forest products desired in the informal regional exchange spheres, such as game animals, incense, bee's wax, and tobacco. In the case of the Tikal village, the inhabitants exploited the differing conceptual uses of the same space to obtain a wide array of exotic and foreign manufactured goods, including metal tools, guns, and decorated pottery, while seeking a new life and autonomy within the "Last Maya Frontier."

[219] *Postclassic Petén Maya Bow and Arrow Use as Revealed by Immunological Analysis*

The bow and arrow has long been recognized as a key component of weaponry in the Postclassic and Contact period (A.D. 1400–1697) Maya Lowlands. Although fragmentary accounts from Spanish sources exist to complement the archaeological record, no current research has reconstructed use patterns of the bow and arrow from artifact data. This paper provides the first immunologically-based study of protein residues on small projectile points in the Maya region. A large sample of 108 small points from the central Petén lakes region was submitted for cross-over immunoelectrophoresis (CIEP) analysis, resulting in 25 positive matches to available antisera. Immunological positives for human, local fauna, and introduced fauna were identified by this study, indicating a wide range of use activities for the bow and arrow that include subsistence, ritual, and possibly defense.

[338] *The Rebirth Of The Maize God: Contextualizing Burial 37 From El Perú-Waka'*

At the core of the ancient Maya site of El Perú-Waka', Petén, Guatemala, an elaborate burial was discovered inside Structure M12-32 dated to around A.D. 600. The burial contained human remains of a ruler, who probably belonged to the centipede dynasty, known in the past as Wak. The diversity

of artifacts placed with the ruler, including a greenstone mosaic, pyrite mirror, and an alabaster vessel, suggest not only that this person was wealthy, but also asserts the important influence of El Perú with regards to trade in the Southern Maya Lowlands during the end of the sixth century. However, not much was known regarding the significance of this funerary precinct, therefore its meaning was explored through the application of the contextual analysis method, which takes into consideration the arrangement of offerings and the iconographic study of symbols depicted on material culture. The results suggest that the ruler in Burial 37 and the grave goods that accompanied him into the afterlife are narrowly associated to the conception of the world tree, considered the axis mundi in Maya cosmology. Moreover, some of the artifacts could refer to the potential name of this king.

Melgar, Emiliano (Posgrado UNAM)

[346] *The Jewelers of the Palace Crafting for the Gods: The Lapidary Objects and the Development of the Imperial Technological Style*

After the defeat of Azcapotzalco in A.D. 1428, the rulers of Tenochtitlan employed different strategies to recreate and reinforce their identity during the Triple Alliance. One of them was the regional request of master artisans, called tolteca, for working at the Aztec capital. Some of these craftsmen and their workshops were located inside the palaces of the tlatocue. Among them were the jewelers that crafted sacred objects for the gods and prestige goods for the elites. The technological analyses of the lapidary objects from the Great Temple, using experimental archaeology and characterization of the manufacturing traces with SEM; and their comparison across the different constructive stages, allowed us to identify the development of the Tenochcan Imperial Style.

[418] *Publishing Masterclass*

This is a publishing masterclass covering five major aspects of the publishing process: (1) copyright (what it is and what it's for); (2) ethics (plagiarism, fabrication, and falsification; retraction, expression of concern, correction (or erratum)); (3) Open Access and CC licenses: what are the options; (4) Impact Factor and other metrics: what they are, how they are calculated; (5) how to be not just a reviewer but a great reviewer. The topics will of course be relevant for all disciplines and all academic journals, not just those published by a specific publisher. There will be time for questions and discussion, and the participants will choose which modules will be covered.

Melton, Mallory (University of California Santa Barbara)

[109] *Communal Food Processing and Culture Contact: An Analysis of Plant Foods and Architecture in the Protohistoric North Carolina Piedmont*

Communities cannot be fully identified by their built landscapes; they must also be understood in terms of mundane activities that enact communal bonds. In this paper I use plant remains and pit features to examine communal food processing events at two Protohistoric sites in Hillsborough, North Carolina: Wall (A.D. 1400-1600) and Jenrette (A.D. 1650-1680). By combining a functional analysis of features with a spatial analysis of plants, I have identified two types of discard patterns: larger pits filled with staple foods in public space versus smaller pits filled with mostly supplemental foods in domestic space. Based on these analyses, I present evidence of communal processing activities and examine diachronic change in the types of plants processed. In interpreting these data, I consider why certain foods were processed (and perhaps consumed) in communal contexts by women engaged in food production and how changes in communal food processing relates to the destabilizing effects of European contact on Native communities.

Melton, Terry [202] see Boyd, Charles

Melton, Judith (Texas A&M University) and Jesse W. Tune (Texas A&M University)**[220]** *On The Waterfront...Or Not: Investigating the Relationship Between Late Archaic Landuse Patterns and Hafted Biface Curation in the Midsouth*

During the Late Archaic period in the Midsouth United States people appear to have practiced seasonal landuse patterns. Warm weather aggregation sites were located along major rivers in the region, while upland site locations reflect occupations of dispersed populations during colder periods. To understand how people organized biface technology within such a seasonal mobility pattern, we analyzed the relative curation rate of hafted bifaces from multiple sites. Magnolia Valley (40RD314) and Fernvale (40WM51) are both Late Archaic sites in the Harpeth River Watershed in middle Tennessee. Magnolia Valley is located in an upland valley, while Fernvale is located on the South Harpeth River. We predict that the level of biface curation was not constant throughout the year, and thus, biface curation values will vary between site types. With this lithic curation analysis, relationships between locale and technological organization will be identified.

Meltzer, David (Southern Methodist University)**[296]** *What If the Restaurant Isn't at the End of the Universe but in a Much Nicer Place?*

In their 2012 paper, 'The restaurant at the end of the universe,' O'Connell and Allen developed a speculative and far-reaching model for the colonization of Sahul, one that sees initial populations as small, spatially concentrated in scattered 'sweet' spots, and which exhibited only occasional growth spurts and geographic expansion along extant coastlines. Although granting the obvious differences between the environmental stage and historical conditions under which the Pleistocene colonization of Sahul and the Americas took place, their model provides an opportunity to riff on the process (processes?) by which North America may have been colonized in the late Pleistocene; what may have served as triggers for the movement of people across what was arguably a far richer landscape than Sahul, and perhaps at faster rates; and serves as a useful heuristic device for identifying the types and availability of archaeological evidence by which the model can be put to the test.

Menaker, Alexander (University of Texas-Austin)**[393]** *An Archaeological and Historical Inquiry of Andagua, Peru, 1000-1800 A.D.*

This paper outlines developing dissertation research that integrates archaeological and historical evidence about the community of Andagua and the Ayo Valley in the Southern Peruvian Andes. Constructed as a Spanish colonial *reducción*, Andagua resides in a seldom-visited highland area, and today is merely considered a rural, provincial neighbor of Arequipa. Andagua, however, has a striking past evident in the substantial prehispanic remains that surround and lie buried beneath the contemporary town. Andagua and the surrounding valley have not received any systematic attention from archaeologists, while an intriguing court case from the mid-18th century recounts how Spanish officials burned ancestral mummies and attempted to eradicate Andean religious beliefs and practices around Andagua. This paper provides preliminary research of the cultural history of the area along with further exploring the "tensions of empire," and asks, how and why did ancestor veneration and mummy worship continue into the mid-18th century among the colonial Andean community of Andagua, and yet at the same time the Andean community identified as subjects of the king of Spain?

Ménard, Clément [401] see Khalidi, Lamya

Mencos, Elisa (Universidad San Carlos de Guatemala)**[193]** *Conjunto Los Árboles: Its Use*

This paper is about the iconographic analysis of the stucco decoration that is part of the exterior facade of the Joint Trees, which shares certain characteristics with the structure of the site called El Diablo at El Zotz, Guatemala Petén, dated to the Early Classic. Likewise Structure 10L-26, whose different layers constitute constructive states within buildings housing royal tombs, shared

iconography and preservation techniques with El Conjunto Los Árboles. To complement the iconography, the use of the interior of buildings will be analyzed by defining the architecture and decoration. Briefly I will talk about the location of this acropolis in the site, making reference to the northern area where there is a steam bath featuring stucco decoration made with the same technique and colors. The aim is to reconstruct the history of the dynasty at Early Classic Xultun and expand the information expand our knowledge of the lowland dynamics during this time.

Mendelsohn, Rebecca (University at Albany, SUNY)

[151] *New Discoveries in the Izapa "Protoclassic" and Early Classic Periods*

Izapa is best known as a Formative period (850-50 B.C.) monumental center with elaborately carved monuments. The site is also known for its Late Classic period monumental construction in Group F, at the northern end of the site. Considerably less attention has been paid to the transitional Terminal Formative or "Protoclassic" period Hato and Itstapa phases (50 B.C.-A.D. 250), as well as the Early Classic period Jaritas phase (A.D. 250-400), which bridge the temporal gap between these two centers. This paper presents new data from the 2013 excavations of the Izapa Household Archaeology Project and addresses this transitional period. It will summarize the recently refined ceramic chronology for the Hato, Itstapa and Jaritas phases, present new C14 dates, and discuss the interactions between people at Izapa with other regions of Mesoamerica during this time.

[2] *Alero las Quemadas, a Key Site for the Study of Human Occupations of Andean Forest in Patagonia (Aisén, Chile)*

The hunter-gatherer occupation of the Andean forests is a major issue for understanding the variability of human adaptations in Patagonia. The paucity of sites at key locations and the incomplete understanding of the climate-human dynamics undermine the full comprehension of the exploration and colonization of such habitats. We present recent work on Alero Las Quemadas, a rock shelter with occupations starting at 6110 cal BP, currently located in the forest-steppe transition of the Aisén region (44° S). Among other topics, we focus on the site context, geoarchaeology, rock art description, and the study of the lithic assemblage. We compare this record with locally available environment reconstructions of lake sediment cores that characterize the fluctuations of the forest-steppe boundary since the Post Glacial. The results consistently suggest that the main occupations extended between 2430 and 2950 cal BP, a period that fully coincides with the most significant Holocene contraction of forests and the highest frequencies of fire episodes as shown by the analyses of pollen and charcoal particles, respectively. The new results herein presented are discussed within the frame of the archaeological data at other contiguous environments and in relation to the current models of forest occupations. [170] *Afrocolonial Archaeology in Panama: La Villa de Santiago del Príncipe, the First Free African Peoples of the Americas*

The first free African peoples of the Americas were the inhabitants of the town of La Villa de Santiago del Príncipe, founded in 1579 when Don Luis de Mozambique and his followers became the first group of cimarrones (escaped slaves) to negotiate a peace with the Spanish Crown, after decades of what came to be known as the "Cimarron wars". These were a conflict in which cimarrones would predate upon Spanish isthmian trade routes and even support foreign attacks on the mainland. Weary of the fighting, the Crown called upon those cimarrones who wanted peace and granted them a full pardon and their freedom, and after negotiations, also land to settle and goods to trade. Archival documentation and cartography state that Santiago lay not more than one league to

the east of Nombre de Dios, the Caribbean terminal of the Camino Real across the Isthmus. Following these leads, archaeological surveys and test excavations in the area in early 2014 located evidence of a 16th century occupation that due to its location, size, ceramic typology and chronology, we contend is the town of Santiago. We present the documentary and material evidence to support our claims.

[44] *Work and Models of Efficiency in Eighteenth and Nineteenth Century Sugar Factories: A Caribbean Case Study*

Industrial design can increase labor management and mobility, increase efficiency, and structure worker behavior. As the industrial period evolved during the eighteenth century, experiments in factory layouts produced efficient modes of production. But when the labor is enslaved, efficiency cannot always be defined in terms of time or cost. This paper presents the industrial foot-print and spatial design of factories at several sugar plantations spanning over two centuries of operation on a former West Indian British colony. Archaeological investigation of nine factories offers insights into work regulated by confinement, patterned by punishment and managerial surveillance. These were non-negotiable spaces, consciously designed to maintain product quality, a uniform flow of sugar, and the maximization of labor with a whip. Although workers were property, and labor was being perceived as part of the machinery, there was, nonetheless, covert space for individual pride among the skilled who held more power over the final product than plantation owners might have cared to admit. It is hypothesized that changes observable in factory layouts are representative of reconceptualization of the individual, and of space itself, as much as efforts to increase labor efficiency, during a period in which significant societal changes were occurring.

Mennear, David

[299] *Making the Bioarchaeology of Care Methodology Public: Understanding the Roles of Ethics, Communication and Public Engagement in a Novel Approach to Physical Impairment in the Archaeological Record*

This presentation will discuss the public perception and communication of the Bioarchaeology of Care approach and the accompanying Index of Care program. The ethical considerations of the methodology, as an integral feature of working with human skeletal remains, will also be considered and discussed within a consideration of who 'owns' the past and, more specifically, who (if anyone) owns the remains of individuals. In particular it will focus on individuals who are described as disabled, or as physically impaired, in the archaeological record, and who are often only understood through the context of the researchers' own cultural understanding of the nature of disability, and are often only the focus of a case study. Communication and public engagement are burgeoning areas of interest to bioarchaeologists as archaeology seeks to go beyond academic and commercial boundaries. As such, new media methods will be discussed, such as blogging and education outreach, in the context of advertising the methodology for potential researchers and members of the public. Therefore this presentation will focus on the novel open approach that the Bioarchaeology of Care offers by contextualizing the methodology within an academic and public sense, highlighting the importance of recognizing care-giving in an archaeological setting.

[79] *Technological Variability in Ceramics of the Neolithic to Early Bronze Age Transition at Phaistos, Crete: An Integrated Approach*

Since the Final Neolithic, Phaistos hosted consumption events leaving deposits of pottery and animal bones, and was a pottery production location from at least the earlier phases of the Early Bronze Age (EBA). A recent re-examination of this important site has produced not only a Neolithic-EBA sequence unrivalled in Crete, but also a deep understanding of the ceramics, tracing change and continuity over this key time of transition, which some have seen as a transformation with an exogenous origin. In order to investigate change over this time, a substantial program of analysis by thin section petrography, SEM, FTIR and pXRF has been carried out to investigate the dynamics of technological choices made in pottery manufacturing over time and to intertwine that information with the contexts of consumption of the site. By integrating macroscopic observation with an analytical protocol, it aims to reconstruct the operational sequence of pottery manufacture. This is integrated with a recent investigation of raw material availability in the area in the context of major geomorphological transformation. The results present a complex picture of continuity and change in pottery manufacture and their relation to consumption practices and architectural transformation at the site.

[190] *From Kebara to KwaZulu-Natal: Integrating Micromorphology and Mineralogical Analyses in the Study of Diagenesis in Combustion Features*

Since the 1990's, Paul Goldberg's micromorphological analyses at Kebara and Hayonim Caves (Israel) as well as his collaborative efforts to understand chemical diagenesis in caves have served as benchmarks for the high-resolution study of Paleolithic combustion features. This paper highlights the results of micromorphology, Fourier transform infrared (FTIR) microspectroscopy and microscopic x-ray diffraction measurements, which were employed together in order to understand different diagenetic pathways that impacted combustion features at the sites of Sibudu (KwaZulu-Natal, South Africa), Diepkloof Rockshelter (Western Cape, South Africa) and Üçağızlı Cave I (Hatay, Turkey). At Sibudu, phosphate- and sulfate-bearing minerals were identified in the field using portable FTIR analyses of loose sediment samples. The impacts of these minerals on both the physical and chemical preservation of combustion features were addressed using microcontextual analyses. At Diepkloof, mineralogical analyses indicate that burning activities likely impacted secondary sulfate minerals in underlying deposits. Finally, at Üçağızlı Cave I, micromorphological observations of variability in the degree of post-depositional cementation of ashes were corroborated using infrared measurements.

[8] *Combining Geophysics, Photogrammetry, and Archaeological Testing at the Mississippian Pile Mound Site, Upper Cumberland Plateau, Tennessee*

The Pile Mound survey includes magnetometry paired with targeted ground-penetrating radar (GPR), electromagnetic induction (EMI), low-altitude aerial photogrammetry and test excavations over the ca. 6.5 ha site. The EMI survey focused on the mound proper and several distinct magnetometry anomalies to the south and east. The aerial imagery was used to create a photomosaic and digital elevation model (DEM) of the mound and immediate surroundings, and to topographically correct the GPR data. From the GPR survey, we have delineated the location of at least two large rock piles

within the mound. Knowledge of mounds in the Upper Cumberland Plateau is lacking (the closest large excavation occurred at the Croley-Evans sites (15Kx24) mound in Kentucky, some 80 km away), so it is unclear if this is atypical, but this type of mound construction distinguishes it from other Mississippian mounds. In addition, the associated ceramic assemblage appears to reflect more similarity to the East Tennessee Valley rather than the Middle Cumberland region. All together these data provide a unique opportunity to better understand the Mississippian occupation in the Upper Cumberland Plateau of Tennessee.

[249] *Examination of Paleoindian and Archaic Subsistence in Southern Belize*

Recent excavations at Tzib'te Yux, a small rockshelter in Southern Belize, have revealed evidence of human occupation in the area spanning the Paleoindian and Archaic periods. Strata dating to the Late Pliocene contain abundant faunal remains, lithic debitage, and highly fragmentary human remains. Preliminary indicators suggest that a broad spectrum of food resources was exploited including considerable input of lotic protein sources as early as the Late Pliocene with continued exploitation into the Classic Period. Evidence for cooking methods lends insight into the utilization of perishable materials to process food resources. Faunal remains were subjected to stable isotope analysis to examine changes in animal diets and forest structure aimed at evaluating how climate variation over this time period impacts the ecology of the region, as well as to establish some baseline data for diet reconstruction of Paleoindian and Archaic peoples inhabiting lowland tropical wet forest environments.

[300] *Addressing Surface Site Palimpsests with GIS and Lithic Technology*

Archaeologists contend with palimpsests and multicomponent surface sites on a regular basis. Although it is interesting to know that one spot on the landscape repeatedly attracted people, these sites present interpretive and methodological problems. Specifically, how can we interpret the behaviors behind non-diagnostic artifacts from multicomponent sites? In this presentation we discuss using a combination of GIS modeling and lithic analysis to better articulate the relationship between non-diagnostic and diagnostic artifacts. The assumption being that closer spatial relationships and technological consistency indicate a stronger temporal affiliation. Buffering, nearest neighbor, correlation, and correspondence analyses in GIS are used to examine spatial relationships between artifact classes. Technological and morphological attributes of flaked stone assemblages can further differentiate between broad time periods (e.g. Paleoindian, Archaic, and/or Late Prehistoric).

Together these analyses can help to eliminate erroneous associations. We have selected a series of multicomponent lithic scatters with high precision spatial data from the Northern Jornada del Muerto in central New Mexico and the Lake Fork Valley in southwestern Colorado. These sites include numerous Paleoindian, Archaic, and Late Prehistoric projectile points, as well as debitage, scrapers, gravers, bifaces, and other tools that spatially overlap.

[397] *Using a Specimen-Scale Approach and Butchery Traces on the Elbow to Refine Paleoeological Interpretations of Early Stone Age Carnivory*

Assemblage-scale proportions of modified specimens are difficult to link with hominins' early versus late carcass access because fragmentation and other taphonomic processes affect assemblage composition and taphonomic trace visibility. This work advocates butchered specimen interpretation and describes the skeletal location of butchery traces inflicted during the sequence of carcass consumption behaviors. Tool-assisted carcass consumption is divided into early (defleshing limbs), middle (defleshing ribs, vertebrae and head) and late (metapodial tendon removal, element disarticulation, marrow fragmentation) consumption stages. This interpretive model uses actualistic cut mark location and morphology on large mammal elbow specimens to distinguish archaeological defleshing and disarticulation cut marks, which are incised on the elbow during different consumption stages. These observations are integrated with interpretations of other modified specimens to support inferences about hominin and carnivore carcass resource consumption. Three Okote Member zooarchaeological assemblages from Koobi Fora indicate early access to large and small mammal flesh, late stage marrow consumption, and minimal activity from primary and scavenging Carnivorans. Abundant small animal butchery and middle stage resource exploitation stands out at one locality. This corroborates a generalist carnivorous role for *Homo erectus*, who likely hunted small animals, enjoyed early access to large animals, and completely consumed certain carcasses.

[284] *Multibeam Swath Bathymetry for Underwater Archaeological Investigations*

Remote sensing technologies have long played an important role in underwater archaeological survey, and among the most recent (and increasingly used) additions to the toolkit is multibeam swath bathymetry, which operates by transmitting sound beams perpendicular to a research vessel's track and then processing the returned sonar data to produce a three-dimensional image of the sea floor. Multibeam survey can be particularly useful in water bodies where conditions are not conducive to other forms of study such as photography or scuba diver investigation, as is the case for the Hudson River, where hundreds of anomalies likely to be archaeological sites (mostly shipwrecks) have now been mapped. Thanks in part to funding from the National Center for Preservation Technology and Training, our team was able to experiment with three multibeam systems in the Hudson to determine which works best for examining archaeological sites, and to refine the methodology for field survey as well as for data collection, reduction, and interpretation. In many cases, the high resolution multibeam imagery alone allows us to accurately characterize different ship types. Subsequent work has focused on refining the survey protocol and conducting ground truthing with divers on selected sites.

[371] *A classification of Middle Formative (1200 – 800 B.C.E.) Ceramics from Chavin de Huantar*

Recent research has expanded drastically the sample size available for performing ceramic analyses at Chavin de Huantar during the last decade. Initial efforts have showed that the ceramic complexity previously described during the end of the last century has fallen short and that it is necessary to rethink Chavin ceramics in terms of the new data available. In this regard this paper attempts to organize and classify the corpus of ceramics dated from the Middle Formative (1200 – 800 B.C.E.) that came from culturally stratified deposits from the Wacheqsa sector, located immediately at the

north of the monumental core. In this sector two spatial units from the Middle Formative were recorded; one yielded evidence from an early domestic occupation, while the other provided evidence for an early canalization of the Wacheqsa River. A methodological insight is provided as well as the initial results of this classification and their implications in the study or relative chronology for this period in the Central Andes.

[136] *Maya Apocalypse 2012 in the Media: The Cataclysm that Never Was*

December 21, 2012 was supposed to be the Maya apocalypse, the end of the world as we know it. In reality, it was only the end of one Maya calendar cycle of 5122 years -- the end of the 13th Baktun. Even at that, the Maya saw the ending of calendars as a renewal, not an end. But somehow, somewhere this event was interpreted as a coming cataclysm of immense proportion. In the popular press and online, the Maya apocalypse was imminent. How was the coming of this supposed event covered by the press both in the U.S. and elsewhere? Who got it right and who piled misconception upon misconception? What can an event like this tell us about archaeological coverage and how it can go very, very wrong?

[186] *Early Holocene Foraging Strategies in the Eastern United States: A View from Koster*

Over the last several decades, Dolores Piperno has made significant methodological and theoretical contributions to our archaeological understanding of the past. This paper draws on these insights to explore Early Holocene foraging strategies in the Lower Illinois River Valley and how these practices fit within their paleoenvironmental and social contexts. The data presented here offer insights into the long trajectory toward plant domestication in eastern North America and the construction of space and place in the ancient past. Findings from this study emphasize the positive influence Piperno's work has had, and will continue to have, on the archaeological community for decades to come.

[33] *Using Neuroimaging in Archaeology to Investigate Cognitive Evolution*

A big question in cognitive archaeology is whether complex tool-making and language co-evolved in the human lineage. There is considerable overlap in the brain structures that support complex body actions, including pantomiming and tool use, but also making music and using language. The activation of shared brain areas for separate skills is the basis of this popular theory. The aim of this talk is to review some of the difficulties - and possible solutions - to measuring the degree of overlap in neural activation patterns across tasks. Action means motion, but most neuroimaging methods (such as fMRI, which identifies areas in the brain where blood-flow is up-regulated during cognitive processing) require participants to lie still during the scans. We review recent results that correlate blood-flow signatures, obtained using functional Transcranial Doppler Ultrasound, to show how tasks that draw on common networks in the brain cause similar blood-flow patterns. We discuss recent work on multivoxel pattern association that shows how specific mental states or representational content can be decoded from fMRI activity patterns to evaluate whether common tasks draw on common representations. Our talk will give cognitive archaeologists guidance for making the best use of modern neuroimaging techniques.

[62] *Holocene Transformation of San Francisco Bay and Transbay Man Site Stratigraphy*

San Francisco Bay was created by post-glacial sea-level rise during the span of prehistoric human occupation. The Bay is the single largest Pacific estuary in the Americas (4,160 square kilometers) and is the outlet for California's largest freshwater drainage system that carries 40% of the state's runoff. The earliest known evidence of widespread human use of the estuary or tidal resources in the Bay Area first appears at shell midden sites located around the Bay in the middle Holocene (6300-

4600 cal BP). Recently, however, an intact human skeleton ("Transbay Man") was found at an elevation of 12.8 meters (42 feet) below sea level in downtown San Francisco, which is the fourth, and oldest (~7600 cal BP) such skeleton recovered from a submerged context in the region. The stratigraphic sequence and paleoenvironmental context of this rare and unusual find are examined in relation to Holocene sea-level rise and landscape changes that transformed the Bay Area into an ideal place for prehistoric human settlement.

[409] *Utility of Low-Cost Drones to Generate 3D Models of Archaeological Sites from Multisensory Data*

With the emergence of low-cost multicopters on the market, archaeologists have rapidly integrated aerial imaging and photogrammetry with more traditional methods of site documentation. UAVs serve as simple yet transformative tools that can rapidly map archaeological sites with increased efficiency and higher resolution than manual measurements while contextualizing the site within the landscape at costs significantly cheaper than plane-based aerial LIDAR systems. Though structure from motion alone produces excellent results, more sophisticated diagnostic imaging systems must be adapted for low-cost aerial deployment to produce multi-modal datasets. This paper proposes a workflow for selecting sensors appropriate for a given environment and combining different modalities and resolutions of data for improved documentation and analysis. We present detailed optimization and automation techniques for structure from motion developed during a multitude of data collection initiatives. Furthermore, we discuss a collection of efforts to incorporate additional diagnostic imaging systems- such as LIDAR, stereovision, and thermal onto low-cost UAV drones to increase archaeologists' access to multispectral and 3D imagery. UAV drones serve as a cost-effective platform, and structure from motion an ideal entry point for further adoption of diagnostic imaging to facilitate efficient site mapping and offer archaeologists innovative ways to visualize and analyze data.

[407] *Human Ecology and Lithic Technology in Late Pleistocene SE Asia: A Whole Assemblage Perspective*

Analyses of lithic assemblages have revealed that Late Pleistocene foragers in Western Eurasia practiced strategies that fall on an expedient-curved continuum of lithic organization linked to shifts between residential and logistical mobility. Here, we apply this model to reconstruct mobility strategies in tropical SE Asia to see whether it works in non-temperate settings. Data from over 42 lithic assemblages from across SE Asia indicate that they appear to reflect a distinct environmental adaption even if it broadly conforms to the expected negative relationship between retouch frequency and artifact density seen Neanderthals and AMH. These data thus show the utility of an alternative approach to address lithic variation in SE Asia that transcends some of the limits imposed by having disparate typologies to study them in the past. They also provide a theoretical benchmark anchored in human behavioral ecology on what kinds of environmental contexts different assemblages are expected to reflect adaptations to. A brief reference is also made to the rather peculiar pattern displayed by the Liang Bua assemblages in the context of this analytical approach. The implications of these environmental expectations are also explored at length.

[372] *Armchair Archaeoethanatology: Post-Excavation Archaeoethanatology in the Caribbean*
Archaeoethanatology is increasingly important in the study of mortuary practices, as it allows us to study aspects of mortuary behavior that were traditionally hard to assess. However, the archaeoethanatomological approach entails a detailed and very time-consuming excavation and documentation methodology that requires thorough training. Increasingly refined excavation and documentation methods have clear advantages for our understanding of the mortuary record, but there is a danger of rendering data from older excavations incomparable. Some recent studies have shown that post-excavation analysis can provide valuable archaeoethanatomological data, using photographs and field drawings. This paper presents case studies from the precolonial Caribbean, of excavations that were carried without the archaeoethanatomological approach in mind, and assesses valuable archaeoethanatomological data may be derived post-excavation. These data are compared to those derived from archaeoethanatomological investigations in the region, and some suggestions are made for the development of guidelines for post-excavation archaeoethanatology.

[48] *Agent Based Modelling on the Origins of the Sexual Division of Labor*
Social differences between men and women are still an object of debate. These differences are the result of a long historical process that led to the establishment of the sexual division of labor as we know it, although we do not know the original circumstances and steps that initially originated it. In order to shed light on this, we are focusing on hunter-gather societies. Ethnographic and historical documentation about these human societies points to sexually differentiated cooperative strategies. This paper presents the first theoretical and methodological results of a research project that aims at evaluating the role of the variables that could have been involved in the original design of the sexual division of labor and its subsequent 'institutionalization' as a social rule. Social simulation, as a kind of virtual laboratory, allows the generation of an "ad-hoc" scenario and a set of agents in order to explore a question like this. Using artificial intelligence, different starting scenarios will be created. Each will consider specific intentional strategies of labor distribution or appropriation, including a number of mechanisms related to the sexual division of labor.

[303] *Postclassic Murals of Mayapan as a Mirror of Cultural Transformation*

The changing pictorial imagery in the murals of Mayapan offers a rich picture of cultural transformation in Postclassic Yucatan. The archaeological chronology of Mayapan and comparisons with murals elsewhere in Mesoamerica provide an anchor for the mural chronology. Between 1350 and 1400, Mayapan's murals represent imagery that apparently was inspired by different sources. One mural program can be compared with the hybrid Maya painting style of the Madrid Codex, which also uses the same pigments seen in Mayapan murals. Other murals that seem to be later are more closely linked with the Mixtec Codex Nuttall and Mixteca-Puebla pottery. The last phases of architecture at the site can be associated with evidence of contact with the Valley of Mexico, also apparent in Landa's account that the Cocom Maya rulers fostered trade with the Mexicans to increase their own wealth, and later resorted to Mexican mercenaries to support their reign. Maya accounts in the Chilam Balam books note that the foreigners began to "afflict" the people of Mayapan in Katun 1 Ahau (A.D. 1382-1401). Between 1400 and 1450, Aztec artists introduced stylistic changes in sculpture, architecture and mural painting that ultimately resulted in a revolt against the foreign intrusion.

Milella, Marco (Institute of Anthropology, University of Zurich)

[299] *Modeling Care in Prehistory through an Analysis of Hunter-Gatherers Social Systems*

Questions about the timing and modalities of the evolution of care-giving behaviors have a direct impact on our understanding of human cultural evolution and early social dynamics. Hypotheses on care-giving behaviors in prehistory are usually developed on skeletal evidences documenting survival with seriously debilitating conditions. However, a theoretical framework to test these hypotheses is still missing. Therefore, we propose a model for care-giving behaviors in prehistory starting from data on hunter-gatherers' societies. Due to their ecology and social organization hunter-gatherers represent a good proxy of early humans' social systems. Accordingly, we postulate that by isolating factors correlated to social support in those communities it is possible to build a theoretical reference for reconstructing similar behaviors in prehistory. To this aim, we collected a large body of ethnographic data on environmental, demographic, social, and epidemiological variables characterizing various small-scale societies. These data are then compared through network analysis and multidimensional scaling with data on social cohesion and care-giving behaviors. Results, though stressing the complex nature of care-giving behaviors, evidence a suite of factors (environmental and demographic) relevant in predicting care-giving attitudes in the past. Altogether, our study demonstrates the usefulness of a model-based approach for testing biocultural hypotheses in prehistory.

[225] *Documenting Ancient Hohokam Irrigation Systems along the Middle Gila River and the Social Organization of Irrigation*

The Gila River Indian Community's Cultural Resource Management Program has conducted a long-term study of canal irrigation along the Middle Gila River in south-central Arizona. The work has been conducted in conjunction with the Pima-Maricopa Irrigation Project with funding by the United States Bureau of Reclamation. These efforts have provided a wealth of information on prehistoric Hohokam canal systems, which were used between A.D. 450 and 1450. Principal contributions of these studies are a greatly clarified map of the canal systems, a major increase in the number of excavated canal segments, and a new understanding of the layout, size, and capacity of the canal systems and their development through time. Soil studies of irrigated fields within these systems, along with experiments in traditional crop production, have greatly augmented our knowledge of Hohokam irrigated agriculture. Other studies have focused on the social organization of irrigation management and canal labor. This paper gives an overview of the major highlights of these studies on canal irrigation.

Milideo, Lauren (Penn State University Department of Geosciences)

[136] *Media Portrayals of Viking Rune Stones in North America*

In North America, rune stones of purported Viking origin have been the subjects of excitement, scrutiny, and dispute. The stones have been called hoaxes, and archaeologists and other workers remain unconvinced about the stones' Viking origin and validity. Nevertheless, claims have appeared over time that rune stones, which have turned up in such diverse locations as underwater and on hillsides, contain the inscriptions of Scandinavian explorers in North America, including inland areas, long before the arrival of Columbus. From Minnesota to Maine, the stones have attracted interest from the media and public alike, with both supporters and skeptics of the stones' Viking origins weighing in. Newspaper, magazine, and television stories have covered rune stones and the controversies surrounding their creation. This paper focuses on how the media has portrayed the study and debates of rune stones in North America, including an examination of how their origins are discussed in various media outlets.

[343] *The Homol'ovi Settlement Cluster (ca. A.D. 1260–1400): Reconstructing Environment and Ancient Hopi Lifeways through Charred Botanical Remains*

The Homol'ovi settlement cluster, a group of Hopi villages occupied A.D. 1260–1400, shared common utilization of a wide range of wild and domesticated plants for both subsistence and non-subsistence needs. Inhabitants had an extremely well-rounded and informed view of the plant world that surrounded them, as well as plant resources obtained from afar. The ubiquity of domesticates in the archaeological record indicates a heavy reliance on agriculture for food, household items, clothing, fuel, and perhaps even trade and economic gain. Wild plant remains signify an equal dependence on the natural environment for subsistence, as well as for medicine, fuel, clothing, crafts and construction materials. Over 325 botanical samples have been examined from five sites within the Homol'ovi settlement cluster; this paper is a combined synthesis of these analyses, used to contribute to a better understanding of the past local environment, as well as human-plant interactions and lifeways within. The synthesis also provides for the interpretation of possible changes that occurred over time within the local environment, as well as within the Homol'ovi settlement cluster itself.

[52] *Whose Bone is this? An Investigation into Modern Histological Methods of Species Identification with Application to Archaeological Faunal Assemblages in the Pacific*

Bone fragmentation is a potential issue for anyone who works with skeletal remains. If a bone is burned or fragmented in a way that prevents morphological identification, it can be nearly impossible to identify which bone it is, or to what taxa it belongs. However, there are techniques for identifying bones based on their microstructure, as the microstructure of human and non-human bone has distinct differences. These differences allow for microscopic comparisons of bone cross-sections and the evaluation of taxa in fragmented remains. There has been, however, little study of limiting or biasing factors that can influence these histological analyses, particularly for archaeological material. In this research, these factors were evaluated in relation to the Pacific, where there has been minimal previous histological research. The archaeological assemblage of interest derives from Aitutaki in the Southern Cook Islands, as well as modern reference specimens of pig, dog, and human bone. Preliminary findings suggest that breed and age are both influential factors for qualitative identification, and taphonomic diagenesis of characteristic features can hinder and prevent quantitative measurements in degraded archaeological specimens. These results support the hypothesis that modern histological techniques are problematic for the identification of unknown archaeological fragments.

Miller, D. Shane (Mississippi State University), David Anderson (University of Tennessee) and Kelsey Meer (Mississippi State University)

[74] *The Pleistocene-Holocene Transition in the Tennessee and Cumberland River Valleys of the Mid-South United States*

The Tennessee and Cumberland River Valleys have a rich history of archaeological research and provide a valuable dataset for exploring the relationship between climate and culture during the Pleistocene-Holocene transition. In this paper, we provide an overview of available archaeological and environmental data in this area, and argue that there were significant changes in diet, technological organization, and landscape use that are most likely related to environmental change. Home to some of the largest and most heavily collected Clovis assemblages in North America, adaptations during the subsequent Younger Dryas period/chronozone and immediately after, during the early centuries of the Holocene, are much less well known away from cave and rockshelter sites. Analyses of site distributions indicate an expansion of settlement into areas previously largely ignored, probably a result of population growth. We conclude by highlighting recent, ongoing research in the region, and provide some future directions for continuing research for this time interval in the Mid-South.

Miller, Sarah

[98] *Project Archaeology in Florida: Teaching and Understanding Slavery at Kingsley Plantation*

The Florida Public Archaeology Network was established in 2005 and within a year hosted its first Project Archaeology: Intrigue of the Past workshop. As a proud sponsor of Project Archaeology in Florida, regional center staff partnered with the National Park Service and University of Florida to publish the first Investigating Shelter investigation in the southeast. It was also the first in the Investigating Shelter series to feature a National Park site. Investigating a Tabby Slave Cabin teacher guide and student handbook were produced through an internal NPS grant which combined the efforts of Teacher-Ranger-Teachers, Park Service interpreters, FPAN staff, and cooperating archaeologist Dr. James Davidson from University of Florida. By investigating a Kingsley tabby cabin through a series of lessons (geography, history, archaeology, preservation), we hope teachers and students will better understand slavery and the families who occupied the cabins. This poster will feature some of the highlights of the past 8 years, including teacher training and professional development for archaeologists. Preliminary data on our new Shelter unit, Investigating a Lighthouse Keeper's House to be launched in the summer of 2016, will also be presented.

[98] *Chair*

Miller, Melanie (University of California, Berkeley)

[107] *An Investigation of Dietary Histories and Skeletal Health in a Muisca Population (950-1350 A.D., Sabana de Bogotá, Colombia)*

Highly stratified societies are characterized by differentiation between groups along various socially defined axes. The Tibanica community (950-1350 A.D.), part of the Muisca culture from the Sabana de Bogotá, Colombia, is an ideal population to study how social roles and identities are intertwined with human diet and skeletal health. Here we present stable isotope data to investigate the complexity of human diets across the life course by comparing childhood diets to adulthood diets for the same individuals in order to understand how access to particular foods may be mediated by age, sex, and social status variables. Additionally, we report an indicator of metabolic stress quantified through the measurement of cortical bone. The development, maintenance, and loss of bone may be tied to both biological factors (i.e. hormones, etc.) and social experiences (physical activity, diet/nutrition, etc.). Through the combination of these data sets we can also investigate the complex relationships between diet (nutrition) and skeletal health (bone maintenance or loss).

Miller, Caitlin (Columbia University), Siu Ying Ng (Columbia University) and Adam Watson (American Museum of Natural History)

[165] *Resilience and Continuity in Iroquoia: An Analysis of Animal Remains from the 17th-Century Seneca Iroquois White Springs Site*

In the summer of 1687, the Marquis de Denonville led a punitive expeditionary force from New France against the Seneca Iroquois in what is now western New York State. As a response to imminent invasion, the Senecas fled under the protective umbrella of the Cayugas. Upon returning to their homeland the following year, with all four settlements destroyed, the Senecas constructed two nucleated villages, one of which was located at White Springs, near present-day Geneva, New York, where they remained until 1715. Since 2007, Cornell University excavations at White Springs have recovered large quantities of artifacts, plant remains and animal bone, in addition to identifying widespread evidence of daily life at the site, including hearths, post molds and trash deposits. The extent to which Seneca behaviors reflect the political uncertainty and threat of hostilities dominating the region during this period remains unclear. Through an analysis of faunal material recovered from a large extramural pit feature, the present study addresses this central question by examining evidence for Seneca Iroquois hunting strategies, economic endeavors and subsistence practices that indicate the persistence of Seneca lifeways despite turbulent times.

Miller, Melissa (University of Tulsa)

[171] *An Attribute Approach to Differentiating Artifacts from Geofacts*

The need for a method to determine if a lithic flake is a product of human manufacture or a product of natural forces is an essential one in archaeology. This project directly compared known geofacts with known artifacts sampled from Oklahoma and Jordan at the attribute level. The comparisons were evaluated statistically in order to determine which attribute characteristics are statistically significantly different between the sampled geofact and artifact assemblages, with the objective of empirically and statistically determining which, if any, flake attributes are diagnostic of human manufacture, using a large sample size and a multitude of attributes.

Miller, Christopher and Susan Mentzer (Institute for Archaeological Sciences, University)

[190] *It's All About Scale—Thoughts on Paul Goldberg's Contributions to Geoarchaeology*

Geoarchaeologists, like their colleagues in the geosciences and archaeology, are required to understand the archaeological record at a variety of scales: from the sub-microscopic to the continental. We track human behavioral change across millions of years and geographic expansions across continents. Yet, our data come from archaeological sites, individual layers, and single artifacts. As archaeologists who investigate past human interactions with various geosystems, we are required not only to think at different scales, but we are also required to conceptually link observations made at a variety of scales. These observations form the basis for interpretations about landscape change, site formation, and human behavior. For the past 40 years, Paul Goldberg's research has challenged us to understand the significance of scale in geoarchaeological work. His work on almost every continent, and from almost every time period, has shown that even the smallest microscopic observation can be significant for understanding the human past.

Miller, Kye (Northern Arizona University)

[209] *An Overview of Architectural Practice at the Ironwood Village, Northern Tucson Basin, Arizona*

This paper provides a brief review of the Ironwood Village site structure, an overview of architectural styles observed at the site, a discussion of variation in architectural practice observed at the site, and a regional comparison of Hohokam pit structure architecture within the greater Tucson Basin. Data recovery at the Ironwood Village site resulted in the discovery of nearly a hundred Pioneer and Colonial period architectural features. The area investigated was centered around a large Pioneer period plaza and Colonial period ball court, as well as adjacent residential, roasting, and cemetery areas that presents a unique opportunity to explore site structure and changing practices in residential architecture between the Pioneer and Colonial periods.

Miller, Naomi (Univ of Pennsylvania Museum-ISAW)

[226] *Beyond Seeds and Charcoal: Constructing a Past for the Future*

The "big issue" of my career has been long-term human impact on the environment, an inherently processual concern. Working on ancient west Asian plant remains, ethnographic analogy and modern vegetation analogs helped me explain how the demand for energy lead to deforestation and increasing dung fuel use, both of which are traceable through archaeobotanical study. Seeds preserved in dung fuel, in turn, allow us to identify agropastoral practices that created new environmental niches for plants, animals and people. At present, human impact on the environment has become a short-term affair. The analogs that we rely on for archaeological interpretation, both cultural and "natural," are fast disappearing. Much of my current work is concerned with protecting and maintaining as much of the cultural and "natural" context of archaeological resources as possible, most directly the historical landscape at Gordion, Turkey, because today is the past of the future.

Miller, Heather (University of Toronto)

[241] *Invented, Adopted, Shared, Acquired, Inspired? Technological Change and the Talc-Faience Complexes of the Indus Valley Tradition*

A bewildering assortment of materials utilizing siliceous pastes were used to make small objects such as figures, beads and containers, in ancient Egypt, Mesopotamia, the Indus Valley, the Mediterranean, and regions beyond and between. From very early beginnings in the sixth millennium B.C.E. or earlier in some regions, the assortment of these materials reached great diversity of production technique and material in the third and second millennia B.C.E., with much less diversity of appearance. In places where these materials have seen more analytical study, such as Egypt and the Indus Valley, similarities but also striking differences occur in the regional assortments of materials and techniques employed to produce quite similar appearing materials, used to make objects clearly belonging to the local corpus of style and topic. What was involved in the spread of these materials and their manufacture? Can we find clues to the social process involved in the innovative development of these materials from analysis of the objects and their production? In this paper, I particularly address the third question posed for this session: how does the spread of technology across significant social, cultural and geographic boundaries differ from the spread of technology within social groups?

Miller, G. Logan (Ohio History Connection)

[331] *Perishable Technology in the Great Lakes Region during the Late Pleistocene: Evidence from Microwear Analysis*

Lithic artifacts typically dominate the assemblages of Late Pleistocene sites in North America. Paleo Crossing (33ME274), a Clovis site in northeast Ohio, provides an excellent example of this pattern. Thousands of chipped stone artifacts have been recovered at the site during surface collections and subsurface excavations. However, lithic microwear analysis on a sample of artifacts from Paleo Crossing indicates that the site's inhabitants expended a great deal of effort on the production of hide, plant, and bone artifacts. Results indicate that most of the end scrapers were used to process fresh, wet hides. Additionally, much of the plant processing at Paleo Crossing was geared toward plant fiber production. These findings provide further evidence that perishable technologies were important elements of the Clovis toolkit.

Miller, Mackenzie

[331] *A Re-evaluation of Oneota Cultural Phases in the La Crosse Locality*

The Oneota culture is dated in La Crosse, Wisconsin, to between A.D. 1300-1625 (Boszhardt 1994). Single component sites have allowed for definition of specific ceramic types and attributes as diagnostic of each of three phases. Previous excavations and analysis of materials recovered from the Tremaine site (47-LC-95) by the Wisconsin Historical Society revealed pottery and radiocarbon dates corresponding to all of the phases (O'Gorman 1995). During the summers of 2011 to 2014, new excavations by the University of Wisconsin-La Crosse have taken place at the site, allowing for more evidence to be collected. Rim sherds from these excavations show attributes that are intermediate between the last two phases. This has created a need for refined criteria for each of the

phases and, perhaps, an additional transitional phase. Two specific measurements that are indicators of each phase, rim notching and rim height, were not systematically quantified from the earlier excavations. Therefore, a sample of sherds from the original and more recent work have been measured and the data analyzed to evaluate the pattern of change. The original 42 radiocarbon dates and two new dates will also be recalibrated and have Bayesian analysis performed on them to help refine the three phases.

Miller Wolf, Katherine (Indiana University East)

[366] *A Bioarchaeological Approach to Diversity and Complexity of Ancient Maya Society at Copan: Results from New Strontium and Biodistance Data*

The UNESCO World Heritage Site of Copan is uniquely situated to address the question of migration and culture contact in ancient Mesoamerica. The city is nestled at the southeastern frontier of the Maya region and the western edge of culturally diverse Honduras. Copan was a dynamic urban city populated by peoples of various places of origin, affiliations, and identities. Research focused on the Copan human skeletal collection, the largest yet recovered in Mesoamerica, to explore the lives of residents in twenty-two patios from eight neighborhoods during the Late Classic period (A.D. 600-820). New biogeochemical and biodistance data are drawn from those who directly participated in the creation and maintenance of social organization and were subsequently interred at Copan. Radiogenic $^{87}\text{Sr}/^{86}\text{Sr}$ ratios from ancient Copanecos are compared to a new baseline for Honduras. Taken together these data provide insights into the complex social and biological relationships of Copan's inhabitants to each other, to their neighbors, and those beyond their borders.

Miller-Sisson, Misha (University of California San Diego)

[24] *Commoner-Elite Interactions: Evidence Subroyal Elite Housemound Excavations at Uxul, Campeche, Mexico*

Interactions between commoners and elites are a poorly addressed area of study in the Maya region. Various excavations of ancient Maya palace structures and royal tombs, epigraphic studies of Maya hieroglyphs, and iconographic analyses of ancient Maya art have revealed a copious amount of information about ancient Maya elite. Similarly, excavations of ancient Maya commoner households and burials have revealed a great deal of information about ancient Maya commoners. However, there are relatively few research programs directly addressing the interaction between elite and commoners. This talk presents data from the excavation of an ancient Maya elite household at Uxul, Campeche, Mexico. The excavatory data is used to reveal social stratification within the Maya elite and demonstrate the lower strata of Maya elite, termed here subroyal elite, were responsible, for amongst other things, interactions with commoners. These interactions change over time and display evidence of greater rigidity and stratification as the sociopolitical structure changed during the Late Classic (A.D. 600-750) when Uxul was incorporated into the Calakmul regional state.

Millhauser, John (North Carolina State University)

[25] *The Social Dimensions of Complex Industries: Insights from a Thin Section Microscopy Study of Aztec Salt-Making Pottery*

In this paper, I show how thin section microscopy enhances our understanding of the social relations and technological sequences of production in the Late Postclassic (1350-1520 A.D.) salt industry of the northern Basin of Mexico. Aztec salt-making sites have dense concentrations of "fabric-marked" pottery, which is a light, friable ware distinguished by impressions of textiles on its exterior surface. Fabric-marked pottery was probably used to mold blocks of salt for sale in the market. Because of its strong correlation with salt-making sites, manufacturing fabric-marked pottery was probably a contingent craft practiced within or near salt-making sites. To clarify the spatial and social contexts of fabric-marked pottery production and consumption, I applied formal, stylistic, and compositional analyses to systematic collections from a cluster of six salt-making sites located along the shoreline of Lake Xaltocan. The results of thin-section microscopy—which included quantitative and qualitative analyses of aplastic inclusions (mineral, zoological, and botanical) as well as voids—reflect a highly localized pattern of consumption and, possibly, production. These data complement the results of bulk compositional analysis, but they contrast with patterns of form and style that reflect a greater spatial scale of social interaction among salt-makers beyond their individual workshops and

settlements.

Milligan, Jennifer (PaleoResearch Institute) and Linda Scott Cummings (PaleoResearch Institute)

[123] *Moving Forward While Looking Backward*

Many know the curation challenges associated with space and data preservation when it comes to archaeological collections. As we keep digging for answers an intense need has developed for appropriate storage of not only the physical findings, but the intellectual materials as well. Most curation repositories require original paper copies of field notes, maps, and analytical data; however, with today's advancing technologies paperwork is being phased out in preference of digital media such as databases, statistical systems, and GIS mapping. Some government projects now require proposals to include plans for managing and storing this digital data. PaleoResearch Institute is transitioning to meet the demands of this fast-paced world of digital data maintenance through the use of databases, tDAR (the Digital Archaeological Record), and Google Maps. Using these systems we manage the large amounts of analytical and spatial data produced through our studies and make information available, selectively, to our clients, the archaeological community, and the public. tDAR fulfills our need to preserve and share grey literature that is generally hard to access.

Mills, Peter (University of Hawaii Hilo)

[34] *Close to Home: Bringing Heritage Management Graduate Programs to Descendant Communities*

Hawai'i's state regulations require principal investigators in the 26 active archaeological consulting firms to possess "a graduate degree from an accredited institution in archaeology, or anthropology, with a specialization in archaeology, or an equivalent field." Because there have been few opportunities for appropriate local graduate training, many heritage management specialists are hired from regions outside of Hawai'i and begin with little background or connection to descendant communities. As of 2008 none of the PI's in Hawai'i were native Hawaiian, and currently only one of the firms has a Native Hawaiian PI/owner. This first PI was a product of a new track at UH Mānoa in "Applied Archaeology." In 2015, the University of Hawai'i at Hilo will be admitting nine students each year to a new Heritage Management MA program with the specific intent of reaching graduate students from Pacific Island descendant communities. The new MA will address heritage training at the most ethnically diverse 4-year public university in the nation. The local graduate programs allow candidates to develop specialties within heritage management with emphases in community-based research, and foster specific analytical areas of expertise that are within geographic, philosophical, and economic reach of their own lives.

[297] *Walking to (A)muse: Exploring Senses of Pace with Ruth*

Walking with Ruth Tringham has always been a social and intellectual adventure. I have been fortunate to have the opportunity to muse on past ways of life while walking with Ruth at a range of different heritage sites in the U.S., Bulgaria, and Turkey. Important themes we engaged with during these walks included: exploring different ways to approach contemporary senses of place, thinking about how senses of place may have been significant to prehistoric people, and how to (re)mediate these ideas for the benefit of diverse audiences in the present. As a result of these peripatetic adventures I have come to realize how integral the act of walking to and within places must have been to prehistoric understandings of the world, as well as the extent that the interplay of the senses

mediate the textures, surfaces, shapes, animals, people, weather and the many other things encountered along the way. In this presentation I attempt to convey some of these ideas about walking and senses of place and to show my appreciation for Ruth's enthusiasm to make the process of doing archaeology exciting, creative and, perhaps above all, enjoyable.

[216] *From Clay Survey to Ceramic Provenance: Establishing a Ceramic Geography for the Late Classic Valley of Oaxaca*

As an overall introduction to this session, this paper introduces our methodology for establishing ceramic provenance within the geologically complex Valley of Oaxaca. Natural clays have now been sampled from more than 300 locations throughout the valley, and their chemistry analyzed via INAA. Spatial averaging was used to create a series of smoothed contour maps showing how clay composition varies over space, and to generate a continuous reference grid of element concentrations against which ceramics can be compared. Within our corpus of Late Classic ceramics, we have identified at least 16 chemically distinct signatures which can be mapped on to these element maps, a strategy which allows us to identify where ceramics were produced and the spatial resolution that can be obtained in mapping those sources. The result is a "ceramic geography" useful for shedding light on intra-valley exchange networks within the Late Classic Valley of Oaxaca.

[226] *Paleoethno...What?*

It is a daunting task to make decades of research appear to be consistent and coherent when it is often ad hoc and opportunistic. During the past four and one-half decades I have tried to meld ethnobotany and archaeology with three themes focusing my work: food, anthropogenic ecology, and the value of research beyond archaeology. On the other hand, I have tended to avoid deep cultural contexts and methodological issues. I will discuss each of these, not only for the past, but for the future of prehistoric ethnobotany.

Minor, Elizabeth (University of California, Berkeley)

[240] *Who Wants to Live Forever? The Practice of Mass Human Sacrifice During Early State Formation in the Nubian Classic Kerma Period*

As the ancient Nubian Classic Kerma kings undertook military campaigns into Egyptian territory (1700-1550 B.C.E.), their mortuary practices grew to include mass inhumation of their subjects within their burial tumuli. The tumulus of the second Classic Kerma king (KX) contains over 300 human sacrifices and is the largest group found at the site. The sacrificed Kermans were arranged in the tumulus corridor alongside Egyptian statues taken as spoils of war, emphasizing the king's control of internal and foreign social capital. Sacrifices range in personal adornment from simple circlets to beaded tunics, skirts and appliquéd hats. Placement of sacrifices varies from being arranged singly to clusters of potential family groups. Rather than a selection of servants or a 'harem', the diversity of social groups within the Kerman community is represented among the sacrifices. The Kermans were

involved in the preparation of their singular mass burial event, both as subjects coerced into death by the king and as members negotiating relationships within the community. The violent act of sacrifice provided a cultural arena for Kermans to construct their identities during a period of rapid social stratification, and presents an important comparative case for the practice of human sacrifice during early state formation.

[19] *Forensic Archaeology Recovery Case Studies, Finding the Unfound*

Forensic archaeology can be a useful tool when searching for "unfound" missing persons. Forensic Archaeology Recovery (FAR, non-profit) has worked on a number of missing persons cases in Massachusetts and New Hampshire. Three case studies are presented that highlight FAR's involvement and assistance in generating new knowledge. The first case study is the search for Maura Murray, a University of Massachusetts student who went missing in 2004. The second case is Melanie Melanson, a fourteen year old girl, who went missing in 1989. The final case is that of Angelo "Andy" Puglisi, a ten year old boy abducted from the Lawrence, MA, swimming pool in 1976. All of the individuals remain unfound. By offering the assistance of non-profits in both expertise and personnel, each one of these cases has yielded additional information in the unresolved case. This has moved the investigation forward, as well as, reactivated these cases and offered families some measure of comfort in knowing that the case has not been forgotten. Unique environments presented challenges and the opportunity to field test grave-detection technologies. These cases have furthered our knowledge in "unfound" missing person cases and informed the field of forensic archaeology.

[145] *Beginning of Agriculture and Immigrants from the Korean Peninsula in Prehistoric Japan*

In Japan a transition from the hunting-gathering Jomon economy to the food producing Yayoi economy took place at some point in the first millennium B.C., and this transition resulted in considerable cultural change. It is widely accepted among Japanese archaeologists that this transition was greatly facilitated by immigration from the southern Korean peninsula where agriculture had already been practiced, including wet rice cultivation. In order to approach relationships between the Korean immigrants and native Japanese people in the first millennium B.C., the author has analyzed pottery in the southern Korean peninsula and northern Kyushu island of Japan, with special reference to the pottery function and production techniques. As a result, it is impossible to distinguish the "Korean type" of pottery from the local pottery assemblage in Kyushu, which suggests that Korean immigrants quickly and peacefully incorporated themselves into local population through marriage.

[250] *Symbols of Transformative Power: Wari Split Eye Iconography in the Middle Horizon*

Feline eyes have a refractory nature that relates to the dichotomy of light and shadows in Andean traditions in Peru and suggests they are significant in Wari iconography. Andean ethnographies have expressed an importance of binary concepts that play a role in understanding cosmology, mythology, and ritual. I will use Susan E. Bergh's (1999) classification of Wari elite textile iconography and apply it to ritual ceramic iconographic data from excavations at Conchopata to identify the characteristics of eye imagery. Located in the heartland, Conchopata was a center of production for ritual ceramics and should have been the perfect place for elites to demonstrate their power with ritual iconography. I will use ethnographic sources to propose a variety of interpretations of the analyzed subset of Wari imagery and to determine the possible importance of the cultural category of eyes during the Middle Horizon. I believe that feline or split eye iconography in a ritual context represents states of transition and transformation that justify an elite status of political power.

Mitchell, Spencer (Humboldt State University), Jessica Blinman (Humboldt State University) and Erik Marinkovich

[103] *An Analysis of the Factors that Impact Accuracy During the Acquisition of Archaeological Geospatial Data Through the Use of GPS Units*

In recent decades, archaeology has seen an increase in the use of geospatial technology. This paper weighs the factors that impact the accuracy of the acquisition of geospatial data in the field and seeks to establish a system to determine the ideal times for data collection with GPS units. Control points were established both within the United States and in northwestern Belize. Each point was input into a database in which we recorded a set of factors including; constellation density, PDOP and weather conditions. Satellite constellations were recorded off the Global Navigation Satellite System Planning Online website and compared to the satellites that were actually present at the time of collection. The data were then subject to differential correction and inlayed into ArcMap 10. We conducted a comparative study and found which variables were ideal for accurate data collection. Accuracy was determined by the amount of displacement between points at the given location.

[209] *The Ironwood Village Cemeteries: Exploration of Burial Customs at an 8th Century Hohokam Village*

Studies of burial practices in southern Arizona and the Tucson Basin have been limited to data from small scale excavations. Recent excavations were conducted at the Ironwood Village site, a late Pioneer and Colonial Period Hohokam village along the Santa Cruz River. Eleven cemeteries were identified surrounding a central ball court and plaza, which included over 250 cremations and 4 inhumations. This paper explores burial methods, physical anthropology, funerary accompaniments, and spatial patterning within the village to better understand internal and regional social relationships during this time period. Based on this site and comparisons to others in the region, suggestions are made about the nature of 9th century Hohokam religious and secular organization.

Mitchell, Juliette (University of Aberdeen) and Gordon Noble (University of Aberdeen)

[332] *Early Medieval Landscapes of the Dead: The Monumental Pictish Barrows of North-East Scotland*

During the 5th and 6th centuries the dead become more visible in the landscapes of eastern Scotland. Elaborate square and circular burial mounds were constructed to commemorate certain

members of society, possibly a newly emerging elite. These barrows are often sited along ridges and form grouped, sometimes linear distributions in the landscape. Few have been excavated and most are known through aerial photography alone. This paper presents some of the results from a project that consolidated and reviewed the evidence of burial practices of the northern Picts, and also evaluated the position of these sites in their wider social, cultural, political and religious landscapes. A variety of methods were utilized, including full transcription of the cropmark sites; analysis of the barrow types and morphological characteristics; and the wider landscape context through GIS analysis of the relationships with natural topography, boundaries, routeways and relation to prehistoric features.

Mithong, Supalak

[407] *An Analysis of Reptile Bone from an Excavation at Moh-Khiew Cave, Krabi Province, Thailand*

A study of animal in species are very few especially reptiles bone when compared to mammal bone in Thailand. And considering the amount of reptile bones found in archaeological sites in southern Thailand were plenty. About half of all animal bones in a site such as the amount of Reptiles bone an excavation at Lang Rongrian rockshelter, Thailand by Douglas Anderson (Mudar and Anderson, 2007) and from Moh-Khiew cave, Krabi province, Thailand analysis by Dr. Prasit Auetrakulvit (Auetrakulvit, 2004) to estimate the amount of reptile bones in archaeological excavations from Moh-Khiew cave in 2551 by Dr. Prasit Auetrakulvit. The concentration of animal bones, mostly reptiles, especially turtles.

Mixter, David (Washington University in St. Louis)

[291] *Liberty on the Periphery: How Actuncan, Belize Escaped the Classic Maya Collapse (for a Time)*

In recent years, scholars working in the Classic period Maya periphery questioned traditional narratives of the 9th century Maya collapse by pointing to settlements along the periphery of the lowlands that appear to have maintained relative cultural and demographic stability. However, this generalization obscures dramatic sociopolitical changes these communities implemented to remain successful through the collapse. In this paper, I argue that populations on the periphery relied on a locally contingent set of factors that included global connections and local particularities to build successful collapse-era communities. I focus particularly on the contingencies that allowed the site of Actuncan to flourish as its neighbors failed. Located on the eastern Maya periphery of western Belize, Actuncan is situated within a fertile landscape along the major Belize River trade corridor. This location provided economic security that may have sustained the site during the collapse era. Additionally, the peripheral location may have allowed for variances from the orthodoxy of Classic period political organization, which provided Actuncan flexibility as the core sites failed. In sum, Actuncan's location along the periphery provided political and economic conditions the local population exploited to build a successful community under precepts that foreshadow the underlying structures of the Postclassic Maya.

[145] *Transition from the Yayoi to Kofun Periods in Third Century A.D. Japan*

The beginning of the Kofun Period in the middle third century A.D. in Japan is often explained in terms of the class distinction of chiefs from ordinary members of the society. This explanation is widely accepted because of the appearance of giant keyhole-shaped burial mounds of more than 270 meters and of "elite mansion." Japanese archaeologists discuss the social complexity of the Kofun Period with reference to social stratification with the chief at the top. In this paper, I apply "Dual-Processual Theory" to explain this phenomenon, and examine the complexity of a society in

which elites were not distinguished. In this way, it becomes possible to present a model different from unilinear evolutionary scheme. Specifically, I consider Middle Yayoi society (first century B.C.) representing a typical corporate strategy, where elites were not distinguished in mortuary practices and residential patterns. I consider Middle Kofun society (fifth century A.D.) representing a typical network strategy, where giant keyhole-shaped burial mounds were dedicated to individual elites. I intend to explain temporal change in social strategy from the first to fourth centuries A.D. within this framework. It is my hope to contribute to the Dual-Processual Theory utilizing rich archaeological data from Japan.

Mizoguchi, Koji (Kyushu University, Japan)

[340] *Contextualizing the Theory of Archaeological Theorization*

The controlled discursivization of various undiscursivized/practical archaeological taken-for-granted, ranging from micro-culturally-constituted traditions in artifact classification to grand meta-theoretical inclinations, is a constitutive function of archaeological theorization. How can it be implemented in the manner which most effectively enhances the potentiality of one's archaeological investigation and practice depends on the purpose of the investigation and practice, and on the characteristics of the context in which theorization takes place. This paper focuses on the latter constraint, and proposes that different discursivization strategies should be adopted in accordance with the target population(s) one aims to 'affect' through one's archaeological practice/praxis. The argument will be supported by some concrete examples.

Moe, Jeanne (Project Archaeology-BLM)

[236] *The Times Are Changing: Project Archaeology Makes a Difference*

Over the last 25 years, Project Archaeology has had a profound impact on educators, students, and archaeologists. Project Archaeology curricular materials and professional development have shown teachers how to transform their teaching into inquiry learning in all subjects. Students have developed deep cultural understanding of the Native peoples who have inhabited our nation before Europeans came to these shores and are still here today. These students demonstrate a profound respect for all archaeological heritage and its importance for today's living descendants. Project Archaeology is an interface between archaeology and Native Americans and archaeology education can be an agent for changing the conversation about honoring our shared heritage, ownership of the past, and repatriation. Archaeologists have a duty to provide teachers with the engaging and interdisciplinary subject of archaeology to help them fulfill their requirements and to help them teach cultural understanding. We have the tools, we see the path, and the time is now. If we do not do this work, who will?

Mohanty, Sudarsana

[232] *Analysis of Mortuary Rituals at Panquilma*

In the Early Intermediate Period (A.D. 1-700) there was a notable development of belief systems or "ideologies of power." These systems reinforced and naturalized the relations of the dominant classes over the less important social groups. The use of ideology to exert control is an efficient tool, especially when applied to concepts of life and death. Funerary practices effectively serve to promote social cohesion, whether related to kinship ties or political and economic means. The intent of this paper is to delve into the traditions of mortuary rituals, with a particular focus on the implications and functions of ancestral veneration within Andean societies. Through a cross-study of the archaeological finds of burials from the domestic and funerary sector of Panquilma (1000-1470 A.D.), an Ychsma site in the Lurin Valley of central coastal Peru, and Patricia McAnany's analysis of Mayan ancestral veneration, the goal of this paper is to examine the ideological processes that form

tradition and communicate political and economic power.

[119] *The Potential Integration of Niche Construction Theory into the Framework of Human Behavioral Ecology*

Throughout the history of hominid evolution, our ancestors developed the ability to adapt to extremely different environments and eventually colonize the entire world. The capacity to adapt to environments as different as the Amazon Rainforest and the Arctic tundra is complex, and has led some anthropologists to question the utility of Neo-Darwinian evolutionary frameworks. The debate over the utility of these frameworks has become more heated recently, with some proposing the use of Niche Construction Theory (NCT) as an alternative to Human Behavioral Ecology (HBE). Here, we propose that, instead of viewing NCT as an alternative to HBE, niche constructing behavior can (and has been) integrated within HBE models. We discuss three examples to show how these two theoretical frameworks articulate with one another, including a discussion of animal domestication in the Near East, human fire use in California, and clam garden construction on the Northwest Coast.

Moholy-Nagy, Hattula

[295] *Monuments as Artifacts: The Significance of the Hiatus at Tikal, Guatemala*

The long hiatus of A.D. 557-692 in the sequence of dates on Tikal's carved stone monuments is widely assumed to indicate a period of decline and troubled times for the city. This assumption, however, is clearly contradicted by archaeological evidence, which demonstrates a high level of material prosperity and cultural innovation during this period. An archaeological approach to the study of stone monuments as items of portable material culture can provide cultural context for recent exciting advances of epigraphy that have permitted the construction of dynastic sequences of named rulers. Archaeology and epigraphy together can provide a better understanding of the causes and significance of hiatuses in dates on monuments at Tikal, and elsewhere in the Classic Maya Lowlands.

Mol, Angus, Lesley-Gail Atkinson (Jamaican National Heritage Trust) and Hayley Mickleburgh (Leiden University)

[153] *At the Edge: Jamaican Amerindians and the Colonial Encounter*

This paper presents a new study of archaeological sites, collections, and historical documents bringing to light a poorly known chapter in the study of Caribbean colonial encounters: the interactions of Jamaican Amerindians with the Spanish, and later the British and Maroons. The island of Jamaica held a special position in the Spanish colonial empire, due to its peripheral position in the global shipping and trade networks that emerged in the early Spanish main and its lack of the precious metals that were so important to the colonial endeavor. Yet even before the colonial encounters, Jamaica and its Amerindian population occupied a singular position in the greater regional interaction sphere. The unique social and cultural character of the island previously meant that its position in regional archaeological debates was once again peripheral. Based on archaeological and historical investigations in north-central Jamaica, we address some notable characteristics of the Amerindian role in colonial encounters. Jamaican Amerindian negotiation, integration, and resistance formed a crucial survival mechanism in the colonial period, and despite appearances to this day, Amerindian heritage is still strongly represented in the island.

Molist, Miquel (UAB / Spain)

[16] *Aspects of Ritual and Domestic Life in First Farming Village (PPNB Period) : Contribution to Tell Halula (Euphrates Valley Syria)*

In this communication we will deal with the symbolic documents that the archaeological excavation at Tell Halula (Syria) (7800-6500 cal B.C.) has provided. The documents are essentially symbolic paintings on the walls of houses, figurines, and a rich array of funerary objects.

This documentation provides an exceptional discussion of the symbolic world of the first farmers while at the same time illuminating the economic and social communities of emerging farmers.

Molle, Guillaume (CIRAP)

[388] *Exploring Religious Practices on the Polynesian Atolls: A Comprehensive Architectural Approach towards the Marae Complex in the Tuamotus*

The Tuamotu Archipelago consists of one of the largest concentrations of atolls in the world. However, the archaeological history of these islands remains much less documented in comparison with the other high islands of French Polynesia. The harsh environmental conditions of the atolls have not favored the preservation of archaeological structures, with the exception of the coral-built marae. Since the pioneering works of K.P. Emory in the 1930s, around six hundred of these ceremonial sites have been recorded all over the archipelago. The surface inventories have showed that the basic architectural features of the marae were organized according to a large diversity of patterns reflecting the complex histories of local communities. In order to investigate the variability of these monuments, we developed a detailed database that allowed us to build the first wide-scale classification of these marae sites. Relying on archaeological and ethnohistorical evidence in addition to oral traditions, we attempt here to explain the development of these sites with regards to external influences, endemic socio-political process, and adaptations to specific rituals.

[295] *Harrison's View: The Importance of Small Scale Analyses in Maya Archaeology*

Peter Harrison's work in Maya archaeology was important in many ways. One of the most important, and perhaps overlooked, was the scale of focus at which he often worked. Single features, single rooms, single buildings, and single plazas: all of these are commonly uncovered when digging in Maya site centers. However, due to a lack of artifacts, analyses at these scales are not often conducted. Harrison's work exemplifies that much can be learned from small-scale architectural analyses and in that way inspired many of my own endeavors.

[34] *From Consultation to Collaboration: Expanding the Scope of Archaeology's Engagement with Indigenous People*

Consultation with descendant communities is now a widely accepted reality of doing archaeology in North America. Since the passing of NAGPRA twenty-five years ago, a robust body of scholarship has developed around the methodological and theoretical aspects of consulting with indigenous communities. Although many scholars today point out the need for "collaboration" in addition to "consultation", the constraints of archaeological research and tribal politics often make true collaboration difficult. In this paper, I will draw on my own experiences working with the Comanche, Ute, and Jicarilla Apache to discuss the pitfalls of consultation as it is currently practiced and to offer some alternative strategies we can employ to move towards a more collaborative framework.

[298] *Botanical Analysis of Sediments in Offerings and Fill at Tenochtitlan's Great Temple*

In this paper, botanical remains in sedimentological samples from offerings and fill are analyzed for biological identification. Seeds, fibers, resins, and other vegetal structures recovered using Struever's floatation technique, modified by members of the Paleobotanical and Paleoenvironmental Laboratory, in the Institute of Anthropological Research (IIA), at the National Autonomous University of Mexico (UNAM), yielded propagules, charred bits of textiles, copal, thorn fragments, splinters, and faunal matter such as micromollusks, ostracods, shark dermal denticles, etc. Taxonomic identification was conducted through comparison with present-day examples and specialized literature. Our modest results indicate the presence of cultivated plants such as squash, chia, maize, and gourd, along with a large variety of seeds of natural, particularly lacustrine deposition, mainly reeds and bulrushes. The cultigens reveal intentional deposition of some taxa (squash, chia, gourd), as well as copal, which derives from tribute. Finally, the lacustrine plants associated with micromollusks and ostracods inform us about the biome surrounding Tenochtitlan five centuries ago.

Moody, John (The University of Western Ontario), Linda Howie (HD Analytical Solutions | The University of Western Ontario) and Lisa Hodgetts (The University of Western Ontario)

[25] *Expanding the (Micro)Scope: Exploring the Technological and Provenance Characteristics of Inuit Pottery Containing Atypical, Animal-Deriving Organic Paste Ingredients*

The extensive research on pottery manufacture in past and contemporary societies suggests that the pallet of tempering materials potters select from includes a relatively limited range of options deriving from the geological landscape, plants (e.g., chaff) and animals (e.g., bone). This tendency is significant considering that almost any material or substance can be incorporated into a paste mixture; what is included in any specific instance is a matter of choice, shaped by the potter's learned knowledge of appropriate procedures. Blood, hair, feathers, fat and internal organs are not typical ingredients of ceramic pastes, yet ethnographic reports of pottery making among the Inuit of Arctic North America indicate that they were commonly used. Accurate identification and quantification of these animal-deriving constituents in archaeological pottery is critical to our understanding of the logic of craft practice among hunter-gathers of the circumpolar region, as well as the interactions and movements of people, resources and material objects within this natural and social environment. In this paper we present a descriptive-systems-based approach for the characterization of ceramic bodies containing atypical organic tempers which expands: 1) current methods of ceramic thin section analysis and description, and 2) the evidentiary basis of technological and provenance interpretations.

Mooney Digrius, Dawn (California State University)

[99] *Teaching Archaeology from a Sustainability Perspective*

In the twenty-first century, archaeology should be applied and should include scientists and engineers. Why? The reason is simple: because the discipline contributes to our understanding of contemporary issues such as global warming and environmental degradation as well as the past. As a paleoethnobotanist (and now historian of paleobotany), I saw a need for more collaborative work. Thus, in my classroom, I utilized a multi-disciplinary perspective, one that drew from anthropology, water resources engineering, and plant science. Once my students were trained in the necessary theoretical and methodological practices, they went into the field (Ecuador) to conduct their own fieldwork under the auspices of sustainable development. Students conducted interviews with the local community, undertook survey work, took water and soil samples, and drew maps of the study region. Upon their return, they created a design plan that took into account the prehistoric and historic use of the land in order to develop a more sustainable development program. In this fashion, archaeology was seen as contributing to global sustainable development projects in a more relevant way, for it allowed the students to tackle real-world problems in a deep and meaningful way.

[188] *A Way Forward with Public and Professional Archaeology: The Exploring Joara Foundation in North Carolina*

The Exploring Joara Foundation, Inc. is a not-for profit, 501(c)3, organization whose mission is to support public archaeology in the western Piedmont region of North Carolina. Formed in 2008, the foundation has grown around the long-term research project at the Berry site, near Morganton, NC; now known to be the location of the Native town of Joara and the Spanish Fort San Juan built by Juan Pardo in 1567. Archaeological investigations at the Berry site since 2001 have involved the public in all aspects of the project and today the Exploring Joara Foundation reaches more than 4,000 school children and other members of the public each year with hands-on programming including classroom visits, field and lab experiences, and summer camps. This paper explores the challenges and rewards of an intentional public approach to professional archaeology.

Moore, Henrietta L.

[297] *Feminism and Experimentation*

This paper discusses the relationship between conceptual development and material experimentation in feminist research. It uses the work of Ruth Tringham as a fulcrum for wider discussions on how we can and should drive new forms of experimentation as we enter the fourth wave of feminism.

Moore, Andrew (RIT)

[334] *Brian Fagan, Climate Change, and Us*

Brian Fagan has been a leader in illuminating the human past for students, and the public of all ages. From his writings and lectures thousands of people have come to understand how human societies have shaped the world in which we live. In recent years Fagan has built on these insights to bring a compelling message to his many audiences: that climate change has profoundly impacted human communities in the past and that it continues to do so in the present. He invites them to ponder these lessons and to consider how they should respond in the light of past human experience, now intensified by increasingly dense populations, large-scale exploitation of the earth's resources, and modern technology. This paper will examine Fagan's recent publications on the theme of climate change, explore the development of his thinking, and offer an assessment of the contributions he is making to present-day debates.

[352] *"Beyond the Solstice"*

The Great Murals of Sierra de San Francisco, Baja California, Mexico, have been the subject of in-depth study (Gutierrez 2013; Hyland 1997; Rubio 2013; Vinas 2013). The latter include recordation of major sites and reconstruction of age, cultural affiliation, and hypotheses as to meaning and function.

Growing evidence supports that these sites display light patterns correlating with winter / summer solstice timings. Arguments have been presented that light manifestations exhibit similarities to central mythological subjects. The latter are documented in the regional oral traditions of the indigenous people (cf. Jones 1995; Rubio 2013; Smith 1985). Ethnographic documentation provides a basis for an interpretive reading of the murals on themes of world renewal, seasonal rebirth and cyclic continuity.

This presentation extends beyond solstice markers. There is substantial evidence that painters included sunlight, not just on the solstice, but also on other times of the year. Painters appear to employ movements of light and shadow as an important factor in the creation of the paintings. This

paper explores these phenomena and their ramifications for understanding Baja California hunter-gather cosmology, symbolism, metaphor and the overall deeper meaning of the images.

[189] *Possible Causes for Major Cultural Change between Classic and Postclassic Occupations in Western Mexico*

Preclassic and Classic occupation on the West Mexico has been dominated by the shaft-tomb culture. In Nayarit there is evidence for shaft-tomb occupation from 300 B.C. to about 900 A.D. Recent archaeological rescue projects related to the construction of the highway from Guadalajara to Puerto Vallarta have documented archaeology covered by extensive volcanic deposits belonging to a cataclysmic (VEI 6) Plinian eruption from nearby Ceboruco volcano. Postclassic Aztatlán culture buildings are situated directly above the volcanic deposits marking a major cultural change at 1000 years BP. The Plinian eruption of Ceboruco volcano can easily explain sudden abandonment of preclassic sites in the surroundings of the volcano. This kind of eruption comes along with meter-thick pumice and ash fallout covering hundreds of square-kilometers, as well as thick (cm to meter thick) deposits left by fast-moving hot pyroclastic flows and surges. These deposits buried croplands and natural vegetation and animals have been severely affected for years to decades.

[303] *Murales prehispánicos en la costa norte del Perú: la imagen del poder y el poder de la imagen*

La costa norte del Perú ofrece impresionantes evidencias de una intensa actividad artística, asociada al manejo geopolítico de las sociedades desarrolladas entre desiertos y valles (3000 a. de C. a 1542). Una muestra del ingenio y habilidad de artistas al servicio de los grupos de poder. Colosales templos de tierra policromada, con impresionantes espacios ceremoniales que fueron acondicionados para pintar en sus paredes un ordenado discurso iconográfico que evidencia la función ceremonial de los patios, murales ejecutados como pinturas planas y relieves. Una práctica que se registra desde el Formativo hasta los Incas. Una compleja descripción de dioses, escenas y mitos, que expresa cambios ideológicos, estilísticos y tecnológicos. Estas representaciones no fueron decoraciones ambientales, pues, constituyeron sistemas de comunicación asociados a la función ritual del espacio. La iconografía expresa a través de imágenes una relación litúrgico-estilística entre murales, indumentaria de oficiantes y objetos de uso ceremonial. Frente a este frágil

y fatigado patrimonio de tierra, se enfrenta el reto de su conservación sin alterar su autenticidad y valores intrínsecos.

Morales-Aguilar, Carlos (Université Paris 1 - Panthéon Sorbonne)

[183] *Classic Maya Households in Northern Peten, Guatemala: An Overview*

The Northern Peten is composed by a complex network of monumental sites that proliferated in the Preclassic during a time period that witnessed the maximal centralization of power in the area. Afterward, during the Classic period, this region experienced a cultural shift and a reoccupation forming a different political panorama. However, little is still known about the Classic Maya settlements of Northern Peten, especially about their households. Recent archaeological investigations at Naachtun and El Mirador have recovered intriguing new data for Late Classic Maya residential architecture. Preliminary results demonstrate that Late Classic residential units in Northern Peten were built on top of Preclassic constructions or next to older buildings. This paper focuses on residential units through the analysis of settlement structure, architecture, and ceramics that evidences the traces of activities that their inhabitants left behind at this particular region. Also, this paper seeks to provide a comparative perspective of elite and commoner households in order to examine the roles of domestic ritual, household economies, and sociopolitical networks in a regional context.

[317] *Exploring the Ancient Mitochondrial DNA of Precolumbian Populations Inhabiting Basin Mexico during the Post-Classic Period (900-1521 A.D.)*

The genetic study of precolumbian populations that inhabited the Basin of Mexico has recently begun. The genetic analysis of different periods in specific spatial territories could contribute to understanding patterns of interaction for precolumbian populations that lived in Mesoamerica. I use ancient mitochondrial DNA analysis to explore genetic similarities and differences within and between precolumbian bone samples provided by the Instituto Nacional de Antropología e Historia (INAH) in Mexico. The samples from post-Classic (A.D. 900-1521) Cholula, Tlatelolco and Teotihuacan will be compared to samples from the pre-Classic period (1200-600 B.C.) from Tlatilco and the Classic period (A.D. 1-900) from Jaina; to assess their biological affinities and the possible movements and origin of populations that lived during the post-Classic Period. This goal of this research is to contribute our understanding of theoretical patterns of migration, cultural fusion, or replacement of Mesoamerican populations through contrasting material culture evidence of social changes and genetic consequences.

[19] *Forensic Archaeology: A Ten Year Retrospective*

In 2004 the first symposium dedicated to forensic archaeology was organized at the Society for American Archaeology's annual meeting. At that time, forensic archaeology was struggling to be defined within the archaeological community and was mostly non-existent to forensic practitioners in the USA. The events of 9/11, several domestic high profile mass casualty events, missing persons and some homicide investigations began a gradual momentum towards the recognition of archaeology's use within a forensic context. This session will look back at the past ten years of the Forensic Archaeology symposium at the SAA and how it reflects forensic archaeology's growth and persistent challenges. Has anything been achieved since 2004? Where does forensic archaeology in the United States go from here?

Morehart, Christopher (Arizona State University)

[180] *Socio-Spatial Isomorphism and Ancient Farming Systems: Nominal versus Practical Tenure in the Basin of Mexico*

The recognition that similarities exist between the form of agricultural systems and the form of society is a fundamental archaeological contribution to the social sciences. This view of socio-spatial isomorphism is especially notable in research on irrigation. The spatial and temporal properties of water require particular forms of cooperation. Organizational configurations are contingent upon scale, integration, and number of users. In the Basin of Mexico during the Postclassic period, the organization and conveyance of land was tied to multiple institutional domains: household, community, state. The creation of named systems of tenure was one means by which the state exerted control over land, at least by the Late Postclassic Aztec Empire. However, the state exerted little direct control over production, and no relationship existed between systems of nominal tenure and the physical characteristics of farming systems. The first step to understand tenure in practice is to map social relations from the physical structure of agricultural systems, a basic method in archaeology. But to elucidate how local and non-local circumstances also shaped practical tenure, archaeologists must study multiple lines of data that go beyond socio-spatial isomorphism.

Morell-Hart, Shanti (McMaster University)

[38] *Fedickschrift: Notes on a Prominent Historical Figure in Ethnoecology, Ethnoarchaeology, and Landscape Studies*

The legacy of Scott Fedick in ethnoecology, ethnoarchaeology, and landscape studies cannot be understated. Aside from years of active collaborative work and mentorship, the dissemination of his research has led to rich interpretations far beyond his immediate influence.

In the first part of this paper, I follow impacts of Fedick's scholarship in several fields, as tracked through citations and students. I also trace his impacts on public policy and common understandings of Maya lifeways. In the second part of this paper, I address Fedick's work at the site of T'isil, Yalahau Region of Quintana Roo, where he carried out over a decade of research. I report my findings from paleoethnobotanical analysis at a well-to-do ancient household in the center of the site, including macroremains and microremains. I consider shifts in plant practices and relationships with the landscape as indexed by these residues.

These findings are illuminated by those from Fedick's own experimental studies and publications on ethnoecology and the landscape. I pay particular attention to his writings on the "managed mosaic" that both reflected and inspired ancient Maya ethnoecological practice. Such work has guided countless scholars, whether field school students, graduate student advisees, or collaborators in archaeology.

[251] *Archaeology of Fuegian Islands: Tierra del Fuego, Dawson and Navarino, Human Settlement and Cultural Interaction (Patagonia, Chile)*

The Fuegian archipelago, dominated by three major islands named Tierra del Fuego, Dawson and Navarino, is located in the southernmost end of South America. Peopled by hunter-gatherer societies since c. 10.500 BP, the interior sea formations date to the Early Holocene. Shoreline environments have evidence of specialized marine adaptation since c. 6.500 BP, after which colonization has been generally interpreted as homogenous, stable and continuous. Ethnohistoric and ethnographic records account for an overlapping network area of three groups: selk'nam land hunters and alacalufe or kawésqar from central-western Patagonia and yamana or yagan, south of Beagle channel, both maritime nomads. This subsistence dichotomy -terrestrial/marine and pedestrian/canoe- has restrained research and comprehension of the archaeological record.

Therefore a broad and comparative assessment has been undertaken, with a methodological focus on objects or artifacts whose origin can be traced as transport evidence and face to face relations (e.g. lithic and bone raw materials). Also, technological traits related to certain cultural elements that involve more complex teaching-learning processes, sharing and information flows have been studied (e.g. complex core reduction, cranial modification techniques).

[341] *Environmental Limitations, Alpine Villages and Logistical Strategies in the Northern White Mountains*

Recent investigations in the extremely remote and previously unsurveyed northern White Mountains have identified a pattern of alpine land use consistent with many other alpine regions in and around the Great Basin: one focused mainly on artiodactyl hunting. But sites similar to the alpine villages in the southern portion of the range were discovered at the subalpine-alpine ecotone. GIS analyses suggest the relative dearth of high elevation villages in the north is explained by environmental limitations, in particular difficulty of access to markedly smaller stands of piñon pine at lower elevations, which are thought to have helped subsidize residential occupations in the south. Complementary GIS analyses suggest the villages in the north served as residential bases from which long-range logistical hunting parties exploited game in alpine meadows on the northern summit ridge, this standing in contrast to the residential pattern seen in the south. Though superficially similar – both the northern and southern portion of the range contain high-altitude villages – the less intensive and logistical pattern in the north points to just how close to the margin the more intensive pattern in the south really was and to how limiting high altitude environments are to intensive human occupation.

[29] *The Intersection at Biscayne National Park of Looting as a Traditional Form of Recreation, Submerged Cultural Resources, and Management Practice*

Protecting archaeological sites from looting is one of the constant challenges facing the 66 park units in the Southeast Region of the U.S. National Park Service. One park in particular--Biscayne National Park--eclipses the others in terms of the quantity and destructiveness of looting it suffers. Research since 2010 at the HMS Fowey, English China, Black, Pillar Dollar, Brick, Long Reef Cannon, and other shipwrecks illustrates the severity of the problem. The submerged nature of the resources is part of the explanation of why this particular park is targeted for looting, but it is only part of the

picture, as other maritime park resources elsewhere do not receive the same degree of illicit attention. Logistical and institutional barriers have impeded law enforcement as a deterrence method, and it is unclear what alternative strategies, such as stewardship education, might most effectively be brought to bear.

[33] *The Social Transmission of Oldowan Lithic Technology*

Flint flakes appear in the archaeological record from 2.5mya and the skill to produce them is believed to have been socially transmitted. However, how this occurred remains a mystery. In an experiment involving 184 participants, we investigated how effectively five different forms of transmission facilitate the acquisition of the ability to produce Oldowan flakes. We compared i) reverse engineering of discarded flakes, ii) observational learning, iii) basic “ape-like” teaching, iv) gestural teaching and v) verbal teaching. We found that teaching, particularly verbal teaching, allowed participants to produce a greater number of flakes from a single piece of flint, to do so more rapidly and with more efficient use of raw materials and energy, than did reverse engineering. There was no evidence that observational learning improved performance relative to reverse engineering. We conclude that reliance on stone tools during the Oldowan would have generated selection for enhanced means of communication and it is likely that forms of teaching were present during the Oldowan. We also suggest that the appearance of Acheulean technology 1.7 mya relied, in part, on the prior evolution of novel forms of communication, which, given the complexity of Acheulean tool-making, plausibly involved a simple form of symbolic communication.

[90] *Utilizing Visual Resource Management to Assess Effects on Historic Properties; Working within the BLM VRM Framework*

This paper will provide an overview of using the established Bureau of Land Management (BLM) Visual Resource Management (VRM) system to assess indirect visual effects on historic properties. Per Section 106 of the National Historic Preservation Act, the introduction of visual elements that diminish the integrity of the property's significant historic features constitutes an adverse effect. The VRM system was designed to inventory landscapes, identify those with high scenic values worth protecting, and use Contrast Rating to determine if proposed projects or actions would be within the range of acceptable change to the landscape. Though VRM was not designed to measure effects on historic properties, by using the Contrast Rating portion of the VRM system, potential changes, which may constitute adverse effects, to the landscapes and settings of historic properties can be identified and quantified. With the introduction of BLM guidelines in 2012 for the management of National Trails, quantifying potential adverse visual effects to National Historic Trails, in addition to effects on other site types, is becoming more common as part of CRM.

Morgan, Jessica (University of South Florida) and Tristan Carter (McMaster University)

[91] *Obsidian Source Selection in the Early Bronze Age Cyclades*

While the obsidian used by southern Aegean prehistoric communities has long been known to derive primarily from Melos, there has been little investigation regarding the relative importance of the two Melian quarries – Sta Nychia and Dhemenegaki. This study employed portable X-ray fluorescence spectrometry to investigate this question and begin to map regional traditions of obsidian source selection during the 3rd millennium B.C. The 715 artifacts analyzed derive from 11 Early Bronze I - late Early Bronze II cemeteries on the Cycladic islands of Naxos and Kouphonisi. The material is dominated by pressure blades manufactured specifically for funerary consumption. Contextually, they reflect the social significance of body modification amongst these islanders, the blades likely used for depilation, scarification, and tattooing. Our results display a clear overall trend. While unsurprisingly, the raw materials are overwhelmingly Melian, the data show a clear preference for

Sta Nychia products (> 85%). Whether this procurement bias is Naxos-Kouphonisi specific is currently difficult to say, though contemporary data from Mochlos on Crete show a similar pattern. Future research integrating source selection with previously defined regional distinctions in pressure-blade technology is necessary to begin mapping synchronous 'communities of practice'.

Morgan, Brooke (Southern Methodist University)

[148] *Folsom Households and Community Structure: A New Look at Hunter-Gatherer Lifespace*

The presence of four contemporaneous Folsom-age structures at the Mountaineer site near Gunnison, Colorado suggests these hunter-gatherers had broader adaptations than previously recognized. Mountaineer provides a unique setting for investigating Folsom socio-economic structure as it relates to domestic architecture, through analysis of lithic assemblages and spatial patterning. A multi-scalar analysis has provided new insight into Folsom lifeways and raised questions concerning how archaeologists operationalize concepts from the ethnographic literature. Though documenting "activity areas" has been fruitful in ethnoarchaeological settings, accurate identification of such areas through k-means cluster analysis was unsuccessful in this case. At intensively occupied, open-air sites like Mountaineer, archaeological deposits are subject to diverse post-depositional c- and n-transforms (sensu Schiffer 1987), precluding meaningful behavioral interpretation at the grossest scales of analysis. However, finer-grained scales of analysis at the level of macro- and microdebitage reveal actual patterning may be preserved over time. These fine-grained data, evidence for offsite foraging, and multiple smaller Folsom sites within the Gunnison Basin point to reduced residential mobility and implementation of a logistical foraging strategy.

[297] *A Chimera Spider at Play: Making, Creativity and Collaboration in Digital Archaeology*

In an interview with Michael Shanks and Christopher Witmore, Ruth Tringham describes her experiments with digital remediations of the past as "expressing and sharing the complex web of relationships and ambiguities that is an essential dimension of the feminist practice of archaeology" (Rathje et. al 2013). As such, Tringham's practice of digital making was an explicitly political expression of archaeological investigation, not as explanation, but as an interpretive process. She shared the excitement and engagement of creating archaeological narratives through New Media with her students, teaching digital media expression as a legitimate form of academic enterprise that can yield a "playful surprise." Tringham's digital remediations, founded on archaeological evidence, explored a vast array of media--photography, videography, hypertext, virtual reality, augmented reality, gaming, and database narratives, to name a few--bringing an unheralded creativity and irreverence to archaeological interpretation. In this presentation I engage with Tringham's contributions to archaeology with particular attention to critical making and play as political, productive methods for thinking about and with the past.

[413] *Overland Trade in the Central Maya Lowlands: The View from Trinidad de Nosotros, El Petén, Guatemala*

Although the largest Classic Maya political capitals are frequently assumed to have served as the critical nodes in long-distance trade networks, empirical data from decades of research suggest that ancient Maya trade was more nuanced in its organization. This paper presents a view on Maya trade from the perspective of Trinidad de Nosotros, a port on Guatemala's Lake Petén Itzá. Trinidad's position, astride overland trade routes and intermediate between these routes and a major political capital, provides an ideal vantage point for exploring the intersection of trade and politics at the local level. Drawing on obsidian analyses, ceramic data, and the architecture of harbor facilities at

Trinidad, we explore the structure of trade in an emergent Late Classic Maya polity. These data demonstrate both the complex and heterarchical structure of ancient Maya trade, and the need to consider small and medium-sized centers as potentially critical to long-distance trade networks.

[396] *A Critical Reappraisal of Middle Paleolithic Diets*

This paper examines dietary patterns amongst Middle Paleolithic foragers in Europe and southwest Asia from ca 300 to 40 thousand years ago. In both regions, faunal studies show that a relatively narrow range of presumably high-ranked animal species—mostly medium- to large-sized ungulates—was hunted. The present review stresses the importance of considering fat procurement and the effects of transport constraints on faunal assemblages while assessing the diet composition of Middle Paleolithic hominins. Overall, the published evidence hints at significant regional and temporal variation in dietary patterns during this time period.

Moritz, Ryan and René Vellanoweth (CSULA)

[383] *Expedient Stone Tool Analysis from Tule Creek (CA-SNI-25)*

San Nicolas Island is the most remote of the California Channel Islands and has been inhabited since the Early Holocene. The island has an abundant supply of highly indurated sandstones as well as quartzites, metavolcanics, and metasedimentary rocks associated with densely packed conglomerate beds. Although there are no microcrystalline rocks such as obsidians, cherts, and fused shales, the local island toolstone is ideal for expedient tool technologies and for working sandstone. The Native islanders made use of local materials for everyday activities such as hunting, food processing, shell fishhook production, and other important domestic undertakings. In this paper we examine expedient tool technology at a late Holocene village site located on the north coast of the island that has been dated to between A.D. 1200 and European contact. We conducted our spatial analysis by selecting several units associated with fishing technologies and comparing the expedient tools with units selected from the same loci (East Locus) but without association to fishing technologies. These expedient tools were then compared to units selected from Mound B, another loci within the site, which is primarily associated with residential habitation. The results of this expedient tool analysis from CA-SNI-25 will be discussed in this presentation.

Morris, Annelise (University of California, Berkeley)

[34] *Materializing the Momentary: Community Engagement Through Ethnographic Practice*

Community engagement is a growing aspect of archaeological practice; not only are archaeologists realizing that these kinds of projects are increasingly important to the movement of decolonization in regards to the histories of under-represented communities, but also that these relationships produce valuable knowledge about sites and their life histories. This paper specifically examines the unique ethnographic moment that arises when descendants and archaeologists come together in the practice of archaeological investigation. I assert that the sensory experience of the materialities of the past create a moment for engaging with memories, ideas, and emotions about sites, their inhabitants, and their artifacts which cannot be accessed or explored any other way. As such, this requires a re-orientation of research design and theoretical interpretations to account for this knowledge. To discuss implications of this reorientation, I'll present examples from my work on the Historic Archaeology Project of Lawrence County, a project which examined processes of racialization during the 19th and early 20th century through excavations centered around rural Black-owned farmsteads in Southeastern Illinois. I will conclude by asserting that collaborative community archaeology offers a rich anthropological opportunity to examine how we, as both archaeologists and community members, know and reproduce our histories.

This presentation is a continuation of research on the intersource and intrasource variability of Burlington chert and its implications for interpretations of pre-contact period settlement and procurement. Our results presented in 2013 suggest that Burlington look-a-like cherts (e.g., Lafayette Formation chert, etc.) display the same mid-infrared spectral range as Burlington Formation chert from quarries and secondary deposits (St. Louis area, northern-central Missouri, and southwest Missouri). Testing of additional chert samples is being conducted in order to verify our 2013 results by exploring spectral similarity to other cherts.

Morrow, Sara [273] see Watson, Adam

Morrow, Sara (University of Notre Dame), Ian Kuijt (University of Notre Dame) and Katie Shakour**[315]** *Materialized Mourning: House Wakes and Pipe Use on Inishark and Inishbofin, County Galway, Ireland*

19th and 20th century Irish house wakes memorialized the dead in a spirit of remembrance, revelry, and community healing. A central aspect of the wake was the smoking of pipe tobacco, with funeral goers smoking in the house and at the burial ground often discarding their clay pipes after smoking. Archaeological excavations on Inishark Island, County Galway, Ireland, revealed complete and incomplete clay pipes in a deposit within building 8, a home dating to the late 19th century. By comparing clay pipes from building 8 with other excavated sites from Inishark, and neighboring Inishbofin, we examine how unique properties of the building 8 assemblage reveal information on use and discard of pipes and other contextual material regarding funerary practices. This poster examines how pipes were used in a daily context of island life, but also how they may have

transcended that role and were repurposed into ceremonies of death and burial given the relative isolation and unpredictable access to goods on the island. As a result, islander wake customs during the 19th and early 20th century fostered local community ties, shared regional identity and engagement with symbols of resistance to colonial rule.

[19] *A Missing Person Body Recovery Case: Maintaining Professionalism and Best Practices as a Forensic Archaeologist Amidst Escalated Tensions*

In Fall 2012, I was contacted by a county sheriff's department in South Carolina and their Coroner as well as by the family members of a missing person, to request my assistance as a forensic archaeologist in a body recovery. A 54 year old male had been missing for nearly two years until a timber worker stumbled upon a human bone in the course of marking trees for harvest. What followed was a body recovery wherein I witnessed growing tensions between family members towards law enforcement resulting in misguided efforts by the family that compromised the search area. Insinuations of a police cover up and homicide were among the unfounded and inflammatory speculations introduced by previous search and recovery volunteers on the scene before we arrived. Ultimately, I and my crew became unwitting negotiators between parties to quell hostilities. This paper is an attempt to address issues of professionalism amidst tensions that have escalated and complicated a body recovery.

Moses, Victoria (University of Arizona)

[51] *Temple, Tavern, and Table: Zooarchaeology at the Area Sacra di Sant'Omobono from the 7th Century B.C.E. to the 13th Century C.E.*

The Area Sacra di Sant'Omobono in Rome, situated on the banks of the Tiber River at the base of Capitoline Hill, contains evidence of Rome's people from the earliest inhabitants to modern day. This research utilizes zooarchaeological analysis to investigate how the space was used in three time periods: Archaic, late Roman, and Medieval. The diachronic analysis of the faunal remains reflects the range of uses at the site during its occupation and highlights the integration of quotidian activities in a sacred space. The Archaic faunal assemblage, associated with the late 7th to early 6th century B.C.E. temple, contains the remains of sacrificed animals. The sacrifices consist mostly of very young sheep/goat, but pig, cattle, and dog are also represented. The late Roman assemblage is a 3rd to 4th century C.E. tavern. In contrast to the sheep/goat dominated Archaic assemblage associated with the temple, these later remains are dominated by pig. The 12th to 13th century C.E. midden contains remains of domestic consumption that are more varied and show a marked increase in chicken consumption.

Moshenska, Gabriel (UCL Institute of Archaeology)

[235] *Digital Public Archaeology in the UK - A Review*

This paper offers an overview of recent and emerging trends in digital public archaeology in the UK. It draws on examples of research and practice in public archaeology by academic, museum, amateur and professional archaeologists engaged in public engagement activities, as well as the emerging field of crowd-sourced and/or crowd-funded public archaeology in which digital public engagement has played a leading role. I take a skeptical view of some of the more extravagant claims made for digital public archaeology, and question the utility and - in particular - the sustainability of some categories of projects. The role of funders and in particular the Heritage Lottery Fund will be considered as a factor (and a potential hazard) in the growth of digital public archaeology, alongside the growing academic archaeological engagement with digital humanities. I hope that insights from the UK experience of the financial, cultural and knowledge economies of digital public archaeology will be of wider interest and value.

Mosher, M. J. (Western Washington University)

[415] *Can Epigenetic Mechanisms Illuminate Dietary Ancestry in Populations?*

Illuminating genetic and environmental factors underlying complex traits is a daunting task. Dietary nutrients provide continuous and evolving influence on gene expression, thus affecting individual growth and development and adaptive capacities over the life course. Metabolic traits represent the culmination of many gene-by-nutrient interactions. Genes set parameters for susceptibility to environmental factors, and variation in both internal and external environmental dynamics mediates the ultimate response. Epigenetic mechanisms, such as DNA methylation, register environmental signals and mediate gene expression without altering gene sequencing. These mechanisms provide a more rapid, flexible and even reversible response to the environment than natural selection pressures on DNA. Nutrients play a pivotal role in the ongoing modification of these mechanisms. While we may extrapolate from abundant research in animal studies, studies examining normal human variation are lacking. Here we discuss the role of nutrients in DNA methylation and confounding environmental factors also affecting its variation. We present the modern migration model used in our previously reported pilot studies of four populations, examining methylation variation in the leptin core promoter, a gene regulating energy homeostasis, adipogenesis and reproduction. Maternal/offspring duos from three continents were compared: two African populations, one North American, one SE Asian.

Moss, Madonna (University of Oregon)**[415] *The Nutritional Value of Pacific Herring: an Ancient Cultural Keystone Species on the Northwest Coast of North America***

Pacific herring play a special ecological role in North Pacific marine ecosystems by converting phytoplankton into energy consumable by a variety of animals, including humans. Northwest Coast peoples have been consuming herring since the early Holocene, and patterns of usage likely changed over time. Herring are available in different forms during different times of the year. This paper will evaluate the nutritional value of herring and seasonal herring products vis à vis other Northwest Coast animal foods by comparing values for protein, fat, calories, and brain-selective nutrients including Omega-3 fatty acids DHA (docosahexaenoic acid) and EPA (eicosapentaenoic acid), in addition to iodine, iron, zinc, copper, and selenium. Herring are found to be remarkably rich nutritionally and function as the linchpin within complex ocean food webs. Their seasonal patterns of abundance attract a wide range of animals, almost all of which have been of economic value to Alaska Natives and First Nations for thousands of years.

Motsinger, Thomas**[209] *Digital Archaeology at Ironwood Village: A Model for Archaeology's Paperless Future***

The particular challenges at the Ironwood Village excavations—time constraints, burgeoning data opportunities, and management of a complex array of excavation staff and machinery—begged for a modernized approach to data collection and workflow management. PaleoWest Archaeology's digital workflow system—already four years in development—was customized for the project and implemented throughout. The result was one of the world's first all-digital major excavation projects, the success of which could serve as a model for a high-quality, efficient, and cost-effective archaeological workflow, in both cultural resource compliance and academic field research settings.

[209] *Chair***Motta, Laura (University of Michigan) and Laura Jessmore (University of Michigan)****[54] *Analysis of Plant Remains from the Bronze Age Site of Pecica Șanțul Mare***

The site of Pecica Șanțul Mare, Romania is among the most important settlements of the European Bronze Age to understand the origins and control of metalwork networks that redistributed the metal resources of the western Carpathian Mountains throughout prehistoric Europe. The study of the ways vegetal resources were used by the inhabitants of Pecica will provide crucial information about

the level of social, political, and economic complexity achieved during the Bronze Age. In particular archaeobotanical remains are examined to explore how Pecica acted as a center of food production and redistribution, how the people of Pecica shaped their environment, and why they may have abandoned the site after a period of rapid increase in social complexity. Initial findings indicate that cereals, especially einkorn wheat (*Triticum monococcum*) and barley (*Hordeum vulgare*), were grown as a principal food source throughout the Bronze Age. In addition, several species of weeds and wild plants have also been found across the site and there is a clear difference in taxon distribution between earlier and later phases of occupation.

Motuzaitė Matuzeviciute, Giedre (Lithuanian Institute of History) and Martin Kenneth Jones

[345] *Earliest Direct Evidence of Crop Consumption in the central Tian Shan (Kazakhstan and Kyrgyzstan)*

The main goal of this research is to explore the contribution of plant foods to the diet of pastoral societies. It is still a subject of debate whether domesticated plants were being consumed and grown or just traded in this region during the Bronze Age, as the role of domesticated crops and their intensity of consumption in pastoral societies has been overlooked. This research presents the first results of stable carbon/nitrogen isotope analysis and archaeobotanical investigations from prehistoric sites in the central Tian Shan mountains of Kazakhstan and Kyrgyzstan. AMS dates of human bones and charred cereal macrofossils allow for the identification of the earliest established agro-pastoralists in this region.

Mountjoy, Joseph (Universidad de Guadalajara, México)

[352] *Huichol Symbolism and the Interpretation of Rock Art in the Western Sierra of Jalisco Mexico*

The Huichol are not known to have inhabited the western sierra of Jalisco in historic times. However, it has been possible to use Huichol symbolism to interpret rock art at several locations in this region. This was first done with the large pictograph panel at La Peña Pintada in the Tomatlan river valley, indicating the use of the sun's position on the eastern horizon as a dry season/wet season calendar and individual pictographs depicting plants and animals important for native subsistence. Subsequently, Huichol symbolism was used in the valley of Mascota to interpret petroglyphs in the Canon del Ocotillo as they relate to the transitional dry season/wet season Huichol ceremony of the Sacred Deer Hunt, done preparatory to planting. Most recently, Huichol symbolism has been used to understand associated deer and scorpion petroglyphs at the El Bordo II site as they relate to the growing season of maize. The El Bordo II petroglyphs can be dated to about 2,000 years ago, suggesting that major sites of rock art may have been visited seasonally over perhaps hundreds of years in order to conduct rituals related to the agricultural cycle.

[412] *From Raw Material to Symbol of Social Value: Obsidian Movement in the Paleolithic*

Recent research has demonstrated the extensive use of obsidian throughout the Paleolithic in all the areas where obsidian sources were available at the time. Further analysis revealed that obsidian covered a wide range of distances on the Paleolithic landscape but in the majority of cases its movement was linked to long distances, i.e. ≥ 100 km. This surprising conclusion cannot be satisfactorily explained on purely functional terms. Obsidian's physical properties could have been the primary reason for its use in short site-to-source distances but this explanation fails to explain why our early ancestors would have undergone the effort of traveling far to acquire obsidian when other good quality materials were locally available. A more likely explanation, discussed in this paper, seems to be associated with obsidian's aesthetic properties, specifically color, brilliance and iridescence. These features transformed obsidian into a material of social value that allowed early humans to control their global social landscape and negotiate otherwise completely unrelated individuals.

Moy, Rachel (UCLA)**[53]** *Neolithic vs. Late Stone Age: The Neolithic Revolution in the Horn of Africa Reconsidered*

This poster assesses the applicability of the term “Neolithic” to describe the beginning of sedentism and agriculture in Ethiopia, and whether we can compare it to similar periods in other regions. The use of the term “Neolithic” has been criticized in recent years (Finlayson 2011; Zeder 2009) both for the implication that the period was one of revolution and its associated package of characteristics. This designation originally derived from the definition of the term as including the birth of agriculture and increased sedentism in the Near East (Childe 1951), but has now become a blanket term to describe prehistoric societies across the globe. Scholars now recognize that the adoption of separate components of the “Neolithic package” happened at various rates and scales in different regions. Though designations of Late Stone Age are more common in African archaeology, the term “African Neolithic” is still regularly used. This poster reconsiders evidence for when components of the “Neolithic package” were first adopted in the Horn of Africa, and through this discussion, considers if the term “Ethiopian Neolithic Revolution” is appropriate for the region's prehistory.

Moyes, Holley (University of California, Merced), Shayna Hernandez (University of California, Merced) and Lauren Phillips (University of California, Merced)**[355]** *Little Finds Big Results: The Utility of Small Artifacts in the Spatial Analyses of Looted Sites*

Ethnographically cave use in Mesoamerica is well-documented and there are many accounts of modern rituals occurring in or near caves. These analogies provide excellent evidence for understanding the meaning of caves and provide supporting evidence to demonstrate that they functioned as ritual spaces in ancient society, yet analogies have little resonance when considering ancient rites occurring deep within caves. For this type of question we are much more dependent on the archaeological record itself. To complicate matters, most cave sites have been heavily looted destroying artifact assemblages and disturbing contexts. In spite of these challenges, caves still contain a great deal of information and new methods of recording provide new data for analyses, hence new interpretations. In this paper we examine the use of small finds in archaeological analyses using two case studies from ancient Maya cave sites in Belize, Chechem Ha Cave and the cave at Las Cuevas. In both instances, spatial analyses using GIS reveal the contexts and structure of rituals occurring within the sites allowing us to better understand the nature of ritual practice as well as its changes over time. This has broader implications in understanding how ritual practice articulates with larger socio/political processes.

Mrozowski, Stephen (Fiske Center for Archaeological Research, University of Massachusetts Boston)**[340]** *Empirical Imperialism and the Development of Indigenous Archaeologies*

One way of situating the empirical research that often accompanied European colonialism is to view it as an instrument of imperialism. This legacy stands a major impediment to the kind of collaboration that is an essential part of the growth of indigenous archaeologies. Yet empirical research remains an important part of archaeology. Used in a collaborative framework it can provide powerful evidence that can augment and refine indigenous histories, especially those being disputed by governments that seek to deny those very histories. This paper provides an overview of the Hassanamesit Woods Project that involves collaboration between the Fiske Center for Archaeological Research at the University of Massachusetts Boston and Nipmuc Nation of Massachusetts. It presents an example of the manner in which the Nipmuc Tribal Council has embraced empirical archaeological evidence as a way of extending the temporal depth of their cultural and political history. The strength of this research is aiding the Nipmuc in appealing a denial of federal recognition that was initially granted by the Clinton administration only to be reversed by the Bush administration.

[99] *Teaching Archaeology with Campus Trash*

Student participation in campus trash audits connects to multiple principles of curricular reform articulated by the SAA, including making them aware of basic methodological and cognitive skills used by archaeologists, real-world problem solving, and becoming effective communicators. Their physical participation helps convey field and laboratory skills. Having them draw behavioral inferences from trash provides experience in cognitive skills of interpretation. Results of trash audits can be used to significantly reduce waste, improve recycling, and increase campus sustainability, making the real-world problem solving aspect of archaeology clear. At Capilano University, the trash audit is a theme that runs through the Introduction to Archaeology course, incorporated into course components on rationalizing archaeology; research design; field and lab methods; reconstructing behavior, and the archaeology of contemporary times. Students have a prefatory orientation on how the waste audit works. On the day of the audit, students work in 90 minute shifts sorting 100 percent of the accumulation of the trash from the previous day. Students write a report in standard scientific format, including background, methods, results, and discussion. Feedback from students has generally been positive.

[404] *A Fortified Frontier - LIP Defensive Settlement in the Moche Valley*

During the Late Intermediate Period (LIP, 1000-1476 CE), the florescence of the Chimú Empire in the Moche Valley on the coast corresponded with an explosion of fortified and defensive settlement up-valley and into the nearby highlands. Previous scholarship has associated these forts with tentative stages of Chimú expansion into the middle and upper reaches of the Moche Valley, placing the imperial frontier as located in the transitional zone between the river valley and the highlands above. While work by pioneering scholars provides a general outline of settlement during the LIP, many questions remain unanswered regarding the affiliation and origin of fortified valley and highland communities during this time, in addition to the variety of interactions which may have structured this frontier zone. Since 2010, I have mapped and conducted preliminary surface collection at several fortified sites in the Moche Valley in order to gain a better understanding of the nature of defensive settlement on the valley-highland frontier during the LIP. Using a synthesis of original data supplemented by previous scholarship, this paper presents current understandings of fortified settlement in the Moche River Valley and its tributaries while outlining avenues for future investigations aimed to better understand the complex frontier.

[412] *Sourcing Rapa Nui mata'a from the Collections of Bishop Museum Using Non-destructive pXRF*

On Rapa Nui (Easter Island), four geological sources of rhyolitic obsidian were utilized to manufacture obsidian artifacts, including tanged implements known as mata'a. In this study, a total of 332 mata'a from the collections of Bishop Museum were analyzed using portable X-ray fluorescence (pXRF). Two analytical methods, Discriminant Function Analysis and Support Vector Machines Classification, were used to assign geographical provenance to these artifacts, which appear to be manufactured using obsidians predominantly from Orito, one of the four geological sources on the island. This study demonstrates how non-destructive analyses of museum collections can contribute to our understanding of obsidian procurement and production on Rapa Nui.

[347] *Methodological Considerations for Examining the "Slave Diet" at Colonial Wine Producing Estates in Nasca, Peru*

The 2012-2013 season of the Haciendas of Nasca Archaeological Project focused on the recovery of material correlates of domestic production, consumption, and discard from two Jesuit coastal haciendas, San Joseph and San Xavier, where the majority of the labor was enslaved and of African descent. Our systematic analysis of macrobotanical remains and sediment samples aimed at branching our understanding of: a) colonial foodways beyond the Native Andean/European dichotomy, as several years of incorporation into a flourishing global economy had been underway by the time the Jesuits acquired the properties in the early 17th C; and b) the impact of the use of dry screening vs. flotation as processing techniques that yield different results with regards to quantity and quality of the materials recovered. The results of dry screening demonstrate that the enslaved population of San Xavier and San Joseph consumed fully domesticated animal and plant species of both New and Old World origin that either grew within or around the haciendas or that could be obtained through market transactions. Flotation results, on the other hand, were more sensitive to the presence of wild species.

[353] *Taming the Beast: Rock Art Data Management and Archival Strategies*

One of the most important, yet often neglected, components of any archaeological project is what happens outside of the field—processing the data. Without meticulously organizing and archiving the data we collect, these fast accumulating pieces of information become no more useful than a pile of papers pushed to the corners of our desks. Worse yet, irreplaceable data could be lost. Shumla Archaeological Research and Education Center is taking measures to avoid this pitfall by developing methods for long-term management and storage of vast data sets. The organization currently manages more than 2 terabytes (TB) of visual and textual rock art data. With increasing use of sophisticated digital technology, the demand on storage space is rapidly increasing. For example, three weeks in the field this past year generated almost 750 GB of raw data alone. In the interest of inciting further discussion on archaeological data management, this paper will present the strategies employed by Shumla to organize and manage large data sets. This will include discussions on hardware and software considerations, as well as field and lab procedures implemented to ensure data integrity and longevity.

[129] *Análisis de redes haplotípicas del DNA mitocondrial (parcial) de los pobladores del Valle de Toluca.*

El valle de Toluca es una región que ha jugado un papel histórico importante dentro del altiplano central de México. Hasta el momento se desconoce el origen de estas poblaciones, aunque la primera aproximación basada en el estudio genético ha sugerido que podrían haber sido conformados por los grupos de raigambre otomiano. El presente estudio a través de la secuenciación del DNA mitocondrial y su análisis filogenético tiene el objetivo de conocer el origen materno de las poblaciones antiguas que habitaron en dichos sitios en tiempo del Clásico tardío al Epiclásico (450-900/1000 d.C.). Es, por ello, que analizaremos la región hipervariable I (RHV-I) del A.D.N mitocondrial de los restos óseos de los entierros provenientes de Santa Cruz Atizapán y San Mateo Atenco. Hasta el momento se ha realizado la extracción del DNA y la amplificación de uno de los fragmentos más informativos de la RHV-I. Asimismo, contamos con la secuenciación de 6 de estos fragmentos. Basados en estas secuencias y mediante PCR Tiempo Real hemos identificado los haplogrupos y, mediante el análisis de redes haplotípicas, sugerimos su posible origen materno y su asociación con otras poblaciones.

[40] *Faunal Evidence for the Neolithic Colonization of Franchthi Cave, Greece (ca. 7000-6500 cal B.C.)*

Franchthi Cave is a pivotal case in research on the mechanisms of the forager-producer transition in the southern Balkans region. Publications on this site have documented the geological, artifactual and macrobotanical records, but detailed information on the faunas is lacking. This zooarchaeological study focuses on the Final Mesolithic and Initial Neolithic periods and the question of whether livestock were adopted as isolated components by late Mesolithic foragers or the site was colonized by people who possessed a fully agricultural lifestyle. This question is addressed using zooarchaeological and taphonomic data, since minor stratigraphic mixing may underlie earlier perceptions of a gradual inclusion of domestic animals into the diet. Changes in taxonomic abundance, contrasting patterns of burning damage, and caprine demographic and body-size data together reveal an abrupt shift from a broad spectrum diet during the Final Mesolithic period to a

highly domestic economy in the Initial Neolithic that centered on caprines (sheep and goats). The caprines that the colonists brought to Franchthi were small in size, and these animals were intensively managed to optimize meat production. The evidence indicates a wholesale replacement of Mesolithic economies by a Neolithic package at Franchthi Cave soon after 7000 cal. B.C.

Munro, Kimberly (Louisiana State University)

[250] *The 2014 Excavations at the Early Horizon Period Ceremonial Complex of Cosma, Ancash, Peru*

The Cosma Archaeological Complex was first documented during a survey in the summer of 2013, outside of the small community of Cosma, Peru. Cosma is located 2600 M.A.S.L at the headwaters of the Nepeña river valley, in the Department of Ancash. This past season was the first to map and excavate within the site complex, which includes three Early Horizon temple mounds, a domestic area, and a hilltop fortress. The 2014 work focused on the main mound of Karecoto, a multi-storied ceremonial mound, and the smaller mound known as Ashipucoto. Preliminary data points to the earliest construction of the site to the Initial Period, with a final capping episode at Karecoto during the Early Horizon. Testing at Ashipucoto reveals that it was utilized from the Early Horizon well into the Late Intermediate Period. This poster will present on a sample of the first year's findings that include the a tradition of circular walls and rooms throughout the site, and the interments of four children and an underground gallery going through a quadrant of the main mound center of Karecoto.

[248] *Dynastic Traditions and Patterns of Ritual Variation in Classic Maya Writing*

Inscriptions found on Classic Maya monuments largely document important historical events and record the political achievements of named royal individuals. Previous onomastic studies of these king lists identify striking patterns in naming conventions which may mark ethnic boundaries as well as signal important attributes or transitions in the life history of Classic Maya rulers. This study investigates the hypothesis that divergent dynastic traditions existed during the Classic period based upon ritual acts recorded on hieroglyphic monuments dated between 250 and 900 CE. Inscriptions compiled in the Maya Hieroglyphic Database provide comprehensive evidence for a range of ritual practices tied to monument construction, feasting, sacrifice, deity impersonation as well as various priestly duties. According to anthropological theories of signaling, extravagant displays by high status leaders are essential to effectively communicate specific information about an individual's beliefs or status. This perspective provides a framework for interpreting the cultural variation and transmission of dynastic traditions in Classic Maya society.

[317] *Early Urbanism in Central Mexico: Preliminary Results of the Tlalancaleca Archaeological Project, Puebla*

Tlalancaleca was one of the largest settlements before the rise of Teotihuacan in Central Mexico and likely provided cultural and historical settings for the creation of Central Mexican urban traditions during later periods. Yet its urbanization process and socio-spatial organization remain poorly understood. This paper presents preliminary results of mapping, ground survey, surface collection, manual auger probe, and test excavations, which were carried out over the three seasons of fieldwork since 2012. It discusses the timing and extent of urban development along with the presence of discrete urban zones and their spatial relationships. The site is characterized by a complex natural landscape, consisting of a large plateau and its surrounding areas. Current evidence suggests that there was an extensive occupation both on the plateau and in the surrounding areas

during the Middle Formative, whereas population was concentrated on the plateau during the Late to Terminal Formative.

[411] *Characterizing the Relationship Between Two Early States of the Andes: The Moche, The Wari and the Product of their Contact. An Archaeological and Archaeometric Perspective*

This paper explores from an archaeological, anthropological, and archaeometric standpoint the relationships between two early states in Andean prehistory: the Moche of the North Coast (A.D. 400 - 850) and the Wari of the Southern Highlands of Peru (A.D. 600 – 1,000.) In spite of many theoretical models that have been proposed to explain the nature of this relationship, little attention has been paid to analyzing the material expressions of such interaction. This paper focuses on one such expression of this contact: the Moche-Wari hybrid ceramic styles found at the archaeological site of San José de Moro (SJM), an important Moche ceremonial center located in the Jequetepeque Valley. An archaeometric analysis on a set of Moche as well as hybrid pieces coming from SJM was conducted in order to characterize, chemically and structurally, these styles and their technological relatedness. The methods employed in this study were OM, CL, SEM, XRD and pXRF. Our results revealed that new technological styles emerged not only as a consequence of interchanging design motifs, but also as a product of the technological transfer of raw materials, and manufacturing, decoration, and firing techniques that occurring in the context of high dynamism and variability in the Andes.

[140] *The Technology and Trade of Glass in SE Europe: Analysis of 12th-9th Century B.C. Beads from Lofkënd and Methone*

The archaeometric study of glass provides not only an understanding about the technology and manufacture of this material, but can also shed light on aspects of ancient societies such as trade, craft specialization, and cultural connections. The research presented looks to answer questions about glass production and trade in southeastern Europe during the LBA and EIA through the analysis of glass and faience beads from the sites of Lofkënd (southwest Albania) and Methone (northern Greece). This study applies a multi-analytical approach to identify the raw materials used to make these 12th-9th c. B.C. vitreous artifacts and source their origins. Specifically major, minor and trace element analysis conducted with SEM-EDS and LA-ICPMS, along with radiogenic isotopic studies using SIMS, is used to determine the composition and sources of the raw materials in order to provide information on the glass manufacturing industry and interregional trade during the LBA-EIA transition in this area. These techniques are also used to analyze severely corroded beads from both Albania and Greece in order to understand the mechanisms that led to their current condition and the types of information that can be obtained from such deteriorated objects in order to determine their composition, technology and origins.

Murphy, Reg [56] see Look, Cory

Murphy, Melissa (University of Wyoming)

[81] *First Contact: Friend or Foe?*

Native Andeans' first contacts with foreigners were not necessarily with the Spanish foreigners themselves, but with the foreign pathogens that were introduced prior to the arrival of the Spaniards through trade networks and early incursions in the northern extent of the Inca Empire. Violent encounters with indigenous peoples followed the Spaniards as they made their way down the

northwestern half of the Central Andes, such as the fateful battle in Cajamarca. Yet not all native Andeans perished by epidemic disease or fought battles against the Spaniards; some allied themselves with the Spaniards in the hopes of liberating themselves from Inca imperial rule. This paper theorizes these material traces of the first contacts in the Central Andes from a bioarchaeological perspective, such as the (lack of) evidence for epidemic disease, aberrant and hybrid mortuary treatment, and perimortem trauma. These examples are compared to the growing corpus of research on the bioarchaeology of colonialism from the coast of Peru and then discussed in relation to the legacy of colonialism. This paper takes a literal interpretation of "first contacts," noting that contact, conquest, and colonialism were fluid, dynamic and ongoing processes.

[84] *Changing Channels: Simulating Irrigation Management on Evolving Canal Systems for the Prehistoric Hohokam of Central Arizona*

Societies that rely on irrigation face challenges arising from the variability and unpredictability of water supply and the physics underlying the flow of water through open channels; they overcome these through structured social interactions and institutions ranging from simple to complex. To better understand these past interactions we combine geoarchaeological studies with flow simulations and Agent Based Modeling. Fieldwork conducted during CRM projects on Hohokam irrigation structures in central Arizona has revealed new details about canal morphology, including shape, size, elevation, slope, and cleaning events. The micromorphological study of the sediments that fill these structures allow finer resolution in discerning the performance (velocity, discharge, etc.) of the canal channels and their evolution through time. We couple this with an agent-based model to explore how these constraints might have required alternative strategies for cooperation. The combination of both approaches is key to discerning both broad differences between periods and fine variation within major chronological periods. We show that the coupling of social and physical models on very fine time scales can offer insight into the social arrangements and day-to-day life of people in the prehistoric past and inform our understanding of those societies' long-term changes.

Murphy, Terence (University of California, Davis), Karen R. Adams (Crow Canyon Archaeological Center, Cortez, Colorado) and Keith L. Johnson (California State University, Chico, California)

[127] *DNA Identification of Prehistoric Puebloan Quids*

Quids are small wads of fiber that were chewed or sucked by prehistoric Native Americans and then spit out. To identify the plants used for making a selection of quids from Antelope Cave, we extracted DNA from 10 quids, used polymerase chain reaction to amplify a 250-base section near the chloroplast trnL gene, and determined the sequence of the amplified fragment. DNAs from the 10 quids had identical base sequences, and these matched corresponding sequences from authentic samples of *Yucca baccata* and *Y. glauca* (the two species had identical sequences in that region). The amplified DNA sequences from the quids differed from those of *Agave angustifolia*, *A. deserti*, and *Nolina microcarpa*, and from *Nicotiana attenuata*, the putative contents, by at least seven bases.

Murphy, Beau (University of New Mexico)

[247] *A Spatial Analysis of Surface Artifact Distributions at the Inka Administrative Site of Turi, Northern Chile*

While it is well established that mineral acquisition motivated Inka imperial expansion into the high-altitude Atacama Desert of northern Chile, finer points of the area's political economy during the Late Horizon are the subject of ongoing research. The site of Turi in the Antofagasta region offers a unique opportunity to investigate this topic, as the site represents a preexisting local settlement co-opted for use as a regional administrative center by imperial authorities. This study contributes to our understanding of this complex political and economic situation with a spatial analysis of production loci within the site. A pilot study centered on the surface distribution of the remains of different production activities was conducted. Results suggest that production loci of several kinds are distinguishable, though complications of artifact displacement and a lack of temporal resolution necessitate interpretive caution. The location and contextual characteristics of suggested loci serve

as the basis for a preliminary discussion of the organization of small-scale production activities at Turi, with particular attention paid to considering this organization in the context of a mixed Inka-local settlement.

Murphy, Amanda (University of Manchester, UK)

[265] *Publishing the Perished: Uniform Collection Standards and the Future of Cemetery Excavations in the United States*

As research in historic archaeology progresses, it is possible to explore numerous facets of past cultures from health to funerary practices through cemetery excavations. Despite this, only a handful of historic cemetery reports in the United States include certain categories of data or the most basic anthropological analysis necessary to address specific research questions. Fewer still have been widely disseminated. As part of one of the largest surveys of historical cemetery excavations to date, 109 reports were studied for their analysis and inclusion of available data in five categories: osteology, artifacts, grave features, secondary data sources, and synthesis. The average number of pages per report was 248, with African-American cemetery reports tending to be the most comprehensive. Reports have focused on artifacts and historical background with information limited in the remaining categories. Biological anthropology and synthesis are particularly lacking, however gaps exist in every other area from basic grave depth measurements to biochemical analysis. Excavation and publication requirements vary by state so report content strongly reflects the personal values and specialist skills of the excavators. This study offers guidelines detailing the wealth of information that historic cemetery excavations may yield and proposing uniform standards for collecting it.

Murphy, Elizabeth (Institute for the Study of the Ancient World, NYU)

[398] *Tinker, Tailor, Soldier... Potter? Roman Legionary Ceramic Production and Its Organization*

One of the most iconic images of the Roman Empire was and is that of the Legions, citizen-warriors clad in shiny lorica segmentata and with gladius in-hand. These soldiers were however skilled not only in the art of war, but also in crafts and trades – supplying and supporting the operations of the Roman imperial military through their daily activities. One such industry about which we have relatively extensive evidence is ceramic production (of tile, brick, and pottery). While most ceramic production in the Roman period has been attributed to private investment, semi-permanent sites of production directly associated with military activities have also been identified. Such legionary production sites present unusual features in terms of their organization of the manufacturing process and its skilled labor, which offer insights into wider questions concerning imperial interests and crafts production. This paper investigates the spatial organization of Roman (A.D. 50 – 250) legionary ceramic production sites, assessing the extent to which the scale and organization of production were influenced by and integrated into larger military and imperial structures of the period.

Murphy, Charlene (University College London, Institute of Archaeology)

[414] *Un-entangling Pulse Domestication in South Asia*

India possesses a unique Neolithic transition to sedentism and agriculture which has shaped the cultural and ecological trajectory of the subcontinent. In the early Holocene South Asia was a subcontinent of hunter-gatherers. By 2000 years ago it was mostly inhabited by farmers, supporting densely populated river valleys, coastal plains, urban populations, states and empires. South Asia appears to have been host to a mosaic of processes, including local domestication of plants and animals, the dispersal of pastoral and agro-pastoral peoples between regions and the adoption of food production by indigenous hunter-gatherers from neighboring cultures. While some of the crops that supported these early civilizations had been introduced from other centers of origin (Near East, China, Africa), a large proportion of important crops were indigenous wild plants from the subcontinent. This paper will incorporate the relatively new complimentary theories of Niche Construction and Entanglement theory to examine the local transitions from foraging to farming in India. Specifically, this paper will focus on patterns in the available data for native Indian pulses including Horse gram (*Macrotyloma uniflorum*), Urd Bean (*Vigna mungo*) and Pigeon Pea (*Cajanus cajan*) to explore current ideas on evolutionary change and plant domestication in the subcontinent

of India.

Murphy IV, Timothy (Northern Arizona University, University of Central Lancashire)

[143] *Contextual Implications: Excavating Open Air Sites Adjacent to Cache Cave*

This paper outlines the cultural context of a complex of sites (known as the LCC sites) nearest to Cache Cave in South Central California. Results from LCC test excavations provide new information that help characterize cultural occupation of this Chumash and Yokuts borderland area in the San Emigdio Hills. The paper focuses on artifact assemblages from excavations near bedrock milling features associated with LCC sites. Artifacts recovered during excavation, such as lithics, fragmented faunal bone, beads, and shell, indicate varying types of food procurement and possible goods manufacturing. Bead and lithic typologies and a single successful AMS date offer the first interpretation of chronological activities of the closest open air sites to Cache Cave. While the data recovered from the LCC sites provide a context for behavior and status of people that occupied the area, it also poses questions concerning the relationship of these open air sites to that of Cache Cave itself. Data from these excavations may help characterize occupational histories and cultural relationships of the San Emigdio Hills.

[352] *Ancestral Abstract Art of the Mojave Desert*

The "archaic" abstract rock art style in the midst of the revered, fiercely defended cultural sanctuary of the Yuman-Hokan speaking tribes in the Mohave Valley along the lower Colorado River links culture with style, particularly when considering the absence of styles associated with linguistic family branches later expanding into surrounding areas. Further, that an archaic abstract style regionally associated with historic period Hokan speakers is also found throughout the Mojave Desert, strengthens the supposition supported by archaeological remains and linguistic evidence that Hokan speakers were more widely spread prehistorically. Examined is the regional archaeological evidence along with the physical occurrence of variations in rock art styles together suggesting that drying pluvial lakes and the abstract rock art were left behind during the Holocene climate optimum for wetter shores on the lower Colorado River, leaving a void in a tempered desert for Uto-Aztecs to fill.

Mussington, John

[290] *Archaeology and Community Development: A Perspective from Within*

Citizen science has been a relatively new component of the curricular activities at Sir McChesney George Secondary School in Barbuda. This approach is designed to more effectively engage youth living in a technologically advanced age in a small island community. By using science to understand and develop solutions to everyday challenges associated with climate change and development, classroom work is made more relevant and science comes alive and is transformed from the abstract to the reality. In the process, our young people are provided with more options and possibilities for the future. This presentation will discuss some of the challenges facing small island communities and highlights some successful breakthroughs which provide examples for a way forward.

Muzzall, Evan (Southern Illinois University Carbondale)

[207] *Burial and Social Organization in Italian Iron Age Necropoleis: Testing a Biodistance Approach*

Using correlations between biodistance and tomb distance, this poster examines how mortuary practices of two central Italian Iron Age (1000–27 B.C.) ranked societies partially encoded responses to increasing sociopolitical instability. This time period witnessed reorganization of clan-based, transhumant, agropastoral societies immediately prior to long periods of conflict and Roman

encroachment. Although they used similar mortuary arrangements, local groups had different attitudes towards these new spheres of interaction. Despite small and incomplete samples, data suggest that Samnites from Alfedena have weak, but patterned correlations between cranial, dental, and spatial tomb distances when compared to the Pretuzi from Campovalano, whose associations are indiscriminate. This is possibly due to the strategic geographic and economic position of Campovalano near the Adriatic coast, where further reaching contacts potentially allowed for nonbiological rules in the definition of kinship and access to burial rites. However, weakened correlations are detected in the Alfedena Samnites from the Orientalizing-Archaic (800–500 B.C.) to Classical periods (500–400 B.C.), a possible result of shifting power structures and new rules for burial treatment. This research suggests the utility of incorporating quantified spatial tomb distances as another line of evidence for creating a more robust intracemetery biodistance measure.

Myers, Jordan

[333] *Holocene Precipitation Variability in Northern Baja California: Correlating Lithic Abundance and Climatic Change from Scorpion Shelter*

In order to understand human adaptation to climatic regimes, I compare lithic assemblages and oxygen isotope values from kangaroo rat remains found at the hunter-gatherer shellfish-collecting site of Scorpion Shelter in coastal northwestern Baja California. Scorpion Shelter is important because it contains a continuous faunal record for a coastal community that spans from the terminal Pleistocene through the Holocene (~11,600 BP – present). Using Human Behavioral Ecology, we would expect to see a reduction in human activity at the site as a result of the rapid increases in precipitation brought on by an El Niño event. Precipitation variability is important because it can be a strong indicator of local ecology. Specific events, such as El Niño, can decimate or change access and abundance of wildlife and vegetation for human subsistence. Patterns that emerged in the abundance of lithic tools and the amount of precipitation in different occupation levels suggest that during times of precipitation increase at the site, tool use declined. This supports the assumption that climatic conditions at this site strongly influenced human behavior and diet.

Myers, Emlen (ERM) and Tomas Mendizabal (Independent Consultant)

[381] *History and Prehistory of the Panama Canal Zone Revealed by the Current Canal Expansion Program*

A wide array of archaeological resources has been identified by the Panama Canal Expansion, a civil construction effort that began in 2008 and will end late in 2015. Over 40 separate cultural resource studies have been contracted by the Panama Canal Authority since the start of the project. Located at the narrowest point of the Central American isthmus, the project area has been an environmentally rich and strategically important location since Prehispanic times. Pre-construction survey and construction-phase finds have yielded artifacts and information from ca. 700 B.C. through to the mid-20th century. The prehispanic data are of scientific interest. The majority of the finds, however, are Historic period sites and artifacts, which are unique, providing a rich and varied record of both the French (1881-1904) and U.S. (1904-1914) construction periods; and the U.S. Operation Period (1914-1999). This data set is further enriched by the copious primary and secondary records maintained by the Panama Canal Authority, and other sources. The presentation focuses on historic period finds including construction camps, abandoned construction equipment, numerous cemeteries, and early operational infrastructure. Themes addressed by the data include, Central American and Afro-Caribbean labor history, industrial history and U.S. military history.

Mytum, Harold (University of Liverpool, UK)

[177] *Monumental Biographies: Structure and Agency in European Hillfort Construction*

European hillforts contrast greatly in scale and complexity, and different regions of the continent have experienced varied historiographies of research. Using a few key examples to illustrate the

different approaches to hillfort monumentality, this paper addresses the contrasting emphases on function and meaning seen in such studies. Particular focus will be placed on three aspects, through the theoretical lens of structure and agency: the role of earthwork construction in the creation of meaningful places; entrances and what have been termed 'guard chambers' in the management of access to site interiors; and the role of the cheaux-de-frise in creating significant zones beyond the main physical perimeters of hillforts. Much remains to be done to understand individual site biographies and then place these in regional and wider comparative contexts, but those few sites which have received intensive long-term research programs can offer far richer understanding of space, place, and monumentality than the limited data from partial excavations available from the vast number of hillforts.

Nadal de Masi, Marco (UNISUL)

[157] *Tha Archaeology of Lower Canoas River Valley*

The results of an archaeological project in the Lower Valley of the Canoas River in the Highlands of southern Brazil show a cultural system of proto-ge groups formed by residential bases, camp sites, cultivation fields, storage pits, hunting camps, ceremonial centers, and burial mounds. Burial mounds show evidence of social hierarchy and the storage pits show variability in their size, indicating different functions for those pits. Pollen from a few pits shows how the environment evolved near the settlements in disagreement with the regional data.

Nadeau, Jaclyn (University at Albany)

[171] *Studying Debitage, Analyzing Behavior*

There is little evidence to support widespread changes in subsistence and settlement practices from the Late Archaic through the Mid-Late Woodland in Eastern New York. Analysis of lithic assemblages from a multitude of sites suggests a gradual settling in of past populations. Specifically, it does not appear that methods of procurement, manufacture, or use differed in any significant way. The question, then, is what forces were driving those cultural changes apparent throughout the Eastern Woodlands during this time. This presentation will explore alternatives to techno-functional and environmental change as factors influencing cultural dynamics.

[342] *Boulders, Outcrops, Caves: A Proposed Method for Documentation of Cultural Landscape Features Demonstrated in San Diego County, California*

Ubiquitous cultural features such as mortars, basins and slicks on rock outcrops, boulders, and cave floors attest to the long history of human use of landscape features. Although widely noted, methods for systematic investigation of such features lag behind well-developed study protocols for other archaeological material categories. Answers to questions such as how cultural landscape features were manufactured, how they were used, and how they were incorporated into the spatial organization of sites remain speculative. Even accurate documentation of such features is rare; this, along with terminological issues, hinders intersite comparison and regional synthesis. As a first step in addressing the situation, we recently piloted a new methodology for the efficient and precise documentation of cultural landscape features at two sites in San Diego County, California. In this paper, we describe steps in the creation of a high-resolution model of each site, of specific rock outcrops or boulders within each site, and of individual cultural features by using Structure from Motion photogrammetry. Use of a handheld microscope camera improves discrimination between culturally-modified and natural stone surfaces, as well as providing a basis for suggesting wear mechanisms. We present preliminary comparisons between the two sites and some possible interpretations.

[228] *Two Archaeologies? Costly Signaling and Human Behavioral Ecology in Archaeology*

Archaeological research using human behavioral ecology (HBE) models has significantly increased over the past decade both in number and scope. Originally most HBE research was relatively narrow, focusing on prey choice, diet breadth, and resource depression. Since then, it has expanded into areas beyond examining efficiency of foraging strategies. Driven mainly by anthropological and ethnoarchaeological research, these studies have investigated the influence of factors such as age, gender, and social capital in foragers' subsistence decision making. Interpretations involving costly signaling, in particular, have become a popular alternative explanation for patterns in large game abundance. The utility and validity of costly signaling, however, within archaeological research has been questioned. In this paper, I examine why proponents and opponents of costly signaling find it difficult to reach a middle ground. The impasse can be explained by fundamental differences in how the two sides view the goals and methods of archaeological research. These differences are not limited to HBE and costly signaling but can be seen in many areas of archaeological research where "camps" have formed, such as the overkill debate.

[115] *An Application of Obsidian Hydration Dating to Prehistoric Sites in Japan*

Recent progress of obsidian hydration dating (OHD) has now extended the utility of OHD to evaluate chronometric dates of prehistoric sites in various climatic conditions. The present paper discusses the reliability of OHD as the dating method, through a comparison of multiple specimens that were recently obtained from prehistoric sites in temperate and subarctic regions in the Japanese Archipelago. Besides effective hydration temperature estimation (EHT) using annual and diurnal variances of the temperature history recorded in weather stations, we will consider underlying factors that potentially affect hydration rates. The present case study will investigate to what extent OHD plays a role to provide reliable site dates distributed in different climatic zones and geological backgrounds.

Napolitano, Matthew (University of Oregon) and Matthew C. Sanger (Columbia University)

[178] *Transformation by Fire: Human Cremation, Metalworking, and the Transmogrification of Bodies by Flame in the Late Archaic American Southeast*

A copper band recovered from a Late Archaic burial located on St. Catherines Island, Georgia, demonstrates the earliest use of metal objects in the region. This discovery shows that copper usage in the American Southeast, largely thought to relate to Hopewellian and Mississippian influences, has a greater antiquity and distribution than previously assumed. A reassessment of the copper found within the burial dates to the Archaic throughout the Eastern Woodlands; chemical analysis shows the existence of wide-ranging trade networks between the Great Lakes region and the American Southeast. These networks are discontinuous and focused on specific locales, which distinguishes them from the more evenly distributed trade routes found in later periods. This variability is best interpreted as relating to different types of trading partnerships based on diachronic political, demographic, and mobility patterns. The placement of copper within a cremation—a practice also found at contemporaneous sites along the Great Lakes—suggests that copper was not simply traded but was instead part of a larger cosmological vision that likely included a particular conception of personhood, bodily composition, and relation between fire and material

transmogrification.

[78] *Una Nueva Visión del Rol de Kuélap en el Valle del Alto Utcubamba*

Nuestros trabajos en Kuélap han permitido la excavación de un centenar de estructuras circulares, densos rellenos, estructuras ceremoniales y secciones de la muralla exterior y la muralla del Pueblo Alto. Estas excavaciones han afinado una secuencia estratigráfica apoyada en una veintena de fechados de radiocarbono y permitido el hallazgo de diversos contextos que sustentan una nueva hipótesis respecto del rol del monumento. Estos estudios han concluido en lo siguiente: a) el monumento comenzó a construirse aproximadamente entre los siglos V y VI, estableciendo conexiones con la costa norte, la región Cajamarca y Huari y se abandona alrededor de 1570; b) las estructuras circulares sirvieron como viviendas con gran cantidad de basura doméstica asociada; c) la muralla exterior fue realizada con una tecnología de relleno basado en segmentos de construcción, recordando la modalidad de trabajo comunitario de los monumentos contemporáneos de la costa norte. Este relleno contiene entierros secundarios asociados al largo proceso de construcción, sacralizando al lugar y generando una sujeción ideológica de los diversos pueblos convocados. Kuélap por lo tanto, se debe considerar como un axis mundi, un centro político teocrático capaz de movilizar a las comunidades del valle para emprender la gran obra pública por varias generaciones.

Nash, Stephen (Denver Museum of Nature & Science)

[90] *The Pine Lawn-Reserve Area Archaeological Project: Results and Prospects*

Between 1939 and 1955, Paul Sidney Martin and John Rinaldo of the Field Museum excavated or tested more than 30 archaeological sites in the Pine Lawn/Reserve region of New Mexico. Researchers from the Denver Museum of Nature & Science, the United States Forest Service, and elsewhere have since 2010 been working to re-locate and record those sites, many of which were never properly registered with state and federal authorities. This paper shares results of that research as well as exploratory Ground-Penetrating Radar studies at Three Pines Pueblo, AMS radiocarbon analysis of sandals from Tularosa Cave, and X-ray fluorescence analysis of obsidian from Tularosa Cave. Finally, we outline plans for future research, including a large collaborative project that utilizes collections at the Field Museum, takes advantage of non-invasive analytical techniques, includes collaborative ethnohistorical analysis, and engages new fieldwork opportunities.

Nash, Sean (Coastal Environments, Inc.)

[171] *Indurated Sediment Masses (ISMs) from Southern Texas*

Baked-clay nodules are reported at many archaeological sites across southern Texas. These nodules are indurated sediment masses (ISMs) and are found in many contexts. William A. Duffen first found ISMs within a hearth at the Morhiss site in Victoria County. His discovery led researchers to conclude that these were heating elements used in place of stone and analogous to Poverty Point Objects. Ricklis came to the same conclusion about ISMs found in a hearth at 41NU2. The heating element interpretation is convincing when ISMs are found within a hearth. However, most ISMs are not found in hearths but they are still assumed to be heating elements. Contradicting this interpretation, others posit that ISMs are natural concretions, the result of fires used in historic land clearing, or the remains of clay linings from hearths. This paper will show that ISMs from southern Texas sites represent both naturally occurring concretions as well as cultural features and artifacts. A method will be presented to separate the cultural ISMs into types that resulted from incidental

formational processes (e.g. field clearing) and those created to be functional tools (e.g. heating elements) and constructions (e.g. clay linings).

[405] *The Future of the Past at Fort St. Joseph, Niles, Michigan*

The Fort St. Joseph Archaeological Project was initiated in 1998 as a collaborative partnership between Western Michigan University, the City of Niles, and various community groups. After 10 seasons of site investigations, scholarly publications, and public archaeology at this eighteenth-century French fur trading post, the Fort St. Joseph Archaeology Advisory Committee invited historic preservation professionals, economic development planners, educators, students, and community members to assist in developing a strategic plan to manage the archaeological heritage of Fort St. Joseph and assess the feasibility of presenting Fort St. Joseph as a cultural heritage tourism destination. Recommendations were solicited from various stakeholders on the future of the past at Fort St. Joseph to generate ideas regarding viable possibilities for facilities, programs, and partnerships in support of the community's archaeological heritage. The process and results of our deliberations are the focus of this paper, including how to protect a site after it has been excavated, the disposition of the recovered data (artifacts, notes, and samples), analysis and publication of results, the effects of research on the local community and the environment, the ramifications of heritage tourism, and sustainable practices for site interpretation, among other issues.

Naudinot, Nicolas (University of Nice)

[35] *Take Shelter! The Contributions of Rockshelter Archaeology to Understanding the Socio-Economic Organization of Final Paleolithic/Mesolithic Societies in Western France*

In some areas of France, the first archaeological investigations were conducted in rockshelters, and allowed archaeologists to establish the Paleolithic chronology. Later, in other regions, and influenced by Leroi-Gourhan's research, archaeologists focused on open-air sites, using spatial organization to create "paleoethnography." In Western France, even if the first excavation of a Paleolithic site, in 1874, was that of a rockshelter, later, all the investigations focused on coastal open air sites. This is partly a consequence of the geology as the region's crystalline massif lacks limestone formations. But there are rockshelters in the region; in fact, they are numerous though often small: marine erosion caves, rifts in sandstone cliffs, and granitic boulders. Our research program is investigating these small rockshelters, and first results of the excavation of two early Azilian sites and one Mesolithic shelter, shows that since these sites are usually short, task-oriented occupations, their study is essential to understanding the complexity of past land use strategies.

[370] *The Development of Techniques and Methods Used to Record Hoyo Negro: A Submerged Cave Site on the Yucatan Peninsula*

The Underwater Caves of the Yucatan Peninsula have become central to understanding the climate, paleontological and anthropological records from the Late Pleistocene in Central America. Archaeological recording of those hostile environments is extremely complex and requires innovative techniques. In Hoyo Negro, remains of a human, gomphotheres, two giant ground sloths, cave bears, and, sabertooths have been found directly associated by depth and/or position, all in unburied contexts. Over the last 4 years we have applied a range of techniques to record this site: Starting with traditional methods including photography, videography and cave cartography, followed by more advanced reality capture techniques including spherical giga-pixel imaging, and venturing out by

experimenting with Structure for Motion techniques that allow for 3D models of remains and cave features to be captured for later study and analysis.

Navarro, Mariana (PACJ), Ricardo Higuelin (IUB), Verónica Pérez (SUNY-ALBANY; PACJ) and Antonio Martínez (SUNY-ALBANY; PACJ)

[249] *The Symbolism of Prehispanic Twins from Ñuu Savi, Mixteca Alta, Oaxaca*

In Mesoamerica twins were associated with a rich symbolism and imagery. The study of this topic has focused mainly on Nahua and Maya societies because of the large number of available stories and associated imagery. In archaeological contexts, finding twins is unusual. During the 2014 season of the Cerro Jazmin Archaeological Project two infants were found and excavated in a domestic terrace dating to the Ramos phase (300 B.C.E.-300 CE). Osteological analyses indicate that they were two premature individuals who died at the same age (around 32 weeks gestation). The archaeological and osteological data, integrated with information from Mixtec codices and ethnohistoric chronicles allow us to investigate infant mortuary practices in the Mixteca Alta and the role that twins and their symbolism played among the ancient Ñuu Savi.

[306] *A Forest of Queens: The Legacy of Royal Calakmul Women at El Perú-Waka's Central Civic-Ceremonial Temple*

In 2012 archaeologists discovered Waka's main civic-ceremonial temple was enshrined by numerous offerings as well as the construction of a monumental hearth and the placement of various fragments of carved stelae adorning the final platform phase. These fragments included previously unknown Stela 43 mentioning an ancestress and royal woman of Calakmul origin, Lady Ikoom. Excavations in the interior of the fronting platform revealed the tomb of Waka's renowned Late Classic queen, Lady K'abel, built into an earlier construction phase. Also buried along the building's centerline and in association with the sealing of Lady K'abel's tomb was Stela 44. This monument features a standing ruler and bears lateral texts that also mention Lady Ikoom, in this instance with clearer historical context. Together, these monuments, the funerary assemblage, and the structure in which these elements are interred comprise an impressive tableau commemorating the importance of both these Early and Late Classic royal women from Calakmul who made their mark on Waka's dynasty, sealing its role as a loyal vassal to that great superpower to the north.

Navas, Ana (University of Texas, Austin), Franz Scaramelli (San Francisco State University) and Kay Scaramelli (Universidad Central de Venezuela)

[371] *Mitología y tecnología: el hierro en la cosmovisión guayanesa, Venezuela*

La alusión a la tecnología metalúrgica del hierro en las construcciones narrativas (relatos, mitos) y prácticas rituales es un fenómeno común de muchas sociedades alrededor del mundo. La importancia de esta tecnología se evidencia en los diversos significados otorgados a las etapas del proceso productivo y en las representaciones de deidades o personajes legendarios vinculados a la herrería en los relatos provenientes de África o Europa, pero qué ocurrió en aquellas sociedades en las que el hierro fue un elemento nuevo y disruptivo durante el período colonial. En este trabajo se estudia la percepción de las comunidades indígenas del Orinoco sobre la naturaleza del impacto de la tecnología del hierro, como una forma de interpretación histórica complementaria al análisis de la evidencia arqueológica recuperada en sitios misionales del siglo XVIII en esta región. La evaluación de narrativas mitológicas de grupos indígenas de Guayana revelan una percepción positiva del papel que tuvieron los artefactos metálicos, muy diferente a la visión trágica proveniente de otras regiones latinoamericanas. La mitología guayanesa demuestra la agencia local en el contexto de introducción de la tecnología de producción metalúrgica y de sus productos, destinados al

intercambio con las poblaciones indígenas y al sostenimiento del régimen colonial.

Nazaroff, Adam (Stanford University)

[185] *Calibrating pXRF Instruments for Chert Provenance: A How-to from the Anatolian Plateau*

In the past decade, a tremendous increase in the use of portable X-ray fluorescence (pXRF) instruments in archaeological provenance research has warranted several critical reflections on the analytical protocols which underpin their application in various material and regional contexts. This paper approaches the use of pXRF analysis for determining chert provenance with particular emphasis placed on tailoring empirical calibrations to best suit the dynamic properties of chert materials. In so doing, it highlights the need to set in place specific procedures relevant to each context of study in order to develop a productive and successful study of chert provenance. Using as a case-study chert consumption at the Neolithic community of Çatalhöyük, Turkey, this paper reveals how pXRF instruments, when properly calibrated to specific geologic contexts, are capable of distinguishing between multiple geochemical sources of chert, and can be used to produce probable provenance determinations for chert artifacts.

[300] *The Beaucoup Site: A Bison Kill in Northeastern Montana*

Communal bison kills are among the most visible archaeological sites in the northwestern plains. They can originate from a variety of hunting practices, including jumps, pounds, corrals, traps, etc. Because of the group nature of the activities, these sites can be rich in archaeologically interpretable materials and behaviors. The Beaucoup site (24PH188/189) is a large Late Prehistoric site on the Milk River in northeastern Montana consisting of a kill, drive lines, cairns, and tipi rings. First recorded in the 1970s, it was interpreted as a "jump" based on the location of the bone bed in a coulee bottom; however, recent test excavations suggest an alternative explanation. Of particular concern regarding the original interpretation, is the absence of a suitable gathering area and the discontinuity between the drive lines and the bone bed. This paper synthesizes bison behavior and ethnographic accounts in concert with a recent geomorphological investigation to hypothesize that the Beaucoup site bison were moved up into the coulee from the Milk River rather than down from above.

Neely, James (University of Texas at Austin)

[241] *Large-scale Prehistoric Water Management Projects by Small Cooperating Corporate Groups in Mexico and Arizona*

Two large-scale water management systems, one in the Tehuacán Valley of Puebla, Mexico and the other in the Safford Basin of southeastern Arizona, are briefly described and compared. In the Tehuacán Valley, the Purrón Dam exhibits a massive construction effort totaling about 370,000 m³ of earth and stone. In contrast, the 28 "hanging" canals of the Safford Basin are small but extensive in nature, with the longest about 9.5 kilometers in length and the total length of all canals exceeding 80 kilometers. A short history of technological change leading to each of these phenomena is presented. Evidence for the hypothesized engineering and construction of these sophisticated large-scale systems by small cooperating corporate groups is discussed.

[151] *Izapa's Industrial Hinterland: The Eastern Soconusco Mangrove Zone during Archaic and Formative Times*

LiDAR coverage of a portion of the eastern Soconusco mangrove zone due south of Izapa has identified nearly 300 archaeological mounds within an area of 56 km². The vast majority of these mounds contain Formative period deposits. Surface and subsurface investigation indicate a major movement of people into the zone around 1600 B.C., followed by population growth through the Late Early Formative (Cuadros phase). Middle through Terminal Formative (900 B.C. through A.D. 200) deposits consist of superimposed firing features and abundant coarse pottery inferred to have been used in the production of salt. The Late and Terminal Formative peak in industrial activity within the mangrove zone coincides with the apogee of monumental activity and, presumably, population at Izapa.

Neffe, Angelique (Université Paris1 Panthéon-Sorbonne)

[139] *Jade Polishing Techniques in NW Alaska, from the end of the 1st Millennium A.D. to the 18th Century*

The study applies a qualitative and quantitative characterization of polished jade tools from Cape Espenberg in Northwestern Alaska, dated from the Thule period. An experimental study of polishing techniques on jade was carried out in order to reproduce diagnostic use-wear traces associated with different polishing techniques, processing, and craft activities. The study was carried out at the Laboratory of Tribology and Systems Dynamics - Ecole Centrale Lyon 2 and was based on different scales of observation (interferometry, confocal microscopy). Different parameters of characterization (bearing area, various topographic parameters) and the method of continuous wavelets were applied. This methodology allowed for the identification of different use wear patterns related to various tool functions and polishing processing: wood processing, hide processing, butchery, and resharpener of the active part of the tools.

[228] *Costly Signaling and the Dynamics of Consumption in the Early-Modern Atlantic World: The Case of Clay Tobacco Pipes*

For 60 years archaeologists studying the early-modern Atlantic world have relied on the decline in the stem-hole diameters of clay-tobacco pipes to date their sites. But they have been incurious about the causal dynamics responsible for the ocean-spanning secular trend and variation around it. In this paper I draw on costly signaling theory to build a simple model of change in marketing strategies of producers and the signaling strategies of consumers that might account for the trend. I use data on clay pipes from seventeenth-century Jamestown and other sites in the Chesapeake region to evaluate predictions from the model. Predictions fit for well imported pipes, but less well for locally-made pipes. The lack of fit raises a question: Why might we expect signalers faced with a choice between two or more equally costly but stylistically distinctive signaling strategies, might prefer the one with which their socially salient superiors are more familiar. A tentative answer to that question promises to illuminate causal dynamics behind "identity" not only in the early Chesapeake but in colonial situations more generally.

Neitzel, Jill (University of Delaware)

[229] *Color Symbolism of U.S. Southwest Jewelry*

The colors of turquoise and shell jewelry in the prehistoric U.S. Southwest were imbued with a diversity of inter-related symbolic meanings. To begin to understand these embedded messages, we

must consider the results of cultural anthropologists' different approaches to color perception and archaeologists' reliance on ethnographic analogy. Stephen Plog's seminal publication on the color symbolism of Pueblo pottery describes the religious significance of blue/green, the color of turquoise, and white, the color of marine shell. This sacred content all related to water and fertility -- factors that were critical for survival in the prehistoric Southwest. For jewelry, these religious meanings reinforced the colors' other inter-connected messages about status, long distance connections, heritage, and cultural affiliation. The symbolism was more powerful when it was broadcast redundantly by greater quantities of ornaments and intricate composite pieces.

[34] *Engaged Research, Management and Planning at Tolay Lake Regional Park*

Archaeology has a long history of extracting knowledge and physical resources from Indigenous communities without redistributing resources or benefits to these communities. The ideas of giving back or "paying in our own currency" are well-meant, albeit simple, attempts to atone for our discipline's history. However, the historical traumas in Indigenous communities from political, economic and scholarly colonialism are complex, and cannot be remedied with simple fixes. Research that seeks to engage communities should therefore begin with the recognition that decolonizing research is a long and difficult process, and justice in the face of historical trauma is never finished. Research begun in this context is better suited to address the ongoing needs of Indigenous communities. I will discuss the examples of my dissertation work, inevitable side projects, and other involvements with the Federated Indians of Graton Rancheria at Tolay Lake Regional Park. The Tolay Valley is a sacred landscape that Sonoma County Regional Parks Department is developing for public recreational use. My research was designed in collaboration with the tribal community. As such, this research and researcher have the ability and responsibility to advocate for the community's views on policy, management and interpretation of cultural resources at this park.

[150] *Investigation and Analysis of Anthills Found in Archaeological Settings in the Northern Great Basin*

Anthills are ubiquitous across the Great Basin, with the potential to affect archaeological sites through bioturbation. This study considers if lithic debitage found on the surface of anthills (and within) represents the redistribution of specific size grades, with an emphasis on vertical redistribution of smaller flakes from below ground to the surface. Our study targeted anthills near previously analyzed lithic plots around the perimeter of Rimrock Draw Rockshelter (35HA3855), a

Paleoamerican site in Harney County, southeastern Oregon. Two sampling methods were used to collect debitage and gravels that compose anthills. Samples were taken above ground, and auger sampling was used to explore the relationship between debitage cast on the surface and in the heart of the colony. Mass-analysis of debitage and particle size-analysis of the gravels was conducted to create a profile of sedimentary and archaeological size grades that may inadvertently be interpreted as rejuvenation pressure flaking events for the former and high energy stream transport episodes for the latter, further advancing the way archaeologists interpret site disturbances.

[288] *Vulnerability and Human Security in the Face of Climate Change*

Vulnerability to climate change is a central issue in contemporary policy at local, state, national, and global scales. Facing an uncertain future, public and private organizations, policy makers, and resource managers are concerned about our ability to develop social-ecological systems resilient to climate change. "Long-term sustainability" in the face of present and anticipated climate impacts is a national and international goal. However, planning for long-term sustainable management is a daunting task, as the future is inherently unknowable. Further complicating planning is the limited nature of scenarios of possible futures, which are based on information drawn from present and very recent past. Such short observational spans or artificially restricted case examples hamper sustainable management. Long sequences documented by archaeologists and historians provide knowable changes in human-landscape-climate interactions that represent sets of completed experiments in human eco-dynamics. Scholars from two research teams— North Atlantic Biocultural Organization (NABO) in circumpolar North Atlantic region and Long-Term Vulnerability and Transformation Project (LTVTP) in arid and semi-arid deserts of southwestern US and northern Mexico – are investigating the relationship between aspects of climate change and social change in extremely different settings and over many centuries. In this presentation we describe outcomes of our comparative research.

[289] *Courtyards, Plazas, Paths: Empty Spaces Full of Meaning*

In recent years, geophysical survey techniques have allowed archaeologists to identify subsurface cultural features—a dataset that has filled previously empty spaces on our site maps and made our interpretations of ancient landscapes all the richer. Significantly, geophysical datasets reveal not only features, but also the empty spaces in between those features. This paper explores the spaces between geophysical anomalies—the courtyards, plazas and paths that are common yet rarely investigated spatial components of Mississippian Period (A.D. 900-contact) sites in the southeastern United States. Plazas, courtyards and paths are spaces between built architecture that can have potentially different meanings and allow for different types of social interactions. I review some of these possibilities before turning to Parchman Place, a case study that illustrates the organizing yet flexible nature of such spaces. At Parchman Place and sites like it, it is the spaces between more visible archaeological features that structure daily interactions among people and that give us important clues about changing sociopolitical relationships in the past.

[415] *Don't Drink the Water: Differential Diagnosis of a Pathological Process Present at the Ray Site and Discussion of Environmental Context*

In environments with naturally high or anthropogenically increased fluoride levels (>1.5mg/l), communities are at risk for toxic exposure to fluoride. Groups exposed to toxic levels of fluoride have higher incidence of maladies of the musculoskeletal, reproductive, and neurological systems. With chronic exposure individuals may develop skeletal fluorosis, a condition characterized by

osteosclerotic activity evidenced by the ossification of ligamentous and tendinous attachments, along with an increased incidence of fractures. During the course of a complete survey of skeletal remains recovered from the Ray Site (50 B.C. to A.D. 450) eight individuals were found to share a constellation of abnormal bony changes. This Middle Woodland site is located the Illinois River Valley, an area rich in natural fluoride. In this study we evaluate the prevalence of symptoms consistent with skeletal fluorosis at the Ray Site while also presenting personal, environmental, and genetic factors influencing manifestation of the condition. This paper describes the observed abnormal bony changes while providing a differential diagnosis and discussing possible environmental influence on community health.

Nelson, Wendy

[415] *Diet, Sex, and Fitness: The Nutritional Potential of the Fish Slough Cave Diet Revisited*

Archaeological investigations conducted in the late 1980s at Fish Slough Cave, Owens Valley, California recovered over 300 well-preserved human coprolites. When the nutritional profile of the diet inferred from coprolite analysis was compared against optimal foraging model predictions, based on energetic returns, the diet was considered to be deficient. However, when the same data were considered from a nutritional ecological perspective using macronutrients (e.g., water, protein, fat and carbohydrates) as the currency, the diet was more favorable. The current study goes a step further by taking a holistic approach and addressing nutritional needs based on age, sex, and level of activity and the role both macro- and micro-nutrients play in an individual's overall fitness. This research, based on nutritional ecological principles, suggests that the variation in nutritional needs may in part have contributed to shifts in settlement and subsistence patterns observed in the Late Prehistoric Period.

[12] *Modern Material Culture Studies in Modern and Past Populations*

This project presents data from a month long archaeological survey of refuse conducted on a university campus in New York City and uses it in conjunction with conventional theoretical methods applied to the analysis of the material culture. The previous archaeological analyses of secondary aggregates or deposit sites in which localized, high concentrations of refuse are examined, provide hypotheses regarding human behavioral patterns (Johnson, 1999) and serve as a comparative model from which to derive further inferences about the modern refuse sample. The identification of secondary aggregates involves determining the frequency of relevant artifacts, their density, diversity, and deposit location resulting in a link between behavior and the materials examined in situ. The constant presence of material culture and its discard in human life acts as an analogous correlate to human behavior. This project highlights the importance of material culture research for a greater understanding of human interaction with surrounding environments, both past and present.

[292] *Sourcing the Obsidian from Campanayuc Rumi: Implications for Understanding Chavín Interaction*

Campanayuc Rumi is a large civic-ceremonial center located near Ayacucho in the south-central highlands of Peru. Dating to the late Initial Period (1100-800 B.C.) and Early Horizon (800-300 B.C.), Campanayuc Rumi is notable for its close association with the Chavín sphere of interaction. In particular, the site has been considered significant because of its geographical proximity to Quispisisa, the most important obsidian source during the early first millennium B.C. Recent excavations at Campanayuc Rumi recovered large quantities of obsidian in temple, offering, and residential contexts. In 2014, pXRF was utilized to chemically source a sample of 394 obsidian

artifacts. This analysis demonstrates that the overwhelming majority of the obsidian comes from the Quispisisa source. The pXRF data coupled with excavations of a probable lithic workshop lead us to conclude that Campanayuc Rumi was the locus of processing and eventual circulation of obsidian to other locations in highland and coastal Peru during the Early Horizon.

[181] *Domestic Space or Burial Space? Interrogating the Final Gravettian at the abri Pataud*

The status and significance of the assemblage of human remains in the Final Gravettian of the Abri Pataud (level 2, 22 kya) had never really been broached during the excavations of H.L. Movius (1958, 1963). A three-pronged approach (archive analysis, study of old collections, and targeted excavation), started in 2005, allows us to propose a new interpretation of these remains as well the entirety of level 2. This study takes into account the natural configuration of the rock shelter, its geological history, the detailed analysis of sedimentary deposits, the archaeological context of human remains, and their revision through an archaeothanatological approach. The result is a new interpretation of the human remains and the discovery of unexpected mortuary practices in the Final Gravettian at differs from known mortuary practices in other Gravettian sites in Europe. The link between habitat and burial place (succession or synchrony) is discussed. Our results and assumptions contribute to the cultural definition of an original facies of the French Gravettian. Our approach highlights the importance of reinvestigation in key Paleolithic sites and emphasizes a major methodological challenge: how to integrate old and new data and interpretations separated by 40 years?

Netherly, Patricia (Vanderbilt University)

[411] *Spondylus and Ideology: 5000 Years of Interaction between Manabí, the Circum-Gulf of Guayaquil Region and Northern Peru*

Interaction and cultural exchange between the coastal societies of northern Peru and the cultures of Manabí and Guayas are evident from the late Preceramic in Peru and early Valdivia in western Ecuador. While spondylus is the best-known material manifestation of this exchange, there is evidence of early cultural influences which predate the heavy movement of spondylus to the south and Lambayeque metalwork to the north. Other influences which can be called ideological are seen in the iconography of textiles and ceramics and myths of political validation. These relations may have developed from earlier exchanges dating from the Terminal Pleistocene and Early Archaic for which there is now material documentation.

Neubauer, Fernanda (University of Wisconsin-Madison, CAPES Foundation)

[280] *Lithic Technological Organization on Grand Island, Michigan, during the Late Archaic Period*

This paper presents the results of a study of subsistence, chipped stone and hot rock technologies, settlement variability, residential mobility, and landscape interactions of the Late Archaic (c. 5,000-2,000 BP) people on Grand Island, in Michigan's Upper Peninsula. Recent excavations by the Grand Island Archaeological Program (GIAP) have yielded a sizable body of evidence for Late Archaic occupations on Grand Island, which is the largest island of Lake Superior's southern shore. Direct evidence is drawn from six archaeological sites excavated by GIAP that span the entire Late Archaic period and allow for a study of socioeconomic changes through time. I focus on the social-technological relationship between lithic raw material availability, raw material choice, and the manufacture of different stone tool types by Late Archaic hunter-gatherers occupying Grand Island. There, people utilized local materials for the production of expedient tools, and non-local cherts to manufacture curated formal tools. Faunal data indicates that the island was seasonally occupied in the autumn. Hearth features and the density and diversity of lithic artifacts suggest that the location was repeatedly used and represented an important place in the landscape.

[278] *Renegotiating Identity in a Cultural Crossroads: Salado in the Safford Basin*

Current perspectives on the origin and nature of the Salado phenomenon vary amongst Southwest archaeologists. Evidence from the Safford Basin in southeastern Arizona suggests that in this area, Salado came about as a response to multiple waves of migration of various sized groups from the Kayenta and Tusayan regions of northeastern Arizona. Following the arrival of these migrants, the archaeological record shows that both migrants and groups indigenous to the Safford Basin renegotiated their identity to provide community cohesion in this new social milieu.

[157] *The Interrelated Establishment of Sedentary Lifestyles in Tropical Lowland South America in the Late Holocene*

The archaeological record of lowland South America shows the widespread establishment of sedentary life styles, associated with marked signs of landscape modification, starting around the mid first millennium B.C. Such changes had a large scale, ranging from the lower Orinoco basin in the north all the way to the mouth of the Plata river in the south, albeit with earlier dates towards the north. This paper argues that this process of change needs to be understood from a continental perspective, associated to the establishment of the wet tropical climatic conditions verified today in this area.

[204] *Testing the Applicability of Non-destructive Methods and Databases for Determining Biological/Cultural Affiliation within NAGPRA*

Determining biological/cultural affiliation of prehistoric human skeletal remains for NAGPRA compliance is standard protocol in museums and academic institutions. However, the biological affiliation of skeletons of unknown provenience is not always straightforward, especially when they preclude the use of destructive analytical methods (e.g., DNA extraction). Although software is available for the estimation of ancestry of human skulls in forensic cases, few comparative datasets are available for assessments involving prehistoric crania in California and other regions of North America. To circumvent this problem, a digital database using non-destructive 3D scanners was created for biological assessments of potentially Native American crania. The dataset contains high-resolution scans of over 400 North American human crania from archaeological sites and five "unknown" crania, two of which may be affiliated with Native American groups. To test the biological affinities of the "unknown" crania, we recorded 34 craniofacial landmarks for a subset of adult individuals in the database. These data were then subjected to a series of 3D geometric morphometric analyses comparing the "unknowns" to individuals in the North American database. Although preliminary, our analyses show that this North American comparative database serves as a viable, non-destructive alternative for conducting biological assessments of Native American skeletal remains.

Newcomb, Elizabeth (Northern Arizona University)

[274] *Relations in the Zuni Region: A Comparative Study of Ceramics*

In the Cibola region of the American southwest, the Pueblo III to Pueblo IV transition saw a major increase in the local production of red ware and polychrome vessels. In addition, the period is characterized by a dramatic increase in ceramic decorative style diversity in the Cibola region. In this poster, I present evidence for shifts in settlement patterns and community organization, including collective actions and social transformations in the Zuni region during the Pueblo III and Pueblo IV periods. Specifically, I address ceramic variation of design elements on the exterior portion of White Mountain Red Ware bowls. The evidence from this variation suggests a concerted reorganization in the Zuni region from A.D. 1200-1500. Through analysis of design motifs in the ceramic assemblages from the Sandstone Hill Pueblo Ruin and the Zuni Airport Project (NM:12:L3:141), I investigate the interaction between potters residing at local sites to potters in the broader region.

[185] *Assessing the Validity of pXRF for Sourcing Cherts in the North American Great Basin*

As a cost-effective and non-destructive method for multi-element analysis, portable x-ray fluorescence spectrometry (pXRF) has the potential for broad archaeological application. Several studies have demonstrated the validity of pXRF for sourcing obsidian and fine-grained volcanic artifacts. In this study, I assess the validity of pXRF for sourcing chert artifacts from Paleoindian sites in the North American Great Basin. Because chert artifacts dominate many archaeological sites, the ability to effectively source these artifacts using compositional data generated by a comparatively inexpensive method like pXRF could significantly enrich our understanding of prehistory, but we must demonstrate this potential before we can celebrate it.

Newman, Sarah (Brown University)

[22] *Ritual in the "Great Household": Termination Deposits in Classic Maya Royal Residences*

In a certain sense, the Classic Maya royal court can be seen as an expanded, intensified household, a comparative model for which can be found in the "Great Households" of early medieval Europe and elsewhere. Closely linked to governing political structures and notable for their size, complexity, and levels of expenditure and waste, royal courts mimic the patterns of interaction that define the household as an archaeological unit, but on a grander scale. This paper examines ritual at the "Great Household" level, focusing specifically on examples of termination deposits associated with royal residences. Compiling examples from across the Maya area, temporal and regional patterns in these deposits are evaluated, showing their content and character to reflect tensions between regional and local influences, exclusivity and access, and integration and instability experienced by the Classic Maya ruler and his sprawling "family."

Newman, Elizabeth (Stony Brook University)

[76] *Landscapes of Labor*

During the last quarter of the 19th century, Mexico experienced a period of rapid social and economic modernization under the leadership of dictator Porfirio Diaz. Central to this was the dismantling of community-held lands, a practice that was intended to undermine the social aspects of the agrarian/indigenous lifestyle. The nineteenth century architects of Mexico's progress believed that by dismantling communal villages lands and thus communal indigenous communities, they were moving Mexico's indigenous people away from an outmoded past and into modern forms of industrial capitalist production. This paper will explore the ways in which settlement and architecture reflect those transformations in the decades leading up to Mexico's Revolution of 1910. I integrate archaeological data with archival and oral sources to explore the ways in which the physical transformations of landscape and the structures that marked it impacted Nahua communities in Puebla's Valley of Atlixco.

Newsom, Lee (Penn State University) and Lourdes Pérez Iglesias (Departamento Centro Oriental de Arqueología, CISAT,)

[339] *Ancient Caribbean-Mainland Plant and Animal Translocations: Cultural, Biogeographic and Biodiversity Legacy*

The Caribbean's pre-peopling flora and fauna were the culminations of both vicariant and long-distance dispersal processes, coupled with evolution in relative isolation spanning more than 20 Mya. Human colonization beginning around 7,000 years ago coincided with the extinction of the archipelago's only large terrestrial vertebrates-- probably precipitating the first human-induced trophic cascades and initiating the first of a series of human-environmental legacy effects. Early migrants translocated familiar home garden trees and root crops from mainland sources, the cultivation of which signals the earliest evidence for biotic resource management. Large accumulations of shell midden and burning outside the natural fire regime are additional expressions of human niche construction over time. Later migrants from South America introduced additional plants and animals-- both domesticated and wild or tamed-- and transferred some native taxa among individual islands. These circumstances enhanced the agrobiodiversity and affected food security. These activities also suggest a broader range of managerial practices, encompassing both food and non-food purposes and behaviors, generally tracking increasing social complexity. A final phase, known as the "Columbian Exchange," involved European introductions of additional taxa, such as pig and watermelon, from the Old World and Pacific Islands.

Newsom, Paul (American University of Beirut)

[325] *The Archaeology of Conflict Damaged Sites: Hosn Niha in the Biqa' Valley, Lebanon*

When faced with the destruction of archaeological sites through conflict, and the accompanying loss of knowledge, what can archaeologists do? Archaeologists, politicians, and many others recognize that damage to heritage is irreversible and has very serious, lasting consequences. The impact of war on archaeological sites is rightly an area of great significance and concern to archaeologists and other heritage professionals, and is increasingly an area of research and debate, both within and outside academic circles. In this paper we use the example of a site in Lebanon which has been severely damaged by multiple conflict episodes to show that by careful fieldwork and analysis a great deal can be learned from an apparently destroyed site. Following an initial appraisal of the site damage, it was felt that by using an appropriate range of fieldwork methods useful information not only in assessing the effect of conflict on a site, but also about the development of the site could be gathered and meaningful results produced.

Nez, Nanabah (Arizona State University / Tonto Nat. Forest)

[374] *Apache Use of a Sacred Site. Oral History of Apache Elders*

The area known as Fossil Creek in Central Arizona is of significant cultural importance to the Western Apache people. It is known to them as Tu'dotliz (TWO DOE CLIZ), or "blue water." Tu'dotliz is associated with the Dilzhé'é (Tonto Apache) creation story, and a clan origin location imbued with ancient place names. It is a venue for ceremonies, home of the Gáân (Apache mountain spirits), a source of holy water and herbs, and place where prominent Apache historical figures once lived. As one elder put it, "Tu'dotliz is as important as it gets." With a growing awareness in Indian Country regarding the need to take proactive measures to protect sacred sites, this work represents the efforts of Apache historians and tribal advocates to utilize oral history to increase awareness of tribal affiliations to holy landscapes. To support a Traditional Cultural Property nomination, historical documentation and ethnographic testimony document historic and contemporary use of Tu'dotliz as a venue for prayer, healing, ceremony, and the collection of natural resources for subsistence, ceremonial, and medicinal use.

Nials, Fred (Desert Archaeology, Inc.)**[55]** *Agriculture at Las Capas: Tales Told by the Canals*

Las Capas is an Early Agricultural period site in the Tucson Basin, Arizona. Canal irrigation began at the site as early as 1200 B.C. and the canal system encompasses more than 50 hectares.

Agricultural features are unusually well-preserved, and more than 250 canals of various sizes and over 1000 bordered fields were exposed in multiple stratigraphic levels during excavation. The unusual degree of preservation provides an exceptional opportunity to examine the mode of construction, hydrology, agricultural technology, and operation and maintenance of the canal system at the site. Water requirements and limitations, delivery options, and time and labor needed for completion of individual watering cycles have been calculated. Despite major environmental changes, the irrigation system shows no signs of significant experimentation, changes in operation methodology, or major technological advances during the 800 years of occupation at the site.

[378] *Pigment Identification as a Proxy for Intercultural Interaction in Casma, Ancash during the Initial Period (2100-1000 B.C.E.)*

Differential distribution of mineral resources in the Andean area has necessitated a long history of interaction between coastal and highland peoples. However, when it comes to the Casma Valley, it is

not clear when these interactions began. This paper addresses this issue through an examination of the mineralogy of a set of pigment samples collected from tools found at four sites of the Sechin Alto Polity identified by way of X-ray diffraction (XRD). The results of the XRD findings will be linked to the most probable source regions where people collected minerals that were processed, distributed, and consumed for purposes such as the adornment of structures and body decoration during the Initial Period (ca. 1500 B.C.E.). This information, coupled with GIS derived least-cost paths, allows an understanding of the extent of movement of coastal Casma people within the river valley and whether or not they were in contact with highland peoples who lived near modern-day Huaraz. Additionally, this paper will advocate for more widespread use of XRD analysis due to the benefits it offers in the protection and preservation of cultural resources.

Nicolas, Richard (California State University Los Angeles)

[355] *An Analysis of Lithic Production at the La Milpa Sinkhole (RB-25-A5)*

Caves are prominent earth openings in Maya sites that are widely recognized as being important sacred landmarks. There is a wide range of earth openings at sites, however, that are rarely recognized as possible landmarks and this can impact the interpretation of associated artifacts. Investigation of the La Milpa Sinkhole (RB-25-A5) is a case in point. Investigation in 2012 classified the feature as a trash pit. The recovery of large quantities of what were thought to be chert flakes led to the interpretation of the feature as being associated with a lithic workshop. Examination by a California State University, Los Angeles team in 2014 recognized the feature as a sinkhole with a possible ritual function. Excavation also recovered large quantities of chert but a unit within the cave-like portion found similar pieces still within their matrix of soft dolomitic limestone. A meticulous analysis eliminated most of the recovered material as natural shatter while confirming the presence of 27 formal lithic artifacts.

[88] *Bellicose Relations between Cacaxtla and Xochicalco in the Epiclassic Period*

Whereas the Epiclassic (A.D. 600-900) has long been recognized as a period characterized by increased conflict and warfare between the dominant city-states of central Mexico, concrete evidence for actual military actions has been rather limited. Here we discuss epigraphic and iconographic evidence that suggest that two of the major Epiclassic powers, namely Cacaxtla and Xochicalco, were involved in a violent conflict, and that Cacaxtla succeeded in capturing several prominent individuals from Xochicalco, which were subsequently portrayed on the tread of the hieroglyphic stair of the Red Temple at Cacaxtla. The tradition of displaying and naming important captives on stairs is known from other areas of Mesoamerica and at Cacaxtla their origin is betrayed by a probable toponymic reference to Xochicalco recorded in the glyphic text on the frontal riser of stair, as well as a distinct type of headdress that during the Epiclassic was worn by prominent individuals at Xochicalco and may even have served as an ethnic marker in the Postclassic. While the Epiclassic writing system remains undeciphered, we hope to show that important insights can be achieved based on careful analogies with other Mesoamerican scripts coupled with structural analyses of the texts and their accompanying imagery.

Nielsen, Christina

[256] *A Microstratigraphic Approach to Evaluating Site Formation Processes at Eagle Cave*

Eagle Cave (41VV167) is a large dry rockshelter with deep stratified deposits spanning the Early Archaic through the Late Prehistoric periods. My thesis research focuses on the deposits in the northern sector of the shelter sampled during the 1963 excavations by UT-Austin and again a half century later by Texas State University in 2014. My goal is to use multiple lines of evidence to evaluate the natural and cultural formation processes that resulted in the complexly stratified,

culturally rich deposits present in Eagle Cave. By using data derived from stratigraphic documentation, geoarchaeological sampling, artifact analysis, macrobotanical and faunal identification, constituent size distribution, and radiocarbon dating, I hope to develop a viable protocol for understanding the site formation processes evident at Eagle Cave and many other Lower Pecos rockshelters. This presentation summarizes the preliminary results of my thesis research.

[408] *Central Plaza Excavations at El Mirador*

The Great Central Plaza of the West Complex at El Mirador lies on an early and important alignment for the entire city. Excavations of two small altar platforms, and test units of structures on the boundaries of the plaza and the Leon Plaza suggest that this was probably among the earliest areas of the city, and continued to have symbolic and ritual importance throughout the Middle and Late Preclassic periods at El Mirador. The Central Acropolis creates the southern boundary, the east and west boundaries are delimited by Leon Temple on the west and an elongated structure on the east (E group complex) and the Cascabel Complex creates the northern boundary. The two small altar platforms are situated on the center line of the Central Plaza, creating a symbolic trajectory accessing the lower plaza and main stairway to the palaces of the Central Acropolis, with the center line extending through the E group and ending at the Cascabel group, the earliest grouping of temples yet known at the site. Evidence suggests that this may have been the earliest ritual center of the city and remained ritually significant to the inhabitants of El Mirador throughout its history.

[174] *Spatial and Chronological Components of Middle Stone Age Artifact Assemblage Variability in Deeply Buried Alluvial Fan Contexts*

Alluvial fan deposition characterizes the geological setting of many Stone Age sites in the East African Rift System. In these settings, researchers must consider multiple origins of technological variability, such as chronology, spatial trends, and depositional history. Because of logistical constraints, deeply buried artifacts in alluvial fans can only be examined through small excavation windows or where deposits have been heavily eroded. Under both scenarios, variability in in situ artifact attributes cannot be assessed over large areas. The Chaminade II (CHA-II) site in Karonga, northern Malawi, is situated within the Chitimwe Beds, a remnant alluvial fan dating to the Middle-to-Late Pleistocene. It preserves a Middle Stone Age (MSA) archaeological record whose interpretation is largely dependent on understanding the complex cycles of successive alluvial deposition, exposure, and erosion. By first mechanically removing 2m of largely archaeologically sterile fan deposit, a 32-x-2m trench containing over 15,000 in situ MSA artifacts was hand-excavated, screened and 5572 of the artifacts were plotted using a total station. Combined with excavated material from elsewhere in Karonga, the site demonstrates how both chronological and spatial factors affect the visibility of MSA technological variation—seen in lithic reduction patterns and site preservation—in this region of Africa.

[169] *Excavations at Huaca Soto: 2000 Years of Ritual Reuse at a Paracas Platform Mound,*

Chincha, Peru

Huaca Soto is one of the best preserved precolumbian platform mounds in the Chincha Valley and perhaps the largest standing example of Paracas monumental architecture on the south coast. Excavation in the huaca's western-most sunken court in 2014 yielded a sequence of ritual deposition stretching from the Paracas Formative through the Inka Period. While the mound's substructure and earliest occupation levels are squarely associated with Paracas post-fire resin painted wares and architectural techniques, subsequent offerings in the site's uppermost sunken court demonstrate Topará, Wari, Chincha, and Inka ritual participation. Deposition of high-value spondylus shell ornaments, hundreds of guinea pigs, dozens of camelids, and standardized serving wares attest to the site's significance as a major arena for communal events. On the other hand, isolated and idiosyncratic offerings of adobe and copper figurines, appearing in various forms, may represent more ad-hoc depositions left by particular individuals or itinerant visitors. Overall, Huaca Soto brings to light new data on processes of ritual appropriation on Peru's south coast.

[168] *On the Role of Sablefish (*Anoplopoma fimbria*) in Northwest Coast Fisheries: The View from the Tse-whit-zen Site (45CA523), Coastal Washington*

Though the study of human-prey animal relationships in the Pacific Northwest has focused largely on salmonid species (family Salmonidae) and their hypothetical connections to ancient increases in social complexity, a growing body of research demonstrates that many more fishes than have been previously recognized played key roles in the diets and social systems of peoples past and present. The Tse-whit-zen fauna, with over 80,000 fish bone specimens identified by ongoing zooarchaeological analysis, provides a unique opportunity to explore the importance of non-salmonid fishes. Preliminary results indicate sablefish (*Anoplopoma fimbria*) – a species rarely discussed in ethnographic and archaeological literature and scholarship – may have been equal to salmonids in dietary importance during part, if not all, of the village's occupation. This poster will explore how the diachronic and synchronic patterns of sablefish representation at Tse-whit-zen might be related to taphonomy, resource procurement, relative social status of house occupants, and gradual and sudden environmental changes. While sablefish remains represent a single line of evidence, close analysis of this species may generate novel hypotheses about ancient environments and past human behavior, and help to emphasize the roles played by "secondary" resources.

[53] *Red and Yellow Tracks in the Aurignacian: The Spatial Distribution of Colorants at Abri Castanet (Dordogne, France)*

Abri Castanet is one of the most important Early Aurignacian sites in the Dordogne (France). First excavated in the mid-20th century by early pioneers of modern excavation techniques, the site yielded invaluable insights into Paleolithic art and personal ornamentation. More recent excavations continued this trend, using total stations to precisely provenience artifacts and sieved sediment. Such rigorous methods and others have elucidated production and use patterns of stone tools, personal ornaments, and hearths. Adding to these studies, this poster addresses colorants' contribution to our understanding of Aurignacian inter-site spatial organization. Geoarchaeological studies of the recently excavated South Sector found substantial quantities of iron oxides within the site's hearths (Lévêque and Mathé 2010). Coupled with earlier analyses that found XRD spectra associated with heat treating goethite into hematite, the Abri Castanet assemblage fits data suggesting calcining was a regular Paleolithic colorant exploitation technique (Pomiès 1998). To better understand the technique's role within the wider operational chain(s) of iron oxide processing, I analyzed the spatial distribution of mineral finds. The analysis explores the differential distribution of hematite and less well-represented goethite fragments. Combined with previous analyses, these findings help add paleoethnographic detail traditionally reserved for well-preserved open-air sites in a rockshelter context.

[125] *Ouiatenon and Its Informational Analogs: Making Connections in Colonial Archaeology Less Hard to Handle with the Digital Index of North American Archaeology (DINAA)*

The archaeological remains of forts, outposts, settlements, extraction sites, and other activity areas established during European colonial ventures in North America span several hundred years and thousands of kilometers. The intricacies and interconnectedness of these sites are not easy to quantify or describe within the traditional limits of archaeological data management. The Digital Index of North American Archaeology (DINAA) can reveal colonial sites and their neighborhoods of effect on a multiscalar basis of regions defined by research designs. The ontological bridging vocabularies of DINAA also permit consideration of relationships of sites from colonial contexts across spatiotemporal divides, cultural categories, and active behaviors. The characteristics of the French-American and Algonquian sphere of interaction in and around Fort Ouiatenon (1717-1791), Indiana, are used as an example against which to compare and contrast the data representation of colonial archaeological sites in eastern North America. DINAA is constructed on a model of linked open data (LOD) which facilitates the connection of numerous data sets across a variety of networked systems; the rich-yet-incomplete record of Fort Ouiatenon helps to suggest what forms of data may be most useful for larger research collaborations into colonial archaeology.

[261] *Slippery Oysters and a Cold Beer: Incorporating Food into Archaeology Education*

Through outreach and education, The Florida Public Archaeology Network, promotes the public appreciation and value of Florida's archaeological heritage. Food has regularly been used as a fun learning device in classroom settings: from teaching excavation techniques using a chocolate chip cookie to finding core samples in a PB&J. Public events held in cafés or over a pizza seem to break down social barriers and garner greater community cohesion. Recently, we have taken this one step further by having dining events that incorporate the tasting of historically-authentic food as a way to enhance the public understanding of Florida's archaeological heritage. This paper examines the effectiveness of using food to facilitate public archaeology, looking specifically at how food is used to bring archaeology to the classroom, provide a social and more relaxed atmosphere, and incorporate taste in the learning process.

Nolan, Kevin (AAL, Ball State University) and Mark Hill (Ball State University)

[9] *Exploration of Wet and Dry Portable X-ray Fluorescence for Archaeochemical Prospection: A Pilot Study in Comparative Method*

Geoscience approaches are being applied for prospection and intra-site analysis with increasing frequency in a variety of contexts around the world. There currently are a variety of archaeochemical procedures in use, each of which suffers from inherent limitations. Colorimetric measurement is limited in the number of elements measured simultaneously. Inductively Coupled Plasma techniques are expensive and restricted to a narrow range of institutions. Yet the recent availability of Portable X-ray Fluorescence (pXRF) offers a more flexible (wide spectrum of elements) and relatively inexpensive piece of equipment that is potentially more widely applicable to archaeological issues.

However, pXRF is most often used for whole-sample, dry chemistry which introduces a potentially geological confounding factor. In contrast, weak acid extraction preferentially extracts weakly adsorbed, and more likely anthropogenic, ions. We perform a comparative analysis of colorimetric measurement of phosphate, ICP-OES measurement of multiple elements, and both wet and dry pXRF of soil samples from a variety of glacial till plain contexts to assess the ability of pXRF to comparably measure the chemical imprint of human activity in till plain soils.

Noldner, Lara (Iowa Office of the State Archaeologist and the University of Iowa)

[85] *Isolated Human Remains from the Central Mesa Verde Region: Taphonomic Distribution Patterns across Sites*

This paper examines the taphonomic distribution of isolated human remains at several archaeological sites in southwestern Colorado, an area occupied by Ancestral Pueblo people from the A.D. 500s to around A.D. 1280. The Crow Canyon Archaeological Center defines isolated human remains as fewer than five disarticulated elements. The majority of isolated skeletal elements analyzed were recovered from Pueblo II and III (A.D. 900-1280) contexts, but earlier Basketmaker III (A.D. 500-750) contexts will also be discussed. Isolated human remains that are identifiable by element will be analyzed for their location within each site, their proximity to architectural features, and the type of matrix in which they were found. The goal is to identify any discernible patterns in the types of elements that are most often redistributed by taphonomic processes and where they are found in relation to both built structures and intact burials.

Noll, Christopher (Versar, Inc.)

[6] *Using the Lithic Technological Organization at Procurement Sites to Parse the Multiple Occurrences of Browns Bench Obsidian in Southern Idaho*

Volcanic rocks such as obsidian were commonly used for the formation of chipped stone tools by people during prehistoric times. Archaeologists have been able to learn a great deal about the movements of prehistoric people by charting the procurement sites and use locations of these stones through x-ray fluorescence (XRF). Typically XRF can determine the procurement location of volcanic tool stone within a few square kilometers. Occasionally sources are characterized that are widely scattered and XRF alone does not provide precise locational information; Browns Bench obsidian, which is found at scattered outcrops within a 37,500 square kilometer area, is one such source. The Browns Bench outcrops are highly variable due to the environmental factors that have acted on the nodules at each location. The physical properties and reduction strategies identified at each Browns Bench procurement site help generate expectations about which sources were used to produce tools transported over long distances, and those that were only suitable for locally used informal tools. The analysis shows that many of the occurrences of the Browns Bench source are not suitable for large formal tools that could be transported and curated.

Noriega, Aldo

[227] *Expansión de la Cerámica Chancay en el valle de Checras en la Sierra Norte de Lima*

La presente investigación brinda los primeros resultados de los trabajos exploratorios de excavación llevados a cabo en el sitio arqueológico de Tupish, localizado en el valle de Checras, en la sierra norte de la región Lima en Perú. Encontrándose evidencia cronológica relativa de su ocupación cultural que abarcaría de manera discontinua desde el periodo formativo medio hasta la época Inca. Esta convergencia cronológica y foránea mostraría indicios de los intercambios culturales o influencias políticas venidos de otras regiones a la zona del valle de Checras, tanto de la sierra central andina como de la zona costera próxima de Chancay, esta última para el Intermedio Tardío. Precisamente la investigación pone a consideración la presencia de alfarería Chancay hallada en el contexto de investigación documentada y no documentada en Tupish. Se propone una nueva área de expansión de la cerámica Chancay y los posibles factores de su presencia en el valle de Checras.

Norman, Garth (ARCON, Inc.)**[130]** *13th Baktun Rebirth at Izapa: Discovery Vistas with New Technologies in Applied Structural Archaeology Are Writing Preclassic History*

Norman's latest "Izapa Sacred Space" book will be introduced, highlighting shared culture contacts near and far. Izapa popularity peaked at the end of 2012 and is being rekindled with the 13th baktun zenith sun (August 13) and new year (Sept 21) calendar monuments and applied technologies. Recent discoveries at Izapa have been examined with Reflectance Transformation Imaging (RTI) digital imaging technology recording of Izapa sculpture. This work initiated in 2013 and was completed in 2014 under an INAH project permit by CIR (Center for Izapan Research, ARCON Inc.) with Dr. Jason Jones (University of Warwick, England) that dovetails with Robert Rosenswig's Lidar mapping of Izapa. These new technologies confirm the precision of the NWAF's Izapa topo map and superior accuracy of NWAF's primary Izapa reference works, challenged by artistic sculpture re-drawings. These re-drawings can be added to the corpus of Izapa work, but for analytical purposes, the improved outline tracings of Norman, prepared from photographs made with optimum lighting should be used.

Norman, Neil (William and Mary)**[177]** *Negative and "Natural" Monumental Spaces: Ditches and Sacred Groves in Pre-Colonial West Africa*

This paper builds on recent archaeological efforts to theorize the active role landscape features had in framing social relations, delineating zones of safety and inclusion/danger and exile, and marking spaces where cosmological actors tend to reside. In the coastal forests of pre-Colonial West Africa, ditch features and sacred groves did such social work, and as such, these powerful and liminal features held prominent positions within the kingdoms of West Africa. This paper explores massive ditch systems and expansive forests as monumental public works. Further, it and builds upon recent efforts to theorize them within the statecraft of complex societies and the theatrics of political economies.

Novic, Juliana (ASU School of Human Evolution and Social Change)**[237]** *Neighborhood Organizational and Interactional Variation in Comparative Perspective*

The degree to which the residents of neighborhoods form integrated communities with uniform social, political, and economic conditions is highly variable. I define neighborhoods, in agreement with most earlier definitions, as based on place and presence in an urbanized environment. The forms and functions of neighborhoods, and their relationships to larger socio-political urban processes, is not well understood for preindustrial societies. Are neighborhoods fully integrated communities or are people's primary social networks not connected to place? Does class, ethnic and occupational clustering feature as an important component in neighborhood life? Are all neighborhoods in a city tied to the same economic networks? Using available data from Mesoamerica, Asia, and Europe, I show that neighborhoods can be arranged along a continuum from integrated administrative units to fragmented and acephelous residential zones. Within the

same city, neighborhoods often have different socio-spatial conditions. Despite the small sample size, my comparative data offer a glimpse into the processes that produce these varying neighborhood conditions and dynamics that may lead to healthy or decaying cities.

Novotny, Claire (University of North Carolina - Chapel Hill)

[188] *Shifting Perceptions of Local Heritage: Community Archaeology in Aguacate Village, Toledo District, Southern Belize*

The recent expansion of community-based approaches to archaeological research signifies a renegotiation of how, and for whom, historical knowledge is produced. This paper reviews the implementation of a community-based archaeological heritage program in the Toledo district of southern Belize. Research conducted by the Aguacate Community Archaeology Project seeks to understand the degree of social, political, and economic integration of ancient Maya households with regional political centers during the Classic period (A.D. 250-850). Archaeological excavations conducted in collaboration with Aguacate, a Q'eqchi' Maya village, and Tumul K'in Center of Learning, a Maya-run high school, not only enhance our understanding of how ancient rural farmers negotiated regional social and economic relationships, but also become a nexus of negotiated engagement between Aguacate villagers, Maya high school students, and archaeologists. This paper explores how engagement with diverse publics over multiple field seasons revealed differing claims, perspectives, and priorities surrounding archaeological resources. Ultimately, incorporating public perceptions of archaeology resulted in the protection of archaeological sites and renewed interest in local Maya heritage.

[338] *Bioarchaeological Analysis of an Ancient Maya Ancestral Context at Cahal Pech, San Ignacio, Belize*

Interaction of the living with the bones of the deceased is a tradition practiced in various forms throughout ancient and modern Mesoamerica. Among the ancient Maya the manipulation of the deceased's body is associated with powerful ancestral rituals likely carried out to reinforce and legitimate sociopolitical power. Structures placed on the eastern perimeter of plaza groups often contain multiple inhumations and are interpreted as ancestral locations. Structure B1 at Cahal Pech, located within the Belize River Valley, is one such structure. Ongoing excavations have revealed numerous burials and caches placed within B1 over the course of its use. Recently recovered Burial 7 consists of a tomb of cut stone blocks containing the remains of at least three adult individuals of both sexes and additional isolated human remains. Artifacts and body positioning suggest a possible origin outside the Belize Valley for at least two of the occupants. In this paper we use taphonomic, isotopic, and carbon-14 data to reconstruct the sequence of interment and residential history of the tomb occupants. We compare Burial 7 to other collective interments from eastern structures in the Belize Valley and nearby sites to refine current perceptions of ancient Maya ancestral ideology.

Nowak, Jesse (Texas State University), Daniel Bigman (Georgia State University), Daniel Seinfeld (Florida Bureau of Archaeological Research) and Grant Stauffer (Texas State University)

[8] *A Deeper Look at Lake Jackson: New Insights into Settlement Patterns and Ritual Space at a Florida Mississippian Center*

This poster presents the results of magnetometer and ground penetrating radar surveys as well as excavations conducted in 2014 at the Lake Jackson site located in northwest Florida. The geophysical and excavation results augmented with previously recorded site data provide a new view of occupation and architectural placement in and around the mound complex. Evidence from the remote sensing survey reveals several anomalies that represent probable Mississippian-style structures, while shovel test data provides occupation evidence in previously unexplored areas. These findings lead to an identification of the functionality of certain sacred spaces and associated ceremonial behavior.

Nowell, April (Univ of Victoria-Dept of Anthropology) and Daniel Stueber (University of

Victoria)**[64]** *Good Things Come in Small Packages: Acheulian Small Tool Assemblages from the Shishan Marsh site (Jordan)*

Over the past century, prehistorians studying Acheulian assemblages have focused their energies largely on the handaxe arguing that its iconic symmetrical, tear drop shape can be a window onto the origins and evolution of modern cognition, sociality, language, teaching, skill acquisition, and even symbolic behavior. This focus on the handaxe, and by extension big game hunting, has largely been at the expense of Acheulian small tool and microlithic assemblages and their associated tasks. These assemblages, comprised of small cores and utilized flakes and tools of less than 5 cm in length, are known from sites in Europe, the Levant, Africa and Asia. A comprehensive study of these assemblages may challenge our definitions of what constitutes the "Acheulian" and alter our understanding of Lower Paleolithic subsistence practices, craft production and technical knowledge. In this paper, we present a detailed study of the small tool assemblages from the Shishan Marsh site, a newly excavated Acheulian paleomarch site in Azraq, northeast Jordan and explore the role these assemblages played in hominin survival in a shifting paleodesert environment.

Nowell, Sarah (University of Montana) and Anna Prentiss (University of Montana)**[312]** *Variation in the Lithic Technological Organization Accompanying Household Expansion at Housepit 54, Bridge River Site, British Columbia*

The degree of preservation of Housepit 54 at the Bridge River site located in south-central British Columbia provides a rare look at a long series of intact occupational floors within a single pithouse. As data collection continues, a vast number of opportunities emerge to examine behavioral variation at the household level. During the 2014 field season, excavation revealed a household transition that reflected shifts in the organization of space within the household. Changes included fluctuations in the extent and spatial positioning in pit-storage along with shifts in hunting, fishing, and plant gathering strategies. This poster examines lithic artifacts collected from these floors in order to determine whether or not a parallel change can be observed in lithic technological organization. Variability in decision-making regarding the organization of tool production, maintenance, and use is reconstructed from functional and technological analyses of lithic debitage, cores, and tools. Understanding the nature of relationships between technology and subsistence decision-making can inevitably lead to further research questions to deepen our understanding of socio-economic history at Housepit 54, and the Bridge River site.

Nuevo Delaunay, Amalia (Universidad Alberto Hurtado), Juan Bautista Belardi (UNPA-CONICET), Flavia Carballo Marina (UNPA), Hernán de Angelis (CA.D.IC-CONICET) and Maria José Saletta (AIA-CONICET)**[251]** *Incorporation of New Raw Materials by Hunter Gatherers in Patagonia since the Sixteenth Century*

Since the arrival of sixteenth-century Europeans to Patagonia, different indigenous societies inhabiting the region were forced to deeply modify their ancient lifeways. The incorporation of new raw materials (for example glass and stoneware) in the production of traditional instruments (for example scrapers and projectile points) was one of several modified aspects recorded both archaeologically and historically. At first glance, the use of new raw materials appears to have been equally incorporated all over the region; however, this is far from true. In this paper, we analyze data obtained from chronicles and archaeological contexts from continental Patagonia and Tierra del Fuego Island. We also bring into discussion data from experimental replication. We compare both sub-regions and evaluate their particular characteristics. In a deeper analysis, differences arise in the ways indigenous societies incorporated new materials. These differences could be related to both the existence of reservations and marginal settlements, as well as a market for guanaco hides in the continent; while in the island, inhabitants were not immersed in permanent commercial relationships, but rather contacted through religious missions. Finally, data herein presented has wider implications in that they reveal various ways in which hunter-gatherers coped with contact.

Nugent, Selin (The Ohio State University) and Hannah Lau (University of California Los Angeles)

[380] *The Walking Dead: Osteological and Isotopic Indicators of Mobility from Middle Bronze Age Commingled Human and Faunal Burials in Naxcivan, Azerbaijan*

Tracing the mobility patterns of pastoralists and their herds is a critical part of illuminating the lifeways of people who inhabited the southern Caucasus in the past. During the 2014 season, the Naxcivan Archaeological Project excavated several Middle Bronze age kurgans overlooking the Şərur Plain. In these burials humans and animals were interred together, speaking to the significance of the animals in the lifeways of the people inhabiting the area during the Middle Bronze Age. We correlate data from bioarchaeological and zooarchaeological analysis with isotope analyses of $\delta^{18}\text{O}$.

We performed an analysis of $\delta^{18}\text{O}$ ratios on both the human and animal remains from these burials, sampling human molars to determine movement over a lifetime and sequentially sampling across animal molars to determine seasonal grazing patterns. These results are compared to known environmental bioavailability ranges of $\delta^{18}\text{O}$ in Naxçivan. This allows us to calculate both likely elevation and geographical locality during enamel deposition of each individual. Our research is part of a long-term study to understand patterns of movement of people and, by their agency, animals throughout the landscape.

Núñez, Luis

[86] *Regional Distribution of Mortuary Domestic Rituals in the Upper Usumacinta Basin: A Burial Practice Comparison from the Palenque Region and Its Neighboring Areas during the Late Classic*

From a macro regional perspective, ancient Maya mortuary practices seem to be highly variable in many features, like skeletal position, head orientation, type of grave, offerings, and successive reentering events. But, from a closer view, micro-regional similarities can be found suggesting the use of common burial rituals, practices, and beliefs. The Palenque region provides an interesting example. The available burial data from Palenque, El Lacandón, and Chinikihá are discussed to show the existence of a common domestic burial set of rituals. The results are compared with the burial collection from neighboring areas influenced by larger and autonomous sites like Piedras Negras, Bonampak, Altar de Sacrificios and other sites from the San Pedro Martir basin. Each of the mentioned sites also shows similarities but enough differences as to suggest particular or exclusive ways of disposing the dead as primary and secondary deposits.

Núñez Aparcana, Bryan (Universidad Nacional Mayor de San Marcos)

[232] *Ancestor Veneration in a Domestic Space in Panquilma. A Preliminary Approach Based on the Ceramic Analysis*

One of the characteristics of the funerary practices in the central coast during the late periods is the presence of interments inside domestic spaces. It has been proposed that this type of funerary practice in the region is related to an increase in ancestor veneration practices due to the proximity of the Inka invasion. This study presents the analysis of ceramic materials associated with secondary burials recovered from a Central Household Compound in the domestic sector at the site of Panquilma. Characteristics, including attributes such as the high variability of ceramic forms and decoration, coupled with the identification of sumptuary and exotic artifacts will be used to assess the social identity of the buried individuals. The study of the social identity of the individuals buried in Panquilma's domestic compounds will help us understand better the effects that the Inka presence in the region.

Núñez-Cortés, Yajaira (University at Albany-SUNY)

[246] *Traveling and Trading in Ancient Costa Rica*

Evidence for the increase in trade between Greater Nicoya and the Central region of Costa Rica during the later Precolumbian periods (A.D. 800-1550) is likely tied to the expansion of commercial networks from more complex chiefdoms. Different trading routes have been proposed, including the Central Pacific as a possible gateway to the Central Valley. The feasibility of trade routes in the

region is explored and evaluated here taking into account the known archaeological sites and routes followed by the first Spanish explorers during the period of conquest. Local as well as inter-regional exchange included more archaeologically visible goods such as polished stone, gold, and polychrome ceramics. However, perishable items such as cacao, maize, salt, cotton, animal skins, and other items could have been part of an established trading network moving across the territory of modern Costa Rica by land and river routes, and even beyond it by sea routes. Ethno-historical documents, which will also be discussed, provide insight into prehispanic trade and economics.

Nystrom, Kenneth (State University of New York at New Paltz), Niels Lynnerup (University of Copenhagen) and Dario Piombino-Mascali (Department of Cultural Heritage and Sicilian Ident)
[299] *Mummy Studies and the Soft Tissue Evidence of Care*

Evidence of care in the bioarchaeological record has focused on two broad circumstances: (1) long term survival with disability in which functional independence is impossible and (2) healed/healing trauma or illness that would have necessitated intervention or care to ensure recovery and survival. These conditions reflect relatively extreme, life-or-death circumstances and thus provide the clearest opportunity to observe care. The preservation of soft tissue, however, not only affords the opportunity to observe a wider range of pathological conditions but presumably a greater chance of observing, or inferring, evidence of care. The first part of this paper is a synthesis of the degree to which researchers have engaged (explicitly or otherwise) with the concept of care in the analysis of mummified remains. The second component of the presentation will focus on the case of an 18th-19th century mummy from the Piraino Mother Church, in the province of Messina, Sicily. This individual exhibits evidence of pleural adhesions, whipworm infection, and skeletal evidence of multiple myeloma. Some level of care may be inferred based on our understanding of the progression of this cancer. Care is more directly supported based on results of palynological analyses through which plants with known medicinal properties were identified.

Oas, Sarah (Arizona State University)

[167] *Examining Settlement Reorganization and Plant Food Use in the Greater Cibola Region A.D. 900-1400*

Investigations at varying scales have been undertaken to understand the role of maize in the diets and daily lives of prehistoric societies in the U.S. Southwest. In the Cibola region, around the modern Pueblo of Zuni, archaeological studies provide a detailed temporal and spatial picture of rapid settlement reorganization and aggregation in the Pueblo III and IV periods between A.D. 1150-1400. Less well understood, however, is how daily subsistence practices and interactions with local environments changed in relation with widespread increases in settlement size and density over time. This research draws on a large number of archaeological plant analyses to explore spatial and temporal patterns in plant subsistence practices. In particular I examine evidence for changes in maize agriculture and the use of wild plant resources over the Pueblo II-Pueblo IV periods (A.D. 900-1400) in the Cibola region of the U.S. Southwest. The comparison of macrobotanical and microbotanical assemblages from across the Cibola region suggests an increased investment in agricultural activities and possibly the use of other plant food resources with the establishment of large nucleated PIV settlements across the Cibola landscape.

[273] *Exploring Pithouses: Using GPR to Identify and Map Taos, NM Sites*

In June of 2014, multiple pithouse sites within the Taos Valley were surveyed with ground-penetrating radar (GPR). GPR survey was employed to map two known pithouse sites and two possible pithouse sites. The Taos Valley ranges dramatically in elevation and terrain, many times leaving the surface indications of sites nonexistent. Also, the components (features) of each site exist at different depths. Because GPR is a high resolution mapping method that allows features of interest to be analyzed in 3D, using this method allowed us to map the structure of the pithouses and determine the presence of possible extramural features and additional structures without large scale excavation. These maps will be used to create a database of pithouse sites across the Taos Valley, giving us a more complete understanding of this period.

[213] *Visualizing Prehistoric Artifacts: 3D Scanning, GIS, and Data Sharing*

Since 2009, the 3D Scanning of Molded and Modeled Artifacts Project has collected a sample of

approximately 100 specimens. The main goals of our project include the assessment of mold and stamp use as methods of standardized mass production of clay artifacts in prehistoric Mesoamerica and beyond, as well as, digitally archiving images housed in various collections. In this presentation, we aim to introduce a virtual catalogue of clay artifacts that contains digital raw 3D data. The Digital 3D Catalogue provides an opportunity to researchers interested in identification and comparison of their site collections with others that may not be reachable, fosters further metrological analyses, encourages data sharing, and will be accessible to the general public in the near future.

[37] *A Technical Study of Casting and Inlay on Chinese Ceremonial Weapons at the Harvard Art Museums*

The Harvard Art Museums contain one of the world's largest collections of inlaid Chinese ritual weapons from the Shang dynasty (c. 1600–1046 B.C.E.). These weapons are ornately decorated with turquoise inlay, exemplifying power and elitism in early Chinese society; yet little is known about their manufacture and use. A technical study of 32 inlaid weapons and pre-Shang plaques has yielded new observations on early technology and production organization in ancient China, and concluded that the mold-making process for casting weapons is distinct from early vessels. The turquoise stones and other inlay materials were categorized into groups through observations of shape, size, and finishing marks. The adhesive joining the inlay to the bronze was identified as a fruit tree gum, not lacquer as speculated in most literature. Evidence observed on the objects suggests that early Chinese production for inlaid weapons began with jade working, followed by bronze casting, and finalized with decorative turquoise inlay. This project also compared the museums' collection with contemporaneous, excavated inlaid weapons now housed in Beijing, Anyang, and Taipei.

OConnor, John (University of Oregon)

[233] *Artifact Networks, Cultural Transmission, and Polynesian Settlement*

The colonization of Polynesia was a motivated dispersal of culturally related human populations on a massive geographic scale. The settlement of distant oceanic islands involved the development and sharing of technological information specific to local environments, including exclusively stylistic aspects of artifact design. A reassessment of artifact comparisons from a neo-Darwinian evolutionary perspective continues to provide information regarding social interaction among island communities. Here I measure similarity in line-attachment-devices (L.A.D.) among artifact fishhook assemblages to determine significant cultural relationships among island populations. Artifact classes were documented for each assemblage. Similarity/dissimilarity coefficients were then calculated to remove sample bias and permit the simultaneous comparison of multiple assemblages. A series of non-parametric randomization tests were performed to directly evaluate the influence of geographical distance and sample size on assemblage relatedness, revealing distinct statistical relationships between certain assemblage attributes. Relational networks were constructed based on the degree of statistical similarity among artifact groups. The quantification of artifact similarity among fishhook assemblages allows the construction of undirected network models that illustrate the transmission of technological information in a non-hierarchical structure and contribute to a better understanding of human relations in prehistoric Polynesia.

[44] *Opposing Views in African-American Archaeology: Use of Resistance or Risk Management to Explain Cultural Material of the Enslaved*

This paper argues that theories in favor of resistance as the primary cultural response of enslaved African-Americans do not offer a complete picture of the diasporic experience but rather theories in risk management offer a better explanation for the variation inherent in slave responses and material culture. Risk management theories suggest resistance as only one of a myriad of responses a slave community might choose in reaction to their environment. When investigating the residential spaces and subfloor pits of enslaved Africans across Southern plantations, symbols of both resistance and risk management are represented in everyday utilitarian objects such as ceramics, metal housewares, tools, ammunitions, and other European-American materials, which were often adopted and reused in ways that were meaningful to enslaved peoples. While historical narratives indicate that resistance would have been a daily occurrence and would have been a major factor in how slaves formed their identity in an "us" versus "them" framework, this paper argues that resistance would have been only one of many responses to enslavement and evidence suggests that it was most likely not the dominant response in the slave community.

Oesch, Karla (University of Memphis)

[275] *A Stylistic Analysis of Protohistoric Polychrome Ceramics from the Lower Mississippi Valley*

The unique nature of ceramics from the Mississippi Valley provides an important basis for detailed ceramic studies that serve to aid researchers in understanding social agency and processes. These ceramic assemblages, especially those dating to the Protohistoric period, will be the focus of this research. Ceramic vessels from counties in Arkansas and Mississippi will be used to compile database of design motifs, in addition to other ceramic characteristics. Using the dates from these sites, my research will help to better understand the chronological distribution of particular ceramic characteristics. It is the hope that this research will not only further ceramic chronologies, but also better understand processes of change both in society as well as material culture.

[356] *A Middle Stone Age Paleoscape near the Pinnacle Point Caves, Vleesbaai, South Africa*

While MSA caves/rock shelters can provide long sequences of early human residential activities in circumscribed contexts, most resource procurement activities occurred on the landscape in uncircumscribed space. We have a limited understanding of these resource procurement activities at present, making studies of open-air sites crucial. To alleviate this bias, we report on a series of MSA open-air assemblages that are exposed on ancient land surfaces suggestive of intact paleosols at Vleesbaai and Visbaai. These localities are situated within 10 km of the long cave/rock shelter sequences at Pinnacle Point, South Africa presenting the novel potential to study evidence of MSA behavior in closed and open settings where their proximity to each other approximates the typical hunter-gatherer daily foraging radius documented in ethnography. We present a fabric and technological analysis of MSA stone tool assemblages from three "areas." The fabric analysis suggests that the lithic assemblages have undergone limited post-depositional disturbance. The technological analysis and exploratory comparisons between these open-air assemblages and MSA cave and rock shelter contexts at Pinnacle Point Cave 13B and 9, and Cape St. Blaize Cave suggest a dichotomous pattern of retouched tool discard, and that the quartzite artifacts from Vleesbaai were locally procured and field processed.

Offenbecker, Adrienne (University of Calgary), Jane H. Kelley and M. Anne Katzenberg**[328]** *The Relationship between Violence and Geographic Origins at Casas Grandes, Chihuahua, Mexico: Preliminary Results from Strontium Isotope Analyses*

Casas Grandes, also known as Paquimé, was one of the largest and most complex societies in prehistoric northern Mexico, with established trade networks and cultural influences from Mesoamerica, the American Southwest, and western Mexico. Analyses of the human skeletal remains from Casas Grandes have found evidence for interpersonal conflict, human sacrifice, and cannibalism during the Medio period (ca. 1200-1450 A.D.), which coincides with the site's increasing sociopolitical complexity and emerging social differentiation. Unfortunately, the nature of violence at Casas Grandes is still poorly understood. The primary objective of this pilot study, therefore, is to determine whether violence was directed toward members of the local community or outsiders, such as immigrants or captives. We accomplish this by using strontium isotope analysis to examine the relationship between geographic origins and various osteological and mortuary variables. Our preliminary results indicate that $87\text{Sr}/86\text{Sr}$ values are not correlated with mortuary treatment, post-mortem processing, or trauma, though significant patterning by sex was observed. We discuss these results in the context of emerging complexity and inequality and also highlight the strontium results from several distinctive burials, including potential human sacrifices, cannibalized remains, and various interments from an elite burial tomb.

[328] *Chair***Ogburn, Dennis (University of North Carolina at Charlotte)****[247]** *Identifying Possible Inca Census Records in Khipu from Pachacamac*

One of the primary categories of data recorded by the Incas on their knotted string accounting devices (khipu) is detailed census numbers from different administrative units, yet no existing khipu has been identified as containing such population records. In this analysis, Inca concepts of age categories and hierarchical ranking are used to predict a number of different formats for recording census data. Existing data tables of khipu were examined to determine if any matched these expectations, and at least two khipu, both from Pachacamac, were found to closely match one of the primary formats predicted. Analysis showed the numbers on those khipu conform closely to the expected demographic composition that would be represented by Inca age categories, and the numbers on the two khipu further suggest the records are for several hunu (groups of 10,000 tributaries). The two khipu also represent two different levels of an accounting hierarchy.

Ogiogwa, Joan-Mary**[149]** *Cultural Survivals and Social Memories*

Cultural survivals should ordinarily be thought of as anthropogenic in nature as they generally result from the conscious and unconscious influence of humans on their natural environment in an attempt to respond to the cultural, historical, spiritual and environmental challenges facing them.

To this extent, the rock engravings on the Omutedo rock shelter located along the Ijebu-Igbo highway in Ogun state, south western Nigeria have carved a pathway in the way the present inhabitants think about their past as it relates to this cultural survival. The present paper is a report of the survey and documentation work done on the rock shelter with the main aim to know the extent of the shelter, extent of the engravings and to try to understand the motifs of the designs on the rock. Methods used in this project included an inventory study using the surface inspection technique, documentation; that is a thorough description and photography of representative and diagnostic features in situ.

OGorman, Jodie (Michigan State University)**[365]** *Negotiating Migration and Violence in the Precolumbian Mid-Continent: A View from the Village*

Multiple lines of evidence from Morton Village presented in the poster symposium are brought together to consider the social context of marked violence evidenced at Norris Farms 36 cemetery. This current work sheds light on the complexity and context of social interactions whereby migrant and resident populations negotiated a level of cooperation and support by creating new mechanisms

for social integration in the village.

[35] *Near and Far: Spatial Relationships of Inter- and Intra-Site Artifacts at Rimrock Draw Rockshelter (35HA3855), Harney County, Oregon*

Rimrock Draw Rockshelter is located along a relict stream channel in southeastern Oregon. The lithic assemblage includes Western Stemmed (WST) points; Northern Side-notched (NSN) points; and artifacts associated with fluting technology, such as fluted bifaces, fluting flakes, overshot flakes, and bifaces with overshot flake scars. NSN and WST distributions within the rockshelter have vertical and horizontal separations, indicating temporal and areal differences in site use occurred that can be tied to distinct stratigraphic components. Surface distributions outside of the rockshelter also indicate distinct areas of occupation, with WST points found primarily above the rockshelter, NSN points on terraces upstream, and fluted technology on downstream terraces. Obsidian geochemical sourcing of an additional 100 artifacts from the site (250 total) reinforces our perspective that mobility patterns varied through time. WST points were transported from diverse sources in central and eastern Oregon, northern California, and northern Nevada. Fluting technology was localized, with most obsidian originating within 50 km of the site. Sources for NSN points suggest a wide-ranging population. Geochemical sourcing data for fluted and stemmed artifacts from Sagehen Gap, Sheep Mountain, and the Dietz site (all near Rimrock Draw Rockshelter) will enhance our perspective on mobility patterns in Oregon Paleoamerican sites.

[395] *Accessing Social Geographies in Late Glacial Franco-Cantabria through Personal Ornaments*

Besides its rich and complex archaeological record, the Late Glacial of Franco-Cantabria is also a moment of central importance in the population history of Western Europe. This region was the principal demographic source for the post-LGM recolonization of Western Europe, and the influence of cultural trends originating here may be observed across the continent. This paper will present the goals and initial results of an ongoing research project to analyze the internal social dynamics of this critical period of prehistory. It will examine the emergent Late Glacial social geographies, understand the cultural influence exerted by various demographic centers, and chart the principal axes of interaction between these clusters. It will do so by conducting a study of the personal ornaments recovered there from the Initial-Upper Magdalenian periods (approximately 22-14,000 years ago) from the Dordogne to the Pyrenees and Cantabrian Spain. Typological and technological variation across time and space will be analyzed for indications of cultural affiliation or interaction, and stable isotope geochemistry will be used to identify the source of ornament materials, allowing access to networks of mobility and exchange, and how they change through time.

[56] *Exploration in Portable X-ray Fluorescence (pXRF) Applications to Zooarchaeology*

Current research in portable X-ray Fluorescence (pXRF) applications for archaeological research constantly attempts to push the boundaries of what this technology can accomplish. Although research involving lithics, glass, metals and ceramics remain the most common venues of

investigation, bone has also become an innovative focus of inquiry. However, because it has been studied significantly less than these other forms of material culture there is still much that is unknown in terms of how certain elements become represented in bone, such as the relative abundance of elements that contributed to composition during life rather than uptake post-deposition. Fish bones from Betty's Hope plantation provide a range of data that includes a variety of elemental representation, both naturally-occurring and not. This updated analysis will attempt to ascertain how certain elements become represented in archaeological bone samples both during life and post-depositionally.

[335] *Predatory Commerce, Elite Competition: Economic Conflict and the Downfall of Elite Communitas in the Port of Mtwapa, Kenya, 1600-1750 C.E.*

The premise of this session is that "communities are not merely the byproducts of individual households pursuing their own productive strategies nor are households passive reflections of the larger communities of which they are a part." This paper focuses on Waungwana (elite) communitas at the Swahili port of Mtwapa, Kenya between 1600-1750 C.E. Data from 10 elite wards is used to examine the effects of competition on both household and community. Analysis shows that the external predatory commerce in the Indian Ocean trading world of 17th and 18th centuries is linked to the emergence of new competitive elite households within the waungwana at Mtwapa who: a) invested more in 'foreign' merchant networks rather than local and regional alliance networks, and b) shifted from a local-regional value-added manufacturing economy to a regional-global raw material-based extractive economy. While this enabled greater profit for the emergent elite households, it also led to a breakdown in the Waungwana communitas and ultimately, to capital flight, elite out-migration, and abandonment of Mtwapa between 1750-1800 C.E. It is argued that household engagement in competitive pursuit of their own productive strategies in response to predatory commerce may be a fundamental factor in the breakdown of communitas and communities.

[265] *Don't Forget Me When I'm Gone: Examining Relationships between the Living and the Dead through Decorated Headstones*

Cemetery grave sites allow a continual dialogue between the deceased and their descendants. Many living relatives choose to decorate graves with flowers, ceramic figurines, flags, letters, and decorative seasonal items. This study was aimed to examine the relationship between the deceased and loved ones who choose to decorate graves after burial. Two cemeteries in Evansville, Indiana were examined in order to investigate the typology of decorations and the length of time graves remained decorated. The activity recorded, along with information obtained from online memorial web pages, indicates an intricate relationship the living share with the departed.

[244] *With Turkeys on Spears and Maize on Arrows: Defining and Defending the Province of Chetumal*

Chetumal Bay had political and economic importance for local Maya populations for more than 2000 years. When the Spaniards entered the region in the 16th century, they settled near its political capital and attempted to incorporate it into a larger colonial world system, only to be met with wide-scale resistance. This paper examines the shifting dynamics of the Chetumal Bay territory, from the Preclassic through Postclassic-Colonial Periods, with perspectives drawn from Cerros and Progreso Lagoon. We consider how territorial structures were reworked throughout the history of the region, and the ways in which this history helped to shape Colonial Period interactions.

O'Leary, Owen (JPAC-CIL)

[48] *Predicting the Location of Human Remains on WWII Bombardment Aircraft Crash Sites*

Examination of eight WWII bombardment aircraft loss incidents that have been resolved by the Joint POW/MIA Accounting Command (JPAC) since 2000 has allowed for the creation of a model that predicts where human remains can be expected to be recovered from within a crash scene based upon each crew member's individual duty station. This paper will detail how the remains identification process was utilized in order to determine where each individual was found in relation to the aircraft wreckage at the various crash sites, including those criteria necessary for a case to be included in the model and how hypotheses were developed. These hypotheses were then tested against an additional, previously unexamined, loss incident. Results detailing how far remains can be expected to be found from the individual's corresponding duty station wreckage and maximum spread within a crash site are provided. Additionally, for the cases included in this study, it is determined that the physics of the crash rather than the actions of the crew or post-depositional processes is what primarily dictates where individuals will be found within a crash site.

Olivier, Guilhem (Instituto de Investigaciones Históricas, UNAM) and Leonardo López Luján (Museo del Templo Mayor, INAH, Mexico)

[298] *The Roseate Spoonbills of Tenochtitlan's Great Temple and Their Relation to Deceased Warriors, Nobles, and Kings*

During recent excavations conducted in the Urban Archaeology Program (PAU) and the Templo Mayor Project of Mexico's National Institute of Anthropology and History (INAH), six offerings containing roseate spoonbill (*Platalea ajaja*) skeletal remains were found at the foot of Tenochtitlan's main pyramid. A careful analysis of these bones reveals that the Mexica buried not only complete individual birds in this important ritual scenario, but also their multicolor feathered skins. Although the roseate spoonbills may have come to the ancient city through usual the commercial or tributary channels, it is also possible that they came from the famous Totocalli (House of Birds) located in Motecuhzoma Xocoyotzin's palace. The comparative study of the archaeological contexts, native pictorial manuscripts, and colonial alphabetic sources indicates that these birds were symbolically associated with the souls of deceased warriors, nobles, and kings. Their location at the foot of the great twin-temple structure, specifically on the side dedicated to Huitzilopochtli, would confirm historical data that maintain that the cremated cadavers of Mexica sovereigns were interred there.

[333] *Tree Ring Isotope Record of Climate Change at the Ramaditas Site in the Atacama Desert of Northern Chile*

The Ramaditas archaeological site in the Atacama Desert of northern Chile provides evidence for cultural adaptations during wetter environmental conditions in an otherwise arid environment. From 2.0 – 2.5 kyr B.P., regional population increased and a cultural shift toward agricultural based communities occurred. Tree samples collected from the site provide a high-resolution record of increased water availability as recorded by tree ring oxygen and carbon isotopes. *Prosopis tamarugo* logs from structures and stumps in ancient irrigated agricultural fields show a range of $\delta^{18}\text{O}$ values

from 22.8 to 39.4‰. The change in oxygen isotope values is significantly greater than the 33.5 to 34.6‰ range recorded in modern and early Holocene trees. Precipitation runoff and infiltration in the Andean highlands to the west of the site recharges the lowland Pampa del Tamarugal aquifer. Hydroclimate anomalies leading to wetter environmental conditions during Central Andean Pluvial Events in the region have been attributed to ENSO-like variability. Frequency analyses of annual and sub-annual isotope values suggest decadal trends in climate forcing mechanisms. The timing of these paleoenvironmental and cultural events as recorded by our tree-ring isotope record demonstrate the dynamics between human societies and the environment.

Olson, Kyle (University of Pennsylvania)

[402] *No Aryans Needed: Toward Explaining the Distribution of Burnished Grey Ware Ceramics of the Third Millennium in Northeastern Iran*

The Gorgan Plain in Iran has long been considered to be an important part of the northern frontier of the Ancient Near East. Only recently, however, has this region been considered a center of complex society in its own right during the third millennium B.C.E. While no society in this frontier zone would achieve literate statehood until much later, there is nevertheless mounting evidence that the societies of northeastern Iran developed incipient urbanism, craft specialization, and organized irrigation networks, among many other hallmarks of 'civilization' during the Bronze Age. Unfortunately, considerable confusion remains regarding basic cultural sequences of ceramics, architecture, craft production, agriculture, and animal husbandry. Due to the nature of the published materials, discussion tends to revolve around a few key issues; the most widely published and commented upon cultural materials from northeastern Iran are the Burnished Grey Wares made famous by Erich Schmidt's excavations at Tepe Hissar. This paper focuses on integrating the available Burnished Grey Ware materials into a framework that adequately describes the variation in this assemblage over time and space and evaluating different hypotheses that could possibly account for the observed distribution.

Olszewski, Deborah (University of Pennsylvania), Maysoon al-Nahar (University of Jordan), Daniel Schyle (University of Cologne) and Brian Byrd (Far Western Anthropological Research Group)

[64] *Wadi Madamagh, Western Highlands of Jordan: Lithic Evidence from the Late Upper Paleolithic and Early Epipaleolithic Occupations*

Wadi Madamagh, a small rockshelter in the Petra region of the Western Highlands of Jordan, contained high-density deposits of the Late Upper Paleolithic and the Early Epipaleolithic periods. It was first excavated in 1956 by D. Kirkbride, who placed two trenches into the site and briefly reported on the lithics, which have since been studied in detail (B.F. Byrd). A small test along one of Kirkbride's trenches was conducted in 1983 (D. Schyle), and more intensive excavations were pursued in 2011 (D.I. Olszewski and M. al-Nahar, as well as D. Schyle). As a result of decades of exposure due to the open trenches left by Kirkbride, the remaining deposits at Wadi Madamagh are unfortunately quite limited, especially those of the Early Epipaleolithic. In this paper, we address this issue in part by combining data from the lithic assemblages recovered from all three excavation seasons. This is thus the first comprehensive examination of the stone artifacts recovered from this site. It examines their significance for understanding the behavioral strategies of Late Upper Paleolithic and Early Epipaleolithic hunter-gatherer-foragers in this part of the Levantine Middle East.

[197] *Collaborative Efforts to Preserve Los Angeles' History: Saving The Campo Santo*

In October 2010, human remains were uncovered during the development of Los Angeles County land leased to the La Plaza De Cultura y Artes located in the heart of Los Angeles, California. The remains, which were within the well-known Camp Santo historic cemetery, were that of Los

Pobladores, Native Americans, indigenous Mexicans, and the Gente de Razon, the very people who founded and built the Pueblo of Los Angeles during the early and mid 1800s. Over 90 individuals were removed, unbeknownst to lineal descendants and Native American tribes and without consultation as to the appropriate handling and disposition of the ancestors as is required by state and federal law. This paper will provide a brief history of the Campo Santo Cemetery, describe the impacts to cemetery burials, and most importantly discuss how the various agencies involved worked effectively with the consulting Federally Recognized tribe to carry out adequate preservation methods. Furthermore, it will also look at the current status of the cemetery location and efforts being made for long term preservation.

Opitz, Rachel

[84] *Modeling Behavior in Digital Places Using Low-Level Perceptual Cues*

Serious games and detailed 3D virtual models that allow researchers to explore multiple scenarios and reflect on different hypotheses or potential reconstructions are growing in number and increasingly viewed as serious scholarly tools. These reconstructions tend to heavily foreground the spatial and visual aspects of a place, a natural reflection of the character of the digital media in use. Studies of potential past experiences of these places, typically focused on movement through them and the visual experience as clues to the intentions of their creators or discrepant experiences of inhabitants and visitors, rely heavily on the described experiences of users of the virtual models and games. This raises a number of difficulties, widely acknowledged by the scholarly community, notably the pervasive influence of the cultural baggage of an individual modern explorer of the model. In this paper, using models of Knowth in the Bru na Boinne in Ireland, I present a formal modeling approach that uses the visual perception of space and shape, relying on low-level perceptual cues and scene-structure, to go beyond the individual user's experience and provide a rigorous analytic approach to the modeling of visual experience, on which interpretations can be built.

[5] *Moderator*

Oram, Richard (University of Stirling, UK)

[288] *Stripped Naked, Flayed to the Bone and then Drowned: Settlement Failure in Coastal Scotland in the 14th and 15th Centuries*

Archaeological excavation of medieval settlements in the coastal districts of Scotland has revealed significant evidence of protracted environmental impacts on their material culture exploitation regimes and domestic economies between the later 13th and early 16th centuries. These impacts are represented chiefly by shifts in the marine species being exploited or changes in the levels, species and age profiles of livestock carried on grazing-land, or trends in the suite of cultivars represented, all signifying attempts to adapt to environmental change with varying degrees of success. At several sites dispersed from Orkney to the Outer Hebrides and Buchan to Lothian, however, integrated archaeological and documentary historical research has revealed where failure to adapt practices which emerged in the MCA to the changed circumstances of the 'little ice age' - in soil 'improvement' strategies, fuel resource exploitation or construction-material management - accelerated settlement decline and contributed to system failure and abandonment in even such a resource diverse region as Scotland. This paper will discuss the consequences of adherence to traditional agricultural practices during this era of deteriorating climate, exploring particularly the impact of increased storminess on arable-intensive communities.

Ordoñez, Maria (PhD candidate Universiteit Leiden)

[367] *Forgotten Mummies. Reflections on the Management of Human Remains Exhibits in Ecuadorean Museums*

This paper will address the role of the human remains collections in Ecuadorian archaeological museums through the comparison between the case of the National Museum of Ethnology in Leiden Holland and three Ecuadorian museums: the National Museum, the Sumpa Lovers museum and the Jacinto Jijón y Caamaño museums. This comparison will be done on the basis of archaeological ethical practice in regards to human remains and the experience and points of view of the museum

personnel that work with these collections. These results are considered within the framework of international codes of ethics and treatment of human remains in museum collections, as are being discussed at present in the USA, UK and international associations such as the SAA and ICOMOS. The objectives of this paper are to present case studies using management practices of Andean human remains in collections and exhibitions, encourage discussion on the subject in archaeology and anthropology museums in Ecuador and assess the need for national policies and professional standards for the regulation of the work with human remains, beyond their analysis and conservation.

Ore Menendez, Gabriela (Vanderbilt University) and Steven Wernke (Vanderbilt University)

[287] *Mapping and Feature Classification of Low Altitude Orthomosaics Using Geospatial Image Analysis in a Planned Colonial Town in Highland Peru*

Large archaeological settlements with complex architecture have been always difficult to map. The introduction of unmanned aerial vehicles to fly over sites has helped reduce the time and increase precision of archaeological mapping; nevertheless post-processing time is still a workflow bottleneck. We present a geospatial imagery-based methodology for identifying and mapping surficially visible structures and environmental features at a late prehispanic and colonial settlement with extensive and complex architectural features in the highland Andes of Peru. Satellite imagery and aerial photography has been used before in archaeology to identify archaeological sites at a macro scale. Now, the use of high-resolution panchromatic photography analysis allows the identification of individual features in detail. Using feature extraction principles over a high resolution orthomosaic image, we identify architectural and natural features at the site. The results enable walls, complete structures and collapsed buildings to be readily identified and mapped as vector themes while also revealing swamp and high-density vegetation areas and wall foundations not observable on the ground in the field. The application of this feature extraction methodology in other archaeological context is also discussed.

[193] *Ritualized Shatter: An Introduction of Obsidian to La Mipla, Belize*

California State University, Los Angeles Archaeological Field Program in Central America conducted an investigation of a sinkhole containing a small grotto at the ancient Maya site of La Milpa, Belize in 2014. Excavation discovered that a rubble-cored platform had been built around the feature, formalizing the space and suggesting that it had functioned as a sacred landmark. During the excavations, a fairly dense concentration of sherds was encountered along with three dozen fragments of obsidian prismatic blades. The recovery of the blades is not surprising in that obsidian has been reported from dozens of caves in the Maya area. What is unique, however, is the extremely fragmented condition of the blades which suggests deliberate breakage. Analysis of fracture patterns and use-wear are currently being conducted in an effort to determine how the blades had been used and fragmented before being deposited in the sinkhole. The material is also being sourced to see if procurement differed for a ritual use.

Orozco, Joseph [355] see Lorenz, Samantha

Orrego Corzo, Miguel (National Archaeological Park Takalik Abaj) and Heber Delfino Torres Estrada

[242] *Current Ritual Materiality at Tak'alik Ab'aj*

Tak'alik Ab'aj since its heyday in the Preclassic and during its long history up to the Late Classic,

was an important trade and cultural center of the southwestern Maya Periphery. After an abandonment of 1700 years of long-lived and uninterrupted history in 900 A.D., this ancient city apparently maintained its significance as an ancestral sacred place. However, rituals were performed as inconspicuously as possible, since the site has passed into private properties. Since the beginnings of the creation of the Archaeological National Park Tak'alik Ab'aj in 1987, indigenous people were invited to the site to perform and unfold their ritual traditions in an ambiance of respect and consideration for the conservation of the site. This has propitiated a growing affluence of ritual activities, set to the sacred calendar days, which has been carefully documented, producing a wealth of details and information about character, patterns, protocol and diversity in materials employed in current rituality. This signals a powerful process of re-invention.

Ort, Jennifer (PAL, Inc.) and Dianna L. Ducette (PAL, Inc.)

[281] *Undiscovered Country: Preliminary Results of Eleven New Sites Identified in the Susquetonscut Brook Valley, Eastern Connecticut, USA*

PAL, Inc (the Public Archaeology Laboratory) conducted archaeological investigations in Connecticut, Massachusetts, New York and Rhode Island in preparation for upcoming modifications to an existing pipeline. The project in particular crossed large areas of Eastern, Central and Western Connecticut that have not previously been systematically surveyed. This paper will focus on those sites identified in Eastern Connecticut, specifically those found along the Susquetonscut Brook, a tributary of the Yantic River. Diagnostic artifacts coupled with 14C dates of 3901 ± 23 RCYBP (PRI-14-065-2820.02-04) and 4026 ± 23 RCYBP (PRI-14-065-2820.02-05) place these sites within the Late/Transitional Archaic Period to the Early Woodland Period. Considering the paucity of previously recorded sites in the Susquetonscut Brook's Valley, these sites offer a wealth of new information for the region. In this paper we focus on specific questions about these sites: (1) What activities took place at each site, what local resources were exploited, and how do these factors relate to site use and seasonality? (2) Are the sites along Susquetonscut Brook related? (3) Why were no earlier or later sites found despite extensive survey coverage?

[413] *Population Movements, Trading, and Identity along the East Coast of Postclassic Yucatan. Dental Morphology, Isotopic Provenience Analyses and Body Modifications in Human Series from El Meco, El Rey, and Tulum, Quintana Roo, Mexico*

Different hypotheses exist for explaining population development and replacement on the east coast of the Yucatan peninsula after the so-called Maya collapse, one involving the presence of the Putun-Chontal folk fringing the Gulf Coast of Mexico. Here we examine these proposals through the lenses of conventional paleodemography, dental morphology, body modifications (dental decorations and head shaping) of human skeletal series from the Postclassic coastal trader settlements of El Meco, El Rey and Tulum, Quintana Roo, Mexico. We match these with the provenience profiles obtained from 87Sr/86Sr and d18O isotopic analyses in 37 individuals of the collection (both sexes) and put the data in broader contexts of social organization and regional population evolution. The series from the core settlement of Tulum shows higher biological heterogeneity than the two other series, higher diversity in artificial head shapes and a small proportion of non-locals, stemming perhaps from the adjacent northern Peten area. Despite the limitations in sample sizes and diversity in contexts, our results echo broader trends in population movement and cultural cohesion along the Yucatecan coast.

[196] *Revisiting the Preclassic Ceramic Sequence of the Greater Kaminaljuyu Zone*

In a recent work, Inomata and colleagues present a revised chronology of Kaminaljuyu during the Preclassic period which cross-dates other cultural sequences in southeastern Mesoamerica. This paper provides further ceramic data including a re-evaluation of the various typological sequences already established in the literature and presenting a modal sequence of vessel shape, surface treatment, and decoration based on ceramic analysis of collections from the most important sites in the greater Kaminaljuyu zone (i.e., Kaminaljuyu, Naranjo, Piedra Parada, and Rosario-Naranjo). This paper demonstrates that significant data is still attainable from stored ceramic collections and that implementing detailed modal analysis of Maya archaeological research has the following significance: 1) it refines local ceramic sequences, 2) it highlights the importance of synchronic ceramic developments through ceramic modes and types in order to cross-date extant regions.

[196] *Chair*

Ortiz Barrera, Rosa (Rosa Ortiz), Cindy Cristina Sandoval Mora and José Luis Punzo Díaz**[156] *The Activity of Hunter Gatherers in the Northwest of Durango, México***

The Northwest part of the state of Durango is an understudied area in which it has now been possible to detect, record, and describe archaeological sites and materials. The work carried out at the sites "La Peña" and "El Indio" have marked important milestones in the research of hunter-gatherer groups. The excavation of La Peña, located in a rock shelter, allowed us to learn the specialization that these groups had in the development of lithic artifacts, since a lot of Toyah arrowheads were found, a little common tool associated with the Trans-Pecos, Texas, and Bravo Valley Livemore phase (1200-1800 A.D.) and (900-1200 A.D.). Radiocarbon dating associated with Toyah arrowheads makes clear the obvious link to archaeological sites of the Guadiana Valley, where these arrowheads were found in late sites of the Chalchihuites Culture between 1000 and 1350 A.D. The archaeological site El Indio has a panel with rock art, structures, and associated material. A detailed study of the designs suggests a possible reuse of the site as it has a varied iconographic mix and overlap of elements, many of which are very similar to designs attributed to hunter-gatherer groups, especially geometric shapes and anthropomorphic and zoomorphic naturalist figures.

Ortiz Ruiz, Maria (El Colegio de Michoacán A. C. Centro de Estudios Arqueológicos)**[399] *Archaeometry and Lime Kilns***

Over the past two years the characterization of the ring structures strongly suggests the presence of kilns for lime production by the Classic and Colonial Maya. Archaeometric techniques used in this research were critical in the recovery, mineralogical characterization, and dating of the organic waste associated with lime production. In this paper I present the results of two years of work that have allowed the characterization of limestone used in the production of lime as well as the temperatures associated with these structures.

Ortman, Scott (CU-Boulder)**[348] *Uniform Probability Density Analysis and Population History in the Tewa Basin, New Mexico***

One of the basic challenges facing archaeology is translating surface evidence into population estimates with sufficient chronological resolution for demographic analysis. The problem is especially acute when one is working with sites inhabited across multiple chronological periods. In this paper I present a Bayesian method that deals with this situation. This method combines uniform distributions derived from a local pottery chronology with pottery assemblage data to reconstruct the population history of individual settlements. I then illustrate applications of the method at the site and regional

level, using data from Cuyamungue and the surrounding Tewa Basin. The results of these studies allow one to identify periods of significant population movement at the site, sub-regional and regional levels.

Osborne, James (Brown University)

[287] *Visibility Graph Analysis of Monumental Buildings in Iron Age Turkey*

Visibility Graph Analysis, or VGA, is a means of evaluating architectural environments based on a number of properties of intervisibility between points distributed within two-dimensional building plans. Created by Alasdair Turner for modern architects as a way to further space syntax analysis (itself based on patterns of accessibility instead of visibility), archaeologists have slowly been incorporating VGA into their work over the past decade. In this paper I outline the stages involved with the method in the standalone program Depthmap to illustrate how easily archaeologists can experiment with it. I then illustrate two case studies of VGA, one from a royal palace at the site of Tell Tayinat (ca. 9th-8th centuries B.C.E.) and one from two monumental gateways at the site of Kerkenes Dağ (7th-6th centuries B.C.E.). In both cases I show how visibility was deliberately deployed by the ancient architects to further the goals of the building projects, whether to emphasize royal authority in the palace or to highlight different religious principles to people entering and exiting the city.

[192] *Micro-Regional Approaches to Underwater Landscapes and Submerged Archaeological Sites*

Some of the most pivotal questions in human prehistory hinge on archaeological sites that are now under water. While the discovery of such sites presents technological challenges, they offer unique potentials for investigating time periods, cultures, and adaptations that are only poorly known on land. Unfortunately, underwater research rarely produces the systematic coverage of space and material culture that is needed to conduct anthropologically relevant research.

The investigation of micro-regions as a means to elucidate economic and social relations in the past has been widely adopted in terrestrial archaeology, and yet is arguably even better suited to submerged settings. By defining specific and comparable localities as the target for intensive research, a micro-regional approach can provide the framework for generating the needed systematic coverage of space and material, while still operating within the physical and financial constraints of underwater research. In this paper, the application of a micro-regional approach is illustrated as applied to the study of the Late Paleoindian occupation of the Alpena-Amberley Ridge beneath modern Lake Huron.

[319] *Environmental Processes and the Archaeological Record along the Louisiana Coast*

The environmental processes of erosion and subsidence are key post-depositional factors affecting the formation of the archaeological record along coastal Louisiana. These factors contribute to terrestrial archaeological site loss and present researchers with a unique set of challenges for understanding past human behavior at both local and regional scales. From 2010 to 2014, HDR visited a total of 212 sites across 5,293 km during a survey of the Louisiana coast. This paper provides new insights on coastal geoarchaeology and the interplay between site formational processes and beach environments.

Ostapkowicz, Joanna and Fiona Brock (Research Laboratory for Archaeology and History of)**[387] *Black Pitch, Carved Histories: Prehistoric Wood Sculpture from Trinidad's Pitch Lake***

Since 6000 B.C., if not earlier, Trinidad has been the gateway into the Caribbean for waves of South American migrants - the first stepping stone in the long chain of islands that make up the archipelago. Its critical position to the settlement of the Caribbean is reflected in its deep archaeological record, documenting the complex interactions between its diverse peoples over millennia. Unique among its archaeological sites is Pitch Lake, one of the largest natural deposits of asphalt in the world, which over the years has yielded extremely rare wood carvings - to date the largest concentration of ancient wood artifacts in the Lesser Antilles. However, unlike any systematic archaeological excavation, these carvings have been dredged up as a consequence of commercial pitch harvesting, and any association between them, or the skeletal remains that were also recovered, have been lost. The current multi-disciplinary study, supported by the UK's AHRC (2014-2016) and in its early phase, aims to place these objects in a chronological and cultural perspective through AMS radiocarbon dating, material identification and stable isotope analyses.

Oster, Elizabeth (Jemez Mountains Research Center) and Michael Elliott (Jemez Mountains Research Center)**[81] *The Geopolitics of Conquest: The Mixtón War and the Caxcan Diaspora***

The chronicler Tello describes the Caxcans as *rústicos mexicanos* who accompanied the Mexica on their march south from Aztlan in the 1100s, but to the Spanish, they became known as the *gente belicosa*, fierce fighters who did not accept the terms of their conquest, and who ultimately led the Mixtón War of 1541-42. The discussion focuses on the results of the Spanish encounters with the Caxcans and the ways in which these interactions informed the military and political strategies pursued by the colonizers as the conquest and occupation of New Spain moved north, into what would ultimately become known as the Spanish Borderlands and the American Southwest.

Osterholtz, Anna (University of Nevada Las Vegas) and Kyle Waller (University of Missouri)**[245] *Comparative Approaches to Casas Grandes Taphonomy and Violence***

Recent bioarchaeological analyses of human skeletal remains from the Medio Period Casas Grandes region (A.D. 1200-1450) have demonstrated taphonomic indicators variously interpreted as massacre, violent persecution of witches, or anthropophagy. In this presentation, we re-examine taphonomic data from Paquime within a larger southwestern perspective. We combine new approaches to demography and individual well-being with taphonomic and mortuary datasets from Paquime to evaluate the causes, consequences, and social meaning of violence and post-mortem processing. By examining who was subject to trauma, violent death, and body processing, bioarchaeological analyses can show the cultural role that violence plays within society. Based on a comparison with violently killed and processed remains at sites throughout the greater southwest, including Sacred Ridge and Mancos, patterns of violence and trauma are identified. Findings unique to each site are also identified, specific to their cultural contexts.

Otis Charlton, Cynthia and Patricia Fournier (Escuela Nacional de Antropología e Historia, Mexico)**[76] *Conspicuous Consumption in the Basin of Mexico: Chinese Porcelains as Prestige Markers in the Eastern Teotihuacan Valley***

Beginning with the 16th century opening up of the New World, New Spain was integrated into the complex trade networks of the expanding world system as part of the Spanish Empire in the Indies. Prior to the rise of capitalism in Europe, mercantilism dominated sociopolitical and economic development trends. Indirect contact with the imperial power of China by way of the Philippines led to the establishment of the Manila-Acapulco galleon trade starting in the 1570s. Exotic goods, including thousands of pieces of porcelain tableware, sumptuously adorned some residences and the

haciendas of those who were able to afford the most exquisite and expensive ceramics available in New Spain. This paper illustrates the extent of conspicuous consumption of porcelain vessels at haciendas and ranches in the Teotihuacan Valley, a rural area in the Basin of Mexico, briefly comparing these archaeological assemblages with those of the capital of the viceroyalty, Mexico City, at the same period. During the Early and Middle Colonial period, Chinese goods were prestige markers that made and maintained social relationships and fixed public meaning among non-indigenous consumers.

Ott, Aaron

[249] *Center and Satellites The Relationship of Templo Mayor to Similar Twin-Temple Pyramids in Central Mexico*

This poster displays the relationship between the Templo Mayor of Tenochtitlán and four smaller pyramids, of similar architecture, concurrently in use at the sites of Tlatelolco, Tenayuca, Teopanzolco and Santa Cecilia Acatitlan, during the period of Aztec dominance of central Mexico. I will demonstrate how the satellite pyramids worked in conjunction with Templo Mayor to form a cohesive religious network, reflecting shared ideology through common ritual use. Using the ethnographic analogy of medieval Catholicism, I will show how Mexica-Aztec religion utilized this network of ritual centers to strengthen sociopolitical controls at the center of the Aztec empire. My poster will include recent photographs taken of the five sites in question, with comparative analysis regarding their distinct features. This reflects Aztec power cohesion in central Mexico during the Late Post Classic period.

Overholtzer, Lisa (Wichita State University)

[253] *Consuming in Empire: The Materiality of Household Consumption at Postclassic and Colonial Xaltocan, Mexico*

Consumption, as Paul Mullins explains, “revolves around the acquisition of things to confirm, display, accent, mask, and imagine who we are and who we wish to be.” Consumer choices of goods in the marketplace relate to the desire to connect oneself with particular networks of people and places on the landscape, and these connections play a role in the formation of personal and household identity. Here, I present research on the social dimensions inherent in economic practices, which are notably absent in many existing models of central Mexican economies. Specifically, I use instrumental neutron activation analysis (INAA) to reconstruct diachronic shifts in the interpersonal relationships formed through the exchange process in one household at the site of Xaltocan. INAA offers evidence of the provenance of 209 decorated serving vessels (Aztec Black on Orange and redwares) recovered in five stratified, firmly dated household middens and reflects changes in the consumption practices of a single household over four centuries, including the rise of the Otomí state centered at Xaltocan, the formation of the Aztec empire, and the arrival of the Spanish. These findings are contextualized via comparison to previous findings for site-wide trends in ceramic consumption.

Overly, Stephen (U.S. Bureau of Land Management)

[138] *The Past, Present, and Future of Archaeological Investigation on the BLM: An Introduction to Public Research on Public Lands*

The overall symposium provides a series of case examples that demonstrate the important role the BLM plays in promoting proactive non-compliance related archaeological research. This introductory paper sets the frame by offering direct experience from multiple perspectives working on BLM land as a field school student, graduate student researcher, volunteer, contractor, and agency archaeologist. This is done to provide additional context for how the BLM has typically supported archaeological investigations on public lands in the past, to offer some comments on the current state of work being conducted, and to consider what the future might look like based on general trends in the discipline.

Overmann, Karenleigh (University of Oxford)**[33]** *Numbers and Time: The Role of Materiality in Numerical Cognition*

Numerical elaboration and the extension of numbers to non-tangible domains such as time have been linked to cultural complexity in several studies. However, the reasons for this phenomenon remain insufficiently explored. In the present analysis, Material Engagement Theory, an emerging perspective in cognitive archaeology, provides a new perspective from which to reinterpret the cultural nexus in which quantification and timekeeping develop. These insights are then applied to representative Neolithic, Upper Paleolithic, and Middle Stone Age artifacts used for quantification.

Owen, Bruce (Sonoma State University)**[184]** *Post-Tiwanaku Settlement Patterns in the Peaceful Coastal Osmore Valley and the Tense Upper Valleys*

Some refugees from the collapsing Tiwanaku province in Moquegua settled in the coastal Osmore valley, where they appear to have integrated peacefully with the Chiribaya population, living in seemingly undefended settlements closely intermixed with their ethnically distinct neighbors. Others moved into the upper valleys of the Osmore drainage, where they apparently experienced a competitive, fearful social environment, living on defensible high points, some with vestiges of what may have been circumvallating walls. Building on recent analyses of settlement patterns associated with peace and conflict, this study tests and explores the contrasting "war and peace" interpretations in the two portions of the Osmore valley through a variety of GIS-based settlement-pattern analyses of full-coverage survey data using measures of topographic defensibility, site spacing and clustering, size distributions, viewsheds and intervisibility, access to water, catchments, and other approaches. The results can be compared to other periods and regions in assessing social conditions on a scale of tranquility to tension based on settlement data.

Owens, Andrew (SWCA Environmental Consultants)**[8]** *Kite Aerial Photography and Archaeology: Grandfather of the Drone, Ancient yet Applicable*

The use of kites in capturing aerial images of archaeological sites has been used by archaeologists in the past, but is quickly becoming overshadowed by the use of drone aircraft. Despite the obvious advantages of drone vehicles, kites still offer practical solutions in capturing aerial site imagery. Kites present affordable, durable, and easily deployed methods of capturing a bird's-eye view of sites without the need for cumbersome and expensive drone technology. The poster is designed to re-invigorate the potential field applications of KAP in the minds of current researchers, and offers inexpensive solutions for various archaeological institutions and professionals. The photos in this presentation provide case studies of aerial site imagery captured over the past several years in Wyoming, Montana, and Colorado. The images from the studies allow for nearly instantaneous advantages over traditional site mapping and interpretation. Kites offer perspectives of site structure and spatial organization, and can be easily incorporated to provide a more encompassing view of the site.

Ownby, Mary [79] see Reed, Lori

Ownby, Mary (Desert Archaeology Inc.) and James Heidke (Desert Archaeology Inc.)**[304]** *Chronological Changes in Pottery Production in the Phoenix Basin: Evidence from La Villa*

Recent excavations at La Villa recovered a large quantity of pottery that spanned a broad range of time from the Vakhí (ca. A.D. 500-700) to Early Sacaton phase (ca. A.D. 950-1020). Binocular and petrographic analysis of this corpus provides insights into changes in pottery production and distribution in the Phoenix Basin, particularly for Hohokam decorated ceramic types. The results from examining early red-on-gray through red-on-gray/buff sherds indicates those vessels were made with crushed schist and sand that mostly derived from sources located along the Middle Gila River. Later red-on-buff types appear to have been produced with sand containing natural schist from areas

along this river, but also from production sources near South Mountain. In addition to an increase in decorated production in this area, plain ware manufacture also occurred here and confirms existing data indicating specialized production around South Mountain. Thus, data from La Villa has corroborated the focused manufacture of plain and decorated wares in specific areas of the Phoenix Basin, while also documenting a technological change in the production of Hohokam buff ware. This has broader implications for clarifying chronological changes in the economic and social connections of people in this area.

[326] *The Archaeology of Meaningful Places in Amazonia: the Teotônio Site (Upper Madeira Basin)*

The aim of this presentation is to discuss the importance of the occupation of the so called meaningful places in Amazonia, such as rapids and waterfalls, in the development of regional networks which were archaeologically materialized by the concentration of different ceramic styles in the same site, and possibly through the appearance of new ceramic styles. We further argue that the economic viability of some of these places – and we present here the Teotônio site as an example - did not necessarily have to rely on the intensive production of staples, such as manioc and maize.

El desarrollo de nuevas tecnologías (UAVs) han permitido explorar, generar y diversificar nuevos puntos de vista aéreos de sitios arqueológicos y como resultado generar una conciencia social hacia la conservación, investigación y preservación del patrimonio cultural de México. En esta ponencia se presentarán los casos de Cuicuilco y El Salto, México, como ejemplos de modelación fotogramétrica de sitios arqueológicos y monumentos coloniales con UAVs.

Pacheco-Cobos, Luis (Universidad Veracruzana) and Bruce Winterhalder (University of California Davis)

[28] *Economic Benefits of Hunting Dogs in the Context of Tropical Horticulture*

We provide evidence useful to ethnoarchaeological research on the behavioral coordination of hunting movements among humans and dogs. The domestication of dogs (~15000 y BP) is hypothesized to have benefited humans by increasing food supply, saving human energy, and guarding camps or agricultural fields. Drawing on a year of fieldwork in Santa Cruz, Toledo District, Belize, we analyze the economics of hunting and the extent to which dogs could have helped humans to protect cultivated fields from mammalian pests. We observe when hunts were initiated and track hunting trips with GPS units in order to describe quantitatively the coordinated movements of humans and their dogs while hunting. We note the composition of hunting parties, the skills of dogs, hunting returns and the horticultural benefits of this practice. We comment generally on implications of our results for the co-evolution of humans and their canine companions.

Pacheco-Fores, Sofia (Arizona State University)

[247] *Examining Ethnohistory: Cranial Modification and Social Status in Prehispanic Inca Peru*

The social meaning of cranial modification in the Andes has long been debated. Ethnohistoric accounts recorded by Spanish priests and travelers after the conquest assert that within Inca Peru, the practice of cranial modification was related to social status. They claimed that the Inca royal

family preferred a particular head shape, and only certain noble families were permitted to reproduce that shape. In contrast, non-elite Inca supposedly practiced strictly local traditions of cranial modification. These claims are routinely cited within modern bioarchaeological reviews of the practice. Such uncritical acceptance of Spanish reports is problematic, given that these accounts are frequently inaccurate, internally inconsistent, and culturally biased. As such, this study aims to determine whether such ethnohistoric accounts of cranial modification are supported by bioarchaeological evidence. Mortuary and cranial data were collected on 361 individuals from several Imperial Inca period (1400-1532 C.E.) sites. In addition to assessing the veracity of colonial ethnohistoric accounts, this study seeks to gain a deeper understanding both of Inca society and of the practice of cranial modification.

[204] *Validation of a Non-Destructive DNA Extraction Protocol for Ancient DNA Analyses*

The destructive nature of traditional DNA extraction techniques presents one of the primary obstacles to accessing genetic information from museum and archaeological collections. Here we assess a recently published “non-destructive” DNA extraction protocol by Bolnick and colleagues in terms of the amount and quality of DNA extracted from a set of samples of even greater antiquity than those tested in the original analysis. DNA was successfully extracted from archaic period samples from the Eva site in Tennessee. Both quantity and quality of DNA extracted were high enough to obtain mitochondrial sequence data using traditional (Sanger) sequencing. Two samples were successfully amplified using a whole mitochondrial genome amplification kit and underwent next generation sequencing. We also show that the method is indeed “non-destructive.” Dental metrics and weights taken before and after extraction indicate no significant change in the teeth due to the extraction process. Thus, the use of this protocol could not only expand the range of samples available for DNA analysis, but also the amount of genetic information obtained from the analysis.

Pacyga, Johanna (University of Chicago) and François Richard (University of Chicago)

[398] *Crafting the Fringes of French Imperialism: Ceramic Politics in Siin, Senegal*

In this paper, we examine aspects of craft production in west-central Senegal between the 18th and 20th century. This period encompasses turbulent political times marked, in succession, by the apogee of African centralized polities, the abolition of the Atlantic slave trade, the advent of formal colonial empires, and the establishment of the postcolonial state of Senegal. Using a perspective of the long-term blending archaeological and ethnohistoric evidence, we explore the dynamics of ceramic production and circulation in the hinterland of the province of Siin, focusing on the village of Diohine and its surroundings. After reviewing the role of pottery in Siin's pre-colonial kingdom, we analyze the political life of ceramic-making in the context of French imperialism, paying special attention to its entanglements with systems of governance and intercontinental markets. We conclude with a few remarks on the fate of indigenous pottery in Senegal's political economy after independence.

[418] *Indifference, Inertia, Limited Budgets, and Preservation: Insights from Site Stewardship Programs*

Archaeological sites are fragile and non-renewable, but how do we protect them from visitors, development projects, and natural processes that are accelerated by climate change? People are interested in reports of new archaeological discoveries, but they don't know -- or care -- about local archaeological resources, and publicizing them is restricted by confidentiality requirements. Government agencies are charged with protecting archaeological resources, but they do not have enough resources to fulfill this mandate. Often, one agency archaeologist must manage districts covering thousands of acres that contain a large quantity of historic and prehistoric resources. There are new threats to archaeological sites, but people and organizations are slow to adopt new responses. Archaeologists, professors, and consultants are hired to get the "job done" (analyze project impacts, teach archaeology, evaluate the site) but not necessarily on how to preserve or protect archaeological sites. This report discusses some of the methods that site stewardship programs use to meet these challenges.

[207] *Deviance in Youth: Anomalous Nitrogen and Carbon Isotopic Values among Individual Subadults at Medieval Alytus, Lithuania*

Rapid turnover of bone collagen $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values in subadults can reveal dietary and physiological changes experienced by illuminating chronic stress not apparent as skeletal, pathological lesions. To assess subadult morbidity and mortality in Medieval Alytus, Lithuania, an osteobiographical examination was undertaken of individuals who presented humeral isotopic values $\pm 2\sigma$ from sample and cohort means ($-20.02 \pm 0.43\text{‰}$; $11.09 \pm 1.21\text{‰}$). Four infants (0.1-2.9 years) and four juveniles (5-11.9 years) were found to exhibit isotopic values outside of the expected sample mean. Two individuals, 1.5 year-old (-18.8‰ , 14.28‰) and 11.5 year-old (-19.46‰ , 13.26‰), were $\pm 2\sigma$ from their respective $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ cohort averages (Infant: $-19.70 \pm 0.40\text{‰}$; $12.51 \pm 0.80\text{‰}$; Juvenile: $-20.26 \pm 0.38\text{‰}$; $10.24 \pm 0.88\text{‰}$). Skeletal analyses do not indicate specific disease processes but all infants exhibit at least one non-specific skeletal marker of chronic, metabolic stress (e.g. periostitis, porotic hyperostosis), likely caused by prolonged weaning resulting in malnourishment. Three of the four juveniles did not present skeletal stressors, indicative of death from an acute disease process during a growth spurt and potentially the onset of puberty. This study contributes to growing literature on metabolic variation in isotopic values and paleopathology of Lithuania.

[244] *Shifting Allegiances at Yaxuna during the Early to Late Classic: Territory and the Loss of Independent Rule*

The site of Yaxuna, Yucatan, Mexico was an independent Maya city from the Formative to Early Classic periods. While the size of its territory during the early periods is unknown due to the lack of regional data on other large early cities in Central Yucatan, the Early Classic dynasty at Yaxuna was violently and abruptly vanquished towards the end of this period. At this time, a 100 kilometer causeway was also constructed connecting Yaxuna to the large metropolis of Coba, which was at its political apex during the seventh century A.D. This paper will discuss data from both Yaxuna and Coba that indicates that the domain of Yaxuna was incorporated into a growing state at Coba and also assumed a new role as the western border of the territory controlled by Coba during the Late Classic.

Pailes, Matthew (University of Arizona)

[257] *Pochtecas and Pilgrims: Models for Elite and Commoner Exchange in the Río Sonora*

The potential for the river valleys of eastern Sonora to serve as conduits for long distance trade between Mesoamerica and the U.S. Southwest was one of the original impetuses for research in the region. Researchers of the U.S. Southwest, using the same basic data sets, have come to drastically different conclusions regarding the frequency and overall importance of such long distance connections. Previous research in eastern Sonora has produced minimal direct evidence of long distance trade, but the relative dearth of excavation precludes definitive statements. This presentation will take an alternative approach that investigates the structure of local communities and economies as a means to determine what sorts of exchange economies were feasible. Quantitative methods are used to predict the likelihood of goods passing through the region under different assumptions of consumption and transmission. Down-the-line exchange seems like an ineffective way to account for the movement of most material goods, but would be effective for ideational content or goods that are divisible/replicable. Other systems of direct procurement, such as pochteca and pilgrimage economies are more feasible explanations for the rare movement of physical goods. These results offer a means to partially reconcile non-consistent previous interpretations.

[227] *Ideología y rituales de lluvia compartidos por los yungas del Período Cerámico Inicial (1,600 a.C.) y las poblaciones serranas del presente en la cuenca del Rímac, Costa Central del Perú*

Investigaciones en el sitio arqueológico La Explanada de Unión-Ñaña, ubicado a 772 msnm, en las laderas del cerro La Parra en Ñaña, margen norte del valle del Rímac, permitieron vislumbrar inadvertidas modalidades de culto, en el extenso macizo que configura el cerro La Parra, santuario de montaña del Período Inicial (1,600 a.C.) en el valle medio del Rímac. Las excavaciones, revelaron rituales propiciatorios, que evocan los rituales en uso, en la vecina población altoandina de San Antonio de Jicamarca, a más de 3,000 msnm, entre las cuencas del Rímac y del Chillón, 60 km al este de la ciudad de Lima. Rituales como la observación del “huayco” producido por el acto de libar chicha con la huanca, así como “El calentamiento del agua”, aunado al peregrinaje para el corte y traslado del hielo de los nevados limeños, plantea la preexistencia de un substrato común de creencias y prácticas rituales en los Andes. Ideología de lluvia conocida como ceremonia secreta del agua por los jicamarquinos, y que con distintos matices, continúa siendo practicada por las restantes poblaciones que ocupan las cabeceras del río Santa Eulalia, tributario del Rímac, así como en la vecina provincia de Canta.

[55] *Environmental History of an Early Agricultural Period Irrigation Canals Network at Las Capas (Site AZ AA:12:753 [ASM]), Tucson, Arizona*

The Santa Cruz Drainage Basin contains a rich record of prehistoric irrigation for at least 3200 years. Archaeologists and paleoecologists have identified the evolution of this agricultural technology from opportunistic to systematic canal operation. The present study documents the first detailed analysis of a networked canal system during the Early Agricultural Period (1200 B.C. – A.D. 50) using ostracodes, micro-mollusks, calcareous algae and the geochemical signatures of ostracode (*Ilyocypris bradyi*) valves that allowed us to generate an aridity index. The index resulted from the combined data of stable isotopes (d18O and d13C), and trace elements (Mg/Ca, and Sr/Ca). The aridity index suggests the irrigation waters salinization trends at the time of canal operation.

[292] *Leaving No Stone Unturned: Investigating Preclassic Lithic Production, Consumption, and Exchange at San Estevan, Belize, and K'o and Hamontún, Guatemala*

From the gathering of agricultural surplus to the construction of small homes or large scale monuments, stone tools played a major role in many dimensions of everyday Formative Maya life. This presentation will examine the degree in which the production of stone tools made of chert and chalcedony were controlled by empowered political authorities or social groups at the sites of San Estevan in Northern Belize and K'o and Hamontún in the northeastern Petén region. The dynamics of the subsistence economy and utilitarian industries at major Preclassic centers is an understudied research problem and analysis of lithic tools and debitage found in Preclassic Period contexts at San Estevan, K'o and samples from elite and non-elite household contexts from Hamontún provide valuable comparative, diachronic data set that document the developmental changes in regional economic activities across the Preclassic Period. Inter- and intra-regional examinations of lithic industries at these sites suggest a range of production and consumption activities that are similar and dissimilar to lithic production and consumption activities recorded at other contemporaneous sites. This investigation is suggesting that a multitude of interacting economic mechanisms existed among vertical and horizontal exchange networks and may have varied across several regions.

[158] *Where There's Fire, There's Smoke: Contemporary Lacandon Maya Incense Burners and Ritual Transformation*

Lacandon Maya fabricate incense burners ("the gods' ceramic vessels") found by archaeologists in Maya ruins, caves, and abandoned "god houses". Ethnographies and my field notes describe the incense burners and how they are made and used. The function and symbolism of the burners provide clues to the importance of fire and smoke in past Maya rituals, including cremation. The incense burners are formed from clay with human heads, arms, and legs. The anthropomorphic bowls become bodies of gods following firing and painting, like when humans were formed by gods, and after pebbles or seed "organs" are placed in their bowls. Gods inhabit the vessels to partake in burnt incense nodules shaped like people. The fire and smoke transmit these offerings as food or assistants to the gods. The burners die and their souls return to the gods after being exposed to fire to remove their paint and organs. Since Lacandon bodies are similarly viewed as vessels for souls, perhaps cremation by their ancestors released the souls of the dead to the gods. Death, rebirth, and ritual transformations through fire and smoke may ultimately be linked to the Maya slash-and-burn maize agriculture cycle.

[385] *Uncovering New Opportunities: Community Colleges and Archaeological Lab Experience*

There is a perception that community colleges offer few practical opportunities to students interested in archaeology. Through an agreement with California State Parks and the support of our college, we established the Cosumnes River Archaeological Working Lab (CRAWL) to provide community college students hands-on training with artifacts. This paper discusses the project and findings, logistics of starting a community college lab, and benefits of exposing novice students to archaeological lab techniques. The Enterprise Hotel site in Old Sacramento was excavated thirty years ago but the collection was orphaned and left unanalyzed until 2012. Through a new agreement, State Parks has loaned part of the collection to the college for cataloging and analysis. CRAWL, now in its third year, has trained dozens of students, supported presentations at conferences, and is a step to field school and four-year universities. The lab, run on volunteer hours and virtually no budget, has established connections with area universities which offer assistance in technical analysis and the use of comparative collections. Community colleges can play an active role in providing lab experiences for students and in fostering relationships between the colleges, state agencies, and research institutions to promote cultural preservation and public outreach in California.

Panagiotakopulu, Eva

[256] *Bugs in Eagle Cave, Lower Pecos Canyonlands, Texas*

The desiccating conditions in desert caves provide a unique opportunity for detailed research on organic materials. Previous examples of insect studies from the desert edge in Egypt, from Akhenaten's city at Amarna, have indicated the potential of research with fossil insects, both for understanding environmental change and the nature of agriculture, and also for evidence of the early biogeography of insect borne diseases. However, there is limited information on hunter gatherer societies and origins of any accompanying 'pests' of storage and occupation sites— from bed bugs to corn weevils - and there is virtually no relevant research from US sites. Excavations at Eagle Cave have produced rich and optimally preserved insect remains from deposits long pre-Columbus, associated with food debris. The material involves primarily Coleoptera , and a few Hemiptera, and consists of species which are in their majority pests of stored products, infesting pulses and squash and breeding in moldy materials stored in the cave. This material provides the opportunity to view the transition from hunter gathering to agriculture from the point of view of the uninvited lodgers of Eagle's Cave and also to fill in the gaps for the early establishment of New World pests in stored foodstuffs.

Panich, Lee (Santa Clara University), Sarah Peelo (Albion Environmental, Inc.) and Linda Hylkema (Santa Clara University)

[175] *The Archaeology of Community at Mission Santa Clara de Asís*

In this paper, we examine the challenges associated with understanding indigenous community formation and change through the archaeology of the native ranchería at Mission Santa Clara de Asís. The mission's indigenous population had well-documented and distinct temporal shifts, initially drawing local Ohlone converts but eventually extending recruitment to Yokuts groups in the more distant San Joaquin Valley and Sierra Nevada foothills. These population changes pose an intriguing archaeological problem. We investigate the ways in which the archaeological record may illuminate how native people re-articulated regionally distinct material traditions at Santa Clara during moments of great demographic change within the mission's indigenous community. We focus here on four main issues: 1) Identifying moments of important population movements within the mission; 2) Assessing ways to refine methods for dating archaeological features within the ranchería's approximately 60-year period of occupation; 3) Identifying artifacts or other archaeological patterns that may be related to the expression of native identities rooted in ethnolinguistic background and/or relative status within the mission estate; and 4) Offering preliminary hypotheses regarding how

Yokuts and Ohlone peoples formed community at Mission Santa Clara.

[132] *Forensic Archaeological Research in the Recovery of WWII MIA's on a Pacific atoll: Tarawa*
Archaeological research on 538 MIA's from WWII has been ongoing on the Pacific atoll of Tarawa over the past two years under the auspices of History Flight, an NGO. Tarawa, one of the bloodiest WWII battles in the Pacific, still has hundreds of MIA's unaccounted for in one of the most densely populated locations on earth. History Flight, with the collaboration of professionals, para-professionals, military volunteers, DOD and the local community have been successful in locating and recovering over 110 individuals. The team has used a trans-disciplinary approach to the research, starting with extensive historical documentation, followed up by extensive archaeological remote sensing, and the use of a cadaver dog. Corroboration of GPR data with cadaver dog alerts and historical information has allowed History Flight to recover over 13,000 human osteological remains, often in direct association and in situ with military artifacts assisting in the field identification of U.S. soldiers versus Japanese. The field detection and archaeological excavation of these "burial" sites has been significantly impeded by the direct impacts to the sites immediately following the cessation of the war, together with impacts of today's dense population. Procedures and results of this public/private partnership work will be presented.

[36] *Difference in Archaeology Theory and Practice: the Case of Classical Greece*

The dichotomy between the "dirt" and the "word" has loomed large in the study of the Greek past, in a manner not shared by many other regions. This is true, ironically, for both the historical and prehistoric period. The interplay between the material record with the textual and the iconographic records in Greece is rich and complex, and one that extends across a broad time range. Disjunctions across these different avenues of inquiry are numerous, and often ignored. But it is precisely in these disjunctions and discrepancies that a systematic methodology in the way we approach the past can emerge, thereby potentially providing a powerful heuristic discourse. This paper will explore, through selected case studies, the dichotomy between the material and textual and iconographic realms in Greek archaeology in an attempt to incorporate non-correspondences in our interpretations of the past.

[279] *Geospatial Strategies for Mapping Large Scale Archaeological Site Destruction: The Case from Egypt*

This paper will focus on the use of innovative new tools and technologies for the mapping of archaeological site destruction. Post Arab Spring, the Middle East has seen an increasing amount of looting and general site destruction, yet how is it possible to locate, map, and quantify these activities to save the sites? The author used a series of high resolution satellites images as well as Google Earth to map looting in Egypt from 2002-2013. The methodology is one that can easily be replicated globally, and could be used as a way to map the global problem of site looting. If we do not map affected site, we simply will not know where to start to protect them. The paper will focus on her work in Egypt, but will discuss other countries as well as additional approaches like crowdsourcing.

[409] *A UAV-Based Approach for a Cost-Efficient Documentation of Agrarian Structures in the Arid Atacama Area (N. Chile)*

The paper summarizes the contribution of UAV to the documentation of a vast group of late Prehispanic agrarian elements (fields, irrigation canals) in the arid Atacama area (northern Chile). Taking advantage of the extraordinary preservation and visibility of fields, canals and other constructions, the general mapping of the area was based on a combination of visual interpretation of high resolution satellite images (GeoEye 1) and fieldwork. However, despite their high resolution, satellite images did not provide sufficient detail of some areas. A more detailed approach was needed to produce an adequate documentation of fields, settlement areas and singular constructions. An SFM-based photogrammetry approach was carried out, based on a low cost UAV (Dji Phantom) and a consumer-grade compact digital camera for the acquisition of low altitude aerial images that allowed the generation of 3D models and orthoimages of some areas. Finally, ground based photogrammetry was also used to capture and represent some elements in greater detail. The main result has been the construction of a highly detailed and accurate map of a complex group of archaeological structures, which has been used since for the analysis and interpretation of the area, and also for the design of new fieldwork seasons.

[291] *People without Collapse: An Introduction*

Eric Wolf's seminal work, *Europe and the People Without History* (1982), drew our attention to the periphery as an important locus of anthropological inquiry. By examining "people without history," Wolf was able to show that social complexity before the modern era was not a process that laid solely in the development and decline of isolated societies. Rather, both ancient and modern forms of social complexity rest upon the interconnections among peoples at global scales. This perspective has especially significant import for the archaeology of collapse, as it suggests that our frame of inquiry needs to be much wider than it has traditionally been. Specifically, we must consider the "peoples without collapse" – groups that are generally excluded from collapse narratives, either because their complexity is non-hierarchical, or because they lie on the periphery of hierarchically-organized states, city-state networks or empires. Some processes of collapse may be most visible in peripheral areas, and the actions and changes that occur in these areas may play important roles in the degree and nature of collapse as experienced in core areas. Ultimately, a focus on periphery areas and peoples provides insight into the relative stability of different social institutions in societies experiencing cultural transformation.

[185] *Lithic Procurement Patterning as a Proxy for Identifying Late Paleoindian Group Mobility along the Lower Tennessee River Valley*

The Tennessee and Cumberland River Valleys boast some of the highest concentrations of diagnostic Paleoindian artifact finds in the Americas. However, many of these finds are from secondary contexts void of associated deposits. The study utilizes chert provenance data, obtained

using reflectance spectroscopy, on a large sample of Late Paleoindian diagnostic bifaces from sites along the Lower Tennessee River Valley. The objective of the study is to visualize group mobility at the close of the Pleistocene. Resulting data suggests that band group mobility may have been significantly less than proposed models for adjacent regions. The data may also indicate that groups were settling into resource rich patches in central Tennessee as early as the terminal Pleistocene. Chert source data provides a means to glean useful cultural information even from disassociated materials.

[113] *Household Socio-Economic Organization in Puuc Maya Suburbia: Excavations at Escalera al Cielo, Yucatán*

Investigation of a hilltop residential complex at the Terminal Classic (A.D. 800-1000) Maya site of Escalera al Cielo in the Puuc region of Yucatán, Mexico has yielded one of the most holistic data sets on household life in this area of the Maya world. Horizontal excavations of over nine buildings, many with on-floor assemblages, have unveiled evidence for both the discrete and general functions of architectural spaces in the complex, including evidence of spaces used for storage, culinary activities, dormitories, and masonry work. Combined with data gleaned from discard areas, the evidence from this suburban hilltop site permits one of the most complete characterizations of consumption behavior and socio-economic organization in the Puuc region. This robust and still burgeoning occupation was interrupted by a planned abandonment with an anticipated return, though an assemblage from a nearby water cistern indicates some ritual re-visitation may have occurred later. The site abandonment is examined in the larger context of the demographic collapse in the Puuc region at the end of the Terminal Classic period.

[380] *Strontium and Oxygen Isotopic Evidence of the Origins of Homicide Victims from Middle Islamic Period Qasr Hallabat*

Qasr Hallabat, a luxurious Umayyad (7th – 8th century A.D.) desert retreat in Jordan, declined after the mid-8th century due to political destabilization and earthquakes. Despite official abandonment, the qasr's extensive hydraulic resources were utilized by local groups. Excavation and restoration of the qasr by the Spanish Archaeological Mission discovered the remains of six individuals at the bottom of an internal cistern, a precious regional water source. These individuals, who perished between 772-895 cal A.D., showed perimortem blunt and sharp force trauma. While it is clear that these individuals were victims of homicide, the reason for dumping their corpses into a viable water source remains uncertain. This latter situation makes it likely that the perpetrators were non-locals, but who were the victims? Strontium and oxygen isotope ratios from dental enamel were used to identify their origins, which can shed light on the circumstances surrounding their death. When compared to archaeological faunal samples and published data on regional oxygen and strontium isotope variation, it is possible to determine if these individuals are from geological region similar to Hallabat. If they are indeed locals, this would indicate that the Hallabat region continued to be an economic crossroads even after the post-Umayyad decline.

Parker, Bradley (University of Utah)**[398]** *A Tale of Three Assemblages*

This paper examines ceramic production in the Upper Tigris River Valley of southeastern Anatolia before and during the incorporation of this region into the Neo-Assyrian Empire. Using manufacturing techniques and technologies as windows on the organization of ceramic production, this paper argues that imperial incorporation drastically altered the organization of labor, the distribution of ceramic type fossils and the relationship between producers and consumers. This paper also suggests that, at least in this case study, the distribution of imperial ceramic type fossils is a good indicator of the level of cultural porosity of the imperial frontier.

Parkman, Breck (California State Parks)**[30]** *Sacrifice, Litter, and Loss: The Archaeology of the Recent Past atop a Sacred Island in the Sky*

Located in the eastern San Francisco Bay area, Mount Diablo (3,848') rises from an otherwise almost featureless terrain, making it highly visible from much of central California. Because of its visibility, Diablo is a backdrop to ethnographic and contemporary mythologies. The view from the peak is considered one of the most spectacular and unhindered in the world. Easily accessible by vehicle, the summit is visited daily by hundreds of tourists, many whom throw coins and other objects from the observation deck located atop the Summit Museum, an activity that dates back at least fifty years. This paper examines the nature of the archaeological deposit found on the upper slopes of this mountain and uses the evidence to address the nature of intentional versus accidental deposit and to distinguish between the esoteric "sacrifice" of objects versus common litter. The discovery of vast numbers of coins and the remnants of human cremains on the upper slopes suggest that the summit evokes a strong response to the "Sacred" and is thus part of a world-wide tradition deeply rooted in Pagan times.

Parr, Christopher (Virginia Department of Military Affairs)**[70]** *Discussant***Parrish, Allison****[93]** *Independent Women: A Story of Gender and Agency in the Colorado Rockies*

Artifacts can tell us stories, as long as we recognize that those stories include a reflection of us, the archaeologists, within those interpretations. This project comprises a theoretical approach to addressing these issues of reflexivity within archaeology as a practice. In particular, reflexivity is explored with regard to negotiations of feminine gender identity and how the agency of an unmarried, Victorian-era female homesteader parallels the agency of a female archaeologist studying her life. This is a story about how two unique histories (or her-stories, in this case), one past and one present, intersect. The use of digital storytelling, embodied by a short film illustrating the realities and nature of archaeological reflexivity, further enhances this application and exploration of reflexivity as archaeological practice.

[198] *Los murales de El Tajin: Excavaciones en un antiguo edificio pintado*

Hay en Mesoamérica, en el arte del período Epiclásico local (ca. 850-1000 d.C.), la clara necesidad de proclamar que sólo los actos del gobernante y no los del pueblo eran verdaderamente eficaces. Es revelador que en los relieves y murales de El Tajín la comunidad en su conjunto esté representada por la figura simbólica del soberano. Sus enemigos aparecen como un montón de desvalidos cuyo ineficaz oposición sólo sirve para resaltar la naturaleza sobrehumana del gobernante. Este es justo el momento en el que la ciudad se encuentra en su máximo esplendor y cuando se emprende la construcción del Complejo del Edificio de las Columnas, un imponente grupo arquitectónico que sorprende por la vastedad de sus dimensiones. Esta ponencia está dedicada a examinar una serie de murales que hemos recuperado en fragmentos en uno de los edificios de este conjunto arquitectónico de El Tajín para proponer una revisión cronológica y una visión más equilibrada de los fenómenos que caracterizan al período Epiclásico en la llanura costera del Golfo de México.

Pasqual, Theresa (University of New Mexico/Pueblo of Acoma) and Kurt Dongoske (Zuni Cultural Resource Enterprise)**[197] *Mitigating the Sacred? Examining the Role of Native American Associative Values in Resolving Adverse Effect***

Under federal historic preservation legislation, mitigating adverse effects to archaeological sites commonly involves treating the site as a materialistic entity from which scientific information about the past is retrieved through systematic data recovery. Native American values associated with archaeological sites, which view these places as sacred because they are the home of ancestors and exhibit physical affirmations of oral histories and collective cultural identities, are rarely given suitable consideration in a Section 106 process. Utilizing the Amity Pueblo disturbance as a case example, this presentation considers the following issues: Are there ways to measure damage/harm to sacred places? What does that look like for an indigenous community? Are there traditional forms of repairing damage/harm to a sacred place? If so, who are the actors in that reparation? Is the restoration a post-Section 106 process that happens on its own?

Xianrendong (Jiangxi Province) is one of only two Upper Paleolithic sites in South China that have been systematically sampled for radiocarbon dating coupled with micromorphological analysis. The cave produced the earliest known pottery sherds (20,000 cal BP), together with a typical cobble tool industry. We present a micromorphological analysis of the formation processes of the Xianrendong deposits, investigating both the stratigraphic integrity of the pottery-containing contexts and the nature of the anthropogenic inputs. Results show a differentiation in spatial use within the cave and negligible disturbances within the deposits. A dumping area was identified in the eastern side of the cave, while the western side contains alluvial sediments. This research is part of a wider study involving the early pottery site of Yuchanyan (18,000 cal BP) and aims to reconstruct Late Upper Paleolithic activities at these sites with the earliest pottery yet found. We also demonstrate the advantages of the systematic use of geoarchaeological methods (e.g., micromorphology, FTIR, and XRF) in the study of the Chinese Upper Paleolithic.

Patel, Shankari (Foothill College)**[146]** *Women, Reproduction, and Fertility: How "Common-Sense" Assumptions of the Present Filter into the Mesoamerican Past*

This paper queries models of Mesoamerican fertility that define women's social roles in terms of dependency, and interrogates narratives that link gender relations to nature where they are beyond critique. The problem with the category women is that it is often thought of as an ahistorical and eternal facet of biology hidden within an implicit model of human nature. Biology becomes a metaphor for social relations and wifehood or motherhood is then characterized as a relation of dependency effectively excluding women from any other cultural contributions to society. The portrayal of women in Mesoamerican archaeological discussions of fertility rituals and goddess cults has reproduced sexist understandings of the past. Using research on the Nepean Collection, the largest collection of artifacts from the Postclassic (A.D. 900-1519) pilgrimage site of Isla de Sacrificios in ancient Mexico, this paper highlights women's important economic, political, and religious contributions to Mesoamerican society. This paper also reclaims and refashions the Mesoamerican fertility narrative by demonstrating that ancient women controlled their reproduction rights within the context of Postclassic religious practices.

[82] *Development and Idea of Neolithic Longhouses in Middle Europe*

The earliest longhouses of the first agricultural population in Central Europe appear discontinuously, without continuity with the previous settlement; only indirect information about the residence patterns of the latter is available. This is due both to a different settlement strategy by Mesolithic hunter-gatherer groups and to the state of research. Therefore, only the evolution of Central European Neolithic longhouses can be assessed. Their introduction in Central Europe is supposed to be of Carpathian basin origin. The longhouse ground plan pattern varied throughout the Neolithic, occurring not gradually but abruptly and along with changes in other cultural elements. Although the basic type scheme of the pole construction with wattle-and-daub walls seems to be clear, construction details including the interior layout and equipment remain undocumented. Current interpretations of longhouse function are based on the analysis of artifact association. It cannot be ruled out that longhouses served not only as home for the living but also as a place of the rest for the dead.

Pawlowicz, Leszek

[171] *Documentation Of Lithic Artifacts Using An Inexpensive Reflectance Transformation Imaging System*

Reflectance Transformation Imaging (RTI) creates a relightable virtual image of an artifact, allowing interactive manipulation of the light direction and light curve characteristics to bring out details difficult to see with the naked eye or in a photograph. One potential use of RTI is in the visual documentation of lithic artifacts, traditionally done using line drawings because of the difficulty in recording their features using still photographs. Techniques for enhancing lithic artifact detail for photographs, like casting or flake scar decoration with magnesium oxide or ammonium chloride, are time-consuming, present safety risks, and have the potential to leave residues or even damage artifacts; RTI requires no special specimen preparation. One impediment to RTI's adoption has been expense – custom-made systems are extremely costly. We present results on lithic artifacts from an RTI system custom-built for a small fraction of the traditional cost, but which offers performance comparable to more expensive systems. We describe image enhancement techniques that use results from our RTI system to create visual artifact documentation comparable or superior to traditional line drawings or photographs, at a fraction of the time and cost.

[405] *Critical Heritage Archaeology at the W.E.B. Du Bois Homesite*

The University of Massachusetts Amherst has conducted Critical Heritage Archaeology at the W.E.B. Du Bois Homesite in Great Barrington, MA in collaboration with a community group interested in commemorating Du Bois and fostering an understanding of African American life in western Massachusetts. W.E.B. Du Bois was one of the most important scholars and political leaders of the late 19th and first half of the 20th century. A 1969 commemoration at the site was met by local and national opposition that brought to the surface divisions along the lines of class and race in rural Massachusetts. Partly because of this the National Historic Landmark W.E.B. Du Bois Homesite had become virtually invisible. With our collaborators, private funding, and support by the University of Massachusetts, we have recently installed an interpretive trail with signage that introduces the general public to Du Bois's efforts to foster a more socially just world. This paper discusses issues surrounding the presentation of such a prolific, influential, and long-lived global figure with limited space and a tight budget. These issues, along with Du Bois's insights on world history, provide a food for thought about the critical management of archaeological heritage in the 21st century.

Pazan, Kyra (University of Michigan) and Robert A. Cook (The Ohio State University)**[331]** *Diet at the Edge of Fort Ancient: Preliminary Faunal Analysis from an Unusually Positioned House at the Guard Site, Dearborn County, Indiana*

This study analyzes faunal remains from a recently excavated house at the Guard Site in southeast Indiana, which was occupied by the Fort Ancient culture between A.D. 1000 and A.D. 1300 during a period of optimal climate in the American Midwest. During such periods, abundant resources and low stress allow people to pursue more desired resources. In the case of Fort Ancient, the key species was the white-tailed deer. We hypothesize that Guard's inhabitants were free to pursue large deer in the primes of their lives and could afford to ignore other deer and less optimal resources. However, social and seasonal distinctions are important considerations. Our house is outside of the main habitation ring of the village. The odd location of this house could be related to seasonal occupation or to the presence of a distinct social group, either of which could alter the composition of the house's faunal assemblage. These possibilities will be explored against expectations derived from optimal conditions.

Pazmiño, Estanislao**[367]** *Excavaciones arqueológicas en la pirámide de Huataviro*

A mediados del 2009 en la parroquia de San Antonio de Ibarra, provincia de Imbabura, el descubrimiento casual de una tumba rica en ofrendas dentro una pirámide prehispánica atrajo la atención pública y permitió el inicio de una intervención arqueológica. Las plataformas piramidales constituyen un elemento recurrente en varios de los asentamientos prehispánicos tardíos del denominado País Caranqui. Las investigaciones arqueológicas realizadas en la pirámide de Huataviro, arrojan nuevas luces sobre el desarrollo de los cacicazgos norandinos del Ecuador en una época poco conocida entre el 600 y 1300 d.C. El presente trabajo, precisamente analiza la evidencia obtenida durante las dos fases de investigación y rescate auspiciadas por el Instituto Nacional de Patrimonio Cultural (INPC).

Peacock, Evan (Mississippi State University)**[284]** *Development and Applications of a Minimally Destructive Method of Sourcing Shell via LA-ICP-MS*

Shell artifacts and shell-tempered ceramics can be chemically sourced to point of origin because shellfish are in approximate chemical equilibrium with the waterways they inhabit. Analyzing artifacts or shell temper via Laser Ablation-Inductively Coupled Plasma-Mass Spectrometry is attractive due to the minimally destructive nature of the method. A pilot study in Mississippi funded by the NCPTT verified the potential of the method for sourcing shell-tempered pottery. Subsequent work includes the chemical sourcing of a prehistoric shell "spoon" and application of the method to encrusted pottery from the Hungarian Plain. Other scholars are now applying the method in a variety of archaeological settings, emphasizing the positive effect of NCPTT "seed money" for spurring innovative applications in low-impact archaeological research.

Pearlstein, Ellen [121] see Warmlander, Sebastian

Pearsall, Deborah (University of Missouri)**[226]** *The Nature and Status of Paleoethnobotany: Methods and Approaches for Understanding Site Formation Processes*

Paleoethnobotany is a diverse discipline, with practitioners around the globe. A systematic discussion of methods and approaches is beyond the scope of this presentation. I focus instead on an issue concerning paleoethnobotanical practice and inference that cross-cuts the kinds of

materials being studied, or the geographic or topical focus of research: deposition and preservation of plant remains. Determining what kind(s) of human behaviors and natural processes led to deposition and preservation of plant tissues/pollen/phytoliths/starch grains in archaeological sites/coring localities/artifacts is the interpretive challenge at the heart of paleoethnobotany. I review current methods and approaches for understanding formation processes of the paleoethnobotanical record, and suggest that an approach that integrates multiple biological indicators provides the most promise for drawing strong inferences of past human behaviors.

[247] *Preserving a Section of the Inca Road in the Lower Lurin Valley, Peru*

The Qhapaq Ñan or great Andean Road was declared World Heritage by UNESCO in June 2014. The road located between the Pachacamac Sanctuary and the Inca administrative center of Hatun Xauxa, located in the central highlands of Peru, not only constituted one of the main sections of this network, but was also one of the segments selected for this declaration. Following this process, a series of conservation projects have started taking place along this network in the segments that have been considered to be best preserved. This is the case of a road segment located near the modern town of Santa Rosa de Chontay, in the lower Lurin valley, central coast of Peru. The project focused not only in the research concerning its function and importance during the Inca period, but also in the conservation of its architecture and its surroundings. From all points of view, this initiative constituted a challenge that aimed not only to ensure its persistence as an archaeological landmark, but also remain relevant to the local community.

Pecci, Alessandra (University of Calabria)

[176] *Chemical Residues as Anthropic Activity Markers: Food Production and Consumption*

When activities are carried on, the substances used and/or produced during the activities are poured onto the on floors and absorbed by them. Specific analyses can be performed to identify the chemical residues absorbed in porous materials, like plastered and earthen floors. As these residues are strictly related to the activities carried on, and reflect their spatial distribution, they can be considered "anthropic activity markers". A methodological approach concerning the understanding of the markers of activities related with food production and consumption will be presented pointing out the advantages and problems of the use of spot tests and gas chromatography-mass spectrometry to detect and identify organic compounds. Experimental, ethno-archaeological and archaeological examples from different sites in the world will be shown.

[106] *Impact of Rising Sea Levels on Native American Cultural Sites in Southern California*

Humans arrived in Southern California about 13,000 years ago, shortly after sea level began rising following the last glaciation. Most of their sites along the shoreline of the time have been inundated and are unknown. Now hundreds of remaining sites on-shore are threatened, or will be threatened, in the foreseeable future by rising sea levels. A survey of prehistoric and historic human site elevations in Southern California reveals the 1.4 m rise in sea level expected in 2100 due only to the

thermal expansion of sea water will impact 194 sites. If the ice on either Greenland or West Antarctica were to collapse or melt into the ocean, sea level would rise some 8 m and impact an additional 295 sites or 17 m and 434 sites if both collapse. While each of these scenarios have different time estimates, the collapse of parts of the Greenland and West Antarctica ice sheets could happen soon and quickly, adding their sea level components to the estimates for thermal expansion (= 18.5 m). Protection of human archaeological and historic sites in coastal Southern California should be coordinated and included with efforts to reduce damage to modern infrastructure and buildings from sea level rise.

Pederson Weinberger, Jennifer (National Park Service - Alaska Region)

[29] *Overview of Archaeological Research in the NPS Alaska Region*

Human occupation of the 54 million acres of land managed by the National Park Service (NPS) has spanned millennia from early use of the ice-free corridors, later migrations and adaptation of tool kits to meet changing needs, and contact with explorers, fur traders, and others from distant lands. Research conducted each year along coasts, in and around mountainous terrain, small towns, and places in between aids efforts to inventory park land for archaeological resources, understand past human use of the land and the deep connections that remain for the descendants, and monitor and minimize/mitigate threats to these archaeological sites. This presentation will provide an overview of current research being conducted at National Park Service units in Alaska.

[175] *Maintenance of Tribal Communities in the California Spanish Missions*

In this symposium, we have been tasked with investigating how communities were forged during the Mission Period in California (1769-1834). Some researchers currently suggest that diverse indigenous populations in mission communities formed collective Indian communities and identities (e.g. Lightfoot 1998; Panich 2009; Peelo 2009). However, others maintain that indigenous peoples were not only part of a mission community, but they were simultaneously part of diverse traditional village communities during the colonial period (Haas 2014). When we look beyond the mission walls (e.g. Panich and Schneider 2014; Schneider 2012), we may learn something new about what Indian communities looked like in Colonial California. Within the mission walls it may be true that indigenous peoples were trying to form collective groups sharing in cultural practice. But outside of those walls, people may have maintained diverse communities, tied not to the mission, but to their home village. Here, we investigate community in colonial Alta California by exploring the details of traditional community maintenance that occurred outside the mission walls through investigation of the mission registries. We also propose ideas for archaeologically investigating the persistence of indigenous tribal communities during the colonial period.

[335] *Scales of Identity and Scales of Analysis in Western New Mexico*

Archaeologists typically use the term "identity" to refer to the ways in which individuals define membership in larger social groups through direct interaction or the perception of similarities and differences with others. Such social groups can be defined at a variety of scales (e.g., family unit/household, community, ethnic group/culture, etc.) and most archaeological studies tend to focus at only one particular scale. Recent archaeological research across a broad range of social and political contexts suggests, however, that social identities at increasing demographic and/or geographic scales are not necessarily neatly nested and hierarchical. In this paper, using ceramic,

architectural, and chemical compositional data from large settlements dating from the 11th through 14th centuries in west-central New Mexico, I explore the complex interplay among social identities at multiple scales (households, communities, and regions) and suggest that the degree to which these scales intersect is closely related to trajectories of population growth and movement through time. I argue that an explicit consideration of the tensions among these different social and analytical scales can provide insights into the processes driving the creation of discrete social groups or the long-term persistence of diversity.

[128] *19th Century Mining Life in Michigan's Upper Peninsula: The American West on the Wrong Side of the 100th Meridian*

The western Upper Peninsula of Michigan was home to many mining boom towns, similar to those associated more commonly with the American West. Clifton, the town site of the first profitable Copper Mine in Michigan, attracted workers of diverse ethnic backgrounds: Cornish, German, Irish, Native American, and African American. Michigan Technological University has conducted five seasons of field work at Clifton and the Cliff Mine, and has uncovered material remains that aid in the remembrance of this community that served as a gateway to The American Frontier for many. Artifacts that have been extensively studied from the sites include ceramics, faunal remains, and also iron artifacts, many of which have undergone experimental treatments involving polymer impregnation. This discussion of these assemblages and their contextual relationship to boarding houses, taverns, mid-continental shipping, and frontier military forts will illustrate the Upper Peninsula of Michigan's deeper connection to the American West of the 19th Century.

[122] *A Formal Model of End Scraper Performance on Dry Bison Hide*

End scrapers are a widely recognized tool in the archaeological record, but their performance characteristics are poorly understood. We use experimental results and adapt marginal value theorem (MVT) for use in lithic studies to devise a formal model of end scraper performance that predicts the optimal time at which one should resharpen their end scraper under several scenarios of raw material abundance. Our study is the first to apply MVT to end scraper performance through an actualistic study, and it allows us to make explicit archaeological predictions related to end scraper use, time management, raw material economy, and ultimately dry hide processing.

[321] *Quantifying Pre-Industrial to Mid-Late 20th Century Anthropogenic Lead and Mercury Pollution in Caribbean Marine Environments*

Various lines of evidence indicate that levels of anthropogenic pollutants, such as lead and mercury, have increased in terrestrial and atmospheric environments since the early 19th century and the advent of industrialization. While exposure to these two heavy metals is a global concern, this study focused primarily on Caribbean marine environments. Using ICP-MS, this study aimed to detect and quantify anthropogenic pollutants, specifically lead (Pb) and mercury (Hg), using skeletonized remains of sea turtles as biological proxies for environmental quality. Archaeologically-derived (n=5) and mid-late 20th century (n=6) Hawksbill and Green turtles were used to create a chronology of pollution exposure in Caribbean marine environments and to establish a pre-industrial baseline for pollution exposure, useful for gauging how human activities in the Caribbean, namely industrialization and tourism, have changed mercury and lead concentrations over time. Results from this study are integral to informing and improving strategies for research and training related to

stable monitoring of patterns of anthropogenic pollutants affecting the health and conservation of large marine ecosystems in the Caribbean.

Peña, Jose

[46] *The Role of the Tambo in the Inka Administration: A View from the Site of Inгатambo, Cajamarca-Jaen, Peru*

Archaeological investigations conducted at the site of Inгатambo highlight the Inka imperial policy in the provinces, which relied on the use of local ethnic groups in the state bureaucracy. Colonial documentation noted the movement of coastal communities within the Inka Empire to the Cajamarca region in order to serve in the tambos. Pottery sherds from the Inгатambo site illustrate that the coastal communities charged with administering this site continued to produce pottery following the style of the northern coast. In addition, the presence of a ceremonial area at this site suggests the importance of this structure in the Inka imperial economy. It is possible that the Inгатambo site functioned as a center in which social relations were reinforced within the communities located in the Huancabamba Valley. This research offers a perspective on the provinces of the Inka imperialism in which the tambos played a significant role in the Inka administration because they symbolized not only the Inka presence but also reinforced social cohesion.

[24] *Haciendo público lo privado: La arquitectura de las élites de Cahal Pech durante el Preclásico Medio*

Cahal Pech es una antigua comunidad Maya localizada en el Valle de Belice que mantuvo una ocupación continua por más de 2000 años (1200 a.C.-1100 d.C.). Múltiples exploraciones en la acrópolis y en la periferia del asentamiento han revelado que los grupos fundadores edificaron sus primeras residencias en el área de la Plaza B de la acrópolis. Para el Clásico Tardío, esta plaza llegó a funcionar como el principal espacio cívico del sitio. En años recientes, como parte del proyecto "Belize Valley Archaeological Reconnaissance," se realizaron excavaciones extensivas en Plaza B con el objetivo de estudiar la población Preclásica de Cahal Pech y el surgimiento de la complejidad sociopolítica en el Valle de Belice. Como resultado, se expuso una compleja secuencia arquitectónica que permite investigar como el ambiente construido de la acrópolis de Cahal Pech fue cambiando durante el Preclásico Medio. De esta manera, este ensayo tiene como objetivo examinar cómo la arquitectura y el paisaje del Preclásico Medio de la acrópolis fueron modificados, tanto en su función como en su forma, a medida que el estatus de los grupos fundadores fue transformándose hasta convertirse en uno de los primeros grupos de élite del Valle de Belice.

[356] *Building a Better Egg timer: Amino Acid Dating of Ostrich Eggshell from South Africa*

Chronology underpins our understanding of the past, but beyond the limit of radiocarbon dating (~50 ka), sites become more difficult to date. Amino acid geochronology, which uses the time-dependent breakdown of proteins in biominerals, has the potential to date the whole of the Quaternary. Ostrich eggshell (OES) is often associated with archaeological sites in Africa, as early humans utilized them as a food source, water carriers and for artistic purposes. OES's calcitic structure potentially offers a "closed system" of intra-crystalline proteins encapsulated within the calcite, which is imperative for

accurate amino acid dating. We have rigorously tested these intra-crystalline proteins through high temperature degradation studies and independently dated, well-stratified OES from the key archaeological sites of Elands Bay Cave and Pinnacle Point. If OES has been heated prior to or during burial, this can confound the age signal. Using a new UHPLC chiral amino acid analysis method, we have found six markers that enable identification of “heated” OES and therefore significantly increase the age resolutions and accuracies possible. We also demonstrate the potential of mass spectrometry in helping to unravel the complex nature of protein diagenesis, with successful extraction and sequencing of peptides from OES samples ~71 ka

[36] *The Demise of Angkor: Infrastructural Inertia and Climatic Instability*

The demise of Angkor and its city-region offers insights into the vulnerability of giant low-density cities to climate extremes. At Angkor, the iterative growth of massive, convoluted and intractable infrastructural networks progressively decreased the resilience of the settlement to changing circumstances by restricting or removing adaptive strategies. The nature and consequences of the water crises in Angkor between the 13th and the 16th centuries has been revealed by a combination of remote sensing, paleo-botany, dendrochronology and excavation. Excavation and the new LiDAR remote sensing images have mapped and excavated the massive water management infrastructure of Greater Angkor, revealing the efforts to stabilize a network suffering from water shortages and erosion, damage to the southern canals of the network and the reduction of the urban area. Paleo-climate indicia have shown that from the 13th to the 16th century SE Asia was experiencing drastic variability in summer monsoon strength, from mega-wet to severe drought in the 13th, 14th and early 15th centuries. The infrastructural breakdown that ‘switched off’ Angkor as a viable low-density city was a result of interaction between the rigidity of the urban fabric and extreme climatic variability.

[106] *Downpours, Storm Surges and Wildfires, Oh My! A Look at How Climate Change Will Affect the Archaeological Record of San Diego County*

The effects of climate change on the physical environment are just recently beginning to be understood by scientists and local planning agencies. Climate Action Plans and Future Proofing studies are being conducted to help planners implement policies and plans to protect communities from the various effects of rising temperatures, fluctuating weather patterns, more intense storm and flood events, sea level rise, and ocean acidification. However, one area of research that has not received much attention is archaeology. This presentation will explore the potential effects of climate change on the archaeological record in San Diego County, California. The study includes preliminary results of a coastal oriented field survey sponsored by the Society for California Archaeology and the San Diego County Archaeological Society that spans the public land of San Diego County’s coast to inventory archaeological sites and their current conditions as well as a look at how to approach the same research question across the rest of the county.

[290] *From Theory to Real Life applications: Citizen Science in Heritage and Sustainability in Barbuda*

The small sister island of Antigua, Barbuda, has been the center of archaeological and paleoenvironmental investigations over the last nine years. Archaeological presence on the island has progressed from seasonal projects with some local volunteers to the creation of two museums and a research center with a permanent presence on the island. This transition assisted in the

founding of the first ever NGO on island, The Barbuda Research Complex focusing on research, heritage, education, preservation, conservation and sustainability. This year the historical site of Highland House became the focal point of heritage activity, where university faculty and students funded through grants were joined by a team of local participants that were financed through the local government, Dept. of Labour. Heritage work brings a proactive approach to addressing issues generated by the anthropocene and empowers citizens in better connecting with their past, taking charge of discoveries and innovations as well as incorporating science in solution based approach for the future.

[250] *Architectural and Functional Characterization of Sector 2 at Cerro Chepén*

Archaeological research in Cerro Chepén started with the purpose of characterizing the cultural manifestations in the Jequetepeque valley, especially the political and social relationships of the inhabitants of these sites and the activities related to the regional center of San José de Moro. The poster includes the results of the research conducted in Sector 2 of Cerro Chepén, which is one of the most important sites for the Late Moche and Transitional periods in the Jequetepeque Valley. The work carried out focused on architectural analysis in order to characterize architectural patterns and construction techniques.

Sector 2 is located on the north slopes of the mountain. Eight architectural compounds were identified there, which, aside from being related through their location in the archaeological complex of Cerro Chepén, are formally related since they are located in a same area that has been delineated by perimetric walls. The compounds share architectural characteristics like the use of platforms and terraces delineated by contention walls adapted to the ground and linked through paths and complex rooms. Evidence of limited access to the sector was found, as well as restricted circulation flow between spaces and visual control of each of the architectural compounds.

[93] *Archaeological Field schools: Teaching Heritage Management. An Example from Menorca*

The archaeological field school is a traditional means of training students in the practical skills of survey, excavation, recording, and artifact processing. Recent discussions about field schools have emphasized the need to approach fieldwork from a holistic perspective and incorporate the theory and practice of archaeological stewardship: preservation, interpretation, management, and public outreach of archaeological resources. In this paper we describe our experience in the development of a heritage management component for Boston University's Archaeological Field School held on the island of Menorca (Spain) from 2000 through 2014. For the past five years we have developed different projects that combine archaeological fieldwork and heritage management at different sites in Menorca that range from prehistory to the 19th century. We have also trained students in the complexity of an island that is both a UNESCO Biosphere Reserve and a candidate for World Heritage status. We ultimately view the incorporation of the values of heritage management and stewardship into our field school as important as teaching traditional subjects like excavation and recording, and as a means of approaching Archaeology in a holistic way.

[312] *One Group or Many? Cultural Inheritance at Housepit 54, Bridge River Site, British Columbia*

The Bridge River housepit village, located in south-central British Columbia, features 80 housepits with radiocarbon dates spanning the past 2000 years. Many of these structures include stratigraphic records indicating multiple generations of household re-occupation. Housepit 54 offers a particularly impressive record with an estimated 15 superimposed anthropogenic floors, the majority of which date to the period of ca. 1100-1500 cal. B.P. Extensive excavations undertaken in 2013 and 2014 demonstrate that the house grew in size over time, mostly dramatically with at least two doublings in floor area. Housepit (HP) 54 offers the opportunity for us to examine the histories of cultural traditions over many generations within a single household. However, we cannot simply assume that this house was occupied by the same group throughout its entire history. This poster presents analyses designed to test alternative hypotheses regarding inter-generational cultural transmission in HP 54. To accomplish this, we draw on data concerning variability in artifact manufacture and style along with the organization of space within floors. We expect to develop conclusions regarding patterns of cultural continuity in this long-lived house. Results should also offer implications for the utility of different methodological approaches to cultural transmission in evolutionary archaeology.

[379] *An integrated digital approach for ceramic analysis at Baita Semati, northern Ethiopia*

This paper provides an overview of the methods and results of the ceramic analysis conducted in two study seasons at the archaeological site of Baita Semati, in northern Ethiopia. The work was articulated into three main steps: 1) analytical description of the morphological attributes, 2) typological classification, 3) chronological and cultural interpretation and comparisons. Our goal was to create rich records for all pottery objects that would include standardized descriptions, typological attributions, and media. In order to do so, we adopted the archaeological database Codifi. The database was deployed as a local server without internet access and was made available to multiple users for simultaneous data entry from different devices. Photos of all objects were taken with camera and iPad and uploaded in real time in the database records, optimizing time and resources in the field.

[313] *Reconstructing Caribbean Paleotopography during the Holocene: Implications for Archaeology and Biogeography*

Our understanding of the Holocene sea level history of the Caribbean Sea is improving through the development and analysis of mangrove and coral-based relative sea level data. In this poster we present a time-series of maps showing how the paleotopography of the region changed throughout the Holocene. The maps were generated using a recently developed model of Caribbean sea level change that incorporates the effects of both eustasy and isostasy to model past sea level positions. The results show that shallow water areas such as the Bahamas, south Florida, and parts of Cuba would have been exposed subaerially during much of the Holocene. In addition, a fairly dense archipelago would have existed from the coast of Nicaragua to Jamaica (the Nicaragua Rise). As relative sea level rose through the Holocene, many of these islands and shelves were submerged, most disappearing between 4000 to 5000 cal yr BP. The sea level model does not include the effects of tectonics or sedimentation. Nevertheless, our findings have implications for the peopling of the

Caribbean (as well as the migration of plants and animals) as a range of potential migration routes from Central America would have been available.

Perreault, Charles (Arizona State University)

[191] *Measuring the Complexity of Lithic Technology*

Assessments of the complexity of lithic technologies coming from different time periods, regions, or hominid species are recurrent features of the literature on Paleolithic archaeology. Yet the notion of lithic complexity is often defined intuitively and qualitatively, which can easily lead to circular arguments and makes difficult the comparison of assemblages across different regions and time periods. Here we propose, in the spirit of Oswalt's techno-units, that the complexity of lithic technology can be quantified by counting the procedural units involved in tool manufacture. We define procedural units as mutually exclusive manufacturing steps that make a distinct contribution to the finished form of a technology. As a proof of concept, we use the procedural-unit approach to measure the complexity of 13 Paleolithic assemblages. While preliminary, these results provide a quantitative benchmark confirming that lithic technological complexity increased throughout the Paleolithic period. The method to measure lithic complexity outlined here will allow us to revisit several claims made about change in technological complexity during human evolution.

Perri, Angela (Max Planck Institute for Evolutionary Anthropology)

[28] *Dogs as Weapon Technology: Their Role in Prehistoric Hunting Groups*

Dogs have played a variety of roles in ancient and modern groups, including hunting companions. This role is often suggested as an impetus for domestication or one of the dog's earliest functions. Though advantageous in some cases, the hunting dog's effectiveness (or inefficiency) is linked to external factors, such as environment, prey species, and hunting method. Under optimal conditions, dogs can act as the primary tool in capturing prey, often proving critical to hunting success. In other cases they are a detriment, jeopardizing hunting returns. A survey of ethnographic hunting literature characterizes the relationship between hunting dog effectiveness and environmental factors. This analysis illustrates the vital role hunting dogs may have played as weapon technology in past hunter-gatherer groups.

[119] *Paleoenvironmental Change and Megafaunal Extinction at Page-Ladson, Florida*

Sporormiella sp. is a coprophilous fungi associated with large herbivore dung that can be used as a proxy to track megafaunal extinctions. The data is based on its abundance or absence within dated sediments, which is often presented as a percentage related to the total pollen sum. This poster presents the results of a fossil pollen and *Sporormiella* analysis from a sediment core extracted from the Page-Ladson Site, located in a sinkhole in the Aucilla River, Florida. The 5 meter core spans the Pleistocene-Holocene boundary and most of the Holocene. The types and percentages of fossil pollen combined with the presence/absence of various percentages of *Sporormiella* sp. provide a unique window into the timing and possible causes of megafaunal extinctions in that region of Florida.

Perry, Gareth (University of Sheffield)

[79] *Pottery Production in Anglo-Scandinavian Torksey (Lincolnshire): Reconstructing and Contextualizing the Chaîne Opératoire*

Ninth-century England witnessed major social upheaval. Viking armies moved throughout the north and east, towns flourished again for the first time since the Roman period, and land ownership was fundamentally transformed. Significant in the material record is a veritable revolution in pottery production; pottery was wheel-thrown, kiln-fired, and made on a near

industrial scale. A number of production centers were established under a Viking elite hailing from regions characterized by their aceramic nature. Whilst the decoration and form of this new pottery has attracted attention, there is little understanding of pottery manufacture itself. Using a range of analytical techniques, including thin section petrology and SEM, this paper characterizes the chaîne opératoire followed by potters working at Torksey. Its potters made specific raw material choices which impacted upon the location of their workshops and the success of their industry. Whilst raw materials remained unchanged over the industry's life, Torksey's potters made significant modifications to their firing regime. Contextualizing these seemingly superficial choices exposes a series of regional potting traditions. In the light of wider social changes that characterize the period, this window into the agency of individual potters provides new perspectives upon the mechanisms that enabled these new technologies to flourish.

[203] *Life and Death at the Mouth of the River Loa: Bioarchaeological and Biogeochemical Analysis of Human Remains from Formative Period Northern Chile*

Recent research has shown that during the Formative Period (1500 B.C.-A.D. 500), in northern Chile's Atacama Desert life was sustained and enriched by inter-zonal movement and networks of exchange of both prestige goods and staple materials. In order to further detail these phenomena, a series of five cemeteries in the region of Caleta Huelén were recently excavated. In this work, we present the results of contextualized bioarchaeological and biogeochemical analysis of over 30 individuals, focusing in particular on the distillation of patterns of diet, lifetime residential mobility, relatedness, and ethnic self-representation (in the form of intentional cranial modification). The observed patterns speak to a complex web of social, economic, and ethnic relationships, as well as between the Caleta Huelén sites and their contemporaries on the Pacific coast, oases of the desert interior, and beyond. These data support the contention that the Atacama Desert's Formative Period was one of far-reaching interaction and exchange.

[187] *Identity, Presence, and Political Relationships in the Mortuary Rituals Of Paracas Necrópolis*
 Does a Paracas Necropolis mortuary bundle represent the identity of the individual at its core, those who honored that person, or a broader social network? Extraordinary aspects of these mortuary bundles include the quantity and quality of the layered garments and their diverse styles and imagery. Data related to their production indicates their origin in many different communities directly engaged in textile production, agriculture and herding, as well as the management of natural resources from diverse environments. Fiber qualities, dye lots, spin and ply, and weaving practice indicate groups echoed by more visible features such as color use, garment design, image style and iconography. A knowledgeable viewer could have named the producers of each artifact. What sociopolitical model may explain the gathering of diverse styles in groups of equivalent garments as part of postmortem rituals that constructed an ancestral effigy around the mortal remains of an individual? Both indexical and symbolic reference made the addition of a textile to a mortuary bundle a political act, which must have strengthened and renewed relationships of power and leadership among descendent groups.

[29] *Archaeology of the Nez Perce War of 1877 in Yellowstone National Park, WY*

The Nez Perce (Nee-Me-Poo) National Historic Trail was designated by Congress under the National Trails System Act in 1986 to commemorate the 1877 flight of the non-treaty Nez Perce from their homelands in present day Oregon, Idaho, and Washington, across Idaho, Montana, and Wyoming, including 85 miles within Yellowstone National Park. In 2008, Yellowstone began archaeological investigations of the trail corridor. This six-year project includes: consultation with the Confederated Tribes of the Colville Indian Reservation, Confederated Tribes of the Umatilla Indian Reservation and the Nez Perce Tribe; historical documentary research and broad scale archaeological inventory; site-specific investigations to identify historical association with the trail with participation of tribal archaeological program staff; and creation of park interpretive material and information for park Management plans. Over seventy sites ranging from Paleoindian to the early 20th century were discovered including five previously unverified 1877-related sites and a high-elevation bivouac where the Nez Perce may have rested prior to their descent to the plains on their race to Canada to seek refuge with Sitting Bull. Results are already being incorporated into Fire Management, Interpretation, Concession Management, and Resource Management Plans, and contributing important information archaeological and interpretive information to adjacent parks and national forests.

Peterson, Christian [36] see Drennan, Robert

Peterson, Christian (University of Hawai'i at Manoa), Robert Drennan (University of Pittsburgh) and Adam Berrey (University of Pittsburgh)**[82] *Patterns of Household Refuse and Socioeconomic Differentiation: A Comparative Analysis***

Household garbage constitutes the most ubiquitous and least ambiguous class of information on Neolithic household activities, social standing, and economic well-being available to archaeologists. Unlike the short-lived symbolism of funerary ritual expressed in burials, or the celebration of individuals and institutions in monumental architecture, accumulated household garbage time-averages longitudinal patterns of domestic life. Remains from midden deposits are thus ideally suited to the comparative study of Neolithic social and economic differentiation. Compositional variation revealed through non-metric multidimensional scaling of artifact assemblage data is readily interpreted as evidence for qualitative differences between households. Different configurations of the constituent variables reflect differences in the social structure and underlying bases of differentiation in Neolithic communities. Comparing the average of the Euclidean distances used to produce each scaling provides a direct and quantitative means of assessing differences in the magnitude of household differentiation between cases. For cases where differences in economic well-being can be discerned between households, a Gini-like coefficient of wealth accumulation can be calculated from artifact assemblage data to explore this aspect of differentiation further. These measures are applied to household artifact assemblage data compiled for several different communities drawn from Neolithic societies around the world.

Peterson, John (University of Guam)**[238] *Islamic Trade and Entrepôts in the Second Millennium Philippines Archipelago***

The spread of Islamic influence throughout Island Southeast Asia and into the Philippines Archipelago was rapid and extremely effective in the second millennium A.D. This model of colonization utilized down-the-line and proxy trading through Taosug and Iranun raiders as well as by the establishment of entrepôts established through intermarriage and local exchange. Power flowing through horizontal networks cemented regional networks and exported an extensive power structure into an otherwise acephalous, dispersed, and disconnected lineage and socio-political structure. The Islamic imprint on the region linguistically, with terms for power such as *rajah* and *data*, into the region was enduring and highly successful in competition with hierarchical European models of colonization. Islamic nodal trade networks spread a distinctive material culture and cultural practices such as wet-rice agriculture that were rapidly adopted within two hundred years of the advent of Spanish settlements in the region and remain highly resilient and adaptive.

Peterson, Elizabeth (Simon Fraser University)

[245] *Changing Life Styles: New Lithic Finding from Small Sites in Casas Grades, Chihuahua Mexico*

This paper reports on findings from the analysis on lithic collections from several Medio period small sites uncovered during the 2013/2014 summer excavations in the Casas Grades region of Chihuahua Mexico. While prior excavations within the region have placed focus on the large and medium sized site types found throughout the region, the summer 2013/2014 excavations focused solely upon the small, lesser-understood sites in order to evaluate their relation both spatially and temporally to the rest of the area including the large site of Paquimé. Analysis of the lithic collections from the small sites has revealed changes within the lithic technology occurring from the middle to the end of the Medio period suggesting changes occurring with relation to the selecting of specific behavioral strategies tied to changes within the overall environment. Studying these differences may aid in revealing the role small sites played within the larger Casas Grades interaction sphere.

[275] *Late Pleistocene – Early Holocene Stratigraphic “Marker Horizons” in North Florida*

The recognition of chronologically synchronous paleosols along the Cody Scarp in north Florida reflects broad patterns of deposition, pedogenesis, weathering, and climatic stability at the Pleistocene – Holocene transition. These paleosols, or stratigraphic “marker horizons,” formed during rapid burial of A-horizons under mesic forest conditions. Marker horizons are best understood from the framework of genetic stratigraphy because they contain temporally diagnostic Early Archaic Bolen points. Since Florida notoriously lacks deeply stratified alluvial packages along major river drainages on the Atlantic Seaboard and west of the Appalachian Mountains, identifying chronologically specific horizons places relative sequences in Florida on firmer chronological ground.

[108] *“Under the Volcano”: Assemblages, Causality, and Volcanic Matter at San Pedro Aguacatepeque, Guatemala*

The colonial Maya community of San Pedro Aguacatepeque, located in Pacific piedmont Guatemala, sits on the eastern flank of the Volcan de Fuego, a long-active stratovolcano. The interventions of new materialist approaches, in particular Bennett’s notion of the “vibrancy” and influence of nonhumans in the unfolding of history, are brought into relief when considering the abundant historical entanglements between the Volcan de Fuego and Aguacatepeque. The regular flows and bursts emanating from the Volcan afforded much (productive and destructive) for Maya populations drawn to settle at Aguacatepeque. The continual eruptions of the Volcan contributed to the emergence of a unique corridor linking coast and highlands, and a high altitude microclimate and well-drained soils amenable to cacao cultivation. In turn, the Volcan continued to play a critical role in structuring life and practice at Aguacatepeque. The influence of the Volcan and other nonhuman entities in the affairs of Aguacatepeque provides a compelling case for expanding attributions of historical causality at the community beyond humans. This paper focuses on the Volcan de Fuego,

its capacities, and its place within the assemblage of human and nonhuman actors and emergent effects that afforded Aguacatepeque's unique historical trajectory both before and after colonization.

[372] *Temporal Trends in Reliance on Maize among Ancestral Huron-Wendat Villages, as Reflected in $\delta^{13}C$ from Human Enamel*

Following the entry of Zea mays to northeast North America, there are indications of human population growth, suggesting crop intensification. Isotopic values from bone collagen have been inconsistent with this hypothesis, showing temporal and regional fluctuations that have led to hypotheses of sporadic overreliance on this super-crop. Following Katzenberg's suggestion that intake of this carbohydrate should be measured through apatite rather than protein tissue, and with the permission of the Huron-Wendat Nation of Wendake, Quebec, we measured tooth enamel $\delta^{13}C$ from 167 permanent tooth crowns (most M1), retained after reburial of the skeletons. Enamel values encapsulate diet from early childhood (3 to 4 years of age). The teeth represent 16 ancestral Huron-Wendat sites in southern Ontario. Isotopic values show a gradual increase in reliance on maize from the 14th to 17th centuries, perhaps reflecting development of crop strains that were more reliable at higher latitudes. This pattern of $\delta^{13}C$ temporal enrichment is not apparent in bone collagen (n=56). Consumption of lake and river fish, known to have been important for these communities, likely complicates collagen $\delta^{13}C$ values.

[189] *Selective Influence of West Mexico Cultural Traditions in the Onavas Valley, Sonora, Mexico*

Recent archaeological work at El Cementerio, a burial mound located in southeast Sonora, Mexico dated between A.D. 897 and 1635, has identified a local cultural tradition exhibiting selective influence from contemporaneous traditions in west Mexico. The vast majority of material culture reflects local manufacture and evolution, however, the presence of shell (from the Pacific Ocean) jewelry and the incorporation of biocultural practices of cranial deformation and dental modification suggest a link to populations further south in Sinaloa and Nayarit. Although the population of El Cementerio evolved within a local archaeological tradition, we consider the site to represent an example of the intense socio-cultural changes initiated around 700 A.D. and intensified during 900 A.D. in west Mexico. We also suggest that this population was actively managing their identity in response to these macro-regional influences by selectively adopting limited aspects of southern material culture practicing modification of their skulls and teeth.

[7] *Exploring Fire Use at Sibudu Cave Using the Kernel Density Tool in ArcGIS*

This project utilized Geographic Information Systems (GIS) in an attempt to better understand fire use at the Middle Stone Age site of Sibudu Cave, South Africa. Our project focused on the Howiesons Poort deposits (HP; ~65-62 ka). Hand drawn maps of layers/features were digitized by S.

Bentsen; these maps were combined with faunal data from each feature and 50 x50 cm quadrant. Using the kernel density tool, density maps were created which allowed for an assessment of the relationship of calcined bone to hearth features. Initial results revealed that the highest frequencies of calcined bone were sometimes—but not always—in direct association with identified hearths. Furthermore, some hearths were associated with “cool” spots in which calcined bone was rare. The first result may suggest cleaning or sweeping of certain hearths, while the second finding suggests some hearths had a distinctive function in which bone was neither disposed in the fire nor used as fuel. Future work will incorporate additional artifact classes, potentially allowing for the identification of activity areas. We argue that the methods developed here may prove useful for exploring spatial organization at other sites excavated by traditional means (i.e., not subjected to 3D piece plotting).

Phillips, James and Ofer Bar-Yosef (Harvard University)

[40] *Terminal Pleistocene Foraging Societies in the Nile Valley*

This paper is concerned with interpreting the terminal Pleistocene foragers of the Nile River basin, dating between ca. 22,000 to 11,000 years BP. From Wadi Halfa at the Second Cataract, downriver to Qena, at least twelve archaeological traditions occupied and/or utilized the Nile River ecosystem, with subsistence strategies organized around the Nile floods, and the migration of migrating birds. Some settlement patterns within the confines of the Valley shifted seasonally, while others maintained large settlements for most of the year.

[168] *A Regional Perspective on the Etched Stones at Tse-whit-zen*

More than 900 incised and painted pebbles were recovered from the Tse-whit-zen Site in Port Angeles WA, yet, few have been reported elsewhere in the Pacific Northwest region. Similar stones from two sites on the Canadian side of the Strait of Juan de Fuca were reported by an art historian, but no spatial or temporal data was provided. Anecdotal accounts by archaeologists indicate that some incised stones have been found elsewhere in the Salish Sea, but have not yet been reported in archaeological publications. This research attempts to track down these unique and elusive artifacts, then summarize their geographic and temporal distribution throughout the Salish Sea. The specific spatial and temporal distribution of the stones at Tse-whit-zen within the selected households and environmental events defined by the Tse-whit-zen Project will also be presented.

Phillips, Erin (University of Alabama)

[173] *The Associations Model for use of Hemphill-Style Engraved Pottery at Moundville*

This paper will examine one possible model for the use of pottery engraved in the Hemphill style at Moundville, the associations model. The Hemphill style is Moundville's local representational art style. The most commonly engraved themes in the style are winged serpents, crested birds, raptors, paired tails, center symbols and bands, and human trophies in the form of skulls, scalps, and the hand and eye design. It is suggested that these designs represent patron supernaturals relating to the sodalities that would have used this pottery in their rituals or events.

[361] *Exploration of Wind as an Environmental Consideration for Campsite Selection at Holocene Dunes*

Cultural material-bearing sand dune deposits are common across the intermountain basins of southern Wyoming, dating from the region's Archaic through Late Prehistoric periods in particular. Investigations there have sought correlations between dune field occupations and plant processing activities in explaining the density of sites in these settings. The abundance of groundstone and fire-affected rock concentrations has led researchers to suggest that the unique plant communities associated with dunes made them favorable environments for food procurement and associated occupations. Our current research in this region, for the Chokecherry and Sierra Madre Wind Energy

Project, has added availability of modern wind-strength data to consider in relation to the positioning of archaeological sites in dune fields. Within our on-going research, here we explore the possibility that campsites at dunes in high wind areas could also represent the selection of more sheltered areas. This, combined with other evidence, such as that for plant processing activities, may have further implications for investigating seasonality of site and area use.

Picard, Jennifer (University of Wisconsin-Milwaukee) and Rachel McTavish (University of Wisconsin-Milwaukee)

[331] *Ecology, Culture, Conflict and Diet: Comparisons of Two Late Prehistoric Sites in Southeastern Wisconsin*

The late prehistoric landscape of Southeastern Wisconsin was characterized by the dynamic interaction of at least three distinct ceramic cultures. The Aztalan site (47JE001) has yielded both Late Woodland and Middle Mississippian vessels dating between A.D. 1000-1200, indicating a period of cultural coexistence. At the nearby Crescent Bay Hunt Club Site (47JE904), in the Lake Koshkonong locality, Upper Mississippian Oneota ceramics have been recovered; no indication of a coexistent occupation with other cultural groups is present at the site. Radiocarbon dates indicate overlapping occupations at Aztalan and the Lake Koshkonong locality. Recent paleoethnobotanical and zooarchaeological research suggests that differences in ceramic technology mirror differences in diet. Reasons for these differences are explored through an examination of site placement, ecology, intergroup conflict, identity, and larger regional connections.

Piccini, Angela (University of Bristol)

[297] *Archaeology's Moving Images*

Ruth Tringham belongs to a small group of archaeologists who engage seriously with the media practices through which archaeology disciplines itself. She has tirelessly worked to place audio-visual media – from film to networked media – at the heart of how we think about and do archaeology. In a 2009 paper about the UC Berkeley Archaeological Film Database, Tringham sought to move debate beyond reductive critiques of archaeological accuracy to explore how it is that we watch films about the past, how we use them in our teaching and in our research, how we create meaning, and how we watch critically. By introducing archaeologists to the key questions that structure narrative fiction and documentary, Tringham taught us that screen grammar (cinematography, sound, lighting, editing, mise-en-scène), aesthetics, narrative, production contexts, industry structures and audience all shape how archaeology becomes subject matter, practice, and discipline. Where Michael Shanks and Christopher Tilley called upon archaeologists to understand media manifestations as rhetorical performances rather than as representations (1992: 95), Tringham has given archaeologists the precise tools required to become reflexive, critical-creative practitioners. In this presentation, I consider Tringham's engagements with the 'liveness' of the moving image and with archaeology's diverse travels across our screens.

Picha, Paul (State Hist Soc of North Dakota) and Carl Falk (PaleoCultural Research Group)

[230] *Where Rivers Flow: Mandan and Hidatsa Subsistence Economies from an Archaeomalacological Perspective*

Three classes of molluscan data generated from Mandan and Hidatsa villages along Heart and Knife river drainages in North Dakota are reviewed: freshwater bivalve, marine, and fossil gastropod shell. An outline of Mandan and Hidatsa ethnomalacology obtained from native collaborators is found in the writings of anthropologists Gilbert L. Wilson and Alfred W. Bowers and corresponds with the aforementioned molluscan classes. Mandan and Hidatsa subsistence economies are diverse during the longue durée as indicated by the vertebrate and invertebrate faunal records reported to date. Mandan and Hidatsa traditions and ethnomalacology reflect contrasting long-term differences from that of neighboring Arikara villagers.

Picin, Andrea (Friedrich Schiller University of Jena)

[389] *Neanderthal Mobility in the Northeast of the Iberian Peninsula: The Patterns of Chert Exploitation at the Abric Romaní Rockshelter*

Understanding the changes in the technological organization of prehistoric hunter-gatherers is important to research into hominin foraging activities. During the Middle Paleolithic, the coexistence or the replacement between Levallois and discoid technologies has frequently been recorded, but there is still no clear understanding of the reasons for their alternating and fragmented use in the archaeological record. This paper aims to contribute new data to the current debate, by exploring the chert assemblages from Levels O and M of the Abric Romaní rockshelter. The technological analysis reveals a change in the flake production from Levallois in Level O to discoid in Level M. This modification in Neanderthals technical behavior is accompanied by the use of different axes of mobility, a reduction in the foraging radius and a more careful management of raw materials. A cross comparison with other archaeological evidence indicates a similar pattern in the northeast of the Iberian Peninsula during the late Middle Paleolithic.

Pierce, Wendy and Gary Scholze (Caltrans)

[41] *Native Irrigation in Owens Valley: The 2000 Year Back-Story*

Owens Valley is unique in that the Native Paiute were recorded as using irrigation to promote growth of certain crops such as taboose, *Cyperus esculentus*. This paper looks at the archaeological occurrence of the taboose tuber and other archaeobotanical remains in Owens Valley to explore the issue of whether Native irrigation would have made sense for this hunter-gatherer group. For roughly the last 2000 years of prehistory the Owens Valley archaeological record shows a cycle of alternating successful subsistence adaptations and population growth with each shift in subsistence denoting more labor input resulting in higher yields or outputs. It is argued based on well documented patterns from the archaeobotanical record, that irrigation would have been a logical step in the intensification cycle prior to disruption by Euroamerican contact.

Pierce, Karen (University of Colorado/Denver), Claude Belanger (Lamanai Archaeology Project) and Elizabeth Graham (University College London, Institute of Archaeology)

[147] *Recent Excavations in the 'Ottawa' Plaza N10[3] Palace Group at Lamanai*

Individual structures of the 'Ottawa' Plaza N10[3] Palace Group at Lamanai have been the focus of excavation at various times since Pendergast's first investigations there in 1981. The time of inception of construction remains unknown, but the group is notable in that its structures were altered, added to, and occupied into the Early Postclassic period. Recent excavations of Str. N10-15 have yielded information on a flurry of activity in the Late and Terminal Classic. Results will be discussed in terms of what we are learning about the kinds of adjustments, adaptations, and changes that occurred at Lamanai from the Classic to the Postclassic period.

Pierce, Daniel (University of Missouri-Columbia)

[189] *Preliminary Results on Regional Postclassic Aztlán Obsidian Usage Patterns*

The usage and trade of obsidian from various sources is well established during the Postclassic in West Mexico. Different qualitatively similar obsidian sources were used in different ways within sites, which suggests preferences for certain sources over others for different types of reduction. No studies, however, have explored this differential usage regionally. Here, I have macroscopically and microscopically analyzed collections from three Aztlán regional centers in Nayarit: Coamiles, San Felipe Aztlán, and Amapa. The results are preliminary, pending further analysis on lithics from broader excavations within these centers. However, the large sample size for each of these sites is sufficient to make broad generalizations despite incomplete excavations. These results are also complimented by the inclusion of selective data from various smaller sites. In this study, I identify differences in how obsidian sources were used within and among sites. Results indicate that while some sites used substantial amounts of distantly traded obsidian, others favored locally produced blades. Further, there are marked differences in how these sources were used within the sites. All artifacts considered in this project were sourced using portable XRF technology in Nayarit, Mexico in

the summer of 2014 and analyzed at the University of Missouri Research Reactor

[285] *Fortifications in Mukaranga, Northern Zimbabwe (1600-1700 A.D.): A Socio-Political Perspective*

Portuguese written sources mention 'great stone buildings' including state capitals, fortified hilltops and trading centers in their accounts of the Kingdom of 'Monomotapa' (Mutapa State) in northern Zimbabwe in the late 16th and 17th centuries. On the one hand, feiras, the trading centers frequented by the Portuguese, served primarily commercial functions, and only fortified themselves when confronted with external military threats. On the other, the monumental, stone-built structures sited on hills and mountains in the area between the Mazowe and Ruya valleys – a region also referred to in written sources as Mukaranga, the original heartland of the Mutapa State – seem to have been constructed by rebels who disrupted the feira trade. The archaeological evidence from these fortifications suggest these structures served more than defensive purposes, playing critical social and political roles that subsequently replaced a well-established state system in the region.

Pilaar Birch, Suzanne (University of Georgia)

[377] *Multispecies Archaeology*

This paper discusses ecological novelty in the archaeological record from a multispecies perspective. Pivotal research topics in archaeology have long simplified these novelties into transitions that emphasize the uniqueness of the human species. Though views have evolved from completely anthropocentric perspectives in archaeology and natural history in the 19th and 20th centuries, there is still a pervasive sense of progressivism when we center our points of inquiry on human originality. To some extent, the very debate surrounding the creation of the "Anthropocene" belies a paradigm wherein humanity is gaining importance as a central object of inquiry. In the parallel—but in practice, often separate—field of paleoecology, scientists have worked to understand a "natural" past, often to the point of excluding the role of the human, or viewing it as a disruptive element. These disparate foci create and reinforce an artificial boundary between humans and the natural world of which they are an integral part. A multispecies archaeology can really be viewed as archaeo-ecology, which understands the past through networks and interactions rather than stochastic events and places. As "multispecies ethnography" gains ground in anthropology, this paper questions what a wider consideration of life might play within archaeology.

[277] *The Sinagua and the Western Pueblo Tradition: Perspectives from Material Culture and Burial Practices*

The highland country of central Arizona has historically been interpreted as a region peripheral to the more dominant Hohokam, Kayenta, and Mogollon traditions that surrounded it. However, peripheries are defined by one's perception of where the center is located. Our case in point is the prehistoric Sinagua, which has been the subject of a five-year long study and documentation of more than 1500 human remains and 4000 funerary objects that have been repatriated to the Hopi Tribe by

the Coconino National Forest, as required by the Native American Graves Protection and Repatriation Act. These remains span the entire history of the Sinagua, from about A.D. 600 to 1400, and we believe they demonstrate a developmental trajectory that merges into the Western Pueblo and its ancestral Hopi groups. Ceramic styles, technologies, iconography, unique artifacts, and burial customs suggest the Sinagua were part of a larger cultural pattern, a Central Arizona Tradition, that, although populated by different social groups, maintained a distinctiveness that is reflected by its relationships with surrounding cultural groups through time - relationships that appear to come together with a coalescence that is evident at the sites of Nuvakwewtaqa, in Chavez Pass.

[216] *Rural Craft Production and Market Participation in Late Classic Oaxaca: A Case Study from Yaasuchi*

Many models of the Zapotec economy during the Classic Period (A.D. 200 – 850) have relied on an assumption of mutual dependence between rural farmers and urban craft specialists, yet little research has focused explicitly on the economic behavior of rural households. To address this assumption, over 300 archaeological ceramics from the rural site of Yaasuchi - including samples from two domestic structures and a ceramic firing feature - were characterized via INAA to establish provenance. Results of these analyses show that 90% of Yaasuchi ceramics were produced on site and exchanged between households, while 10% were imported from nearby centers. The lower status household relied primarily on domestic production, but also engaged in ceramic production for intra-site and regional exchange. In contrast, the higher status household acquired the majority of ceramics from other households within the community and imported ceramics from fewer sources. Yaasuchi households were thus neither dependent on exchange in urban centers for access to ceramics, nor isolated from the regional economy. Rather, households employed a range of economic strategies to fulfill domestic needs, including craft production for exchange, both within the community and in regional markets.

[215] *The Exploration and Colonization of Two Southern Deserts: Case Studies from the Puna and Patagonia*

The peopling of South America is a subject that has been discussed from many angles, including timing, migration routes, genetics, among others, and at various scales of analysis. In this paper we take on a supra-regional scale of analysis and examine stone tool assemblages from a series of Pleistocene/Holocene transition and Early-Middle Holocene sites located in two desert areas on the eastern side of the Andes –Patagonia and the high Puna. Our objective is to assess how these lithic assemblages match up to the expectations of an exploration and colonization model proposed for Patagonia. Information on raw material provenance is used in order to assess changes in human behavior through time. The comparison between both regions allows us to examine how this process might have varied in these two similar but yet different regions of the Southern Cone, and to offer explanations about how the exploration and colonization strategies used by early hunter-gatherers in desert environments varied in relation to their knowledge of the resource structure and the distribution of resources.

Pinto, Lourenco (Rock Art Research Institute, University of Witwatersrand)

[149] *Understanding Variation: Stylistic Ethnographic Analysis of Rock Art from the Makgabeng Plateau, Limpopo Province, South Africa*

The use of style is in its infancy in southern African rock art studies with work on style originating with broad generalizations which linked modes of subsistence, material culture and lifeways to style.

Recent studies have focused on regional art traditions. The author presents a research case study that advocated for the use of style as praxis. Looking at specific depictions of cross-cultural motifs from the Makgabeng plateau, South Africa, this paper explores the intricate spatio-temporal background that foregrounds the art-making process. Much of the interpretation of Makgabeng's rock art has drawn upon the shamanistic explanation. However, the research in this area has provided an array of cross-cultural motifs shared by many different identities and functions, which cannot be explained by the shamanistic explanation alone. This stylistic approach using embodiment theory aims to acquire deeper insight into the intricacies behind rock art variation and the choices taken during the image-making process within Khoekhoe and Bushmen rock art traditions. The concern with choices in the production of art provides important information regarding identity, function, and social context of a particular art object. This coupled with relevant ethnographic analogies could further explain spatial and temporal variation amongst past and present peoples.

[226] *Some Comments on Present and Future Contributions of Paleoethnobotany in the Neotropics*

Paleoethnobotanical research the past two decades from around the world makes it clear that multi-proxy data including from genetic and paleoecological approaches are necessary for understanding plant exploitation, domestication, and spread of agriculture. Recently, bio-archaeologists using such kinds of multidisciplinary endeavors have come to understand that addressing prehistory is also relevant to understanding species adaptation and survival in future environments. This paper discusses these issues and highlights some potentially productive areas of future Neotropical research.

[22] *Issues of Function and Scale as Viewed through Possible Ritual Structures at the Late Archaic Site of Huaricanga, Peru*

Throughout the Late Archaic Period (3000-1800 B.C.) communities along the north-central coast of Peru witnessed a dramatic increase in the material manifestations of ritual performance. During this time, the earliest monumental ceremonial architecture in South America was constructed at over 30 sites between the Huaura and Fortaleza River valleys in a region known as the Norte Chico. While considerable archaeological research has been conducted on the large-scale platform mounds and sunken circular plazas, little attention has been given to the small-scale ceremonial buildings distributed among the monumental structures. The emphasis on the impressive monumental buildings has also overshadowed our understanding of household archaeology during this time period. Therefore, some basic anthropological questions are still largely unanswered for the Late Archaic Period in the Norte Chico region: Where did people at these sites live? Did the small-scale structures serve ceremonial or domestic functions, or perhaps a combination of the two? What does the difference in scale between the smaller buildings and the monumental platform mounds and plazas suggest about the role of ritual in the emergence of complex societies? This paper addresses these questions using recent results from innovative, multi-disciplinary research conducted at the Late Archaic site of Huaricanga.

[245] *Recent Explorations for Casas Grandes Viejo Period Settlement*

Much is known about political, social, economic, and ritual organization during the Casas Grandes Medio period (ca. A.D. 1200-1450). A looming question is, What are the roots of the Medio period? The preceding Viejo period, assumed to begin around A.D. 500, is poorly understood because so little work has been conducted at Viejo sites, and few sites from this time period are known. We recently conducted reconnaissance and systematic survey north and south of the Medio capital settlement of Paquimé and identified six previously unrecorded sites. We present the characteristics of each site, including a ground stone quarry, and how they fit into our anticipated long-term research program focused on the Viejo period and the roots of the Medio period.

[274] *A Study of Miniature Pottery Vessels in the Mimbres Region*

What role did miniature vessels play in the lives of pit house and pueblo peoples of the ancient American Southwest? Were they toys? Were they ritual? What is the evidence of their uses? To begin answering these questions I have compiled data to explore the contexts of miniature vessels. This poster explores a case study of Mogollon sites (A.D. 200-1450) from Southwestern New Mexico. In this poster I will discuss traces of the life histories of miniature vessels including where they are found (e.g., floors, burials, fill), their relative frequencies, their associations with other artifacts and differences in their formal properties (surface treatment, shapes, paste).

[27] *It Takes a Village to Curate Burro Flats*

Nestled in the hills of Simi Valley at what is known as the "old" Rocketdyne site and where NASA conducted testing for the Airspace program, is the sacred site of Burro Flats. Considered to be a ceremonial site with evidence of astronomical alignments, Burro Flats carries important meaning for some of the tribes of Southern California, primarily the Chumash and other local communities such as the Fernandeno and the Gabrielino/Tongva. Mainly known for its' painted cave drawings associated with the winter and summer solstices, Burro Flats is also the source of a diverse archaeological assemblage. Originally housed as a complete collection in the mid to late 1950s, this assemblage was later split in the 1980s and only recently reintegrated as a complete collection under the auspice of the Autry National Center of the American West. Through collaboration with public and private sectors, as well as institutional and academic branches, the Autry museum has created opportunities allowing students to assist with the reincorporation of the artifacts while working towards a solution for the curation crisis.

[14] *The Role of Highland-Lowland Interaction in Political Development: A View from the Hilltop*

Fort Site Ayawiri, in the Andean Highlands of Peru

The florescence of the precolumbian Andean cultural sphere presents a classic, almost trite counter example to the development of highland-lowland relations seen in other areas. Far from marginal, the highlands are where the Inca empire emerged, following the earlier Wari and Tiwanaku states. However, highland-lowland relations were complex and varied; urban societies also developed independently on the Pacific coast, while eastern Amazonian lowlands were often cast as marginal and 'difficult'. Investigation of the pre-Inka site Ayawiri in the South-Central Andean highlands provides some insight into the changing nature of highland-lowland interaction. Ayawiri was a regional center in the northern Lake Titicaca Basin during the Late Intermediate Period (A.D. 1000-1450), a period characterized by conflict and a fragmented, fluid political landscape. Somewhat counter-intuitively, interregional contacts were maintained and continued to play a vital role in political and economic organization. Analyses of excavated assemblages (lithic, metal and faunal) suggest that residents' participation in interregional trade critically contributed to its rise as a regional center. At the same time, they appear to have rejected previously wide-spread ideologies of status and power seen in the Tiwanaku and Upper Formative periods, suggesting that the nature of interregional interaction and trade may have changed substantially.

In the 13th century, crusading armies unleashed a relentless holy war against indigenous non-Christian societies in the eastern Baltic region. Tribal territories were replaced with new Christian states run by the Teutonic Order and individual bishops, who constructed castles, encouraged colonists, developed towns and introduced Christianity. At a time of deteriorating climate, their impact on the local environment, especially plants and animals, would have been profound. Furthermore, since many aspects of the natural world were sacred to the Baltic tribes, this impact would be synonymous with the cultural changes that created a new world - a European world - at this frontier of Christendom. The Ecology of Crusading project has been investigating this impact from diverse perspectives with interdisciplinary objectives. Focusing on a suite of environmental data associated with castles built by the conquering theocratic elite in Prussia and Livonia - the centers of landscape re-organization following the crusades - the project has contextualized the role of the crusades within the ecological history of NE Europe. It has been possible to trace intensities in environmental exploitation associated with multiple waves of colonization, as well as uses of the landscape tailored to the practical and ideological requirements of the conquerors.

Poehler, Eric**[59]** *From Invention to Methodology: The Overlooked "DIY" in Everyday Archaeology*

Archaeology has always been "DIY". It has borrowed nearly all of its physical tools and many of its intellectual instruments as well. In this still new, 21st century realm of digital archaeology our implements look different, but their basic implementation does not. From the shovel to the computer, from the trowel to the database, from the paintbrush to the paint program, archaeology has had to teach itself how to adapt an object - physical or digital - to the needs of the discipline. Using the experience of one deeply digitally invested research project, the Pompeii Quadriporticus Project, this paper explores this overlooked world of DIY in archaeology. At issue are the risks and rewards enmeshed in the many strategies available to any project starting today: the investment in building your own infrastructure, the compromises of cobbling together resources ready-made for other purposes, and the costs in personnel and training. Yet these issues only address one part of ubiquitous DIY in archaeology, the design and creation of a conceptual, if sometime tested, framework. Fieldwork has always been where concept and reality collide, and it offers (requires) yet another moment of DIY adaptation.

In this paper we address the results of an Instrumental Neutron Activation Analysis (INAA) on a sample of sherds from Santa Luisa and Higosñoc, two Las Trancas Valley sites from the Southern Nasca Region (SNR), Perú. By sampling sherds dating from the Early to the Late Horizon, this study adds temporal depth to previous compositional work in the region. While results confirm previous analysis conducted in the SNR suggesting compositional uniformity during Early Nasca, results also reveal compositional uniformity through time beginning in the Early Intermediate period (EIP) as well. We hypothesize this pattern is the result of a technological tradition developed during the beginning of the EIP that correlated with major sociopolitical changes taking place in the SNR.

Pokotylo, David (University of British Columbia)**[188]** *Public Perceptions of Archaeology and Its Impact on Archaeological Resource Preservation: A Case Study from Western Canada*

Although archaeologists acknowledge a legal and ethical responsibility to engage the public, the level of public appreciation and knowledge of archaeology and attitudes toward heritage preservation still remain poorly understood. A handful of past social surveys in North America and Europe give an initial perspective of public opinion on archaeological heritage preservation and its role in contemporary society. Given recent digital advances in public access to information and forums for communication, more research is needed that revisits and extends the scope of these studies to better understand today's public and the challenges of engaging them. Using a case study from

western Canada, this paper analyses individual responses to online news articles on archaeological heritage preservation to monitor public perceptions of the role of archaeological preservation in contemporary society and its economic implications. These results are then compared to the baseline from past surveys to assess current public support of archaeological preservation policies.

[135] *Myths about the Tropical Rainforest Hunter-Gatherers: A Reappraisal from South America*

Twenty years ago the Foraging Spectrum highlighted the variability in forager behavior around the world and generated several models to reconstruct the lifeways of these kinds of societies in the past. However, contemporary tropical rainforest hunter-gatherers of South America are still underrepresented in the current debate and they are rarely used as a source of analogy to interpret prehistoric foragers. This is partially due to the existence of several myths about them that still persist in the archaeological scenario. These myths are: a) most contemporary hunter-gatherers from the South American tropical rainforest were horticulturists in the past. Therefore, they are the result of a sort of cultural “regression “, b) edible resources in the tropical rainforest are scarce and difficult to obtain, and c) related to this, viable hunter-gatherers populations in tropical rainforests are extremely difficult to maintain without the contribution of domesticated plants. In this presentation these myths will be challenged with the information obtained among contemporary hunter-gatherers from this kind of forest (nukak, hoti, awá, etc.) and their potential for interpreting prehistoric hunter-gatherers will be discussed.

[151] *Transisthmian Ties: Epi-Olmec and Izapan Interaction*

Beginning with Matthew Stirling, who in 1943 opined that "Izapa appears to be much more closely related to the earth-mound sites of southern Veracruz ... than it does with sites in the Maya area," scholars have postulated ties of varying strength between Late Formative polities on either side of the Isthmus of Tehuantepec. Ceramic similarities have been noted between southern Chiapas and the Gulf Coast, but discussion of Late Formative transisthmian interaction has focused primarily on sculptural similarities between Izapa and sites of the lower Papaloapan basin, especially including Tres Zapotes. Indeed, Michael Coe suggested that the Izapan art style may have originated on the Gulf Coast rather than on the Pacific slope. In this paper we re-examine Late Formative interaction between Izapa and Epi-Olmec polities with an expanded data set based on recent iconographic studies and archaeological investigations in and around Tres Zapotes.

[274] *A Chronological and Functional Analysis of Pottery from the HO-Bar Site: A Mogollon Early Pithouse Period Site in West-Central New Mexico*

Pottery is thought to have been introduced into the Mogollon region sometime between A.D. 1 and A.D. 500, probably closer to A.D. 500 than A.D. 1. Dating of the HO-Bar Site and the paucity of ceramics suggest these ceramics are some of the earliest ceramics of the Mogollon Early Pithouse period. A geoarchaeological analysis of the site indicates a main occupation between 200 B.C. and A.D. 200. Typological and functional analyses of 355 sherds and 26 rims from the excavation of approximately 30 cubic meters are used to examine the implications of this set of ceramics for the chronological placement and range of functions of these ceramics.

Pool, Kelly (Metcalf Archaeological Consultants, Inc.)

[282] *Ruins and Restoration on the Colorado Plateau: Earl Morris and the PWA (Public Works Administration)*

In 1934, the Carnegie Institution "loaned" archaeologist Earl Morris to the National Park Service to supervise the repair of ruins in Mesa Verde National Park, Colorado, and Aztec Ruins National Monument, New Mexico. The NPS had received funding in 1933 for long-term development projects through New Deal emergency work relief programs, one of which was the Public Works Administration. The PWA provided money for physical improvements in parks and monuments, including funding for restoration and stabilization of prehistoric ruins. Morris was recommended for the job as an acknowledged expert, with previous reconstruction experience at sites such as Chichen Itza and Canyon de Chelly's Mummy Cave. With the help of unemployed locals, Native Americans, and experienced fieldhands, Morris reconstructed the Great Kiva he had excavated a decade earlier at Aztec and stabilized the Mesa Verde ruins, most notably Cliff Palace. Morris' work served as a model for future projects, and a permanent MVNP stabilization team headed by PWA foreman Al Lancaster grew out of this work. After the PWA, other New Deal programs such as the CCC continued to undertake stabilization projects in these and other Colorado Plateau parks and monuments.

[242] *Smoke Signals: Interpretations*

This paper compares expressions of ritualistic concepts that can be found on images on censers and on other artistic creations, including monuments and documents. The research concentrates on Late

Preclassic and Early Classic developments in the Guatemalan South Coast and Highlands but also uses relevant information from other areas. One of the objectives is to trace continuities and changes in forms of rituals and the manner in which individuals participated in them. It is found that contrasting attitudes can be recognized between regional populations. The idea is tested at Takalik Abaj.

Popescu, Gabriel (SHESC, Arizona State University)

[389] *Assemblage Formation and Paleolithic Variability in the Middle Prut Valley Region (Romania)*

The research I will report in my paper has two main goals. The first is to learn something of the behavior of the hominids responsible for the production and accumulation of the Middle and Early Upper Paleolithic assemblages at two multistratified sites in NE Romania, Middle Prut Valley region (Ripiceni-Izvor and Mitoc-Malu Galben). The second goal is methodologically related. Paleolithic assemblages recovered from the archaeological record are mostly interpreted as "typical" expressions of cultural identity. Yet assemblages are also a product of formation processes, they accumulated over varying time spans, with various artifacts combinations and discard rates, and represents therefore the context of complex relationships, as opposed to essentialist view of static types. The excavation methods used at those two sites provide us with the opportunity to examine the assemblage formation by focusing on differential rates of deposition, of the whole assemblages rather than relative frequencies. As shown in several recent studies, this will allow us to understand how the characteristics of the conventionally defined assemblages have evolved during the long occupational histories of those two sites.

[191] *Why Terrestrial Diets in Island Environments? Evolutionary Considerations of Isotopic Results from Rapa Nui*

Archaeology and isotopic studies have demonstrated several examples of initial colonists of Pacific Islands subsisting mainly on terrestrial diets, with exotic domesticates preferred over local seafood. Seemingly a poor adaptation to remote island environments, this appears confusing from a behavioral ecology perspective. From a culture evolutionary viewpoint, however, this could demonstrate how intergenerational transmission of human behavior may preserve dietary traditions in long-distance migration into vastly different environments. Here this hypothesis is explored through high resolution isotopic evidence from Rapa Nui. $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ compound specific analysis of individual amino acids from human and faunal remains, and a range of reference food items, confirms that seafood was not a significant component of early Rapa Nui diet. Additionally, rat collagen amino acid isotope values provide a baseline to test the hypothesis of human diets based largely on rats and chickens, and to investigate effects of environmental change on Rapa Nui. Consumption of palm nuts by introduced Pacific rats has been proposed as playing a role in deforestation. Multivariate statistical analysis of amino acid data investigates this, and whether palm nuts may have been a component of human diets too. This presentation situates the updated results within the broader evolutionary questions.

[121] *A Portable Photogrammetry Rig for the Reliable Creation of High-Quality 3D Artifact Models in the Field*

3D modeling is becoming an increasingly utilized tool in archaeology. Currently, there are three principal ways of obtaining 3D models of objects: laser scanning, white light scanning, and photogrammetry. Photogrammetry is becoming increasingly popular since it is relatively inexpensive, mobile, and requires less equipment that has the possibility of malfunctioning. This poster presents a photogrammetry rig consisting of materials that can be obtained easily in the US. These include a kitchen turntable (lazy susan), 12" x 12" interlocking foam tiles, laminated mm paper to act as a

scale, a black velvet background, and a camera and tripod. In addition, the use of rechargeable battery-powered LED lights means the rig can even be used in areas without direct access to electricity. Tips on taking photos (camera settings, etc.) are provided, along with explanations of ways to streamline and optimize photo and model processing using software including Adobe Photoshop / Gimp, Agisoft PhotoScan, and Meshlab / Geomagic. Limitations of this system, such as object size and raw material, are also discussed in the context of alternative scanning-based systems. Although this system may be used on a wide variety of artifact types, here particular emphasis is given to the modeling of lithic artifacts.

[266] *Small Sacred Spaces: The Results of Investigations into Subterranean Features at N950 and Grupo Agua Lluvia in northwest Belize.*

This paper explores the ways in which the Maya conceptualized subterranean features as sacred landscapes within the Three Rivers Region in northwest Belize. Contemporary archaeological investigations have suggested that large cave systems served as important locations for rituals. The ubiquity of these features to the Maya indicates that these concepts of sacred space may have extended to regions and sites without naturally forming caves. This research focuses on the utilization of small subterranean features located at two sites on the periphery of Dos Hombres. Grupo Agua Lluvia, situated approximately 1.7 km west of Dos Hombres and N950, positioned 1 km north of the site center. This paper will present interpretations using artifact and spatial analysis to determine the role in which these small features were utilized at both sites. Additionally, a comparative analysis of the features that were investigated will provide a greater understanding into how these features were used and incorporated while emphasizing evidence for ritual activity. Investigations into these features will assist in the understanding of the complexity of ancient Maya conception of cultural landscapes.

Posadas Vidales, Lylliam (University of California, Los Angeles)

[311] *We Want In on This: Contemporary Queer Archaeology and the Preservation of Queer Cultural History*

This research will address how contemporary archaeology can be used to explore notions of identity, gender expression and self-determination, community belonging, and the value of queer cultural heritage, with an emphasis on the experiences and engagement of queer and trans youth. Queer and trans youth are organizing in their schools and communities to create change that affects their lives and the lives of their friends and families. They are creating new language for queer and trans identities and gender expressions that better fit them, and are using new technologies in innovative ways to connect with each other and share information about what it means to be queer and trans today. This research uses contemporary archaeology to engage queer young people in exploring and reflecting on cultural heritage as it pertains to queer history and culture and their own place within it. It uses the perspectives of queer and trans youth to address questions on the curation of queer archives and collections and capacity-building for organizations that house and support these collections by emphasizing the needs and interests of queer and trans youth.

Poston, Victoria

[193] *Architecture and the Subjective Experience*

Architecture shapes the subjective experience of those living in it as well as those simply interacting

with it. The Maya continuously changed their environments to fit their needs and desires, thus these spaces mirror their everyday practices. This paper compares the overall architectural arrangement of Xultun to other Classic Period Lowland Maya urban centers, such as Tikal and Palenque, to determine how the reciprocal relationship between urban populations and their built environments reflect cultural interaction and human experience more broadly.

Poteate, Aaron [52] see Thompson, Adam

Poteate, Aaron (University of Oregon)

[105] *Marginalization of the Margins: The Importance of Smaller Islands in Human Prehistory*

Across the world's seas and oceans, archaeological research focused on islands has traditionally privileged those which are larger in size. Myriad reasons can explain this phenomenon, ranging from the (mis)perception by scholars that prehistoric peoples would have been attracted to the greater number and diversity of resources typically available on larger islands, to the ephemeral aspect of archaeological evidence on smaller land areas along with issues that archaeologists face in terms of logistics and infrastructure that limit access to labor, equipment, and transportation to conduct field activities (e.g., remote atolls in the Pacific). An increasing amount of research, however, is demonstrating that peoples in the past readily occupied and/or accessed the smallest of islands for both terrestrial and marine resources. In some instances, evidence shows an earlier occupation on smaller islands within an archipelago versus larger ones, or an attraction to the former given unique or seasonal resource availability and/or defensive capabilities. In this paper, we describe cases from major aquatic regions around the world which highlight the importance that small islands—defined conservatively as those around or under 100 square km in area—have for understanding long-term human adaptations in what many have considered to be the most marginal of environments.

Potrebica, Hrvoje (University of Zagreb, Department of Archaeology)

[177] *Hillforts of the Eastern Hallstatt Circle. Central Places, Fortified Areas or Something Else?*

One of the most prominent landscape features of the Hallstatt Culture that more or less stands for the Early Iron Age of Central Europe are hillforts. They are usually located on prominent spots on the landscape and are surrounded by some kind of fortification. This paper will try to combine geographic and social contextual analysis of these enclosures and create a complex model of their meaning within cultural and physical landscape of Iron Age communities. Usually they are interpreted as central settlements of local communities built in their core, and ramparts and ditches were seen in a purely defensive role. The very idea of central place seems to be coherent in terms of content as well as function within the social structure of local communities. It is possible that an enclosure (rampart or a ditch) does not only function as a fortification but also as a definition of special space. It is probably true that these sites were central places of Iron Age communities. However, it is much more difficult to determine whether they were created in the core of communal activities or if they became central places because of the focus of such activities around them.

Potter, Stephen and John Bedell (The Louis Berger Group)

[29] *Searching for King Opessa's Shawnee Town in the Mountains of Maryland*

In 1688, a band of Shawnee left Fort St. Louis on the Illinois River and headed east. Eventually, some of them settled at King Opessa's Town on the upper Potomac River, circa 1722, in the vicinity of Oldtown, Maryland. In 1975, a National Register Nomination was prepared identifying a 122 x 213 m surface scatter of prehistoric artifacts as the site of King Opessa's Town, which also corresponds to the location of "Shawno Indian Fields Deserted" on Benjamin Winslow's 1736 map. Subsequent test excavations and a magnetometer survey in 2009-2010 by archaeologists of the Louis Berger Group revealed two villages dating 1490-1560 CE. Intensive archaeological survey and testing was also undertaken on the Moore Tract, closer to Oldtown, where land patents mentioned the prior location of a Shawnee town. Despite these efforts, King Opessa's Town remains unidentified. There are at least three explanations for this failure: 1) it is not within the bounds of the C&O Canal NHP; 2)

it is located somewhere that has not been surveyed; or 3) it is in a place that has been searched but has not been recognized. The latter explanation is a distinct possibility that is discussed further.

Potter, James (PaleoWest Archaeology)

[85] *Cowboy Wash Pueblo and Community Organization on the Southern Piedmont of Sleeping Ute Mountain*

Located on the southern piedmont of Sleeping Ute Mountain in southwest Colorado, Cowboy Wash Pueblo (5MT7740) is a large, late Pueblo III site containing thirteen kiva depressions and more than thirty rooms. It is the largest site within what has been termed the Cowboy Wash community, yet it is one of the least well documented of all the habitations composing this community. Recent investigations documented a different configuration for the site than had originally been understood, identified a large D-shape structure previously unidentified, and conclusively placed the construction and occupation after A.D. 1225, when it appears that about half of the small sites in the Cowboy Wash community aggregated in Cowboy Wash Pueblo. This paper discusses the transmogrification of the community from the Basketmaker III period to the end of the occupation sequence at around A.D. 1280 and suggests that, even at its peak in population, this residential-drainage community was too small to be a sustainable community; it is likely that the entire southern piedmont comprised a larger sustainable community. The paper concludes with a comparison of Cowboy Wash Pueblo with other large late settlements in the vicinity.

Potter, Ben (University of Alaska Fairbanks)

[302] *Recent Discoveries in the Tanana Basin, Eastern Beringia*

Recent developments in Western subarctic archaeology have transformed our perspectives on technological, subsistence, and land use strategies implemented during the Pleistocene - Holocene transition and into the later Holocene. This talk encompasses my intersite and intrasite investigations at Upward Sun River, Mead, and other sites in the middle Tanana River basin geared towards explanatory model construction and testing. Athabaskan ethnographic data provide robust frameworks to evaluate the earlier prehistoric record. Results indicate surprising levels of connectivity between ancient and recent lifeways in the subarctic. Significant differences suggest changing responses to risk and the importance of social contexts of site structure and organization and regional land use.

Pottier, Christophe (Ecole française d'Extrême-Orient (EFEO))

[36] *Insights from Difference: Text and Archaeology in Angkor*

The study of Angkor was predominantly the domain of epigraphers, art historians and architects for much of the past century of research. To some degree it continues to be. This focus, to its great credit, has reconstituted a millennium of the political history of Khmer society prior to the 16th-17th C CE. The effect has however, been to prioritize a historicist viewpoint, leading to the material record of the monuments being fitted in to the expectations of textual interpretation. Archaeological inquiry has also tended to focus on the monuments rather than their context, the urban landscape and environmental conditions. Since the early 1990s this focus has changed dramatically, initially with the work of the EFEO and then the addition of the Greater Angkor Project. As a result significant differences have become apparent between the textual evidence and the archaeological record in the dating of monuments, the history of urban development, the perspective on Angkor as an urban landscape, and our understanding of the demise of Angkor.

[294] *Peering into the Past Cape Vegetation during the Last Glacial Maximum Using Species Distribution Modelling and Dynamic Global Vegetation Modelling*

The Cape has a rich archaeological record that spans the Quaternary. Understanding shifts and changes of vegetation across this landscape will help to contextualize this record and understand the prehistoric resource paleoscape. In order to do this we couple high-resolution regionally downscaled climate simulations of the Last Glacial Maximum, landscape features (e.g. geology, aspect, slope) and two different approaches to modelling vegetation: species distribution modelling (SDM) and dynamic global vegetation modelling (DGVM). In this talk, we cover the reasons for using a multi-pronged approach to vegetation modelling and, more importantly, what vegetation do the models predict for the southern Cape coast during the Last Glacial Maximum. The predictions are compared between approaches and with existing paleoarchives. In addition, we utilize these modelled vegetation changes to test hypotheses regarding the resource paleoscape for early humans; such as the hypothesis that the abundance of heat-treated silcrete in the archaeological record is linked to the availability of fuel-wood.

[295] *Vision and Revision in the Use of Residential and Non-Residential Space at Middle Preclassic Maya Sites: A View from Pacbitun, Belize*

Most Maya archaeologists never take advantage of excavating into plazas. The perception might be that there isn't much information other than recovering artifacts to date successive constructive phases associated with the buildings they are investigating along the edges of the plaza. Over the years, some archaeologists have seen the utility of this approach — one that emphasizes locating early Maya buildings, even entire communities — beneath plaza surfaces in site centers. The amount of data can significantly impact one's understanding of site formation and development. Without investigating plaza architecture how does an archaeologist know the complete construction sequence for any site center? For example, temples are a constant feature of ancient Maya societies, yet their origins remain somewhat obscure. Where are the earliest temples located on a Maya site? Are their Classic period counterparts always built directly over top of them? Are temples ever completely buried beneath plaza surfaces? If so, why? Where are early temples found in relation to residences, whether they are elite or commoner? These questions and others are being addressed at Pacbitun where we are investigating why spot X as opposed to spot Y, and comparing our results with other in the Belize Valley and beyond.

Pozorski, Thomas (University of Texas-Pan American)

[66] *Ritual Hearth Structures at the Casma Valley Site of Huerequeque: Making a Case for Highland/Coastal Interaction in Initial Period (2100-1000 B.C.E.) Peru*

Recent excavations at the site of Huerequeque, some 24 km inland at an altitude of 450 m, exposed several large and elaborate hearths, including three ventilated examples. While hearths for cooking and warmth are very common within residential architecture at Huerequeque, these special hearths are consistently associated with non-domestic architecture. One example occupies the center of an intermediate-sized mound structure adjacent to the main platform mound at the site where it served as a likely focal point for congregation, feasting, and ritual by selected individuals. Among the other examples, one is especially reminiscent of highland-style Mito hearths, suggesting that Huerequeque's mid-valley location facilitated communication between the highlands and the lower-valley sites of the Sechin Alto Polity which likely established and controlled Huerequeque as an outpost. Insights gained from the study of special hearths at Huerequeque also help us to

understand the presence and seemingly late occurrence of ventilated hearth structures at down-valley sites and coastal sites during the Initial Period.

[408] *El Mirador Mapping Program 2003-2015: Investigation of an Ancient Maya City with Total Station, Remote Sensing, and Gis*

The ancient city of El Mirador is surrounded by subsidiary centers forming a state level organization indicated by a strong sociopolitical organization developed during the Preclassic period. This paper illustrates the results of Total Station mapping, Remote Sensing, Global Positioning Systems, and GIS applications in archaeological investigations at El Mirador conducted by the Mirador Basin Project over a 12 year period and covering approximately 50 km². This program initiated a comprehensive survey and mapping program designed to document all mounds and features associated with El Mirador, including the causeway network, definition of bajos and vegetation changes. An inductive predictive modeling approach was used to identify areas of high archaeological potential such as residential suburbs, intensive agriculture areas and hydraulic systems, among others, pending LIDAR data from the upcoming year conducted by the Mirador Basin Project. From these data several maps of the region have been derived which is used to identify the relationship of settlement with environmental resources.

[416] *Archaeology of San Francisco Jews*

Archaeological collections from San Francisco's South-of-Market area speak to the lives of 19th century Jews. We take the position that archaeology can help us understand the effects of the *haskalah* (the Jewish "enlightenment") on European immigrants' efforts to divest themselves of their sociological ambivalence. In this way, archaeology can help illuminate one of the most enduring and controversial issues in contemporary Jewish studies: the relationship between identity and religious practice.

[46] *Laying the Foundations: A Unique Inka Construction Technique in the Northern Ecuadorian Highlands*

While Inka architecture is occasionally discussed as if it were a unified corpus of building styles, regional variation is great, with the Inka frequently adopting local techniques. Recent excavations in northern Ecuador have uncovered examples of a little documented Inka foundation style found at several sites in the region. At Hacienda Guachalá, where local legends maintain that the hacienda chapel, reportedly one of the oldest in Ecuador, was built atop an Inka temple, the early colonial walls are underlain by an earthen platform that is bolstered by rocks. Only present under the oldest part of the Guachalá chapel, this massive earthen foundation matches an unfinished Inka foundation excavated in recent years at San Agustin de Callo where it is thought to be among the last constructions at the site, perhaps abandoned as the Spanish were moving northward towards Quito. Unlike more common Inka wall construction styles, which use finely packed sediments as dry

mortars, the Callo-Guachalá foundation style, which is markedly layered, seems to have utilized wet-lain sediments, unlike other Inka or Spanish colonial foundations. While its origins are vague, the style suggests that the Inka continued to evolve technologically even as their empire was falling apart around them.

[50] *Land Degradation at Betty's Hope Historical Plantation, Antigua*

The islands of the British West Indies in the eastern Caribbean have been subjected to continuous sugarcane farming since the 17th century. Current land degradation in Antigua has been attributed to centuries of intensive monocropping. However, recent scholarly discussion of the concept of *landesque* capital challenges the idea that long-term cultivation is a main driver of landscape degradation. The Betty's Hope plantation on Antigua operated from 1651-1944 and currently faces problems of land degradation, primarily in the form of soil erosion. This research creates an EPIC (Erosion Potential Impact Calculator) simulation of soil erosion and productivity at the Betty's Hope plantation, and tests the model with ethnohistorical and geoarchaeological data about the plantation's crop yield and landscape degradation. This study evaluates the simulated trajectory of landscape change using ethnohistorical information about the plantation's agricultural yield and a geoarchaeological analysis of the regional landscape. By determining the unique combination of continuous human and environmental changes over the past 300 years, this research contributes to the understanding of how certain practices impact the landscape over time.

[52] *Application of Object-based Image Analysis of High Resolution Imagery to Identify Archaeological Features on Rapa Nui (Easter Island, Chile)*

Object-based image analysis provides a powerful tool for using remote sensing data as a means of identifying archaeological features. Object-based image analysis has multiple advantages over pixel and spectral based tools, because it isolates features in image data based on a combination of spatial, spectral, and geometric characteristics. Using high spatial and spectral resolution imagery available for Rapa Nui (Easter Island, Chile) and the Trimble eCognition software package, we explore how object-based image analysis can be used to identify and extract two classes of archaeological features: circular stone walled gardens known as *manavai*, and rectangular stone platforms known as *ahu*. The results of our study demonstrate how remote sensing imagery can improve upon traditional pedestrian surveys and create a systematic and comprehensive survey of archaeological features for Rapa Nui.

[351] *Missing Bodies and Cat Skeletons: New Perspectives on Ritual in Viking Age Iceland*

The research that has dominated Icelandic burial practices has until very recently been quite narrow. Burials were excavated to extract the skeleton and artifacts within the grave cut itself, leading to a central theory that Icelandic burials are poor in ritual and culture. Recent excavation and theories, however, have led to open area excavations of pagan cemeteries, which reveal much more complicated ritual. Snorri Sturlusson, the author of the famous Icelandic Sagas and Eddas, might give us some clues as to what these newly discovered rituals might have been. How much did Snorri know about his ancestors and what does that mean for Viking Age Icelandic identity?

[191] *Mobility and Cultural Diversity in Central-Place Foragers: Implications for the Emergence of Modern Human Behavior*

Although anthropologists have long recognized the importance of mobility to hunter-gatherer subsistence strategies, it remains unclear how mobility affects cultural diversity in subdivided populations. A better understanding of how mobility affects both total diversity and regional differentiation in selectively neutral cultural traits may provide us with an additional line of evidence for explaining the appearance of archaeological indicators of modern human behavior. Here, I introduce a spatially explicit central-place foraging model to investigate how length of the effective foraging radius affects the effective size of a metapopulation composed of central-place foraging groups. Simulation results show emphasizing logistical mobility over residential mobility often inhibits intergroup interaction, which in turn increases the effective size of a subdivided population. Considered within the context of Sewall Wright's work on the effects of isolation by distance, the findings have interesting implications not only for neutral cultural diversity at the level of the metapopulation but also for cultural differentiation between foraging groups. To the extent that we are able to identify shifts in hominin mobility strategies in the Paleolithic archaeological record, the findings of this study may help us better understand and explain the appearance of modern human behavior.

[312] *The Ancient Floors of Housepit 54, Bridge River Site: Stratigraphy and Dating*

The Bridge River Archaeological Project is a long-term partnership between The University of Montana and X'wisten, the Bridge River Indian Band. The focus of the project is on understanding the historical development of this large housepit village, located near Lillooet, British Columbia. Previous research has emphasized village-wide demographic, technological, and socio-economic and political change during the Bridge River 2 (1600-1300 cal. B.P.), 3 (1300-1000 cal. B.P.), and 4 (post 600 cal. B.P.) periods. With support from the National Endowment for the Humanities, excavations conducted from 2012 to 2014 focused on a remarkable occupation sequence from a single house. Housepit 54 contains an estimated 15 superimposed anthropogenic floors, each with extensive primary evidence for household activities. Dating to the BR 2 through 4 periods, these contexts provide us with abundant opportunities to examine change and continuity in household occupation patterns during these times. In this poster, we introduce the ancient floors (BR 2 and 3 periods) of Housepit 54 with a focus on stratigraphic resolution and radiocarbon dating. The poster also serves as an introduction to the poster symposium.

[268] *Late Archaic Plant Remains from the Québec City Area (Canada)*

It is more and more recognized that mobile hunter-gatherers can have a significant impact on their environment. In the Northeast, one of the traits of the Late Archaic period is the intense consumption of nuts and acorns and possible management of this key resource to increase its productivity. The botanical macro-remains recovered at the site of côte Rouge, located near Québec City, indicate that butternuts and hazelnuts were indeed consumed but their low densities in the archaeological record cannot support the idea of an intense use. Because these nuts, along with many other species of berries, are shade-intolerant, their presence at côte Rouge indicates some openings in the forest canopy. Repeated seasonal stays could have caused disturbance that favored the growth of these useful plants. However, these observations contrast with the wood charcoal data from the same contexts that revealed mostly trees characteristic of shady climax forests. These results seem to suggest that disturbance was subtle and that prolonged occupation did not limit the access to high quality firewood. Preliminary results of starch and pollen analyses will also be discussed in this paper.

[57] *Pirates of the North Sea? The Viking Ship as Political Space*

The contextualized meaning of specifically 'Viking' identities, in relation to the general population of early medieval Scandinavia, is a topic of perennial debate. Who were the Viking raiders, how did they see themselves, and how did others see them? How did our artificial construct of 'the Viking Age' actually begin? A key concept in unravelling these problems may be what the Vikings' much later successors, the pirates of the so-called Golden Age, called "the new government of the ship". Over the last two decades, influential work on these pirate communities has recast them as radical actors and social revolutionaries, subverting political norms among state-based societies to create a new and freer maritime identity for themselves and others on the margins. More recent studies have retreated from this vision of political enfranchisement and instead re-emphasized the rational pursuit of self-interest and profit under the cloak of controlled anarchy. All this research can be usefully applied to the Viking Age, not by a direct transfer of paradigms but as a lens through which to view the archaeology of the period afresh, and to shape new models of agency and influence.

[397] *Following the Herd: Isotopic Access to Faunal Commodity Chains in LBA Mycenae, Greece*

This paper explores variation in the management and distribution of faunal resources recovered from disparate socio-economic spheres of consumption at the palatial settlement of Mycenae, Greece, during the Late Bronze Age (1600-1100 B.C.). It has long been acknowledged that early state economies comprise multiscalar, intertwining spheres of economic activity. Mechanisms driving these spheres of interaction are predicated on the modalities of exchange which connected nodes of production and consumption. Commodity chain analyses of exploited goods offers one effective method to model how socio-political systems of production and consumption and exchange networks were interconnected. Fauna are versatile and ubiquitous, operating at all levels of economic exchange and social hierarchical divisions. As fauna are purposefully managed with their consumption in mind, faunal commodity chains comprise their life history. Management practices, in turn, are recorded in the biological tissues of exploited fauna. Isotope ratios (Pb, Sr, O) allow us to "follow the materials" by tracing individual life histories of exploited fauna. We present new isotopic

faunal and baseline data to demonstrate how isotope ratios can track commodity chains of faunal resources to assist in the identification of distinct faunal economies within a larger socio-political network using management and distribution practices as a proxy.

Price Steinbrecher, Barry (University of Arizona) and Paul Tosa (Pueblo of Jemez)

[239] *Jemez Oral Traditions and Ancestral Landscapes*

Ethnographic research with cultural advisors and research partners from the Pueblo of Jemez on fire ecology, use of plant resources, and landscape within the Jemez Mountains in northern New Mexico reveals significant ongoing connections to Jemez ancestral places. The ancestral places within the Jemez Province that archaeologists define primarily through the distribution of Jemez Black-on-white ceramics, which dates between approximately A.D. 1250 to A.D. 1750, reflect an intensively occupied locus within a vast cultural landscape. The oral traditions among the community at the Pueblo of Jemez encode historical information, commemorate significant events, and provide geographical context for historic land use from time immemorial. The network of Jemez ancestral places, which can be conceived of as a “footprint”, illustrates a high degree of mobility among Jemez ancestors. We examine defining elements of a Jemez ancestral landscape, draw comparisons with archaeologically defined cultural areas, and consider the continued role of cultural landscapes within contemporary tribal society and traditions.

[404] *La Poza de Huanchaco: A Late Early Horizon – Early Intermediate Period Fishing Community: Social and Material Culture Interactions between Salinar and Gallinazo*

La Poza has been excavated since 1965. Today is one of the most intensive sites that have been studied in the Moche valley but at the same time is perhaps the most damaged by modern urban growth. The recent excavations carried out at the site, using the test pitting technique have uncovered principally a Salinar and Gallinazo occupations. Human burials and domestic contexts with complete ceramic vessels are the most common findings in this site. The dense deposits provided a great collection of ceramic sherds, plants and abundant faunal remains. More important, six radiocarbon dates taken from secure contexts are available and allowed to place these materials in an absolute sequence, linking these occupations with the rest of the Prehispanic occupations in the Moche Valley. In this paper I will present preliminary results and some thoughts about the Salinar and Gallinazo interactions during the end of the Late Early Horizon and the beginnings of the Early Intermediate Period.

Pritchard, Erin (Tennessee Valley Authority), Johannes Loubser (Stratum Unlimited, LLC), Jan Simek (University of Tennessee, Knoxville) and L Mashburn (University of Alabama, Tuscaloosa)

[353] *Tennessee Valley Authority Conservation and Management Initiatives at Painted Bluff, Alabama*

Located in northeastern Alabama, Painted Bluff contains motifs similar to ones found on Mississippian ceremonial objects, and an associated charred river cane dating to between A.D. 1300 and 1440. Approximately 80 images were recorded on the limestone cliffs of the bluff, most of which are red ocher paintings, a few with yellow pigment, one containing white, and at least three separate thinly-plastered surfaces with fine-line incisions. Following initial recording of the site by Simek, Cressler, and Hermann, Pritchard from the TVA decided to pro-actively conserve and manage the painted site with public visitation in mind. In consultation with relevant Native American Indian groups, Pritchard launched a condition assessment, graffiti removal and camouflage session, and thorough graphic recording of the site with the aim of opening and interpreting a selected portion to the public, with the aid of a boardwalk and interpretive infrastructure.

Prociuk, Nadya (University of Texas at Austin)

[417] *Marking Your Place: Exploring the Symbolic Communication of Identity in the Castro Culture of North-Western Portugal during the Bronze and Iron Ages*

How did the people of the Castro Culture of north-western Iberia use symbols to convey meaning and identity during the Late Bronze and Iron Ages? The repeated inscription of symbolic motifs on a variety of material mediums suggests that the role of symbols was more than merely decorative for the Castro people, and the literature is curiously silent regarding the social implications of these motifs. In this paper I will present the results of this research, and argue that the people of the Castro Culture utilized repetitive and recognizable symbolic motifs to assert facets of their identities by inscribing the everyday materials of their lives with symbols that communicated to themselves and others who they were, and their place in the world. The research is based on a newly developed motif typology and database recording the context, frequency, association and presence/absence of each motif as it appears in the ceramic collections from six Castro sites. I have also surveyed museum collections and the published literature for instances of motifs appearing on domestic and communal architecture, and on items of personal adornment.

[355] *Subadult human sacrifices in Midnight Terror Cave*

Children throughout Mesoamerica were preferred sacrificial victims, especially to water deities. Because caves were associated with rain, ethnohistoric sources mention the sacrifice of children in caves. The importance of children in sacrifice was documented early on by Edward Thompson's dredging of the Cenote of Sacrifice at Chichen Itza. More recently archaeological investigations of caves have recovered have recorded the skeletal remains of children that have been interpreted as sacrificial victims. This paper reports on the juvenile skeletal assemblage from Midnight Terror Cave with an eye toward refining our understanding of the age at death with this large sample. Attempts will also be made to determine method of sacrifice.

[288] *IHOPE Maya: Linking Lessons of the Past to Our Present and Future*

Since 2007 the IHOPE Maya team has focused on synthesizing dynamic human-environmental interactions of the ancient Maya of southeastern Mexico and upper Central America (400B.C.-900 A.D.). A series of great tropical societies, the Maya occupied a diverse range of tropical environments, adapting local strategies to meet varied subsistence, economic, political, and ecosystem service needs at large and small urban centers. Cycles of expanding populations, increasing despotism, and reliance on long-distance trade to support statecraft and domestic life characterize a millennium of development. By the 9th century A.D., downward pressures on fragile tropical resources combined with increasing climate variability introduced uncertainties at a time of maximum populations, intensifying warfare, and multi-decadal droughts. Though differing responses across the geopolitical landscape reflect the resilience and rigidity of highly networked polities, within 150 years the political and economic systems of the Classic Maya had disintegrated. IHOPE Maya recognizes the stark similarities to the challenges confronting our current global developmental trajectories, and the applicability of these data to modern issues. Linking the past to the present allows us to explore human decision-making and its consequences for the future of our humanity that is now facing similar challenges to those of the past.

Jones (University of Cambridge)**[345]** *Human Dispersal or Environmental Selection? Using Genetics to Decode Diversity in Millet Landraces across Eurasia*

Eurasian millets (genera *Panicum* and *Setaria*) are amongst the world's oldest cereal crops, with evidence of cultivation in China from 10,000 years cal BP. Archaeobotanical evidence also indicates the presence of domesticated millet in Europe as early as 7,000 years cal BP. New archaeological evidence coming to light suggests that these important staple food crops were part of a 'Trans-Eurasian exchange' during prehistory. Traditional cultivars, or 'landraces,' of millet have been preserved in living seed collections from across their past cultivation ranges. Phenotypic analyses of these landraces have demonstrated high diversity in traits pertaining to plant architecture, grain quality and flowering time. Applying several different genetic techniques to DNA obtained from these landraces, we have been able to paint a picture of molecular diversity and population structuring across the millets' geographic ranges. Diversity in the environmentally significant adaptive trait of flowering time has a particularly interesting genetic basis in *Setaria*. This will be discussed in the context of human routes of migration and the effect that new climatic conditions would have exerted on the crop plant as it was transferred to different environments.

Przystupa, Paulina**[7]** *Idyllic Childhood or Practical Placement: Examining Children's Homes Using GIS, Remote Sensing, and Landscape Archaeology*

The late 19th century represents a turning point in Western beliefs about childhood. These new cultural beliefs redefined childhood as an innocent stage in the human life cycle and encouraged particular environments for raising children. Rural areas encouraged learning and exercise, sheltering children from the dangers of the polluted urban environment. However, this ideology contradicted the economic realities of the late 19th century. Other archaeologists have examined this tension between the ideology and reality of childhood during this time by examining artifacts excavated from household contexts. Interestingly, children's homes, which increased in use during this time and cared for children whose parents could not, have rarely been investigated. This poster examines how closely children's homes were able to adhere to this new concept of childhood by using landscape archaeology theory, GIS, and remote sensing to investigate America's historical children's homes within their environmental and anthropogenic context. Since humans alter their landscape to reflect their culture, I hypothesize that institutions built earlier will be placed in environments that embodied the practical nature of children's homes, while later children's homes will choose landscapes that reflect this new ideology of childhood.

Puckett, Neil (Texas A&M CSFA)**[243]** *Underwater Geoarchaeology of Perennial Lakes in the Great Basin*

Underwater archaeology in the Great Basin has been generally ignored because underwater researchers often do not associate this desert with inundated environments. Despite this misconception, many large lakes, marshlands, and rivers are found throughout the region. For instance, northern Nevada includes 168 sizable man-made perennial reservoirs that partially or completely cover 188 known sites. In addition, during the late Pleistocene large lakes of fluctuating size covered many of the valleys across the Great Basin. Though most are now dry, a select number of natural lakes remain that have been neglected with respect to underwater archaeology. Research in and around three of these, Malheur Lake, Eagle Lake, and Walker Lake, began in the summer of 2014. Terrestrial and underwater survey, cores, and cutbank stratigraphy reveal the potential for buried site preservation within and around these lakes. These data also allow for predictive modeling of site locations and thus a controlled subsurface testing program. Since most open air sites in the Great Basin are found in surface context, identifying buried sites around these lakes has the potential to vastly improve our understanding of temporal changes in adaptive land use around Great Basin lakes.

Pugh, Timothy, Prudence Rice (Southern Illinois University at Carbondale) and Evelyn Chan (CUDEP)

[219] *An Orthogonal Grid at Nixtun-Ch'ich', Petén, Guatemala*

Nixtun-Ch'ich' is a large archaeological site on the western edge of Lake Petén Itza in Petén, Guatemala. Recent remapping of the site revealed that its architecture was largely organized by an orthogonal grid. While most Maya sites exhibit some degree of urban planning, the organization of sakbes (roads) into an orthogonal grid has not been described elsewhere in the Maya world. The grid seems to have developed at Nixtun-Ch'ich' in the Late Preclassic period. It is not yet known whether it developed independently or whether its designers were influenced by interactions with Central Mexico. It is likely that that planning and construction of the grid were centrally organized, which would have required a great deal of political power.

[326] *Sol de Campinas Site and the Cultural Variability in Southwestern Amazon: Moundbuilders and Archaeological Earthworks in Acre State – Brazil*

The central area of Sol de Campinas site is composed of fifteen mounds, dispersed in an elliptic arch surrounding a plaza with an area of almost 15 m². The site is geographically related to other earthworks of southwestern Amazon known as geoglyphs in the Brazilian states of Acre, Rondonia and Amazonas. Although it shows similar attributes to other places in the region, such as its geometrical forms and "roads" structured from the peripheral portions of the site, its main structures are composed of 3 meters high mounds and not of ditches and embankments as frequently seen in other sites. At this presentation we intend to show how the excavation of sites like Sol the Campinas can be used to study the function of the archaeological earthworks in the region. Showing a well preserved stratigraphy the excavation of the mounds contributed to the understanding of the formation of the earthworks and the results brought a new light to the emergence of cultural complexity at southwestern Amazon river basin.

[48] *Revealed by Flames: Modeling Site Distribution in Arizona's White Mountains after the Wallow Fire*

EcoPlan Associates developed a site spatial density model for, and in partnership with, the Apache-Sitgreaves National Forests (ASNF). In 2011, the Wallow Fire started in the Bear Wallow Wilderness in the White Mountains of East Central Arizona, eventually burning over 538,000 acres within 840 square miles of Arizona and New Mexico. Four contractors and ASNF inventoried 63,424 acres in various portions of the burned area after the fire, much of it at high elevation. Unexpectedly, the surveys identified 136 sites concentrated within a few small areas; yet, most of the post-fire survey areas were devoid of any cultural resources, including isolated occurrences. The unusual bimodal site distribution was not accounted for in the model, particularly the presence of communities of Reserve/Tularosa phase Mogollon habitations above 8,000 feet elevation. Analysis of the model in light of the Wallow Fire findings suggests that Douglas Fir forest does not provide an appropriate proxy for high elevations, and that high elevation projects were underrepresented in building the model. Larger block surveys more closely approximated the modeled site distribution than did smaller and linear projects.

[300] *Out of Ice: A Review of Greater Yellowstone Area Ice Patch Hunting Technology*

While the unique plant and animal communities of the alpine are of clear ethnohistorical and modern significance to the indigenous communities of the Greater Yellowstone Area (GYA), no histories regarding the use of ice patches have been identified. Information sharing with tribal groups and the public regarding the nature of ice patches, including the technical analysis of recovered materials, fosters understanding of and appreciation for these endangered features. This paper focuses on the technical analysis of wooden shafts recovered at five ice patch sites in the GYA relative to other organic hunting implements from the region. Foreshafts and darts are primarily made of birch (*Betula* sp.), but willow (*Salix* sp.) and spruce (*Picea* sp.) were also used. One presumed arrow shaft is made of pine (*Pinus* sp.). Structural and physical characteristics of birch, spruce, and pine wood make them excellent choices for this type of use.

Putt, Shelby [122] see Dellopoulos, Emma

Putt, Shelby (University of Iowa)**[122]** *The Origins of Stone Tool Reduction and the Transition to Knapping: An Experimental Approach*

There is now a general consensus that the earliest Oldowan artifacts were made by skilled toolmakers with a clear understanding of the fracturing mechanics of different toolstone materials, thus leading several researchers to propose a simpler lithic reduction stage that occurred prior to 2.6 Ma. Three reduction techniques that are within the behavioral repertoire of the genus *Pan* are proposed as potential intermediate stages between the percussion behaviors of the LCA of chimpanzees and humans and the skilled knapping of the Oldowan toolmakers. These include direct and indirect projectile percussion and bipolar flaking techniques. To better understand some of the factors that influenced how early hominins obtained sharp flake tools, measures of productivity, expediency, and efficiency were obtained and compared between these three reduction techniques and novice knapping. The results of this experiment indicate that dropping or throwing a large hammerstone on a brittle core is the most efficient way to exploit a core, while bipolar flaking is the most expedient method; however, novice knapping creates the most productive flakes with large, sharp cutting edges. Thus, the transition to knapping in the late Pliocene may have been due to a shifting emphasis on productive toolmaking over expediency or efficiency.

Puzachenko, Andrey Y. [74] see Van Kolfshoten, Thijs

Pyburn, Anne (Indiana University)**[147]** *The Same, but Different*

Variations in the architecture, settlement patterns, local environmental context, and occupational history of Maya archaeological sites are difficult to assess. Which differences are culturally meaningful? Which similarities indicate social relationships, and if so, what sort of relationships? Which differences are simply a result of local climate and available building materials? In this paper I will examine some of the similarities and differences among the three Maya sites in North-Central Belize where I have done research: Chau Hiix, Albion Island, and Nohmul. This comparison will shed light on the value of regional analysis.

[236] *Discussant***Pye, Jeremy (Cultural Resource Analysts, Inc.)****[204]** *Laboratory Techniques for the Detection of Human Parasites in Archaeological Samples.*

Parasites have had a significant impact on the course of human history. Activities of a variety of parasites throughout the world can lead to lethargy, dementia, malabsorption of nutrients, bowel obstruction, internal bleeding, blindness, physical disability and deformation, and many other symptoms of disease. Furthermore, parasites have caused the deaths of countless individuals, have resulted in the abandonment of settlements, and have even affected the outcome of wars. The effect that parasitic illness has had on people worldwide is a hot topic in fields like medical anthropology. It is curious, therefore, that archaeologists have paid relatively little attention to looking for evidence of parasites in archaeological samples. This poster explores a variety of laboratory techniques that can be used to identify evidence of parasites in samples that can be collected from archaeological contexts. Perhaps once more archaeologists are aware of the importance of archaeoparasitological testing, we can make more informed interpretations of past population health, as it relates to parasitic disease.

Qin, XiaoLi**[37]** *Turquoise Ornaments and Inlays Technology in Qijia Culture -- A Comparative Study of Qijia Culture and Erlitou Culture*

Most turquoise ornaments from early Neolithic sites are pendants with a single material. However, from the later Neolithic period such as Qijia culture, people started to use ornaments which were inlaid with turquoise and other materials by unique techniques. In early Bronze Age, turquoise

production process, especially the inlays technology, reached its peak. From a Qijia culture site, we found a bone hairpin. On its tail part, small white bone rings were sticking on black jelly. From Majiayao culture site, we found 12 bracelets bone plates of the same length, which were stuck on black jelly. From later Qijia culture site, ceramic inlayed with turquoise have been found. Meanwhile from Erlitou site, archaeologists found a large dragon-shaped turquoise painting, variety animal-shaped turquoise decorations, and turquoise workshops. In this paper, I will compare the turquoise products in Qijia culture and Erlitou culture, then try to understand the importance of turquoise products in early dynastic formation process by analyzing the following topics: the technological evolution, the combination of composite materials, the usage of adhesive, and the production process of this type of ornament.

[283] *A Geoarchaeological Investigation of Ancient Agricultural Fields at Sanyangzhuang Site, Henan Province, China*

Over the last 10,000 years, agriculture has gradually replaced hunting and gathering, and become the dominant food resource. Because of their extreme importance agricultural issues have attracted much academic attention; a wide variety of new perspectives and understandings, especially concerning agricultural origins, have been gained in the past few decades. However, there is a huge intellectual gap between the extensive agriculture soon after the earliest domestication and intensive agriculture practiced by early states. How was the gap bridged? What resources were invested to intensify food production? Questions concerning agricultural intensification have been attracting but also puzzling anthropologists and archaeologists for a long time. Field management technique is one of the most significant aspects of agricultural intensification. This paper presents the result of the geoarchaeological surveys at the Sanyangzhuang site in recent years, and explores the development of the field management techniques on the basis of micromorphological and geochemical analyses of soil samples from the site. Plowing, manuring, and irrigation are focused. By doing that, the outline of the trajectory of agricultural intensification from the late Neolithic Age to the early Iron Age in the local scale will be depicted.

Qualls, Catherine and Leslie Drane (Glenn A. Black Laboratory Of Archaeology- Indiana)

[359] *The Creation of a Comparative Resource for 1000 B.C.E. – 1600 C.E. Indiana Ceramics*

This poster explains the work being conducted for the creation of a booklet about Indiana (and likely surrounding states) ceramic types and varieties from approximately 1000 B.C.E. – 1600 C.E. We anticipate this booklet being utilized as a field guide and a comparative resource for those studying precolumbian people in the area. Because archaeologists so often encounter unfamiliar types and hybrid ceramic formations, this resource could be extremely beneficial for any researchers studying Midwestern people. Using the collections at the Glenn A. Black Laboratory at Indiana University, Bloomington, we are producing a guide that will contain photographs of each ceramic type with a detailed report on variety of the type, as well as a list of examples located at the lab. Ultimately, this project will end in the production of a comparative resource on Indiana ceramics, as well as a revision and inventory of the ceramic type collections held at the Glenn A. Black Laboratory. Our poster explores the process of creating this guide, the benefits it will provide researchers, and the future, collaborative advances we hope to accomplish.

[404] *Linking Chronology, Culture History, and Culture Process in Moche Studies.*

Revised chronologies affect our interpretations of cultural phenomena more than vice versa. This paper explores these issues in relation to the Moche. New dates suggest that the Moche phenomenon occurred later and ended later than previously thought and this is linked to a number of key issues in Andean culture history. The collapse of the Larco ceramic sequence is linked to the undermining of the concept of the Moche state and affects our concept of "Moche," in general. Particular attention will be focused on the relations between the dual temples at Huacas de Moche and El Brujo, a case study that provides some of the most detailed information currently available for examining chronology, culture history, and culture processes.

Quinlan, Angus (Nevada Rock Art Foundation)

[352] *Exploring Nevada Rock Art as a Social Landscape*

Approximately 1,500 rock art sites that broadly span the Archaic have been identified in Nevada. Regional and temporal differences in site structure, rock art styles, landscape settings, and associated archaeological contexts are discernible in these data, offering insights into Great Basin culture history and the categorization of the environment as a social landscape by prehistoric populations. Traditional approaches to Nevada rock art have often emphasized interpretation at the expense of explanation, seeking rock art's cultural significance or "meaning" in subjective considerations of its imagery. As Nevada rock art marks only a small percentage of the landscapes prehistoric populations are known to have used, I argue that understanding what made these locations appropriate places to be marked by rock art is a research theme that can address mainstream archaeological interests in describing the structure of past landscape use. Relating Nevada's rock art to the physical environment and settlement patterns provides information about the structure and properties of special places in the landscape, and illustrates that the use of culturally significant places was a consideration in residential mobility strategies.

[54] *Decoupling Decoration and Dates: A New Absolute Chronology for the Transylvanian Middle Bronze Age*

Metal from southwest Transylvania fueled the development of inequality and regional polities across Eastern Europe during the Bronze Age. However, little is known about the communities in the resource-rich region. Through regional survey, test excavation, and digitization of existing collections, the Bronze Age Transylvania Survey (BATS) Project seeks to understand the long-term dynamics of social organization throughout the Middle Bronze Age in southwest Transylvania (2000-1400 B.C.). A robust chronology is critical to monitoring contemporaneous variability across the region and change through time in social, political, and economic organization. However, current models for the structure and dynamics of Bronze Age communities in Transylvania are based on a previously untested relative dating system based on ceramic seriation. In this poster, I present a new radiocarbon-based chronology for the Middle Bronze Age. These new dates challenge our understanding of the social significance of ceramic decoration as well as the long-term dynamics of

social complexity in Bronze Age societies.

[370] *General Taphonomy and Diagenesis of a Submerged Pleistocene Skeleton from the Cenote of Hoyo Negro, Tulum, Quintana Roo, Mexico: Preliminary Results*

This paper examines the macroscopic taphonomy and the diagenesis of a partially lifted preceramic skeleton of a female juvenile (called "Naia"), dated approximately between 13,000 and 12,000 yrs. AP. Naia was recovered at 41 meters below sea level in a submerged karstic cave. Despite the good general preservation of Naia's remains, the bone segments are brittle, showing changes attributable to time, weathering, changing salinity and micro-organisms. The external bone layer is only loosely attached to the subjacent bony core. Our present research aims to understand the fluctuating postmortem conditions of Naia, to prospect the analytical possibilities for conducting molecular research, and assisting mid and long term stabilization measures of the dental and bony remains. The study combines macroscopic taphonomy with X-Ray Diffraction Raman Spectroscopy, SEM, histology of undecalcified bone, and ICP analyses of associated water and sediments. Our results show diagenetic substitution of the inorganic substrate with exogenous calcareous minerals and moderate preservation of histological structure. This study was financed by the Subdirección de Arqueología Subacuática of the Instituto Nacional de Antropología e Historia, CONACYT-152105 (2012-2015), the Laboratorio Nacional de Nano y Biotecnología (FOMIX LAB-108160, CONACyT-123913).

[154] *A Social Topography of Fishing: Exploring the Spatial Variability of Fish Consumption Practices at Songo Mnara*

In the Swahili towns of the East African coast, fish have contributed a major source of protein consumed by coastal inhabitants, but the role of fish consumption in the construction of social meaning is rarely discussed. This paper addresses this gap by exploring spatial differences in fish consumption strategies around Songo Mnara, a fifteenth -sixteenth century Swahili town in the Kilwa Archipelago, and links them to social patterns visible in the organization of the town. The spatial distribution of discarded fish and other animal remains shows variability in the relative frequency, taxonomical composition, and estimated size of fish, indicating that food consumption practices varied across different socially-defined spaces around Songo Mnara. Inhabitants in a non-elite area of the town relied more heavily than their elite counterparts on the consumption of fish rather than domesticated animals; the elite also consumed larger fish and more outer reef fish compared to their non-elite neighbors. More than reflections of the socio-economic status of their consumers, these differences in fish consumption could indicate processes through which people constructed and reinforced social status, such as through access to particular tools and forms of consumption that connected them to the Indian Ocean trading network.

Quintus, Seth (University of Auckland) and Jeffrey Clark (North Dakota State University)

[233] *Examining The Temporal Scale of Human-Environmental Relationships on Ofu Island, Manu'a Group, American Samoa*

Pacific Islands have long been considered natural laboratories or model systems for the examination of human-environmental relationships. The impact of temporally variable environments on human populations is now well-documented throughout the Pacific, though questions remain on how the variable temporal scale of environmental change can modify the human response to these changes. An opportunity to address this question is presented by the cultural sequence of Ofu Island, a small

island in the Manu'a Group of the Samoan archipelago, in which the impact of both short-term environmental hazards and long-term landscape evolution is apparent. The reconfiguration of the coastline through the 1st millennium A.D. led to a transition in human settlement and subsistence patterns, eventually leading to permanent settlement in the island's interior uplands. The recurrence of quasi-predictable hurricanes, on the other hand, led to investment in infrastructure to mitigate the effects of hazards on the terrestrial food production system. The differential response to these environmental factors can be understood in terms of risk and uncertainty. Furthermore, the influence of coastal reconfiguration is significant on small islands such as Ofu, where marine regression modifies the ratio of shallow marine environments to terrestrial lowlands.

Raczek, Teresa (Kennesaw State University)

[292] *A Plethora of Possibilities: Evaluating Debitage from Large Habitation Mounds*

For the past few decades, the analysis of lithic production has incorporated an extensive consideration ofdebitage. While this work has been fruitful, the social and economic context of early habitation mounds presents a number of challenges todebitage analysis. Debitage can result from a number of activities beyond chipped tool production; as a result, researchers must carefully analyze broader economic and social activities in order to offset these challenges. This paper will present the analysis of lithics,debitage, and other related artifacts from a variety of sites in third millennium B.C. southeast Rajasthan in order to demonstrate how our analytical methods must be modified for early complex societies.

Radde, Hugh (California State University Northridge)

[27] *Understanding Island Tongva Villages: Results from the Catalina Island Museum's Toyon Collection*

The Catalina Island Museum (CIM) cares for the largest collection of Island Tongva (Gabrielino) artifacts in the world, the results of early expeditions, modern excavations as well as objects donated by Catalina Islanders. Opened in 1953, the Catalina Island Museum boasts a wealth of historic, archaeological, and archival materials that document life from the first islanders 8000 years ago to the present day, and strives to provide awareness and appreciation of the island's rich heritage through the use of research, exhibition and educational programs. However, most of the collection remains unstudied and unanalyzed and in some instances in the same paper bags that they were put in over 50 years ago. This presentation will discuss the importance of using legacy collections to understand Island Tongva lifeways and provide the results of one such collection from Toyon Bay, on Catalina Island, California.

[260] *Pattern Recognition and Automatic Feature Extraction in GIS*

Archaeological applications of geographic information systems and remote sensing technologies are becoming increasingly popular, especially in regard to site prospection and the geospatial analysis of cultural features. Utilizing aerial LiDAR and high-resolution satellite imagery of North Dakota, a training data set was used to define the boundaries and characteristics for certain morphological features of anthropogenic origin, which include mounds, earth lodge depressions, and fortification ditches. From this, a data mining algorithm was developed to adapt machine learning into an automated extraction program. This system was then tested on other data sets aimed at detecting similar, unrecorded features in the landscape, and verified in the field through ground truthing to determine accuracy. Implications for the successful development of this technology will allow archaeological investigators to review topography and locate specific anthropogenic features on the surface that can otherwise be difficult to distinguish in the field due to vegetation cover, terrain, or landowner permissions. Additionally, it could reduce the amount of time ground crews spend in the field and provide the researcher with site leads and an accurate model of feature distribution within a project area.

Radivojevic, Miljana (UCL Institute of Archaeology)**[89]** *Paint It Black: The Rise of Metallurgy in the Balkans*

This study integrates archaeological, microstructural and compositional data of c. 7000 years old metallurgical production evidence with an aim to address the how and why of the world's earliest metallurgy. The main focus is set on copper ores and metal production debris coming from four Vinča culture settlements in Serbia and Bosnia and Herzegovina, all dated between c. 5400 – 4400 B.C. Chemical study of copper minerals throughout all sites points at striking uniformity in selecting black and green minerals for metal extraction, some of which predate smelting events at c. 5000 B.C. Microstructural examination of metal production debris showed convincing technological similarity throughout c. six centuries of copper making in studied sites. It is argued that black and green ores were intentionally selected as ingredients for the metal smelting 'recipe' in the early stages of Balkan metallurgy based on the knowledge related to their appealing visual aspects. This finding demonstrates a unique technological trajectory for the evolution of metallurgy in this part of the world and illustrates the capacity that materials science carries in addressing the how and why of the emergence of metallurgy, and outlines methodology for future studies of early metallurgies worldwide.

Radivojevic, Miljana [89] see Amicone, Silvia

Radovanovic, Ivana (University of Kansas)**[74]** *Correlating Climate Change and Archaeological Record in the Iron Gates Mesolithic*

Material culture record from the Danube Iron Gates Mesolithic reflects a variety of hunter-gatherer adaptive strategies, including shifts in foraging methods, changes in preferential choices for the raw material extraction, and a variable use of the same locations for residential and/or aggregation camps covering over five millennia. Archaeological debates however remained focused mainly on a few hundred years of the local hunter-gatherers' interaction with the incoming food producers during the Final Mesolithic. Recent geoarchaeological and archaeological survey of Mesolithic sites beyond the Danube Gorges in tandem with building a finer resolution record of the climate oscillations on the local and regional scale (AMS dating and stable isotope analyses), provides a possibility to explore a fuller context of the Iron Gates Mesolithic settlement and establish if there is a chronological correspondence between the late Pleistocene and early Holocene climate oscillations and the archaeological record.

[40] *Chair***Radovic, Marija (University of Belgrade) and Kevan Edinborough (University College London)****[89]** *Teeth As Tools: Paramasticatory Dental Modifications Reflecting Habitual Behavior in the Danube Gorges, Serbia (9500 - 5500 B.C.)*

Technological knowledge and task-related activities of past populations are known mostly by analyses of material culture remains. Here we use a new line of evidence for reconstructing habitual behavior by investigating paramasticatory use of human teeth. Paramasticatory dental modifications (chipping, notching, occlusal and interproximal grooving) are examined on 89 individuals' dentitions (1308 teeth) from three sites of the Lepenski Vir culture: Vlasac, Lepenski Vir and Padina in the Danube Gorges, eastern Serbia (9500 - 5500 B.C.). Both macro- and micro-scopic (scanning electron microscope - SEM) lesions were analyzed. Paramasticatory use of teeth was detected in 43% (38/89) of individuals. Variations in sex/age categories and diachronic changes in teeth use-wear patterns were quantified. SEM surface imaging and micro-residue analyses of lesions enabled comprehensive investigation of their etiology. Specific task-related activities involving teeth-as-tools (e.g. cordage/basketry, bow-drilling) were only detectable using SEM analyses.

Our SEM results show that teeth formed an integral part of tool kits for prehistoric inhabitants of the Danube Gorges. Ethnographic and material culture comparisons indicate patterns of tooth-wear found in our study have significant implications for understanding technological evolution in other case-study areas. Thus, archaeometry can provide an essential insight into human behavior.

Rafferty, Kevin

[352] *The Rock Art of Valley of Fire, Clark County, Nevada*

Valley of Fire is one of the gems of Nevada archaeology known as an area rich in archaeological resources. Yet little work had been undertaken in the area. Since 2003 the College of Southern Nevada (CSN) has conducted five survey field schools in Valley of Fire designed to teach students survey and site recording. The results so far demonstrate that Valley of Fire is an area rich in rock art and other cultural resources, with new rock art sites being recorded and data from earlier recorded sites being updated. These sites range in age from the Archaic period (ca. 5500 B.P.-2000 B.P.) to the proto-historic Numic period (ca. 800 B.P.-150 B.P.). The data also suggests that in the late prehistoric period, several different cultural traditions occupied or used Valley of Fire as a resource procurement zone. This succession of occupations and cultural traditions will be examined through a discussion of the rock art resources of the locality. In the end the results demonstrate that Valley of Fire is an important archaeological zone that holds the potential to enhance or change many of southern Nevada's archaeological community's ideas about the prehistoric occupation and use of the southern Great Basin.

[57] *The 'Bare Branches' of Scandinavian Society and the Origins of Viking Raiding*

The surge of violent raiding that traditionally marks the beginning of the Viking Age at the end of the 8th century ushered in a period of turmoil and change across much of Europe. Though the factors that might have triggered this have been repeatedly debated, no hypothesis has thus far provided a convincing explanation for this important historical phenomenon. One of the oldest arguments, discussed in this paper, was that proposed during the 11th century by Dudo of St. Quentin in *Gesta Normannorum*, who suggested that an excess of young males amongst Scandinavian societies forced many to embark on raiding in search of wealth and reputation. This paper will propose a hypothetical social model for the conditions that might have prompted this violent behavior. The mutually reinforcing social practices of polygyny and selective female infanticide will be considered in light of their potential to generate a pool of low-status males who were required to seek wealth and status in order to enter an elite-dominated marriage market. Relevant archaeological, historical and anthropological data will be consulted in order to identify the possible social mechanisms underpinning Iron Age Scandinavian societies, as well as the extent to which these precipitated socio-political change.

[337] *The Genetic Prehistory of the New World Arctic*

The New World Arctic, the last region of the Americas to be populated by humans, has a relatively well-researched archaeology. However, there is no consensus on how the different Arctic traditions were genetically related to one another. We present genome-wide sequence data from ancient and present-day humans from Greenland, Arctic Canada, Alaska, Aleutian Islands, and Siberia, contributing new perspectives to the debate of cultural versus genetic replacement in the New World Arctic. We show that Paleo-Eskimos (~3000 B.C.E. to 1300 C.E.) represent a migration pulse into the Americas independent of both Native American and Inuit expansions. Furthermore, the genetic

continuity characterizing the Paleo-Eskimo period was interrupted by the arrival of a new population from western Arctic, representing the ancestors of present-day Inuit, with evidence of past gene flow between these lineages. Despite periodic abandonment of major Arctic regions, a single Paleo-Eskimo metapopulation likely survived in near-isolation for more than 4000 years, only to vanish around 700 years ago.

Ragsdale, Corey (University of New Mexico) and Heather JH Edgar (Department of Anthropology, University of New Mexico)

[217] *Biological Distance among Huastec, Veracruz, and Maya Groups*

The people of the Huasteca region have a shared language history with the Maya region. This connection has long been of interest to Mesoamerican archaeologists and linguists. They also traded with other populations along the Gulf Coast, such as those in Veracruz. To date, biological evidence for these connections remains limited. We compared Huastec (n= 62), Veracruz (n= 47), highland (n= 29) and lowland Maya (n= 63) groups to evaluate the effects of shared language and economic exchange on biological similarities using dental morphological observations. We also conducted non-metric multidimensional scaling to evaluate within-group variation among samples from each region. Our results show a high similarity between Huastec and Maya groups compared with Veracruz groups. The highland Maya is similar to both the Huastec and lowland Maya groups. Additionally, non-metric multidimensional scaling results suggest high variation among individuals from the Huastec sample from Tamtoc, indicating high immigration related to cultural processes. Our results are consistent with archaeological and linguistic evidence for similarities between Huastec and Maya groups. We further conclude that shared migration histories between Huastec, Veracruz, and Maya groups affect population structure based on morphological (phenotypic) data.

[142] *"My Only Equal [as Sovereign of This Land] Is Rice": The "Technology" of Rice Production Politically Deployed and Ideologically Appropriated in Early Merina "States" of Central Madagascar*

Over past centuries the landscape of the central highlands of Madagascar has been dramatically transformed. Draining, diking and terracing have created vast expanses of irrigated rice fields where forests once stood. The employ of this transformative technology depended on collective social labor; unsurprisingly the dikes that rendered the land productive also served in the political organization and unification of territory and populations. Yet, the destruction of these dikes was also a ploy and consequence of political warfare. Under the rule of Andrianampoinimerina, credited with creating a unified and expansionist Merina "state" in the 18th century, the additional vast marshland expanses that were drained and diked were not only put into standard rice production, but also allowed a second "counter-seasonal" crop of rice. The crediting of this innovative "technological" move to this sovereign was put to extensive ideological use: (1) construction of dikes and rice fields was confounded with the construction of polity; (2) food security served as an "index" of legitimacy of rule; (3) the counter-seasonal second crop of rice was understood as a "true" product of the "state"; and (4) the ruler, as innovator/creator, beyond the constraints of ordinary mortals, was portrayed as a "god seen with the eyes."

Railey, Jim (SWCA - Albuquerque)

[67] *Bell-Shaped Storage Pits and Social Evolution in the Yuanqu Basin, North China*

Control and manipulation of stored food was an important force driving human social evolution. Among the more distinctive forms of storage facilities are bell-shaped pits, which have a global distribution and were common in ancient north-central China. In this paper, size variation of 86 bell-shaped pits, spanning the Neolithic to Early Bronze Age in China's Yuanqu Basin, are examined in relation to other evidence of sociopolitical complexity and change. The data show a significant

increase in the average size, and size range, of bell-shaped pits between the Yangshao and subsequent Late Neolithic and Early Bronze age periods. This may be evidence for increasing inequality, and possibly intensified competition and variable success at control over food production and storage. Moreover, given that concealment was an important function of bell-shaped pits, their presence throughout this sequence may signal household-level management of food stores, resistance to economic control by elites, and perhaps conditions of intense warfare and a desire to hide stores from enemies. These trends are considered in relation to evidence and arguments that the development of sociopolitical complexity, inequality, and state-level societies in China was rooted more in the ceremonial and ideological realm, and less in control over subsistence economics.

[245] *Plainware Ceramics from the Surface of the 76 Draw Site, Luna County, New Mexico*

The 76 Draw archaeological site (LA 156980) is located in southwestern New Mexico. This Medio period (A.D. 1200-1400) site is situated within the northern edge of the Casas Grandes interaction sphere just south of Deming, New Mexico. It includes the remains of pueblo-like adobe structures overlain with a scatter of thousands of artifacts including lithic and mixed ceramics. In the summer of 2013, the University of Missouri and University of North Florida surface sampled the site. One purpose of this sampling was to assess the cultural connections between the Casas Grandes, Salado, Black Mountain, and El Paso Phase, Jornada in the Animas region. In this paper we report our analysis of the plainware ceramics retrieved from the site. We explore four questions. First, to what extent do the 76 Draw Plainware ceramics conform to the original Di Peso type descriptions for Casas Grandes plainwares? Second, we assess whether or not plainware ceramics provide meaningful information about the regional connections of those living at the site. Third, our data allows us to investigate how plainwares were used at the site. Fourth, and finally, we assess whether or not the plainware ceramics provide clues to the chronological placement of the site's occupation.

Ramos, Martha [11] see Carini, Claudio

Ramos, Jorge**[366]** *A Sacred and Defensible Hill and the Memory of Ruler 12 in Late Classic Copan, Honduras*

Inscribed monuments, iconography and archaeological correlates point out the pivotal role the founder of Copan's dynasty, K'inich Yax K'uk' Mo' played in the religious and political ideology of the local community. Moreover, several lines of evidence in the archaeology of Copan show the importance of the long-lived Ruler 12, K'ahk' Uti' Witz' K'awiil (ruling from 628 to 695 CE) in the Maya kingdom of Copan during the Late Classic period (600-820 CE). Recent research in the Copan Valley at the outlying Group 6N-1, in the area traditionally known as Rastrojon, has revealed an ornately decorated residential complex devoted to the memory of Ruler 12, his sacred mountain and

defensive system. This paper explores the motives behind the construction and use of this architectural complex at a very strategic place within the Copan Valley and seeks to add to our understanding of the local ideology in connection with the figure of Ruler 12 in Late Classic Copan's multi-ethnic community.

[93] *Statistics: It's a Sherd Thing: Archaeology in a High School Math Class*

Entire books have been dedicated to the subject of math applied to archaeology, both in the field and in analysis. Archaeology educators have recognized that the excitement of archaeology can be used to share elements of trigonometry, statistics, geometry, and more. Educators at the Robert S. Peabody of Archaeology and Phillips Academy have collaborated to use existing collections of pottery sherds from sites in New Mexico to introduce statistics to high school students. In the "It's a Sherd Thing" exercise students analyze sherds and then test hypotheses about chronology, all the while contending with issues of collections bias and other challenges often absent from textbook problems. A writing assignment asks that the students concisely describe their results, providing an opportunity to assess the learning goals of the project. Like other learning opportunities offer by the Peabody Museum, "It's a Sherd Thing" supports existing curricula, using the concept of "teaching with" archaeology, rather than adding archaeology to the already burgeoning curriculum. Problem and project oriented learning, like "It's a Sherd Thing," fosters deeper knowledge and contribute to greater self-esteem, and provides a new way to use older museum collections.

[186] *Contributions of Archaeological Research in Panama to the Early Human History of the American Tropics*

There has been a sea change in our understanding of the early human occupation in the tropical lowlands of the Americas over the last four decades. Research carried out in Panama has contributed to this change in a number of ways. First, evidence of Terminal Pleistocene hunter-gatherer populations using both Clovis technology and presumably later fluted fishtail projectile point technology was recovered in tropical forest as well as open woodland habitats. Importantly, the pioneering analyses of phytoliths and starch grains by Dolores Piperno documented the early domestication and dispersal of tropical lowland plant species in the Americas. In addition, by establishing a massive comparative collection of terrestrial and aquatic faunas, a detailed assessment of faunal use over the last 8000 years has been established in the region. Finally, a probabilistic site survey of a tropical watershed documented changing settlement patterns and occupational densities from 13,000 years ago until European contact. This research implies that New World tropical forests were occupied by hunter-gatherers as early as other non-forested tropical habitats and that tropical forest populations were key participants in the early domestication and widespread distribution of New World crops.

[122] *Detecting Signatures of Cultural Transmission: An Actualistic Study*

The potential to detect signatures of cultural transmission in stone tool technology is quickly gaining traction in Paleolithic archaeology (e.g. Tostevin 2012). These methods, rooted in middle range theory, remain to be tested through controlled experiment. This project uses experimental flint

knapping and a social learning framework to test the hypothesis that signatures of direct cultural transmission can be detected in core reduction strategies. The participant pool included experienced North American flint knappers. The experiment consisted of three isolated sessions simulating different degrees of information transfer ranging from Baseline (low fidelity) to Imitation (high fidelity). Preliminary results suggest that variation in core form is driven primarily by shape of the original cobble and skill level. Skill was determined by both post-experiment questionnaire and by pre-experiment observation. Variation in flake morphology was correlated to different stages of reduction intensity. This study attempted to empirically elucidate signatures of cultural transmission and demonstrates the importance of analyzing these markers across the reduction sequence. The lithic variables measured in this study can be applied to various spatial and temporal contexts.

[359] *Geochemical and Physical Characteristics of Anthropogenic Sediments from Cahokia*

The 110 mounds that characterize Cahokia's landscape represent the most visible aspect of anthropogenic transformation of landscape. Recent ongoing efforts on the northern edge of the east plaza at Cahokia are uncovering a hidden landscape of earthmoving, illustrating the social complexity of this urban center. Traditionally, mound building has been perceived as a simple process of moving and reshaping earthen material. Because of this simplified model of mound construction, studies of mound building have primarily focused on identifying and dating construction stages, as well as studying the structures supported by these various construction stages. Recent interpretations suggest mound construction required a planned effort to organize labor, prepare the original ground surface for construction, and select specific building materials. We apply geochemical and physical soil analyses to anthropogenic sediments from the northern edge of the east plaza at Cahokia that are associated with a planned effort to transform the landscape. We treat the sediments as artifacts that can contribute to our knowledge of social complexity, as well as show how precolumbian North Americans were actively engaged in transforming their environment.

Rankin, Amanda (University of Nevada, Reno)

[386] *High Altitude Residence in the Great Basin and the Rocky Mountains*

It has been suggested that high elevations are highly demanding environments, poor in resources, and only heavily used to procure high ranked animal prey. Steward's work in the Great Basin with the Shoshone and Piute showed that valley and foothill resources dominated subsistence patterns, with high altitude resources playing only a minor role for hunting. However, evidence exists for high altitude residential sites in both the White Mountains of eastern California (Great Basin) and the Wind River Range of western Wyoming (Rocky Mountains). These sites appear to be anomalous in that they contradict previously held ideas about hunter-gatherer adaptive choices, specifically intensive plant processing in lieu of hunting, evidenced by large quantities of groundstone. Ongoing research seeks to define the use of grinding implements through starch residue and use-wear analysis to better understand hunter-gatherer adaptive choices at high altitude.

[29] *Mystery in Grapevine Canyon: Gender and Ethnicity in a Historic Period Site*

The Grapevine Archeological District in Death Valley National Park contains evidence of prehistoric and historic occupations. The district also overlaps with the Death Valley Scotty Historic District. A road realignment project in 2014 led to the discovery of a historic period site that appeared to be a mining camp with features and artifacts typically associated with tasks performed by men. Surface features and artifacts included a forge and hand-forged axes; a mining claim cairn marked the eastern boundary of the site. Excavation conducted for mitigation of adverse effect revealed artifacts that hint at the presence of women and children and also raise issues of ethnicity. These artifacts include a thimble, doll's leg, metate fragments, and knapped glassware.

Raslich, Nicole (Michigan State University)

[95] *Indigenous Perspectives On Cultural Heritage Management And Preservation*

Cultural Heritage Management has various perceptions when utilized by indigenous communities and archaeologists. Heritage management professionals advocate preserving sites from looters, limiting access to curb erosion and protecting historical places from the degradation of time. Preservation methods may include stopping traditional uses of these locations unless otherwise specified through legislation. Most often, sites are located and archived through historical and archaeological research. Various Sami and Ojibwa groups along with other indigenous communities use cultural heritage management to preserve sites or buildings while allowing for the continued traditional utilization of the place. Often, indigenous perspectives on cultural heritage preservation refer to the passing of cultural knowledge to future generations through the continued traditional use of sites. Many times these places are located through oral history surveys and visual surface surveys with archaeologists and elders. Both of these often contested perspectives speak to the same principle that is at the core of archaeological practice; stewardship. By aligning these methods along the common principle of stewardship, mutually constructive and meaningful partnerships can be achieved.

[365] *Coming Together: Evidence of Ritual and Public Space as a Mechanism of Social Integration*

Structure 16 at the Morton Village site (11F2) provides a unique opportunity to examine social interactions between Oneota and Mississippian populations situated within the Central Illinois River Valley. Prior to our work, the nature of these interactions at this site was poorly understood. Burgeoning data supports our interpretation of a cohabitation at Morton Village between these populations following Oneota in-migration. A method of this integration is demonstrated through ritualistic activity expressed extensively at structure 16. This structure is a unique public space illuminating various forms of ritual. Our archaeological investigations at structure 16 provide strong evidence of cultural admixture within an exclusively integrated public domain. Our data suggests a negotiation of identity occurs, after the Oneota in-migration, through the active adaptation of select traits, activities, and behaviors between these populations. We explore the nature of integration that existed between the Oneota and Mississippian populations identified through the material remains and architecture found at structure 16.

Rasmussen, Amanda**[120]** *An Analysis of the Archaeological Remains at Fort Halifax Park*

Fort Halifax, located in Halifax Township, Pennsylvania, was occupied from 1756 to 1757 during the French and Indian War. Fort Halifax Township Park, where the fort is believed to be located, contains rich expanses of prehistoric and historic archaeological data. Since the Fort Halifax Park contains information regarding several occupations, the collected archaeological data has been useful in identifying the spatial relationships between occupations. This data, when further analyzed through the implementation of Bayesian Statistics, could assist in identifying which locations are most likely to yield remnants of fort activity. The use of Bayesian Statistics assists in assessing a group of test criteria through the incorporation of archaeological evidence. The probability is influenced not only through geophysical data and historic artifact densities and distributions, but also other factors such as landscape data, soil stratigraphy, and levels of disturbance. This investigation implements these attributes into a statistical analysis, increasing the likelihood of recovering Fort Halifax.

Rasmussen, Josephine (University of Oslo)**[218]** *Heroes of Heritage: Detrimental Situations as Commendable Motivation for Hobbyist Metal Detecting*

Within the contemporary European heritage discourse, agriculture and forestry are increasingly identified as threats to archaeological remains. At ploughed-over archaeological sites, objects that were once associated with primary depositional contexts become mixed into the top soil, and this enhances their destruction. This paper explores the discourse that revolves around hobbyist metal detecting as a large scale means of rescuing archaeological material from destruction. Based on a case study from Norway, I address the rhetorical dichotomy between commendable and dubious motivations that permeate debates concerning hobbyist metal detecting, archaeology, the antiquities trade, and artifact collecting.

Rath, Pip (University of Sydney, Australia)**[412]** *Negotiating Social Identity through Practices with Stone*

Dazzling, large, highly retouched obsidian objects comprised part of the material world of prehistoric people from West New Britain, Papua New Guinea from sometime between ca 6300- to 3300 years ago BP. Beyond their role as valuables, the seemingly mundane practices of choosing and acquiring raw material together with the application of a sequence of actions on the material and knowledge used in making them were fundamental for creating and structuring social relations. A case study, identifying and comparing the routine practices at three sites where various mixes of obsidian sources were exploited to make the stemmed tools, illustrates how people used these practices to negotiate social identity and ownership of the sources.

Raubenheimer, David (The University of Sydney)**[415]** *The Nutritional Ecology of Human Obesity*

Nutrition has exerted a powerful influence on human evolution and history, and continues to play a central role in global challenges such as food security and obesity. However, the complexity of nutrition presents considerable challenges for researchers to unravel its grip on human affairs. In this talk I will introduce an approach called nutritional geometry that has been developed to aid this process. Nutritional geometry differs from conventional nutritional models in acknowledging that nutrients do not act alone, but interact extensively in their influence on humans. I illustrate this in the context of human obesity, showing how nutritional geometry has provided new insight into the ways

that recent changes in human nutritional ecology have interacted with evolved human traits to generate this major global problem.

[10] *Geochemical Analysis of Construction Materials in the Cave at Las Cuevas, Belize: An Intrasite Analysis*

The entrance chamber of the Cave at Las Cuevas, Belize prominently features many platforms, staircases, and terraces. To date 72 platforms, seven staircases, and two sets of terraces have been mapped and recorded. Geochemical analyses of the plastered surfaces were conducted in situ and in the lab in order to understand the technology used to create the platforms within the cave. Geochemical analyses were conducted in situ using portable XRF (pXRF) and additional samples were collected for portable XRF analysis in the lab. Platforms from different areas of the cave entrance, different light quality, and different sizes were considered for this study. I hypothesize that differences in chemical composition may represent differences in function or may represent a construction chronology. I will present the results of the pXRF analysis and discuss the range of variation and possible reasons for the variation.

[417] *Wine or Wax? Organic Residue Analysis on Pottery from the Early Bronze I at Nahal Tillah*

Nahal Tillah is an Early Bronze I site in the Southern Levant with evidence for a strong Egyptian trade presence. Twenty-eight sherds from four different vessel types underwent absorbed pottery residue analysis to identify possible traded resources and to confirm vessel functions. Although wine and olive oil are believed to be the major trade resources in the region, wax was an unexpectedly important resource in the pottery sampled, particularly among the Southern Levantine styled jars.

Reddy, Seetha (Reddy Anthropology Consulting)

[41] *Changes Palates and Resources: Modeling Diachronic Plant Use in Prehistoric California*

Despite considerable diversity in plant communities across coastal and inland California, the region's hunter-gatherers often have been viewed as having broadly similar plant resource orientation. This paper reassesses this perspective by explicitly examining spatial and temporal variation in plant use west of the Sierra Nevada. In doing so, the study capitalized on a growing body of paleoethnobotanical data to explore similarities and differences in plant food resource emphasis across six main regions in western California. Initially, the talk will highlight regional patterning in potential plant resource distribution and density. Then analysis will emphasize trends in the relative reliance on exploited resources, focusing on three main plant food groups - seeds, nuts and geophytes. The results provide a baseline to explore to what degree observed spatio-temporal patterns in plant use are primarily a function of resource distribution, and in what contexts do social factors (such as investment in labor, risk assessment, population density, settlement organization, and cultural preference) play a more prominent role. The talk concludes with a consideration of the underlying causal factors driving the pace and scale of change in plant usage, and the social context in which certain plants became keystone resources.

[240] *Mortuary Practices through Time at El Hibeh, Egypt*

El Hibeh is an isolated urban site some three hours south of Cairo. The walled town was founded at the beginning of Egypt's Third Intermediate Period, when it reached its greatest importance, and was occupied for approximately a millennia and a half--at least into Coptic/Early Islamic times. Hibeh was an important provincial town during Egypt's Third Intermediate Period (early first millennium B.C.E.) after which it lost much of its regional significance. The town mound is surrounded by burials cut into the natural limestone; the mound itself was also used for burials at various times. This paper provides an overview, based on available evidence, of shifting mortuary practices at the site through time and seeks to correlate these shifts with developments in contemporaneous political, religious, economic, landscape, site usage and other patterns as relevant.

Reed, Lori (Aztec Ruins National Monument) and Mary Ownby (Desert Archaeology, Inc.)

[79] *In the Land of Lava: Petrographic and Chemical Analysis of Pottery from El Malpais National Monument*

Pottery found at four sites located in the eastern half of El Malpais National Monument offers significant clues into the importance of this area for the southern Chaco cultural extension. Further, the movement of pottery within the area is also significant as is information on local or non-local production. In order to begin to understand these issues, chemical and petrographic analysis was carried out on pottery mostly from the great house site of Las Ventanas. The Cibola White Ware, Socorro White Ware and White Mountain Red Ware are dominated by sherd temper that can cause difficulties for analysis. This may have resulted in the many chemical groups identified, for which petrography indicated some connections. We suggest that Cibola White Ware from the monument was made at many sites, while Socorro White Ware and White Mountain Red Ware may have had more limited production. Examination of the NAA data within a larger database also indicated such a pattern. These results have provided a preliminary hypothesis on pottery exchange in this area which further analyses will test.

[382] *Life and Ritual at the Edge of the Lava: The Ancient Chacoan Community at Las Ventanas*

The ancient Chacoan-affiliated community at Las Ventanas, New Mexico, on the El Malpais National Monument, has been known to the southwestern archaeological community since Adolph Bandelier's time in the late 19th century. Knowledge has accrued over nearly 140 years with visits by various archaeologists. Archaeology Southwest's recent Las Ventanas Community Landscape Project has continued this work and produced some astounding findings. Seven extensive trails were documented in the lava west of the Las Ventanas Pueblo Community and the Sandstone Bluffs area. Hints of trails were apparent before, in this area and across the entire Monument. But, new research has shown the construction and use of trails to have been much more intensive and extensive than previously suspected. Furthermore, these trails were not built primarily or exclusively as utilitarian transportation corridors. Rather, most were built as ceremonial byways to access a variety of rituals features in and around the lava flow.

Reeder-Myers, Leslie [105] see Rick, Torben

Reeder-Myers, Leslie (Smithsonian Institution)**[120]** *Modeling Sea Level Rise and Shoreline Change in a Complex Sedimentary Environment: Case Study from Chesapeake Bay*

Accurate estimates of past shoreline locations are important for archaeologists interested in the complex relationships between sea level rise and human ecology. However, shoreline reconstructions require careful consideration of highly variable eustatic, isostatic, tectonic, and sedimentary processes. In the Chesapeake Bay, records from marsh cores have produced high resolution models of relative sea level rise since the Bay first emerged between 8000-7000 BP, influenced by both global sea level rise and local subsidence. Shoreline reconstructions within Chesapeake Bay, however, are complicated by significant and highly variable sediment deposition during the Colonial, Historic, and Modern periods, which has obscured the original bathymetry. This study explores different methods for measuring and compensating for that sedimentation to model shoreline change across the entire Bay. Results suggest that even the relatively slow sea level rise during the Late Holocene produced shifts in shoreline locations that would have affected estuarine ecosystems and the people who depended on them. Modeling, in this case, is an important starting point, but variability in sedimentation rates requires more localized studies to produce accurate reconstructions to contextualize archaeological studies.

Reedy, Chelsea (University of Oklahoma) and Leland Bement (University of Oklahoma & Oklahoma Archaeological S)**[122]** *Tool Production, Subsistence, or Practice: An Investigation of Human Modified Bison Phalanges Present at the Bull Creek and Clary Ranch Sites*

The Clary Ranch site in Southwestern Nebraska and the Bull Creek site in Northwestern Oklahoma are Late-Paleoindian camps that were used for processing the meat and bones from bison hunts. This is an experimental archaeological investigation involving Clary Ranch and Bull Creek, both of which contain evidence of spiral fracturing on bison phalanges resulting from the butchering and preparation process. This archaeological experiment investigates possible motives Paleoindian hunters would have for breaking the small, dense, and low-yield marrow bison phalanges at these two sites. The hypothesized reasoning behind this anomalous butchering practice is threefold; perhaps the use of the broken phalanges for bone tool production, a possible addition to the Paleoindian subsistence strategy, or the practicing of spiral fractures for the later butchering of higher yield areas. The results are consistent with the idea of marrow extraction over spiral fracture practice and bone tool production.

Reedy, Chandra (University of Delaware)**[284]** *Incorporating Image Analysis into Ceramic Thin-section Petrography*

In 2002, our laboratory received a grant from NCPTT to research digital image analysis of petrographic thin sections. Two years previously we published our first paper on the application of image analysis to thin-section studies; the enormous potential of this line of research was apparent, but to fully pursue it would require a period of dedicated time and effort. The NCPTT grant gave us this time, and allowed us to purchase new software packages and upgrade our computer and microscope digital camera capabilities. That original grant resulted in a document comparing two comprehensive commercial software packages and one free shareware package, taking each through a series of typical operations important for image analysis of archaeological thin sections. Twelve years later, image analysis is a routine part of thin-section petrography research in our laboratory. We currently focus on ceramic studies, which now incorporate both traditional qualitative thin-section petrography (such as identification of minerals and other aplastics, geological comparisons, and inferring fabrication and production methods) and collection of quantitative data through image analysis. Examples illustrating these new routines will focus mainly on low- and high-fired ceramics (particles, pores, and decorative layers) from a variety of sites in China, especially within Sichuan Province.

[344] *Ideology and Power at Copán, Honduras*

The ideology of place was central to the structures of power that directed the socio-political trajectories of the myriad polities that comprised the Classic Maya landscape. Nowhere was this more vital than at Copán, Honduras. In their book *Forest of Kings*, Linda Schele and David Freidel highlighted the ideological underpinnings of Copán's dramatic architecture and sculpture. They defined an interpretive history based on the inter-weaving of archaeological, art historical, and epigraphic data to craft a socio-historical narrative from both an academic and anecdotal perspective.

Reese, Kelsey (Washington State University) and Timothy Kohler (Washington State University)**[287]** *Agency of Access: Public Architecture in Mesa Verde National Park*

There are many architectural features in the Mesa Verde region that have been defined as "community centers," or rather, specific areas of cultural and social significance. Community centers may contain several public features, including a: Great Kiva, Reservoir, Great House, Plaza, Tower, and others. Although these features are assumed to have served a large surrounding population, the placement of these structures on the landscape can help us understand the ease with which the surrounding population may have accessed these public features—either visually or physically. The production of public architecture suggests forethought into the level of visibility and accessibility to each public feature—and this paper hopes to extrapolate and quantify that thought process by examining the placement of both habitation sites and public features. This paper combines least-cost and viewshed analyses to produce an accessibility metric that represents the ease of travel and participation from habitation sites to contemporaneous public architecture. By running these analyses across the Mesa Verde landscape and through time, changes in accessibility can be observed to suggest how communities may have responded to social, cultural, and environmental changes from A.D. 600-1280.

Reese, Elena [416] see Ballard, Hannah

Reese-Taylor, Kathryn and Julia Guernsey (The University of Texas at Austin)**[306]** *Situating the Narrative Style and Legacy of A Forest of Kings*

In this paper, we situate *A Forest of Kings*, which combined archaeological and art historical data, within the genre of ethnographic fiction. We consider its waxing and waning throughout time as a popular narrative form and its legacy that continues to this day. *A Forest of Kings* was conceived and written at a significant moment within the history of ethnographic fiction. While it is strongly grounded in the reflexive and representational practices of the late 1980s and early 90s, *A Forest of Kings* simultaneously presents an interesting departure. One that, we believe, was "before its time" in its effort to present archaeological data and also people the past with individual actors and agendas through "story-telling." This style of writing and its goals of imaginatively populating long abandoned archaeological sites provided a vehicle through which innovative ideas concerning performance and the built environment were presented that have been pursued and criticized by many scholars in the field since then. The goals of this paper, therefore, are both to provide a long overdue historical context for *A Forest of Kings*, as well as to assess its influence within the field of Maya studies.

Reetz, Elizabeth, Cynthia L. Peterson (University of Iowa Office of the State Archaeologist) and Melody Pope (University of Iowa Office of the State Archaeologist)**[43]** *Bridging the Professional-Public Divide through Flood Recovery Compliance Archaeology at the University of Iowa*

Recent federally-funded flood relief compliance projects on the University of Iowa campus provided the University of Iowa Office of the State Archaeologist with an opportunity to involve various publics in our work. It also provided us with an opportunity to reflect critically on how we represent our work and archaeology more broadly to the public and how our work is presented to even wider publics by the media. We first present an overview of the various approaches we took to engage the public in

learning about on-going compliance archaeology resulting from a major flood that impacted the university and city through active learning, lectures, discussion forums, and media interaction. We then offer some critical reflections on the successes, failures, challenges, and responsibilities of representing archaeology and the past to various publics in what are often politically-contentious settings.

[411] *Cultural transmissions and indigenous influences: Glazed tiles from Mughal India*

The use of glazed tiles for architectural embellishment in the Islamic world was widely patronized by the Timurids in Central Asia in the fourteenth and fifteenth century, influencing in times to come the decorative traditions of neighboring lands. In northern India, glazed tiles began to be used in substantial numbers by the Mughals on their buildings in the sixteenth and seventeenth century, in the province of Punjab near the north-west border, and further inland at Delhi. Samples representative of tile-work on buildings in these two regions were subject to laboratory investigations using electron microscopy. The tiles from the Punjab region are similar in character and composition to tile-work from nearby Central Asia, their manufacture thus seemingly in the hands of itinerant craftspeople. In contrast, tiles from Delhi were found to be technological hybrids, exhibiting an interesting amalgamation of imported and indigenous technologies, in the bodies and glaze layers respectively. Our findings provide firm evidence of the incorporation of traditional Indian glass technologies in the manufacture of a product of essentially foreign Central Asian character. Overall, the paper aims to present the efficacy of archaeometric investigations in studying such cultural interactions, through an assessment of technologies manifest in the archaeological record.

Reich, David [396] see Krause, Johannes

Reichardt, Stephen (Arizona State University)

[7] *Development and Integration of Cultural Resource Data in a Geographic Information System from Nuvakwewtaqa, Chavez Pass, Arizona: A Model for Spatial Data Management*

The six year Chavez Pass Archaeological Project (Arizona State University - Chavez Pass Project 1976-1982) consisted of survey and excavation at the large Puebloan site of Nuvakwewtaqa. The burial assemblages that resulted from this project were recently reanalyzed in cooperation with the Coconino National Forest, as part of ASU's Forest Service sponsored NAGPRA Documentation project. The initial project recorded and documented all features identified across the site. However, a comprehensive site map tied to a non-arbitrary coordinate system was not generated. Archaeological relationships within and between features at Chavez Pass are complex and as such, necessitated a visual mode of spatial data interaction. Recent improvements in mapping technology including Geographic Information Systems (GIS) greatly facilitated georeferencing the digitized site maps. Once georeferenced and projected (Arizona NA.D.83 UTM Zone 12), the non-arbitrary site coordinates were applied across all subsequent feature maps. These new georeferenced data layers served as foundations to build a comprehensive geodatabase and map of the Chavez Pass site that will provide researchers, and students with a visual mode of spatial data interaction.

Reid, David (University of Illinois at Chicago)

[149] *Rock Art and Prehistoric Roads: The Connection in Southern Peru*

The site Toro Muerto, located in the Majes Valley of southern Peru, constitutes one of the largest and better studied rock art sites in South America. Approaching Toro Muerto through a 'landscapes perspective,' we can situate the site within a changing ideological, socio-economic, and political landscape beginning in the Middle Horizon (A.D. 600-1000) to the 18th century Colonial-period. This paper goes beyond the typical site-level analysis to place Toro Muerto at the center of a southern Andean rock art tradition that extended beyond the Majes Valley. Utilizing geographic information systems (GIS), a least-cost path analysis was conducted between Toro Muerto and other known Middle Horizon sites of southern Peru. Remote sensing and archaeological survey of the modeled path show that Toro Muerto was a major node on a road and caravan system that linked other prehistoric settlements and rock art sites. Petroglyphs depicting camelid caravans, the presence of stone cairns or apachetas, fresh water wells, and geoglyphs at Toro Muerto also require us to reexamine previous interpretations of rock art sites in the southern Andes.

Reid, Kenneth (Idaho State Historical Society) and Ethan Morton (Idaho State Historical Society)**[300]** *Idaho's Radiocarbon Record and the Challenges of Chronometric Hygiene*

Idaho's position as a hub adjoining several culture areas gives its radiocarbon chronology more than local interest. The record of late Pleistocene and Holocene radiometric dates extends back more than fifty years and includes at least 800 known or reported assays, not all of which are on file at the Archaeological Survey of Idaho. As of mid-2014 more than 650 dates were available from 184 sites distributed across all ten of the Level 3 ecoregions intercepted by the state's border. Not surprisingly, here as elsewhere, issues of chronometric hygiene haunt interpretation and contribute to debates and uncertainties concerning initial colonization, the emergence of the storage-anchored "winter village pattern," the arrival of bow-and-arrow technology, the appearance and spread of pottery, and, more generally, the accurate establishment of occupation timing throughout the state. This paper reviews the sample, and offers a preliminary scoring system combining sample type, measurement method, and the age and precision of the measurement to gauge the relevance of the dates to events of interest in Idaho prehistory.

Reider, Kevin [30] see Hoffman, Brian

Reilly, Kent [182] see Stauffer, John

Reilly, Frank (Texas State University) and David Freidel (Washington University St. Louis)**[306]** *Middle Formative Origins of the Early Classic Period Stela Cult*

Stela are standing stones, incised or carved with iconographic or hieroglyphic information. Stelae vary in size from the portable to monumental stones. Some of the earliest examples of stelae were erected at the Middle Formative period site of La Venta. Undoubtedly, these La Venta stela, like their Maya counterparts, are linked to concepts of rulership and sacred cycles of time. A close iconographic analysis supports an interpretation that finds the origin of these early stela firmly rooted in the caches of polished green stone celts and or figurines and statues that carry incised symbols and motifs as secondary information.

Reindel, Markus [31] see Isla, Johnny

Reindel, Markus (German Archaeological Institute, Bonn, Germany)**[100]** *Overview: MayaArch3D - A Web-based 3D-GIS for the Analysis of the Archaeology of Copan, Honduras*

The documentation and analysis of complex archaeological sites constitutes a challenge for modern research. Large amounts of data have to be stored and accessed, normally by different research teams, based on places all over the world. Funded by the German Ministry for Education and Research (BMBF), and in cooperation with partners from Germany, Italy, USA and Honduras, the MayaArch3D project is using data from the Maya site Copan, Honduras, to develop a state-of-the-art, open source, online system for the documentation and analysis of complex archaeological sites. The data, different in kind and resolution, include text and numerical information, raster data, vector data, 2.5D surface models, and 3D models of objects, architecture and landscape. The system combines the database functions with the analytical functions of Geographical Information Systems (GIS) into one single platform. On the back-end of our system, a Filemaker Pro database contains the archaeological attributes for each digital object and two PostGreSql databases that hold the geometries for 3D objects and 2D shapefiles. On the front end, the public sees a 2D geobrowser, a 3D geobrowser, and a Single Object Viewer. A user management system offers different security levels, with both a public and password log-in.

[127] *Dietary Reconstruction Based on Coprolites from Antelope Cave*

Results of 20 Antelope Cave coprolites show both consistencies and inconsistencies with other Ancestral Pueblo coprolite analyses. Most of the human coprolites appear to be late summer and early fall depositions. Four principal plant foods were ground to a fine flour: maize kernels, dropseed caryopses, sunflower achenes, and cheno-am seeds. Maize and dropseed were found in six coprolites each and they did not co-occur. Microscopically, maize starch occurred in seven coprolites. Thus, maize was slightly more important than dropseed. Sunflower occurred in four coprolites and dominated three of these. Ground sunflower flour, in our experience, is unique to Antelope Cave. Flour was also made of cheno-am seeds and was found in three coprolites but dominant in only one. Following maize and wild grass, prickly pear pads were an important food source. Four coprolites included macroscopic remains of prickly pear while eleven contain microscopic remains. Prickly pear tended to co-occur with other foods. Therefore, prickly pear was an important stand-alone food and also supplemented other foods. Nutritionally, there was a high reliance on fiber-rich plant foods with low glycemic indices. The relevance of this diet to the development of NIDDM in descendent populations will be presented.

[235] *Playing Pedagogy: Videogaming as Site and Vehicle for Digital Public Archaeology*

While there is an extensive literature on the pedagogical uses of video games in STEM education, and a comparatively smaller literature for languages, literature, and history, there is a serious dearth of scholarship surrounding videogames in their role as vectors for public archaeology. Moreover, video games work as 'digital public archaeology' in the ways their imagined pasts within the games deal with monuments, monumentality, and their own 'lore'. In this presentation, we play the past to illustrate twin poles of 'public' archaeology, as both worlds in which archaeology is constructed and worlds wherein archaeological knowledge may be communicated.

[67] *Of Kings and Artisans: Comparing Household and Palace-Temple Rituals at Yanshi Shangcheng*

Elite ritual has been a primary focus in Chinese archaeology. Well known studies of the oracle bones from Anyang and bronze ritual vessels have shed light on elite ritual practices but have also generated a bias linking ritual with elites. Indeed there is strong evidence of elite ritual activity in palace temples of the early Bronze Age site of Yanshi Shangcheng (the Shang city at Yanshi), located in the Central Plain area of northern China. However, there is also evidence of similar rituals in domestic contexts of an artisan's neighborhood. This calls into question the idea that elites monopolized access to ritual power. In this paper, I will compare these two contexts, explore the relationship between ritual and power, and raise questions about ritual, social status, and agency.

[118] *GIS Illuminates Site Formation Processes: Archaeology of the Fortín de la Perla*

This is the first archaeological investigation into a 17th century Spanish fortification whose remnants lie within a dynamic urban slum setting in La Perla, San Juan, Puerto Rico. The Fortín de la Perla does not enjoy protection by any government or cultural agency and its condition has substantially deteriorated due to natural and cultural processes. During the first quarter of the 20th century, parts

of the Fortín's structure and immediate surroundings were settled by poor workers and country folk from all over the island. These first La Perla community members reincorporated what remained of the dilapidated structure as a foundation for dwellings and reutilized building materials. This process is evident in aerial photographs starting in the 1930s. By digitizing and georeferencing historical maps, Spanish Military Engineering plans, and aerial photographs, we are able to distinguish the cultural site formations processes. Armed with this information, we can enter into the discussion of what should be done with the Fortín as it stands today.

Reitz, Elizabeth (University of Georgia)

[178] *The Transect Survey at 30-Something*

In 1977, an American Museum of Natural History team lead by David Hurst Thomas began an ambitious survey of St. Catherines Island, Georgia. The intent was to systematically survey 10% of the island following a series of transect lines using a research design from plant ecology. The survey collected hundreds of small vertebrate samples, none of which met zooarchaeological standards for adequate sample sizes and analysis. These hundreds of small samples, however, proved invaluable because they were used to develop hypotheses about change and stability in animal use that have guided all subsequent zooarchaeological studies of both prehispanic and Hispanic sites on St. Catherines Island and elsewhere in the Georgia Bight. These systematically recovered survey data provided a broad perspective of people's lives on the island, snapshots of how they used each habitat available to them from the very earliest known sites through the Mission period. Many of the hypotheses developed from the transect survey samples have been supported by larger samples recovered by subsequent work, others need revision, and new hypotheses have emerged. Starting a long-term zooarchaeological study with a survey program, even with very small samples, is more than worth the effort when long-term research is anticipated.

Reitze, William (University of Arizona)

[148] *Folsom on the Edge of the Plains: Occupation of the Estancia Basin, Central New Mexico*

At the end of the Pleistocene, during Folsom occupation, the Estancia Basin contained the eastern-most pluvial lake in the American Southwest. The basin has a long history of archaeological research and the story of changing lake levels has played an important part in understand the Paleoindian occupation of the New World. Within the basin, geoarchaeological assessment at the Martin site can be used as a baseline for understanding environmental change during the late Pleistocene. The large well documented Martin and Lucy Folsom artifact assemblages provide a window into lithic technological organization. Combining these data within a broader basin-wide analysis provides a glimpse at Folsom occupation and land use between the well-studied Southern High Plains and the Middle Rio Grande. By combining the stories of environmental change, fluctuating lake levels, lithic variability, and human mobility a better picture of life at the Pleistocene/Holocene transition emerges.

[100] *Virtual Copan - From 3D Data Collection to Analysis Inside a Web Visualization Tool*

3D modelling technology is increasingly used for research, preservation, reconstruction, documentation, and communication of cultural assets. Heritage 3D models, accessible on the web, are the most powerful solution to disseminate culture and, at the same time, a great source for tourism, research, and education. While the use of 3D technologies in CH have been around for many years there are still some blocking factors that slow down a wider approach. On the technological side we still lack robust and easy to use technologies that allow the practical use of complex 3D models. On the other hand, the authoring tools for developing 3D applications are mostly borrowed from the entertainment industry and oriented to the creation of dedicated applications. The creation and management of 3D applications oriented to remotely study, visualize, analyze, query, and interact with 3D digital copies of heritage is still partly missing. This presentation

presents on the reality-based, multi-resolution and multi-source 3D documentation and digital reconstruction of architectures at the ancient Maya kingdom of Copan, Honduras. We discuss our strategies for 3D surveying and modeling as well as optimization of the 3D models for use in 3DWebGIS.

[350] *Ecological Legacies of Precolumbian Raised Fields and Their Implications for Agroecosystems Today*

Some South American lowland environments bear impressive legacies of precolumbian agriculture: vestiges of raised fields that have persisted since their abandonment centuries or millennia ago. In an interdisciplinary approach, we aim at understanding how the construction and use of raised fields in the past influence the functioning of these ecosystems today. In a raised-field landscape in a seasonally flooded coastal savanna of French Guiana, we characterized the distribution of soil macroinvertebrates (ants, termites, earthworms) and plant roots within the landscape and quantified their influence on soil physical properties. Our results showed that landscape modification by precolumbian farmers has long-lasting effects on the distribution of soil organisms in this wetland. Since their abandonment, and perhaps before, raised fields have attracted a diverse and abundant community of soil engineers that enhance the stability of mound soils, allowing their maintenance against erosion. We compare similarities and differences in the ecological functioning of ancient raised fields in this study site with those in the Beni savannas of Bolivia, where raised fields have a different history and show very different spatial organization in the landscape. Finally, we examine the applications of our results in the framework of ecological engineering to conceptualize new durable agroecosystems.

[168] *Conservation Biology and Archaeology: Using faunal remains of Pacific cod from the Tse-whit-zen village*

In 2010, the Salish Sea stock of Pacific cod (*Gadus macrocephalus*) was listed as a species of concern, which resulted from declining commercial and recreational catches that have not increased despite harvest reductions. Fishery managers typically use historical data from the past 40 to 50 years to create baselines to manage reduced fisheries; archaeological data can extend these baselines much further back in time. The Tse-whit-zen village site, located on the southern shore of the Strait of Juan de Fuca in Port Angeles, WA, provides a ~ 2000 yr history of indigenous fisheries for one part of the Salish Sea and thus presents a unique opportunity to study Pacific cod history in the area. Through measurements of skeletal elements and faunal frequency estimates it is possible to reconstruct data that fisheries biologists collect, such as length, age, fecundity, and relative abundance compared to other species. This would extend the data available to fisheries biologists back 2000 years, and, along with site-scale and other regional paleoenvironmental records, enable us to study ways Pacific cod are affected by climate change and other processes.

[128] *Dendroarchaeology of the Otero Cabin, Valles Caldera National Preserve, New Mexico*
 The Valles Caldera National Preserve (VCNP) in northern New Mexico has been the site of many culture group activities from prehistoric to present times due to its exceptionally resource-rich environment. During the early 20th century, profit-driven ventures left the landscape that we see today. A few families during this period were critical participants in the development of the VCNP

environment. The earliest of these families was the Oteros who used land in the VCNP primarily for grazing horses, cattle, and sheep. As part of this land use, the Oteros built cabins to serve as housing for family and workers, corrals, and other outbuildings. One such structure, the Otero Cabin, is said to have been constructed in 1908, and based on historical records, is one of the oldest Euroamerican structures in the VCNP. Dendroarchaeological samples from the Otero Cabin were collected during our 2014 field season and the results are presented here. These data and resulting interpretations will provide the VCNP staff with the most recent and accurate data to be presented through interpretative tours while also informing the public about dendroarchaeological methods.

[341] *Plant Resources in Great Basin High Altitude Foraging*

Prehistoric high altitude occupation sites in the White Mountains and Toquima Range contain archaeobotanical assemblages that inform on the use of plant resources both alpine in origin and imported from lower altitudes. Plant assemblages from the two areas show many similarities in the range of plant resources represented, as well as evident differences that reflect variable modes of high altitude living across the Great Basin. This presentation compares the plant materials from the White Mountains and Toquima Range and considers how plant resources fit into high-altitude foraging patterns.

[397] *Opportunistic Fire in the Early Paleolithic: Evidence of Small Mammal Incidental Burning at Cueva Negra del Estrecho del Río Quípar (Murcia, Spain)*

Cueva Negra, an upland rockshelter in southeastern Spain, has revealed a delineated ash feature containing burnt macrofauna and chert within Early Pleistocene deposits (>0.78 Ma). This paper details a novel methodology utilizing heat-altered micromammal remains to identify opportunistic fire-use by the inhabitants of this site. We hypothesize that micromammal bones deposited in the by non-human predators were unintentionally modified by anthropogenic fire, and may be used as proxy evidence of human behavior in the past. Taphonomic analysis of 2290 rodent remains identified discoloration indicating exposure to temperatures exceeding those common in natural fires (>600°C). SEM – EDS confirms this modification is not due to post-depositional mineral staining. Charred/calcined micromammal remains constitute 32% of specimens within the ash feature, or 97% of all heavily burnt bone examined. This is a statistically significant pattern in the distribution of burnt bone ($\chi^2 = 169.7$, $p < 0.001$). Digestive corrosion and skeletal representation suggest the assemblage was deposited by non-human predators. As such, the thermal alteration of these remains represents unintentional anthropogenic modification. This represents another type of taphonomic bias rarely considered in small mammal studies, as well as a novel line of evidence in identifying hominin pyrotechnological capabilities at early Pleistocene sites.

[304] *The Interaction of Hohokam Ideology and Religious Beliefs in the Hohokam Practice of Dual Cemeteries*

From A.D. 900 to 1400 Hohokam populations frequently used both corporate and household cemeteries within the same village. The practice became more visible following A.D. 1200, when burial was by inhumation in household cemeteries and by cremation in corporate cemeteries. The choice of cemeteries gave households flexibility in dealing with the tension between Hohokam sociopolitical ideology and religious beliefs. Burial in the privacy of household cemeteries served their egalitarian ideology while burial in public corporate cemeteries served their religious beliefs. Faced with a death, households chose the strategy best suited at that moment for maintaining or advancing their social standing.

Rice, Prudence (Southern Illinois University) and Don Rice (Southern Illinois University)

[413] *Ixlú: A Postclassic Entrepôt on Lake Petén Itzá*

Ixlú, occupied from pre-Mamom times through the late seventeenth century, is a relatively small site on the isthmus between Lakes Petén Itzá and Salpetén. This siting conferred a strategic advantage for monitoring movements of goods and people. Just southwest of Ixlú, pairs of raised jetties or wharfs modified the lower courses of the Ríos Ixlú and Ixpop and extended into the eastern end of the main body of Lake Petén Itzá. These large, wide channels likely served as port facilities and could handle canoe traffic of different drafts; Itza canoes could hold up to 40 persons. We propose that in the Postclassic through Colonial periods Ixlú was an entrepôt: an intermediate transshipment point in long-distance trade. Ixlú and its facilities were controlled by the powerful Itzas, but at some point their eastern enemies, the Kowojs, allied with the Chak'an Itza faction to the west, challenged that control. With a substantial settlement at nearby Zacpetén, the Kowojs built a characteristic temple assemblage at Ixlú and established settlements on the northeastern shore of Lake Petén. The Ixlú port facilities were contested in the conflicts between the Kowojs/Chak'an Itzas and the Petén Itzas over Spanish demands for submission.

[306] *From A Forest of Kings to the Forests of Petén: The Mirador Group at El Perú-Waka'*

More than 10 years of research at El Perú-Waka', carried out under the co-direction of David Freidel and several Guatemalan collaborators, has resulted in a wealth of information about this ancient city and the role its rulers and residents played in the Classic Maya world. Enhanced through his work with Linda Schele, Freidel's persistent focus on the interplay between ancient history and archaeology—on stelae, buildings, and people—has shaped research at Waka', located in Guatemala's Laguna del Tigre National Park. The Mirador Group, one of the site's principal civic-ceremonial settings, was an initial focus for the El Perú-Waka' Regional Archaeological Project. While the Mirador Group's stelae are either blank or largely eroded, archaeological investigation of the monumental architecture has shed light on topics explored in *A Forest of Kings*, including the role of Teotihuacan, Tikal, and Calakmul in Classic period interactions. This paper will explore Waka's involvement in these relationships, particularly as evidenced by the Mirador Group's royal interments and the narrative figurine scene depicting an elaborate courtly ritual.

[305] *What's an (Archaeological) Peasant? Notes on Rural Subjectivities in Atlantic Africa*

This paper explores rural communities' historical relationships to state authority in the Siin province (Senegal). I engage with classic literature to examine how the concept of 'peasant' might be relevant to archaeological realities in Senegal's countryside during the Atlantic era, and how it might help to think about political identity among social actors chronically understudied (and under-documented) in the African past. I am interested in the term as one way to conceptualize the relations tying rural people with the various formation of power – pre-colonial, colonial and postcolonial – that governed

the Siin over the past 300 years. I lend special attention to the material worlds that peasants made and that mediated their experiences of centralized government. The landscapes fashioned over the centuries by collective labor and organization provide both a record of political relations in the past and a medium for their construction and negotiation. Specifically, I argue that peasant landscapes were a key vector of subjectification, through which people constructed themselves as members of communities of political feeling and crafted their relationship to the state. Historically, peasant landscapes appear to have worked less as avenues of subjugation than as conflicted spaces that frequently collided with state rule.

[301] *Using PXRF Technology to Aid in the Recovery and Analysis of Human Remains*

Excavation and analysis of human remains from the Milwaukee County Institution Grounds Poor Farm Cemetery (MCIG) provided an opportunity to test the effectiveness of portable X-ray fluorescence (pXRF) as both a field and laboratory tool. During the fieldwork portion of the project, excavations exposed soils that visual inspection suggested might harbor a concentration of toxic materials. PXRF was used on site to determine the nature of the potential toxins and determine the risk factor associated with continued excavation. Subsequent laboratory analysis used the pXRF analyzer in two separate instances. First, elemental composition of excavated soil samples was identified to determine background levels of soil constituents that might produce diagenetic changes in human skeletal remains. Second, the MCIG excavations recovered 77 instances of commingled human remains representing multiple individuals. This paper reports the results of a pilot study to use pXRF as an aid in identifying commingled bones from MCIG interments as belonging to specific individuals.

Richards, Nicholas (University of Wisconsin-Milwaukee)

[301] *MCIG according to MCIG: historic document research*

The Milwaukee County Institutional Grounds Cemetery in Wauwatosa, WI, operated under the administration of the Milwaukee County Institutions, which prepared official reports for submission to the Milwaukee County Board of Supervisors. These primary documents survive in varying degrees of completeness at repositories across Milwaukee and include evidence of the mortuary activities of County institutions that may have buried individuals under institutional care at the MCIG cemetery. Submitted annually by law, the reports offer an 'official' picture of institutional operations and the population therein to compare with the archaeological understanding of the cemetery. Statistical and prose reports evidence the institutional process by which the cemetery was created. Intake and outtake statistics record age, nationality, occupation, and religious affiliation, drawing a demographic portrait of aid-seekers at various institutions over time. Tallies of coffins built, burials conducted, County-related post-mortems, Hospital and Home for Dependent Children deaths, and fulfillment of the religious needs of those served by the County can be accounted for in the County's official

documents. Taken together, these documents give a contemporary picture to compare with the archaeological evidence.

Richards, Patricia (University of Wisconsin-Milwaukee)

[301] *Here Lies.... You Know, Weaver, I've Forgotten Who We Just Buried: The Milwaukee County Poor Farm Cemetery Project*

The Milwaukee County Poor Farm Cemetery Project was initiated in 2008 and is a collaborative effort of the UW-Milwaukee Archaeological Research Laboratory, UW-Milwaukee Anthropology Department graduate students, UW-Milwaukee Undergraduate Research Opportunity Students, and the staff of Historic Resource Management Services (now UWM-CRM). In 2008 UWM Archaeological Research Laboratory applied for and was granted by the Wisconsin Historical Society final disposition of all human remains, personal artifacts, burial hardware, field notes and field images associated with 1991 and 1992 excavations of human remains at the Milwaukee County Institutions Grounds-Froedtert Tract (site # 47 MI 527). In 2013, Historic Resource Management Services of the University of Wisconsin-Milwaukee recovered an additional 640 individual coffin burials representing over 700 individuals from the Milwaukee County Institution Grounds (Froedtert Tract) Poor Farm Cemetery. This paper provides a summary of the overall progress of the project as well as the preliminary results of analyses of human remains and material culture recovered as a result of the 2013 excavations.

[235] *Public Archaeology in a Digital Age: An Overview of My Research*

This paper examines the impact of the democratic promises of Internet communication technologies, and social and participatory media on the practice of public archaeology in the UK. This work is based on my doctoral research undertaken from 2010-2014 and addresses the following issues: the provision of authoritative archaeological information online; barriers to participation; policy and organizational approaches to evaluating success and archiving; community formation and activism, and the impact of digital inequalities and literacies. This research was the first overarching study into the use of participatory media in archaeology. It is an important exploration of where and how the profession is creating and managing digital platforms, and the expanding opportunities for networking and sharing information within the discipline, against a backdrop of rapid advancement in the use of Internet technologies within society. It demonstrates that archaeologists do not yet fully understand the complexities of Internet use and issues of digital literacy, the impact of audience demographics or disposition towards participation in online projects. While recognition of democratic participation is not, on the whole, undertaken through a process of actively acknowledging responses to archaeological information, there remains potential for participatory media to support and accommodate these ideals.

[294] *Environmental Implications of Marine Bird Remains in the Late Holocene of Pinnacle Point*

Marine bird remains are common in late Holocene coastal sites in South Africa. The Pinnacle Point Shell Midden Complex (PPSMC) is such a site. Marine bird remains from the PPSMC were studied to better understand their role in the foraging and mobility patterns of late Holocene stone age people on the Mossel Bay coast. The PPSMC has four separate excavation areas and marine bird remains are present and were studied in each. Microscopic analyses for signs of surface modification proved to be difficult as root damage was extensive. However some signs of cutting and tool manufacture were found. Research of modern bird wash-ups by Avery have shown that certain marine bird species are more commonly found washed out along the South African coast during

certain times of the year. A comparison of the PPSMC analyses to these modern data shows that the four excavated areas were exploited on a seasonal basis. The strong seasonality of marine birds provided a predictable food and raw material resource for hunter-gatherers.

Richards-Rissetto, Heather (University of Nebraska-Lincoln)

[100] *A 3D Landscape Analysis of Stelae Visibility at Copan, Honduras*

From the early 5th to early 9th centuries, a dynasty of sixteen kings ruled at the ancient Maya site of Copan, Honduras. In the mid-7th century, Chan Imix K'awiil, or Ruler 12, is believed to be the first of Copan's rulers to erect stelae outside the city's main civic-ceremonial group. Why did he do this? Did these stelae exist as solar markers? Did they serve as territorial markers? Or, were they part of a communication system? Scholars have set forth these and other hypotheses, to explain the purpose of the valley stelae. In this paper, we use traditional Geographic Information Systems (GIS) and the MayaArch3D WebGIS to perform visibility studies using GNSS GPS data of the stelae and terrain modeled from airborne LiDAR data. We then evaluate our results using additional archaeological and iconographic data in relation to existing hypotheses and explore new potential interpretations for the placement of these stelae in the Copan Valley.

[191] *Cultural Evolution in Archaeology*

Models of cultural evolution aim at a process level understanding of cultural change and gene-culture coevolution. The micro level foundations of these models can be tested in the lab and field on living populations and, in favorable circumstances, with fine-grained archaeological data. Macro scale problems can only be studied by fitting models to historical and archaeological data that can resolve patterns on time scales of a century or more. Progress in two areas in particular is contributing to making this project feasible. First, improvements in dating resolution and increases in the spatial and temporal resolution of the archaeological record are making it possible to generate high quality quantitative databases that resolve the longer time scales. Second, increased computing power and improvements in statistical methods allow us to fit competing evolutionary models directly to this data.

[105] *Small, But Not Insignificant: Human Subsistence, Ecology, and Land Use on Anacapa Island, California*

Anacapa Island (2.9 km²) is the second smallest of California's Channel Islands and has limited freshwater and terrestrial biodiversity. Called 'Anayapax, a word meaning deception or mirage, by the Chumash, archaeologists have long speculated that the island was occupied seasonally or as a stopover by people based on the mainland or other islands. Here, we focus on our recent archaeological research at CA-ANI-2 and other Anacapa sites. Occupied between about 3130 and 2750 cal BP, CA-ANI-2 contains diverse faunal and artifact assemblages, including the remains of whales, pinnipeds, deer from the mainland, a variety of marine fishes, and unique chipped stone and bone tools. Stable oxygen isotope data suggest that mussels deposited at CA-ANI-2 were harvested during all seasons of the year. When placed in the context of other archaeological sites on Anacapa

and Santa Barbara islands (2.6 km²), these data suggest that, despite their small size and perceived marginality, both of these islands played an important role in larger Native America interaction spheres and settlement/subsistence systems.

Riebe, Danielle (University of Illinois at Chicago)

[391] *Exploiting, Exchanging, and Establishing Boundaries: Lithic Trade during the Neolithic on the Great Hungarian Plain*

There has already been extensive analysis of Late Neolithic material culture on the Great Hungarian Plain. Much of that research, however, typically has been restricted to one site as opposed to multiple sites within a region. This paper explores assemblage variation in lithic materials from multiple sites across the Plain. By identifying differences in lithic materials, one can assess the extent to which lithics either reflect or even potentially reinforce social boundaries. In addition, building off of a study assessing ceramic stylistic and compositional variability from this period, this paper addresses how patterns of lithic long-distance trade and exchange relate to short-distance trade and exchange of ceramics in order to discern socio-cultural boundaries in the past.

[181] *Upper Paleolithic Use of Space at Riparo Bombrini (Balzi Rossi, Italy)*

We present an analysis of the spatial distribution of various features (hearths, dripline, etc.) and of four broad artifact classes (lithics, fauna, ochre, shell) in the proto-Aurignacian levels of Riparo Bombrini. The site is a collapsed rockshelter in the Balzi Rossi site complex and is interesting in part for having yielded very late Mousterian and very early proto-Aurignacian levels. The site thus offers an ideal setting in which to study behavioral differences between late Neanderthals and early Homo sapiens in this part of the world. Our analysis comprises complementary multiple levels of resolution: visual; density; and unconstrained cluster analyses are performed to tease out 1) whether evidence of spatial segregation of activities is visible; 2) whether these activity areas are recurrent over time; and 3) what may cause this variability. We conclude with a discussion of what the patterns seen at Bombrini mean for our construal of Upper Paleolithic behavioral strategies and of how to best integrate spatial analysis with other lines of evidence to do so.

Rieth, Christina (New York State Museum)

[43] *Public Engagement and Compliance Archaeology in a Museum Setting*

Public engagement in compliance archaeology is inherent in Section 106 of the National Historic Preservation Act as well as many state historic preservation ordinances. Engagement in publically funded projects allows those who pay for the research to share in the project results but also provide information as stakeholders of the past. Although such regulations provide for public engagement, the process and type of involvement varies by project, geographic area, and archaeological resource. This paper provides an overview of the benefits and challenges of public engagement and the need to diversify engagement strategies to serve the various publics encountered by compliance archaeologists. The importance of including a plan for engagement into scientific research designs is discussed along with the need to consider engagement both during and after the completion of fieldwork. Examples of public engagement from state and federally funded compliance projects in New York are provided.

[191] *The Origins and Distribution of Oceanic Agricultural Techniques Revealed through Comparative Phylogenetic Analysis*

Agricultural innovation fueled the development of Oceanic societies. Techniques such as pond-fields and lithic mulching increased yields and made marginal landscapes habitable. Unfortunately, our knowledge of the evolution of techniques, including ancestral states, homologies, and independent inventions has been largely speculative. Here we present a phylogenetic analysis of ethnohistorically and archaeologically documented agricultural techniques across Oceanic societies. The analysis combines linguistic trees as models of population history with agricultural technique data to explain the evolution of techniques across Oceania. Results have implications for explaining prehistoric interaction, variation in social complexity, and the concept of Polynesia as a monophyletic cultural unit.

[15] *Innovative Applications of Archaeological Perspectives: An Analysis of Home Front Material Culture within the Context of Individual vs. Municipal Investments in Oakland, CA*

Through the growth and development of satellite imagery and panoramic street photography championed by Google Earth, a mass archive of accessible imagery has been created documenting intimate material worlds frozen in space and time. Utilizing these newly available forms of public data, our team (built of one historical archaeologist, one GIS technician, and one statistician) conducted a virtual pedestrian survey of 1000 randomly selected home fronts in Oakland, California, implementing a five-facet rating scale to document evidence of resident investment. Personal investment was compared to city investment to test for bias in use of replacement strategies within negatively characterized neighborhoods as opposed to refinement within positively characterized neighborhoods. We argue that through innovative selection of subject material, interdisciplinary collaborations, and the utilization of all available tools, historical archaeology will continue to expand in scope and relevance.

[272] *Plants in a Day: A Cost Distance Analysis of Single Day Distance to Floral Resources of the Ancestral Puebloans at Goat Springs Pueblo (LA 285)*

The way in which groups interact with their surrounding environment can provide insight into the importance of natural resources for a social group, despite having a large reliance upon cultivation for subsistence. For this study the landscape around Goat Springs Pueblo (LA 285) was analyzed to identify accessible botanical resources for the pueblo's inhabitants. Current research has indicated that abiotic natural resources were not frequently accessed, therefore site use may have been related to biotic resource availability. Through cost distance analysis in a geographic information system, in tandem with data from the Ecological Site Description System and the Terrestrial Ecological Unit Inventory, a single day foraging area was digitally replicated around the pueblo. Results indicate that Goat Springs Pueblo's unique location allowed access to elevation-based environmental gradients, both north and south of the pueblo, in addition to grassland and shrubland plant communities that bisect the foraging area. More specifically the cost catchment indicates access to large stands of an ethnographically important winter food staple: piñon pine (*Pinus edulis*) nuts. Finally, results indicate that ease of access to stands of Douglas fir (*Pseudotsuga menziesii*), an important construction material, may have further predicated the site's positioning.

[164] *Preservation of Faunal Remains from an Underwater Cavern, Padre Nuestro, Dominican Republic*

Between 2005 and 2010, Indiana University dive teams performed surface collections at the entrance chamber to Padre Nuestro Cavern, a submerged limestone cavern located in the East National Park in the southeastern peninsula of the Dominican Republic, where they recovered Taino

ceramics, Casimiroid lithics, and many faunal remains including two extinct sloth species (*Acrotocnus* ye and *Parocnus* serus), an extinct platyrrhine monkey (*Antillothris bernensis*), and other commingled bones including sloth, bird, bat, fish, rodent, and insectivore. The faunal remains were sent to the Human Origins and Primate Evolution Laboratory at Indiana University for preservation. Water can have a negative impact on the preservation of bone, sometimes causing cracking and flaking. This poster details the preservation process applied to the monkey specimen along with the commingled remains. The specimens were immersed in distilled water for 30 days, changing the water every 10 days, in order to dissolve impurities within the bones. The next stage involved submerging the bones in increasingly concentrated solutions (10%, 20%, and 50%) of polyethylene glycol (PEG) 4000 over a period of 30 days. They were then allowed to dry. Overall, the process proved successful in stopping or slowing down the deterioration of the bone.

Riley, Tim (Prehistoric Museum @ USU Eastern)

[352] *Revisiting the Stylistic Similarities of Utah's Barrier Canyon and Texas' Pecos River Murals*
 Polly Schaafsma was among the first to recognize the many stylistic elements shared between Utah's Barrier Canyon rock art and the Pecos River style along the Lower Pecos Canyonlands in Texas. While the Barrier Canyon murals are markedly simpler in execution, common elements include anthropomorph shape and torso decoration, composed sets of zoomorphs, and the depiction of wild plants. During this initial study, Schaafsma (1971) defined the Barrier Canyon style based on nineteen sites located in the San Rafael Swell and the associated Green River desert. Since that time, many more Barrier Canyon panels have been located in this region of the Colorado Plateau. This paper reevaluates the argument of stylistic similarity between these two styles in light of this broader data set. The recently published optically stimulated luminescence (OSL) dates of the type site in Horse Canyon will also be incorporated into a discussion of the cultural association of the Barrier Canyon style and possible temporal variation within the style.

[190] *Recent Applications of Micromorphology to Cultural Resources Management in the Pacific Northwest*

Solving geoarchaeological questions in a cultural resources management (CRM) context can be difficult due to time and budget constraints. In the Pacific Northwest, however, recent projects have fortunately allowed for some micromorphological analyses. Paul Goldberg has championed micromorphology as a valuable geoarchaeological method over the past three decades. The micromorphological analysis of shell middens, peat deposits, and alluvial sediment in and around the Seattle, WA area has elevated the resulting cultural resources assessments and data recovery reports. The conclusions drawn from these micromorphological analyses can be applied to both academic research and the private sector. If time and money for geoarchaeological analysis, such as micromorphology, can be built into CRM schedules and budgets, then CRM archaeologists can continue to produce useful and sophisticated scientific reports while conducting business. This presentation provides examples of the successful application of micromorphology to specific geoarchaeological research questions asked in CRM. Examples come from the Paleoindian Bear Creek site in Redmond, the Cattail Lake midden on the Bangor Naval Base, and Foster Island in Lake Washington. This talk also includes special thanks to Paul for teaching me how to collect and process micromorphology samples and for sharing his knowledge and mentoring me along the way.

Rincon Mautner, Carlos

[193] *Ritual Constructions of the Mesoamerican Underworld View in the Caves and Cavates of the Southern Mexican Highlands: An Exploration of Changing Functions and Meanings*

This presentation explores the diachronic significance and variety of ritual uses assigned to caves and cavates by the peoples who lived in what is now southern Puebla and northern Oaxaca, Mexico from the Archaic through the Early Colonial Periods. The existence of distinct ritual complexes for different time periods suggests changing functions and meanings, which are inferred from

archaeological artifacts, parietal pictograms and petroglyphs for different caves, and documentary sources. These cave ritual complexes focused principally on cosmogonic, fertility/generative, propitiatory, mortuary and socio-political foundational themes. Caves also served to introduce Christianity to the native peoples.

Ringberg, Jennifer (California State University - Stanislaus)

[404] *Ceramic Petrography and Early Intermediate Period Interaction in the Moche Valley, Peru: Current Understanding and Future Research*

Understanding the spatial distribution of pottery styles in combination with pottery composition and raw materials availability can help illuminate networks of interaction among groups at a regional scale. My research focuses on distinct pottery styles of the middle and upper Moche Valley that had wide distribution during the Gallinazo and Early Moche phases. The pottery assemblage from three large, high status households at Cerro León (A.D. 60 to 350, 2 sigma cal.) in the middle Moche Valley demonstrated that imported highland pottery was integral to particular activities, especially feasting, spinning, and certain daily food processing and storage activities. However Cerro León's relationship to contemporary sites in the valley during this dynamic period remains unexplored. The data presented in this paper represent initial efforts to understand the composition of stylistically similar pottery assemblages from eight sites in the upper middle Moche Valley. Context and contemporaneity must be confirmed, but preliminary results indicate broad technological similarities with possible differences in paste composition that may indicate local variation in manufacture.

Ringelstein, Austin

[27] *Turning "Crisis" into Opportunity: Rediscovering and Reconnecting with a Colonial Era California Collection*

In the late 19th century museum collectors recovered an abundance of cultural materials from the Channel Islands and dispersed them to national museums. Although they recorded important ethnological observations, their practices were often not in the best interests of native peoples or even academics. Many of the artifacts were stored without provenience information and in many ways disregarded. However, the unique preservation of legacy collections provides an excellent opportunity to recover valuable information without filling more valuable space on repository shelves. Institutions such as the Peabody Museum of Archaeology and Ethnology are supporting research of such collections. Current research on the Schumacher Collection aims to rediscover the material practices of the Tongva people on Catalina Island. Many of the artifacts embody how the Tongva were integrating local and non-local materials as new people were arriving on California shores. Although these artifacts were originally removed from their community, they now offer a fresh chance for archaeologists to help reconnect native peoples with the brilliant traditions of their ancestors.

[157] *Precolumbian Monumentalism and Social Structuration: Geospatial Modelling of Relative Accessibility as a Proxy for Emergent Territoriality among the Southern Proto-Jê*

How did southern proto-Jê mound and enclosure complexes (MECs) in the eastern La Plata basin structure their social landscapes? MECs possess a broad geographical distribution from the banks of the Rio Paraná to the Atlantic mountains of southern Brazil, as well as a variety of configurations, relative densities, and sizes. Discussions of their functions have emphasized their implications for the perception of social inclusion/exclusion among the groups that constructed them. Archaeological evidence from them has been linked to the emergence of kin-based socio-political hierarchies, based on commensal relations established through feasting practices.

To date, however, the effect and presence of MECs in their broader environmental settings has not been studied through formal and statistically robust spatial analytical techniques. This research employs simulation and modelling in order to enable the analysis of the relative accessibility of MECs, and, describe their relationship to their social environment in clearer terms. Ultimately, the goal will be to establish a framework within which competing hypotheses on the interpretation of the material record may be tested. The findings of the simulations are placed within the context of our archaeological understanding of precolumbian complexification and anthropological explorations of territoriality. Correlations with settlement data are also proposed.

[185] *Multi-Tiered Proveniencing Analysis of Early Holocene Radiolarite Artifacts from Northern Spain*

Radiolarite is a fossil-rich derivative of biogenic chert found in isolated geologic formations across northern Spain. This inconsistent presence on the landscape has often led archaeologists to misidentify it with other siliceous rock types. However, as the proveniencing of lithic raw materials increase in Spain, archaeologists are becoming more aware of radiolarite and its possible unique technological, typological, and social significance in prehistoric cultures.

This paper will present the results of a multi-tiered analytical program that combines the results of macroscopic, petrographic, and geochemical analyses to characterize and compare natural and human altered radiolarite samples from the northern coast of Asturias, Spain. Natural radiolarite source areas were identified, sampled, and analyzed from the montane and coastal region of eastern Asturias. Using the same analytical techniques, these results were compared to radiolarite artifacts originating from the Early Holocene assemblages in the El Mazo rockshelter site located in proximity to the identified source areas.

By establishing the geographic presence and geologic characterization of radiolarite, archaeologist will have new empirical data in which to help define how hunter-gatherer-fisher cultures: 1) organized stone procurement strategies, 2) moved and settled across the landscape, and 3) utilized stone material in a sociocultural context.

[413] *Shifting Tides along the North Coast of Quintana Roo: Recent Research at Conil and Vista Alegre*

In the northern lowlands, there is strong evidence for a coastal Maya presence since at least the

Middle Preclassic, and scholars have long discussed how inland-coastal connections served as a catalyst for the development of social complexity. The scope and scale, however, of maritime commerce and interaction was closely linked to the ever-changing political and economic landscape. The work of the Proyecto Costa Escondida at the neighboring port sites of Conil and Vista Alegre highlight the shifting nature of coastal-inland relations over millennia. During the Terminal Preclassic and Early Classic periods, both Vista Alegre and Conil appear to have been involved in robust trade with regional inland polities, which may have been facilitated by seasonally navigable interior waterways as well as overland routes. The parallel occupational histories of these sites, however, diverge in the Terminal Classic. The Terminal Classic period at Vista Alegre was characterized by participation in larger peninsular networks of exchange, controlled or influenced by more distant polities, like Chichen Itza. In the Late Postclassic period, while Vista Alegre was largely abandoned, the coast remained a dynamic locale as evidenced by the reoccupation and growth of Conil into a large center at the time of Contact.

[98] *The Power of National and State Engagement for Archaeology Education in Kansas*
 Kansas has played a synergistic role in Project Archaeology for more than a decade. Archaeologists in the state linked with educators as early as 1992, disseminating curriculum materials as part of Kansas Archeology Week. An early focus on shelter played a key role in the development of national Project Archaeology's first Investigating Shelter unit, drawing on a Kansas example. Since then, the Kansas Historical Society has adopted the national themes of shelter, food and culture, and migration to create state-specific units. The relevance of these units to current educational goals (Kansas College and Career Ready Standards/Common Core) makes them flexible and attractive to both educators and students. Today, Project Archaeology is spreading in the state through a variety of partnerships and teacher contacts in workshops, in-service trainings, and university courses, resulting in the adoption of Project Archaeology materials in K-12 districts, classrooms, virtual schools, home schools, and informal educational settings.

[410] *Un estudio sobre la iconografía de los huesos grabados de la Mixteca Baja*
 Los huesos humanos grabados, encontrados como ofrenda en depósitos funerarios, representan un marcador especial del gremio sacerdotal de la sociedad del Oaxaca antiguo. Por un lado, al ser huesos humanos, establecen un lazo con los ancestros del grupo; por otro, la imaginería que muestran permiten establecer el tipo de rituales y oblaciones a los que estaban dedicados. Más aún, estos objetos eran considerados como reliquias y en algunos casos se les ilustra en la imaginería de los códices posclásicos. En este trabajo se analizan unos ejemplares procedentes del sitio clásico de Cerro de las Minas, en Huajuapán y de Tonalá; en ellos es representativa la iconografía ñuiñe y por el contexto de las piezas es posible determinar el rol y papel que sus poseedores tuvieron en la estructura social mixteca.

[141] *Paleosols and Human Activities in the Lakebed Area of the Basin of Mexico during the Middle Holocene*

During 2013-2014, archaeological research was undertaken in San Gregorio (Xochimilco) and Tepexpan, Basin of Mexico, to recover evidence for human activity associated to the preceramic period in the lakebed area of Chalco-Xochimilco and Texcoco. One of the specific objectives of this

research is to characterize soil conditions north and south of modern Mexico City during the early agriculture period (6500-4000 BP) by means of paleopedological analysis, and evaluate environmental and anthropogenic processes involved in site formation using micromorphology, pollen, phytoliths, and stable isotope analysis. These data will be correlated with human activities in both sites, the introduction of domesticated plants and the effects of management by human groups on the lacustrine environments before the first villages in the region were established.

[290] *Una experiencia personal en el descubrimiento de la arqueología: mi voz como ciudadano*
Un interés personal por la historia me llevó a buscar cómo entender mejor mi presente, aprendiendo sobre los errores y los éxitos de nuestro pasado. La creación de las investigaciones de Ciudadano Científico coordinadas por Para la Naturaleza da oportunidades al público para obtener experiencia en varias áreas de la naturaleza y personalmente me abrió las puertas hacia el mundo de la arqueología. Mi experiencia en la investigación Descubriendo Nuestras Raíces y en proyectos anteriores del programa de Ciudadano Científico inspiró a enfocarme en la arqueología como campo de investigación y así poder re-descubrir un pasado poco conocido. Esta perspectiva multidisciplinaria me ha dado la oportunidad para estudiar y presentar mi perspectiva dada por las experiencias personales en otras actividades tales como estudio de cuevas y cavernas, flora y fauna, viéndolo todo no solo como actividades recreativas, sino como una posibilidad de contribuir a la ciencia, uniendo disciplinas que antes yo no relacionaba. Esta experiencia me ha permitido comprender la relación entre la naturaleza y la arqueología. Esta ponencia presenta mi perspectiva sobre el conocimiento adquirido a través de la investigación e interacción con las personas me dieron la inspiración y vías necesarias para aprender y compartir sabiduría.

Rivera-Collazo, Isabel (University of Puerto Rico, Rio Piedras)

[290] *Codes of Ethics and Archaeology in Practice: "Communal Archaeology" and Citizen Science towards the Advancement of the Discipline*

Adherence to codes of ethics is central to successful and respected practice of archaeology. The SAA's Code of Ethics includes eight principles that address critical broad issues, including the importance of in-situ long-term conservation and protection of archaeological sites (Principle 1), establishing beneficial working relationships with all parties (Principle 2) and the importance of public outreach (Principle 4). Even though, as members of the SAA, we agree that these principles are the best standard to which we should all aspire, in practice it is not that simple. In this presentation I argue that the practice of community archaeology, from the Latin American perspective of "communal archaeology", and the opportunity of informal education provided by citizen science, can help us comply with all the Principles. While practicing communal archaeology, the archaeologist as expert can demonstrate ethical behavior to the public without restricting access to the archaeological heritage or the production of knowledge. I propose that this approach can help reduce destruction of sites by shifting public perception of archaeology from a selfish endeavor (go, excavate and disappear) to a communal work for the recovery of lost pieces of history that belong to the community, and they are part of the process.

[290] *Chair*

Rivers Cofield, Sara (Maryland Archaeological Conservation Laboratory) and Jodi Reeves Flores (Center for Digital Antiquity)

[123] *Evaluating a Cooperative Approach to the Management of Digital Archaeological Records (ECAMDAR): A Defense Legacy Project Assessing tDAR for the Department of Defense*

The Maryland Archaeological Conservation Laboratory (MAC Lab) and the Regional Archaeological Curation Laboratory (RACF) in Ft. Lee, Virginia are archaeological repositories that meet high professional standards for the care of artifacts and paper records. Unfortunately, neither facility has

the expert technical staff and specialized infrastructure necessary to qualify as permanent repositories for digital records, despite the exponential rise in site documentation that exists in digital form only. This project is designed to test tDAR as an alternate repository for digital records held by the MAC Lab and RACF on behalf of 25 different military installations in Maryland, D.C., and Virginia. Of paramount importance is determining whether tDAR can strike a balance between accessibility and the stringent security that many DoD installations require in a way that is cost-effective and applicable to many different kinds of installations. The project results are positive, and the procedures developed to address the 25 installations included in this project have therefore been converted into standards and recommendations for the DoD as a whole. Ultimately, the project participants hope to impact DoD policy so that their irreplaceable archaeological data will be protected regardless of its form.

Rizvi, Uzma (Pratt Institute)

[142] *Harappan Urbanites: Standardization, Ratios and Subjectivity*

Hallmarks of the third millennium B.C.E. Harappan civilization include baked bricks, weights and measures, and water wells, which index centralized control, civic management and urban planning. In this study, I aim to locate the Harappan in a Harappan urban environment. I will consider the ways in which the use of space, design, and architecture may inform the constructions of self. Furthermore, I will interrogate the ancient urban form by considering ratios and standardization as a means to construct an ideal ancient urban subject. The co-production of politics and technology in relation to the construction of self will be of central concern. These urban subjectivities should not be read as passive constructions of the self, rather as active decisions to maintain a cosmopolitan and urban sensibility. Through an investigation of how the self may be constructed, and the ideals linked to that self that are being encouraged by the production of space, questions related to Harappan political structures will be addressed.

Roberts, Charlotte (Durham University)

[299] *The Potential and Challenges of Constructing a Bioarchaeology of Care for a Person with Leprosy in the Late Medieval Period*

Everybody suffered ill health at some point during their lives in the past. In late medieval England (12th-16th centuries A.D.) historical data suggest the availability of care and treatment of disease, but it is unknown how many, and which, people got access to care. There is also little direct evidence of specific care seen in skeletal remains beyond trepanation, amputation, and dentistry. Using the 'Index of Care' (IoC; Tilley and Cameron 2014), this paper describes bone changes of leprosy in a middle aged man from a late medieval leprosy hospital that functioned in Chichester, Sussex, England. Potential 'disability' (life experience) is assessed through applying signs and symptoms to the man, based on the bone changes, and attempting to construct a model of care. Likely and uncertain interpretations of the data are provided, along with the type of care that would have been needed for the 'patient'. It is emphasized that the IoC is a more objective method to use for inferring care, yet every person experiences even the same diseases in different ways and would not necessarily have required the same kind of care. 'One size cannot fit all'; a personalized approach through an osteobiography is recommended.

Robertshaw, Peter (CSU San Bernardino), Laure Dussubieux (Field Museum, Chicago) and Freda Nkirote (National Museums of Kenya)

[194] *The Explanation of Ceramic Variation in East African Prehistory: New LA-ICP-MS Results from Gogo Falls, Kenya*

Two of Frannie Berdan's abiding research interests are the concept of ethnic identity and the application of scientific analyses to archaeological problems. These two topics intersect in research on pottery in East Africa. Pioneering work in the 1970s by Simiyu Wandibba led to the recognition of several ceramic 'wares' represented among Neolithic and later assemblages from Kenya and northern Tanzania. The occurrence on some sites of more than one ware in the same occupation horizon challenged conventional culture-historic frameworks and prompted a long-lasting debate with

opinions ranging from claims that the initial analyses were flawed and that a traditional culture-historic framework could be constructed to a view that the ceramic variation found in East Africa was unique. While theoretical advances in our understanding of both ethnicity and ceramic variability has led to more mature discussion, there has been little progress in understanding East African ceramic variation, perhaps because no new analytical tools have been used. We report here results of chemical analysis of 94 sherds of three different Neolithic and two different 'Iron Age' wares from Gogo Falls in Kenya. The compositional analyses of these ceramics represent a first step in opening new avenues of inquiry.

[413] *Prospering in Place: Cerro Maya and the Late Preclassic Exchange Networks*

Cerro Maya, located on Lowry's Point at the southern edge of Chetumal Bay in northern Belize, sits at a strategic intersection between riverine and coastal transportation routes used by the Maya from Preclassic times onward. Evidence suggests a major dock facility was the first monumental construction undertaken during the initial Late Preclassic occupation, indicating the site was intentionally founded to mediate access to interior sites on the two principal river drainages in the region for purposes of exchange with coastal traders transporting goods from all over the Maya Lowlands. During the 100-150 years of Late Preclassic occupation, the diversity of the ceramic inventory and comparative richness of the material remains evinces interactions with sites on the Northern Plains of Yucatan, as well as central Peten and the Central Karstic Uplands. Cerro Maya flourished during this era, developing from a small village of perishable structures next to a monumental dock into an important center with monumental architecture remembered well into the Postclassic era.

[196] *The Antigua Valley, Guatemala: Dating and Contexts of the Middle Preclassic Period*

Evidence of sedentism in the Antigua Valley begins in the Middle Preclassic Period at the archaeological sites of Urias and Rucal, located at the head of a corridor to the Pacific coast. This area has evidence of mobile Early Preclassic peoples as early as 1400 B.C. Middle Preclassic finds at Urias and Rucal include middens, bottle-shaped pits, stone markers, platforms, a burial, and pottery similar to Charcas types from Kaminaljuyu and Naranjo. Radiocarbon dating and stratigraphy could support interpretation of settlement beginning at 800 B.C., rather than 1,000. B.C. This later date would suggest discontinuity with the Early Preclassic remains.

Robinson, David (URI-GSO), Doug Harris (NITHPO) and John King (URI-GSO)

[243] *Identifying Submerged Paleocultural Landscapes: A Collaborative Archaeological Approach*

Narragansett Indian Tribal oral history relates to us that “More than 15,000 years ago, the ancient villages of the Narragansett were out where the ocean is now. The waters began to rise overnight and the people had to abandon their homes.” This Tribal oral history echoes the regional geological record indicating that at the time of the last glacial maximum, ca. 24,000 years ago, what are now the Atlantic waters of Rhode Island and Block Island sounds were part of a subaerially-exposed continental shelf that was an open vegetated plain available for ancient human habitation. Since 2012, a research team from the University of Rhode Island's Graduate School of Oceanography and the Narragansett Indian Tribal Historic Preservation Office has been working collaboratively in the Atlantic Ocean off Rhode Island's coast on a 4-year BOEM-funded study designed to assist with the development of protocols for identifying submerged paleocultural landscapes and the ancient Native American archaeological sites they may contain. This paper will present our initial methodological approach and preliminary results from these ongoing investigations, as well as provide some insights about what has been learned along the way regarding the integration of marine geoarchaeological research with Tribal knowledge, perspectives and concerns.

[298] *Images of Death in Offering 141 of Tenochtitlan's Great Temple: Human Sacrifice and the Symbolism of Effigy Skulls*

Offering 141 is one of the numerous deposits found at the Great Temple of Tenochtitlan that contain the remains of decapitated individuals associated with the Mexica practice of human sacrifice. After the immolation of men, women, and children, their heads underwent various cultural treatments in order to be utilized by the city's priests in specific rituals. Although some of these severed heads were buried shortly after death to consecrate the building, others were transformed into effigies of defleshed beings that represented earth and death deities. This paper presents the results of osteological and symbolic analyses of the seven skulls found in Offering 141, which are characterized by their magnificent conservation and for preserving sufficient polychromy to generate a graphic register and pictorial reconstruction of their facial decoration. The skulls also were adorned with insignia of shell, pyrite, and wood, and were found associated in the context of skeletal sculptures, marine material, and animal pelts—ritual objects that help us understand the symbolism of the effigies represented.

[82] *Which Neolithic House? Pithouses and Pueblos in the U.S. Southwest*

The archaeology of the United States Southwest permits examination of the process of Neolithization with chronological precision in a wide range of contexts. In broadest outline, Southwestern data parallel social, economic and technological patterns documented worldwide. The recency, large sample, and fine resolution of Southwestern data allow recognition of multiple divergent and convergent patterns shaped by local environments and cultural traditions that are difficult to observe in other areas.

A major dimension of change in the Southwest is the architectural shift from semi-subterranean pit structures to individual, or more often conjoined surface pueblo buildings, the "pithouse to pueblo transition." While this shift is widespread in the Southwest, its timing, specific form, correlation with other aspects of Neolithization, and the degree to which the transition occurs all vary. I suggest that the pithouse-pueblo contrast helps to disaggregate some of the closely linked variables that are often thought of as part of a single Neolithic "package." At the same time, variation within the pithouse to pueblo transition demonstrates how, despite the seemingly straightforward contrast between pithouses and pueblos, use of these architectural forms as proxies for other variables over-simplifies the interplay of processes that together constitute Neolithization.

Rockman, Marcy (U.S. National Park Service)**[83]** *A National Strategic Vision for Climate Change and Archaeology*

The US National Park Service (NPS) recognizes a two-fold relationship between cultural resources and climate change: climate change affects cultural resources, while in turn cultural resources contain invaluable information about long-term human capacity to adapt to changing climates. The NPS Climate Change Response Strategy (2010) set out four pillars of climate change response: science, adaptation, mitigation, and communication. Work is now underway to merge these two approaches, integrating the two-fold perspective of cultural resources with each climate change response pillar. The result is a full complex strategic vision for a national climate change and cultural heritage program. This paper walks out roles and examples of NPS archaeology in this program.

Roddick, Andrew (McMaster University)**[252]** *Chijipata Alta: Tracing A Genealogy of Potting Practice in the Lake Titicaca Basin*

Andeanists have produced rich ethnoarchaeological studies of specialized potting villages, yet up until now scholars have ignored contemporary ceramic production in the Southern Lake Titicaca Basin. This poster reports on recent work of the Proyecto Olleros Titicaca Sur (P.O.T.S.), a recently initiated project in the village of Chijipata Alta exploring the relationship of learning, identity, and social boundaries using both ethnographic approaches (participant observation, oral history, and videography) and archaeological methods (excavation, petrography, and radiography). This community of specialized "olleros" produces standardized forms and exchanges them throughout the altiplano. Three particular material traces associated with the life of these vessels resonate with ongoing archaeological research in the region: (1) The paste recipes, which are excavated from a long utilized and important clay quarry to manufacture the utilitarian pots. (2) The ash mounds that grow over many generations of pottery firings within and across the boundaries of this specialized community. (3) The fragments of Chijipata Alta produced cooking pots that are distributed across the larger South-Central Andes. I argue that the social dynamics behind these three variables provide valuable insights to ongoing archaeological research into issues of identity and social boundaries in the deeper past.

Rodgers, Kendra (Penn State)**[149]** *Using GIS in Archaeological Research: A New Look at Hunting Rock Art Sites*

Place, space, and movement are core concepts for analyzing how cultural behaviors of traditional

hunting societies shape a landscape. Sites mark the use of a landscape and connect people to particular events, movements, or places on this landscape. Analysis of rock art must consider who created and used this art and the roles it played in shaping landscape use. Panels depicting hunting scenes have been recorded at communal hunting sites, in rockshelters that served as habitation areas, and as isolated panels. Common archaeological evidence of hunting includes faunal remains, stone tools, architectural features, and topographic features that provide favorable vantage points. Notably, the presence of hunting images may be interpreted as overall evidence for hunting behavior, but unlike other artifacts are not individually interpreted as a sign of hunting.

Assuming these images played a role in hunting behaviors whether in the form of actual subsistence practices or hunting like rituals, I use spatial analysis and traditional archaeological methods to take a new look at the potential relationships between hunting-themed rock art locales and surrounding archaeological sites in the landscape at the Pinon Canyon Maneuver Site to gain insight into the placement of images and the land use of the area.

[81] *Conquistadores, Colonists, and Chiefdoms in Northern La Florida: Artifacts and Architecture at the Berry Site in Western North Carolina*

From 1566 to 1568, the northern frontier of the Spanish colonial province of La Florida was situated in western North Carolina. Members of the Hernando de Soto expedition traversed the province of "Xuala," in the upper Catawba Valley, in 1540, en route to towns on the other side of the Appalachians, in eastern Tennessee. Expeditions led by Juan Pardo between 1566 and 1568 visited many of the same places and provinces in the Carolinas and eastern Tennessee as the Soto expedition, including "Joara." Pardo established six outposts along what was intended to become an overland route connecting Santa Elena, the capital of La Florida in what is now coastal South Carolina, with New Spain and the Spanish silver mines of Zacatecas, Mexico. That overland route never materialized, but Pardo chose the Native American town of Joara as the location of his principal outpost (Cuenca) in the interior of La Florida, where he established Fort San Juan. Investigations at the Berry site—the location of Joara, Cuenca, and Fort San Juan—shed light on the sixteenth-century Spanish colonial presence in western North Carolina and responses by the people of Joara and other Native American towns to Spanish contact and colonialism.

[225] *Rock Art Heritage Conservation and Management*

The Gila River Indian Community is actively engaged in the inventory and documentation of petroglyphs located within the Community. These recording efforts also include oral history interviews with tribal members who have knowledge of the areas where the art occurs. Rock art sites include prehistoric and historic period figures, and they are found throughout the buttes and mountains surrounding the Middle Gila River. This art often occurs along trails, and in prominent locations such as mountain ridges or passes. Petroglyphs are associated with many areas that are sacred to the modern members of the Community, and most rock art sites are considered to be Traditional Cultural Properties (TCPs). Other goals of our work are to prevent rock art site damage, as well as to mitigate and restore damaged sites. Public outreach within the Community maintains and strengthens ties to the landscape. These efforts are also designed to facilitate access to sacred sites for elders as well as young people learning O'odham traditions. Heritage awareness fosters preservation and protection of these important locations. The Community is committed to a holistic

approach for the appropriate sharing of knowledge, while also safeguarding sacred and important places on the landscape.

[312] *Dog Coprolites as a Source of Dietary and Genetic Information at the Bridge River Site, B.C.*

DNA recovered from ancient coprolites can provide an important source of dietary and host information. In this study, ancient DNA techniques were applied to dog coprolites recovered from two pithouses at Bridge River, a complex hunter-gatherer village on the Fraser River, British Columbia. Dog mitochondrial DNA was targeted to assess the genetic relationship between the domestic dogs of Bridge River and other ancient and modern dog populations both locally and worldwide. Multiple *Canis familiaris* mitochondrial DNA sequences were recovered from the ancient remains, some of which matched sequences recovered from ancient dogs at other Pacific Northwest Interior Plateau sites. Mitochondrial sequences matching *Oncorhynchus nerka* were recovered from salmon bones within the canid coprolites, and from the coprolites themselves, indicating that domestic dogs at Bridge River had access to sockeye salmon. Whole genome analysis, followed by next-generation-sequencing on an Illumina MiSeq platform was also applied to investigate other dietary components, as well as the potential for obtaining host nuclear DNA from coprolites.

[15] *Microscale Geoarchaeology in a Historic Context: Soil Micromorphology Analysis with the Fort Davis Archaeological Project*

Microscale geoarchaeology, specifically soil micromorphology, has incredible potential for enriching archaeological understandings of the materiality of past experience through detailed information on the events, actions, and processes which create archaeological sites. Soil micromorphological analysis can parallel the strict time scales available through historic documentation with material evidence of specific human, non-human, and natural events. This paper shows how micromorphological approaches can be integrated into a historical archaeology project through examples from the Fort Davis Archaeological Project in Fort Davis, Texas. Micromorphological sampling during field season 2014 was crucial in understanding the development of archaeological sites excavated by the project, particularly in terms of deposition and the effects of water action on archaeological features. Furthermore, micromorphological analysis was incorporated into the analysis of living spaces and depositional practices at several sites analyzed by the project. Using these examples this paper shows how integrating microscale geoarchaeology within a historical archaeological framework provides a material and temporal correlate to historical and artifactual modes of analysis which are standard practice within historical archaeology.

[134] *Characterization of the Cerro de Oro Pottery Style*

This study focuses on the analysis of the ceramic material from the archaeological site Cerro de Oro, located in the Cañete Valley. While the Cerro de Oro pottery style has been defined previously in a generic way (Menzel 1964), this study seeks to reopen the investigation and conduct a deeper analysis with recently excavated material, which allows us to characterize it in itself. The aim is to define an iconographic program that allows us to compare and contrast it with popular styles from a defined time and space. Evidence from literature and preliminary studies show that styles from the Nasca, Wari and Lima societies are present in the ceramic of Cerro de Oro and would play an important role in the dynamics of defining the cultural identity of these societies during the late Early Intermediate and early Middle Horizon (550-750 A.D.)

[393] *Postconquest Figurines from Central Mexico: Aspects of Phenotype and Artifice*

This analysis focuses on figurines made after the Spanish conquest (1521 CE) of Mexico, based on the collections from three museums: the Hearst Museum, the American Museum of Natural History, and the Field Museum. The central questions address figurines as media that could potentially negotiate issues of racial (or casta) categorization, phenotype, and artifice. The figurines were collected and accessioned in the early 20th century, before the development of archaeological methodologies that pay close attention to context and stratigraphy. Therefore, they present serious challenges to chronology-building, to our knowledge of the sites where the figurines were collected, and to any determination of use of the figurines. Still, it is possible to address three basic questions regarding the figurines: 1) Do they portray what we would recognize as phenotypes or any other aspects of racial categorization? 2) Do they focus instead on what we would associate with ethnicity, including aspects of dress, hairstyles, and other material culture? 3) Were figurines media for conveying ideas about race or casta, ethnicity, class, or other social distinctions in postconquest Mexico? The figurines offer us a unique opportunity to understand how indigenous people portrayed aspects of ethnicity and casta in colonial and republican Mexico.

Rodríguez Zariñán, Nora (Universidad Nacional Autónoma de México)**[21]** *Parallels between Pseudo-Cloisonné and Huichol Votive Gourds: Iconography, Processing, and Disposal*

Pseudo cloisonné is a characteristic ceramic type of West Mexico. It has generally drawn the attention of researchers because of its complex iconography and elaborate manufacture, which have led many to regard it as a prestige/exchange good. The study of this ceramic type, supported by ethnographic analogy with votive gourd bowls produced by the Huichol of northern Jalisco, suggests the possibility that many pseudo-cloisonné pieces may not have been considered as prestige/exchange goods. The Huichol do not even conceptualize the votive gourd bowls as vessels for deities, but as the deities themselves. And then, the ethnography also supports the possibility that this pottery was manufactured in situ. This study shows how pseudo-cloisonné vessels and Huichol gourds share patterns of manufacture (with respect to both iconography and ceramic forms) and disposal (sherds in fill or whole vessels in ceremonial contexts), thus justifying the possibility that not only are these patterns shared between the vessels, but also the cosmogenic value that they possess. It is important to mention that these analogies are not trying to indicate a direct relationship between the groups involved. However, properly argued, this analogy provides an enlightening and clearer understanding of pseudo-cloisonné pottery.

Rodriguez-Rellán, Carlos**[137]** *Watch out for Rocks: a GIS and Agent-Based Modeling Approach to the Rock Art of Northwestern Iberia*

Geographic Information Systems and high-resolution cartography (LIDAR), together with Agent-Based Modeling, are used for assessing the traditional view of open-air rock art as an active element in the shaping of the prehistoric landscape. Petroglyphs have usually been thought to play a major role in the configuration of different significations of prehistoric landscapes, their location repeatedly analyzed in terms of spatial proximity with paths and resource-rich areas that would have been key for the local Neolithic and Bronze Age communities. Nevertheless, such considerations were often based on relatively shallow spatial analyses, which the importance of perceptibility of the engravings as a main element in determining their agency. The use of new GIS approaches to mobility and

perception, such as the density of potential pathways and the reverse viewshed analyses, together with the simulation of the processes of perception of rock art sites by applying Agent-Based Models, shall allow us to check the accuracy of the notion of rock art acting as a landscape marker linked to the so-called "geography of movement."

[124] *Using Archaeogeophysical and 3D Laser Surveying to Visualize an Integrated Landscape*
Archaeogeophysical and 3D laser scanning at the Old Fort Johnson National Landmark site in Fort Johnson, New York provides a case study for creation of an integrated landscape. The ability to digitally image above and below ground features creates a new way of visualizing an integrated landscape. Above ground remains of historic structures often appear out of their original context. Defensive elements, outbuildings, agricultural areas, ceremonial areas, walkways, and shape of the ground surface may be modified or removed. Evidence for these former features on the original landscape may appear in historic documents, artwork, photographs, collective memory, and beneath the subsurface. Archaeogeophysical survey, historic document research, and other archaeological methods have the ability to help us visualize the landscape in its original state, and address anthropological questions.

[245] *Paquimé and Diablo Phases at Paquimé: An Examination of Architectural Validity of Phase Declarations*

This paper will present on the results of statistically-based analyses of architectural data relating to the Paquimé and Diablo Phases at the site of Paquimé collected and published by Charles Di Peso et al. in 1974. A re-examination of the architectural data is necessitated as, in a methodology dissimilar to standard procedure, Di Peso utilized architectural attributes as a basis for phase differentiation. While prior statistical analysis (Frost 2000) has been applied successfully to architectural remains correlating to the Buena Fe and Paquimé Phases, no known successful statistical analysis of the Paquimé and Diablo Phases, nor division therebetween exists. The analyses undertaken have the dual objective of determining the validity of Di Peso's declaration of structures sans secure dating to either phase, and whether a phase distinction can be supported using architectural attributes. The results to be presented will assist in future understanding of the diachronic constructive history of structures at Paquimé, as well as that of individual architectural attributes and the frequency of their presence.

[313] *The Nicaraguan Rise and the Problem of Early Peopling of the Greater Antilles*

This presentation examines the patterns of interaction in the Greater Antilles at the time of early migrations, the sources of those population movements and the reasons behind them, with a special focus on the probable links between Lower Central America and the Western Caribbean, in light of recent research results from several academic fields, such as archaeology; aDNA studies; physical anthropology; toponomastics. It investigates developments that made possible such long distance maritime links and population movements. The Nicaraguan Rise – extending from Honduras and Nicaragua as far as Jamaica – with its numerous low-lying islands, provides both an ideal situation for island-hopping, and an extremely rich environment for economies based on fishing. If the sea level, as recent bathymetric studies have suggested, was just two meters lower than it is today in the period between 8 and 4 ka. years BP, many more islands would be exposed, providing early fishing communities with an easy island-hopping route towards the Greater Antilles. This hypothesis is in agreement with recent views, which analyze the process of island colonization as consisting of the phases of discovery, exploration, visitation, and year-round utilization, followed by seasonal settlement, and finally establishment, or permanent settlement.

[313] *The Earliest Dated Skeletal Remains from the Atlantic Coast of Nicaragua*

A recent discovery of a female skeleton from Monkey Point – a shell matrix site on the Atlantic coast of Nicaragua – represents the earliest confirmed evidence of the occupation of the region. In 2014, the skeleton eroded from the profile (left unprotected after the excavations in the 1970s) prompting rescue excavations. The skeleton was not disturbed, and the excavations could follow proper archaeological procedures, allowing us to reconstruct the burial position and to attempt chronometric ¹⁴C dating. Here we present the skeletal and burial data in their archaeological and chronological context. Situated in Bluefields, Atlantico Sur Province, Nicaragua, (11° 36' 0" North, 83° 40' 0" West), the site is a large shell-matrix site in the Duck Creek region, considered to be very important in the subsistence of the local indigenous Kriol and Rama communities. This particular region, because of its geographic position on the coastal area of the Nicaraguan rise, plays a potentially critical and yet poorly known role in our understanding of the early peopling of the Greater Antilles. The discovery of human remains at the site offers us material evidence of the early population and the opportunity to examine population affiliations and movement.

[77] *Marquesan Voyaging during the East Polynesian Archaic Era*

Early East Polynesian chiefdoms are remarkable for their voyaging spheres, as evidenced by archaeologically-documented interisland contact. One of the most prominent examples of interisland contact derives from a 1974 study by Bill Dickinson in which it was found that a handful of pottery sherds discovered in the Marquesas can be sourced to Fiji, an archipelago lying more than 4000 km to the west. Various interpretations of this discovery continue to fuel debate surrounding the context and intentionality of early East Polynesian voyaging. An emerging consensus suggests that the imported pottery is linked to an early period of systematic long-distance voyaging, prior to a later

breakdown in interaction. Recent research, including new excavations at the Archaic era Hanamiai site (southern Marquesas), highlights the value of stone adzes and phonolite (a distinctive green-colored rock) for reconstructing early voyaging and refining the chronology of the ca. A.D. 1450 breakdown in interaction spheres.

Romanowska, Iza (University of Southampton)

[84] *Testing the Variability Selection Hypothesis on Hominin Dispersals - A Multi-Agent Model Approach*

The Variability Selection Hypothesis proposed by Potts (1996; 1998) postulates the evolution of behavioral plasticity among early hominins arising during periods of strong environmental fluctuations in the last 6 million years. It argues that the inconsistency in selection regimes caused by the rapid environmental fluctuations produced particularly strong selection pressure on adapting to change rather than any particular set of conditions (termed 'adaptive complexity', 'adaptive flexibility', 'adaptive versatility', or simply 'versatilist organisms'). The work by Potts was further formalized by Grove (2011) in a single locus model and tested on the temperature curve spanning the last five million years. The current implementation aims to assess the implications of the Variability Selection Hypothesis on the agent's ability to disperse, a process that is visible in the archaeological record. The model was translated into a stochastic multi-agent simulation to investigate the dynamics between individuals with different positions and range on the adaptive spectrum (including the 'versatilist' individuals) within a non-homogenous population. The initial results shows that using heterogeneous multi-agent simulation can successfully replicate Grove's formal implementation but also sheds new light on how the pattern of dispersal unravels under different environmental regimes.

[242] *"Just the leftovers!" Pre-Christian Ritual in Highland Maya Colonial Documents*

In this paper I will present an analysis of colonial texts in indigenous languages that describe or paraphrase prehispanic ritual. I will present comparisons between the structure and poetics of such texts and those of contemporary Christian sacramental practice as attested in sixteenth and seventeenth century doctrines and catechisms. Based on the analysis of intertextuality, I will show that prehispanic ritual genres became a template for the Spanish mendicant friars and their native collaborators charged with the translation of Catholic ritual and prayer into highland Maya languages. Eventually, this led to two opposed Christian ritual traditions. The first, represented by the Dominican Domingo de Vico's *Theologia Indorum*, closely followed prehispanic poetic and lexical templates. The second, represented by the diocesan Antonio del Saz' sermons, sought to distance itself from any discursive repertoire with potential "pagan" associations. These two incarnations of Christian language were solutions to tensions among Spanish clergy resulting from different views of the Maya and of evangelization. However, they also reflected tensions among Maya elites torn between continuity and adaptation to Spanish colonial rule. Christian language underwent constant changes and readjustments but Spanish clergy never really succeeded in exorcizing the linguistic traces of prehispanic ritual.

[262] *Recent Test Excavations at an Early Agricultural Period Cerro de Trincheras Site on the Upper Gila River, Arizona*

Investigations on a cerro de trincheras site overlooking the Gila River were conducted in 2014. The Round Mountain site tentatively dates to the Early Agricultural period (2100 B.C.-A.D. 100). The 6 ha expanse of the site includes 1.9 km of constructed walls and terraces. The remains of 16 houses are defined by a constellation of rock rings in the central part of the site. Projectile points include five Tularosa corner-notched points. This style of point is associated with both Early Agricultural period and Pithouse period occupations. Other surface artifacts include 63 metates, and are largely basin and slab forms, as well as 14 complete one-hand manos. In addition two stone pipes and a rectangular stone mortar or tray were also found on the surface. This ground stone assemblage is consistent with that seen in other Early Agricultural period contexts. Early Agricultural period cerro de trincheras sites have been documented in the Rio Casas Grandes in northwestern Chihuahua and along the San Pedro River in the Tucson Basin where they are associated with the spread and adoption of maize agriculture. The Round Mountain site on the Upper Gila extends this phenomenon to a third major river valley in the Greater Southwest.

Ronsairo, Karleen (California State University, Northridge)

[323] *Postclassic Chen Mul Fragments from the Cochuah Region, Quintana Roo, Mexico*

Postclassic Chen Muls are known as effigy censers, or incensarios. Thompson (1957) suggested that these objects were placed at the feet of altars and used in ceremonial shrines during rituals of renewal. During the 2014 Cochuah Regional Archaeological Survey, we recovered a collection of Postclassic Chen Mul fragments from excavations at four sites in the project area: San Felipe, San Francisco, Venadito, and the Fortín de Yo'okop. While we did not recover whole incensarios, visual analysis of the Chen Mul fragments we found from the Cochuah region suggests that the deities portrayed in this assemblage are comparable to those of other Postclassic Chen Mul collections from sites throughout the Yucatan Peninsula, such as Mayapan (Smith 1971) and Tulum (Sanders 1960). Analysis of our sample of Chen Mul fragments not only provides insight into the ritual practices associated with these Postclassic incensarios, but also the changes in Maya power and ideology in the Cochuah region during the transition from the Terminal Classic to the Postclassic, as Maya ideology and religion centered on kingly power was replaced by folk religion that glorified deities (Johnstone 2008).

[353] *Doing It the Old-fashioned Way: Dating Paleoindian Rock Art in Eastern South America*

Rock painting flourished in several parts of the world, including eastern South America. Traditions that can be important evidence not only of development of art, society, and religion but also of science and technology. Techniques for direct dating are in active development these days, but archaeological stratigraphy and radiometric dating can give an important baseline to compare with other methods. We present an example of this strategy and its results at Monte Alegre, Brazil and briefly summarize evidence from sites in the larger region. At Cavern of the Painted Rock, people dropped paint and prepared pigment on the ground below art panels, and sediment subsequently covered them. We radiocarbon dated charcoal and carbonized plants with the paint, thermoluminescence-dated burned lithics, and OSL dated sediment. At the open site of Panel of the Painted Rock of the Pestle, paint stone and carbonized wood were left on the ground next to the painted walls and these became buried in sediment. The sediment was shaded, so could not be OSL dated, but the charcoal was radiocarbon dated. Both sites paint-bearing layers dates averaged c. 13,150 cal years BP., making the art and its archaeoastronomical alignments among some of the oldest yet dated.

Roper, Donna (Kansas State University)

[79] *Characterizing Eighteenth Century Technological Changes in Pawnee Pottery*

The pottery produced by the Pawnee of the central Great Plains of North America underwent extensive modification in the eighteenth century. Although twentieth-century archaeologists described the "early" and "late" materials, they did not adequately characterize how Pawnee potters modified their craft in terms of vessel morphology or technological practice, nor did they consider pottery function. Thus, we have no satisfactory account of this change. Situated in the context of technological changes during the contact era, this study uses petrography, vessel morphometrics, pXRF, and FTIR to address how the pottery changed. The analysis reveals that the introduction of metal vessels did not lead to a phase-out of native pottery, but rather that the functions formerly performed by pottery alone were divided between metal and earthenware. The appearance of the material was so markedly different because manufacturing technology and form were modified to facilitate pottery's revised role in foodways.

[114] *Restricted Forms of Knowledge in Pre-contact Coast Salish Lithic Craft Traditions*

Recently anthropologists have increasingly recognized the role that the control of knowledge has in the production and reproduction of social inequality in small scale societies. In the case of the pre-contact Coast Salish of the Pacific Northwest, ethnographic data emphasizes the role that the control of elite prerogatives had in the maintenance of their status. Drawing upon cultural transmission models, these social relationships would be reflected not only in the prestige goods often discussed by archaeologists but in a shift towards more restricted household learning in a wide range of technologies during the Marpole period (2400-1000 BP) when large winter plank house villages and hereditary forms of social inequality are argued to have emerged. High resolution analyses of formed lithic tools from previously excavated archaeological collections were conducted to examine fine scale stylistic and metric variation in assemblages in sites throughout the Salish Sea. The impacts of material quality, tool curation, and time-averaging effects were also assessed and did not appear to be factors significantly patterning this sample. Overall these data suggest that the learning of these technologies may have been restricted by gender and kin lines, and became increasingly influenced

by prestige over the past 3,000 years.

[285] *Beyond Defense: The Political Implications of Defense in Contact-era New Guinea*

At contact, New Guinea polities were uniformly at war, either episodically or permanently, with at least one of their neighbors. As a result, they all adopted significant defensive measures, commonly some mix of advanced warning systems, settlement nucleation, and natural or artificial fortifications. These measures were crucial to survival but they had numerous social and cultural implications. In this paper, I outline some of the more important of these consequences, before focusing on the political implications. In communities where people perforce interacted on foot through face-to-face communication, the distribution of population across a landscape had significant political consequences. I trace some of these outcomes drawing on data from about a hundred contact-era New Guinea polities.

[45] *Getting Burned: Fire, Politics, and Cultural Landscapes in the American West*

The National Historic Landmark town of Jacksonville, Oregon is celebrated for its nineteenth century past. While saloons, hotels, and shops survive as testament to the days of the Oregon gold rush, the selective preservation of the built environment has created a romanticized frontier landscape. A sleepy park now covers the once bustling Chinese Quarter, which burned to the ground in 1888. Recent public archaeology excavations revealed the remains of a burned building and led to a fruitful collaboration with the local fire department, which helped illustrate the taphonomic processes of the historic fire. While fires often lead to the recovery of well-preserved archaeological deposits, the context of the fire itself as a socio-political artifact has been underexplored. Used as both a deliberate and opportunistic means of controlling and creating social and political landscapes, fire was effective at displacing, marginalizing, or even erasing populations like the Overseas Chinese from historic communities.

[292] *The Importance of Being Ad Hoc: Patterns and Implications of Expedient Lithic Production in the Bronze Age in Israel*

Analysis of the ad hoc component of lithic assemblages from three Bronze Age sites in Israel shows common technological patterns without significant chronological and geographical differences. Like more formal components of lithic industries, expedient and opportunistic production of tools can be characterized using technological criteria and parameters which discern recurrent patterns in lithic manufacture. Irregular flakes, variable in shape, size, and raw material, and with only minimal retouch, constitute coherent assemblages, resulting from basic knapping strategies based on a few rules and simple flaking schemes. Specifically, the absence of standardized morphologies should not be misconstrued as random production. A general uniformity and stability in the ad hoc production system through the Early, Middle, and Late Bronze Ages indicates the maintenance of common technical behaviors that did not change in parallel to other technological transformations, either within the flint system or outside it, and nor in response to significant socio-political changes. This diachronic continuity, attested through the early Iron Age, reflects a stable technological substrate. Low technical investment and elementary production/consumption systems represent domestic contexts, widespread within the society, which for millennia played a leading role the daily life of ancient people.

Rosen, Arlene (University of Texas at Austin)**[334]** *Climates of History in Ancient China: Lessons from Deep-Time and Cross-Cultural Perspectives*

In recent decades, studies of climate change and its impact on past societies have been colored by a veneer of political agenda and oversimplification of how ancient societies might have actually responded to changes in their environments. Although many of these climatic changes would have profoundly impacted economic systems of past societies, these social and economic systems have often demonstrated remarkable resilience in the face of such changes. Other times, abrupt environmental changes initiated profound transformations in past societies. The scholarship and published works of Brian Fagan have provided us with an invaluable compilation of case studies which help to illuminate the complex responses of societies to environmental change in both the distant past and within historical periods. In the spirit of honoring this contribution, this paper relates a sequence of environmental changes and human responses in northern China beginning with the Neolithic Holocene Climatic Optimum that encouraged rice farmers to spread to the moist valleys of the Loess Plateau, the abrupt onset of drier conditions which coincided with the first state society in the Early Bronze Age Erlitou Period, and the impact of droughts on the expanding Han Empire at the beginning of the Iron Age in China.

Rosenberg, Danny [91] see Campeau, Kathryn

Rosenberg, Michael**[228]** *That Complex Whole: Hierarchies, Sorts, and Punctuation*

Implicit in most approaches to the evolution of culture is both the view that cultural evolution is always incremental and that cultures are structurally simple entities, making individual cultures seem entirely as capable of evolving in one direction as another, based solely on phenotypic plasticity and/or selective forces. However, as noted 140+ years ago by Tylor, culture is a complex whole. Structurally, it can best be viewed as multiple reflexive social, behavioral and informational hierarchies, each subject to a different mode of selection. Selection within each hierarchy produces a sort that feeds into each of the other hierarchies to be reflexively acted on there by the specific selective forces in operation within each of the destination hierarchies. The sort sent by one hierarchy to another given hierarchy and the selective forces operating within that destination hierarchy are not of necessity always compatible. When such incompatibility occurs, punctuational change is sometimes produced.

Rosenberg, Danny (Zinman Institute of Archaeology, University of Haifa)**[342]** *Bedrock Features and Cupmarks-Bearing Boulders: An overview of a Natufian and PPNA Phenomenon*

The Natufian–Pre-Pottery Neolithic A transition (ca. 11,500 Cal BP years ago) in the southern Levant is evident in many aspects of the material remains, and reflects pronounced socio-economic changes. One of the most fundamental changes is documented for bedrock features such as mortars, basins and cupmarks. While during the Natufian we find bedrock features mainly in 'public' contexts near or within sites, it seems that during the following PPNA period these were also introduced into the domestic arena. The documented transition includes a notable shift from natural outcrops/cave floors to large boulders, slabs and querns, on which cupmarks were now made; the latter were found for the first time on many floors of dwelling structures. Also, it appears that while Natufian bedrock features reflect a typologically rich and diverse assemblage (from tiny holes to deep narrow shafts) the PPNA remains reflect a dramatic reduction in the variety of types (shapes, depths, diameters and morphologies). In our talk we offer an overview of this intriguing change and suggest possible explanations, linked to other contemporaneous shifts documented in the archaeological record.

[406] *Zooarchaeological Inferences and Analogical Reasoning at Chavin de Huantar (Peru)*

Chavín de Huantar (1000-500 B.C. Peru) has long been considered a major center in the central Andes given its complex architecture and art. Mostly based on art depiction, ritual at Chavín has long been associated with psychoactive plant ingestion. Stone sculptures show the hallucinogenic San Pedro cactus, as well as the representation of monstrous animals and supernatural beings interpreted as priests transforming into animals during hallucinogen consumption. Inspired by Diane Gifford-Gonzalez's epistemological work on zooarchaeological inferences, analogical reasoning, and actualism, I analyze and interpret the manufacture and use of bone artifacts at Chavín in its ritual context.

Rosenstein, Dana Drake (University of Arizona) and Christopher I. Roos (Southern Methodist University)**[239] *Luminescence Dating of Surface Ceramics from Naturally Burned Archaeological Contexts***

Luminescence dating of surface ceramics at archaeological sites is problematic for many reasons, including estimation of environmental dose rate, likelihood that an artifact is in situ and weathering. Until now, there has not been systematic research on the effect of natural fires on luminescence dating of pottery. This is an important consideration, because while the temperature of a typical fire is well above the threshold for resetting the luminescence signal in a sherd, the length of time exposed to that heat is relatively short. At Wabakwa village in the Jemez Mountains (LA 478), we developed a robust sampling strategy for collecting surface ceramics around the pueblo from specific areas of differential heating and smoldering during the San Juan Prescribed forest fire in 2012. At this level of specificity, we can compare the luminescence signals of sherds exposed to varying temperatures and duration of heat at the same time. This study is a guide for archaeologists dating sites where surface collection of artifacts is the only sampling method permitted.

Rosenswig, Robert (University at Albany)**[151] *Defining the Izapa Polity with Lidar and Pedestrian Survey***

This paper reports the results of the first systematically collected Formative period settlement data from the area around Izapa. Three environmental zones (coastal plain, low hills and piedmont) were documented by the Izapa Regional Settlement Project combining lidar and pedestrian survey methods. Results indicate population was highest on the coastal plain from 1700-850B.C. as a series of four sequential political centers rose and fell, each lasting for a century or two. After 850B.C. collapse of the La Blanca polity (the fourth and final coastal plain center), occupation shifted to the piedmont as the Izapa polity coalesced. Between 750-350B.C. (the Escalon and Frontera phases) population peaked in both the low hills and piedmont survey zones while there was almost no one documented in the coast plain survey zone. At this time, eight lower-tier monumental centers are documented in the low hills zone — all arranged with the same orientation and architectural features as Izapa. During the Guillen phase (350-100B.C.) the quantity of occupation decreased in both the low hills and piedmont zones and population was relatively more concentrated in and around existing monumental centers. These data begin to illuminate regional demographic changes as the Izapa state was established.

Rosenzweig, Melissa (Miami University)**[305] *The Negotiation of Political Subjectivity in the Neo-Assyrian Empire***

Thinking of political subjectification as the processes by which individuals recognize themselves as subjects to authority, this paper pursues the negotiation of this subjectivity for people living within the purview of the ancient Neo-Assyrian empire. Negotiation resides between the poles of subjugation

and resistance to authority, and constitutes the ways in which people participate in defining the contours of their socio-political positions. In the provinces of Upper Mesopotamia in the early first millennium B.C.E., Neo-Assyrian authorities put conquered peoples to work farming the land, and this program of agricultural colonization instituted human-environment practices that established ties between agriculturalist and empire. But, importantly, subject agriculturalists cultivated agro-pastoral practices that circulated outside Neo-Assyria's large-scale, surplus economy. These divergent forms of land-use nuance subjects' relationship to the empire. Neither wholly assenting to nor rebelling against the Assyrianization wrought on them through imposed resettlement and taxation, subject agriculturalists preserved and/or created avenues (both material and performative) for fostering non-imperial subjectivities. Archaeobotanical data from the provincial capital of Ziyaret Tepe (ancient Tushan) in southeastern Turkey demonstrate the archaeological imprint of this negotiation of political identity and agency.

[144] *Surface Ceramic Distributions at Matacanela, Southern Veracruz, Mexico*

Prior archaeological research in the Sierra de los Tuxtlas, southern Veracruz, Mexico demonstrates significant sociopolitical transformations spanning the Formative through the Postclassic periods. Ongoing fieldwork at the site of Matacanela, located within the central portion of the Tuxtla Mountains, is contributing to this understanding. This paper discusses the results of the first season of fieldwork at Matacanela with a focus on patterning in the distribution of surface ceramic material. These systematic survey data allow us to identify both temporal and spatial trends in the site's material record and provide additional insight into the internal development of Matacanela as well as its position within the regional cultural sequence.

[109] *Agriculture and Inter-village Space in the Ancient Haudenosaunee (Iroquois) World*

Ancient Haudenosaunee (Iroquois) settlement patterns have been commonly presented as a series of well-spaced two acre defended agglutinated villages. Inter-village space was generally viewed as dangerous within a landscape of endemic warfare. Surveys and excavations in the Cayuga heartland (east side of Cayuga Lake) of the Finger Lakes region, central New York, are altering that vision. By at least the 15th century, agricultural complexes and stations were established between villages. These locales, possibly hosted by a particular clan, served as nodes of contact and communication between both local and distant groups. Based on recent excavations at the Myers Farm site, they do not contain the size, organization, or longhouse architecture of villages, but do contain small middens, unusually small ceramic bowls, and high frequencies of ground stone, farming implements and smoking pipes. As evidenced by large-scale food production at small sites, communal feasts were held to host visiting work parties.

Rossi, Franco (Boston University)

[303] *Sabios in Situ: Art-making and Representing Authority at Classic Period Xultun*

The study of mural art has moved beyond analytical approaches that isolate these highly meaningful works from the anthropological contexts that produced them, toward approaches that underscore their inseparability from the complex circumstances surrounding their production. However, such contexts in the ancient world are not directly observable and therefore cannot be studied using ethnographic methods. Instead, sociological dimensions of ancient art must be reconstructed

through careful analysis of the archaeological context in which it occurs—situating specific works in place, time, and socio-cultural setting. This paper attempts one such reconstruction, focusing on the eighth century Maya mural at the Los Sabios group within the site of Xultun, Guatemala. I discuss the social and political implications of the Xultun mural in light of the archaeological record on site, to shed light on the ways residents shaped this living work of art and were themselves shaped by what anthropologist Stephen Houston calls the mural's "moral narrative." Together, the images, texts, and archaeological materials found in and around the chamber enable us to contextualize acts of art-making and their authorship, as well as engage larger questions regarding the cultural constructs and systems of authority shaping artistic literacy and its pedagogy in Maya society.

Rostain, Stéphen

[180] *What's That Mound? Answers from Interdisciplinary Approach*

Modern archaeology must diversify its scientific approaches. First, it is essential to get various viewpoints and different scales to understand better the artifact. Moreover, the interdisciplinary methodology improves considerably the interpretation. The Amazonian raised fields study is a good example of such multiple scientific approaches. While raised field agriculture is no longer widely practiced today, it was quite widespread in the past. These structures are frequently found on the coast of the Guianas, the remnants of a technique widely used during the precolumbian period. The interdisciplinary research recently conducted on these structures revealed many surprising aspects of such intensive agriculture. Only the multiplicity of expertise completed successfully to a general understanding of these ecofacts. The Guianas coast has a long history of human impact and the actual landscape partially results of a millenary cultural action.

[276] *Lithic Technology and Households at the Harris Site, Southwestern New Mexico*

Recent excavations at the Harris Site in the Mimbres River Valley of southwestern New Mexico have documented differences between Three Circle phase (A.D. 750-1000) pithouses and associated features that suggest differences in social organization. In this poster we use data from cores and chipped stone tools recovered from house floors, extramural work areas, and extramural storage areas to examine core reduction technology and raw material use associated with these households. Our main goal is to determine if a consistent pattern in core reduction technology, raw material access, and raw material preference exists across the community or if differences exist between households. Factors influencing the similarities and differences in lithic technology will be explored.

Rouse, Lynne (Washington University in St. Louis)

[291] *In-Visible Periphery of Old World "Collapse": Recognizing Choice and Circumstance in the Archaeological Record of Mobile Pastoralists*

As in many regions of the Old World, the end of the Bronze Age in southern Central Asia is marked by a prolonged period of social "collapse" toward the end of the 2nd millennium B.C., during which the size, arrangement, and apparent sphere of influence of agriculturally-based population centers changed. Discussions of this period focus primarily on the loss of visible markers of social hierarchy and inter-regional trade networks, but as our collective knowledge of mobile pastoralists in Eurasian prehistory grows, previously 'invisible' practices operating outside the direct control of agricultural centers can be recognized as stabilizing and even driving forces in Old World history. In re-framing pervasive binaries such as Center/Periphery, State/Non-state, and Sedentary/Nomad in terms of social networks and alignments of practices, "collapse" becomes a matter of perspective, and might productively be analyzed for the arenas of daily behavior, relationships, and social institutions that endured across it.

Rowe, Matthew (William R Adams Zooarchaeology, Indiana University)

[35] *Rockshelters in the Bighorn Basin, Wyoming; Environment, Ecology, and Landuse Patterns*

Archaeologists have investigated many aspects of rockshelters in the Bighorn Basin, Wyoming, but questions remain about the role of these sites within regional settlement patterns. It is clear that the Bighorn Basin is a moisture-controlled ecosystem and that variability in environmental moisture levels produces dramatic changes in both animal and plant populations. Changes in environmental moisture also appear to affect human population levels, and past settlement and subsistence patterns. This research combines geoarchaeology and zooarchaeology to interpret environmental conditions and cultural responses to changes in environmental conditions preserved in four Bighorn Basin rockshelters. This study incorporates faunal material from BA Cave (46BH1065), Eagle Shelter (48BH657), Alm Shelter and Paintrock V (48BH349). Results of this research suggest that well-established geographic features contribute to predictable patterns of resource distribution through the preservation and maintenance of productive microclimates at high elevations and in deeply cut riverine canyon systems. This suggests that settlement and subsistence patterns observed ethnographically reflect a long-term adaptation to these recurrent patterns. By combining environmental data derived from rockshelter sediments and cultural information based on faunal remains, this research clarifies our understanding of the role these sites played during different environmental conditions in the Bighorn Basin.

[155] *Archaeology in a Cretaceous Swamp*

During the Late Paleocene and Early Eocene, a tropic/sub-tropic forest located in a large swamp was located in present day east-central Colorado. Over time the swamp was enveloped by subsequent volcanic eruptions which resulted in the creation of the Paleosol-Dawson Arkose formation. The primary area of this geological formation is located in Elbert County, between Colorado Springs and the small town of Agate on the plains of Colorado. Large stands of tropical wood, including sycamore, walnut, ginkgo, sequoia, and palm became silicified as a result of the deposition of the volcanic ejecta. Due to uplifts of the area and subsequent erosion of the formation, large areas of petrified wood have become exposed creating a readily accessible source of stone tool material for native populations to exploit. The presence of this material allowed the native populations to occupy the area with a moderate population. Archaeological surveys in support for the installation of a natural gas pipeline across the study area allowed a unique opportunity for archaeologists to map the area of the silicified wood deposits and determine how much exploitation was taking place and if there was preference for type of wood to another.

[284] *Cold Plasma Oxidation and "Nondestructive" Radiocarbon Dating*

A decade ago, with partial funding from the National Center for Preservation Technology and Training, Marvin Rowe and his students at Texas A&M University developed a cold plasma oxidation method for "nondestructive" radiocarbon sampling of organic materials. This sampling approach is applied to the whole artifact, is carried out under vacuum, plasma temperatures can be maintained below 100°C, only organic carbon is oxidized (carbonate and oxalate are not sampled), and sampling leaves the artifact virtually unaffected. This approach takes advantage of the AMS direct dating potential of samples as small as 100 micrograms, and since the sample is in the form of carbon dioxide, no further treatment is required at select AMS labs. A new and improved cold plasma device has been constructed at the Office of Archaeological Studies, resulting in a more efficient procedure with even lower temperatures. We report on the design innovations and on additional experiments in sampling.

Rowe, Sarah (UNC Chapel Hill)

[367] *Local Communities, Ceramic Use, and the Uneven Development of Social Complexity in the Late Valdivia Period of Coastal Ecuador*

The Late Valdivia period of the coast of Ecuador is often portrayed as one of movement, as sites in the former "heartland" adjacent to the Santa Elena Peninsula were abandoned and new, larger sites were founded at the former peripheries to the north and south. These new sites are implicated in the development of incipient social hierarchy within Valdivia society. However, recent research at the site of Buen Suceso in the Manglaralto Valley suggests that this process of developing social complexity was highly varied and mediated by local social dispositions. Comparative analysis of ceramic assemblages from several Late Valdivia sites highlights differences in ceramic use and assemblage composition that indicate diverging ways of fomenting community through participation in communal eating. These differences point to the negotiated character of communities and highlight the contingent nature of increasing social complexity within Valdivia society. This variation further emphasizes the need for locally-developed and historicized examinations of social practices to understand changes in the Valdivia period.

[110] *Home on the Range: An Environmental History of Land Use Changes at Paa-ko, New Mexico*

By using multiple lines of evidence from the archaeological material record, as well as from the environmental pollen record, this paper will explore the history of anthropogenic landscape changes at one particular site in the Galisteo Basin of New Mexico. Located on the margins of the Spanish mission system, the ancestral Pueblo site of Paa-ko and its surrounding field systems present an ideal opportunity to tease out the thread of colonial influences on local communities, particularly with the introduction of livestock into the region. The impacts of grazing continue to be felt into the present, as the eastern field systems are currently a privately owned ranch with small herds of cattle and horses. The transition from an exclusively agrarian landscape to an agropastoral landscape had dramatic and long-lasting social and physical consequences, and these dynamics will be the focus of this study. This project will explore the details of this physical transformation and examine these ecological shifts within the context of changing economics, politics, and aesthetics.

Ruane, Jonathan

[193] *The Development and Modification of a Hydraulic Urban Space at the Classic Maya Site of Xultun, Guatemala*

In order to better understand the use history of the central reservoir at Xultun an investigation was performed during the 2012 and 2014 field seasons. ArcGIS 10.1 was used to model the site's hydrology and excavations were performed both within the reservoir and on architecture within the catchment area to the north. The reservoir was built from a modified quarry and in use since the Late Preclassic. The larger architecture associated with collection and management of this resource was not added until the Early Classic. A series of depressions within the catchment area led to the discovery of a large sub-plaza drainage canal. This feature and the sacbe to the east of the reservoir were used to divert water from Plaza B into the reservoir. An elite administrative neighborhood was positioned between these two collection points. The reservoir was modified over time being dredged and expanded in the Late Classic. The use of the canal also changed through time having surface collection points added and eventually being filled in and abandoned. Hydrological strategies employed by the Maya were adaptive, changing with population pressure.

[73] *Modelling Group Formation in Small Scale Societies*

Several human activities require an optimal number of individuals to maximize their utility, often leading to the coexistence of positive and negative frequency dependence. This generates unstable equilibria, as group close to the optimal size will be invaded by joiners who will increase their fitness by becoming new members, leading either beneficial or detrimental effects to the incumbent members. If a group is optimally sized, incumbent member will experience a decline in fitness, while joiners will increase its fitness by joining the group. This leads to an Evolutionary Stable Strategy (ESS) where group sizes are greater than the optimal size in the case of ideal free individuals. This outcome will be different if the acceptance of a new member can be blocked by the receiving group. The group members will face a volunteer's dilemma, as any cost of rejecting incoming individuals will be benefited by the entire group. This paper examines the role of this ESS in group formation dynamics. The decision-making process of individuals is explored, focusing on situations where members of a group can choose to reject new members for a given cost. Different scenarios are considered, including individual and shared costs, and macro scale implications are discussed.

Ruck, Lana

[33] *Determining Hominid Handedness in Lithic Debitage: A Review of Current Methodologies*

Lithic analysis is of great value for understanding hominid biological, cognitive, and cultural evolution, but analyses of handedness in lithics are rare, despite their potential to elucidate the evolution of human lateralities in the body and the brain. This paper will present results of an experiment to determine handedness in lithic materials. In a blind study on debitage (n=631) from Acheulean handaxes created by right- and left-handed flintknappers, several flake characteristics significantly indicated handedness, with a binary logistic regression correctly predicting handedness for 71.7% of the flakes. However, some characteristics were indistinguishable for handedness, and regressions account for little variability in the data overall. This is likely a result of personal knapping styles, as additional analyses show that individual knappers associate to discrete features better than handedness does. These results are congruent with general issues in analyzing evidence of handedness, but are more conclusive than many of the previous studies. Continued improvement of these methodologies will enable analysis of Paleolithic assemblages in the future, with the ultimate goal of tracking population-level hominid handedness rates through time and using them as a proxy for cognitive development and language evolution.

Ruhl, Donna (Florida Museum of Natural History)**[201]** *Exposed Again: Current Environmental Impact on Dugout Canoes---Their Research and Care!*

Across Florida, severe drought in recent years lowered water levels, especially in 2000 and then again a decade later. Both times this resulted in the exposure of dozens and dozens of ancient dugout canoes. This trend occurred not only in Florida, but also the greater southeastern U.S. This paper discusses the concerted efforts of state and local agencies as well as private stewards to document the environmental impact on these canoe finds, as exposure to sun and elements accelerated their degradation. This destructive process nevertheless provided an opportunity to again record, map, photo, sample, identify, analyze and even preserve a few of these remains. Results of this analysis include many new C-14 dates that reveal insights about paleoenvironmental impacts, waterscapes, settlement change, economies, and overall significance of these typically overlooked yet unique artifacts. In addition, initiatives to exhibit and preserve selected dugout canoes has given way to innovative, green methods for their stabilization and care.

Rühli, Frank [264] see Bouwman, Abigail

Ruiz Y Costello, Donna (Arizona State University) and Sarah Striker (Arizona State University)**[277]** *Color and Technology: A Legacy of Painted Burial Objects at Nuvakwewtaqa (Chavez Pass, Northern Arizona)*

Known to the Hopi as Nuvakwewtaqa, the Chavez Pass pueblo complex (13th-15th CA.D.) was excavated in part by researchers from Arizona State University from 1976 through 1982. Before these excavations, the site had been subjected to decades of looting, especially in burial contexts. A recently completed Forest Service sponsored NAGPRA project provided the opportunity to photograph and analyze the exceptional artifacts found in burial contexts prior to repatriation. This poster discusses new insights gained from examining a clay-lined, painted basket as well as painted wood artifacts which demonstrate specialized craftsmanship and knowledge. As part of the repatriation process, we present our research and documentation of these items as a legacy for future research. The clay-lined, painted basket found at Chavez Pass is one of less than fifty known examples of these types of baskets, arm bands, and hats from archaeological contexts in the American Southwest. When considered with the painted prayer sticks, wands, and staffs from the same assemblage, a vibrant image of social life at Nuvakwewtaqa emerges. Through their use of color and technology, it is evident the people of Nuvakwewtaqa were engaged with regional stylistic traditions and, at the same time, creators of their own local style.

Rumold, Claudia (USFS)**[162]** *Insights into the Context, Mode, and Timing of Potato Domestication through Microfossil and Ground Stone Analyses at Jiskairumoko in the Western Titicaca Basin*

The data presented in this poster provide novel and direct microfossil evidence for the exploitation of potato (*Solanum tuberosum*) approximately 5000 years ago at Jiskairumoko, an early village site in the south-central Andes. In the Andes, elucidating the trajectory of potato domestication is central to an overall understanding of the development of agriculture, as this crop was perhaps one of the most important of the autochthonous highland Andean suite. Nevertheless, efforts to elucidate the timing, mode, and context of its domestication have been hindered by the paucity of direct macrobotanical evidence. The results of this study demonstrate the combined effectiveness of starch grain and grinding tool analyses in addressing questions relating to the chronology and context of domestication for the potato. Forty-one starch grains derived from 14 grinding tools are identified as consistent with domesticated potato. Some archaeological *Solanum* starches may reflect the role of grinding in detoxifying potatoes and catalyzing the domesticatory process. Additionally, use-wear analysis of 98 grinding tools indicates women's intensive use of this technology throughout the Late Archaic-Early Formative Period occupation of Jiskairumoko. These results are taken as indicating plant resource intensification reflecting low-level food production.

[29] *The Promise and Pitfalls of Geophysical Survey at Valley Forge NHP*

The use of geophysical survey techniques to identify potential archaeological deposits has a long history at Valley Forge NHP (VFNHP). As early as 1974, while it was still a state park, Dr. Bruce Bevan conducted magnetometer and GPR surveys of some of the brigade areas. Since 2011, archaeologists at VFNHP have undertaken a series of geophysical surveys aimed at identifying possible encampment related features. The surveys produced a series of promising anomalies, many of which have been tested through excavation. Although no definitive encampment-era remains have been identified as a result of these recent surveys, the anomalies did correspond to deposits from other cultural periods. The results of these surveys have demonstrated that, when combined with historical research, geophysical techniques are useful tools to identify areas likely to contain archaeological features at VFNHP.

[338] *Of Cenotes and Serpents: Modern and Ancient Cave Ritual at Mayapán, Yucatán, Mexico*

The pairing of ritual architecture with sacred underground spaces is common throughout Mesoamerica and makes clear the importance that ancient inhabitants of the culture area placed on caves and cenotes. These spaces were home to powerful forces. The Late Postclassic Maya center of Mayapán (1150-1450 A.D.) is known for its clear spatial associations between temples and cenotes. These temple/cenote complexes have been found both within and outside of the large defensive city wall. Cenote Sac Uayum, located south of the city wall is still believed to be guarded by an enormous feathered serpent with the head of a horse, an easily angered chimera. Underwater exploration of the feature has revealed at least 17 ancient skeletons within. Cenote San Jose, also located south of the wall contains dozens more burials. Several cenotes in the area currently serve as the focus of rain or other rituals. Some cenotes are said to be "alive". They are considered the source of winds, both good and bad, that can bring disaster or prosperity to individuals and the community. This paper will examine several examples of archaeologically known cave ritual at the site and compare those to modern practices still evident at the nearby village of Telchaquillo.

[284] *The Archaeological Dynamic Friction Cone Penetrometer*

Archaeologists have used metal probes for centuries, and, more recently, their digitized descendant, the penetrometer, to locate artifacts and features that yield greater resistance in the soil. Most recently, geological miners and agricultural technologists have added additional instrumentality to the penetrometer to measure both resistance and friction. To determine if archaeological soils and other midden features could be distinguished using a penetrometer employing both resistance and friction metrics, a prototype archaeological friction cone penetrometer was constructed and tested on a known archaeological midden in northwest Florida. The results of those tests are presented here.

Rutecki, Dawn (Indiana University South Bend)

[269] *Ambiguous Iconography: Queering the Shell Game*

This paper queers archaeological interpretation by unpacking and destabilizing underlying assumptions in Southeastern iconography. While not focusing expressly on sexuality or gender in these representations, this research discusses the ways ambiguities in engraved shell iconography, more broadly, have been dismissed, glossed, and deemphasized. In part, this exclusion is unintentional and results from the amount of research that remains to be conducted on the vast body of images, but we need to more fully consider the implications of these monolithic interpretations. Using iconography from Spiro Mounds, Oklahoma, this paper begins to bridge the gap through feminist and queer readings of these images, providing alternative possibilities for their interpretation and a better understanding of their use in Spiro society.

[227] *Forming Bonds in the Late Intermediate Period Huaura Valley and Central Coast of Peru*

This paper will examine the ceramic forms from excavated contexts at Cerro Colorado de Huacho, Huaura Valley, Peru in order to address conflict, cooperation, and exchange on the central coast of Peru in the Late Intermediate Period (LIP) (A.D. 1000-1450). Though dominated by Chancay black-on-white and Lauri impressed ceramic styles, the range of diversity in forms from Cerro Colorado is sizable. The diversity of these forms will be compared and contrasted to ceramics from contemporaneous central coast and highland sites as a means of identifying potential interregional exchange networks and sociopolitical affiliations and how they were developed.

Rutz, Matthew (Brown University)

[14] *Mental Topographies of Ancient Mesopotamia: Textual Perspectives on Learned and Lived Highland-Lowland Interactions*

Textual sources from southern Iraq's early historical periods constitute a surprisingly rich body of material for exploring highland-lowland interactions in ancient southwest Asia. Cuneiform inscriptions typically convey only one perspective on these interactions, namely, that of the elite inhabitants of city-states and territorial polities of the southern Mesopotamian alluvium. However, these decidedly one-sided representations were hardly monolithic, and in this paper I explore the various views found in the written record by attending to the archaeological and historical contexts in which the texts were produced. First, focusing in particular on the third and early second millennia B.C.E., I briefly survey the prominent literary topoi, historical episodes, and epigraphic/iconographic landscapes that shed light on long-term trends in how mountainous regions and their populations were imagined by Babylonian states and their scribes. I then look in specific at the ways in which early second-millennium educational practices at sites such as Nippur and Ur created geographic knowledge. By treating textual remains as material culture it is possible to ground the ancient production of literature in practices of cognitive socialization.

[22] *Rooting the Kiva: The Placement of Coal in Ancestral Pueblo Construction Rituals*

Architectural construction is the process by which material and non-material elements and overall spatial setting are made fixed. Consideration of the ways in which physical space-defining elements function can provide insights to the ways in which space was used and understood by the occupants or builders. This study illuminates how ancestral Pueblo kiva construction rituals were integrated within Pueblo worldview concepts in the northern Southwest during the Pueblo II (A.D. 1050-1150) and Pueblo III (A.D. 1150-1280) periods. The placement of coal, or lignite, below kiva features and floors followed strict principles of spatial composition referencing axes that ordered space and served as symbolic representations of the layered cosmos. Moreover, the placement of coal during construction rituals ensured the strength of the house, long life, fertility, and good health of its occupants, the fertility of crops, abundant rain, and provided for the general welfare of occupants in the larger village.

Ryan, Joseph (Osaka University)

[145] *The Role of Iron Weaponry and Martial Ideology in the Political Consolidation of Early Japan*

In addition to their functional role as military implements, weapons can also serve as material representations of martial ideology. Research on weapons burials must therefore take into consideration the multifaceted nature of weaponry within a society. During the majority of Japan's Kofun period (mid-3rd century to early-7th century), the archipelago relied on the importation of finished iron products and raw iron materials from the Korean Peninsula. This formed an intimate connection between elite power, which was capable of conducting long-distance trade, and iron products (weapons, tools, and agricultural implements). Iron weapons, which facilitated elite control, also functioned domestically as symbols of sociopolitical legitimation. While weapons burials are a defining feature of the Kofun period, there are almost no other archaeological correlates of widespread warfare or conquest. This apparent contradiction can be resolved by interpreting the archipelago-wide spread of weapons burials as representing the formation of a confederacy of elites bound by a common martial ideology. A diachronic analysis of the changing nature of weapons and weapons burials reveals the conditions behind the formation and spread of these authority symbols among the elite.

Ryan, Stacy (Desert Archaeology, Inc.)

[278] *Technology and Typology in the Upper Gila: Flaked Stone from the 3-Up and Fornholt Sites, Mule Creek, New Mexico*

Several seasons of field school excavations at the late Pueblo period 3-Up and Fornholt sites in Mule Creek, New Mexico, have produced a substantial number of flaked stone artifacts. Because these sites are located adjacent to the extensive Mule Creek obsidian source, and were occupied at a time when Mule Creek obsidian was widely distributed, the collections provide information about lithic technology at sites with immediate access to the material. Obsidian composes a large proportion of the artifacts, and projectile points are almost exclusively made from this material. Although occupations at these sites may have overlapped, the Tularosa phase (A.D. 1200-1325) Fornholt site produced a more diverse set of projectile point types than those recovered from 3-Up, where a late 13th to 14th century probable Kayenta migrant enclave and a later Salado occupation have been identified. This poster summarizes the obsidian core reduction and tool production patterns at 3-Up

and Fornholt, and illustrates the stylistic variability of the projectile point types from these sites. The points are compared with late pre-contact typologies from southwestern New Mexico and southern Arizona to make inferences regarding their temporal and cultural affiliations.

[312] *Household Hearth-Centered Activity Areas at the Bridge River Site, British Columbia: Formation Processes and Site Structure*

Archaeological investigations at Housepit 54 within the Bridge River site have identified approximately 15 discrete floors dating between 1500 and 100 years ago. In this poster we draw data from a Bridge River 3 (ca. 1300-1000 cal. B.P.) period floor to examine the formation of activity areas with a larger goal of reconstructing "site structure" in a constrained space. We address questions specifically directed at formation processes as well as potential relationships between at least two hearth-centered activity areas by examining variability in artifacts, faunal remains, and features. More specifically, we examine feature form and function, lithic tool production and maintenance, animal and plant processing, taphonomic processes, and potentially, ritualistic practices to reconstruct the means by which the items in each activity area came to be co-associated. From these studies, we draw conclusions regarding the roles of these spaces on the house floor. We then seek to address potential relationships between activity areas by application of re-fitting analysis and examination of inter-assemblage variability. Results of this research permit us to develop a range of implications regarding household occupational history and sociality.

[287] *Mapping the Monumental Architecture of the Largo Gap Great House*

This study combines spatial technology with traditional field methods to accurately identify and map the monumental architecture of the late Pueblo II Largo Gap great house. Although previous visits by early researchers to the site identified monumental architectural characteristics typically associated with Chaco-style great houses (primarily the presence of a great kiva), the surface expression of such features is currently lacking. Rubble present along the steep slopes of the knoll upon which Largo Gap is situated suggests not only a lack of major external architectural features but also an atypically small overall architectural footprint. We present a case study utilizing multiple data lines (aerial thermography, ground penetrating radar, surface mapping, and limited excavation) to obtain surface and subsurface architectural signatures for the great house. We use these data to counteract the impacts erosion, significant historic stone borrowing, and modern ranching have had on understanding the structure's surface expression, and to identify monumental architecture through minimally invasive means. Our approach is balanced between obtaining specific architectural signatures relevant to determining identity and participation in the Chaco Regional System while also broadening our spatial and analytical scope to expand beyond using surface wall alignments to form socially contextualized interpretations for the site.

[147] *Dragons through a Ceramic Lens: Evidence for a North-Central Belize Ceramic (Sub)Sphere*
As viewed through a ceramic lens, it is becoming evident that North-Central Belize was distinct from surrounding areas. Starting in the Middle Preclassic, the ceramics of the Swasey/Bladen Sphere of North-Central Belize are notably different than those of adjacent areas of the Belize Valley, Peten, and Yucatan. The extent of the Middle Preclassic Swasey/Bladen Sphere is becoming clearer with work at Ka'Kabish and the surrounding area. Similarly, the Terminal Classic/Early Postclassic ceramics of Lamanai and Ka'Kabish have unique attributes when compared to those of adjacent areas. The time periods in between — the Early Classic and Late Classic — still need further investigation in order to determine if they are also ceramically outstanding. Possible implications of a coherent North-Central Belize ceramic sphere or sub-sphere for political and cultural interaction/entanglement and shared identity will be explored.

[174] *Assessment of Projectile Use at Aduma (Middle Awash, Ethiopia)*

There is not yet clear evidence for the beginning of complex projectile technologies (propulsion via mechanical aid). Morphological attributes and miniaturization of stone points at Aduma have been used to suggest early complex projectile use ~100,000-80,000 years ago. Hafting traces on stone segments and geometric pieces were presented as better indications of early complex projectile use at Sibudu Cave, South Africa, ca. 64,000 years ago. However, neither point shape/size nor evidence for hafting unequivocally imply the existence of complex projectile technologies. With only the lithic component of complex projectile technologies so far recovered from the African Middle Stone Age, confident reconstruction of the entire armature system (based on ethnographic analogues) requires unambiguous evidence, such as fracture propagation velocity on stone points damaged from impact. Unfortunately, this method has extremely limited applicability. Given these facts, the use of multiple lines of circumstantial evidence is the best approach to a sound assessment of complex projectile use. This study examines morphological attributes and macrofracture damage patterns on the Aduma assemblages. In so doing, it re-assesses previous suggestions for the points' use as tips of early complex projectiles.

Sahlen, Daniel (Stockholm University)

[89] *Non-Ferrous Casting Molds and Technical Logic: What Can the Technical Differences between the Bronze Age and Iron Age Molds Tell Us about the Technological Development of Metalworking?*

Studies of technological changes in non-ferrous casting during the shift between the Bronze and the Iron Age in Europe have particularly looked at changes of crucible manufacture or the use of different alloys, while technology of the casting mold has not been studied to the same extent. Mainly three types of molds were used during the prehistoric period – single piece, two-piece, and investment. The first two types were made in clay, stone and occasionally metal, while investment molds were only made from clay. These differences are often discussed as a chronological evolution of technical complexity. However, all three types were used at least during the Iron Age and would have been part of the skill set of the caster; the choice of mold would rather relate to the object to be cast. The purpose of this presentation is to use microscopic and elemental analyses to examine the technological changes of the manufacture of casting molds from the Bronze Age to the Iron Age. This makes it possible to highlight technological choices and to recreate craft practice on macro- and micro-levels. Material from Scotland will be in focus, though assemblages from other parts of northern Europe will also be discussed.

Sailors, Damion**[233] *Ring Graph Analyses of Early Communities on Rapa Nui Measuring the Distribution of Stone-lined Earth Ovens (umu)***

Agricultural societies are commonly thought to have begun as small, kinship-based groups of people that eventually extended their social interaction beyond the household level and intensified their adaptive efforts through a variety of means. Most of these early, sedentary communities began to demonstrate aspects of social inequality and had cooperative, centralized settlements that have left a detectable pattern in the archaeological record. For this paper, stone-lined earth ovens from the remote Pacific island of Rapa Nui were chosen for a spatial analysis of settlement patterns using a ring graph technique developed by Drennan and Peterson (2008). Ring graphs are derived from the more traditional approaches of rank-size graphs and histograms which have been used for the last several decades to study settlement distributions and to determine the nature of stratification and interaction in sedentary, agriculturally based societies. The results of this analysis were used to investigate the possible centralization of early Rapa Nui communities. An emphasis on the intra-regional variation in settlement dynamics exhibited by the colonizers of this isolated island were discussed within a behavioral ecological framework.

The objective of this study is to discuss the social changes of the societies in the Nasca region, the south coast of Peru through the analysis of ceramic sherds distributed near the lines and line centers. In 1926 the Nasca lines had been discovered by Alfred Kroeber and was investigated archaeo-astronomically by Paul Kosok and María Reich. At the 1980's Anthony Aveni and his colleagues carried out investigation at the pampas and contributed to reveal the details of the Nasca lines and centers. Since the year 2010 Yamagata University have conducted field research at the pampas. We have tried to investigate thoroughly the archaeological remains at the pampas, which Dr. Clarkson had carried out a preliminary study in the 1980's. In our research, more than ten thousand sherds were recognized in association with lines and centers. Interestingly, their chronological position varies from Late Ocucaje to Ica Period and they were intentionally smashed at the lines and centers. In this presentation we will not only report a result of these ceramic analyses, but also discuss the diachronic social changes around the Nasca pampas for two thousand years.

Trumbull, Arizona***

Recently, optically stimulated luminescence (OSL) dating of sediment has been used increasingly in the study of human occupation history in archaeology. This paper employs OSL to date the Little Springs Lava Flow, a lava flow near Mt. Trumbull, northern Arizona, thought to have erupted about 1000 years ago. The accepted dates are based on cosmogenic helium dating. This lava flow covers some of the most productive agricultural land in the Mt. Trumbull area. Previous archaeological surveys revealed multiple structures built on the top of this lava flow and potentially suggested that their construction was for defensive purposes. In this paper, we re-evaluate the timing of the eruption of the Little Springs Lava flow using OSL dating of sediments from just beneath the lava. One goal of this study is to compare OSL dating of the sediment vs cosmogenic helium dating for determining the age of lava flows. Second, understanding the timing of the eruption or eruptions will contribute to a

better understanding of their impact on the Ancestral Puebloan people who inhabited this marginal agricultural environment.

[87] *Taphonomy and Actualistic Studies of Carnivores: Applications to Understanding Sima de los Huesos (Atapuerca) and other Pleistocene Sites in Spain*

The study of carnivore activity on bones is crucial to understand the role of the carnivores in site formation since some carnivores are able to accumulate bones in cave dens. The studies of Professor Haynes reveal that actualism is a very useful tool for taphonomic studies, as it allows understanding the behavior of the fauna in the past. In Spain there are several Pleistocene sites with evidence of carnivore activity. The Sima de los Huesos (SH) is the site with the largest accumulation of human remains from the Middle Pleistocene. Studies in the last two decades have proposed different hypotheses to explain the origin of the SH hominin accumulation, carnivores being one of them. We have approached the taphonomic study of SH through actualistic research with living carnivores (ursids, canids, and large felids). The comparison of bone modification patterns at SH to actualistic data allows us to suggest that bears were likely to have been the carnivore responsible for the modification observed on human fossils but we discard the carnivores as the accumulation agents. The research developed by G. Haynes was decisive in this study since it was the framework of our actualistic experiments.

[2] *Environment, History and Resilience of Archaic Coastal Hunter-Gatherer-Fishers from the Atacama Desert, Northern Chile*

The coast of the Atacama Desert in northern Chile is one of the most extreme environments of the Andean area. However, the high productivity of the Pacific Ocean facilitated the peopling of this territory as early as 12,000 years cal BP and also a continual occupation of hunting-gathering-fishing communities throughout the Holocene. In this paper we discuss significant environmental changes during the Middle Holocene, as well as the systematic interaction of local communities with inland agropastoral groups during the Late Holocene. We are especially interested in exploring the resilience of local economy in the face of these important external conditions and transformations, making them one of the few cases in the coastal Andes where a hunter-gatherer-fisher economy was maintained until at least the 19th Century.

[82] *Early Village Dwellings and the Reproduction of South Andean Formative Communities*

Agriculture was adopted by in northwestern Argentina around 3500 BP as part of a complex process of macroregional population reorganization, economic intensification and increase of territoriality. This transition was followed by a rapid introduction of large and solid buildings that became the major and most visible features in the village arrangements after 2500 BP. Thousands of multi round-room compounds were built and inhabited by several generations all over several high valleys, like Taffí, Anfama, Yocavil and Cajón, creating continuous and centrifugal village landscapes. This particular spatial configuration has been interpreted as the material traces of fluid and heterogeneous communities built up by largely autonomous extended households. Taking some remarks from "symmetric archaeology" we address the relations between humans and the material settings of daily life, considering how these relations allowed the emergence and reproduction of household and communities within the conflictive medium of early village societies. We include GIS landscape and space syntax analyses for both outdoor village space and indoor inhabited place, and a study of quotidian practices carried out within house occupation.

[415] *Plant Food Consumption among Modern Foragers Informs Paleolithic Dietary Ecology*
Reconstructing hominin diets is hindered by biases in the methods used to recover dietary information, and by our narrow interpretations of modern forager behavior. A better understanding of these limitations necessitates re-examination of dietary evidence in the archaeological record. Zooarchaeological and stable isotope data suggest that medium and large game dominated the diets of Middle and Upper Paleolithic foragers, and environmental reconstructions indicate that energetic returns from large game far exceeded returns from plants and smaller animals. Yet our studies of dental calculus from several Paleolithic populations demonstrate consumption of starchy plant foods. Furthermore, our data on plant food consumption among Hadza foragers of Tanzania and Twa foragers-horticulturalists of Namibia demonstrate that 1) caloric and biological value (digestibility) of plant foods are not always predictive of foraging strategy, and 2) microfossils in dental calculus present an incomplete record of plant consumption. These results indicate that we continue to underestimate the importance and presence of plants in ancient diets. We suggest that calories must have come from both plant and animal origin in Paleolithic Eurasia, not only to enable macronutrient balance, but also to ensure acquisition of essential micronutrients in the diet despite the lower energetic returns of plant food resources.

[60] *Is It a Priestess? Preliminary Analysis of the Excavations of a Late Moche Chamber Tomb from San Jose de Moro, North Coast of Peru*

San Jose de Moro, located in the North Coast of Peru, is a well-known ceremonial site where ritual practices were held over a span of 1000 years. This, in relation with the burial of high rank individuals whom are believed to have performed important roles within Moche society, especially during the Late Moche Period, places this site as one of high importance for the understanding of the Moche society along with its region. This paper will present the results of excavations held in 2013, when we uncovered a Late Moche Chamber Tomb in which we found the main individual within a coffin covered by copper plaques with maritime designs. This individual was surrounded by 7 other individuals as well as an astonishing quantity of funerary offerings like raw architectural models, beads from semiprecious rocks, spondylus and over 102 ceramic vessels. The aim is not only to show the excavation process and its findings, but also to try to figure out through osteological and material analysis whether this main individual was buried as an actual priestess, as the tradition at the site indicates, or whether we can identify a new type of high ranking individual from Moche society.

[91] *Technological Approach of Obsidian Sources in North Patagonian: Comparative Studies between Plain and Highlands Sources*

Obsidian sources in northern Patagonian reflect early use (ca. 8000 years BP). Provenance studies

conducted so far realize that obsidian sources located in the Andes even with limited access (only during the summer) are those that reflect a wider spatial dispersion and more continuous use than those located in the plains. In this way, the sources located in the plains reflect local use for the last 1000 years BP. This presentation compares the results of the technological studies that have been sampled in the mountainous source "Las Cargas" and in the plain source called "El Peceño". The results obtained from both sources show differences in procurement activities carried out and allow discuss models proposed for southern Mendoza.

Salinas Acero, Jennifer (UC Berkeley)

[107] *Paleoethnobotanical Analysis of Preceramic Sites in the Sabana de Bogotá*

The Sabana de Bogotá is one of the most extensively studied regions of preceramic archaeology in Colombia. Many of these projects were carried out by or in conjunction with Dr. Gonzalo Correal (UNAL) and contributed a wealth of information on the period including paleoenvironmental data, tool use, and faunal data. However, few botanical remains have been recovered which resulted from the sieving of a few small samples or were found in-situ. Recent excavations conducted at rockshelters and open-air sites revisited several sites in the in the region that had yielded macrobotanical evidence when excavated by Dr. Correal. These excavations resulted in the systematic collection of column samples for flotation and microbotanical analysis affording the first opportunity to fully examine the use of plants in the preceramic period of this region. This presentation provides a preliminary summary of the paleoethnobotanical analysis of this preceramic assemblage. An assemblage that will eventually serve as a baseline for understanding diachronic changes in foodways and contribute to an understanding of human-environmental interactions in the preceramic period of the Sabana de Bogotá.

[162] *The Domestication and Migration of Zea mays L. in Association with Holocene Climatic Variance*

Maize is known to have originated in Mesoamerica from which it spread north and south adapting to many varied climatic and environmental conditions. This study details the origin of the species *Zea mays* L. The teosinte hypothesis and the concepts of seasonality and scheduling are used to discuss the domestication of maize by means of human selection. This information is used to highlight the basic circumstances necessary within a human population for maize agriculture to be adopted. Furthermore, climate is examined through the minimum and ideal environmental conditions needed for the successful growth of maize. Environmental cues play a profound role in the phenotypic characteristics a species exhibits; therefore, Holocene climatic events are examined in areas with extensive evidence of maize domestication. The minimum requirements for maize growth are compared against the actual conditions during periods of significant climatic change (Little Ice Age, Medieval Warm Period, etc.). By comparing the ideal versus realized conditions over time, a model for the diffusion of maize from Mesoamerica into North America, with a particular focus on the Southwest and Ohio Valley, is developed.

[30] *Issues Involved in the Recording and Protection of a Previously Unknown Rock Art Site in Northern California*

This paper will discuss the interaction between an archaeologist, a Native American who is a most likely descendent from the archaeological site, and a municipal government agency in the

rediscovery, documentation and eventual repatriation of indigenous knowledge of a previously unrecorded rock art site. The rock is located in Northern California, on the lake bottom of a municipal water district water property. How should the rock be recorded? Does anyone really “own” that information? Who determines whether it could be sacred or the meaning of the symbols in the context of a cultural tradition? Only through the accumulated data base of site reports and studies can more possible cultural patterns be uncovered and help in the continued search for the more of these little known or understood early rock art sites. By working with the all three interested parties, protocols could be developed for future rock art site discoveries that would establish a consistent documentation and protection plan for these cultural resources.

Salyers, Kimberly (University of California, Santa Cruz)

[24] *Resource Procurement at the Local Level in Classic Maya Chinikihá (A.D. 600-900)*

Resource procurement is a topic traditionally approached from a geographic macro scale. In the Maya area, this refers to the scale of settlement patterns or the landscape, involving the territory inhabited by a large number of people living in different settlements. What this scale often misses is the role that commoner households play in these processes. This presentation will discuss how geographic setting and access to resources not only shaped the daily lives of Maya commoners but the role households play in local polities, like those at the Classic period site of Chinikihá, Mexico. Through the use of GIS analysis and analysis of material recovered from household excavations, this presentation demonstrates changes in understanding of the procurement of local resources. Possible applications such as fauna, ceramics and lithics will be considered.

Samei, Siavash and Karim Alizadeh (Department of Anthropology, Harvard University)

[402] *Craft Production and Specialization in the Transcaucasian Early Bronze Age: A View from Köhne Shahar, NW Iran*

A common image of the Kura Araxes Cultural Community (KACC) of Transcaucasia is one of egalitarian and mobile groups of pastoralists. While mobility and pastoralism are important aspects of KACC, this generalization dampens what in reality is a more complicated picture of the Early Bronze Age of Transcaucasia. Recent investigations in Transcaucasia, including the site of Köhne Shahar (KSH) in northwestern Iran, present a much more nuanced image of social and economic interactions in this time period. In this paper we contend that KSH served as a locus of craft specialization in the region, focusing on the large-scale production of such goods as metal and antler tools and ornaments. Finally, we discuss the importance of KSH and its economic and productive activities within a broader regional framework, including the relationship between the Caucasian highlands and the steppe communities to its north and Mesopotamia to its south.

[251] *Offing 2 Locus 2 Archaeological Site (Dawson Island, Patagonia, Chile), Marine Hunter-Gatherers and Interaction during the Late Holocene*

The results from Offing 2 Locus 2 archaeological site are presented and used to discuss broader implications for Patagonia hunter-gatherer contexts during Late Holocene. The site is located near Dawson Island, in a strategic geographical position between Fueguian-Patagonian archipelagos and the South America mainland. Radiocarbon dating suggests occupation around 800 BP. Evidence is characteristic of shell midden deposits and chronological evidence indicates a short occupational sequence. Lithic technology includes the use and transport of green obsidian with predominant use of local rocks, and a wide typology of instruments such as end-scrapers, side-scrapers and knives, common along the macro-region. As for projectile points they are predominantly stemmed but varied in typology and small size points are identified with bow-arrow weapons similar to those described for ethnographic collections. Bone instruments consider wedges, retouchers and awls, among others, but the key characteristic instruments are harpoon points of one barb and simple-tenon base that are detachable, also described in historic-ethnographic times. Other fauna elements include guanaco bone remains (*Lama guanicoe*) and scallop shells (*Chlamys* sp.) (both of exotic origin) and decorated bird bone pendants. Subsistence strategies are dominated by pinniped exploitation, sea birds and fishing. Results are discussed in relation to cultural traits and interaction evidence.

[103] *Testing the Association of Chipped Stone Crescents with Wetlands and Paleo-Shorelines of Western North America: A GIS-based Spatial Analysis*

We use ArcGIS and spatial analysis to quantitatively test a proposed association between chipped stone crescents and wetland environments in western North America. Dating between ~12,000 and 8,000 cal BP, crescents are often found in association with stemmed points of the Western Pluvial Lakes or Western Stemmed traditions. Many scholars have suggested that crescents served as transverse projectile points for hunting waterfowl, others have viewed them as more generalized and multi-purpose tools, possibly associated with wetland resource processing. In this paper we provide the first quantitative analysis of the proposed association between crescents and wetland habitats—testing their proximity to ancient pluvial lakes, marshes, rivers, estuaries, and islands using a GIS-based model. During the Terminal Pleistocene and Early Holocene, coastal habitats were highly dynamic and the Great Basin was cooler and moister than today, with numerous lakes and much more abundant marsh habitat. 8,000 years ago, environmental changes led to significantly drier conditions in the Great Basin, reducing lake and marsh habitat. Our results will help evaluate previous theories about the ecological association of crescents, as well as their function.

Sanchez Miranda, Guadalupe (INSTITUTO DE GEOLOGIA-UNAM) and John Philip Carpenter (Centro INAH Sonora)

[189] *Funerary Practices in Prehispanic Sinaloa: Assessing Aztatlán Mortuary Behavior*

Funerary traditions reflect social behaviors that contain important information about the integration of several social groups. Funerary practices seem to persist over time because they comprise an integral aspect of group identity. In this paper we discuss the funerary practices known for the identified late prehispanic Sinaloan archaeological traditions. Specific locations to bury the dead appear to be the usual practice for the Aztatlán and Huatabampo traditions. Funerary mounds with extended burials appear to be associated with the Huatabampo/Guasave tradition and are present on the Pacific coastal plain of northern Sinaloa and southern Sonora. During the northern expansion of the Aztatlán tradition (between 900-1400 C.E.) urn burials, along with several commodities, expanded into northern Sinaloa; the northernmost urn burial known is located on the Bahía Agiabampo adjacent to the Sonoran border. Additionally, we discuss the evidence for interaction and integration of the Sinaloan archaeological groups based upon funerary practices, trade goods and

social identity.

[77] *Geological Subsidence and Sinking Islands: The Case of Manono (Samoa)*

W. Dickinson, as part of his wide study of the geological history of Pacific islands, has proposed in a series of papers to explain the unique case of the deeply submerged Lapita site of Mulifanua in Western Upolu (Samoa) as linked to the slow subsidence of Upolu Island. Recent archaeological research on the neighboring small island of Manono has brought new and detailed data on this geological process. A series of dates aid in chronologically defining the speed of the subsidence as well as the massive environmental changes to which the local population had to adapt over the past 2500 years.

[30] *The Hindquarters of God, Seeing the Sacred in a Landscape*

As the needs of our expanding society increasingly refashion our natural environment, we struggle to maintain healthy habitats and our sacred places. Archaeologists, land developers, lawmakers, theologians, and indigenous practitioners of traditional spirituality all struggle with conflicting views of what do we mean when we declare that something is sacred and how do we recognize and preserve sacred places. The burning questions at the heart of this struggle are seemingly unanswerable: "What is sacred and what is not sacred." If something is sacred, can we interact, alter or develop it? If everything is sacred what can we develop, consume or even study in an academic setting? Dakota Elder Tom Ross taught that the sacred cannot be defined. He believed that the more we defined the sacred, the further we got from understanding it. Tom was taught by elders how to think about the sacred. He was taught how to recognize what could not be defined. This paper briefly outlines the teachings on the sacred and sacred places of some Dakota, Cheyenne, Arapaho and Shoshoni elders.

[119] *Climate Change and Subsistence Shifts: Wet-Rice Agriculture in Ifugao, Philippines*

The Little Ice Age was a global phenomenon beginning in the late 13th century A.D. that impacted the northern Philippines by creating more arid conditions. This was more evident in the eastern lowlands of Luzon where northeastern trade winds were typically dry. Conversely, the central highlands of Ifugao and the Cordilleras were relatively more humid due to orographic relief. These conditions, caused by periodic volcanism cooling the northern hemisphere, forced the Inter-Tropical Convergence Zone south to 0-5° north latitude, exposing the northern Philippines to 5-15° north latitude to drier conditions. This may have sent lowland farmers in search of humid highland terrain, documented around 3,200 years before present in the Cagayan lowlands of Luzon, allowing for the rise of wet-rice farming after its introduction into the Philippines ca. 1400-1500 A.D. As recent research shows, the rice terraces were not 2,000 years old but date to 1400 A.D., corollary to Spanish settlement in the lowlands and emergence of mountain settlement by Ifugao and other farmers. Spanish colonialism in the 16th-17th centuries A.D. led to the rise of extensive wet-rice farming in regions peripheral to Spanish governance.

[180] *Approaches to Assessing Anthropogenic Soil-Landscape Change in Ancient Agricultural Systems*

Farming alters and can wholly transform landscapes and soil properties, through both deliberate management and unintentional trajectories. The archaeological record of agriculture holds important long-term evidence about land management and change relevant to archaeology and current agriculture. Quantitative assessments of soil change in ancient fields are relatively few because of methodological challenges, soil's dynamic nature, and post-agricultural imprints of environmental change and land use. This paper discusses approaches to measuring and interpreting soil change through examples, identifies potentials and pitfalls, and considers new methods. Evaluating soil change requires baseline reference data. Inferring soil change is commonly based on a "space-for-time substitution" method in which agricultural soils are compared with uncultivated reference soils in similar geomorphic and pedogenic settings. Because soils are dynamic, reference soils do not represent original soils, but rather what cultivated soils would be like now had they not been farmed. Another way to detect soil change is to identify anthropogenic properties outside the range found in natural soils. Most comparative studies involve soils farmed during one period in the past, but there are examples involving multiple periods that allow studies of soil change pathways. Soil change outcomes range from degradation to enhancement of soil productivity.

[231] *Petrographic Analysis of Ceramics and Construction Materials: The Dwellers of Cueva del Maguey in the Sierra Madre Occidental and the Ferreria site of the Guadiana Valley in Durango, Mexico*

The archaeological site of the Ferrería (550-1350 d.C.) is undoubtedly the most important prehispanic settlement of Chalchihuites Culture in the Guadiana valley in Durango. The work done was based on a chronology made for Charles Kelley who divides into two main branches (Súchil and Guadiana). The presence of archaeological materials allowed reconsider the provenance of ceramics Madero Fluted type in the Guadiana valley and the Sierra Madre Occidental, activities and tasks has been important in the travel of materials, objects and ideas. The operational chains are the join of operations that were made to transform some materials in a product and that chains interfere jointly in the traditional knowledge lapsed socially and the experimentation. The ability of the constructors in the sierra allowed the use of constructive strategies for the edification of masonry. The traditional methods include itself the transmission of knowledge and the concept of learning (Castrellon, 2009:79). At the same time the presence of materials associated with the phase Tunal and Calera (1000-1350 d.C.) in Durango and the exchange with the dwellers of the sierra, reveal the deep cultural continuity that exist in the groups of La Ferreria and the Cueva del Maguey site.

[194] *Why Pilgrimage? The Ethnography and Archaeology of Journeys to the Center*

Pilgrimage is a "dynamic concrete isolate" found throughout the world at all levels of socio-cultural integration. Pilgrimage involves a journey to a significant geographic location and a return to the place of origin. Pilgrimage shades into tourism and a pilgrim's destination may range from the site of a miraculous appearance of a deity to Graceland. In Mesoamerica, pilgrimage has become a major focus of archaeological research. Sites with ritual associations and little evidence of habitation are routinely interpreted as pilgrimage centers. Pilgrimage and the meanings attached to it are also a recent focus of our own ethnographic research among Nahua people of the Huasteca. Contemporary indigenous and as well as non-indigenous participants continue the ancient pilgrimage tradition throughout Mesoamerica. We see pilgrimage as a means for people to escape the confines of a rigid social structure, introduce innovation into the system, and reset social relations without threatening the overall system. Pilgrimage has the potential to allow people to escape a social straitjacket while at the same time demonstrating commitment to cultural values embodied in a significant site. We dedicate this presentation to the ethnographic researches of Frannie Berdan, and especially her work among Nahuas in the Sierra Norte de Puebla.

Sandweiss, Daniel (University of Maine)

[334] *Floods, Famines, and Fagan: Recent Research on El Niño in the Age of Andean States and Empires*

In 1997-98, the first mega-Niño of the internet age devastated vast regions of the equatorial Pacific basin and altered weather throughout the globe; El Niño became a household term. Within two years, Brian Fagan had published "Floods, Famines, and Emperors: El Niño and the Fate of Civilizations", calling global attention to potential impacts of the phenomenon in prehistory. The Peruvian coast is ground-zero for El Niño, and Fagan included a chapter on Peru in his book. Over the last 15 years, new research has increased our understanding of the timing, frequency, and potential impacts of this climatic perturbation in coastal Peru. In this paper, I review the most salient new results on climate and civilization over the last two millennia, when complex states and empires controlled the Central Andes. Niño-related topics include landscape alteration and monument location, cycles of temple abandonment, population displacements, and the effects of the Spanish Conquest on coastal change, among others.

[400] *Animate Landscapes and the Transference of Authority: Resistance to hierarchy among Hunter-Gatherers of the Eastern Woodlands*

Traditional conceptions of power, hierarchy, and inequity focus on the relations between and among human communities. To a certain extent, objects and places are considered important aspects of human relations, but they are largely framed as inanimate tools wielded by human actors. This prevalent view is threatened by a rich body of research among non-Western societies that shows non-human things, places, and animals are often considered to be powerful beings imbued with agency and efficacy. Drawing from this research, this paper investigates the societal structure of hunter-gatherer groups who inhabited the Southeastern American coastline during the Late Archaic (5000-3000 B.P.). Several of these groups had all of the components thought to lead to social inequality, including sedentism, amassed resources, and long-distance trade, yet there is no evidence of entrenched status differentiation. Considering the likelihood that non-human actors were important members of this past community, it is suggested that certain aspects of emergent elitism, including ownership over material goods, were transferred out of human hands and instead emplaced within particular places on the landscape thereby reducing the threat of intra-human

dominance and inequity.

[116] *The Price of Freedom: Health Status in a Freed Slave Community in Le Morne (18-19th Centuries, Mauritius)*

This contribution presents the preliminary results of an osteobiographical approach to the life conditions of a slave/ex-slave population from Le Morne cemetery (18-19th centuries, Mauritius Island). We evaluate the incidence of several stress indicators/pathologies on the human remains that are the result of environmental conditions during life. Dental health, infectious diseases and physical activity markers were analyzed to address the daily life of this population. Our results indicate high incidences of caries, periodontal disease, dental calculus, antemortem losses and dental enamel hypoplasia. In addition, a nonspecific infectious disease in form of osteomyelitis was recorded on bones from four of the individuals. Evidence of stress from physical activity was also observed in the sample. These markers are enthesopathies, Schmorl's nodes, herniated disks, osteoarthritis in the spine and appendicular skeleton, bilateral spondylolyses and fractures of the secondary ossification centers in some ulnae and calcaneus. The osteobiographical profiles documented in the population from Le Morne suggest poor health conditions, consistent with historical data. In this regard, osteobiographical research on this population contributes to recovering the historical memory of this community.

[378] *"Diet and Connections among Cultural Groups in the Atacama Desert during the Late Intermediate Period (A.D. 950-1450)*

The Pica-Tarapacá and the Atacama cultures appeared in northern Chile during the Late Intermediate Period, after the decline of the Tiwanaku state. Archaeological data suggests that both groups practiced maize agriculture and pastoralism to variable degrees, but their trade and exchange links differed significantly. Interaction with coastal groups, in the form of fish and other marine resources is common in the Pica-Tarapacá sites. The Atacama groups, who occupied the Atacama oases and pre-cordilleran area, seemed to have directed their networks towards the highlands instead. Here we applied stable isotope ratio analysis of carbon, nitrogen and oxygen to test the archaeological reconstructions of their dietary patterns and residential mobility. Our results show that diet amongst Tarapacá and Atacama cultures differed significantly: the Atacama group was mainly based on the consumption of terrestrial resources, while values for the Tarapacá group indicate consumption of both marine resources and maize. Oxygen isotope values from at least five individuals strongly suggest the presence of foreigners in the cemetery associated with the Pica-Tarapacá culture, consistent with evidence for high mobility patterns during this period. This evidence for human mobility accompanies the high levels of trade and interaction observed in the archaeological record.

[24] *Placing Cahal Pech on the Map: Implications of Burial Goods Recovered in the Site's Eastern Triadic Shrine*

Between 2011 and 2014, the BVAR Project focused considerable attention on the excavation and preservation of the site's Eastern Triadic Shrine (a.k.a. E-Group). In addition to revealing important information on the evolution of the architectural complex, our investigations also uncovered a series of burials that span from the Preclassic to the Terminal Classic periods. The burials, particularly

those discovered in Structure B1, the central structure of the eastern triadic complex, reflect considerable wealth and an astonishing assemblage of unique artifacts that has contributed to a better understanding of the elite Maya who lived at Cahal Pech. The grave goods in the elite burials within Structure B1 also provide evidence for interregional trade and interaction, and serve to position Cahal Pech as one of the most important socio-political centers in the upper Belize River Valley.

[41] *Ancient Starch Research In California: Results from CA-SBA-53*

Acorns were an essential foodstuff across prehistoric California; the transition to acorn use is currently being investigated. CA-SBA-53, a single-component Middle Holocene site on the mainland coast near Santa Barbara, contains an assemblage fairly evenly split between mortars and pestles, traditionally associated with acorn processing, and manos and metates, generally associated with seeds; furthermore, these mortars and pestles are some of the oldest known in California. By extracting and analyzing ancient starch grain extracted from ground stone tools, we can study subsistence shifts and associated shifts in technology. Such analyses can further illuminate issues of technological transitions and resource intensification during this period. Final results, presented here, suggest that this method could be very useful in reconstructing ancient foodways in prehistoric California, even though there remains much work to be done, particularly in regards to identification.

Sarich, Steven (Michigan Technological University) and Timothy James Scarlett (Michigan Technological University)

[126] *Physical Characterization of Stoneware Ceramic Materials*

The Davenport Pottery manufactured earthenware and stoneware in Utah, between 1853 and 1888. This poster uses data from a broad range of analyses, including XRF, INAA, petrography, and mechanical stress testing to develop profiles of the outcomes of technical processes at the pottery shop. These characteristics then provide insight into various key research topics in archaeology, including pottery systematics, life-expectancy and depositional time lag, experimental archaeology, and the applicability of RHX dating techniques on high-fired ceramic samples.

[273] *Twin Pines: Looking Beyond Mimbres Valley*

The Twin Pines site, located in the Gila National Forest, New Mexico, is a large Mimbres site that shows signs of multiple occupational periods spanning the Late Pithouse Phase (A.D. 550-1000) through the Mimbres Classic phase (A.D. 1000-1130). On the basis of recent mapping and reconnaissance, the Twin Pines site can provide crucial information about the Mimbres culture. First, it is a large Mimbres site which lies farther north of the extensively studied Mimbres Valley and most

other sites of the same period. Investigating the site allows us to understand the interaction and affiliation between the people from Chaco Canyon and the Mimbres areas. Second, the site is a source of several interesting artifacts, including copper bells, a copper effigy, an abundance of turquoise, and obsidian flakes. Tracing these artifacts to their source allows us to understand and reconstruct trade between people in the Upper Gila and other areas in the American Southwest. Finally, the site is of interest because it features rock art panels, which include several mortar holes. Understanding these features allows us to better understand the social landscapes and how people interacted in the Mimbres region.

Sasaki, Ken-ichi (Meiji University)

[145] *Adoption of Horse-Riding Practices in Fifth-Century Japan and Its Political Significance*

A practice of horse-riding was introduced to Japan from the late fourth century and after. Since horses were not native to Japan, Korean specialists of raising and breeding horses were invited. Recently, fifth century evidence for raising horses has been excavated at various places in Japan. In the central Osaka Prefecture near where the central polity was located, horses were carefully buried at the foot of small fifth- and sixth-century circular burial mounds, and Korean ceramics were discovered at nearby settlement sites, along with pottery specially used for salt production. A situation is very different in the central highlands of Japan. There, we found numerous fifth-century cairns, which is very unusual in Japan and suggests that descendants of Korean immigrants were buried. A few ceramic figurines of horses were offered, but no horse burials at the foot of burial mounds and nor Korean ceramics. It seems likely that local elites who might be descendants of Korean immigrants introduced methods of producing and raising horses quite independently from the central polity. It might be the case that the central polity in the fifth century did not fully monopolize the diplomatic rights.

[274] *Further Analysis on Vessel Size and Feasting in Three Chacoan Great House Communities*

Examining rim sherds and identifying ceramic vessels size is one method of investigating feasting practices. Larger vessels may indicate larger scale food preparation and consumption than found at normal households. Chacoan Great Houses are thought to have been used as gathering places for local communities to serve as the locus of ritual and feasting activities. The temporal element is expanding the research by using general ware types as temporal indicators on the ceramics recovered from Pueblo II sites in New Mexico's southern Cibolan communities of Cox Ranch Pueblo, Cerro Pomo, and Largo Gap.

Saturno, William

[303] *Presenting Order: Painting as Mythic Past and Mathematical Future in the Murals of San Bartolo and Xultun, Guatemala*

Though the murals of San Bartolo and Xultun are located only 8km apart in the lowland forests of Guatemala, they are separated by more than 800 years of Maya history and reflect very different relationships between society and the cosmos as well as between the artworks and their intended audiences. Where one publicly recounts episodes of Maya mythology and the idealized roles of both gods and kings in the creation and maintenance of cosmic order, the other, painted within a private household, illustrates the king and members of the court as the background for the scholarly calculations of cosmic cycles themselves. This paper uses the excavation, conservation, and

interpretation of these two remarkable examples of Maya mural painting as a point of departure for discussing the evolving role of Maya muralists and the continued use and alteration of these paintings long after their initial renderings.

[144] *Perceptions of the Matacanela Archaeological Site by the People of Zapoapan de Cabañas*

The town of Zapoapan de Cabañas, located south of Lake Catemaco, Veracruz is adjacent to the archaeological site of Matacanela. Even though little historical continuity exists between the archaeological site and the contemporary settlement, perceptions that Zapoapan's inhabitants have about the site are informative because they suggest how the site is internalized and integrated into daily life. The historical memory of the inhabitants of Zapoapan de Cabañas, through oral tradition and the reuse of space, is a cultural phenomenon that links the daily landscape with the past. Archaeologists play an important role in how the community's perceptions of the past are shaped. We present some findings from preliminary ethnographic research into their ideas of the past and how they relate to it on a daily basis.

[316] *Keep your Boots on: LiDAR as a Reconnaissance and Survey Tool on the Vaca Plateau, Belize*

Recent studies have demonstrated the revolutionary potential of LiDAR as a means of mapping archaeological features within densely forested and/or inaccessible landscapes. In a matter of days, aerial LiDAR scans can survey swaths of forest which would take decades to map on foot. However, in order to effectively exploit the analytical potential of LiDAR datasets, we must understand how the spatial information captured by these systems compares with those produced by traditional ground survey. To this end, we employ a blind-test to examine our ability to identify and classify known archaeological settlement features on a LiDAR map. The results of this blind test expose a number of limitations which may bias LiDAR based settlement surveys. Nevertheless, we emphasize the value of this technology as a means of targeting high potential areas for further exploration, as well as reconnaissance of isolated regions

Sawyer, Alicia (Department of Archaeology, Boston University) and Justin Holcomb (Department of Archaeology, Boston University)

[9] *Interpretation of Midden Formation Processes at Three Farms in Skagafjörður, Northern Iceland Using Thin Section Micromorphology and pXRF Chemostratigraphy*

Skagafjörður, northern Iceland is a fertile valley bottom where farms established during the Landnám in the late 9th century are still occupied today. In this study, we examine middens from three farms: Reynistaður, Syðra-Skördugil, and Stóra Seyla. The middens show deposition from the Landnám through the Medieval Period. This research answers four questions: What is the sediment composition of the midden fill? What are the main modes of deposition? How do these deposits contribute to the chemostratigraphy of the site? Given these data, what assessments can be made as to the formation of these middens? To answer these questions, we applied a combination of thin-section micromorphology and portable x-ray fluorescence spectrometry (pXRF) to sediments from three sites in the local area. By generating a chemostratigraphic framework targeted on sampled areas, a predictive in-field approach via pXRF can be obtained for future application throughout the study areas.

Sayre, Matthew (University of South Dakota) and Daniel Contreras (Kiel University)**[186]** *Lessons from the Tello Obelisk- Domestication and Plant Use at Chavin de Huantar, Peru*

The work of Dolores Piperno has significantly advanced our understanding of the rise of agriculture in the tropical Americas. Her work has been fundamental in the development of microbotanical techniques used to understand the use of plants in the past. This paper builds off of Dolores' analysis of plants depicted on the Tello Obelisk, at the site of Chavin de Huantar in Peru, in order to consider the role that plants from distinct ecological zones across the Andes played at the temple site. This analysis is presented in conjunction with a discussion of how the agricultural community at Chavin managed the landscape that surrounds the temple site. New phytolith data will be presented in conjunction with macrobotanical data in order to reach a more nuanced understanding of how the inhabitants of Chavin varied their plant use across the different sectors of the site. Data will be presented from a hearth in the West Field, from the Wacheqsa area near the monumental center, and from the La Banda domestic sector.

Sayre, Matthew [347] see Mayer, Aaron

Scales, Mary**[8]** *Learning from Disturbance: A Late Woodland-Early Mississippian Site in the Georgia Piedmont*

Between 2012 and 2014, the University of Georgia field school in archaeology undertook investigations at Raccoon Ridge, a highly disturbed Late Woodland-Early Mississippian site in the Georgia Piedmont. Systematic surface collections and shovel tests were used extensively to define the site's geographical footprint. Geophysical survey, including shallow magnetic gradiometry and susceptibility, together with phosphate analysis were also utilized. Anomalies detected with these methods were investigated by test excavation, with mixed results. Following the 2014 season, our findings have revealed a more intricate picture, as the site is more highly disturbed than anticipated. Ultimately, what we thought was a single large site was determined to consist of two separate occupations. The importance of disturbed sites, whether existent on private or public lands, is discussed here. Conclusions regarding this site and the findings of each season are compiled briefly to address how the investigation of sites that may be overlooked or written-off because of extensive destruction, intentional or otherwise, can contribute to the archaeological record.

Scaramelli, Franz [371] see Navas, Ana

Scarborough, Vernon [295] see Dunning, Nicholas

Scarborough, Vernon (University of Cincinnati)**[334]** *Crosscultural Archaeology and the Role of the Tropics in Informing the Present*

The ancient Maya and Khmer developed in semitropical environmental settings, both having not dissimilar chronologies. Tropical ecological rhythms dictated their respective dispersed land-use patterning. To cope with seasonal abundant precipitation followed by 4-5 months of drought-like conditions, the Maya accepted cropping designs based on the limitations of extended ground storage while the Khmer located resources to elevated reaches of stilted housing; approaches conditioned by accelerated organic decomposition and pest infestation. To accommodate rapidly grown and harvested food, though subject to the vagaries of regional rainfall, extensive roadways and canoe transport connected groups and polities into elaborate exchange networks coordinated by sizable centers and their calendrical scheduling. The effects of climate, both at the nuanced seasonal level and at more coarse decadal levels, resulted in environmental adaptations which provide a potential picture of our own. Internet connectivity to resource-specialized communities located in hinterlands away from urban aggregates and physically linked by light-rail would mimic the successes of past tropical socioenvironmental systems. Urban hubs would continue to prosper as coordinating centers for global socioeconomic supply/demand, but rural communities would be prized and elevated in their importance and influence. Community-based cooperatives today would have a global reach not

apparent in antiquity.

[273] *Burning as Ritual in the Jornada Mogollon*

What is the significance of multiple burning events at Cottonwood Spring Pueblo (LA 175) an El Paso Phase (A.D. 1300-1450) Mogollon village in Southwest New Mexico? What do these burning events tell us about the life history of the pueblo? When did they occur? How do they compare to burning events at contemporary sites in the American Southwest? Contextual evidence suggests they are separate ritual events. What purposes did these events serve? How do they differ from other purposeful pueblo burning? This poster explores these questions through a case study of one of the largest villages in the region. We employ multiple chronological methods (stratigraphic superposition, dendrochronology, radiocarbon and archaeomagnetism) to contextualize burning within the site for our comparison. This pueblo straddles a cultural boundary between the Jornada and Mimbres branches of the Mogollon offering a good case study in this understudied region and phase. We found burning events in 16 of the 18 rooms and at least two areas with evidence of superimposed burning events. Our poster argues that the burning appears to have resulted from a combination of retiring particularly important ritual rooms, remodeling phases, and the final abandonment of the site.

Scarlett, TimothyJames (Michigan Tech University)

[126] *Multi-Lab Collaborative Experiments with RHX Dating*

Michigan Technological University, California State University-Long Beach, and Arizona State University scientists have been collaborating on a critical assessment of the novel RHX Dating technique, pioneered by Wilson et al. (2009). This chronometric technique, if proven reliable, will transform archaeological dating practices. We have conducted multiple trials with a wide range of ceramic types from Neolithic through Early Modern, using varied set ups of instrumentation and thoughtful lab protocols. We continue to refine models of the rehydration and rehydroxylation processes; explore the relationship between relative humidity and RHX behaviors and other water crystallization systems; examine different lab practices and protocols; and assess other mechanisms of mass loss and gain, such as decarbonation, carbonization or organic contaminants, and decomposition of sulfates and salts. At this time, analytical trials of 50% of our samples yield dates close to expected dates of manufacture while the other 50% remain inaccurate. We are cautiously optimistic for the ongoing development of this dating technique, but many very important questions remain to be answered.

Scarre, Chris

[334] *The Comparative Archaeology of the Channel Islands*

Brian Fagan's long fascination with the sea and sailing gives special resonance to his studies of coastal communities and human adaptation. In Before California he studied the Chumash peoples and the prehistoric settlement of the Channel Islands of the Santa Barbara Channel. In recognition of Brian's evocation of broad-scale cross-cultural comparisons, the postglacial communities of the Californian Channel Islands are here contrasted with patterns of settlement and social change in the Channel Islands of the English Channel. Despite many differences in technology and social organization, both sets of communities were dependent on maritime connectivity and both subject to the vulnerability imposed by their coastal environments. This study will demonstrate the value of cross-cultural comparison in throwing new light on even such disparate prehistoric settings as the

islands of western North America and those of northwest Europe.

Scattolin, María (Museo Etnográfico, Buenos Aires)

[371] *Before Calchaquí. The Formative Period and Middle Horizon ceramics in Northwest Argentina*

This paper gives a characterization of the ceramic styles as well as the forms and functions of vessels and, broadly, the production of pottery in the village societies that inhabited the southern Calchaquí Valleys (Northwestern Argentina) during Formative period and Middle Horizon (first millennium A.D.). The study of ceramics in Northwestern Argentina has traditionally been centered on descriptions, taking decorative motives as fundamental evidence in the definition of styles and periodization. From this perspective, style is generally understood more from the point of view of an observer than from the perspective of the potter. Following an examination of the main settlements of these periods, the extent of styles recognized until now is considered. Then, results of new chronological-stylistic analysis based on the study of museum collections are offered. Changes in the main traditions are discussed as well as correlation and disjuncture from previous classifications. Morpho-functional and petrographic studies recently performed on fragments and vessels found at excavations in Cajón and Santa María Valleys are then provided. Pottery manufactures are compared with those from other sites in the region to display an overview of ceramic production of prehispanic agro-pastoral societies that inhabited the Southern Andean Area previous to the Calchaquí populations.

Schaafsma, Curtis and Polly Schaafsma (Museum of New Mexico)

[137] *How Values, Prejudice, and Social Issues Shape Rock Art Research in North America*

We present a brief history of rock art research in North America, identifying some of the social forces and schools of thought that have shaped these studies within and outside of the confines of traditional archaeology. Among relevant issues within academia are prevailing paradigms that aspire to specific goals and interests that orient archaeological research. Even when these interests and concerns would benefit from the analysis of prehistoric images made by the socio/cultural groups under investigation, rock art is often ignored or left up to the purview of active amateur rock art groups, who have enthusiastically embraced these endeavors, thereby creating a social division in the field of rock art research in North America. Also because rock art is an artifact of worldviews and social practices, in cases where there are living descendants, issues regarding interpretation and preservation have arisen. Problems encountered in these areas are considered.

Schaafsma, Polly (Research Associate, MIAC\LOA)

[189] *Some Observations on Hohokam Figurines: Implications for Early American Southwest Connections with West Mexico*

Hohokam anthropomorphic figurines differ in style, mode of manufacture, and meaning with most, if not all, other figurine traditions in the American Southwest which appear to be regional in their derivation. In contrast, clay Hohokam figurines have often been cited as evidence of early cultural relationships between southern Arizona and Nayarit and adjacent regions. Between the Formative/Pioneer Period and prior to ca. 800 C.E., simple Hohokam figurines display distinctive stylistic norms that nevertheless link them to the slightly earlier and much more elaborate and sophisticated clay shaft tomb sculptures of West Mexico. Many scholars have postulated that early Hohokam figurines had roles in household rituals pertaining to fertility and the ancestors, the latter further supporting a West Mexican connection. These early parallels with West Mexico presage events between 800 and 950 C.E. when rapid changes in Hohokam ritual and socio-political organization included the appearance of ball courts and trade items manufactured in the West Mexican highlands. Simultaneously new stylistic developments of the figurine complex with strong Mexican affinities are found associated with formalized and public mortuary rituals seemingly adding a political role to ancestor veneration among the Hohokam.

[378] *"Feeding the Dead" at Chiribaya Alta*

The inclusion of foods and eating utensils within graves at Chiribaya Alta, a Late Intermediate site ~5 km from the mouth of the Osmore river, suggests that "feeding the dead" during funerary rites was a common practice within the Chiribaya polity. Thus far, however, these foods have not been systematically considered in relation to funerary practices. This study examines food items placed within tombs at Chiribaya Alta (n=307) and considers their potential symbolic meanings within funerary practices, as informed by documented ethnographic and ethnohistoric cases. We compare the foods included within graves to the aggregate diets of skeletal individuals as determined through previously published carbon and nitrogen isotopic analyses. This study will allow for a consideration of the importance of symbolic foods within the daily diet of Chiribaya individuals.

[335] *Seeking New Metaphors for Communities and Households in the Ancestral Pueblo Southwest*

Investigations of households and communities have long been strengths of archaeological research in the American Southwest. As the spatial breadth and temporal resolution of these studies has improved, the archaeological record has raised key challenges to our preconceptions of the scale, stability, and structure of Ancestral Pueblo communities and households. Newer models must reconcile evidence for the frequent movement of individuals and households with contrasting data attesting to long-term use of residential and non-residential locations and the complexity of local economies. These new models must also directly confront the fact that the archaeological record has a temporal and spatial depth that is rarely present in models of community and household derived from ethnology. In this paper, I explore multiple examples of community organization and household strategies in the Western Pueblo region in order to illustrate the benefit of shifting the spatial scales of our analyses and argue for the adoption of models that more fully embrace the temporal rhythms of the archaeological record.

Schaeffer, Bryan (Florida State University)

[259] *Interaction as Movement, Movement as Interaction: The Tripod Vessel in the Maya Region*

Interaction between the central Mexican city of Teotihuacan and the Maya region, and the subsequent influence of Teotihuacan on Maya material culture, has been much discussed. Although many scholars have noted the tripod cylindrical vessel as a diagnostic trait of Teotihuacan and as evidence of interaction and/or influence in other areas of Mesoamerica, further examinations of the tripod ceramic vessels and their imagery found in the Maya area have not been fully developed. The tripod vessel has even been questioned as a characteristic solely of Teotihuacan. A few scholars postulate that the tripod form originated in the Gulf Coast cultures of Veracruz. Previous examinations of these vessels have not adequately explained their presence in various Maya cities, from the highlands of Guatemala, to the southern lowlands of the Petén region, to the southern-most Maya city of Copán. This paper examines the movement of a stylistic form closely associated with Teotihuacan and the interactional dynamics of a culturally appropriated artistic form. Several ceramic tripod vessels from the Maya region demonstrate a fusion of Maya and "Teotihuacanoid" elements, underscoring an artistic exchange that traversed divergent Mesoamerican regions.

[162] *Weediness: Modern, Historic, and Prehistoric Plants at Poverty Point, LA*

With construction beginning about 3,700 years ago, Poverty Point (16WC5) in northeast Louisiana is one of the earliest and largest sites of its kind in the United States. What were conditions like when people began constructing the mounds? What kind of environment did they live in? How did this change (or not change) over time? This poster presents lithological and palynological evidence covering the period before, during, and after prehistoric occupation at this site. Comparing and contrasting prehistoric with historic and modern vegetation in the area reveals how vegetation has changed over the last half of the Holocene, putting both past and present environmental conditions into perspective.

Scharlotta, Ian**[391] *Trade Routes and Contradictory Spheres of Influence: Movement of Rhyolite through the Heart of the Western Mojave Desert***

Provenance analysis of obsidian and rhyolite artifacts from four Late Prehistoric sites located on the edges of the western Mojave Desert suggest direct procurement practices and the presence of a trade network through the Antelope Valley. Less clear is whether evidence for the movement of materials can effectively be used to infer particular cultural territories or specific cultural interactions. Ethnographic work in the Antelope Valley suggests that areas surrounding rhyolitic formations may have been controlled by different groups. The boundaries described by ethnographers may not have accurately reflected the prehistoric territories of groups in the area, as Mission contact likely altered regional populations prior to recording. Notes from early missionaries and explorers provide conflicting information regarding the location of villages, native groups, and associated territories within the Antelope Valley. Furthermore, reports suggest that enmity/amity relationships varied between regional groups over time, and that open conflict occurred near Santa Clarita, California during the 1770s. These actions likely inhibited trade networks between the western Mojave and coastal Chumash populations. The movement of lithic artifacts is examined in light of the different lines of evidence to infer modification of previous trade networks and territorial boundaries in the Antelope Valley.

Scheder Black, Ash (University of Arizona)**[396] *Applied Archaeological Visualization: Technical Advances and Research Insights from the Effort to Visualize Neanderthal/AMH Interactions at Deep Time Depth***

Geospatial and temporal mapping technologies continue to rapidly evolve, making possible archaeological visualizations capable of revealing patterns in the past from new and potentially dramatic perspectives. The TemporalMapping.org project, now in collaboration with the University of Oxford's PalaeoChron.org, will share techniques and research results from data visualization efforts including a global 30-arc second resolution model of sea level change from 475,000 BP to Present and a high resolution animation of Neanderthal/Anatomically Modern Human interactions based on research published in August, 2014. Details of current modelling processes and programming methods will be discussed along with a brief introduction to using similar techniques and freely available tools to craft bespoke visualizations, and the potential for archaeological applications of emergent technologies originally designed for Business Intelligence.

Scheiber, Laura (Indiana University)**[406] *The Future of Zooarchaeological Collections in Twenty-First-Century Scholarship***

Zooarchaeological research is nearly impossible without comprehensive comparative collections that aid in the identification and analysis of archaeofauna. Throughout her career, Diane Gifford Gonzalez has been a strong proponent of developing and maintaining comparative research

collections of modern and ancient vertebrate specimens. In this paper, I discuss the current state of zooarchaeological collections in twenty-first century scholarship. I highlight the William R. Adams Zooarchaeological Laboratory at Indiana University, which contains over 10,000 modern specimens from all over the world. The lab recently completed a massive overhaul of its curation facilities, with the help of a large award for capital improvements from the National Science Foundation. The investment in comparative collections by the National Science Foundation demonstrates the fundamental importance of these resources. Quality comparative collections are the foundation of zooarchaeological research, and the strength of the research is directly limited by the types of comparative resources available. Efforts have now turned to three-dimensional scanning of the comparative collection in order to help overcome a major hurdle in zooarchaeological research. These bring irreplaceable research collections and comparative collections together from disparate geographic locations. I will also discuss digitization results within the context of broader anthropological and ecological research goals.

[282] *The Civilian Conservation Corps in Chaco Canyon, New Mexico*

In 1937, a unique Civilian Conservation Corps (CCC) sponsored "Indian Mobil Unit" was established in Chaco Canyon. The camp was located east of Pueblo Bonito and the goal was to train Navajo men and a woman in stone masonry, ruins stabilization, drainage control, archaeological excavation, and associated administrative tasks. In 1939, under the direction of National Park Service (NPS) archaeologist Gordon Vivian, men from the Indian Mobile Unit excavated a small village site in advance of the construction of CCC camp NP-2-N, designed to house a regular 200 man unit. Camp NP-2-N was closed in 1941 and the Indian Mobile Unit was closed in 1942. The success of the Mobile Unit program resulted in the establishment of permanent Ruins Stabilization Units at parks in the Southwest. The 1939 excavation of the archaeological site, the CCC Site, exposed nine rooms and associated sheet trash. In 1949, two deeply buried kivas were excavated by the NPS. In the mid 1970s, the Chaco Project re-excavated portions of the two kivas and Room B in order to obtain archaeomagnetic dates.

[187] *High and Low: Highland and Coastal Dress in the Andean Region, 100-800*

Dress can be a key aspect of stating a cultural or ethnic identity. Garment shapes, textile techniques, and accessories all contribute to creating a particular ensemble that can define a group identity. This effect can be heightened in the representation of dress, as the artist and patrons decide what are the essential elements that are worth depicting, and as the medium of representation dictates what can and cannot be conveyed visually. This paper examines the similarities and differences in the representation of dress in ceramic effigy vessels among the Moche, Nasca, and Recuay cultures of Peru. These cultures overlap in time, providing a chance to understand what were considered important elements of the cultures themselves, and whether commonalities in coastal dress styles noted by A. Rowe (1990) and others (Frame 2003, Horié 1991) persisted in the representation of costume in ceramic. Similarities and differences in garment forms, decorative motifs, and accessories are all used to analyze the statement of identity and difference made by these pieces.

[158] *To Burn like the Sun: Rituals of Fire and Death among the Classic Maya*

The dichotomies of hot and cold, light and darkness were essential to Classic Maya cosmology. The celestial and underworld journey of solar deities offered a fundamental mythic charter, and fire was the ultimate transformative force, providing a bridge between earthly and otherworldly realms. Such ideology is especially patent in rites of death, sacrifice, and veneration. Monuments from western kingdoms describe censuring rituals performed months, years, and even decades after the death of important personages. Work at Piedras Negras demonstrates that even the long cold remains of the kings were activated by exposure to flame. In other kingdoms, fire was used to transform the most precious of mortuary offerings: the corporal remains of mourners and the bodies of sacrificed youths.

[242] *The Universe of Ritual Manifestations at Tak'alik Ab'aj*

The archaeological record of 27 years of research at the ancient site of Tak'alik Ab'aj at the southwestern pacific piedmont of Guatemala has summed up evidence of a wide range of different ritual activities and patterns, which are represented through a huge diversity of materials and artistic or handicraft skills. The pivotal role of Tak'alik Ab'aj as a long distance trade center and precocious cultural and religious "mecca" with "international flair" is reflected in the materials and artifacts employed in its rich ritual tradition. With a rapid overview of its ritual manifestations, it will come apparent that these are present at Tak'alik Ab'aj in almost every aspect of common life and rulership, and repeatedly employ powerful messages, as well as ritual protocols, which trespass time, space and materiality.

[29] *Challenges and Opportunities of Archaeology in Urban Parks: an example from the Arch*

Jefferson National Expansion Memorial is an anomaly in the National Park Service. The park was designated in 1935 as the first national historic site, memorializing America's westward expansion, yet it is best known for the Gateway Arch, a modernist monument that towers over the city. Archaeological information from the St. Louis riverfront is sparse, but the park is located in an area that was densely settled from prehistory to the beginning of the twentieth century. In the late 1930s, NPS razed the historic city and then for the next half century completely recontoured the grounds in

a series of cut and fill stages as the monument was built. In the past, archaeologists have documented a few historical items encountered during construction, but intact features are rare. The CityArchRiver 2015 project along the riverfront will involve deep and extensive excavations potentially exposing early undisturbed landscapes and features. Other aspects of the project may expose historically sensitive deposits within the Old Courthouse. The scale and extent of this project are atypical for the NPS. In this paper, I discuss how the Midwest Archeological Center is partnering in innovative ways with multiple stake holders to preserve archaeological resources during this project.

[155] *Micromorphology of Middle to Later Stone Age Sites at Mwanganda's Village, Northern Malawi*

The Mwanganda's Village site, northern Malawi, was first excavated in 1965-1966 under the direction of J. D. Clark, who reported the recovery of early Middle Stone Age (MSA) stone tools in possible association with the remains of an elephant. New work in 2009-2012 revealed that the elephant and the artifacts were not likely to have been behaviorally associated. The site lies within a series of river terraces dating from the Middle Pleistocene to the Holocene. Near the top of the sequence an in situ Middle to Later Stone Age deposit dates to before and during the Last Glacial Maximum, providing an opportunity to examine human behavior in light of changing paleoenvironmental conditions.

Micromorphological analysis is employed to reconstruct a detailed site formation history of the sequence at Mwanganda's Village. Post-depositional features observed in thin section are especially informative about the paleoenvironment, as they are associated with ancient water tables and soil formation. Data from sediment cores collected in Lake Malawi indicate a series of mega-droughts during the Late Pleistocene. The association of terminal MSA artifacts with depositional and post-depositional features linked with riparian environments shows an emerging pattern of wetland adaptation during the MSA in central Africa.

[416] *A Mid-19th Century Lighter from San Francisco Bay's Yerba Buena Cove: Context, Documentation, and Conservation*

In 2013, WSA recovered a well-preserved Gold Rush Era lighter from the original shore of Yerba Buena Cove. This class of boat, used to load and unload ships where there is no adequate harbor, was used extensively in San Francisco prior to the completion of sufficient deep-water wharfs in the 1860s. This paper contextualizes the use of lighters in frontier San Francisco and presents new insights into the construction of the recovered lighter gained from the creation of a 1:12 scale model. The authors also describe the methods and results of the conservation effort undertaken by the National Park Service to stabilize the lighter for future study and possible public display

Schleher, Kari (Crow Canyon Archaeological Center), Jamie Merewether (Crow Canyon Archaeological Center) and Grant Coffey (Crow Canyon Archaeological Center)

[85] *Material Culture of Communities: Temporal and Spatial Patterns in the Material Culture of the Goodman Point Community*

In this paper, we explore temporal and spatial patterns present in the material culture of the Goodman Point Community. The Goodman Point area of southwestern Colorado was home to ancestral Pueblo peoples from the A.D. 600s until depopulation of the broader region around A.D. 1280. Recent laboratory analyses by the Crow Canyon Archaeological Center have produced a large data set of the material culture within the later Goodman Point Community, including data on over 95,000 sherds and 75,000 lithic artifacts primarily dating from the A.D. 1000s through A.D. 1280. In this paper, we discuss this robust assemblage focusing on types of artifacts, including pottery, pottery tempering materials, stone tools, and exotics, to evaluate both contemporaneous and diachronic artifact patterns to assess social connections within the community and to other peoples further afield. These patterns are compared to other material signatures recorded for contemporary communities in the region, including the Sand Canyon Community.

Schmader, Matthew (University of New Mexico)

[81] *"They Had So Many Stones to Hurl": Evidence of Inter-Indigenous Conflict on the Vázquez de Coronado Expedition, 1540-1542*

In 1540, Francisco Vázquez de Coronado led one of the largest expeditions ever assembled by the Spanish crown into the present-day American southwest. The expedition had 375 European men and was supported by a large contingent of at least 1,300 native Mexican soldiers from various ethnic groups. The native Mexican soldiers likely did much of the advance work, hand-to-hand fighting, guarding, and other military detail. The whole expedition was not well-equipped with European military technology and had to rely on native weaponry to a great extent. Upon its arrival in the Rio Grande valley of central New Mexico, the expedition took over native villages for shelter and engaged in several battles with indigenous pueblo people. In so doing, the fighting that broke out between native Mexican soldiers and pueblo people is a rarity in the cultural history of the American southwest. Physical evidence of this conflict from a pueblo site in New Mexico is examined. Slingstones, projectile points, and obsidian flakes are possible links to the Mexican soldiers. These artifacts are intermixed with European items such as crossbow points, musket balls, horse shoe nails, and personal gear. The pattern of artifacts and apparent puebloan defense of their village is described.

[397] *Home Is Where the Herd Is: Social Factors and Mobility Patterns in Prehistoric Kazakhstan*

Our understanding of the structure of pastoralist societies in prehistoric Eurasia is currently being reevaluated in light of new data from a range of sources. I present the results of a cementum annulation study done on domestic sheep teeth from prehistoric pastoralist communities in Semirech'ye, Kazakhstan. These data provide evidence that past mobility patterns were not necessarily rigidly dictated by seasonal climate conditions. Rather, although the environment was certainly a major factor in people's decisions about when and where to move, there was a good deal of flexibility in migration patterns. Even in a difficult environment, a range of social and cultural factors influenced people's decisions about what was best for their herds. On the other hand, some of these factors also seem to have been resilient in the face of larger social influences. Flexibility in the timing and location of migrations pertained throughout the Bronze Age and the Iron Age, even during a transition to a more stratified society. The social changes that took place during this time do not seem to have influenced herding practices. I consider possible explanations for this continued flexibility that take into account both social and environmental factors.

Schmid, Magdalena (University of Iceland)**[321]** *Colonization Models of Iceland: New Archaeological and Environmental Data*

This study aims to improve the dating resolution of archaeological and environmental data from the earliest sites of human occupation in Iceland in order to understand better the timing, scale and rate of the colonization of Iceland. This can be achieved through critical examination of the whole corpus of approximately 650 sites which is now accessible; through cross-referencing of different dating methods – primarily tephrochronology, radiocarbon dating and typology – and through application of new statistical methods of analysis, such as Bayesian statistics which in turn allow testing of specific colonization models. A key motivation for this research is the idea that Iceland is located in the deep ocean, where in the ninth century neither indigenous people nor land-mammals lived, and agriculture had not yet been practiced making this volcanic island the most extreme case study to test colonization models.

Schmidheiny, Martin (MIT)**[327]** *Seeing Red: Characterizing Historic Bricks at Sylvester Manor, Shelter Island, New York 1652-1735*

This project develops a basic material characterization of pre-mechanized, handmade bricks excavated at the site of Sylvester Manor on Shelter Island, New York. In the early Manor period of 1650-1690, this early Northern provisioning plantation supplied Barbadian sugar operations and pursued mercantile interests independent of state control. The technology and processing of pre-mechanized brick and other architectural ceramics have received comparatively little attention in historical archaeology. Here, qualitative visual analysis on different scales as well as petrographic thin-sections were used to characterize the internal composition, variation, and production evidence in the bricks. Accounting for the range of production defects and fabric properties of the bricks demonstrates an unappreciated diversity of the brick material, and further suggests on-site or local manufacture as a regional ceramic industry developed in Long Island Sound in the 17th and 18th centuries. Interpreting the results of this analysis offers alternatives to the assumptions about building materials on the site. Moreover, it identifies different material experiences of regulated, municipal brick-making versus home-grown industries utilizing expedient resources. Thus, the project advocates an active role of material science to assess the complex contribution of building materials to a changing landscape and urban development.

Schmidt, Mary [94] see Heller, Abigail

Schmidt, Caroline and Ryan Parish (University of Memphis)**[292]** *Determining Implications of Lithic Selectivity in the Early Historic European Trade of the Central Mississippi Valley*

Exchange between Protohistoric Period Native American and European traders in the Central Mississippi Valley reorganized the lithic industry to focus on hide processing. The most distinctive markers of this industry, thumbnail scrapers, increased as participation in the regional trade intensified and gradually led European-made goods replacing traditional tools. Although several avenues concerning the implications of thumbnail scrapers have been investigated, their raw material source remains inconclusive across the region. Verifying material source will shed light on possible shifts in lithic procurement strategies, mobility patterns, and interregional relationships following participation in the skin trade economy. Additionally, variations in lithic selectivity may be a factor in certain groups' success or failure in the trade. Using reflectance spectroscopy, the chert type and source will be non-invasively determined for a collection of thumbnail scrapers from various protohistoric sites in the Central Mississippi Valley.

Schmidt, Peter (University of Florida)**[340]** *Co-practice amongst Non-Western Peoples: Abandoning Theory at Center Stage*

Theory as Western performance in archaeology has hogged center stage so long that other actors standing in the wings ready to play their roles are not included in the drama. Indigenous theories of knowledge have been relegated to permanent off-stage status. Yet those who have had the privilege

to work with and collaborate with historically-minded counterparts in other cultures have incrementally accumulated local beliefs and have, both consciously and unconsciously, woven local epistemologies into interpretation. These new interpretative tapestries are not ethnographic uses of best inference, but constructions drawing on meanings arising out of mutual co-practice that lead us in new theoretical directions. Discourses arising out of co-practice in heritage work in NW Tanzania capture how heritage is theorized today. Embodied experiences, such as building shrines, bring multiple meanings to the surface—including human rights claims and religiously informed ethical principles pertaining to sacred places—that differ significantly from how indigenous heritage was previously theorized and how the West theorizes heritage today. Acceptance of indigenous theories of heritage requires moving off center stage, embracing local practice, and discovering how co-practice may enrich Western theory.

Schmitt, Dave (Desert Research Institute) and Karen Lupo (Southern Methodist University)

[296] *Is Bigger Always Better? Body-Size, Prey Rank, and Hunting Technology*

Zooarchaeological applications of rationale derived from the Prey Choice Model (PCM) are based on the assumption that prey body-size is a robust proxy for prey rank and post-encounter return rate. The PCM predicts dietary expansion and contraction in response to the encounter rates with large-sized and highly ranked game. In zooarchaeological assemblages, co-variation in the abundances of large and small-sized prey are often viewed as reflecting changes in foraging efficiency and are usually attributed to resource depression or other processes that influence the encounter rates with large-sized, high ranked prey. However, changes in hunting technology and techniques can greatly alter the efficiency of hunting different prey. Using empirical data from ethnographic sources we show how snaring and other techniques used to procure smaller-sized prey can be more reliable and productive than hunting certain large game. We then use archaeological data from Holocene sites in the Bonneville basin of western North America to show that leporids were more frequently targeted than larger-sized and presumably high ranked game, even when the latter were abundant on the landscape.

Schneider, Tsim (University of California, Santa Barbara)

[175] *Making Community in the Colonial Hinterland of Coastal Marin County, California*

From the first baptism in 1783 to the last recorded baptism in 1832, at least 2,800 Coast Miwoks from the Marin Peninsula entered Spanish missions in the San Francisco Bay area. Understandably, and like most accounts of Indian entanglements with Spanish missions, the story of Coast Miwok missionization and assumed cultural loss is told through the documents and trowel work at Spanish missions. Comparably less is known of the world beyond the mission walls and in the hinterlands that took shape during the mission-era and afterward. After discussing the hinterland landscapes of Spanish missions in the San Francisco Bay—including the places where Coast Miwok fled to escape missions and other places where some kept to themselves—I borrow the concept of a “littoral borderland” to showcase community-making at shoreline zones away from the eyes of missionaries. In doing so, I present archaeological and historical research underway examining Coast Miwok communities of the Tomales Bay region forged in the wake of consecutive waves of colonization.

Schneider, Anna (University of Colorado, Boulder)

[273] *A Preliminary Analysis of Chipped and Ground Stone Artifacts from Garden Canyon Village*

Garden Canyon Village is a large multi-component site located in southeastern Arizona. The main occupation dates to the Classic Period, but the rich resources of the Huachuca Mountains drew ancient people to the site from Preceramic times through the end of the Prehistoric Period (A.D. 1450). Located 10 miles north of the U.S.-Mexico Border and 65 miles southeast of the Tucson Basin, Garden Canyon Village was located on the frontier of the Hohokam, Mogollon, Mimbres, and Trincheras culture areas. This poster presents an overview of Garden Canyon Village as well as a preliminary analysis of chipped and ground stone artifacts from the site. The sample consists of chipped stone tools and ground stone from two excavation areas: the E75 complex, a residential area with two adobe-walled structures, and the E100 complex, a courtyard with two adobe-walled

rooms. In addition to providing insight into raw materials, lithic technology, subsistence strategies, and regional trade, this project addresses Garden Canyon Village's position in the larger Southwest and the cultural affiliation of its residents.

Schnell, Joshua (Department of Anthropology, Michigan State University)

[204] *Three-dimensional Osteometry: A Comparative Study of 3D Model Generation Techniques for Cranial Osteometry*

The recent proliferation of three-dimensional scanning devices and model generation techniques has made the use of 3D models in bioarchaeological research a reality. Despite the numerous applications of 3D modeling both in the field and in the lab, the existing body of research and published literature about constructing, analyzing, and sharing these models within archaeology is slim. The primary goal of this study is to test the accuracy of two of the most popular techniques for digital osteometry. A sample of crania was digitized using a NextEngine 3D Laser Scanner and 3D models were created with the accompanying ScanStudio HD software. The same crania were then modeled with a photo capture/photo stitching technique using Agisoft PhotoScan Professional software. Standard measurements were taken from each of the models after generation according to major osteometric cranial measurements and subsequently compared to results taken from the original crania using traditional osteometric instruments. We present the results of these comparisons and discuss the relative utility and efficiency of each technique.

Schober, Theresa (University of Florida)

[372] *Perishable Disparity: Mortuary Treatment in Baja California Sur*

Missionary and explorer accounts document status differences in adornment, possession of ceremonial items, and body proportions in the marine foraging populations of the Cape Region, Baja California Sur, Mexico. The antecedent and concurrent Las Palmas Culture (ca. A.D. 1200 to 1700) was originally defined by William Massey based on excavation of small exclusive-use mortuary caves. Each cave held one or two primary interments and several secondary bundle burials representing both sexes and all ages. Skeletal elements in bundle burials were typically painted with ochre before being bound in sewn palm fiber mats or less frequently, animal hides. Both burial types have produced a diversity of largely perishable grave offerings, particularly in child burials and adult primary interments. Other mortuary programs occur in some coastal sites with interments directly in sand dunes with more frequent association of utilitarian objects. Previous research has demonstrated mortuary patterning does not correlate with differential access to food resources based on stable isotope analysis of bone collagen and apatite carbonate. Formal disposal areas with excellent preservation of burial items, in conjunction with bone chemistry data permit an investigation of differing interpretations of social identity and equality when perishable objects are included and removed from analysis.

Schoeman, Maria (University of the Witwatersrand)

[177] *History Runs Through It: A Biography of Gorges in Bokoni, South Africa*

Stonewalled enclosures and associated terraces embody the intersection of Bokoni gorge biographies and broader social history. The complex biographies of the gorges include being ritual spaces marked by rock art, iron smelting sites, refugia and strongholds. Many of the uses did not substantially alter the gorges, but in the troubled times of the eighteenth and nineteenth centuries in southern Africa, pre-colonial farmers used stonewalling to reconfigure several gorges in Bokoni. The stonewalled enclosures and associated terraces, however, materialized ideas about 'home' that had developed at earlier sites configured around ideas about livestock and farming. While the older ideals and ways of living materialized in the stonewalled architecture were no longer feasible. Being a person of Bokoni had become entangled with a specific pattern of configuring stonewalls, and people attempted to transfer these ideas onto gorges. They, however, were simultaneously informed

by the existing meanings and identities of gorges, and this shaped the specific configuration of gorge enclosures and terraces.

Schoenemann, P. (Indiana University) and Lindsey Kitchell (University College London)

[33] *Handedness and the Evolution of Tool Use in Humans*

The right-handed bias in humans is significantly stronger at the population level than what has been found for other primates. The functional connection this might have with the elaboration of tool use in general, and stone tool making in particular, has long been of interest. Tracing the development of handedness in the fossil record would allow for an assessment of the degree to which handedness is associated with technological advances evident in the archaeological record. The extent to which handedness can actually be assessed in fossils is a first step towards understanding this relationship. Research relevant to this question will be reviewed, including a study of 71 healthy human subjects for which brain asymmetries were first assessed from MRI, followed by an analysis of whether these correlated with handedness and throwing accuracy. A number of areas showing significant brain asymmetry were found, including primary motor areas devoted to the hand, left occipital and right frontal petalias (protrusions), and cerebellar areas involved in motor coordination. The extent to which these asymmetries correlate with handedness and throwing accuracy will be discussed, and will be integrated into a review of what is known about fossil hominin brain asymmetries.

[282] *The Legacy of New Deal Programs to Northern Arizona and Southwest Archaeology*

During the 1930s, federal New Deal programs financed and supported a number of archaeological projects in northern Arizona. Within National Parks and Monuments, surveys and excavations were undertaken so that people could see archaeological sites, and visitor centers were constructed to display and interpret archaeology for the public. Several major expeditions by the Museum of Northern Arizona were also supported by New Deal programs. Excavations from 1933 to 1939 were directed by professional archaeologists employed by the Museum with laborers and students financed by the U.S. Civil Works Administration, Federal Emergency Relief Administration, and the Works Progress Administration. This work took place during a time when little was known about the prehistory of northern Arizona and the field of Southwestern archaeology was relatively new. The Museum's excavations formed the basis for numerous publications by Harold S. Colton and his colleagues that greatly influenced the next 80 years of archaeological research and National Park Service interpretation. This paper explores the relationship of archaeological research conducted by the Museum with federal New Deal Programs and its enduring legacy to the archaeological profession and the American public.

[334] *Farmers' Responses to Resource Stress and Climate Change in the Prehistoric US Southwest*

Researchers in the semi-arid US Southwest have long linked abandonment, mobility, and other high-visibility culture changes to climate change, particularly shifts in precipitation patterns. Early researchers used synchronicity to infer causal relationships between cultural changes and climatic shifts. Recent work indicates a more complicated pattern in which some climatic shifts are contemporaneous with periods of population movement and upheaval, while other equally severe shifts are not accompanied by substantial archaeologically visible human responses. In this paper, case studies from the region demonstrate that prehistoric farmers adjusted their settlement and land

use strategies in response to their own perceptions of below-average conditions, sometimes well below thresholds modern researchers might identify as causing food stress or other resource acquisition problems. Climate changes are one component in a complex relationship between human population size, history and intensity of landscape use, and social factors involved in farmers' decisions to move or make other changes in their land use practices, and the strength of prehistoric reactions relative to different levels of stress varied widely. The importance of people's perceptions of changing conditions in decision-making has implications both for understanding past culture changes and for planning effective responses to modern climate change.

[191] *Using Glyphic Variation to Infer the Social and Spatial Scale of Learning among Classic Maya Scribes*

This study uses Maya hieroglyphic inscriptions to trace the evolution of alternative writing conventions during the Classic period (ca. 250-900 C.E.). The third person ergative pronoun *u-* is represented by up to a dozen different graphemes in Classic Maya writing. These glyphs are also the most common set of signs found in the corpus of hieroglyphic inscriptions, regardless of media. The variation and frequency of these signs provide data to model cultural forces that shaped this writing system. We evaluate diversity in *u* glyphs to examine changes in the make-up of scribal traditions during the Classic period. Some have suggested that antagonistic polities used different signs to denote *u* glyphs. We evaluate this claim with antagonistic and other social networks using a comprehensive dataset of texts and network ties. In addition, we evaluate the role of geographic space in structuring choice between alternative *u* glyphs. These analyses contribute to our understanding of the social and spatial scales of learning among the Classic Maya.

[417] *The Performativity of Measurement*

This paper examines the archaeological traces of measurement in light of the roles of mensuration in quotidian rituals. Most archaeologies of performance emphasize public spectacle, coordinated by elites, usually taking place in highly visible ceremonies. While some instances of measurement do fall under this rubric, most occur with less fanfare. Nevertheless, even mundane acts of measuring may be accompanied by some amount of pageantry. Differences in context, furthermore, yield varying archaeological traces. For example, the act of weighing goods privately requires little more than a somewhat accurate scale. The act of weighing in a public market, on the other hand, requires instruments of greater precision. More importantly, these instruments must appear standardized and precise in order to maintain trust between exchange partners. They may even show signs of verification by third parties, such as agents of a state authority. By considering the contexts and materiality of acts of measurement using cases from the Old World Bronze and Iron Ages, this study aims at improving our understanding of ancient metrology as well as the public performance of daily ritual.

Schortman, Edward (Kenyon College)

[314] *Through a Smoke Cloud Darkly: The Possible Social Significance of Candeleros in Terminal Classic Naco Valley Society*

Candeleros, fired clay artifacts with one to over 20 chambers, are widely distributed across Terminal Classic (A.D. 800-1000) contexts in the Naco valley of northwestern Honduras. Though reported from other parts of Mesoamerica, little is known about the varied ways this distinctive artifact figured in tasks engaged in by people of diverse ranks and might have been used in negotiating interpersonal transactions. This presentation provides initial responses to these queries based on a functional and distributional analysis of 150 candeleros derived from Terminal Classic contexts at the Naco valley political center of La Sierra. The items in question were retrieved from three residential complexes of varying sizes, levels of complexity, and involvement in different crafts. Patterns identified in the course of this work allow us to assess the extent to which candelero use correlated with socioeconomic status, domestic affiliation, and occupational specialization. As one of the only systematic studies of candeleros conducted in southern Mesoamerica, these analyses offer hypotheses concerning the artifact's social, economic, and political significance that can be evaluated in other settings.

Schott, Amy (University of Arizona, Petrified Forest National Park)

[364] *Understanding Formation Processes of Archaeological Sites in Eolian Settings in the Petrified Forest National Park*

Located on the southern edge of the Tusayan Dune Field in northeastern Arizona, the Petrified Forest National Park contains abundant archaeology sites located in dune settings. Past and recent archaeological survey has shown an apparent correlation between archaeological site locations and eroded dune blowouts. It is likely that sites are located in dune settings due to their favorable environmental setting; however, it is not clear if the apparent distribution of visible sites in relation to eroded dunes relates most closely to cultural behaviors, or is more closely tied to exposure through post-depositional dune movement. This study uses spatial analysis of dune landscapes in several study areas to better understand the formation processes of archaeological sites in these dune environments. The relationship between archaeological site location and geomorphic landforms is explored to determine whether there is a significant correlation between site location and areas with dunes or dune blowouts. In addition, statistical analyses are used to explore whether geomorphic patterning is due to behavioral processes or due to natural processes of erosion and deposition. This is a first step in understanding formation processes, distribution, and visibility of sites in eolian settings in the Petrified Forest National Park.

[356] *Patterns of Lithic Edge Damage from the Open-air Middle Stone Age Assemblages at Vleesbaai and Oyster Bay, South Africa*

Much of our understanding of the South African Middle Stone Age (MSA) comes from deep sequences recovered from caves and rockshelters. These discreet, enclosed contexts represent one aspect of a foraging continuum; where many other activities take place on the continuous, open landscape. A different suite of taphonomic processes are also more likely to occur on open landscapes, complicating comparisons between site contexts. Developing meaningful inferences regarding past human behaviors requires testing models of both taphonomic and behavioral processes that influence observed archaeological patterning. Here we use assemblage-scale lithic edge damage patterning coupled with tool morphology (shape, size, and edge angle) to analyze two open-air MSA assemblages along the southern coast of South Africa. These assemblages contain components of microlithic, Howiesons Poort-like industries, which are poorly understood from open-air contexts. The archaeological edge damage distributions are compared to a long-term lithic trampling study undertaken over six-months at a small farm in Northern California, a fluvial tumbling experiment, as well as butchery and projectile experiments. We place our results within the context of a Paleoscape foraging system, where caves and open-air sites may represent different aspects of a transport, use, and discard spectrum.

[205] *A Bioarchaeological Assessment of Diet and Dental Health During the New Kingdom/Napatan Transition in Ancient Nubia (Tombos, Sudan)*

Nubia, once colonized by the Egyptian Empire during the New Kingdom Period (ca. 1550-1070 B.C.E.), became increasingly independent and powerful with the rise of the Napatan State during the Third Intermediate and Napatan Periods (ca. 1070-664 B.C.E.). This research addresses the social impacts of the New Kingdom/Napatan political and economic transition via the bioarchaeological examination of diet (carbon and nitrogen stable isotope analysis) and dental health (ante-mortem tooth loss, caries). We focus on skeletal remains from the archaeological site of Tombos due to the unique cultural and geopolitical positioning at the Third Cataract of the Nile River, but also make comparisons with other Nubian populations. The assessment of dental health (n=66) suggests a decrease in negative health indicators between the New Kingdom and Napatan Periods, indicating an improvement in overall health. Dietary reconstruction at Tombos is less conclusive; tentatively, the local Tombos diet does not appear to have changed substantially between the two periods (n=11); however, further testing is necessary. In conclusion, the local Tombos population appears to have maintained similar dietary habits and good health during the New Kingdom/Napatan transition.

[408] *Preclassic Causeways of the Mirador Basin, Guatemala*

A vast system of inter-site highways (sacbes or sacbeob) traversed an inhabited countryside between the major urban centers of the Kan kingdom in the Mirador Basin. Development of this system began during the Middle Preclassic period and continued throughout the Late Preclassic period (ca. 600 B.C.– A.D. 150). Over time, these transportation routes branched and transformed within densely populated centers to become a network of elevated causeways, processional boulevards with ritual and cosmological significance, thoroughfares, and secondary roadways. In addition to transportation, communication, and ceremonial aspects inter-site and intra-site causeways functioned as critical elements of regional and localized water management strategies that integrated with upland terrace and wetland margin agricultural systems. Here we present some results from ongoing mapping and excavations of these impressive features of ancient Maya civilization that were conducted by the Mirador Basin Project during the past two decades of field study.

[299] *Using the Index of Care on a Bronze Age Teenager with Poliomyelitis: From Speculation to Strong Inference*

Bioarchaeology has come a long way in using differential diagnosis, attending to the Osteological Paradox, using biocultural frameworks to integrate different levels of analysis, and developing ways to work with small sample sizes and fragmentary remains. Designed by Lorna Tilley (U. Aukland), the Index of Care offers a new scientifically-based and systematic tool to collect and integrate a range of information on life history, disease processes, and cultural context. This online tool tests hypotheses using multiple lines of evidence with a rigorous four-step process for describing pathologies, determining disabilities, constructing a care model, and examining caregiving implications. In this study the Index of Care is applied to a previously described and published 18-year-old female from the Bronze Age site of Tell Abraq (UAE). The application of this tool provides a much more nuanced and complete interpretation of past pathology and caregiving. This study highlights the usefulness of the Index of Care in using strong inference and hypothesis testing on ancient cases of unusual and extreme diseases.

[86] *Stop and Go Traffic: Power, Movement, and Emplacement in the Piedras Negras and Yaxchilan Kingdoms*

This paper explores the many sides of the natural and supernatural landscape surrounding the Classic period Maya kingdoms of Piedras Negras and Yaxchilan with a particular focus on how the rulers of these polities struggled with one another for control of movement across the broken terrain of hills, cliffs, valleys, swamps, and rivers that define the Middle Usumacinta River basin. The standard image of a rather homogenous landscape in the Maya lowlands is quickly dispensed with in the Middle Usumacinta, and the challenges of transporting goods and conducting warfare across such a terrain was made all the more difficult by a complex network of defenses that regulated movement. Exploring the archaeological and epigraphic sources from Piedras Negras, Yaxchilan and their surrounding noble courts and hinterland settlements we can begin to envision and experience the dynamic sense of place that was central to the political lives in the Maya west.

[173] *Determining Village Extent and Layout Utilizing Geophysical Survey and Excavation at the Mississippian Site of Cane River, North Carolina*

Geophysical techniques can help to clarify the extent of a site and show spatial relationships between structures, therefore guiding research and excavation strategies. When monuments and larger structural elements are absent, feature density can be a reliable proxy for occupation areas and village boundaries. Utilizing a combination of magnetometry and ground-penetrating radar survey at the Cane River site in North Carolina, we were able to locate borrow pits, storage pits, structures, and hearth features that are not readily detected using traditional archaeological methods. Subsequent coring and excavations over these geophysical anomalies provided evidence for continuity in village layout and allowed us to sample a variety of feature types, illuminating temporal and spatial patterns in community activities. This research has implications for understanding regional variability in Mississippian community social practices throughout the Appalachian Summit of North Carolina.

[131] *Interpersonal Violence among the Prehistoric Hunter-Gatherers of Cis-Baikal, Southern Siberia*

The large number of mid-Holocene cemeteries from Lake Baikal and its surrounding river valleys provide an unrivalled archaeological resource for the study of northern Eurasian hunter-gatherers. In this paper we present an overview of the skeletal evidence for interpersonal violence, comparing the Early Neolithic (7550–6800 cal BP) and Late Neolithic/Early Bronze Age (5700–3700 cal BP), two broad periods exhibiting different mortuary traditions and subsistence practices. Despite the nomenclature, which refers to material culture, these societies relied entirely on hunting, gathering, and especially fishing. Evidence for conflict takes the form of cranial trauma and projectile injuries. With the exception of a probable massacre event in the Early Bronze Age at the site of Shamanka II, levels of violence are not particularly high, and likely relate to both occasional disputes within

communities, and to sporadic conflicts between communities. The latter are not unusual among semi-sedentary hunter-gatherers, and could relate to contestations over the control of particularly productive fishing and sealing locations.

[260] *Macro-Regional Cultural Development of the Interior Columbia Plateau*

Despite a wealth of data and continued opportunities for data collection, the prehistory of the Interior Columbia Plateau of the Northwestern United States continues to be organized and discussed on the basis of a handful of local regional chronologies. Many of those popularly in use were created decades ago and (in spite of a few notable exceptions) there remains a need for the archaeological community to generate a more synthetic chronology. This paper tests the premise that cultural evolutionary and political economy frameworks can be used to organize these regional chronologies into an overarching model for human culture history across the Plateau.

Schulz, Margaret (Colorado State University), Laurie Rush (US Army, Fort Drum, NY) and Duane Quates (US Army, Fort Drum, NY)

[43] *And Then Sometimes, The Public Engages You*

At Fort Drum, our responsiveness to public engagement has been a key element in creating scenarios that have benefited not only the program but the installation and the resource itself. In one example, pressure from Range Control and comments from the public resulted in the conversion of an off limits archaeological district into a training asset and further led to the site's use in global stewardship training. In a second example, a seemingly ordinary visit from a family member of a soldier killed on the installation during a training exercise led to the identification of a potentially National Register eligible site under Criterion A. Data recovery, public involvement, a historic marker and a ceremony were employed as a form of mitigation against the possibility of future development of the area. In both cases, compliance with the law and preservation of sites and the information they hold were coupled with public involvement to create a winning situation for all parties.

[346] *Copper Bells from the Templo Mayor of Tenochtitlan - Imports or Local Production?*

The studies of the offerings of the Templo Mayor of the late postclassic Aztec capital of Tenochtitlan have shown that these concentrate objects of many different materials, styles and origins. The question of how these objects reached the offerings has probably more than one answer, reflecting the complexity of the postclassic economic system. However, recent research has shown that several artifact groups that were thought to be imports were probably produced in strictly regulated workshops in, or close to, Tenochtitlan. Copper bells are a case in point: the bells - and copper objects in general - were often automatically associated with a West Mexican origin. However, the analysis of the copper bells from the offerings of the Templo Mayor has shown that their morphology and compositional homogeneity seem to indicate an origin from a limited number of workshops. Comparison with bells from collections of other regions of Mesoamerica make it increasingly probable that the Tenochtitlan bells were locally produced, forming part of what is referred to in the context of this session as the Imperial Style.

[121] *Multi-Element Characterization of Early Nineteenth Century Pottery Sherds from Native*

American and Euro-American Sites

Fine earthenwares imported from England are a distinctive type of artifact frequently found on early nineteenth century Native American and Euro-American sites. Relatively rapid changes in decorative motifs and technologies can easily be identified by eye and provide information about site chronology and economic status. However, visual analyses of sherds usually can usually provide only general information because of the fragmentary nature of most assemblages. For example, transfer printed pottery can be dated and assigned to a specific manufacturer if the pattern name can be identified, but sherds are usually too fragmentary for such identifications. We present data about the chemical composition of sherds from two sites occupied during the first half of the nineteenth century: Pokagon Village, a Native American site (southwestern Michigan); and Collier Lodge, a Euro-American site (northwestern Indiana). Multi-element compositions determined by electron microscopy, micro X-ray fluorescence (μ -XRF), and laser-ablation-inductively coupled mass spectrometry (LA-ICP-MS) show that sherds with the same decorative methods from the two sites have different chemical compositions, indicating that different manufactures produced the pottery, and that manufacturing compositions changed over time. We show that multi-element characterization has the potential to produce new information about manufacturing sources, technology, and dating from very small sherds.

Schwadron, Margo [83] see Doering, Travis

Schwadron, Margo (NPS-Southeast Archeological Center)

[333] *Battling the Rising Sea: Investigation and Protection of Turtle Mound, Castle Windy and Seminole Rest Shell Mound Sites*

Massive shell midden mounds were once common in the Canaveral region, but since the 1880s an estimated 68% of these sites have been destroyed. The shell mounds preserved within Canaveral National Seashore include one of North America's tallest shell mounds (Turtle Mound), one of the last remaining vestiges of an extensive shell mound culture that inhabited the region. Recent investigations of Turtle Mound, Castle Windy and Seminole Rest inform about interactions and influences between people, environment, coastal landscapes, and climate change (past, present and future). Unfortunately, these sites are undergoing severe erosion due to sea-level rise and climate change impacts. The development of a successful program combining ecosystem restoration, living shorelines and soft stabilization techniques to protect sites is presented, recognizing that a key component to this success is youth and civic engagement, and public outreach for community support.

Schwartz, Christopher (Arizona State University), Hannah Zanutto (Arizona State University), Ben Nelson (Arizona State University) and David Abbott (Arizona State University)

[273] *Intersite Difference in Distant Interactions, Hohokam Canal System 2, Phoenix Basin, Arizona*

Material evidence of interaction between prehispanic peoples in the U.S. Southwest and Mesoamerica is first detected ca. 2000 B.C.E. with the introduction of maize, figurines, and ceramics. Such markers of long-distance interaction, including copper bells, scarlet macaws, and other objects and symbols, increase in diversity and abundance in later periods. These objects and symbols moved up to 2000 km by social actions and mechanisms that remain obscure. Although the Hohokam had the strongest ties to Mesoamerica of any region in the U.S. Southwest, more could be done to examine local variation in that interaction. Also unclear is what role such distantly acquired objects might have played in water control practices. For example, were sites located near headgates more engaged in distant acquisitions than other sites in the canal systems? Scholars believe that these canal systems constituted relational communities. In this study we evaluate whether villages within Phoenix Basin Canal System 2, including the well-documented sites Pueblo Grande and Las Colinas, were differentially involved in distant interactions and how their involvement changed over time. This analysis of the distribution of interaction markers within a canal system

provides evidence about how individual sites and actors were differentially engaged with distant partners in Mesoamerica.

Schwarz, Kevin (ASC Group, Inc.)

- [183]** *Censer Fragmentation and Life History: Rural Domestic Settlement Enchainment and Accumulation Activities and the Classic-Postclassic Transition of the Petén Lakes Region, Guatemala*

Fragmentation theory is premised on the notion that actors purposefully broke valued goods, deposited fragments of them in meaningful places, and enchainment other social beings in relationships with gifts and exchange of them. They also accumulated whole objects in caches. This presentation examines the fragmentation premise for censers and non-slipped utilitarian ceramics in and around architectural spaces at the Quexil Islands, Guatemala. The site is a Terminal Classic-Late Postclassic Maya settlement in the Petén Department. The Classic-Postclassic transition features a transformation in architecture and social use of space in rural settlements and the use, taphonomy and life histories of these ceramics appear to shift as well. Whereas in the Late Classic period, the rural Maya were part of hierarchical society and their use of architecture and ceramic media reflected that hierarchy, in the Postclassic period there emerged a different pattern. Small, seemingly rural settlements, such as the Quexil Islands, had the ability to conduct censer ritual in the Postclassic. An epicentral ceremonial architectural pattern has substantial censer deposits, while a peripheral pattern of small censer fragments and other non-slipped ceramics predominates in residential contexts. The presentation concludes by considering evidence of up-network and down-network enchainment and accumulation activities.

Schwendler, Rebecca (PaleoWest Archaeology)

- [395]** *A Re-examination of Magdalenian Social Organization Ten Years Later*

A decade ago this author completed a synthesis of information about the circulation of exotic lithic raw materials, items of personal ornamentation, and portable decorated objects across western Europe during the Magdalenian ca. 17,000 to 12,000 B.P. Tests of hypotheses about the relationship between population density and visual display suggested that population density was probably not the sole driving force behind the types and intensities of visual displays used by generations of Magdalenian people. Rather, the unique social dynamics surrounding human colonization of new areas likely played a key role in people's choices about the kinds of materials and decorative forms they used. Furthermore, differences in social organization—specifically degrees of enforcement of social equality—probably contributed to the regionally and temporally diverse patterns of visual displays seen in the archaeological record. This paper uses information gleaned from the last 10 years of Magdalenian research to re-examine the author's original interpretations of Magdalenian social organization. By reflecting on how our understanding of Magdalenian lifeways has and has not changed over the last decade, we can identify vital future directions of investigation.

Scott, George (University of Nevada Reno) and Roman Schomberg (University of Nevada Reno)

- [87]** *Sinodonty and/or Sundadonty: Revisiting the Three-Wave Model for the Peopling of the Americas*

Starting with a single root trait, C.G. Turner II developed a model for the peopling of the Americas that involved three migratory waves: (1) Amerind; (2) Na-Dene/Northwest Coast; and (3) Eskimo-Aleut. After expanding to 29 variables, he found the same general pattern and contended that all New World populations were derived from Sinodont groups in Northeast Asia. Recently, researchers have challenged the three-wave model on genetic, archaeological, and dental grounds, including the notion that some groups are derived from Sundadonts (Southeast Asians) rather than Sinodonts (Northeast Asians). To reevaluate the three-wave model and Sinodont origins of New World groups,

23 crown and root traits were analyzed in 31 large samples, including Southeast Asians (4), Australians (4), Northeast Asians (4), North American Indians (4), South American Indians (5), Mesoamericans (2), Na-Dene/Northwest Coast (4), and Eskimo-Aleuts (4). Unrooted neighbor-joining trees and ordinations exhibit the same pattern. At the two extremes are Australians and Native Americans. Southeast and East Asians fall between the extremes with Southeast Asians closer to Australians and East Asians closer to Native Americans. This analysis reveals no hint of Sundadont ancestry in Native Americans and supports the notion that the New World was peopled in three major waves.

Scott, David [121] see Warmlander, Sebastian

Scott, Elizabeth (Illinois State University/Illinois State Museum)

[154] *Consuming the French New World*

All of France's New World colonies were based on relationships with particular geographies, from eastern New France, to the western Great Lakes, to the Illinois Country, to Lower Louisiana, and to the Caribbean, according to the particular products and resources desired by the Crown, which may be thought of as the ultimate "consumer" of French colonial landscapes. Colonists and French descendant communities engaged with these different landscapes for both commercial and family subsistence purposes. Obtaining, producing, and moving such resources as furs, wheat and flour, hams, bear oil, salt, and sugar required a variety of social networks and power relationships among Europeans, Native Americans, and Africans. The cultural landscape of house lots, towns, agricultural lots, shipping routes, and resource procurement sites reflect how people perceived and interacted with the land and each other. Food traditions brought from France combined with local food resources in each region to produce foodways that reflected a particular colonial engagement with the landscape. Even with such differences, however, foodways were also similar among French communities, especially when compared to British and Anglo-American foodways in the same locations. This paper draws on zooarchaeological, archaeobotanical, ceramic, and archival data to address these topics.

Scott, Lindsay (Department of Anthropology, The University of Montana, Missoula MT), Anna Marie Prentiss (Department of Anthropology, The University of Mont) and Matthew J. Walsh (Department of Anthropology, The University of Mont)

[228] *Macroevolutionary Archaeology in 2015: Testing Historical and Evolutionary Hypotheses, for Example, about Arctic Migration Pulses*

Macroevolutionary archaeology seeks to examine cultural evolutionary processes at multiple hierarchical scales spanning artifact technology to economic, social, and political strategies. This approach offers the opportunity for scholars to test general hypotheses about tempo and mode of evolutionary change and it also lends itself to the development of formal tests of general hypotheses about human history in the longue durée. In this paper we present a review of current research in macroevolutionary archaeology and follow with a case study testing the independent (Paleoeskimo and Neoeskimo) arctic pulses hypothesis using archaeological data. It provides an opportunity to discuss the challenges and prospects of this research strategy. It also permits us to engage in a rigorous examination of a major hypothesis regarding human cultural and biological history, so far only rigorously tested using genetic data. Our approach incorporates a variety of phylogenetic and network models to assess potential cultural factors associated with arctic migrations during the past 5500 years. We seek to offer implications for understanding arctic migrations as case studies in cultural macroevolutionary process.

Scott, Sara (Montana State Parks)

[300] *Deciphering WPA Archaeology on the Northwestern Plains: Another Look at the Cultural Chronology of Pictograph Cave*

Pictograph Cave (24YL0001) located in south-central Montana was excavated by Works Progress Administration (WPA) crews between 1937 and 1941. Excavations extended to depths of 23 feet, yet no radiocarbon dates for the site were available until recently. Efforts to re-catalog and process the

artifact collection to professional standards were undertaken along with the creation of three-dimensional models of the excavations rendered from WPA stratigraphy maps. Newly created databases allowed for artifacts from the cave's lower levels to be easily identified and subsequently submitted for radiocarbon analyses providing chronometric dates for the sequence of human occupation in the cave. This paper discusses the results of radiocarbon dating analyses which indicate the earliest occupation of Pictograph Cave dates to the late Middle Archaic period, conflicting with the much earlier chronological sequence developed by William Mulloy in 1958. The cave's location on the landscape and its proximity to major travel routes along the Yellowstone River are also examined.

Scott, Rachel (DePaul University) and Finola O'Carroll (Irish Archaeology Field School)

[332] *Catholic Burial as Native Resistance in Post-Dissolution Ireland*

The Dominican friary in Trim, County Meath, Ireland, was founded in A.D. 1263 by Geoffrey de Geneville, Lord of Trim. An important religious center, the Black Friary was used for burial during the late Middle Ages both by the Dominican friars and by lay individuals living around the town. In 1540, as part of the dissolution of the monasteries, the commissioners of King Henry VIII suppressed the friary and sold its lands, buildings, and goods. However, although the site no longer possessed formal religious status, local Catholics still believed it to be holy ground and continued to inter their dead within the church and cemetery. In this paper, we consider the practice of post-Dissolution burial at the Black Friary, arguing that it not only reflected the deep attachment of the Catholic population to ancestral burial places but also constituted a form of native resistance to the imposition of English government and Protestant religion. Indeed, the right to burial in holy ground with appropriate funerary rituals later became a touchstone for Irish nationalism in the 18th and 19th centuries. The evidence for resistance at the Black Friary and similar sites thus foreshadows the contentious political and religious landscape of modern Ireland.

[186] *Tracing Zea mays through the Americas Using Maize Cob Phytoliths*

Dolores Piperno has addressed the origins of maize agriculture in the Americas through examination of samples from MesoAmerica. Ultimately, maize diffused throughout the world. Prior to globalization, maize spread throughout the Americas. Zea mays is represented by over 100 races in North America alone. My work has focused on the spread of maize agriculture, rather than its origins. Identifying races of maize is a daunting task for any region of the Americas. The most informative remains for this task, beyond ancient DNA, are phytoliths. Extracting phytoliths from cobs provides a record free of contamination by phytoliths of other origin. Measuring individual phytoliths to obtain population averages uses computer-assisted morphometrics to establish signatures for maize races that may they be traced through time and space. Statistical comparison of signatures obtained for existing races with signatures from archaeological samples first associates the archaeological signatures with those from existing races. Archaeological signatures then are placed geographically and back through time, suggesting contact between peoples and/or movement of people across the landscape. The results of statistical analysis suggest associations of existing races with archaeological assemblages. This association suggests our ability to assign race names to statistically similar races from the archaeological record.

[72] *Diving to a Flash of Education: Archaeological Tourism at Maritime Sites*

Underwater archaeological sites around the world draw thousands of diving tourists lured by the

excitement of shipwrecks and the beauty of the marine environment. Through scientific research and beguiling information, archaeologists have the opportunity to educate these visitors about the history of the sites and, perhaps more importantly, about the need for preservation. Effective interpretation leads to appreciation of submerged cultural sites as links to our past, rather than simply as mines of "treasure" to be salvaged for personal gain. This paper describes a variety of interpreted maritime sites to show how archaeological tourism results in changed mindsets, engaged emotions, and informed visitors.

[72] *Public Archaeology at Cottonwood Creek*

In Southcentral Alaska, Matanuska-Susitna Borough is among the Nation's most rapidly growing regions. At the cost of losing indigenous archaeological settlements, subdivision activities have mushroomed in response to increased population. Collaboration with the Knik Native Dena'ina Tribe is tantamount to saving numerous proto-historic settlements where inland rivers confluence with Knik Arm in Upper Cook Inlet. Working with the State and Knikatu Tribal Corporation, who own sites adjacent to Cottonwood Creek above Knik Arm, the borough is listing them in the National Register of Historic Places as an archaeological district. Long abandoned, the sites hold a key to ancestral living patterns for today's Native Dena'ina community. Archaeological surveys of the district resulted in discovering 14 semi-subterranean houses and 333 cache features. Members of Knik Tribe have been integral in locating, describing, and interpreting cultural features in addition to sharing information on their ancestral life-styles with school groups. The district designation will enhance current outreach educational plans the Knik Tribe is developing for youth and adults, including participation in excavations, conducting ceremonies, demonstrating fish harvesting and native plant use, and erecting interpretive signs. This presentation provides an overview of the collaboration between archaeologists and a Native Alaskan community.

[294] *Stable Carbon and Oxygen Isotopes in Faunal Tooth Enamel from Boomplaas and Nelson Bay Cave Record Late Pleistocene/Holocene Environments in the southern Cape, South Africa*

The Pleistocene paleoclimates and paleoenvironments of southernmost Africa are important in both global climate studies and studies of human evolution, but remain poorly documented through time and space. In order to contribute to this project, we have analyzed $\delta^{13}\text{C}$ and $\delta^{18}\text{O}$ in approximately 350 samples of faunal tooth enamel from Boomplaas Cave and Nelson Bay Cave, in the southern Cape, South Africa. The Boomplaas samples span the last ca. 70 kya, and show fluctuations in $\delta^{13}\text{C}$ indicating C3-dominated vegetation ca. 65 kya, between 26-20 kya and in the early Holocene. C4 grasses are markedly more common during the warm interval ~ 36-38 kya, corresponding to Antarctic Isotope Maximum 8, and between 18-14 kya. The Last Glacial Maximum shows a strongly

C3 signal, confirming the pattern in the nearby Cango speleothem. The faunal record from Nelson Bay Cave extends back only as far as OIS 2, but there is less variation in $\delta^{13}\text{C}$ through the sequence, indicating a mixture of C3 and C4 grasses from the LGM through to the Holocene. Comparison of records from multiple sites will help us to understand the extent to which patterns are regional or local, and perhaps shed light on the dynamics of climate systems.

[193] *Willfully Obscured: Figurines and Caves in the Maya Late Classic Period*

As both space and material are used to create interpretations or infer ancient ritual meanings concerning the Late Classic Maya, the consideration of caves and ceramic figurines provide interesting comparators as they evoke restrictions of intent and imagery within a regional setting. Opportunistic sampling of figurines from cave contexts for compositional analysis has resulted in chemically-based patterns from which one can glimpse directional patterns of movement from resource area to recovery context. The compositional data for the figurines obtained through neutron activation is interpreted with a perspective obtained through decades of similar analyses of ceramics from both lowland and highland Maya sites. This presentation provides variably robust vignettes involving figurines in caves, with specific reference along the Pasión river system, that contain aspects of both local performance and assumed trade.

[262] *Reevaluating Mimbres Late Pithouse to Classic Period Transformations of the Upper Gila*

Professional archaeological research has been conducted in southwest New Mexico's upper Gila valley since at least 1929, when Burt and Hattie Cosgrove completed a survey of archaeological sites. Projects of various scales have been carried out periodically since then, however minimal research has occurred at Woodrow Ruin, one of the region's largest sites. This paper presents new information from my recent dissertation research at Woodrow Ruin that is helping to redefine the Late Pithouse-Classic period occupation of the upper Gila. While Woodrow Ruin was previously noted for the number of surface Classic period rooms, it now seems that Woodrow Ruin also had a substantial Late Pithouse occupation, and was likely the hub of the upper Gila during the Late Pithouse and into the Classic. Analyses of artifacts from the site, particularly a ceramic NAA study,

have helped to demonstrate how trade and interaction changed through time in the upper Gila. New data have also demonstrated that Woodrow's influence in the upper Gila continued into the 11th century, although social organization changed substantially between the Late Pithouse and Classic periods.

[148] *Folsom Toolkit Replenishment at Chispa Creek, Texas: Comparing Bifacial to Unifacial Technologies*

Folsom technology has been characterized by Ingbar and others as employing a "serial replacement" strategy, where toolkits are replenished on a more or less continuous basis based on the proximate taskscape. Such replenishment is in evidence at Chispa Creek, a west Texas lithic workshop repeatedly occupied by Folsom foragers. Similar to Hanson, Wyoming, at least three local toolstone sources were used at Chispa to manufacture projectile points and a large number of unifaces. These occupations also saw a small number of depleted non-local tools left on site. Analyses of raw material use for both bifacial and unifacial tools, when compared to the size and state of tools at discard, illuminate the technological decisions being made at Chispa Creek, and allow us to test whether all components of the Folsom toolkit are serially replaced or whether such replenishment is related more to weaponry.

[19] *The Forensics of Commodification: Examples from Louisiana of the Acquisition, Analysis, and Legal Problems Related to Trophy Skulls Seized from Illegal Sales*

Since the inception of the Louisiana Department of Justice's human remains acquisition program in 2007, two Tibetan kapalas have been recovered from illegal sales. This commodification of human remains constitutes technical violations of the law, but the nature of the remains makes for an awkward fit to the existing laws. The forensic, bioarchaeological, and cultural analysis of these remains are difficult due to their altered nature, leading to problems of disposition. Questions inherent in the disposition of these remains include: have these human remains been ritually transformed into religious relics to which the law forbidding remains trafficking no longer applies? If such law does apply, what is a proper disposition of such remains? These questions and a review of the two acquired specimens are the subject of this presentation.

[250] *Primary and Secondary Chiefdom Emergence: A Comparative View from the Titicaca Basin*

The main hypotheses that explain the collapse of the Tiwanaku state, which flourished between A.D. 400 and 1250 in the Titicaca Basin, refer to the internal factional competition that destabilized its governance over the years, summed to agricultural production decline caused by drought episodes in the region. It is of great interest to compare the processes of political reconfiguration and the emergence of the post-Tiwanaku Pacajes chiefly polities with the formation of “primary” chiefdoms in this part of the Titicaca Basin. The aim of this poster is to assess this comparison through the study of the supra-local community scale, supra-local community centralization, demographic density, public works investment, and conflict, observing the trajectory of the polities from the Formative Period (1500 B.C.-A.D. 800), to the Late Intermediate Period (A.D. 1150 -1470).

[398] *Craft, Industry, and Landscape, in the Roman Imperial Marble Trade*

This paper provides an introduction to the session and its associated topics, while also presenting a case study of marble quarries in the Roman empire. Long regarded as an example of imperial power shaping craft production in provincial settings, the case study presented here explores these political and social relationships as located practices that play out in a landscape context. The dynamic interplay between local environmental conditions, existing social practices, and political power demonstrates a marked influence on the creation of a coordinated imperial industry – the Roman marble trade. The development of an imperial craft or industry runs alongside substantial changes to settlement dynamics and changes to the very landscape itself. These changes to industrial landscapes and to the coordination of skilled and unskilled labor, however, operate in a fashion dissimilar to how other parts of the Roman provinces were incorporated into the imperial polity, while also demonstrating variability between stone-working sites. This paper therefore explores the influence of landscape and social context on the form of imperial craft production.

[124] *Geometric Morphometrics & Elliptic Fourier Analysis of 3D Ceramic Data*

We demonstrate two quantitative methods for potential inter- and intra-group comparisons of archaeological ceramics. For 3D morphometrics, we define a single stable landmark that is consistent throughout our ceramic data, and employ opposing curves populated by semi-landmarks to capitalize on the shape variation that occurs in coil-built ceramics. Eight such curves are used to capture four complete profiles. The landmark data are then subjected to generalized Procrustes analysis (GPA) and principal components analysis (PCA). Additionally, we conduct an Elliptic Fourier Analysis (EFA) of 2D profiles produced from 3D scans of the vessels, decomposing outlines into a series of size invariant harmonics (shape variables). Results are paired with additional qualitative attributes (temper, firing, decoration, etc.) to better characterize the range of variation that occurs throughout the dataset. Ultimately, data such as these can be analyzed in terms of both temporal and spatial dynamics as a means of exploring various social behaviors.

[399] *Ring Structures and Lime Production at the Ancient Maya Site of Kiuic*

Powdered lime was one of the most important materials produced and utilized by the ancient Maya. It was a key ingredient in the mortar used to construct monumental edifices and residential structures, as well as in the lime plaster that coated the facades, floors and interior walls of these structures. Lime was even crucial for maintaining a viable maize-based diet through the nixtamalization process. By soaking maize in lime-infused water the ancient peoples of Mesoamerica not only softened the kernels for grinding but also unlocked the essential nutrient niacin for uptake into the body. Despite the obvious importance of lime to daily life in the ancient Maya world, there remains a relative lack of evidence concerning the ancient methods for producing this crucial material. Recent investigations of ring-like kiln structures in and around the ancient site of Kiuic in the Puuc region of the Yucatan peninsula contribute new evidence to the study of ancient lime production. This paper presents the preliminary results of the latest fieldwork at Kiuic and discusses the importance of the lime industry with regard to the local economy and resource management leading up through the peak of Terminal Classic Puuc society.

[58] *Using X-radiography to Reveal an Ancient Zapotec Urn*

Since the inception of thermoluminescence dating we have known that a significant number of Zapotec effigy vessels in museum collections are fakes, manufactured sometime in the early twentieth century. Some of these forgeries are composites that combine ancient and recent materials, but it is not clear how they were assembled, or how a conservator could restore such an object. In order to fully understand how these composites were manufactured and in what way they differ from ancient ceramics, we used X-radiography to analyze composites, fakes and ancient artifacts in a collection at the Royal Ontario Museum, in Toronto, Canada. Part of a broader study, we hope to find out more about the nature and origin of these creations from Oaxaca, products of a clandestine industry that has injected great quantities of fakes into the world market.

[178] *David Hurst Thomas and the Guale Problem: Rethinking Late Prehistoric Mobility along the Georgia Sea Islands*

In his research along the Georgia Coast, David Hurst Thomas identified the "Guale problem" as one of the key issues for late prehistoric research in the region. The problem centers on the relative degree of Guale mobility and subsistence during the pre- and postcontact eras. One view is that these were highly mobile, moving seasonally as they exhausted resources. Alternatively, others posit a more sedentary existence where the rich estuarine environment supplemented by maize agriculture supported large relatively stable year-round villages. Here, we provide a retrospective on the contributions that Thomas and colleagues have made in resolving issues related to Guale mobility. As a rejoinder, we explore contemporary research on the issue and provide commentary on what exactly we know and future avenues of inquiry regarding late prehistoric mobility and village life along the Georgia Coast.

Seong, Chuntaek [80] see Choi, Seonho

Seong, Chuntaek (Kyung Hee University) and Jae Hoon Hwang (Seoul National University)**[80]** *Late Neolithic to Early Bronze Age Transition in Korea: Implications from the Evaluation of Radiocarbon Dates*

The present study attempts to reconsider the late Neolithic and early Bronze Age transition in central Korea based on evaluation of available radiocarbon dates. Issues regarding reliability of the radiometric dating and its implications on the reconstruction of occupational density are addressed along with methods of evaluating a large set of radiocarbon dates falling between 2000 B.C. and 1000 B.C. This in turn provides a basis for testing common assumptions of the transitional period in Korea. First, the current data suggest a significant drop of available radiocarbon dates during the final Neolithic and toward the Bronze Age, 2000 to 1500 B.C. Second, the number of available radiocarbon dates began to rebound from 1500 B.C., and there is a remarkable increase toward 1000 B.C. The sharp increase of the radiocarbon dates, archaeological sites and occupations during the early Bronze Age may be compatible with an assumption of a series of migrations from the north. We also attempt to test the sequential chronology of early Bronze Age assemblage types and present coexistence of different cultures in the central Korean Peninsula.

Sereno-Urbe, Juan and Mario Córdova Tello (INAH Morelos)**[249]** *Archaeological Project Amacuzac, Morelos and Guerrero Mexico*

In this poster, we present the results of the work carried out in the Mexican State of Morelos, which serves as a basis for the study of a wider region along the Guerrero-Morelos frontier. Since 2003 the archaeological project of Chimalacatlán has researched the southern section of the state of Morelos, in the region known as the Huautla highlands. The archaeological importance of the area was demonstrated by the work Florencia Müller in 1943. Our project first focused on the conservation of various architectural structures within the site, especially buildings that were heavily damaged. Then, we conducted intensive surveys to record all the archaeologically significant architectural elements found in the greater region, and many more sites were discovered around Chimalacatlán. Therefore, we think that it is imperative to extend the study region between the states of Morelos and Guerrero, to continue with surveys and follow-up excavations of the different sites established all along the river Amacuzac, the actual frontier between Morelos and Guerrero. Doing so we will be able to develop a better archaeologically understanding a wider region.

Serra Puche, Mari Carmen (IIA-UNAM)**[153]** *Ethnoarchaeology of Productive Activities Xochitecatl-Cacaxtla*

The archaeological site Xochitecatl-Cacaxtla gave ample evidence of productive activities in different residential areas of the settlement. The research has been enriched with ethnoarchaeological studies we have conducted on the current production of handmade ceramics, textiles, lapidary and mezcal in the communities of the region of Tlaxcala. This diversity of productive activities allows us to create a map of the "city" of Xochitecatl-Cacaxtla distinguishing areas specializing in the production of consumer goods and trade.

Serrudo, Eberth, Lawrence Coben and Erika Cabello**[134]** *The Inca Incorporation of the Canete Valley, Part 2: Strategies and Responses, Excavations at Huaca Daris*

Field research by the Canete Archaeological Project (CAP) has begun to unveil rich data regarding the Inca incorporation of the Middle and Lower Canete Valley. Utilizing both systematic survey and excavations, our work suggests a complex but intensive interaction between the Inca and those who occupied the valley before them. In this paper, we begin to tease out the imperial strategies of incorporation and local responses to them.

[240] *Death from Above: Using Remote Sensing Data to Examine Mortuary Landscapes along the Nile 4th Cataract*

The Bioarchaeology of Nubia Expedition project area stretches for over 30 kilometers along the right bank of the Nile in northern Sudan, from the modern village of Abu Tin at the top of the Great Bend west to the area across from Shemkhiya. Many of the numerous archaeological resources located within the concession have principal funerary components from multiple time periods, and their placement in the landscape with regard to specific topographic and environmental features is difficult to ignore. We use a combination of 2- and 3-dimensional historic and modern remote sensing data combined with in-field survey and excavation results to examine issues such as topographic prominence, intervisibility, and other spatial and contextual relationships between archaeological objects and the natural environment in our study area. Combined with a GIS-based, broad-brush style interpretation of modern land use based on historic landscape characterization approaches, these methods allow us to begin situating funerary monuments in the wider context of the landscape. This work, in turn, helps us understand archaeological resources in the region as interconnected components of a larger cultural dynamic with complex relationships to people and the environment in both the present and the past.

[199] *A Satellite-Based Perspective on Ancient Climate in Tropical and Desert Regions*

This research documents the effects of human activity upon tropical forests and desert landscapes. The investigation uses both satellite and airborne imagery to understand the dynamics of human adaptation and interaction upon these landscapes, and the role of natural and human-induced past and present changes to climate variability. These two subjects are highly interrelated since human-induced landscape changes can have strong impacts on climate, while natural climate variability can in turn exert strong pressures on the landscape, potentially exacerbating human-induced effects. Special emphasis will be placed upon the Maya lowlands of northern Guatemala and Belize, areas that are threatened by current deforestation and land use changes. It was in this region that the ancient Maya civilization began, flourished, and abruptly disappeared beginning around A.D. 800. Preliminary research suggests that the destruction of the landscape by human activity contributed to this collapse. These satellite-based techniques are also being applied to the northern desert of Peru.

Seyler, Samantha (New College of Florida)

[208] *Belt-Making Traditions and Identity at the Site of Uraca, Majes Valley, Peru*

This poster examines belt fragments recovered from the mortuary site of Uraca in the Majes Valley, Arequipa, Peru. The textiles utilized in this analysis were recovered during excavations in Sector I to the south, where interments were placed on a high bluff, and Sector II to the north, where interments were placed closer to the valley bottom. These sectors are not only defined by their geographical separation but also the variation in artifact and skeletal assemblages present between the two sectors, though presently it is not known if these variations are due to temporal or cultural differences. Through the analysis of technical attributes and design motifs of belts from both sectors, I define the tradition of belt-making that is represented at the site of Uraca and compare it to other textile traditions in the Majes Valley. These considerations are expected to provide information about whether the populations buried at this site are local or representative of people from different regions, as postulated in studies by other investigators working at Uraca. I examine the development of weaving practices in the Majes Valley and explore what they suggest about the dynamics between local groups and the Wari during the Middle Horizon.

Sgarlata, Cosimo (Western Connecticut State University)

[171] *What Goes Up Must Come Down: The Contribution of Upland Archaeology in Connecticut's Trap-Rock Ridges to Late Archaic Cultural Prehistory*

This research involved survey of West Rock Ridge, one of many Triassic "trap-rock" ridges in

Connecticut's Central Valley. These very rugged Triassic landforms are made entirely of basalt or diabase and rise like long linear spines above Connecticut's otherwise level and fertile Central Valley. The question of the research was whether data from this new and untested setting could contribute new insights into Prehistory of South Central Connecticut. Lithic analysis of numerous Late Archaic sites indicated not only intensive utilization, but also a wide variety of site types including ambush hunting, lookouts, seasonal camps and quarrying. Sources of lithic raw material included quartz, hornfels, and basalt from the ridges, but also a previously unknown high quality chalcedony originating from the geological processes which from which the ridges formed. Both the intensity and variety of Late Archaic occupation, in the absence of significant information from other cultural periods, accords well with a model postulating intensification of land use along with incorporation of more marginal environments; in coincidence with increasing population density for Late Archaic foragers, and packing of local territorial groups.

[91] *Elemental and Isotopic Variability in Mogollon-Datil Province Archaeological Obsidian, Western New Mexico*

The Mogollon-Datil Volcanic Province in western New Mexico has been a subject of geological and geoarchaeological research for over three decades. These Tertiary Period major events incorporated significant areas of crust over tens of thousands of km² and the rhyolite glass produced from these events are consequently similar in elemental composition even though the five major sources are isolated over a 100 linear km radius, and cross a number of cultural territorial boundaries in the late prehistoric period. The obsidian sources are also archaeologically significant in that they were used throughout the chronology from Paleoindian through Historic times (ca. 13,000 ka to ≈A.D. 1600), and transported throughout the North American Southwest. The need to discriminate between these sources is crucial to archaeological interpretation. The elemental composition using mainly laboratory x-ray fluorescence spectrometry (XRF) is so similar between these sources, and the number of cultural territories throughout prehistory is so extensive that extreme care in source assignment is required. An isotopic and ⁴⁰Ar/³⁹Ar dating program was employed to provide discriminating clarity with good results. The isotopic and ⁴⁰Ar/³⁹Ar data do indicate that these sources are distinct, and using these results, a strategy for discriminating sources was devised using laboratory XRF.

[63] *The Trip of a Lifetime: Archaeology, Tourism, and Irish-American Identity*

In America, millions of people claim Irish ancestry and celebrate their heritage in myriad ways. Many actively embrace the identity of Irish-American generations after their family members became U.S. citizens in the aftermath of the famine and socio-political turmoil of the mid-19th to early 20th century. Over the past two decades, the tourism industry in Ireland has flourished with Americans among the most numerous visitors each year. Several of the top destinations are those connected to the famine and ensuing Irish diaspora, events which continue to play crucial roles in the creation of Irish-American identity. Within Ireland, the era of the famine has seen relatively little archaeological excavation and analysis in part due to 20th century distaste for colonial topics. Irish national identity, in contrast, draws heavily from the Early Medieval period and the Iron Age, which have seen tremendous archaeological work and historical study. Thus, in archaeology and in the perceptions of identity, the time of the famine is somewhat disconnected from the rest of Irish history and prehistory. This paper examines the role of archaeology, nationalism, and tourism in the construction of Irish and Irish-American identity.

[405] *Sharing the Teapot and the Science: Challenges and Contributions in Shaping 21st Century Island Heritage in Ireland*

Crucial to heritage management in the 21st century is developing and maintaining cooperative relationships among archaeologists, the local community and decent communities. Different stakeholders have varied views of how to define the past, the cultural and historical relevance of people, places and objects and the extent to which this should be shared when creating multivocal histories. Focusing on the islands of Inishark and Inishbofin, Co. Galway, Ireland, located five miles into the Atlantic Ocean, the Cultural Landscape of the Irish Coast (CLIC) project provides an example of the active involvement of local descendant communities, and how this results in complex and sometimes contrasting bodies of knowledge. This project illustrates the collaborative yet challenging relationship between professional archaeologists, community members, local governmental agencies and the National Museum, all the while trying to understand daily life in post-18th century fishing villages. The combination of archaeological research with local histories produces a complex weaving of different knowledge universes, and results in a richer and more complex understanding of the past. This project also illustrates some of the challenges in managing heritage resources, including contested views of authority at different scales, long term research goals, and who has authority to speak about the past.

[95] *Effective Public-Centered Approach to Compliance work- Case study of the Angoon Airport Project, Alaska*

The Angoon Airport project located in rural southeast Alaska is proposing construction of a land-based airport and airport access road for the community of Angoon. Currently, the only methods of transportation to and from the community are floatplanes and ferry. Under the direction of the Federal Aviation Administration (FAA), SWCA is developing an environmental impact statement (EIS) with an emphasis on ensuring project information is truly accessible to this rural community. In addition to conducting traditional scoping meetings in Anchorage, Juneau, and Angoon, we have sought out opportunities to actively involve all stakeholders in the project, including providing traditional newsletters, an easy-to-navigate website, regular informal community visits and senior center luncheons, quarterly updates to the community, social media including Facebook postings, and calls to nongovernmental organizations (NGOs) to keep them updated on the status of the project. In conjunction with informal community visits, SWCA has also conducted in-person updates with the village corporation and city office. Although these are not required by the National Environmental Policy Act (NEPA) process, they encourage meaningful involvement by community leaders. One of the significant features of our public outreach approach was developing a plain-language format for the EIS and all materials that are intended for the public. This multifaceted approach has gone a long way in garnering community support for an otherwise challenging project.

Sharp, Kayeleigh (Southern Illinois University Carbondale) and Melissa Litschi (Southern Illinois University Carbondale)

[2] *Integrated Archaeometric and Spatial Analysis: A Preliminary Report on Spatial Data Mining in the Prehispanic Central Andes of Peru*

The Gallinazo and Mochica of northern coastal Peru lived side-by-side for centuries. However, the nature of their social interrelationships (one or two ethnic or social groups) is a continuing topic of debate as such complexity is one of the hallmarks of prehispanic central Andean civilization. How can meaningful dimensions of social differentiation and complex social interrelationships be elucidated through archaeological investigation? To answer this question, we present our integrated archaeometric and spatial analytical approach for studying Gallinazo-Mochica coexistence and social differentiation. Mixed-type data from various sources (GPS, pXRF, low-resolution microscopic, and unaided visual inspection, etc.) recorded during two short laboratory sessions in 2013 and 2014, and initial site surveys in 2010, were used in conjunction with various data mining techniques to identify meaningful patterns and establish association rules that will guide upcoming dissertation fieldwork. As this preliminary work shows, we have moved one step closer toward resolving critical debates by integrating high-powered tools used in geospatial and archaeometric analyses. As a means for eliciting broader nuances of social differentiation, the analytical power of such a combined approach is useful for researchers working in and out of the Andes.

Sharp, Emily (Arizona State University)

[250] *Quantifying Defensibility of Landscapes and Sites in Highland Ancash, Peru*

Warfare, as a social practice, can have profound consequences ranging from reorganization of sociopolitical boundaries to forced migration of communities and large-scale settlement pattern changes. This study quantitatively examines the increased concern for defense in the Early Intermediate Period (EIP) (200 B.C.–A.D. 600) by comparing defensibility of archaeological sites to the surrounding landscape in highland Ancash, Peru. Sites located on opposite sides of the Cordillera Blanca, specifically in the Callejón de Huaylas and the Callejón de Conchucos, are compared. In both regions, settlement locations on hilltops are common, particularly during the emergence of the Recuay culture (A.D. 1-700). Recuay-era sites were frequently built on top of supposedly defensible locations. In this analysis, a spatial defensibility index, developed by Bocinsky (2014), is used to assess if the sites built on ridgetops maximize defensibility by this index. This approach considers visibility and elevation indices. Additionally, the sites are ranked by defensibility in order to show the spatial distribution of the most defensible sites. Results are examined to see if they support the assertion that the Recuay purposefully constructed sites in highly defensible locations. All analyses are performed on a 30m digital elevation model in the statistical program R.

Sharpe, Ashley (University of Florida)

[22] *Critter Caching: Animals in Household Rituals at the Maya Site of Ceibal, Guatemala*

With an occupational history spanning nearly two millennia, the Maya site of Ceibal provides a rare opportunity to study the remains of ritual practices and domestic activities at household groups over a long scale of time. This study examines the zooarchaeological remains, both bones and shells, recovered from household caches, burials, and middens from several peripheral locations around the Ceibal site epicenter. The diversity of household types and extended time frame provides an opportunity to explore how the composition of middens and ritual deposits changed over time, how certain animal species and parts may have been appropriated toward different ritual performances (for example, human burials versus dedicatory caches), and how animals that were used in ritual activities at the peripheral household level compare to Ceibal's epicenter cache deposits. Finally, changes in domestic and ritual practices involving animals are compared over time in relation to what is already known of Ceibal's turbulent site history, in an effort to understand the manner and degree to which these societal developments affected the livelihoods of household occupants.

Sharratt, Nicola (Georgia State University)

[184] *From Dispersal to "Disappearance": A.D. 1000-1250 in the Upper Moquegua Valley, Peru*

In the Moquegua Valley, Peru, the decline of the greater Tiwanaku system circa A.D. 1000 was accompanied by a shift to a more dispersed settlement pattern, as populations moved out of the large towns of the middle valley and established smaller sites on the coast and in the upper valley. In

this paper I focus on the upper valley, where the longevity of occupation at post-expansive sites and the presence of secondary occupations offer an opportunity to examine the centuries' long trajectory of cultural transformation. I discuss the considerable recent excavation data from one site, Tumilaca la Chimba, to highlight temporal patterns of continuity and change in the upper valley, and consider how that data sheds light on the ultimate disappearance of Tiwanaku derived traditions from the archaeological record, some 250 years after regional political collapse. Further, in comparing community organization, burials, residential contexts, public space and material culture from Tumilaca la Chimba with neighboring settlements, I also critique a tendency to understand post-expansive upper valley sites as essentially monolithic and suggest that the considerable differences between Tumilaca la Chimba and contemporaneous communities invite us to reassess the nature of the local socio-political landscape post A.D. 1000.

[295] *A Tale of Two Projects: Comparative Findings of the CRAS and Yalahau Projects*

The CRAS and Yalahau Projects of Quintana Roo have shared a similar trajectory for many years: although both projects have focused several seasons on individual sites with detailed mapping, excavations, and artifact analysis, the broader goal has been to address large areas of coverage, with relatively few excavations conducted into buildings. Both projects have focused on site location, with the use of local peoples as consultants and guides. Both projects are in regions that are generally unknown to outsiders, and are frequently left as blank spots on maps representing the ancient and historic Maya world. Despite this relative obscurity, these areas are facing major development pressures from tourism and a disappearing knowledge base about the environment and archaeological features found there. This paper will examine the similarities that the research of these two projects have revealed about these geographically adjacent areas, including shared ritual patterns, environmental challenges, and issues of mobility and visibility of the ancient population. Additionally, we will point out the clear distinctions between the occupational histories of the Cochuah and Yalahau regions, including geographic differences, trade routes, and different trajectories during the Prehispanic, colonial and historic periods.

[75] *A Variety of "Cerendipitous" Discoveries*

Research at the Ceren village archaeological site in 2013 and 2014 has made a variety of discoveries. The plant casts, made by pouring dental plaster into the voids, reveal much about agriculture in the middle of the rainy season some 1400 years ago. The maize plants were doubled over to dry the mature ears, but the Loma Caldera eruption occurred just before planting squash and beans. So what was that single mature squash plant doing in the milpa? What are the limits of preservation of weeds, and have we overestimated the degree of weeding? Why was there less care in microtopographic field management just outside the village, in contrast to within the village and farther south in the manioc fields? A sacbe runs through the fields, and we discovered the compaction of its central zone was extraordinary. But why were the sides so soft and the center so hard? And why were most of the footprints from people headed south? Our efforts in experimental archaeology to duplicate its hardness are presented, and we can only speculate as to what technology was employed to achieve it. Its surprising durability over a full year with no maintenance is described.

[122] *Experimental Replication of Stone Tools used For Agave and Similar Plant Harvesting and Processing*

There are numerous burned rock middens in the region around Fort Bliss. These sites are usually assumed to be agave processing locations, although it is possible that other types of plants, such as yucca, were being processed. Some of these sites have small quantities of artifacts, while others have fairly large numbers of artifacts, particularly modified flakes. We believe that this difference may relate to processing the plants for fiber, rather than food. We intend to replicate stone tools from these sites and use these tools to harvest and process agave and yucca for use as food and for fiber. We will then compare the wear patterns on the tools to determine if there are patterns associated with each type of processing. As part of the experiment we will also conduct efficiency studies that can be used to compare to other experimental work of a similar nature.

[356] *Rebound Hardness Results for the Raw Material In and Around Pinnacle Point, South Africa and the Implications Thereof*

The Middle Stone Age lithic assemblage at the Pinnacle Point site (Western Cape, South Africa) fluctuates between local, coarse-grained material and exotic, fine-grained, heat treated material throughout the human occupation layers. By understanding raw material choice, the first step in the chaîne opératoire, we can better understand these shifts in raw material representation. Quantifying the mechanical characteristics associated with knappability and comparing these ranked benefits to the costs of acquisition allows us to describe and compare utilized lithologies in and between sites in a reproducible and subjective manner. The Schmidt Rebound Hammer has been used in previous studies to quantify rebound hardness as a proxy for knappability of various raw materials within the gathering range of a site. The purpose of this study was to rank the relevant lithologies according to their desirability, and identify acquisition choice patterns. The research focuses on the two most prevalent raw materials from Pinnacle Point, quartzite and silcrete. This presentation reports the rebound hardness results and the implications thereof, and discusses the role of the Schmidt Rebound Hammer.

[191] *Population, Monuments, and Violence in Neolithic Europe*

The EUROEVOL project has recently created reconstructions of changing regional population densities based on summed radiocarbon probability distributions for a large area of western and central Europe for the period 8000-4000 BP, covering the later Mesolithic and Neolithic periods. These have revealed a pattern of population booms and busts in many regions following the arrival of farming. The project has also gathered data on the construction dates of enclosures surrounded by ditches, banks and palisades, and on the dates of significant violence events during this period. These data will be used to try and distinguish between two hypotheses: that the enclosures are an indicator of economic prosperity and the ability to invest in production beyond subsistence or that they are associated with instability as local population densities peak and stress available resources, as suggested by Turchin.

[82] *Changing House Forms on the Northwest Coast of North America*

Traditionally, Northwest Coast houses were rectangular, post and beam dwellings. Architectural details varied regionally, ethnically and even locally. It is presently impossible to trace this variation archaeologically beyond a few coarse-grained statements. The earliest structures date to at least ca. 5000 cal BP; they are rectilinear and some at least are semisubterranean. The longest continuous sequence of houses is presently documented in the Prince Rupert Harbor region of northern British Columbia where, by 2500 cal BP, variation in house size becomes marked. The Salish Sea area also has a long sequence with several rectangular houses early, then a gap until ca 2500. After that date houses are the ethnographic shed roof style. On the Lower Fraser River, villages had a mix of rectangular surface houses and pit houses. What these changes trace, at minimum, are increasing demands on labor and resources.

[25] *Assessing Ceramic Production and Exchange in the Early Monte Albán State (Oaxaca, Mexico)*

In this paper we present the results of an ongoing study of ceramic production and exchange in the Valley of Oaxaca, Mexico, during the Late to Terminal Formative (500 B.C.–A.D. 200)—the period when the Monte Albán state formed and consolidated control over its hinterland and surrounding regions. We have found that adopting a multifaceted approach that combines chemical (INAA) data with detailed qualitative and quantitative mineralogical (petrographic) data enables us to differentiate cultural from natural factors affecting paste composition, and is more effective than a single analytic technique for establishing ceramic provenance in the geologically complex Oaxaca Valley. Detailed analyses of natural clays collected throughout the valley, as well as sherds from Monte Albán and other key archaeological sites in the Valle Grande subregion, have allowed us to identify 12 distinct ceramic production loci and to track the movement of different pottery wares within the heartland of this early state.

Sherwood, Sarah (Sewanee: The University of the South)

[190] *From Microstratigraphy to Ritual Behavior: the study of Earthen Monuments in Eastern North America.*

Traditionally the study of prehistoric earthen monuments has focused on their staged surfaces and the buildings and artifacts recovered there. Mound construction was simplified to volume, and the type of labor and oversight necessary to move basket loads of dirt. With rigorous attention to stratigraphy, there is a new interest and awareness of these earthen monuments as complex constructions. Selection, preparation, placement and maintenance of earthen materials allowed the establishment of mounds that were able to support substantial architecture, convey important cultural information as well as withstand natural forces that would have demolished simple piles of dirt. Researchers are now using interdisciplinary approaches, centered in the local geology and soils, to explore the links between cultural and natural landscapes to consider complex construction

techniques made possible by the selection and manipulation of earthen materials. Using examples from archaeological sites ranging in age from 3,000 to 800 years old, including Poverty Point, Monks Mound, Graveline Mound, and Shiloh, we demonstrate recent advancements in our methodological and conceptual approaches to shed new light on these significant monumental earthworks.

[145] *History of Research into the Jomon-Yayoi Transition*

This paper reviews the history of research and archaeological investigations into the transition from the Jomon to Yayoi Periods. This transition signifies a transition from a hunting-gathering economy to food-producing economy. Traditionally, Japanese archaeology has been characterized by building up relative chronologies of various regions based on pottery. From the 1930's to 1970's, the Yayoi Period was defined as a time period when the Yayoi pottery was used. However, rice paddies were discovered in stratum where Jomon pottery was discovered, which necessitated a re-consideration of this traditional definition. As a result, the Yayoi Period came to be re-defined as a time period when wet rice cultivation was practiced. In recent years, AMS dating has been applied to the date of the beginning of the Yayoi Period, and replica methods are applied to pressured imprint of seeds on pottery surface in order to identify crops raised at that time. These all contribute to our understanding previously-unknowns aspects of the Yayoi society.

Shier, Melonie (University of Central Lancashire)

[128] *In Defense of the Fence in the American West*

The fence is integral to the mythology of the American West, particularly the barb wire fence, such as in the battle between cattle and sheep raisers, and between pastoralists and agriculturalists. The years of the open range were short lived in comparison to the decades of fence construction and maintenance. Serving as boundaries and divisions of landscape, fence lines can give valuable insight into how peoples shaped their landscapes in the past and continue to shape it in the present. Although they were often set in line with the Cartesian grid of land division, many lines also follow the landscape, limiting access of people and animals to particular resources of importance. These divisions can allow for archaeologists to discover which landscape features peoples in the past protected and which they did not. Often constructed of mass produced materials, fence lines can give insight into technological changes, consumerism patterns, landscape based identity, and stylistic preferences. This paper will discuss the significance of fence lines as linear features, as well as discuss possible dating strategies for fence lines, particularly barb wire fence lines.

Shillito, Lisa-Marie (University of Edinburgh)

[210] *Technological Choice or Environmental Constraints? Fuel Use at Boncuklu and Çatalhöyük*

By combining sediment micromorphology with microbotanical and geochemical analysis, we can gain insights into the archaeological record that are otherwise invisible. By characterizing fuel deposits as a package of remains rather than focusing on a single class of material (including charcoal, ash, burnt sediments and associated artifacts) we are better able to reconstruct their formation processes, and thus the activities that produced them. Using examples from the early Neolithic settlements of Boncuklu and Çatalhöyük, this paper will discuss the contribution of microarchaeological approaches to the investigation of fuel use in prehistory, and how it can help disentangle technological choices versus environmental constraints on the selection and use of fuel resources.

[371] *The Organization and Technology of Sicán Metalworks: pXRF Analysis of Floors and Associated Residues*

The technical sophistication and versatility of 1000-year old Middle Sicán gold and other metalworks on the Peruvian north coast have long been appreciated. How were the artisans, raw materials and diverse manufacturing activities organized and managed? This paper aims to answer this and other technical, behavioral and organizational questions based on the 2014 excavation of a large and well-preserved workshop at the base of the monumental temple mound of Huaca Loro at the Middle Sicán capital of Sicán. Systematic application of portable X-ray fluorescence analysis to copper, gold, silver, arsenic and lead concentrations in floors and floor-context production debris such as ash and charcoal, together with abandoned furnaces, tools, scrap and slag, allow tentative reconstruction of the spatial organization, manufacturing sequence, scale and intensity of copper and gold alloy metalworks. As with other manufacturing activities studied thus far, this craft production was also characterized by a multiplicity of small production groups working close to each other. It appears that each of the six major temple mounds at the Sicán capital hypothesized to have represented six governing elite lineages had its own attached and closely supervised metal workshop.

Shipman, Pat (Pennsylvania State University)

[28] *The Paleolithic Domestic Dog Hypothesis*

Using morphological and statistical techniques, Germonpré and colleagues have identified over 40 Paleolithic dogs, ranging from ~36,000 to 13,900 cal yrs BP. These unusual canids have a different dietary signature from wolves at the same sites according to isotopic analyses. MtDNA analyses by Thalmann and others show that at least Paleolithic dog had a unique mtDNA sequence. I propose that these canids represent early domesticated dogs which significantly improved human hunting success. Eight predictions based on ethnographic, archaeological, and biological information can be used to test the Paleolithic Domestic Dog Hypothesis. 1) Additional early dogs will be identified at human but not at Neanderthal sites. 2) Sites with early dogs will yield higher densities of faunal remains and retouched stone tools than Mousterian sites. 3) Early dogs will be discovered at additional sites yielding many individual mammoths. 4) Sites with early dogs will include many wolf remains. 5) Sites yielding early dogs will suggest longer occupation or larger population size. 6) Isotopic studies at additional sites will reveal dietary differences between early dogs and contemporary wolves. 7) Early dogs will be large-bodied, sturdy animals. 8) Both early dogs and early humans will show adaptations to enhanced communication.

[33] *Hominin Cognition across the Acheulean to Middle Paleolithic Transition*

In 2013 I suggested that changes in behavior at a transitional Acheulean to Middle Paleolithic site in India were characterized by increases in generativity, hierarchical organization and recursion, and that the transition was perhaps underpinned by improved working memory. Here I present the results of a knapping experiment that compares the recursive and hierarchical complexity of Acheulean and Middle Paleolithic knapping sequences in order to test this claim. I then look at how differences in Acheulean and Middle Paleolithic cognition are manifested at the landscape level by comparing two remarkable preserved Paleolithic landscapes in the Arabian Desert: Dawadmi and Jubbah. The tools transported, the areas on the landscape used, and the degree of reduction intensity are contrasted between the two periods. I conclude that there are demonstrable differences between Acheulean and Middle Paleolithic hominins in behaviors that may relate to working memory, and speculate that this transition in human evolution might reflect the origins of narrative communication.

Shiratori, Yuko (The Graduate Center, CUNY)

[219] *Where is Temple? Construction and Use of Ceremonial Group at Tayasal*

Since the 1970s, a ceremonial group dating to the Late Postclassic period at the archaeological site

of Tayasal has been excavated by several archaeological projects. These efforts have greatly contributed to the understanding of the Late Postclassic period and the Itza Maya communities in the Petén lakes region. The ceremonial group includes a Postclassic "basic ceremonial group" on the west and a probable Late Preclassic E-group on the east. Excavations revealed architectural arrangements and use of the ceremonial group by the Itza during the Postclassic period. The basic ceremonial group and a modified arrangement called "temple assemblage" were first identified in Mayapán, Yucatán. The presence of a Mayapán-style temple assemblage supports a connection between Yucatán and Petén. This paper examines construction and use of the ceremonial group by the Itza and explores the probable location of a temple in the ceremonial group at Tayasal, compared to other Postclassic sites with temple assemblages.

[205] *Anglo-Saxon and Viking Ship Burials as Indicators of Rank and Wealth*

This study compares the funerary practice of ship burials in Anglo-Saxon and Viking societies. The custom of ship burial is an expression of rank and wealth held by an individual during their lifespan. In addition to common outward appearance of rank shown through such funerary treatment, similar artistic traditions are evident from grave goods and hoards. Items such as jewelry, furniture and boats are crafted in related styles that also express their owner's rank through the materials and motifs. Several aspects of Anglo-Saxon and Viking culture are examined to provide a foundation for the analysis of rank in these societies. Ship burials provide unique insight into the elite culture of northern Europe in the latter half of the first millennium A.D. These types of burials include the presence of female occupants, which presents a new aspect of Viking society to study. The inclusion of males and females in a similar funerary setting and the luxury goods included in their burials suggests that both genders could hold significant roles in Anglo-Saxon and Viking society.

[326] *Borderlands in the Amazon Forest: Can We Draw Boundaries?*

Amazonian occupations from 2500 BP to contact have been characterized into expansive traditions based on ceramic vessels. Meanwhile, ethnographic records point to diverse ethnic groups residing across the basin. Seeking variables that may be associated with precolumbian cultural diversity, we explore a possible intersection between groups, an area located at the headwaters of five tributaries to the Negro and Amazon Rivers. Archaeological data deriving from analyses of settlement structure, lithic technology, subsistence, and ceramics provide the context for reflecting on whether culturally meaningful boundaries can be defined between this and other regions or if the mixture of characteristics is indicative of other cultural interactions.

Shott, Michael (University of Akron)

[280] *Pros and Cons of Consulting Collectors: A Case Study from the River Raisin in Michigan*

In survey, we collect what lies on the surface. But so have others, for decades or more. Ignoring private collections risks neglecting a selective but informative part of the accumulated record. One way to gauge collector effects is to compare what archaeologists found in survey to private collections from the same places. In 1975-77 the University of Michigan surveyed the River Raisin watershed in southeastern Michigan. I compare Michigan's results to what collectors had found already and, because the survey was probabilistic, estimate the number of period components first ignoring and then including data from private collections.

[201] *The Shipwrecks of Pisa: Management, Professional Optimism, and Bureaucratic Myopia*
Between 1998 and 2000 archaeologists discovered nine well-preserved Roman shipwrecks at San Rossore, Pisa, 500 m from the leaning tower. Shortly afterward a grand vision for a “museum with three vertices” was articulated: a public excavation area plus a conservation laboratory and museum of Mediterranean navigation, to be constructed in an underused 16th century barracks nearby. But despite urgent conservation needs, neither the public excavation nor the laboratory opened until 2005, while the museum is still unfinished. Irregular and unpredictable budgets caused organizational chaos, while the inclusion of the project in the City of Pisa’s urban redevelopment efforts added complexity and delays. Moreover, the grand vision of three interconnected institutions became an obstacle in itself: in the absence of an administrative culture that was able to bring projects “down to earth”, the universalist and utopian tendencies of professional discourse fostered a tendency to choose the “best” project over the most feasible one, adding cost, risk, and uncertainty to an already challenging project. Based on extensive archival research, our paper reconstructs the 15-year history of the project and explores the emergent management issues at this unique site, including the role of professional optimism, bureaucratic myopia, urban planning, and uncertainty.

Shurik, Katherine (Louisiana State University)

[133] *Role of Handstones in Mesoamerican Ballgame*

Handstones are one of the artifacts that associated with the Mesoamerican ballgame. However, barely any research has been published about them, since 1961, when Stephan Borhegyi first analyzed them. He identified that handstones vary in size and shape. In the past, it has been suggested that they could be used to serve the ball when initiating the ballgame. Recent analysis of their size, abrasion, and context in imagery identifies the improbability of using them as a serving tool. Not a single image in the sample displays a player holding a handstone while playing the game. All images that contain handstones display a ritual and/or mythological context, most frequently directly connected with sacrifices. These include purely mythological images of various gods interacting and sacrificing another deity and images with historical figures that are being sacrificed and crossing into mythological realm, as a result of it.

[411] *Chimú-Inka Ceramics: Quantifying Differences between Colonial Forms and Their Influences*

Between 1428 and 1534 the Inka conquered the world’s largest territory controlled by a single state including 1300 km of coastline from the 1460 conquest of their main rivals, the Chimú. Studies on Inka provincial administrative policies are increasingly important in understanding the pre-conquest Andes; however, there has been no study of the effects of Inka subjugation on the art of their most powerful former enemy. Ceramics from the Chimú-Inka period offer a striking example of how characteristics from provincial and Inka artistic traditions were combined. This presentation examines three Chimú-Inka vessel forms to assess the level of artistic control imposed by the Inka state: stirrup spout vessels, urpu, and portrait head vessels. The first two forms origins are clear, with stirrup spout vessels continuing an ancient, persistent North Coast vessel type, while urpus are an Inka invention. The final form is a hybrid product originating from the colonized north coast, containing elements of both Chimú and Inka artistic traditions. Proportional analyses comparing vessels of the original culture to the Chimú-Inka version indicate quantifiable distinctions in the two samples, suggesting that Inka administrators allowed a certain degree of flexibility while imposing the acceptance of their own tradition’s forms.

[152] *Preliminary Analysis of Marine Shell Artifacts in the Southern Florida Keys*

The Stock Island site (8MO2), located in the southernmost Florida Keys, was a black dirt midden affiliated with the Glades tradition. Construction of the Monroe County Detention Center in the 1980s destroyed the site, necessitating the uncontrolled and uncontextualized recovery of a large quantity of ceramics and faunal (osteological and malacological) remains. Unprovenienced collections from this salvage work reside in numerous repositories across the state of Florida. In this work, we present the results of a preliminary analysis (taxonomic identification and tool-type categorization) of the marine shell artifacts and ecofacts held by the University of Miami's Department of Anthropology. The assemblage is dominated by two taxa of marine gastropods (*Strombus gigas* and *Busycon contrarium*), which together account for nearly 60% of the collection (NISP), the majority of which were secondarily used as tools (picks, chisels/gouges, and hammers). This analysis provides insights into subsistence practices and material adaptation in the prehistoric southern Florida Keys.

[34] *Taking and Giving: Finding the Balance in Community Archaeology*

One of archaeology's seemingly inescapable practices is the act of taking, and it remains one of the hardest aspects to manage for communities that work with archaeologists because of its appropriative nature and colonial legacies. A way to balance this "taking" is to emphasize at least as much "giving" in the process, which requires a level of sharing and dialogue that are only now becoming part of archaeologists' conceptual and methodological toolkits. This paper considers these issues in the context of the Eastern Pequot Archaeological Field School, a project underway since 2003 between the Eastern Pequot Tribal Nation in southeastern Connecticut and the Department of Anthropology at the University of Massachusetts Boston. More than ten years of ongoing dialogue, pedagogical enhancements, flexibility, and mutual respect – plus the tribe's continuing battle with the federal acknowledgement process – have generated community and scholarly products and opportunities that try to embody that tenuous and ever-shifting balance between giving and taking.

[413] *Ancient Maya Trade and Communication as Evidence by Petrographic and Iconographic Analysis of Unit-Stamped Pottery*

The Paynes Creek salt works of southern Belize were a massive industry for the production of salt for trade with inland Maya consumers during the Classic period (A.D. 300-900). The salt workers lived elsewhere, perhaps at the nearby trading port of Wild Cane Cay, which was a large contemporary settlement. The infrastructure of production includes wooden buildings preserved below the sea floor. The majority of artifacts recovered from survey and excavations consist of briquetage—locally-made pottery used to evaporate brine in pots over fires to make salt. A minor component of the ceramic assemblage consists of unit-stamped pottery which has a distribution from the south coast and inland sites of southern Belize, to sites in adjacent Guatemala, including Seibal, Altar de Sacrificios, and sites in the Petexbatun. We discuss the iconographic, spatial, and petrographic evidence of unit-stamped pottery from the Paynes Creek salt works. The compositional characteristics of the pottery are compared with various potential geological sources to help identify where pots were made. In the absence of salt, we use unit-stamped pottery as a proxy for helping to reconstruct the Paynes Creek salt production and identify the inland consumers of this basic biological necessity.

[155] *Geoarchaeological Issues in Lago Rico Archaeological Site, Central Plateau of Brazil*

The first results of the archaeological research being developed at the interfluvium of the Peixe and Araguaia rivers, indicate the possibility to applying geoarchaeological issues to address a number of issues related to the Lago Rico site, on the left bank of the Peixe river. This site features cultural remains in a section of a low slope as well as two other areas. The first in the alluvial terrace by a lagoon and the second in the floodplain, upstream of the first section, evidencing the erosive-depositional behavior of the river in the archaeological site area. The depositional segment, presents evidence of a different environmental context from the current one (an ancient erosive margin), allowing the hypothesis that part of the site may have been eroded transporting cultural remains downstream. To investigate these hypotheses, geoarchaeological analyses are fundamental to identify the cultural remains in the lagoon area and the depositional margin and obtaining information to aid in characterizing the behavior of the river channel and description of stratigraphic profiles.

Silva, Fabiola and Jane H. Kelley (University of Calgary)

[245] *The Current State of Looting, Preservation, and Education in the Casas Grandes Region*

The looting of archaeological artifacts is a worldwide phenomenon prompting the destruction of our world heritage. Looting and the antiquities market across the U.S/Mexico border is a complex bi-national issue that has highly impacted the archaeological record. A previous examination of the history of looting in Casas Grandes, Chihuahua, Mexico demonstrates three periods of looting: the Museum Period (1900-1939), the Private Collector Period (1940-1979), and the Present Period (1980-present). This paper will examine the Present Period and the contributing factors that have led to the further destruction of sites in the Casas Grandes region; as well as what strategies local government officials, INAH, and other archaeologists are implementing to counter such destruction.

Silva, Rolando (Anthropology Graduate, University of Texas Rio Grande Valley)

[265] *Remote Sensing as a Method of Promoting Group Identity: Rediscovering Edinburg's African-American Cemetery*

Edinburg, Texas, was founded in 1909 some 15 miles north of the Rio Grande in the then newly irrigated "Magic Valley." A decade later Hillcrest Memorial Park Cemetery was established, with a remote corner of the burial ground allocated for African-Americans. Many of the earliest people interred hailed from rural households, and so due to a lower socio-economic status, some graves had no markers. Concerned citizens and the descendants of the deceased have since taken to

assisting grounds keeping at the cemetery, placing historic markers and new burials. Unfortunately, there are still men and women identified only by memorial homage. To offer service towards this issue, in the Spring of 2013 a remote sensing survey using ground-penetrating radar (GPR) was conducted to attempt categorization of the burials and their condition in the environment, as part of a larger methodological study considering the utility of remote sensing equipment for archaeogeological research in the Rio Grande Valley. This fieldwork benefits from the support of the community and will shed light on a largely forgotten founding minority population.

[46] *Understanding the Local Communities through the Study of Lithics and Communication Routes in the Northwestern Maya Lowlands during the Classic Maya: Recent Studies in the Region*

The region known as the Northwestern Maya Lowlands encloses a large geographic and cultural area that included, and was part of, a large system of exchange of goods, people and ideas. Archaeological evidence recovered in the region serve as evidence of the complex system of communication routes and local settlements that were part of local communities and practices. The communication routes and archaeological sites localized between the Usumacinta River and Tulija River serve as a case study of the different dynamics and practices that affected and united the local communities through the use of obsidian tools during the Classic. The study of lithics and communication-exchange routes can help us understand the local technologies, practices and communities of the ancient inhabitants.

[409] *Modeling Space at Tell Timai: Composite Imaging at Greco-Roman Thmuis, Egypt*

Ancient Thmuis represents one of the best preserved examples of a Greco-Romano-Egyptian metropolis in the Nile Delta. However, preservation of the tell is variable, with sections on the periphery having been stripped by systematic looting of mud and red brick to buildings while in the center of the tell walls three stories tall and well-defined streets are common. Archaeological work and subsequent preservation have depended on a variety of imaging methods to reconstruct segments of the city. Recently, a quadcopter has been incorporated into the methods employed providing some outstanding initial results.

Simek, Jan and Alan Cressler

[353] *A Regional Perspective on Mud Glyph Cave Art in Southeastern North America.*

We provide an overview of a signature prehistoric cave art form in the Southeast of North America: "Mud Glyph" images traced and/or carved into plastic sediments inside the dark zones of caves. Today, we know of 21 such mud glyph caves in Tennessee, Alabama, Kentucky and Virginia. Sometimes, mud glyphs form elaborate cave art compositions. While this art form has roots in the Archaic Period more than 3000 years ago, its greatest frequency occurs during the Mississippian Period after A.D. 1000. The subject matter of the art varies, but prehistoric religious iconography associated with the Mississippian Period is very common.

[147] *The Island and the Mainland: Connections between Maya Communities on Ambergris Caye and North-Central Belize*

Ancient Maya occupation on Ambergris Caye has been documented from Preclassic through Postclassic times. Work at the site of Marco Gonzalez has concentrated on several structures in which we have found solid evidence for connections to Maya polities in northern Belize and beyond. Nonetheless, relationships with mainland communities changed substantially over time. Although the

northern location of the caye makes it seem logical that its closest connections were with north-central Belize communities, there is evidence that connections with northern Belize in particular intensify in Terminal Classic times and continue through the Postclassic. Here we discuss the material evidence for these connections through time.

[190] *Site Formation Processes and Stratigraphy of Akrotiri Aetokremnos, Cyprus: The Devil is in the Details*

Akrotiri Aetokremnos is a small collapsed rockshelter that has provided evidence of the earliest well-documented human presence on the Mediterranean island of Cyprus. It is, in fact, amongst the earliest numerically dated site on any of the Mediterranean islands. A large suite of radiocarbon ages indicates that Akrotiri Aetokremnos was occupied around 12,000 cal. B.P., during the Late Epipaleolithic. More controversial than the ages is the association of extinct endemic pygmy hippopotami with cultural materials, as this relates to the continuing discussion of human-related Pleistocene extinctions. Our claim of a direct association has been challenged, despite well-published archaeological and geoarchaeological data to the contrary. This paper addresses the site's stratigraphic sequence and formation processes, both of which indicate that the remains of pygmy hippos are in direct association with cultural features and artifacts.

[130] *Neglected Root Crops of the Prehispanic Maya*

Root crops represent a major lacuna in the archaeological record of the Maya area and discussions of prehispanic Maya foodways in general. Only a handful of exceptional cases furnish direct evidence for the exploitation of root crops. Most notably at Ceren, the recent discovery of entire fields dedicated to manioc cultivation suggests that maize was not the only agricultural staple in this village community. Researchers working throughout the humid tropics have employed microbotanical analyses—phytoliths and starch—to overcome issues of preservation and reveal more detailed information about domestic plant economies, especially regarding root crops. Here I report the results of a systematic study of microbotanical remains from the Puuc Maya residential hilltop site of Escalera al Cielo (EAC). The remains include starch from at least three root crops—arrowroot, manioc, and *Zamia* sp.—that were processed with handheld grinding stones, in addition to abundant arrowroot phytoliths recovered from various domestic contexts. These new data from EAC demonstrate the tremendous potential of microbotanical studies, which can reveal the role of root crops in prehispanic Maya foodways, as well as larger-scale issues of local land management strategies.

Simms, Steven (Utah State University) and Andrew Ugan (Far Western Anthropological Research Group)

[296] *The Faces of Intensification: An Application of Selection Thinking*

The application of HBE and selection thinking can shed light on the study of intensification. This vantage treats intensification as a process, not a threshold, and treats behavior not as normative cultural forms (e.g., “intensive farmers”), but as fluctuating frequencies among alternative adaptive strategies comprising a behavioral mix that may be culturally encoded. There are many ways to work hard. Here we employ case studies from Mendoza, Argentina, and the Great Basin, Southwest, and Midwest of North America to explore the “faces” of intensification.

[8] *The Near and Far: How Aerial Thermography Can Elucidate Findings in Ground-Based Geophysical Datasets*

From dense ground cover to subtle geophysical signatures, researchers utilizing ground-based geophysical methods often encounter a variety of challenges limiting their potential for successful interpretation. With two case studies, we demonstrate the utility of augmenting near-surface geophysics with thermal and color photogrammetric models generated from aerial imagery. These studies include two projects supported through the SPARC program: the late Pueblo II great house at Largo Gap in New Mexico where ground-penetrating radar (GPR) survey was made difficult by dense rubble across steep slopes, and Iron-Age sites along the eastern edge of the Kalahari Desert in the Bosutswe region of Botswana, where constrained survey areas make the interpretation of magnetic susceptibility, electrical conductivity, magnetic gradiometry and GPR anomalies challenging. Both geophysical surveys were augmented by aerial platform surveys using thermal and color sensors. These two imagery types were processed using structure-from-motion photogrammetry software to produce orthophotographs and 3D terrain models. These aerial data sets were successful in elucidating new features in the near-surface geophysical data sets.

[98] *Colorful Collaboration in Colorado: Recent Work by the Project Archaeology Colorado Chapter*

Colorado archaeologists have a long history in promoting Project Archaeology by providing data for curricula, field work opportunities, and training workshops. Nonetheless, for several years the participation was minimal. A revival of Project Archaeology in Colorado began in 2012 with a teacher training workshop in Broomfield, hosted by SWCA Consultants. Since then, the program steadily increased its presence across the state. Through the devoted efforts of its members, the Colorado Chapter provided facilitator/teacher workshops, developed partnerships with local organizations including the Colorado Council of Professional Archaeologists, Bureau of Land Management, and State Historic Preservation Office, and helped in the evaluation of new materials. This poster presents the standing legacy of Project Archaeology in Colorado while highlighting the success of recent programs and efforts.

[204] *Preliminary Testing of Facial Approximation Methods for Finding the Pronasale in Children*
Facial approximation has been increasingly used in archaeological human remains but its accuracy in children is often uncertain due to the lack of research in this area. There are currently several methods in use to predict the nose pronasale position, but they have all been developed for use in adults. Considering that the face, including the nose, undergoes significant size and shape changes during growth, the validity of these methods in children is largely unknown. Preliminary testing of Gerasimov's (1951,1977) method was performed on lateral cephalograms of 22 12 year-old subjects consisting of 10 males and 12 females. The x-rays were imported into Photoshop where the soft tissue outline was removed and the method was blindly tested. Testing showed that in females the estimated pronasale tends to be systematically more anteriorly located, and in males it tends to be systematically more inferiorly located. This may be related to sex-specific changes in facial growth. Additional testing of this method and quantification of differences between the estimated and real pronasale can help to determine whether or not they work on facial approximations of children.

[277] *Past, Present, and Future of Archaeological Legacies: Reassessing the Chavez Pass Burial Collections for NAGPRA Repatriation*

A recently completed NAGPRA documentation project for the Chavez Pass Burial Collections at Arizona State University facilitated a multi-faceted reassessment of the expansive collections of the

site, originally recovered from 1976 through 1982 by ASU archaeologists. In the reassessment, teams of physical anthropologists and archaeologist used original site records, maps, specimen logs, museum catalogs, photographs and reports to reexamine contextual identification of burials and associated funerary objects. The USDA Forest Service Southwest Regional Office and Coconino National Forest provided funding for the NAGPRA documentation over a four year period. Results of this recent documentation effort, utilizing current state-of-the-art methodologies, allowed careful reassessment and more realistic estimations of both numbers of individual and associated funerary objects for the repatriation. Thorough documentation of the burial collections has provided extensive data for use by the Forest Service, the Hopi and Zuni Tribes who received the collection, and for future researchers.

[293] *Fins, Feathers, and Furs: Fish, Bird, and Mammal Remains from a Stege Mound Complex Site, CA-CCO-297*

During approximately the last thousand years, people at CA-CCO-297 focused upon taking small schools of fishes, aquatic and marine ducks, and sea otters. These were obtained from estuarine habitats immediately adjacent to the site. Seasonality profiles for fish, bird, and mammal species indicate procurement occurred throughout the year. Harvesting of these taxa was facilitated by the use of watercraft, nets, and hunting tactics including mass collection, prey switching and coharvesting. Preparation techniques indicate processing emphasized production of animal products focused on both on-site needs and as commodities.

[376] *Resignification: Public Ritual and Changing Cultural Landscapes at Actuncan, Belize*

Across the Maya Lowlands, dedication ritual served a vital role in endowing public and household spaces with meaning and function. Through ritual, structures acquired the soul-force, or k'ulel, necessary to sustain activity within their walls. However, many structures lived (at least) two ritual lives: one associated with their original intended function, and a second following the abandonment of their initial use. We argue that through ritual resignification the original meanings of public spaces were harnessed and reshaped to match new uses and the changing needs of the local populace. In this presentation, we specifically discuss three locations originally vested with value through royal, elite, and exclusive forms of ritual. Each is later resignified to establish powerful locations for community-oriented inclusive ritual to meet the needs of shifting social and political institutions. The loci of interest are an elite residential structure, a palace compound, and the plaza of a triadic temple group at the site of Actuncan, Belize. Parallels and deviations in the structure of ritual deposits within these loci speak to shifting access, and their examination clarifies how the architectural vestiges of Preclassic royal power were differentially incorporated into the Terminal Classic, post-royal landscape of Actuncan.

[351] *Soil Nutrient Management in Norse Greenland*

In this paper we set out to establish the role of soil nutrient management in the sustainability and resilience of livestock agricultural systems in Norse Greenland (ca. late 9th – 14th centuries A.D.). Using a landscape sampling framework that includes large, medium, and small sized farms we use thin section micromorphology and associated SEM-EDX analyses of cultural soils and sediments in home field areas. We identify materials used in the endeavor to sustain soil nutrients together with nutrient levels achieved. Radiocarbon dating of charcoal from the anthrosols provides a robust

chronological framework for our stratigraphies. Our findings allow us to identify selection of materials and the intensity of endeavor to sustain nutrient status across different types of farm and with different environmental conditions over time. The paper concludes by assessing the viability of the contrasting management strategies that emerge from the study.

Simpson, Kay (Cultural Resource Analysts, Inc.) and Brian Glusing (Fort AP Hill)

[363] *The Capture of John Wilkes Booth*

After the assassination of President Abraham Lincoln, the ill-fated escape effort of John Wilkes Booth ended in Virginia on the doorstep of Richard Garrett, where Booth was shot by pursuing federal forces and died on April 26, 1865. Garrett's Farm, frequently the subject of Booth-related intrigue, was purchased in 1940 by the U.S. Army and is part of Fort A.P. Hill, an Army training installation. Although Garrett's house and other structures are long gone, the former Garrett house site is now situated in the median of a divided highway and is the subject of many unauthorized roadside visits each year. As stewards of the land and the highway respectively, Fort A.P. Hill and the Virginia Department of Transportation are undertaking archaeological studies to document the Garrett Farm site. These studies seek to evaluate the integrity and determine the cultural significance of the Garrett Farm site, particularly as it represents the last of the many sites that make up Booth's escape route. The studies also aim to explore the potential to use the site, in cooperation with Historic Port Royal and Caroline County, for public exhibition in April 2015 on the 150th anniversary of the capture of John Wilkes Booth.

Sims, Marsha (Nat Resources Conserv Svc)

[150] *The Southern Hummingbird, Give Me Five*

This research is on the use of the outrepasse or overshot technique of flintknapping of the Clovis culture and the "sacred" use of this technique by the Aztecs in order to connect paleoindian archaeology to culture heroes. In the record of the Aztec, Huitzilopochtli, a culture hero, fought the Four Hundred Southerners and he sacrificed these gygantomachy on the field. A reenactment of this sacred drama is a game called tlachtli and it is played on the ball court called tlacho in the New World. A weapon used in the Aztec iconography is a serpent-headed boomerang or incomparable dart.

Sinclair, Anthony (University of Liverpool)

[93] *Mapping Archaeological Research 2004-2013: A Network of Sources, Authors and Concepts*

Citations data provide an important but underutilized resource through which to appreciate the structure and relationships of archaeology as a discipline. This data can be visually mapped to present the key structures of scientific disciplines. This poster will present three network maps of archaeological research based on an analysis of citations index data from more than 20,000 archaeological research outputs published between 2004 and 2013 inclusive. Each map contains information on more than 1000 elements, positioned and clustered by association to surrounding elements and ranked by importance. These maps include; (i) the network of cited archaeological sources, (ii) the network of archaeological authors, and (iii) the network of terms or concepts used in current archaeological research. These maps provide a unique visual through which to understand the multidisciplinary nature of archaeological research, the nature of its specialties, and the essential knowledge concepts that are required for an understanding of archaeological research. The network of cited authors can be viewed as the disciplinary research core supporting contemporary research.

[364] *All Potted Up: Exploring Seasonality at Small Late Pueblo II and Early Pueblo III Sites at Petrified Forest National Park*

Researchers have conducted archaeological investigations within the vicinity of what is now Petrified Forest National Park (PEFO) for over 100 years. Although the majority of archaeological sites identified at Petrified Forest National Park consist of small habitation sites that date to the late Pueblo II (1030-1125 A.D.) and early Pueblo III (1125-1225 A.D.) periods, archaeologists have gathered little information regarding the habitation practices of people during this transitional time period. Late PII and early PIII archaeological sites often only contain single room structures, ranging from coursed masonry dwellings, to pithouses and jacal structures. Archaeologists often refer to single room masonry structures as fieldhouses, but have conducted little research to substantiate this claim. Archaeologists conducting ongoing survey of nearly 100,000 acres of recently acquired lands surrounding PEFO have identified numerous small late PII and early PIII habitation sites. Since the introduction of modern excavation methods, which include flotation analysis, no small late PII/ early PIII sites have been excavated at the park. Analysis of paleobotanical samples from a complete vessel found eroding out of a single room structure at a late PII/ early PIII site provides insight into the habitation practices of people during a significant period of change.

[294] *Foraging for Bulbs in the Cape Floristic Region*

Underground storage organs (USOs) serve as a staple source of carbohydrates for many hunter-gatherer societies. While the way of life of hunter-gatherers in South Africa's Cape is no longer in existence, there is extensive historical and archaeological evidence of hunter-gatherers' use of such plants as foodstuffs. This is to be expected, given that the Cape supports the largest concentration of plants with USOs globally. To meet the goals of the Paleoscape project, the importance of evaluating the USO resources of the area is a crucial part of modelling the resources that would have been available to hunter-gatherers during glacials. In the past, optimal foraging models were built on data collected from observing hunter-gatherer foraging, this is impossible in the Cape due to the lack of hunter-gatherers. To this end we evaluate the foraging potential of USOs by identifying how abundant edible biomass is in a coastal setting of the southern Cape, how easily it is gathered, and how nutritious it is based on experimental methods. From preliminary experiments we demonstrate that USOs are a readily available food resource in the southern Cape landscape and that they more than likely played a critical role in providing food for early humans.

Singer, Zachary (University of Connecticut) and Brian Jones (Connecticut State Museum of Natural History)

[150] *Documenting Variability Among a Geographic Cluster of Paleoindian Sites on the Mashantucket Pequot Reservation in Southeastern Connecticut*

Over the past thirty years, many Paleoindian sites have been identified near the Great Cedar Swamp on the Mashantucket Pequot Reservation in Southeastern Connecticut. Examination of isolated Paleoindian lithics and three excavated sites, Hidden Creek, Ohomowauke, and Raspberry Trail highlights Paleoindian site variability on the local landscape. The comparison of the lithic technological organization, intra-site patterning, and age of occupations among the sites provides insight into the diversity of Paleoindian land-use around Mashantucket.

Singleton, Hayley (University of Florida)

[163] *Recent Investigations of Subsistence at the Garden Patch Site (8DI4): A Study of Faunal Remains from a Platform Mound and Adjacent Midden*

In summer 2013, a platform mound and newly identified midden deposit were tested at the Garden Patch site, a Woodland multimound center located on the northern gulf coast of Florida. The subjects of this research study are the faunal remains from the dense midden of Area X and adjacent Mound II, a platform mound constructed of shell midden. Results indicate a highly marine based diet focused on the nearby marsh and shallow Gulf waters. A series of dates suggest the Area X village midden accumulated over a 200-year period during and after the rapid construction of Mound II. Given the contemporaneity and proximity of the two assemblages, the potential significance of faunal remains is considered in terms of feasting and ceremony.

[184] *Second-Hand Spaces: Abandonment and Reoccupation during the Final Stages of a Tiwanaku Provincial Temple (Omo M10A)*

The Tiwanaku colonies in Moquegua, Peru represent some of the best preserved archaeological remains left by this south central Andean polity. This has led to a detailed understanding of daily life and ceremonial practices of these Tiwanaku colonists. However, our understanding of how these lifestyles and practices were transformed during and after the disintegration the highland core is still relatively limited. This paper will take a site-specific approach to explore this enigmatic period of Tiwanaku history. Omo M10 boasts the only Tiwanaku monumental structure built outside the highland homeland, several cemeteries, and a domestic sector. This site shows clear signs of socio-political collapse - the domestic sector was razed, walls in the temple structure were toppled, and cemeteries appear to have been looted. M10 also shows signs of continuity in the form of well-established, but limited reoccupation - not just in the domestic sector but in the temple as well. This reoccupation of the temple will be our primary focus. The changes in practice and use of space in the monumental complex also correspond with stylistic shifts in ceramic iconography that point to the emergence of a locally-based identity, in which memory and tradition continued to play a pivotal role.

[24] *Defining a Late Classic Maya Granite Workshop at the Tzib Group, Pacbitun, Belize*

The ancient Maya site of Pacbitun is centrally located between the major ecozones of the Belize River Valley and the Mountain Pine Ridge of West-Central Belize. Investigations in 2012 and 2013 began on a group of mounds, known as the Tzib Group, located outside of the core zone of Pacbitun in order to investigate what is now believed to be a ground stone tool workshop. The workshop produced grinding implements made from granite. Excavations in 2014 into the main mound of the group uncovered more than 500 kilograms of granite debitage as well as large quantities of mano and metate perform fragments varying in size and stage of production. Based on ceramic and radiocarbon dating, the granite workshop is dated to the Late Classic (A.D. 700-900) period. Workshops of this nature are rarely found, and most of what we know has previously only been gleaned from ethnographic data. Magnetic gradiometry was also performed in 2014 to determine the capabilities and limitations of this technique in identifying stone tool production locations. Guided by the geophysical results and the research previously conducted by Ward (2013), we sought to further document the context, scale, and intensity of production of this workshop.

Skeates, Robin

[74] *Causalities, Time-Scales, and Processes of Environmental and Cultural Change in Italy between the Final Upper Paleolithic and Early Neolithic*

This paper reconsiders the significance of a generally warmer and wetter climate, expanded plant ranges and sea level rise to human groups in mainland and island Italy between the Final Upper Paleolithic and Early Neolithic. Fundamental cultural changes in demography, subsistence strategies and social organization certainly coincided broadly with these environmental changes, and do suggest a degree of human adaptation, although the cultural resilience of hunter-gatherer lifestyles should not be under-estimated. But do the available data allow us to be more precise about possible causalities, time-scales and processes in Italy? And, more specifically, do they enable us to identify the impact on human groups of Berger and Guilaine's (2009) claimed abrupt climatic deterioration event around 8200 years ago?

[301] *Entheses and Activities: A Metric and Non-metric Analysis of Enteseal Change of the Shoulder Complex within the Milwaukee County Institution Grounds Population*

The analysis of the features that mark tendon and muscle insertion sites on bone has been used in an attempt to reconstruct past life activity patterns of individuals and populations represented by skeletal remains. Many of these analyses have focused on comparing evidence from these individuals with known musculoskeletal and biomechanical data. Recent experimental tests have illustrated that defining these correlations is more complex than expected (Mariotti et al., 2007). Modern clinical data has expanded our understanding of the development of these markers as a result of enthesopathy and enteseal change, enabling further examination of the underlying forces affecting these changes, such as age and concurrent pathology. To further this study, an analysis of individuals from the Milwaukee County Institution Grounds Cemetery collection is conducted, using the entheses-type-selection technique (Villotte 2010) and an enteseal change scoring method proposed by Henderson et al (2010). 3D morphometric analysis is also utilized. The shoulder complex of adult individuals exhibiting a range of skeletal health conditions is analyzed. This study examines the implications of age, concurrent pathology, and activity for skeletal and enteseal health, as well as the utility of enteseal change analysis for the purpose of determining past life activities.

Skoglund, Peter (University of Gothenburg)

[137] *Approaches to Scandinavian Rock-Art*

The aim of this paper is to discuss and evaluate some general trends in Scandinavian rock-art research. For a larger part of the 20th century scholars from the history of religion had a strong impact on the interpretation of south Scandinavian rock-art. Images were contextualized by a comparative approach where scenes and details from rock-art were compared to similar phenomenon in other media. Today, this perspective is complemented by a variety of approaches; but a dominating perspective focuses on landscape archaeology and the maritime character of many rock-art sites. The landscape perspective is often combined with an interest in chronology and the notion that the same panel could have been used by different people for a very long time. Based on a case study of rock-art in southernmost Sweden, I will evaluate the different approaches and argue that they both may contribute to an understanding of the south Scandinavian rock-art tradition. However, their relevance may vary through time as the rock-art tradition underwent rather significant changes during the course of the Bronze Age.

Skousen, Benjamin (University of Illinois)

[142] *Pilgrimage Centers, Infrastructure, and Cahokian Politics*

Archaeological and historical evidence suggests that pilgrimage centers were vital to the infrastructure, politics, and religions of cities and civilizations throughout the ancient world. The precolumbian city of Cahokia was no different. In this paper, I argue that the Emerald site, a major pilgrimage center east of Cahokia, was integral to the formation of a new political-religious order circa A.D. 1050. Ceramic, architectural, and botanical data show that large groups periodically gathered there to feast, participate in large-scale construction projects, witness rare lunar events, and renew ties with kin and other-worldly beings and powers. I contend that intermittent public gatherings at Emerald allowed continual negotiations between people of diverse ethnicities and backgrounds, which in turn created a communal identity that made this new orthodoxy possible. Emerald, like other pilgrimage centers throughout the world, was an important place where Cahokian politics and religion were simultaneously constructed, enacted, and experienced. Furthermore, this case underscores the problem of examining infrastructural projects, politics, and religion separately.

Skowronek, Russell and Ronald Bishop (Smithsonian Institution- Museum of Natural History)**[416] *Ceramic Production, Supply, and Exchange in the San Francisco Presidio Jurisdiction***

In the late eighteenth century Spain occupied the San Francisco Bay Area and rapidly transformed the region through the introduction of agriculture, animal husbandry, Roman Catholicism, the Spanish language and the use of pottery. This presentation focuses on the latter, and considers the questions surrounding local manufacture, importation, and exchange of ceramics among the missions, presidio and pueblos of the San Francisco Presidio Jurisdiction. Through the application of instrumental neutron activation analysis of ceramic materials, local production of unglazed and glazed earthenwares is shown in addition to glazed ceramics originating from nonlocal sources. These patterns provide insights into the manufacture, supply, and exchange of ceramics in the San Francisco Bay Area, and through them a window on the material expression of the colonial experience.

Slater, Philip (University of Illinois Urbana-Champaign) and Stanley H. Ambrose (University of Illinois Urbana-Champaign)**[174] *Technological Organization Strategies during the East African Late Stone Age: Blade Production and the Evolution of Standardized Technology***

OI Tepesi rockshelter (GsJi53) is located in Kenya's central Rift Valley on the southern slope of Mt. Eburu, northwest of Lake Naivasha. Its 30-meter high rear wall and 45-meter wide floor would have provided prehistoric inhabitants with a vast habitable area. Excavated deposits span the most recent 17,000 years, from the Iron Age back to the late Pleistocene LSA. Almost 200,000 artifacts, including pottery, lithics, fauna, ostrich eggshell and ochre, were recovered during two seasons of excavation. A series of hearths with associated cut and burned bones were also exposed. A sample (n=3039) of flaked obsidian artifacts of a new Late Pleistocene LSA lithic industry was analyzed by typological classification and quantitative morpho-metrics. Backed microliths, burins, scrapers and expedient tools dominate the blade-based assemblage. Results of this analysis provide insight into techniques of systematic blade production and the development of standardized technology at the end of the last glacial maximum. This analysis contributes to our ultimate goal of investigating the evolution of modern human behavior by analysis of technological organization strategies during the Middle and Late Stone Ages in East Africa.

Slater, Donald (Phillips Academy, Robert S. Peabody Museum, & Brandeis University)**[355] *Hallowed (under)Ground – Ancient Maya Dark Zone Use Patterns in the Subterranean Realm of Yaxcaba, Central Yucatan, Mexico***

Cave explorers and scholars classify the different light zones of underground spaces into three categories – light, twilight, and dark. Despite the practical challenges ancient people faced while traveling into and through dark zones (those entirely devoid of light), it is common across the Maya region to find rich evidence that demonstrates that these spaces were heavily utilized during Precolumbian times. Research conducted during the 2009 - 2011 field seasons of the Central Yucatan Archaeological Cave Project (CYAC), however, produced data that suggest that the dark zones of three major caves near the pueblo of Yaxcaba were seldom accessed in ancient times despite evidence of extensive usage in each caves' light/twilight zones. This paper presents these data in stark contrast to what is most commonly observed at other Maya cave sites, while providing interpretations that may help explain this locally isolated phenomenon.

Slaughter, Mark (Bureau of Reclamation) and Jon Czaplicki (Bureau of Reclamation)**[90] *Black Mesa Cultural Resources: An Update***

The Black Mesa Archaeological Project (1967-1987) was undertaken to clear archaeological sites to mine coal for the Navajo Generating Station to provide power for the Bureau of Reclamation's Central Arizona Project. The original permit for this work expires in 2019. The Bureau of Reclamation is in the process of re-permitting (from 2019-2044) all of the connected features of the project that

include the Kayenta Mine on Black Mesa, a railroad, and two large powerlines. This paper will present on-going cultural resource activities connected with the re-permitting process.

Sliva, Jane (Desert Archaeology, Inc.)

[55] *Who Goes There? Tracing San Pedro Phase Migration and Social Dynamics in the Borderlands with a Revised Projectile Point Typology*

The projectile point assemblage from Las Capas (AZ AA:12:111 [ASM]) provides a case study for using a social dynamics model to explain shifts in point design during the San Pedro phase (1200-800 B.C.) in the Tucson Basin. Available evidence indicates that the population of Las Capas and the residents of a possibly related settlement directly across the Santa Cruz River maintained a separate projectile point design orientation from other settlements in the northern Tucson Basin during the early San Pedro phase, but produced points conforming to the local design canon during the late San Pedro phase. This poster presents an updated projectile point typology for the borderlands, and combines chronological point data with additional lines of material culture and biological evidence to argue that the earlier occupation of Las Capas represents a migrant population from northern Sonora, Mexico, who failed to achieve social equity with or assimilate into the existing social fabric of the Santa Cruz River floodplain; the later reflects a re-occupation of the site by an endemic group exhibiting typical San Pedro phase Tucson Basin technology.

Sload, Rebecca

[355] *Primacy of the Cave at the Sun Pyramid, Teotihuacan*

Multiple lines of evidence indicate that the cave determined the definition of the Sun Pyramid. As the earliest monumental construction at Teotihuacan, it is hypothesized that the Pyramid/cave was built within a pan-Mesoamerican worldview that valued the mountain cave, including acknowledging artificial caves as caves, pyramids as mountains, and sacred space as created via engineered spatial relationships. Ceramics and radiocarbon dates indicate contemporaneous construction of and modification to cave and Pyramid. Contemporaneity at the outset reinforces that they were a unit, a mountain cave. It is in modification, however, that the clearest evidence is found. The decision to close the cave appears to have prompted changes to the Pyramid, whose spatial relationships to the cave suggest purposes significant to it. Pyramid modifications are hypothesized as also redefining the Pyramid sans cave. Interpretation of the meanings of changes to the cave and Pyramid is reinforced by finds from recent re-excavation of a 1933 tunnel on the east-west centerline of the Pyramid at its base. In all cases, events appear driven by the cave.

[75] *Paleoethnobotanical Remains Associated with the Sacbe at the Ancient Maya Village of Cerén*

Paleoethnobotanical research conducted during the 2013 field season at Joya de Cerén in El Salvador focused on the analysis of plant remains found on the surface and associated features of an ancient Maya sacbe (causeway) that were well protected beneath tephra deposited by the volcanic eruption of Loma Caldera around A.D. 660. Plant remains were retrieved from the sacbe surface, adjacent drainage canals, and agricultural fields on either side of the sacbe. Because the plant remains found in association with this sacbe were well preserved, a rare occurrence in Mesoamerica, the data recovered from Cerén are quite significant and unique to the study of Maya plant use activities as well as Maya causeways. The project collected over 60 macrobotanical samples and 160 flotation samples processed in a water flotation tank. Prominently represented in these samples are *Spilanthes* cf. *acmella* achenes, *Zea mays* cob fragments, *Phaseolus* sp. cotyledons, *Amaranthaceae* seeds, *Fimbristylis dichotoma* achenes, *Mollugo verticillata* seeds, *Portulaca oleracea* seeds, *Crotalaria* cf. *sagittalis* seeds, and abundant charcoal remains. Recovered plant remains reveal trends associated with each context as well as distance from the site center, and offer a perspective an essentially economic perspective of Maya sacbeob.

[274] *Reducing Human Error and Identifying Unknowns: X-ray Fluorescence as a Tool for Identifying Paint Composition of Mesa Black-on-White Pottery*

Although Mesa Verde Black-on-white pottery paste and temper have been well-studied, the composition of the decorative black paints and white background slips to identify available resources and the varying recipes used across time and space has received much less attention. Paints are typically categorized as either coal-based (organic) or iron-based (mineral), and archaeologists have long used visual differences to identify these two paint bases. While it has been shown that even novices can usually achieve better-than-random accuracy in visually identifying the two paint types, there is still a margin of human error as well as a void of information related to linking specific organic or mineral sources with compositions. Using X-ray fluorescence, we began by characterizing modern test tiles with possible paint recipes produced using local resources (southwest Colorado) to better understand how elemental composition varies with different, known paint recipes. Analyzing known samples created an interpretable baseline that not only permits discerning how the use of slightly different recipes influences composition, but also can be a comparator for archaeological unknowns. We tested the latter utility by comparing the paint composition of samples from Goodman Point Pueblo with the baseline, enabling stronger linkage to the use of specific mineral-based recipes.

[333] *Testing for Evidence of Paleoindian Responses to the Younger Dryas in Georgia*

For the Southeast, Meeks and Anderson (2012) propose Younger Dryas (YD) climate changes triggered a human population crash and/or substantial reorganization. We use the Georgia point record in the Paleoindian Database of the Americas to test for evidence of changes in landscape use through the Paleoindian period and consider these changes in the context of the Georgia paleoenvironmental record spanning the YD. Based on differences in point frequencies, distributions, stone types, and transport distances and directions, we conclude the Coastal Plain was a focus of early settlement, but by the end of the YD, Paleoindian settlement shifted into the Piedmont.

[351] *Climate Change and Resource Management in Eastern Settlement Norse Greenland: Zooarchaeological Perspective*

Changes in climate regimes have played a significant role in the cultural settlement patterns of Greenland for several millennia. This presentation focuses on the Norse Settlement ca. 985-1450 CE and how the terrestrial and marine animal resources were utilized, managed and modified in the face of climatic and environmental changes at all levels of the Norse social strata. Datasets from small tenant farms, middle size independent farms and magnate farms are utilized to understand the site specific, local, and regional management strategies and the level of their long-term sustainability. The Eastern Settlement strategies are compared with parallel data from the Western Settlements. Their comparison aids in understanding the collapse of the whole Norse colony, a century after the abandonment of one of its two core components, the Western Settlement.

[28] *Investigating Genetic Structure and Dietary Ecology through Ancient DNA and Stable Isotopic Analysis of Prehistoric Dogs from San Nicolas Island, California*

The study of prehistoric dogs has become a global trend. Not only did they fulfill a variety of roles and were an important part of past human societies, but they can be used to understand human-modified environments and human movement. On the California Channel Islands the domestic dog has been shown to be a significant component of the archaeological record. Dogs are uncovered in a variety of cultural contexts and their presence on the islands dates to the middle Holocene. Despite their cultural significance, little is known about prehistoric dogs on the Channel Islands. In this study ancient DNA and stable isotope analysis was performed on dog remains recovered from San Nicolas Island, California, from both known archaeological contexts and those collected by Loye Miller during the early 20th century. Preliminary aDNA results identified a mtDNA clade novel to the Americas and isotopic data suggest that these animals primarily subsisted on marine resources. The purpose of this research is to develop data that can be used to elicit information on the genetic lineage and diversity of Channel Island dogs, along with their dietary ecology. In addition this research underscores the importance of revisiting legacy archaeological and natural history collections.

[35] *The Pre-Mazama Occupation of the LSP-1 Rockshelter, Warner Valley, Oregon*

For the past five years, a crew from the Great Basin Paleoindian Research Unit, University of Nevada, Reno, has excavated in the LSP-1 Rockshelter in Warner Valley, Oregon. Our work has identified a modest record of pre-Mazama (~7,700 cal BP) occupation comprised of lithic tools and debitage, a well-preserved faunal assemblage, shell beads, and hearth features. In this paper, we highlight major trends in the LSP-1 assemblage and place it within the broader context of northern Great Basin prehistory. In doing so, we highlight the critical role that caves and rockshelters play in interpretations of human behavior in a region dominated by open-air lithic scatters.

[85] *Five Hundred Years of Plant Use in the Sand Canyon Locality, Southwestern Colorado*

For more than 20 years, the Crow Canyon Archaeological Center has systematically acquired flotation, macrobotanical, and pollen samples from structure floors, thermal features, middens, and other contexts during the testing or excavation of many ancestral Pueblo sites dating from a wide range of time periods. In this study, we synthesize uses of plant materials through nearly 500 years of the Pueblo occupation of the Sand Canyon locality in the northern San Juan region. In order to control for differences in plant use attributable to local environmental variation, we focus on the archaeobotanical data for 16 settlements that were located within a 2 km radius on the landscape. Samples from thermal features and middens provide evidence of short-term activities and long-term plant use spanning the Pueblo I, Pueblo II, and Pueblo III periods; late Pueblo III villages are particularly well represented. We examine subsistence practices through time, including reliance on maize agriculture, wild plant use, seasons of occupation, differences in domestic vs. nondomestic use of kivas and public architecture, and possible long-term anthropogenic effects on plant communities. We also scrutinize the data for evidence of subsistence stress or other impetus for the

early A.D. 1280's regional depopulation.

Smith, Geoff (MONREPOS Archaeological Research Center, RGZM)

[87] *Re-evaluating the Evidence for Systematic Exploitation of Mammoth during the European Middle Paleolithic*

The recurrent presence of mammoth, elephant and rhinoceros at Middle Paleolithic sites, together with Neanderthal isotopes signaling meat as a prominent protein source, have been used to argue for a central role of these species in Neanderthal subsistence. Key to this model are the bone heap horizons from La Cotte de St Brelade (CSB, Jersey), previously interpreted as game drive debris resulting from systematic Neanderthal hunting. However, this hypothesis has never been rigorously tested. Therefore, this paper presents new CSB faunal analyses, contextualizing behavior at the site and in the wider landscape. Furthermore, a broader European perspective assesses the overall role and importance of megafauna in Neanderthal diet.

Initial Neanderthal occupation at CSB was intensive, though, through time visits became more infrequent. Mammoths, alongside other large mammals, were clearly butchered, but increasing carnivore presence suggests a more complex site formation scenario. In general, similar mammoth-dominated sites are rare in Western Europe, indicating a main focus of Neanderthals on large herbivores, with only a minor, opportunistic, role for megafauna. Therefore, currently, the isotope signal and zooarchaeological evidence cannot sustain a one to one equivalency. Whilst Neanderthal diet was meat-orientated, the archaeological data does not indicate systematic contributions from megafauna.

[110] *The Caribou Didn't Come Back: Modelling Human Migration Variations through Local Ecological Changes*

The objective of this paper is to model the effect that the presence/absence of specific ecological variables, such as certain prey species, has on the passive movement of raw materials from their point of origin to their point of deposition in the archaeological record. This study takes place in the Talkeetna Mountains of Southcentral Alaska. The model was built using ArcGIS, informed through ethnographic, historic, and modern ecological and archaeological data, and structured using a theoretical framework from Human Behavioral Ecology. The results suggest significant differences occur in human migration patterns based on the presence/absence of specific prey items, and these inform further hypotheses of site structure and placement on the landscape.

Smith, Kevin (University of California, Davis)

[139] *Examining the Function of Lithic Crescents as Transverse Projectile Points: An Experimental Approach*

Flaked-stone crescents are an artifact type unique to the western portion of North America, and based on direct obsidian hydration and associated radiocarbon dates this artifact was used between the terminal Pleistocene and early Holocene. Previous studies have attempted to uncover the function of this artifact, associated with the earliest inhabitants of western North America, hypothesizing the use of crescents as sickles, ulus or hide scraping tools, among other uses. Recent studies have demonstrated a high correlation between crescent distributions and seasonal waterfowl migration routes. Following on this research, I test the hypothesis that stone crescents functioned as transverse projectile points by analyzing crescent collections within California. Results produced from analysis of lithic-reduction sequences, material-selection strategies, wear and breakage patterns, as well as data derived from replicative and experimental studies (e.g., testing impact fractures, hafting strategies, material performance) appear to support the hypothesis that these artifacts were effective weapons for the acquisition of waterfowl.

Smith, Heather (Center for the Study of the First Americans)

[150] *The Late Pleistocene Transmission of Fluted-Point Technology across a Continent: A Morphological Investigation*

The Northern Fluted-Point Complex represents a Paleoindian occupation in northern Alaska and the Canadian Yukon and appears to form part of an adaptive strategy similar to that of late Paleoindians in the North American plains. This paper presents the results of a shape analysis that uses geometric morphometrics as a tool to identify major factors of variability in fluted projectile-point morphology across a continent by comparing artifacts from Alaska and more temperate regions in North America. Geographic patterns in such variability demonstrate whether fluted-point technologies were "grafted" onto more autochthonous northern complexes or represent movement of discrete Paleoindian groups northward at the end of the Pleistocene. Discussion addresses the role of fluted technology in the context of human dispersal across America and their adaptive context in late-glacial Arctic and Subarctic ecosystems.

Smith, Madeleine (The Ohio State University) and Abigail Buffington (The Ohio State University)

[162] *Feeding the Troops? Patterns of Agricultural Production in the Macrobotanical Remains of Nabatean-Late Roman Sites in the Wadi ath-Thamad, Jordan*

The macrobotanical record from Khirbat ez-Zona, a Late Roman period castellum, reveals a pattern of crop refuse that does not fit the grand narrative of Roman agricultural practice or previous studies of contemporaneous military structures in the region. The Eastern Mediterranean witnessed a considerable boom in both population and agricultural productivity during the Late Roman period. This productivity can reflect the practices of an empire from religious ritual and pilgrimage, to preparation for important visits and festivals and lastly, feeding armies. In a recent macrobotanical study on a similar landscape in the Wadi Araba within the hinterlands of Petra, Ramsay and Smith argue for a largely local origin for agricultural production. Khirbat az-Zona is also in the hinterlands of an important urban center for the empire, Madaba. This study, which ultimately used 40 samples, attempted to address if this trend toward local production is also found in places such as Wadi ath-Thamad, where ecological conditions provided the basis for earlier periods of high agricultural productivity, in contrast to the Wadi Araba. In an effort to isolate the effect of Roman presence on agricultural productivity, samples from Nabataean domestic sites in the region were also sampled.

[187] *Ramada Textiles from Southern Peru: Death's Social Skins*

Textiles from the Ramada culture of southern Peru are currently understudied and poorly understood. Recent research in the Vitor Valley suggests that the Ramada culture was a regional Early Intermediate-to-Middle Horizon cultural manifestation, contemporary with both Nazca, to the northwest, and the Wari traditions, but with its own distinct expressions of cultural identity. This paper presents preliminary analyses, using archaeological textiles from a cemetery dated to 550 A.D., which suggest that the Ramada culture exhibits its own grammar and patterns of textile production, decoration, and use. The use of textiles in Ramada mortuary contexts displays different strategies and internal expressions of identity that were used to reflect regional identity, gender and age as well as group affiliation. While preliminary, these analyses have opened the way for more holistic approaches to defining dress and identity within the Ramada cultural complex in southern Peru.

[194] *The Economics of Aztec Inequality or, the Inequality of the Aztec Economy*

In discussions of Aztec society, economy and inequality are typically treated as separate realms. The former is discussed in terms of production, exchange, and consumption, while the latter is framed around nobles versus commoners and various hierarchies. Although no one would claim that these two topics are unrelated, the full extent of their interconnection is rarely acknowledged. We cannot understand Aztec economic processes and institutions without reference to patterns of inequality, nor does Aztec inequality make sense apart from consideration of the economy. Frances Berdan has made contributions to both topics, and to their joint analysis. I explore the connections among the

economy and patterns of inequality, putting Frannie Berdan's research into a broader context.

[203] *Isotopic Analysis of Dietary Variation in Formative Period Chile*

Northern Chile's Atacama Desert is one of the driest environments on Earth. In fact, it has been suggested that the region serves as a good model for living conditions on Mars. By employing a number of resource management strategies including complex systems of trade, humans have lived in the inhospitable region for millennia. Here we present the results of stable isotope analysis of seven Formative Period (1500 B.C.-A.D. 500) humans from the Ancachi site near the modern town of Quillagua. Analysis of carbon and nitrogen isotopes from human bone collagen and hydroxyapatite, as well as floral and faunal remains, allows us to study the variability in protein and carbohydrate components of these individuals' diets. These data, as well as the comparison of burial methods between Ancachi and several coastal cemeteries, allow us to examine patterns of exchange and social mobility on an individual level. By comparing these data to those of hundreds of other individuals in a broader ongoing study, we can examine patterns of dietary variation in the region which indicate systematic regional exchange of food and other goods.

Smith, Kevin (Haffenreffer Museum, Brown University)

[215] *Color Matters: The Selection and Use of Lithic Raw Materials in Viking Age and Medieval Iceland*

As our abilities to source stone tools increase, our questions become ever more sophisticated as our methodologies reach deeper into the elemental and isotopic levels and an ever-broadening range of statistical analyses. Yet we also recognize that lithic raw materials were selected by their past users for entirely different reasons. A wide range of approaches have been used to explore the roles of proximity, accessibility, mechanical qualities, and exchange relationships, among others, in determining how and why the stone tools and debitage we recover were initially acquired and accumulated in the sites we excavate.

However, relatively few analyses take the actual color of lithic raw materials seriously into account. Color is often regarded as a secondary accident of a raw material's chemical composition or physical structure rather than as the primary reason for its original acquisition and use. This paper will explore case studies from domestic and sacral contexts in Viking Age and Medieval Iceland to argue that selection for color may sometimes have been the primary reason for acquiring and accumulating lithic raw materials for utilitarian use, for specific roles in ritual settings, and even in manuscript preparation. Color was therefore also a key determinant of quarry/source selection.

[238] *Negotiating Power at the Spanish-Philippine Frontier: What Evidence of Indigenous Prestige Economies Reveals about Indigenous-Colonial Interaction*

Historical documents provide most of what is currently known regarding Spain's subjugation of the

Philippine archipelago. However, in this paper I discuss how archaeological evidence of indigenous prestige economies enriches our understanding of the interaction between the encroaching Spanish colonizers with indigenous polities. My study of imported ceramics found in the Malangwa watershed, Negros Oriental indicate that, contrary to Spanish records, indigenous access to foreign prestige goods did not diminish in this region during the early phases of colonization. Instead, the spatial distribution of imported ceramics reveals an intensification of the indigenous prestige economy through the 18th century. This means that in response to the Spanish installed *encomenderos*, who demanded tribute from the polities of Negros, local leaders increased their use of imported wares to solidify regional alliances and loyalties. Thus, while European writings claim that exotic trade was significantly restricted to Europeans after the mid-16th century and that the *encomienda* came to “define” the economy of Negros, the archaeological evidence demonstrates: 1. Indigenous access to foreign goods increased after the mid-16th century and 2. The added demands of *encomienda* tribute did not come to define the economy Negros, but rather, encouraged the intensification of the traditional prestige economy.

Smith, Morgan (Texas A&M University)

[243] *A Geoarchaeological Review of the Guest Mammoth Kill Site (8MR130) in the Silver River, Florida*

The first field school on an underwater prehistoric site in the United States was conducted on the Guest Mammoth site in the Silver River, near Ocala, Florida in the 1970s. This site was touted as a Columbian mammoth kill site, the first found east of the Mississippi River. The excavators presented evidence of this in the form of a single fluted point, six direct percussion flakes, and several pressure flakes found associated with the remains of an adult and a juvenile mammoth. In addition, three of the mammoth bones exhibited potential butchering evidence. However, the sole publication on this site is a five page article published in the Florida Anthropologist in 1983. Poor reporting and contextual issues caused the Guest Mammoth site to fall into archaeological purgatory. Following the trend of re-investigating sites of this nature, the Guest Mammoth site was re-evaluated in the summer of 2014 by archaeologists from Texas A&M University and the University of Wisconsin, La Crosse. This paper will evaluate the known contextual, geologic, and artifactual evidence concerning the site while integrating the information gathered from recent field assessments of the site to determine the Guest Mammoth's place in the North American archaeological record.

Smith, J. Gregory (Northwest College) and Charles L. F. Knight (University of Vermont)

[259] *Variation and Similarity in Obsidian Tool Styles and Technologies at the Zaragoza-Oyameles Source Area, Puebla, Mexico*

The nature and degree of interaction between the Classic period centers of Teotihuacan and Cantona is investigated through two types of obsidian artifacts that characterize Early to Late Classic period obsidian use in the central-east highlands of Mexico: prismatic blades and bifacial dart points. At the Zaragoza-Oyameles source area in eastern Puebla, Mexico the recovery of dart point preforms next to obsidian quarries, combined with chemical analysis indicates that these points were crafted at the source using local obsidian. Surface data indicates that they were part of a linked-reduction sequence that also produced sub-prismatic cores. We investigate the context of the dart points, as well as in the methods of obsidian extraction and its manufacture into sub-prismatic cores at the Zaragoza-Oyameles source area. We then compare information on known caches of dart points at Teotihuacan, and the nature of Teotihuacan-era obsidian extraction and core-blade reduction at the Pachuca obsidian source. In doing so we hope to illuminate variation and similarity in the obsidian reduction sequences and the commodities produced that are associated with these two, large and densely populated regional centers.

[294] *Cryptotephra Discovered at Pinnacle Point Site 5-6 May Correlate with the 74 ka Eruption of Toba in Indonesia: Implications for Resolving the Dating Controversy for Middle Stone Age Sites in Southern Africa.*

Cryptotephra was identified in a sediment stack at Pinnacle Point Site 5-6, South Africa, and occur as small glass shards (less than 100 μm in size). Shards are found in sediment from the Shelly Ashy Dark Brown Sand (SA.D.BS) and the Ashy Light Brown Sand (ALBS) layers with weighted mean OSL dates of 70.6 ± 2.3 and 71.1 ± 2.3 ka respectively. The shards are intimately mixed with sediment and are rare. A preliminary shard distribution profile shows that shards are distributed continuously through the section in two broad peaks separated by a zone of zero shards within the lowermost SA.D.BS. Major element analyses performed on several shards using electron probe microanalysis indicate that they are rhyolite with SiO_2 varying from 72.15 to 77.56 wt. %. Major element chemistry is similar to distal tephra of the ~74 ka eruption of Toba volcano in Indonesia providing for the first time, evidence that Toba ash may have reached southern Africa. The discovery of cryptotephra at PP5-6 provides a powerful new method to create a precise chronological tie-point between archaeological sites and to help identify when a suite of uniquely human features first appeared in our evolutionary history.

[300] *Embedded Activities: Preliminary Analysis of Landscape Use and Mobility Patterns in Colorado National Monument*

Ongoing archaeological survey of Colorado National Monument, located on the eastern edge of the Colorado Plateau, reveals that much of the area is a continuous landscape of non-discrete lithic scatters with light to dense concentrations of artifacts. The ephemerality of many of the sites, coupled with their lack of distinct boundaries, poses a challenge for understanding landscape use and mobility patterns of the hunting and gathering people who utilized the area. To circumvent this issue we draw from regional ethnographic and archaeological data, along with archaeological, hydrological, plant, and wildlife data, recently gathered from the monument, to form testable hypotheses of landscape use and mobility patterns of the locality. Our preliminary analysis of these data suggest that intensive lithic raw material procurement and early-stage reduction activities were likely embedded with other seasonal activities such as hunting and Piñon nut harvesting. Moreover, we establish that results of this study that can be used to guide the next stage of this research, which includes subsurface testing for identification of intact deposits.

Smith, David (Anthropology, University of Toronto, Mississauga)

[313] *The Contribution of Canimar Abajo, Cuba to an Understanding of Early Populations in the Greater Antilles*

Excavation at the site of Canimar Abajo, situated in northern Cuba, has yielded new data that contribute to our understanding of early populations in the Greater Antilles. AMS radiocarbon dates on human bone collagen provide a secure chronology for a mortuary context dating to the 2nd millennium B.C. Analysis of starch grains recovered from human dental calculus demonstrates that common bean (*Phaseolus vulgaris*) was cultivated by at least 1200 B.C. Stable isotope analysis of human bone collagen provides evidence of dietary preferences and indicates that a C4 plant, possibly maize (*Zea mays*) was consumed.

Smith, Beverley (University of Michigan -Flint)

[331] *Loon, Fish, and Beaver: Inland Lake Subsistence and Settlement from the Northern Lower Peninsula of Michigan*

Small Late Woodland period occupation sites around Hubbard Lake, MI provide a rare opportunity to examine the empirical evidence of seasonality and subsistence from faunal assemblages in the Upper Great Lakes region in light of long-standing models. While much work has been done regarding the Inland Shore fishery of the Upper Great Lakes, there have been few opportunities to consider Inland Lake localities and their importance in Juntunen phase strategies of settlement and subsistence.

Smith, Stuart (UC Santa Barbara)

[334] *Gift of the Nile? Climate Change and the Origins and Interconnections of Egyptian Civilization within Northeast Africa*

The Greek historian Herodotus, cribbing from Hecataeus of Miletus, famously wrote, "Any sensible person sees at once... that the Egypt to which the Greeks sail is land acquired by the Egyptians and a gift of the river...." Scholars today see the same basic landscape as Herodotus did before them in Egypt and northern Sudan, a narrow strip of green fed by the Nile and surrounded by an absolute desert. This distinctive ecology thus continues to play a central role in models for the origins of the ancient Egyptian state that downplay ancient Egypt's broader African interconnections. From the 1930's through the present day, however, a group of deep desert explorers and archaeologists have documented that during the Neolithic period much of the Sahara was a vast grassland with seasonal and perhaps permanent lakes. This paper discusses evidence from recent research, including data from the UCSB Dongola Reach Expedition, that points to interlinkages between the cultures of the Upper Egyptian Nile, the Sahara and Sudanese Nubia, demonstrating how interaction combined with climate change in the form of a punctuated but gradual desiccation of the Sahara contributed to the rapid emergence of the Egyptian state while maintaining robust connections across northeast Africa.

Smith, Scott (Franklin & Marshall College)

[411] *The Politics of Connectivity at Khonkho Wankane, Bolivia*

Located in the southern Lake Titicaca basin of Bolivia, the Late Formative period (200 B.C. – A.D. 500) center of Khonkho Wankane was a dynamic place where groups of mobile agropastoralists and caravan drovers engaged with resident ritual specialists. In a social context characterized by diversity, population fluctuation, and mobility, what form did political practice take? I review evidence from Khonkho Wankane for interaction with areas throughout the south central Andes and I explore some of the ways that earlier traditions, both local and distant, were cited and modified at Khonkho Wankane. I argue that ritual specialists at Khonkho Wankane creatively deployed and reconfigured a diversity of objects, ideas, and traditions to negotiate the politics of periodic ritual encounters and events.

[58] *Colorful Pictures: Understanding the Material of the Mesoamerican Precolonial Codices*

In this session the most recent advances are presented of an ongoing interdisciplinary project aimed at better understanding the materials of which, and with which, the Mesoamerican Precolonial codices were made. These materials are as varied as ranging from turquoise from the southern United States to cochineal from Oaxaca, jaguar skins from the tropical areas and Maya Blue from the Yucatan peninsula. As such, this understanding allows for a reconstruction of the whole complex practice of their creation, as well as a reconstruction of the large trade network that underlies this. Furthermore one of these codices is of special interest to this project: the Codex Añute (Selden). As it is a palimpsest, this document has two distinct phases of creation and use. As a result of a collaboration of technical specialists and archaeologists within the project a new technique is being developed. This fully non-invasive technique will allow for the color reconstruction of subsurface features independently of the material composition of the paint. This advantage should allow for a reconstruction of the covered images in this largely organic document.

Snitker, Grant (Arizona State University)

[167] *Humans, Fire, and Food Production: Examining the spatial and temporal patterns of changing burning practices during the transition to agriculture in the Western Mediterranean*

One of the principle objectives of current archaeological research is to improve our understanding of the recursive relationship between humans and their environments through time. Following this objective, archaeological and paleoecological analyses have demonstrated that fire and humans have a coupled relationship in almost every biome on earth. The processes through which humans

modify landscapes with fire reflect the complexities of human-environmental relationships, especially in the context of early food production. This poster focuses on the transition to agriculture in the Western Mediterranean (5,600-5,400 cal. B.C.). Paleoecological studies characterize this period by a substantial increase, or “spike,” in fire frequency, which has been interpreted as a change in human burning practices (i.e. Bal et al. 2011; Gil-Romera et al. 2009). In an effort to expand these interpretations, this project utilizes geospatial (GIS) and temporal comparisons between radiocarbon dates for early agricultural sites and “spikes” in charcoal frequency from regional pollen cores to examine the relationship between food production and burning in the Western Mediterranean. This work seeks to enrich our understanding of the timing and geographic extent of early agricultural burning practices, while also contributing to the overall efforts to characterize the dynamics of food production in social-ecological systems.

Snow, Dean (Pennsylvania State University)

[82] *The Neolithic Transition in Northern Iroquoia*

While details remain debated, the general outline of the emergence of semi-permanent sedentary domestic architecture in Northern Iroquoia is well understood. Communities comprised of bark longhouses came to be associated with subsistence maize horticulture over the course of the last millennium prior to European contact. Various factors triggered periodic community relocations throughout Northern Iroquoia, migratory events that were usually short-distance but occasionally involved long-distance moves. Migration is known to promote and reinforce matrilocality and matrilineality in communities, but there appear to be examples in other regions of these institutions thriving in the absence of migration. This raises the general question of how securely archaeologists can infer such social institutions from settlement patterns and other evidence used for inferring paleodemography. The potentials (and their limits) of contributions from Northern Iroquoian archaeology to more general research into paleodemography and the Neolithic Transition are discussed.

[264] *Ancient DNA and Cranial Morphometric Analysis into Ancestry of Five Burials from Colonial Delaware*

Five burials were excavated from a small Colonial cemetery at the Elkins site in New Castle County, Delaware by Hunter Research, Inc. for Delaware DOT. The remains were analyzed for mitochondrial DNA haplogroups in conjunction with a standard skeletal biological assessment. Analysis of the mtDNA demonstrated European maternal lineages for all of the individuals. Additionally, an infant and an elderly male shared a derived haplogroup T haplotype, suggesting a matrilineal relationship between them. The infant was also established as male by amelogenin genetic testing. The craniofacial morphology of three of the adults is consistent with that seen in other early Colonial Europeans in the Chesapeake and Middle Atlantic, although it could be misinterpreted as indicating African ancestry. These individuals serve as an excellent example of this early Colonial pattern in Europeans and the mtDNA analysis confirms the European ancestry for all individuals from this cemetery.

[30] *The Intersection of the Sacred and the Everyday in Medieval Ireland*

A common vision of the medieval Irish monk involves the aesthetic alone at the edge of the world occasionally appearing to bring flashes of the sacred to the rest of us. Here, the sacred is carefully delimited from the profane. Archaeology has done much in recent decades to elaborate this portrait of the monk into a fuller vision of life at monasteries with all of its mundane entanglements. But, archaeology has largely deferred the task of considering the impact of all that information on how we think of these monasteries as sacred sites. One promising way forward is reconceptualizing ideas of

the sacred so that they do not depend on dichotomies between sacred and profane. As the term 'everyday religion' suggests, the relevant pairing can shift to sacred and everyday: the goal being to understand religious practices as entwined with the general practices of being human. The goal of this paper is to frame recent zooarchaeological work on monasteries in medieval Ireland in terms of everyday religion. Though the animal bones are not remains of sacrifice in the classical sense, considering them from the perspective of everyday religion can make them more than just evidence of foodways and identity politics.

[21] *Working with the Ejido: Negotiating Archaeology and Local Politics in Michoacán, Mexico*
Ejido communities became common after the Mexican Revolution (1910-1920) as a way of dividing land and leadership among an equal number of individuals. The Ejido of Fontezuelas in the eastern Lake Pátzcuaro Basin, Michoacán, controls the rugged landform known as the Classic through Postclassic period (A.D. 200-1521) site of Angamuco. Since 2009, the Legacies of Resilience Project has negotiated and worked with Fontezuelas community members. Here we discuss some of the obstacles that we encountered including intra-Ejido politics and inter-community land use relations. Our discussion is situated within the volatile political situation in western Mexico in recent years.

[346] *Spheres of Production of the Lapidary Objects at the Sacred Precinct of Tenochtitlan: The Legitimacy and Extent of the Power of the Aztec Empire*

In the Great Temple and the surrounding structures at the Sacred Precinct of Mexico Tenochtitlan, the archaeologists recovered thousands of lapidary objects devoted to the religious cult of the Mexica society. Great quantities of them were considered foreign productions or relics related with certain Mesoamerican styles and traditions. In this research we will show that the technological analysis, using Experimental Archaeology and the characterization of the manufacturing traces with SEM, allowed us to identify three spheres of production inside the Sacred Precinct. Based on these results, we discuss the existence of a local style and its differences with the other lapidary traditions detected. The former was employed for reinforce the status and legitimacy of the Tenochcan elites, while the latter the extent of the power of the Aztec Empire.

[303] *Painting as Process: The Context of Mural Production in the Puebloan Southwest*

Murals have played a role in Pueblo religious practice since the A.D. 900s. Mural painting seems to have reached its zenith in the late 1300s to 1600s when richly detailed scenes of anthropomorphs, animals, and objects were produced at multiple sites in the American Southwest, providing glimpses of a complex ritual system. While scholars have traditionally approached these wall paintings from a motif-centered perspective, ethnographic observations of 19th and early 20th century mural painting permit a contextual analysis. In this paper, I reconstruct the ritual role and significance of Pueblo

mural painting in the historic era and suggest parallels in form and function with the precolumbian works. In particular, I examine the significance of sequences of multiple paintings and their relevance to understanding ceremonial organization in the 15th and 16th centuries.

[110] *Leporids and Landscapes: Stable Isotope Ratios of Rabbit and Hare Bones Reflect Local Environmental Conditions at Modern and Archaeological Sites*

This study investigates the utility of stable isotope analysis ($\delta^{13}\text{C}$ apatite, $\delta^{18}\text{O}$ apatite, $\delta^{13}\text{C}$ collagen and $\delta^{15}\text{N}$ collagen) of leporid (rabbit and hare) bones to monitor the environmental conditions in which the animals lived. Since leporids were one of the most commonly consumed vertebrates in the prehispanic New World, their skeletal remains are frequently found at archaeological sites. The relatively small home ranges and short lifespans of leporids, moreover, make them an ideal species to monitor temporal changes in local environmental conditions. Here we present the preliminary results of stable isotope analysis of 145 modern specimens representing multiple environmental zones from across the United States and Mexico. Strong correlations between local environmental characteristics (i.e., mean annual precipitation, grass coverage, and ecosystem type) and bone isotope values indicate the utility of using leporid bones in environmental research. These baseline data are compared with archaeological leporid isotope values ($N=320$) from four archaeological sites (Teotihuacan, La Quemada, La Ferrería, and Pueblo Grande) in different ecological regions, demonstrating the applicability of such analyses.

Sonderman, Elanor (Texas A&M University)

[27] *Addressing the Curation Crisis through Research in University Legacy Collections*

Despite their critical importance, the care and management of archaeological collections has not always been at the forefront of the discipline's overall methodology or federal and state regulations that are intended to mitigate harm to those resources. A seminal paper by Marquardt et al. (1982) argued for the existence of a crisis in the curation of archaeological collections. Marquardt, et al. (1982) as well as Childs (1995, 2003) and Sonderman (1996) highlight the ethical responsibility to both the public and the archaeological profession to properly curate collections so their future research potential can be realized. My previous experience working with collections at the University of Delaware and more recently at Texas A&M University and the University of Texas has demonstrated that many universities are behind state and federal collections repositories on the collections management curve. Universities frequently house the largest collections in their respective states, but few urge their graduate and undergraduate students to pursue research with these collections. In pursuit of research opportunities in legacy collections, particularly within the Texas River Basin surveys, I have encountered a set of challenges that underscore the importance of proper documentation and collections access.

[199] *Amerindian Archaeological Site DEM Construction and Analysis from UAV Flights*

The archaeological footprint of Caribbean precolumbian settlements is often subtle; limited to surface scatter of shell, lithic and ceramic material. In the northern Dominican Republic, slight differences in topography have been identified as additional evidence for Amerindian habitation sites. Circular platforms from 7 to 10 meters in diameter were dug into the hill slope and levelled to form the base of round houses, as shown in recent excavations by the Nexus1492 project. The terraced settlements on the flanks of hills provided inter-visibility between villages, and the opportunity to observe the sea, but were located away from the main food source, fish and molluscs, and even fresh water. In combination with terrestrial surveys, aerial mapping of the site complements our understanding of configuration and extent of this settlement type in its environment. Improved usability and price drop

of unmanned aerial vehicles and easy use of photogrammetric software provides the opportunity to record archaeological features. Produced from vertical and oblique aerial photos, the created DEMs highlight the small topographic changes even beneath low canopy. The result provides the possibility to extract contours, shading, small topography changes, and its implementation in a GIS environment and coarser DEMs for regional aspect analysis.

[280] *Where the Hunters Hunted: Paleoenvironmental Reconstruction of the Submerged Archaeological Landscapes of the Alpena-Amberley Ridge, Lake Huron*

Understanding of early Holocene hunter-gatherer archaeological sites relies heavily on paleoenvironmental data, as many of these sites are ephemeral and have little archaeological visibility on the landscape. In rare cases, such as on the Alpena-Amberley Ridge in Lake Huron, highly visible hunting structures are preserved which offer a unique insight into early hunter-gatherer lifeways, while targeted sediment sample collection provides high-resolution paleoenvironmental information. Since 2011, over 200 sediment samples have been collected by divers and ponar sampler on the Alpena-Amberley Ridge from areas with and without cultural features. These samples have undergone particle size analysis, loss on ignition, microdebitage and testate amoebae analysis. Testate amoebae analysis shows that the area was a patchwork of small microenvironments of boggy ponds, larger inland lakes and forested swamp. Both testate amoebae and sedimentary also point to localized flooding in some areas of the Ridge. The study of this unique archaeological landscape provides a picture of the paleoenvironment while contributing to the understanding of how prehistoric peoples may have utilized the landscape for the hunting of large game.

[14] *Current Approaches to Landscape Characterization as Tools for the Understanding of Highlands-Lowlands Interactions*

In the European Landscape Convention 'landscape' means an area, as perceived by people, whose character is the result of the action and interaction of natural and/or human factors. This view approaches landscape as an integrated and integrating concept, requiring a holistic approach to the investigation, protection, management, and planning of space, consistent with the objective of sustainable development. Landscapes are dynamic socio-ecological systems emerging from long-term historical development of human societies in dialogue with constraints and opportunities presented by their surrounding topography and environment as they change through time. Following this approach, the proposed paper will outline potential strategies and tools for the understanding of diachronic lowlands-highlands interactions in an inter-disciplinary manner through the prism of a landscape perspective. It will draw on examples from a variety of European contexts and will try to respond to major challenges of landscape change as examples of the diachronic interaction of the societies in lowlands with the ones living in mountainous areas.

[321] *Too Loud a Solitude: Landfills in the Landscape*

In this paper, we examine the role of landfills in the construction of landscape. Landfills represent ambiguous spaces where material remains of human action are disposed and forgotten. They tend to be hidden from the view of persons passing by and only those who gone astray might encounter these blind spots on the map. Yet, landfills are well known to the professionals who plan and manage large amounts of waste to transform it into a new kind of assemblage that shapes landscape. In contrast to other parts of landscape, landfills show unprecedentedly stable growth. If we accept the view that landscape is materialized time, than landfills represent intriguing type of temporality converted to material form. In this paper, we use the combination of the phenomenological and garbological approaches to understand the spatiotemporal aspects of landfills, which are situated in different parts of West Bohemia (Czech Republic).

Soto, Martha

[298] *Feather Headdresses among the Offerings at Tenochtitlan's Great Temple*

The excavations conducted during the seventh field season of the Templo Mayor Project have uncovered a large quantity of organic matter, thus the conservation team has dedicated a large part of their efforts to the treatment of these rare materials. During the cleaning of these materials, feathers associated with heron bones were identified. In a level below them were found more remains of feathers belonging to the headdresses of Tlaloc masks. The degree of their deterioration required us to clean and examine them under a stereoscopic microscope, which revealed two different types of feathers: white and iridescent green. This coincides with some iconographic representations where the headdresses of rain gods are decorated with heron and quetzal feathers. This kind of discovery allows us to answer some of the questions about the meaning of Mexica offerings.

South, Katherine (Southern Illinois University Carbondale)

[219] *Conceptualizing Early Pottery Value in the Petén Lakes of Guatemala*

Research projects focused on the Middle Preclassic period (1000-350 B.C.) in the Maya lowlands continue to enhance our understanding of the social, economic, and political lives of early Maya people. The emergence of status differentiation during this time is recognized through different components of the archaeological record, including the presence of prestige goods. While exotic goods such as jade, marine shell, and pyrite mirrors are typically recognized as indicators of social status, the role of pottery within this framework is more nebulous than it is during later periods. How pottery was used and valued during this time drives the current study. Incorporating both production attributes and contextual deposition of Middle Preclassic pottery provides several inroads for a better understanding of how pottery began its trajectory as a prestige good in Maya culture. Using pottery excavated at Nixtun-Ch'ich' in addition to other sites around the Petén Lakes, the concept of pottery value and the process of valuation are considered through multiple lines of data related to production and use. Results from this research advance our understanding of pottery economics and provide a baseline for discussing how pottery developed as a prestige good in Maya culture.

Sparks, Shane [7] see Elder, James

Sparks, Shane (ICF International), Elder James Tait (ICF International), Daniel Stratten (ICF International), Grant Novak (ICF International) and Crilly Ritz (Snohomish County,

Washington - Public Works Department)**[358]** *Using LiDAR and Relative Elevation Modeling (REM) to Identify and Analyze Archaeologically Sensitive Alluvial Landforms*

Alluvial landforms are highly sensitive areas with the potential to contain both surface exposed and buried archaeological deposits, but systematic analysis and identification of these landforms has proved problematic in the past. Although large alluvial terraces can be identified visually on topographic maps, with high resolution LiDAR, and with Digital Elevation Models, smaller, subtler terraces, and other complex alluvial landforms can be problematic due to stream gradient issues and resulting elevation differences along a stream alignment. On a recent project on the Lower Stillaguamish River in western Washington, we employed a new restoration and habitat modeling tool, relative elevation modeling (REM), to eliminate the gradient issue and enhance terrace rises through LiDAR slope analysis. The results have provided pronounced and enhanced visibility of subtle features and show promise for providing adequate data to assign relative dating for sites associated with different terrace elevations on the same watercourse.

Spaulding, Britta (University at Buffalo)**[63]** *The Redneck vs. The Humble Farmer: How Popular Imagination Influences Studies on Rural Identity*

Rural forms of life and their material remains are rich sources of information for archaeologists on what was the largest economic demographic in the Western world until around 1900. Distressingly, influences from popular imagination and culture, with their many simplistic notions about the rural individual as either an idiotic bumpkin or a noble, humble tiller of the soil, continue to plague interest in, and conclusions about, rural remains and identity. Historical archaeologists have to contend with the problematic opinions of wealthier landlords or “city folk” in contemporaneous documentation, but they also must continue to confront how modern culture has influenced views on seeing rural people and communities. As development continues in these areas, we will lose the variety of rural material remains, whether they are those of a single farmstead or home, or of a larger village or community. There has been some improvement in preservation and restoration, but more is needed for education and heritage. Accepting the real variety of identities in rural areas—and the need therein to acknowledge race, class, and gender as attendant issues—is the first step towards more nuanced analyses, as well as representing the material there as valuable for continued archaeological research.

Speakman, Robert [9] see Hunt, Alice

Speer, Charles (Texas State University)**[185]** *A Comparison of the Effectiveness of Instrumental Techniques at Differentiating Outcrops of Edwards Plateau Chert at the Hyper-Local Scale*

Portable X-ray Fluorescence (pXRF) has become a common tool in compositional studies of archaeological materials due to its quick analytical time and ever-increasing capability with new models and technology. Additionally, pXRF is also beginning to see widespread use for sourcing archaeological materials. This study compares pXRF with two other widely accepted analytical techniques, Laser Ablation – Inductively Coupled Plasma – Mass Spectrometry (LA-ICP-MS) and Instrument Neutron Activation Analysis (INAA). These techniques are compared and contrasted in order to determine the accuracy and precision of using pXRF to determine the composition of Edwards Plateau chert. As a case study, three unique chert outcrops only several hundred meters apart (hyper-local) at the Gault site (41BL323) in central Texas are tested with each of the techniques. The qualitative/quantitative differences of each instrumental technique on Edwards Plateau chert is assessed using the geochemical data retrieved. The geochemical data is evaluated with multivariate statistics in order to determine which instrumental technique is most effective at distinguishing between these three unique Edwards Plateau chert outcrops. This study also seeks to determine if any of the instrumental techniques can effectively separate out geochemical differences of Edwards Plateau chert outcrops at the hyper-local scale.

[355] *Architectural Ambivalence: An Interpretation of the Nohoch Tunich Bedrock Outcrop Complex, Pacbitun, Belize*

Archaeological investigations of the Nohoch Tunich Bedrock Outcrop Complex (NTC) located near the prehispanic Maya site of Pacbitun, Belize, revealed a karst landscape that was heavily, yet subtly modified during the Terminal Classic period (A.D. 700-900). Analysis of construction techniques reveal that the modifications were made to conform to a purposefully crude aesthetic aimed at maintaining and enhancing the wilderness essence of the outcrop, while transforming it into a cultural space. Maya perceptions of the wilderness inform this discussion. Rather than being evil, morally corrupt, and dangerous as is commonly asserted, recent studies indicate that the wilderness was also considered the source of beauty, pleasure, and paradise. Comparisons to similar landscape modifications and use by the Aztec suggest that the changes made to the NTC may be the result of transforming that outcrop into a pleasure park-like place, although on a less grandiose scale. Rather than conflicting with the position of the current cave archaeology paradigm, application of this Aztec pleasure park model allows for maintaining that karst features were used for ritual purposes, but that also those spaces could have been parts of larger conceptual places, particularly when clustered close together like those of the NTC.

Spence-Morrow, Giles (University of Toronto)

[187] *Scaling the Huaca: Constructing Late Moche Identity through Architectonic Re-presentation of Place at Huaca Colorada, Jequetepeque Valley, Peru*

Following Descola's "modes of identification", Andean ontology has recently been suggested to represent a combination of animism and analogism that establishes strong intersubjective relationships wherein humans, objects and places are intrinsically linked while simultaneously creating a highly hierarchical scale based on the properties of each autonomous entity. In order to operationalize this animistic-analogical ontology, mimetic processes of imitation and transformation serve to link and effectively collapse these asymmetric relationships. Through a consideration of how ontologies of spatial scale and the mimetic properties of miniaturization have been manifested among the ancient Moche of the Jequetepeque Valley, Peru this paper will present a set of material symbols that served to construct individual and community identities. Specifically, the role of portable maquetas or miniature architectural models of ceremonial edifices as they relate to full-scale architecture found at Huaca Colorada will serve as the focus of my discussion. This examination will analyze these particular examples of scalar transformation not merely as acts of representation but as the mimetic distillation of temporal, spatial and material aspects of modes of being in the world, and how renovation sequences of sacred architecture were simultaneous acts of place-making and identity construction.

Spencer, Kaylee (University of Wisconsin - River Falls) and Maline Werness-Rude (Eastern Connecticut State University)

[133] *Columns and Ideology-Building in the Northern Maya Lowlands*

Ancient Maya builders working in the Northern Lowlands often introduced and distributed columns throughout the architectural volumes they created in a way that distinguished them from their southern neighbors. While northern column usage served pragmatic needs by being load-bearing and facilitating entrance and egress, we explore the possibility that selection and placement of structural supports also seems to have functioned in a highly ideological fashion. We will use case studies from sites such as El Meco, San Gervasio, Santa Rosa Xtampak, Sayil and others to examine similarities and differences in the ways architects used this building form across and within sub-regions. In doing so, we will particularly focus on identifying column types based on shape, size, proportionality, and surface treatment. We will also analyze the ways in which columns are

distributed vertically in building facades and aligned horizontally when found in single story structures. As we will demonstrate, such usage is often idiosyncratic, seeming to implicate specific viewing and activity patterns that vary from center to center, a pattern we hope to further codify through analysis.

[61] *"Unsavory the Qualities of that Soup": Diet and Foodways at Old New-Gate Prison and Copper Mine, East Granby, Connecticut, 1790-1819*

The Connecticut State Historic Preservation Office contracted AHS, Inc. to conduct a multi-phase archaeological survey at the National Historic Landmark Old New-Gate Prison and Copper Mine in East Granby, Connecticut, prior to planned repairs to the ca. 1790 prison guardhouse. Beginning in 1773, the Old New-Gate copper mine was used as a prison and criminals, Tories, and POWs were incarcerated there during the Revolutionary War. In 1790 Old New-Gate became the first state prison in the U.S. and operated in that capacity until 1827. Prisoners initially worked the mines, although a nailery and other industries were later established. Healthy prisoners were lodged underground in the tunnels and older and infirm inmates slept on the ground floor of the guardhouse. Excavations, conducted around the guardhouse in 2013, revealed stratified, state prison-era deposits dated to 1790-1819 and containing nail-manufacturing debris, architectural items, domestic artifacts, and over 1300 well-preserved animal bones. This work includes an analysis of the faunal remains, which represent the vestiges of meals prepared and consumed by inmates and guards. The faunal evidence, contextualized through primary accounts of prisoners and overseers' reports, provides insight into the dietary conditions and foodways at one of the nation's oldest prisons.

[277] *The Sinagua and the Western Pueblo Tradition: Perspectives from Bioarchaeology*

Genetic and cultural relationships among ancient and historic populations in the American Southwest have long been of interest to archaeologists, and more recently to descendant communities.

Documentation of more than 1500 human remains and 4000 associated funerary objects from US Forest Service land in anticipation of repatriation under NAGPRA provides abundant new information to address this topic. This poster discusses research using metric and nonmetric skeletal data and discrete skeletal traits to explore the origin and dispersal of Sinagua populations in central Arizona. Tracing the movement of populations through sites such as Nuvakwewtaqa offers insight on the relationship of the Sinagua to later Western Pueblo populations, particularly in the Hopi region.

Stack, Adam (Harvard University), Sarah Martini (Harvard University) and Matt Liebmann (Harvard University)

[239] *Using Surface Archaeology to Estimate Ancestral Jemez Population Dynamics, A.D. 1300-1700*

Determining the population of ancestral Pueblo villages has beguiled inquisitive observers from the 16th century down to the present day. Spanish explorers and colonial settlers floated wildly variable population estimates upon their initial visits to Pueblo villages. Today archaeologists are no different, offering demographic estimates that often differ by orders of magnitude. This “population problem” plagues the Jemez region of northern New Mexico in particular. In this paper, we present the results of our recent attempts to estimate the populations of large ancestral Jemez villages using surface maps generated from UAV (drone) data, LiDAR, and intensive ceramic sampling. We begin from historically documented examples (Pueblo villages dating to the post-1680 period), deriving a formula to estimate total floor area based on extant surface remains. We then apply those estimates to the large Jemez pueblos of the Classic Period (A.D. 1300-1600) and the early historic (A.D. 1600-1700) era to derive maximum population estimates.

[23] *What's in a Label? Archaeological Taxonomies and Social Processes Past and Present*

The Banda area of west central Ghana is a quintessential example of what Igor Kopytoff (1987) long-ago dubbed the Internal African Frontier—an ‘interstitial’ region between ‘established societies’ that is home to a dynamic composition of people, languages and practice forged by newcomers and autochthones alike. In presumed contrast with their ‘established’ neighbors, frontier societies are ones in which processes of improvisation and the negotiation of social boundaries seem more apparent. While the concept of frontier societies has proved influential in African archaeology, it is one for which archaeology’s taxonomic arsenal of bounded cultures and phases is ill-equipped to deal. Drawing on long-term archaeological investigations of frontier processes in the Banda area, I explore the salience of analytical approaches aimed at discerning the fluidity of social boundaries for both archaeological taxonomy and how the past is mobilized in the present.

[119] *Historical Ecology and Archaeology on the Galápagos Islands*

The poster introduces an interdisciplinary project recently initiated on San Cristóbal Island, the easternmost island of the Galápagos archipelago. Initially focusing on the 19th century plantation of Manuel J. Cobos, the project explores the nature and temporal depths of human involvement in ecological transformation, as novel or 'emerging' ecosystems, defined by their novelty, cultural origin, and subsequent endurance in the absence of humans, were developed within the context of what was to become an internationally renowned biological preserve. Through a partnership established between the University of Victoria, Universidad San Francisco de Quito, and Simon Fraser University, the project addresses a "Galápagos Paradox," the central conservation dilemma facing the park today.

Stahlschmidt, Mareike (University of Tübingen) and David M Carballo (Department of Archaeology, Boston University)

[249] *Employing Micromorphology at the Tlajinga District in Teotihuacan to Investigate Site Formation Processes and Household Activities*

Recent excavations of the PATT (Proyecto Arqueológico Tlajinga, Teotihuacan) have explored two residential zones and the southern extension of the Street of the Dead in the Tlajinga district, located in the southern periphery of Teotihuacan. Excavations at the residential zones are directed at investigating neighborhood dynamics including social organization, craft specialization and domestic ritual. Excavation at the Street of the Dead are directed at evaluating the processes of urbanization at the periphery of the urban epicenter. As a complement to architectural and artifactual studies, micromorphological analyses and Fourier-Transform Infrared spectrometry have been employed on excavated sediments, which present powerful tools for the investigation of archaeological deposits. This geoarchaeological approach is aimed at answering the following questions: Is occupational specialization visible in the sediments? Is obsidian microdebitage present in the sediments, which would indicate in situ obsidian working? What kind of fire use is represented? What differences can be observed in the archaeological deposits of the residential compounds 17:S3E1 and 18:S3E1? What microscopic traces of activities and construction material and technology are preserved within the sediments? Was the Street of the Dead excavated into the bedrock-like, undurated substrate, known as tepetate? What is the infill history of the SOTD?

[139] *Testing the Greasy Luster: A Mass Gloss Analysis of Coarse Grained Silcrete from the Willandra Lakes World Heritage Area, South-Eastern Australia*

The heat treatment of silcrete for lithic production has been identified as far back as 72,000 years ago, using a variety of scientific techniques. However, in most contexts simple visual assessment, notably the appearance of a lustrous red surface, is used to identify the use of heat treatment. Mass Gloss Analysis (MGA) is a quantitative, non-destructive method designed for measuring the increase in luster noted on heat-treated lithics. Initially developed to investigate microcrystalline silcretes in South Africa, these studies illustrated an increase in gloss on the interior surfaces of blanks heat-treated prior to lithic production. This study explores whether MGA is applicable to coarse-grained silcrete by analyzing lithics from the Chibnalwood Lake Beach Quarry, in the Willandra Lakes World Heritage area, south-eastern Australia. Actualistic and laboratory studies of silcrete from the Willandra Lakes region provide a comparison to the archaeological assemblage. The experimental material displayed an increase in gloss unit when heat treated compared to the control samples. This suggests that MGA is applicable to coarse-grained silcrete, although the increase was not as well defined as studies on microcrystalline material. Comparison between experimental samples and the Chibnalwood archaeological assemblage indicate that the assemblage was produced on non-heat treated blanks.

Stapleton, Charles [66] see Stapleton, Maria

Stapleton, Maria (Northern Illinois University) and Charles Stapleton**[66]** *Persistence of Aztec Religious Belief Materialized in the Early Colonial Religious Architecture of the Central Mexican Highlands*

Late Classic conceptualizations of sacred space, cosmologies, calendrical systems, and religious symbols combined to form a powerful and enduring core of indigenous religious beliefs that persisted well into the Early Colonial period in the central highlands of Mexico. Indigenous builders and artisans reconstructed their temples, now Christian, within pre-existing Aztec sacred space, often following indigenous alignments of cosmological significance. The elaborate facades of these churches were sites for the public display of potent indigenous religious symbols and clear references to the Aztec ritual calendar and belief system. The materialization of prehispanic religious belief in the form of Early Colonial religious architecture was a widespread phenomenon that took hold in smaller rural religious spaces as well as those of larger urban centers. The authors' findings from in-situ research of such architecture in rural communities in the central Mexican highlands

provide persuasive evidence of the persistence of the materialization of Aztec religious belief in the Early Colonial religious architecture of the highlands of central Mexico.

Stark, Barbara (Arizona State Univ)

[194] *Ceramic Emulation: Empires and Eminent Polities Seen from Afar*

A systematic evaluation of emulation of powerful capitals using ceramic comparisons requires consideration of (1) degrees of similarity, (2) legacy traditions, and (3) depositional contexts and sample sizes. This analysis uses ceramics from the Mesoamerican Gulf lowlands on the west side of the Lower Papaloapan River in a comparison to ceramics from Teotihuacan during the Early Classic Period and from the Aztec Triple Alliance during the Late Postclassic Period. Replication, imitation, and adaptation of ceramic traits are assessed for different levels of analysis and according to categories of vessel function. The Late Postclassic case provides a better-known imperial context, while Teotihuacan expansion has more diverse and debated characteristics. Both ceramics linked to wealth and status and those in use by the general population are important for a systematic analysis.

Stark, Sören (Institute for the Study of the Ancient World/NYU)

[234] *Territorial Barriers in Central Asia: Investigating the "Long Wall" of Bukhara (Uzbekistan)*

Territorial barriers are a widespread phenomenon in many micro-regions of Western Central Asia where they specifically take the shape of large-scale oasis walls, surrounding the entirety or large parts of the agricultural hinterland of important urban centers vis-à-vis stretches of desert or desert-steppe in the region. Nonetheless, starting with their dating, our understanding of these sizable monuments is still very insufficient. The most monumental and best preserved one of these territorial barriers, the "long wall" of Bukhara--at least 250 miles long and complete with an impressive array of adjoining fortresses and watchtowers--, is since 2011 subject to comprehensive investigations carried out in the framework of an American-Uzbek field project. The results of four seasons of extensive field surveys and excavations (the latter including substantial works at a border fortress and the citadel of a border town) allow, for the first time, substantiated conclusions regarding the chronology of the barrier and provide important new insights into questions related to the purpose(s) of Bukhara's "long wall" system in the context of political and economic dynamics in Sogdiana during the first millennium CE.

[396] *Systematic Butchery of Small Game at Kephalaria Cave (Peloponnese, Greece)*

An ongoing faunal analysis at Kephalaria Cave documents a remarkable standardization in the butchery of small game animals during the Upper Paleolithic. The site spans several phases of occupation, including small Middle Paleolithic, early Upper Paleolithic, and Aurignacian components, but the majority of the materials are from the post-Aurignacian Upper Paleolithic, Epigravettian, and late Upper Paleolithic (possibly Mesolithic) periods. Diverse ungulate taxa are found at the site, but the faunal remains are heavily dominated by small game, particularly hares, partridges, and fish. This abundance of small game is similar to later Upper Paleolithic layers at nearby Klissoura Cave 1. The representation of partridge and hare body parts is biased toward meat-rich elements, suggesting that these taxa were skinned outside of the cave, possibly at a spring directly adjacent to the site. A particularly striking feature in the assemblage is cut marks on the distal tibiotarsus of at least 40 individual partridges, which indicates standardized skinning of these birds across multiple late Upper Paleolithic layers. This might reflect the practicalities of removing the skin and feathers from the body before consumption, as well as the use of feathers for decoration.

Starr, Isabel (Wellesley College), James McGrath (University of Iowa) and Will Russell (Arizona State University)

[324] *Depictions of Human Facial Decoration on Mimbres Pottery as an Indication of Social Affiliation*

The Mimbres tradition is known for its intricate geometric and figurative pottery designs. Analysis of ceramic iconography found on Mimbres pottery allows archaeologists to hypothesize about Mimbres life and social structure. Using data from provenienced, figurative vessels documented in the Mimbres Pottery Images Digital Database (MimPIDD), we investigate the possible relationships between human facial decoration and social identity. Our analysis considers facial decoration in relation to depictions of anatomical sex, inferred gender, physical activities, interpersonal interactions, and depositional contexts.

[182] *In the Fields of the Thunder Lord, Playing the Apalachee Ball Game: Archaeological and Ideological Evidence for Its Antiquity*

This presentation examines the archaeology, folklore, and iconography attesting to the antiquity of the Apalachee Ball Game. We will examine the "Apalachee Ball Game Myth" as recorded by Friar Juan Paina in 1670 as well as several Mississippian carved shell objects (ca. A.D. 1350, Craig Mound, Spiro, Okla.) that thematically express episodes in this myth. From the evidence gleaned from these several sources we can demonstrate that the ideology underlying the Apalachees' Ball Game dates from at least the Middle Mississippian Period (1150—1350 A.D.).

[212] *Interpretations of the Use of Avian and Mammalian Fauna at Sapa'owinge (LA 306)*

Ethnographic reports of ancestral Puebloan peoples from the twentieth century suggested a food taboo for turkeys, except in rare cases. In contrast, some archaeological interpretations involving sites that predate A.D. 1300 have concluded that turkeys were an integral part of the Puebloan diet. From a modern, secular perspective, archaeologists often assume that there is a distinct separation between the use of animals for ritual and dietary purposes. This paper argues that it is impossible to separate the prehistoric uses of animals for ritual or ceremonial practices from their use for dietary consumption. By taking a random stratified sample from midden, room, and kiva contexts from the ancestral Tewa site Sapa'owinge excavated by Florence Hawley Ellis from 1963-1969, the significance of turkey use trends through time is determined with comparative indices. A careful examination of relationships among avian and mammalian fauna and humans during the Classic period contributes to our understanding of the integral, complex roles animals played in northern Rio Grande puebloan life.

[353] *Discovering Hidden Layers with X-Ray Vision: New Applications of pXRF to Rock Art Studies*

Exploring new applications of portable X-ray fluorescence spectroscopy to the study of rock art, we report the determination of paint layer stratigraphy based upon measured elemental levels. In Lower

Pecos rock art, we were able to discern when red and yellow paints superimpose black paints based on elevated levels of manganese. This ability to see underneath paint layers with "X-ray vision" shows great promise in answering stratigraphic ambiguities, complimenting Dino-Lite digital microscopy. In addition, we collected Munsell color designations for each pXRF analysis spot so that we could compare major elemental levels with pigment color and value. We were also able to confirm suspected gunshot damage at a rock art site. These results highlight the advantages of this non-destructive technique.

Steere, Benjamin (University of West Georgia)

[26] *The View from One Thousand Houses: A Macro-Regional Approach to Household Archaeology in the Southeastern United States*

In this paper I reflect on Steve Kowalewski's influence on my research on houses and households in the native Southeast. In the early days of my graduate training, Steve encouraged me to move away from a single-site focus and instead think about household archaeology as a broadly comparative anthropological enterprise undertaken at a macro-regional scale. It was a good idea. To meet Steve's challenge, I constructed a database that catalogs the architectural features of 1258 structures from 65 sites in the Southern Appalachian region and surrounding areas. From this large sample of houses I identified and analyzed broad spatial and temporal patterns of variation in domestic architecture, including changes in the size and spacing of houses, changes in architectural investment, and a secular trend toward the increasing segmentation of houses. Using a theoretical framework developed from household archaeology and anthropology, I argue that certain aspects of this architectural variation can be explained by changes in household economics and household composition, symbolic behavior, status differentiation, and settlement patterning. More generally, I propose that large-scale patterns of diachronic and synchronic variation in domestic architecture are best explained by changes in social organization.

[239] *ArcBurn: Measuring Fire Vulnerability in Southwestern Landscapes*

How can the archaeological record be used as a chronicle of prehistoric forest fires? How do cultural resource managers today evaluate the potential impacts of wildland fires? The "ArcBurn" project, funded by the Joint Fire Science Program, is a collaboration among archaeologists, fire scientists, forest ecologists, and fire managers. This project was created to develop hard data on fire effects to ensure that the best science is effectively and appropriately used to guide management plans, and that these plans are defensible and reasonable under dynamic environmental conditions. We are using laboratory and field experimentation to quantify the fire dose that causes unwanted damage to three kinds of artifacts: pottery, obsidian, and architectural stones. We also measure indirect fire effects by assessing post-fire erosion. The context for this work is the Jemez Mountains of northern New Mexico, a fire-prone landscape where wildfires in the last three decades have dramatically increased in size and severity, resulting in profound impacts to this rich and previously stable archaeological record. We review the goals for this project, provide our preliminary results, and discuss the increasing relevance of archaeological perspectives in comprehending and responding to climate change.

[138] *A New View of the Desert - The Permian Basin Programmatic Agreement Research Program in Southeastern New Mexico*

The research program described in this paper is providing much needed new information for a portion of southeastern New Mexico that was previously understudied. The program is funded by an innovative approach to Section 106 compliance which trades redundant survey information for

monetary contributions to a dedicated research account. The Permian Basin Programmatic Agreement (PA) has been in effect for six years. The purpose of the PA (formerly the Permian Basin Memorandum of Agreement or MOA) is "...to implement a creative, directed program to resolve adverse effects and, in particular, the cumulative and indirect effects of full-field oil and gas development and other industrial-related development undertakings in southeastern New Mexico and result in better decisions affecting the management of historic properties in the Permian Basin." This paper briefly outlines the state of our knowledge of the prehistory and history of southeastern NM before implementation of the PA, describes the "nuts and bolts" of the operation of the PA, and details the contributions made to date by projects funded through the program.

Steinbrenner, Larry (Red Deer College)

[246] *The Mystery of Managua Polychrome Part II*

This presentation continues the discussion of Managua Polychrome I began in a paper presented at the 2014 SAA general meeting. Part I of this study focused on early attempts to describe and define Managua Polychrome, a distinctive Late Postclassic ceramic type characteristically found in the Managua-Masaya region of Pacific Nicaragua that has been largely neglected by archaeologists working in Greater Nicoya, and discussed the connections between the type and Nimbali Trichrome, a ceramic type associated with Chiapa de Corzo. Part II will focus on the relationships between these types and near-identical ceramic types found in supposed Mesoamerican enclaves in countries lying between Nicaragua and Chiapas (including Honduras and El Salvador). This paper will discuss whether these types can be used to delineate some of the trade routes that connected Lower Central America to Mesoamerica—a topic pertinent to ongoing efforts to understand the arrival of Mesoamerican peoples in Greater Nicoya during the Postclassic Period.

[205] *A Bioarchaeological Investigation of an Explosive Impacted Skeleton from Ifugao, Philippines Cordillera*

The Ifugao Archaeology Project (IAP) investigates the sparse prehistoric and colonial archaeological record of the Philippine Cordillera. The biological anthropology of the area is almost completely unknown. A single adult human skeleton has been recovered from primary archaeological context in the Ifugao area. The paucity of skeletal remains is largely due to cultural practices that include the processing and collection of juvenile and adult skeletons for ritual storage. One adult human skeleton was found by farmers after the explosive removal of a boulder. Despite the fragmentation and missing elements caused by the explosion, as the only skeleton recovered from primary context in the area, this individual provides information on health and diet in Ifugao. The skeleton represents a male in relatively good health. There are low levels of osteoarthritis in the joints and vertebra, and a possible infection in the tibia. The skeleton has robust muscle attachments, especially in the legs. Dental and oral health information suggests that the diet was low in cariogenic foods, but periodontal disease may have been present. Isotope analysis gives information on the diet and geographic history of the individual and, together with dating information, can help to contextualize the individual in time and space.

[100] *Applying Digital Technologies to Older Sets of Data: A Study of the Spatio-Temporal Distribution, Design and Function of the Carved Stone Altars at Copán*

The term "altar" is a western concept which has been used in the study of the ancient Maya to describe a plethora of carved stone artifacts, ranging from small pedestals, to carved boulders, to three-dimensional, multi-component, carved sculptures. In many cases, it seems unlikely that the only purpose of these altars was to serve as a place to deposit sacrifices. After spending two field seasons cataloguing the carved stone altars at Copán, Honduras, the chronological trends in shape and style became readily apparent amongst the 78+ examples at the site, especially amongst the pieces dating to the Late Classic period. My research goal is to answer questions such as whether the changes in the form and style of these altars across time and space might reflect a change in their function, or if these differences in style correlate to the positioning of certain altar types in certain locations such as in front of a stela or inside of a structure. The MayaArch3D geo-spatial analysis tool, which allows complexly structured data to be queried based on both geographical and chronological parameters, allows me to apply these new questions, and a new methodological approach to a long-existing set of data.

[122] *Technical Analysis and Replication of Corinthian Polychrome Slips, 8th - 6th Centuries B.C.E.*

Polychrome slipped and decorated pottery from Corinth, Greece, developed over two centuries from monochrome, dark brown slips and washes on a calcareous yellow clay body to a wide range of decorative techniques. Once significant experimentation with color variability began, five colors were produced. Some slip colors involve multiple-step processing to control glass content and degree of sintering; the control of particle size to produce variable roughness and a matte or semi-matt or glossy appearance. Others involve reprocessing of materials from another craft specialty. Considerable evidence supports nearly continuous development and engineering of the ceramic slips, although no data support the improvement in composition or processing of the ceramic bodies. We present the results of study of 29 sherds with 57 examples of Corinthian polychrome slips, measuring 10 to 35 microns in thickness, that were collected by Marie Farnsworth in the late 1950s and 1960s from Greek archaeological sites. Black, red, white, wine red (or purple) and overlying, matte banded slips were studied by optical microscopy, petrographic and scanning-electron microscopy with semi-quantative energy dispersive x-ray analysis, as well as wavelength-dispersive electron microprobe (EPMA) elemental mapping and analysis. Results from compositional analysis were then used to replicate the five slip colors.

[8] *The Uses of Platform-Mound Summits at a Coles Creek Site in Southwest Mississippi*

Excavations at Feltus (Jefferson County, Mississippi) have yielded considerable evidence on how the summits of platform mounds constructed during the middle Coles Creek period (A.D. 900-1100) were used. These summits showed multiple veneers of black and yellow sediments, portions of which were heavily burned. Also present were small pits that may have been votive deposits, as well as large, bathtub-shaped cooking pits. The summits were kept clean, but dense middens accumulated on their flanks. Charred posts may or may not indicate the presence of roofed buildings. All in all, these summits reveal very complex histories of ritual use.

[168] *Geochronology of the Tse-whit-zen Project*

The use of high precision dates provides a chronological framework for reconstructing environmental conditions at the Tse-whit-zen site (45CA523) in Washington state. The geochronology of the site is derived from high-precision radiocarbon dates taken from finely excavated deposits, with ages spanning the time period from ca. 2000 BP to contact. We have added 36 high precision AMS dates from short lived organic material, recovered from intact contexts, to the 52 original dates reported in 2006. Combined, these data allow development of the temporal sequence of beach building events in the sand deposits underlying the site, as well as the sequence of cultural deposits of long and short duration over the course of the site's occupation. Higher and lower frequencies of C14 ages over time serve as proxy means for estimating relative changes in population during the site's occupation; these changes in population are partially driven by environmental conditions. Bayesian analysis of vertical sequences of dates reveal periods of diminished site activity that correspond to known regional seismic events. The sequence of beach building also reveals a period of lowered seas relative to land level after ca 2000 BP, typical of generally drier climatic conditions.

Sterling, Kathleen (Binghamton University)

[395] *The Concept of "Domesticity" in Magdalenian Life*

A number of recent publications about Magdalenian life have used terms such as "domestic" or "household" and their derivations to differentiate between different types of sites or tools, and perhaps also to underscore the fact that archaeology is about people, not just materials. This language also reflects the influence household archaeology has had in expanding studies of sedentary societies. It is not clear, however, that a distinction between domestic and non-domestic activities is appropriate for mobile societies. "Domestic" is typically opposed to "hunting," reinforcing old dichotomies that imply others such as "public-private" and "man-woman." Does "domesticity" add to interpretations of Magdalenian archaeology, or is it a modern conception that over-simplifies aspects of the Magdalenian record?

[139] *Understanding Oneota Stone Tool Functions: A Case Study of Precision and Accuracy in Use-Wear Analysis*

A combination of assemblage analysis, microwear analysis and blood residue analysis allows us to build a new understanding of the role of lithic material in the technological economy of Oneota groups in eastern Wisconsin. One foundation of this approach is accurate and replicable recognition of use-wear patterns. Blind tests have been an essential component of use-wear research since the 1970s. In this paper, we describe a study of 100 experimentally made and used chipped stone tools. Made from two types of chert that were commonly used by occupants of Oneota sites near Lake Koshkonong, Wisconsin, the tools are used in a wide range of activities. Three analysts assess each tool using low and high power microscopy, and the degree of agreement on use identifications is ascertained. This study provides a large sample to measure the analysts' accuracy and precision in recognizing use-wear on stone tools from a specific archaeological context.

Stevanovic, Mirjana

[297] *Ruth's Archaeology*

My contribution to this session will be a personal account of a long-term professional relationship with Ruth as a student and colleague. Ruth and I began the collaboration in the Former Yugoslavia, a country that ceased to exist, and continued with projects in Israel, Bulgaria, and Turkey. Together we were learning the local archaeological practices and were developing our own. Each of us brought something to this process of learning: she - her anthropological interpretation of the material culture, and I - the experience and method of excavating it. Also, we shared many research interests, such as household archaeology, house-fire and burning, and mudbrick architecture. Ruth's work on the archaeology of the Balkans was important for several reasons. One is that her focus on the prehistory of this region renewed attention and deepened the interest in its archaeology. Further, her work made an impact on young archaeologists in the region, and especially on those with whom she collaborated. Ruth included all the team members in active thinking and interpretation process contrary to the local, well-established old-school archaeologists who ignored local input. Paradoxically she brought in more equality to the archaeological practice than existed in the nominally socialist/communist country.

[383] *Geology, Historical Contingency, and Ecological Inheritance in California's Southern Sierra Nevada*

The Late prehistoric archaeological record of the Southern Sierra Nevada can be distilled down to two very visible elements: bedrock mortars and obsidian. Both were imported from outside the area, with obsidian coming from the east and the idea of the bedrock mortar coming from the west. We argue that the presence of transported obsidian, much of it deposited prior to 1000 cal BP, and the later establishment of bedrock mortars encouraged more persistent use of this landscape. We see this as an example of the downstream effects of niche construction.

Stevens, Chris (Institute of Archaeology, University College London.)

[414] *Exploring the Multiple Pathways towards Agriculture within China: The Case for Rice and Millets*

Studies of evolutionary change within selected traits for rice indicate a period of interaction from the cultivation of morphologically wild plants (*Oryza rufipogon*) to the eventual farming of domesticated rice (*Oryza sativa* ssp. *japonica*) that lasted around 3000 years. The shift from the collecting of wild foods to dependence on cultivation was equally protracted. While rice was likely taken into cultivation in a number of areas across China it is only in the Lower Yangtze between 6000 to 3000 cal. B.C. that the full transition from early cultigens to fully domesticated plants is so far evidenced. The pathways towards the domestication of millets (*Panicum miliaceum* and *Setaria italica*) are far less clear. Their probable cultivation is attested from a number of sites, possibly as early as 7000 cal. B.C., within northern China, based upon finds of charred grains, isotope evidence and agricultural tools. Unlike rice however the start of cultivation and the end of domestication period are as yet

unknown. This paper presents comparative models for rice and millet, which explore the morphological changes seen within these plants resulting from human selection and how such changes in themselves modified human behavior.

[135] *Beyond the Shadow of a Desert: Illuminating Southern Africa's Foraging Spectra*

There is arguably nowhere more susceptible to the tyranny of the ethnographic record than southern Africa. From Man the Hunter's quintessential foragers to the revisionists' marginalized proletariat, Kalahari hunter-gatherers cast shadows far longer than those created by the desert sun. There is no denying that this extraordinary record – central to both economic and social approaches to southern African prehistory – has greatly enriched our picture of the past. Unsurprisingly, however, the subcontinent continues to confront archaeologists with behavioral signatures outside the range of variation documented in the Kalahari. Two decades after Kelly's landmark publication, and fifteen years into the paradigm shift towards an African origin for behavioral modernity, the time is ripe for a re-evaluation of southern Africa's foraging spectra. In this paper we provide this, and advocate for a cross-cultural approach that integrates evolutionary theory with ethnography and ethnoarchaeology drawn from within and beyond the Kalahari. If this is critical for studies of prehistoric foragers across the globe, it is particularly pressing in southern Africa with such a diversified ecology and deep antiquity of humanity.

Stewart, Haeden (University of Chicago)

[258] *Crossing the Line (Part II): Taphonomies of Toxicity in Contemporary Archaeology*

This paper is the second part of a two-part dialogue on the use of taphonomy as an archaeological technique in both prehistoric archaeology and the archaeology of the contemporary. Part II explores how using the concept of taphonomy to study the accumulation of harmful toxins in the environment and in the human body opens up new avenues of study for an archaeology of human-environment interactions in the contemporary nuclear and industrial age. Intimately tied to the waste of human activity, and dangerous to both human and non-human bodies, toxins bind bodies into communities of shared danger and toxic harm. Toxins index historical processes of production and consumption, as well as the taphonomic processes of dispersal, disintegration and accumulation connecting them to the bodies they harm. Bodies congeal toxic traces that individuate as well as gesture towards global dynamics. These traces can be 'excavated' to reconstruct individual and collective histories, long-term processes of environmental degradation, and to understand collectivities constituted by emerging toxic dangers. In thinking fishing as archaeological practice, I argue that locating toxicity as a central archaeological concern facilitates useful exchange across different archaeologies, as well as broadening what we consider to be archaeological method.

[364] *Documenting Lithic Landscapes of Petrified Forest National Park, Arizona*

Archaeological lithic landscapes can encompass a broad range of geographic settings – local to regional – where lithic procurement activities by people have left indelible evidence of lithic resource use. The Petrified Forest National Park (PEFO), Arizona on the Colorado Plateau is best known for its massive exposure of late Triassic period petrified logs in the park. Petrified wood lithic debitage and tools dominate the lithic assemblages of prehistoric sites at the park. However, the park also includes large lithic pavements of chert cobbles and petrified wood chunks and gravels. Both petrified log concentrations and lithic pavements have not been documented during past archaeological surveys despite the ubiquity of debitage from lithic testing, reduction, and production activities, in part, because of the widespread spatial extent of the areas. Archaeological survey

conducted at PEFO during the summers of 2013 and 2014 has incorporated lithic pavements, procurement areas, and scatters into the archaeological landscape of the park. Additionally, archaeologists have begun adding lithic procurement areas to previous surveyed areas. This poster presents an analysis of selected lithic pavement procurement areas at PEFO, their spatial extent, geological origins, water drainage associations, and attraction for human settlement especially among archaic and early farming populations.

[92] *Elemental and Microscopic Characterization of Quartzite Stone Discs and Knives from the Slocan Narrows Pithouse Village, Upper Columbia River Region*

Chipped stone tools made from fine-grained quartzite with thin mica-rich (phyllitic) lamellae are commonly recovered from archaeological contexts along the Upper Columbia River in the interior Pacific Northwest. In this study we present the results of a comprehensive analysis of a collection of quartzite discs and knives recovered from the Slocan Narrows Pithouse Village. Our analysis includes examination of microscopic use-wear traces to attempt tool function interpretation, as well as elemental characterization through energy dispersive x-ray fluorescence spectroscopy to identify the number of potential geological sources of the raw material. Because these quartzite tools commonly occur across a wide geographic range, this study provides a foundation for additional studies of quartzite tools that may eventually lead to a better understanding of human land use practices in the Upper Columbia River region.

Stiner, Mary (University of Arizona) and Steven Kuhn (University of Arizona)

[296] *OFT and EVO-DEVO: Antithetical or Mutually Beneficial?*

Short-term constraints that motivate people are an important part of the process social and economic change. Proximate decision (optimality or satisficing) models are particularly useful in archaeology because they play upon basic resource needs and costs in situations where behavior cannot be observed directly. These models are not enough, however, to account for the larger processes by which repeated interactions change the nature of the co-evolving species and the conditions of selection across generations. Thus at least two levels of mechanics and their respective temporal domains must be recognized in co-evolutionary studies such as in Niche Construction Theory (NCT). The fact that many of the empirical patterns that attract NCT thinkers come from research based on simpler models such as behavioral ecology testifies to the potentially complementary relations between these distinct levels of theory.

[242] *Dance and Music in Maya Rituals: The Case of Tecum*

According to the 16th-century Título K'oyoi, the K'iche' captain Tecum participated in two elaborate ceremonies before leading his army into war against the Spanish conquerors. Both included dance and music and even though he later was killed in battle, Tecum somehow continued to dance until the present day, now taking part in the preparation and performance of the so-called Dance of the Conquest. This "fact" alone tells important things about the concepts and functions of dance and music in Maya society. The paper attempts to reconstruct the ritual elements, their "assembly plan," and some goals and meanings of the two pre-conquest ceremonies by means of both contemporary data and insights gained from the ethnomusicological study of the Conquest Dance as performed today in the Guatemalan highlands. The latter are particularly helpful as reminders of the processual character of rituals which is often based precisely on the performance of music and dance. In the case of Tecum one of the goals of such dynamism was and is the transformation of the dancer from one kind of being into another, -- the main thesis of this paper.

Stoll, Marijke (University of Arizona)

[20] *The Practice of Play in the Sport of Life and Death: Exploring Regional Variation in Ballgame Material Culture and Ideology*

There is little argument that the Mesoamerican ballgame was a ritualized and politicized communal sport with great geographical breadth and incredible time-depth. It is also commonly accepted that the ballgame, as a cultural institution, was intimately linked to a political, elite-centered ideology based on cosmology, sacrifice, and agriculture, related to sociocultural themes of conflict, competition, and the resolution or negotiation of both. This interpretation of the ballgame as ritual practice, however, has remained stagnant over the past several decades. Moreover, it disregards local and regional variation across time in both ballgame symbolism and ideology, leaving unexplored the significance that these differences and similarities entailed for Mesoamerican intra- and intercommunity social networks. In this paper, I address these issues by applying a practice-oriented approach to a regional investigation of ballgame material culture, including those objects and symbols associated with game performance and related activities. Importantly for the study of ritual and religion in the past, practice theory enables the exploration of the recursive relationship between materiality and ideology. Using this perspective, I will demonstrate how the specific ballgame practices that produced these regionalized material remains trace back to complementary, competing, and even overlapping ballgame ideologies.

[23] *Economies and Identities in Flux: Consequences of the Arrival of Specialized Fulani Pastoralists in Mali's Inland Niger Delta*

In the Sahel, the Fulani are considered the archetypal cattle herders. Although their spread across West Africa is poorly understood, their arrival had profound effects on local populations. In Mali's Inland Niger Delta, historical sources and isotopic analysis of archaeological cattle, sheep, and goat teeth from the site of Jenné-jeno and the modern town of Djenné suggest that specialized Fulani pastoralists arrived in the Delta between the 13th and 15th centuries A.D. This coincided with dramatic upheaval in local subsistence practices, with a shift from a largely generalized, agro-

pastoral system to one where ethnic identity became tightly linked to subsistence specialization. This paper draws on archaeological, ethnographic, and historical data to explore how socio-political changes, including the arrival of pastoralists whose identity was strongly tied to mobility and cattle, impacted the identities and subsistence regimes of local populations. I argue that despite archaeological evidence for cultural and ethnic continuity, the boundaries and meanings of group identity in this area underwent dramatic transformations. I caution that even in situations where modern subsistence and ethnic configurations are a seemingly good fit for the archaeological record, group identities are a fluid construct and can change radically in the face of historical forces.

[99] *The Integration of Archaeology and its Principles into the Core Curriculum*

Introduction to Archaeology is often included in the college/university wide core curriculum (social/behavioral science module), as well as being a required class for undergraduate majors. This inclusion allows us to introduce the SAA curricular goals to a larger community. At the University of Colorado Denver, multiple laboratory sections of 15 students each are attached to very large lecture sections. The laboratories provide hands on exercises tailored to the historic and prehistoric archaeology of the area. By concentrating on local concerns, students develop fundamental analytic skills, participate in data analysis, and have issues of local diversity and social relevance brought home. In Fall 2014, one laboratory section was linked to a freshman seminar class (topic local history), a freshman composition class and co-curricular activities centered on Denver and Colorado history to form a Living Learning Community (LLC) for first time freshman. The linked classes and content emphasis on local history and prehistory in this LLC reinforces ideas about the relationship of the past to the present, diversity of experience in local areas and the importance of preservation and stewardship. Examples of laboratory exercises and co-curricular activities will be discussed.

[328] *Prehistoric Population Mobility in the Caribbean: Genetic and Isotopic Investigations at Grand Bay, Carriacou, West Indies*

Archaeological research at Grand Bay, a large Late Ceramic Age (ca. A.D. 400-1300) Amerindian village site on Carriacou in the southern Caribbean, has revealed evidence that sheds light on Precolumbian adaptations to small island environments. More than a decade of research here and at other locations on Carriacou have yielded dozens of human burials, including many found in mortuary contexts rarely seen in this part of the Lesser Antilles. Ongoing bioarchaeological research on past lifeways of prehistoric settlers has moved from osteological and paleodietary analysis to the extraction of ancient DNA and heavy isotope ratios of Pb and Sr to examine genetic affinities and mobility among islands and adjacent mainland areas. While the data are preliminary, interdisciplinary research on Carriacou is providing new data on the inter-island movement of people, artifacts, animals, and cultural behaviors.

Stoner, Wesley (University of Arkansas)

[25] *The Analytical Nexus: Multi-Technique Approaches to Ceramic Composition*

Archaeologists have employed many different approaches to characterize the composition of ceramic pastes, but until recently only a minority of studies have used multiple analytical techniques to examine the same sample. An "analytical technique" is used here to mean a single perspective that characterizes an aspect of a ceramic paste. Since humans created pottery using different processes and recipes, it follows that each perspective teaches us about a unique aspect of the

potter's behavior and social context. We have moved beyond the argument of "which technique is better?" into a phase of research that asks "which social or technological behavior does this technique reflect?" It is unrealistic to expect that all perspectives will be represented in any case study, but we must situate the different techniques within a framework that permits interpretations bringing us from technical observation to social deductions. The analytical nexus of these different techniques allows archaeologists to create a rich description of the social decisions and geoarchaeological processes that affect ceramic systems. I exemplify one version of the analytical nexus with my own research in Mexico using petrography, NAA, and LA-ICP-MS.

[322] *Archaeological Education and Public Outreach through Social Media*

With advances in technology and greater access to public lands, archaeological sites are more vulnerable now than ever before. With photos and site locations being shared across the internet, it is pertinent for us as archaeologists to pierce the veil between academics, professionals, and the general public. Visitation to archaeological sites often results in adverse effects including visitor footpaths, touching or climbing on cultural resources, presence of modern trash, and vandalism to the site through looting or intentional destruction. By using common social media outlets such as Facebook, Instagram, Twitter, and personal blogs, we can begin to educate the public on proper site etiquette. By using the internet as a tool for public outreach, we can begin to distribute the sense of cultural resource ownership from land managers, academics, and professionals to the general public.

Stout, Dietrich (Emory University)

[33] *Stone Tool-Making and the Right Cerebral Hemisphere*

Neuroscience research has linked both language and tool-use to neural circuits in the left hemisphere, leading to hypotheses of co-evolutionary interaction between these behaviors. However, it is known that the right hemisphere also contributes to language, particularly with respect to large scale (e.g. prosody, context) processing. Studies of actual tool-making, as opposed to simple use, are sparse, but similarly suggest right hemisphere involvement in the more complex and temporally extended processes involved in the goal-directed transformation of durable objects. In support of this, neuroimaging studies of experimental stone tool-making in our lab have consistently implicated right parietofrontal circuits. This includes evidence of brain activation observed using FDG-PET and fMRI, as well as experience-dependent white-matter structural changes observed using DTI. Comparative (chimpanzee, human, macaque) anatomical studies further indicate a derived rightward asymmetry of this parietofrontal tract in humans. We propose the hypothesis that human frontoparietal circuits in both hemispheres underwent adaptations for Paleolithic tool-making that were behaviorally co-opted ("exapted") to support proto-linguistic communication and subsequently altered by secondary adaptations specific to language, especially in the left hemisphere.

Straight, Kirk

[338] *In this Chapel of Ritual: The Life and Death of Temple XIX at Palenque, Chiapas*

The excavation of Temple XIX at Palenque, Mexico from 1998-2002 garnered considerable attention primarily for the recovery of monuments with preserved inscriptions and iconography carved in stone and modeled in stucco. The fragmented state of several monuments, evidently victims of systematic mayhem in antiquity, preoccupied the excavators constantly as monument fragments were recovered from inside and outside the approximately 9 by 34 meter building. These monuments have now been consolidated and are on display in the site museum near the ruins in Chiapas. Although the epigraphy of these monuments has been discussed extensively in press, the context of their recovery has not received the same attention. As primary supervisor of the Temple XIX excavations I have a unique perspective on the construction, dedication, use, and termination of the building. In this paper I review the recovery program and contextualize how Temple XIX was used by the ruling court of Palenque in the mid-8th century A.D. I then address the termination of the structure and the apparent dereliction of the entire South Group (or South Acropolis) in the second half of the 8th century A.D. prior to total abandonment of the site in the early 9th century A.D.

Strange, David (University of Wisconsin-Milwaukee)**[301] *Evidence for Antemortem or Perimortem Trauma among Individuals Recovered from the 2013 Milwaukee County Institution Poor Farm Cemetery Excavations***

2013 excavations at the Milwaukee County Institutional Grounds (MCIG) cemetery resulted in the recovery of approximately 685 burials containing over 700 individuals, adding to the existing collection of 1649 individuals excavated in 1991 and 1992. The individuals from the 2013 excavations were inventoried and examined macroscopically for evidence of pathology and trauma. Sean P. Dougherty (2011) observed that the pattern of traumatic fractures among the 1991 and 1992 collection reflect not only a tendency for interpersonal violence, but also non-agonistic events inherent through the hazards of life among the impoverished of Milwaukee during the burgeoning Industrial Age. Dougherty classifies evidence of post-mortem medical intervention such as the craniotomy and other signs of autopsy as trauma. It is the case that that many types of impetuses exist for postmortem intervention procedures. In the analysis of the 2013 collection, only antemortem or perimortem signs of trauma will be the accepted parameters. It is expected that this study will reveal similar trends of interpersonal violence and occupational hazard, but a tighter classification of how we define "trauma" should lead to a finer-grained understanding of the lives of the poor in turn of the century Milwaukee, Wisconsin.

The archaeological site of Dzibanché, Quintana Roo, has polychromed stucco remains that seem to date to the Middle Classic when the Kaan dynasty ruled at Dzibanché. The aim of this investigation was to determine the composition of the stucco and the painting (petrography, SEM-EDS, XRD) and date them. The antiferromagnetic hematite in paintings contains remanent magnetization (PiRM). The magnetic record could date them if changes in direction and intensity of the geomagnetic field have been well characterized. The employed curve for dating is improved from Wolfman (1 to 1200 d.C.) with new archaeomagnetic data supported by radiocarbon dates. Stucco contains mainly calcite, dolomite, chert, clays, soil and some organic features; the pictorial layer has at least two layers of red pigments mostly constituted by hematite. Four murals were sampled, eight to ten oriented specimens were taken with double-sided tape. The samples were demagnetized by alternating fields (10 to 40 mT) in order to get their characteristic magnetization. The mean directions were obtained employing Fisher statistics and dating was performed with Bayesian statistics (RENDATE). Obtained dates: A.D. 626-647, Structure 2; Pequeña Acrópolis palaces, A.D. 394-429 & A.D. 500-529, southern, A.D. 417-528, eastern, and A.D. 445-497, northern palace.

Strauss, Stephanie (The University of Texas at Austin)**[151]** *Izapa's Place in the Discourse on Early Hieroglyphic Writing*

Izapa occupies a curious place in the study of Mesoamerican writing and semiotic practice. Although the linguistic affiliation of ancient Izapa is unknown, glottochronological estimates suggest that Izapa stood at a multilingual crossroads between proto-Mihe-Sokean and proto-Mayan speaking populations. The blended visual vocabulary of Izapa-style monuments, coupled with the site's location and chronology, further prompted early scholars to place Izapa on a transitional, regional continuum between the better-studied artistic traditions to its east and west. Epigraphically, this slippery view of Izapa often results in its uncritical inclusion in the greater "Isthmian" writing tradition; and yet the lengthy inscriptions found on La Mojarra Stela 1 and the Tuxtla Statuette are not seen at Izapa. As it is very likely that the people of Izapa had at least some degree of exposure to the early, linguistically transparent writing systems that surrounded them, their use of a text-independent communicative strategy was intentional and significant. How, then, are we to read Izapa-style monuments? What are we to make of the distinctly glyph-like elements so often embedded into their complex pictorial narratives? This paper thus explores these uniquely Izapan "iconoglyphic" elements, reinserting them into the discourse on early Mesoamerican writing and linguistically unbounded signaling practices.

[288] *Data Management and Cyberinfrastructure for Traditional and Local Knowledge and Archaeology in the Arctic*

Scientists are realizing the importance of social science research to fully understand how the rapid environmental change in the Arctic will affect human populations living in the Arctic and beyond. Millions of dollars are invested in scientific research, including in the social sciences, on the changing Arctic every year, and with that investment, scientists have begun stressing the importance of preserving these collected data for future analysis. With the increased recognition of the importance of social science data, however, numerous challenges and obstacles exist to effectively managing data from the social sciences. Data from the social sciences, for example, frequently take a different form from data from the physical sciences and can be highly dependent on context. This paper will present the various ongoing efforts in cyberinfrastructure for traditional and local knowledge and social sciences (with a focus on archaeology) in the Arctic, including The Exchange for Local Observations and Knowledge of the Arctic (ELOKA, <http://eloka-arctic.org>). We will also address the challenges of managing data from the social sciences, including maintaining privacy of subjects, preserving context of the data, and ensuring the data are preserved for the future.

Striker, Sarah (Arizona State University)**[109]** *Categorical Identity and Decorative Style in an Ancestral Wendat Sequence*

This study takes a new approach to Iroquoian ceramics, considering decorative style as evidence for categorical identification. Categorical identity is a shared association with a category such as an ethnic or religious group. Along with relational identification – direct interpersonal relationships – categorical identification is a key element of collective identity. Historical sociologists study these elements of collective identity to understand how individual and collective social relationships facilitate collective action – sustained cooperation toward a common goal. I use this framework to

understand how individual and collective social relationships change over time and contribute to socially cohesive communities. I examine four successively occupied Ancestral Wendat (Iroquoian) communities (1400-1550 C.E.). Previous work traces village aggregation and coalescence through changes in village plans from smaller, dispersed communities to the exceptionally large Mantle site. A spatially-integrated village plan and shared public space demonstrate collective action and a socially cohesive community at Mantle. I evaluate categorical identification by assessing the consistency of ceramic decorative styles within each village using consensus analysis. Intra-site spatial patterns of similarity as well as developments throughout the site sequence indicate whether categorical relations changed over time, and how these developments contributed to social cohesiveness at the Mantle site.

[186] *3D Morphology of Grass Short Cell Phytoliths: Unlocking the Evolution of Grasses and Grassland Ecosystems*

Grass-dominated ecosystems occupy > 40% of today's earth's land surface. Documenting when this prominent biome emerged was traditionally hampered by the rarity of identifiable grass fossils. Recently, phytoliths have emerged as a vital tool for tracking the evolutionary history of grasslands. Key to understanding ancient grassland composition is studying the 3D morphology of silica grass short cell (GSSC) phytoliths. GSSCs have long been known as broadly diagnostic within grasses, but a landmark paper (Piperno and Pearsall 1998) demonstrated the full taxonomic potential of GSSC shape. For example, 3D shape distinguishes between forms that look similar in one view, such as saddle-types in bamboos and chloridoids. Incorporating study of 3D morphology in phytolith analysis of Cretaceous-Cenozoic (66-2 million years ago (Ma)) samples from the Americas, Europe, and Asia has radically changed our understanding of grassland evolution. This work shows that open-habitat grasses (e.g., pooids, panicoids) diversified 10-20 million years before becoming ecologically dominant in North and South America, suggesting that different environmental factors promoted diversification vs. dominance. GSSC analysis also reveals that (C3) stipoid pooids dominated early savanna/grassland vegetation rather than tropical (C4) grasses as previously thought. Ongoing investigation of GSSC 3-D shape promises to further revolutionize our view of grassland evolution.

[196] *Early Maya Script and Visual Culture: A Chronological and Geographical Reassessment*

This paper presents evidence for a lowland origin of Maya hieroglyphic writing and iconography during the Late Pre-Classic period. It calls into question long-standing models of highland-lowland interaction that have assigned temporal priority of Maya monumental art and visual culture to the southern highlands and Piedmont region. In addition to the several known sculpted and inscribed monuments from the Peten region, archaeological evidence from the site of San Bartolo has revealed integrated programs of script and iconography in place in the lowlands by 300 B.C.E., well before their first known appearance on datable monuments in the southern region, at Takalik Abaj and Kaminaljuyu. In integrating archaeological, epigraphic and art historical perspectives, this paper considers a model wherein examples of Maya visual culture at such highland and piedmont centers can be viewed as lowland-inspired, indicating an intrusive political and cultural (though not necessarily ethnic) presence that was also relatively short-lived, diminishing by the beginnings of the Early Classic era.

[327] *Penetrating the Old Woman's Gun: A GPR and Artifact Analysis of a Mexican American War Battlefield Site*

This paper will address the validity of the claim that the Battle of Rancho Dominguez (Battle of Old Woman's Gun) took place on the lower terrace of the Rancho Dominguez. In the summer of 1846, the US military took control of Los Angeles. Soon after, the Mexican Army was able to regain the city. Captain Mervine, of the US military, landed his troops in San Pedro hoping to regain Los Angeles. Folk history tells of Captain Mervine's troops being besieged in the early hours by Californios, wielding a four-pound cannon ("the old woman's gun") and diversionary tactics. An archaeological investigation involving a GPR survey was followed by excavation and artifact analysis. A two cm in diameter iron ball was uncovered, which is consistent with iron shot used by the Mexican Army in 1846. Findings led to the investigation into the whereabouts of "the old woman's gun". Results offer support for the existence of the Battle of Old Woman's Gun and its approximate location, in Los Angeles. The present findings augment the literature on the Mexican American war, particularly the role of the Californios, the fate of the "old woman's gun" and the Rancho Dominguez area.

[29] *Preservation Practice at Knife River Indian Villages National Historic Site: Using New Planning Frameworks to Identify and Address Impacts to an Archaeological Landscape*

Knife River Indian Villages National Historic Site was set aside to preserve, research, and interpret the archaeological and cultural landscapes of the Hidatsa-Mandan villages at the confluence of the Knife and Missouri Rivers. Both park enabling legislation and NPS policy direct park staff to preserve archaeological resources unimpaired for future generations. However, defining what preservation means and how it is put into practice presents a challenge for park managers as they attempt to preserve archaeological resources in balance with natural processes. In 2013, the park began a comprehensive Archaeological Resources Management Plan as part of the new NPS planning framework. These efforts focus on increasing tribal and public involvement in a long term resource management strategy incorporating both NPS and traditional tribal values. This paper will explore these issues and discuss the ways that this planning strategy may guide resource preservation and maintain relevancy into the future.

Sturm, Jennie (TAG Research)

[358] *Using Geospatial Strategies and Ground-Penetrating Radar to Study Sites in the American Southwest*

In American archaeology, ground-penetrating radar (GPR) has enjoyed its longest use in the Southwest. While this method has long been used to locate features of archaeological interest, much of the focus has now shifted from using this technique as a prospection tool to one that can be used directly in the study of archaeological sites. This reflects an increasing sophistication in the ways practitioners process, interpret, and visualize GPR data, which capitalizes on this method's high-resolution, three-dimensional mapping capabilities. Furthermore, combining these data with other geospatial techniques such as aerial photography and high resolution GPS survey means it is possible to associate buried features to surface phenomena, thereby opening up the types of

questions that can be addressed while also preserving sensitive archaeological sites. This presentation draws upon examples from the American Southwest to show how this approach is being used to study sites in relation to the larger archaeological landscape. Far from being a simple prospection tool, the use of GPR in archaeology is enjoying a revitalization as advancements in the way geospatial methods are combined generate data that can be used directly in the interpretation of the archaeological record.

[357] *Paleoindian Use of the Western Ouachita Mountains, Oklahoma*

At present, the archaeological record of eastern Oklahoma reflects abundant evidence of prehistoric occupation in the region's river valleys, from the Paleoindian period onward. Conversely, little archaeological work has been done in the upland environments of the Western Ouachita Mountains. Yet these uplands are notably rich in resources, ranging from high quality lithic sources, lush plant-life, diverse animal species, and many streams and rivers providing water throughout the year. I therefore hypothesize that the western Ouachitas would have been used by prehistoric people throughout prehistory, starting in Paleoindian time. This paper preliminarily evaluates this hypothesis by synthesizing first, what few archaeological findings have been reported for the Ouachita high country; and second, what archaeologists have learned about Paleoindian use of the nearby Eastern Ouachita Mountains and Southern Ozarks of Arkansas. I conclude that there is a high probability that Paleoindian groups did indeed use the Western Ouachita Mountains, and probably in highly diverse ways. I end by suggesting potentially fruitful next steps for evaluating this literature-derived conclusion through fieldwork.

Suarez, Rafael (Depto. Archaeology. Universidad de la República (Uruguay))

[150] *Living on the river shore: Late Pleistocene and Early Holocene Human Adaptations in the Uruguay River Basin*

This presentation provides new data on investigations on the middle basin of Uruguay River. The most recent research on Northern Uruguay in the K87 Tigre type site has yielded radiocarbon dates with similar ages to Clovis (ca. 13,000 cal yr BP). At a regional level, a settlement pattern emerges where the Paleoamerican residential sites are located on the banks of Uruguay River near the mouth of arroyos, near "rapidos", natural passages (pasos), and small cascades (cachoeiras). This pattern suggests that the sites are located in strategic places, where there are significant concentrations of resources related to hunting, fishing and raw material procurement and others resources necessary for human life as fresh water, firewood, wood and plant fibers among others. Recent definition of two Paleoamerican cultural complexes: Tigre (12,300-11,200 cal yr B.P.) and Pay Paso (11,081 to 10,065 cal yr B.P.), allows understanding the cultural diversity for post-Fishtail times. This data is important because it allows recognizing and understanding of the technological reorganization occurred during the Pleistocene-Holocene transition in the Uruguay River basin.

[384] *Facial Asymmetry: Bio-indicators of Stress in Post-Wari Populations*

The role of climatic conditions on sociopolitical systems has been a highly discussed theme in archaeology. Over the past decade, archaeology has had great advancement in the realms of method and theory which have facilitated interpretations of environmental influences on social development. This paper presents research that investigates the biological responses to either environmental or social stresses to help elucidate how ancient Andean populations coped during periods of climatic instability and social and political unrest. Specifically, this paper will discuss the results of a Fluctuating Asymmetry (FA) analysis collected from a Late Intermediate Period (ca. A.D. 1000—1400) skeletal population from the Peruvian south-central highlands. This study analyzed 72 crania using a Microscribe digitizer to record three-dimensional coordinates of standard bi-lateral facial landmarks. Since bilateral structures tend to develop symmetrically under ideal conditions and asymmetrically under stressed conditions, FA is a suitable proxy to measure the developmental instability in human populations. FA was used to compare Chanka populations to illuminate the social conditions after the collapse of the Wari Empire. This research rejects environmental deterministic frameworks and will present alternative explanations to clarify how non-climatic stress can influence skeletal development.

[298] *New 3D Map of the Templo Mayor Architecture, a Symbol of Mexica Cosmology and Political Power with Teotihuacan Tradition*

The 3D map of the Great Temple complex has been elaborated in 2007-2014 with detailed features of thirteen overlapping architectural stages. We first analyze and describe visually each stage calculating dimensions and orientation of the main pyramid complex. Enlarging process gradually changing the spatial distribution and orientations of the temple complex will be discussed in terms of native perspective of cosmology and expanding political power. The E-W orientation and symbolic architecture have been interpreted in relation to astronomical movements and cosmology; however, these hypothetical interpretations need to be reanalyzed with more precise, detailed, and comprehensive map we are creating three-dimensionally for the first time. Our paper also focuses on a new aspect, possible measurement unit or units used by Mexica at the Templo Mayor precinct. Historical references and propositions made by previous studies of Mesoamerican measurement units including those of Teotihuacan will be applied to the new site map to define Mexica standard units. Finally symbolic significance, particularly dichotomy of the Sun/Moon, Dry/Wet, Warfare/Fertility, Male/Female, etc. relating to South/North directionality, integrated in the twin temple of the Templo Mayor will be explored as Teotihuacan tradition representing expanding political force of the Mexica Empire.

[366] *Human/Animal Interactions in the Copan Valley from the Beginning to the End of the Copan Dynasty: Stable Isotope Analysis of the Felids from Altar Q and the Motmot Dedicatory Offerings*

In fifth century Copan, Honduras, beneath the city's first dynastic monument a complete puma was offered beside a female human burial. Over three centuries later, under the watchful eye of sixteenth and final ruler of the dynasty Yax Pasaj, a series of sixteen felids (many of them jaguars) were placed in the dedicatory cache of Altar Q, the "stone of the founder." Here we investigate the remains of some of the largest carnivores on the landscape, the jaguar and puma, to analyze human-felid encounters. These large predators were instrumental icons of power and rulership, but as two of the endangered species that are no longer found in the Copan Valley we must question how humans interacted with these animals, and what they symbolized. Zooarchaeological and isotopic data from these two momentous dedicatory offerings are utilized to reconstruct the entire ritualization process: where and when were these animals acquired, and is there evidence that they were kept in captivity? Why did the ancient Copanecos conduct this sacrifice, and what was the underlying cosmology behind these violent acts? From the beginning of the ceremonial precinct to the demise of the Copan dynasty, human-animal encounters helped re-order and reify the sociopolitical landscape.

[252] *Distributional Studies in North Patagonia, Argentina. An Archaeological Ceramic Approach*

During the last ca. 3000 years BP, there was a change in the socioeconomic organization of hunter-gatherers in Southern Mendoza, north Patagonia, Argentina. New technologies, like pottery and bows and arrows, were incorporated and allowed the exploitation and occupation of marginal areas, such as highlands and arid environments. Technological strategies, mobility and use of space are linked in this research by a distributional analysis of archaeological ceramics from southern Mendoza archaeological sites. The objective is to evaluate the use of pottery in different locations with differential access to water and resources. By considering the patterns of presence, absence and quantities of pottery sherds, different mobility and subsistence strategies can be understood in the study area.

Sullivan, Lynne (University of Tennessee) and Michaelyn Harle (Tennessee Valley Authority)

[187] *Phased Out: The Distinctive Identities of Late Mississippian Communities in Eastern Tennessee*

An often-made presumption is that an archaeological phase (defined mainly by pottery or projectile point types) represents a social group with shared identity. This perspective can conceal other types of cultural variation and practices that may be more significant for presenting and representing group identity. The broadly-defined Dallas Phase in the Upper Tennessee Valley provides a late Mississippian-period example of this type of presumption. While there are broad similarities in pottery styles throughout this large region, there also are distinct differences among architectural styles, mortuary practices, and community plans, as well as in biological variation, which went unrecognized by previous scholars because collections from large, New Deal-era excavations were not studied for decades. This variation at the community level also is situated in differing histories of Mississippian development between geographic localities within the region. An exploration of variation among late Mississippian communities in eastern Tennessee exposes unique characteristics and facets of group identities that archaeological terminology has concealed. The new, comparative view presented in this paper also reveals a dynamic landscape of distinctive communities rather than a monolithic, normative "culture."

Sullivan, Elaine (UC Santa Cruz)

[287] *3D Saqqara: Using 3D GIS to Reconstruct Visibility and Communal Memory at an Egyptian Necropolis*

The integration of GIS and 3D modeling now allows for the recreation and visualization of entire ancient landscapes. 3D Saqqara uses these capabilities to create a truly four-dimensional

exploration of the cemetery of Saqqara, Egypt. The project offers a workflow for how 2D archaeological and architectural data can be transformed into 3D representations of the ancient built and natural environment, while maintaining the geo-spatial coordinate system of GIS and allowing for both quantitative and qualitative visual analysis (specifically 3D aware line-of-sight analysis). By simulating the changing architectural landscape of an entire archaeological site over time, the project demonstrates how the nexus between landscape and memory at ancient sites can be examined in innovative ways. These temporal visualizations allow us to question how the transformation of architectural spaces over time effected peoples' interpretation and memories of past and contemporary communities.

[376] *Two Newly Discovered Maya Chert Tool Workshops in the Belize Valley: Results of the 2014 Surface Reconnaissance*

Few lithic workshops have been found in the Belize Valley of Western Belize. This paper presents the results of surface reconnaissance and debitage collection at two newly discovered chert tool workshops near the villages of Esperanza and Teakettle in the Cayo District of Western Belize. Each of these workshops consists of a single large mound of debitage and includes tools aborted or broken at various stages of manufacture. At both locations, the main tool types produced were oval bifaces and long, narrow bifaces. Based on comparisons to tool types and reduction techniques at other Maya production locations, such as Colha in Northern Belize and El Pilar in Western Belize, both the Esperanza and Teakettle mounds likely date to the Late Classic period (c. A.D. 600-800). The main sources of chert observed at these two workshops appear to be cobbles locally obtained from the nearby Belize River. Preliminary results indicate that the focus of these workshops was the manufacture of utilitarian tools for consumption by farming households distributed throughout the Belize Valley.

Sun, Yan (Gettysburg College, PA)

[234] *Local Communities in the Northeastern Frontier of the Central Plain during the Late Second and Early First Millennium B.C.*

This paper will discuss how local communities in the northeastern frontier of China used metal artifacts and mortuary practice to articulate identity and delineate their cultural and political affiliations among themselves in the region and with polities in the Central Plain during the late second and early first millennium B.C., which was a period that witnessed the rise and expansion of state powers in the Central Plain, namely, the Shang and Zhou. Previous studies examined material culture from the perspective of state expansion and emphasized the dominance of Shang and Zhou culture in this frontier region. This paper instead views the "frontier" as a "center" in which people and communities interacted and negotiated their identities. It introduces the concept of local agency and emphasizes the indigenization of imported artifacts and ideas, as well as discusses the complex socio-political landscape to explain the varied choices made for material cultures by in the frontier communities.

Sunell, Scott (UCLA) and Jeanne Arnold (UCLA)

[310] *The Antecedents to the Specialized Microdrill Industry on Santa Cruz Island, CA*

I analyze more than 400 lithic artifacts associated with the development of intensive Chumash shell-drilling activities from four sites on Santa Cruz Island (SCRI), CA. By the second millennium CE, the Chumash of the northern Channel Islands had developed a specialized bead-making industry and a parallel industry of formal microdrills to perforate those beads (as documented by Arnold [1987]). During the latter part of the Middle Period (A.D. 900-1150), trapezoidal microdrills dominated; in the mid-Middle Period (A.D. 500-900), by contrast, ad-hoc drills with non-standardized methods of manufacture prevailed. These artifacts are flake-drills, identified in small numbers at sites on both the islands and the mainland. I track the origins of microlithic technology on the islands with the region's largest known collection of flake-drills and identify a period of production experimentation at SCRI-474. Type A flake-drills were produced expediently from small flakes and shatter. Type B drills were made on flake forms characterized by bit placement on the long axis. These assemblages chronicle local knappers' experimentation with techniques that would revolutionize the small drill production

process in the region, presaging methods that would become common practice and documenting the earliest steps toward the standardized microdrill industry.

Sunseri, Charlotte (San Jose State Univ)

[34] *Archaeologies by Community Mandate: Who Makes the Call?*

Historically, precious little academic archaeology has occurred under the watchful eye of descendant communities who have witnessed generations of researchers come and go, sometimes with no direct contact regarding the results of archaeological investigations in their ancestral places. Despite more recent overtures to mend these practices, we (as a discipline) are still woefully lacking in this regard. Nevertheless, significant changes in the role of cultural patrimony to that of lynchpin in the mobilization of "community" within the last few years has not only challenged the privileges of the academy, but has also brought researchers closer and more deeply engaged in the contemporary struggles of their hosts and collaborative partners. This reification of community power has meant new kinds of risks and rewards for both sides, and directly impacts the types of research questions addressed in a collaborative project. This paper draws upon examples of nascent research agendas in California, New Mexico, and South Africa to explore why and how what might be seen as taking a chance with research is perhaps the most powerful commitment of all.

[406] *A Saint Jude's Box for Zooarchaeologists In the Making*

Taking on graduate students and shepherding them through the harrowing process of becoming PhD's is something few faculty take lightly. Within the rigorous methodological sub-discipline of Zooarchaeology, even fewer would commit to the requisite long and close apprenticeship with students whose backgrounds lay "outside of the box" of faunal-focused research. Yet, Diane populated her research cluster with a dynamic mixture of scholars from disparate backgrounds, just as she kept the famous "Saint Jude's Box" in her lab for those pieces defying some element of analysis. Though some of these scholars seemed bent on tackling impossible projects, the mentorship and support network sustained among those bone-filled cabinets has resulted in scholarship based around the world and sometimes in the most unlikely of research directions, drawn from the spirit of adventure and resilience modeled by the lab director herself.

[72] *Promoting Responsible Heritage Tourism through Public Archaeology at Two Great Lakes Lighthouses*

Central Michigan University recently undertook a series of public archaeology projects in cooperation with local historical societies and county governments in to investigate two northern Michigan lighthouses that are public parks. The McGulpin Point Lighthouse operated from 1869 to 1906 and was purchased by Emmett County in 2009. The 40 Mile Point Lighthouse was built in 1897, was deeded to Presque Isle County in 1998. The modern political and socioeconomic conditions of the two counties are extremely different, but in both cases archaeological investigations were sought to attract public to the parks. Emmet County, located at the Straits of Mackinaw, already relies heavily on tourism (particularly heritage tourism) for its economy. Presque Isle County, located in the northeast side of the Michigan's Lower Peninsula has extremely high unemployment and few tourist destinations. We compare and contrast the public archaeology projects at these two sites and

explore the ways in which archaeology produced more meaningful experiences with history for tourists and community members. In both cases, our work also included educating society members and public officials of their ethical obligations for responsible heritage tourism.

[148] *Ethnoarchaeological Perspectives on Folsom Households*

Over the few decades, households have been identified in a handful of Folsom sites. Although it should surprise no one that the Pleistocene inhabitants of North America built, lived in, and used domestic structures, it may be surprising we know relatively little about how those household spaces were organized. This problem is hardly unique to Folsom. It could be argued that this is true of hunter-gatherer household archaeology as a whole. Part of the difficulty we encounter in interpreting intra-household spatial patterning is that relatively little research has focused on the factors that govern the spatial organization of human behavior within households in nomadic contexts. Inspired by Folsom household archaeology, the Dukha Ethnoarchaeological Project was designed to examine the general factors affecting where people choose to do things in a modern setting, and how decisions people make regarding spatial positioning should be reflected by material residues in the archaeological record. In this paper, we examine some of the factors affecting the spatial organization of human behavior in the households of nomadic Dukha reindeer herders in northern Mongolia, and how understanding this phenomenon can provide insight into the household archaeology of prehistoric hunter-gatherers.

Susak Pitzer, Angela (University of California, Los Angeles)

[101] *Raw Materials, Reuse, and Refuse: A Multi-Disciplinary Study of Karanis Glass*

This multi-disciplinary study comprising archaeological, scientific, and morphological analyses as well as ethnoarchaeology and textual analysis, interrogates how value was assessed in the ancient world by examining Roman glass from Karanis, Egypt. Onsite portable X-ray fluorescence spectrometry (pXRF) analysis of recently excavated glass was conducted since the Egyptian government prohibits the export of artifacts for further analysis. This research, combined with pXRF and electron microprobe analysis of museum specimens from Karanis, helps distinguish glass compositional groups. A database including several variables--chemical composition, morphology, style, use, reuse, discard, and date--enables the exploration of relationships among variables using statistical analysis to compose a new typology of Karanis glass. An ethnoarchaeological study of modern glass workers in Cairo and in Hampshire, UK allows a reconstruction of the production sequences (*chaîne opératoire*) involved in producing glass objects and relationships between value and technology. The decisions artisans made during the production of glass objects forms the foundation of this typology because they reflect shared conceptions of value in Roman Egypt. This study examines how changes in glass types used at Karanis relate to fluctuations in the economy and to changes in the social, ideological, and political landscape during the Roman Period.

Sutton, Amanda (University of Georgia)

[153] *Toward a Theory of Dispersal as an Adaptive Strategy: Adoption, Migration, and Cultural Survival in the Archaeological Record*

Dispersal of human populations is often perceived as synonymous with abandonment and collapse. Alternatively, cross-cultural studies of historic and contemporary dispersal suggest it should instead be considered a strategic adaptation to external pressures. I argue that strategic dispersal represents a conscious, purposeful transformation of social and cultural structures in the face of bifurcation, resulting in cultural continuity and the selective adoption of external cultural traits and materials. This phenomenon is visible through the archaeological record; however, the most productive way in which to examine strategic dispersal and cultural entanglements is through a synthesis of the archaeological and ethnohistoric records. Utilizing ethnohistorical, ethnographic, and archaeological data from the Americas, West Africa, and Madagascar, this paper examines several

case studies, exploring strategies of dispersal as mechanisms of cultural self-preservation in the face of colonial violence and cultural entanglement. Insights derived from this review are then used to contextualize the 17th-century dispersal of the Huron-Wendat from their homeland in Ontario, Canada. The results of this study offer a new way to conceptualize strategies of migration and cultural integration, and the ways in which people negotiate social, ideological, and economic spheres in the face of colonial entanglements.

Sutton, Wendy (USDA Forest Service, Gila NF)

[282] *Blast Caps and Other Stories of the CCC on the Gila National Forest: Imaging and Reimagining the North Star Road*

The CCC and other New Deal agencies were active across the Gila National Forest during the 1930s. The North Star Road (which experienced earlier use as a Military Road) runs alongside the Gila Wilderness, the nation's first wilderness area, established in 1924. The road is now sandwiched between the Gila Wilderness and the Aldo Leopold Wilderness (part of the first Wilderness established in 1964, under the Wilderness Act). Significant work was conducted along the North Star Road by the CCC. How does the work conducted within this corridor reflect community priorities and values associated with the early wilderness movement? How do we manage this unique landscape and its cultural, recreational, and natural values into the future?

Suvrathan, Uthara (Cornell University)

[49] *Spaces and Places: Examining Historic Maps from South Asia*

This poster presents a preliminary attempt to systematically interpret and analyze historical cartographic data from South Asia. Information from historic maps of South Asia is combined with archaeological settlement data to reconstruct the nature and distribution of regional administrative and religious centers in south central India. Preliminary research in the area suggests that regional administrative centers often occupied a place in local pilgrimage and trade networks. However, this position was not static and seems to have been closely linked to multiple factors such as the political strategies of elites, imperial expansion, regional trade systems, and the establishment of religious institutions. By examining a wide corpus of medieval and colonial maps of South Asia, dating from the 16th century to the early 19th century, and comparing this data to published archaeological settlement data, it is possible to trace some of the spatial and temporal configurations of the loci of political and religious authority. In addition, the poster comments on western and indigenous ideas of the organization (and control) of space.

Swaim, Abby

[359] *Documentation of Missouri White-tailed Deer Chronoclines: Implications for Archaeology, Paleoecology, and Conservation Biology*

Multiple ecological factors (e.g., Bergmann's rule, competition, reproductive rate, home range size, food quality and quantity) may cause changes in animal body size over time. White-tailed deer (*Odocoileus virginianus*) are ideal for studying these variables due to their importance today (to hunters and to wildlife enthusiasts), their known phenotypic plasticity in response to ecological factors, and their high frequency in zooarchaeological collections. Using post-cranial, weight-bearing bone measurements, I determine if stunting of modern Missouri white-tailed deer has occurred relative to prehistoric deer. Possible causes including forage availability, predation and intraspecific competition are evaluated. Missouri samples are compared to modern and prehistoric deer samples from central Texas as a means to gauge current and paleoecological similarities and differences between the two states. The advantages of incorporating paleozoological data with modern conservation biology are highlighted.

Swain, Todd (National Park Service)

[83] *Legal Issues Concerning Cultural Heritage Resources Damage Assessments*

The Archaeological Resources Protection Act (ARPA) was passed in 1979. ARPA requires archaeologists to calculate three different types of value to quantify the amount of loss in federal looting incidents: archaeological value, commercial value and cost of restoration and repair. In 2002, a section was added to the U. S. Federal Sentencing Guidelines to cover the damage, theft and trafficking of Cultural Heritage Resources. These guidelines also require archaeologists to calculate the amount of loss for sentencing purposes. Despite hundreds of training courses and numerous court rulings concerning archaeological damage assessments, many archaeologists are still ill-prepared to complete a document that will withstand scrutiny within the federal legal system.

Swanson, Steve [137] see Vorsanger, Andrew

Swanson, Steve (Arizona State University)

[182] *Mimbres Games, Gambling and Gods*

This paper reviews the archaeological evidence for the presence of games played by the prehistoric inhabitants of the Mimbres region in the US Southwest/Northwest Mexico, emphasizing perishable materials recovered from cave/rock shelter deposits and iconic imagery present on Mimbres ceramic vessels. The archaeological evidence is compared with ethnographic information for gaming and gaming-related activities among Western Puebloan groups. Gaming and gambling among the ethnohistoric Hopi, Zuni and Acoma were important ritual as well as secular activities, and serve as an interpretive framework for understanding the relationship of prehistoric games and gambling with Mimbres ritual.

Swantek, Laura (Arizona State University)

[51] *Understanding Changes in Social Complexity during the Prehistoric Bronze Age on Cyprus: A Bottom-Up Approach*

For at least the last 5,000 years, competition for social and economic control led to the acquisition of social power and wealth by some individuals or groups and the emergence of complex social systems. This paper will present the preliminary results of a larger study intended to identify the changing network structures that underlie society at the household, village and regional scales and led to the emergence of social complexity as a system-level phenomenon during the Prehistoric Bronze Age on Cyprus (2400-1700 Cal B.C.E.). Using data from excavated settlements and cemeteries as proxies for facets of social and economic inequality-- including differential access to resources, labor, and exchange networks-- this research quantifies wealth based on Gini Coefficients and identifies changes in social networks and the emergence of social complexity through time and across space. It incorporates theories and methodologies developed in the interdisciplinary field of complex systems science and network theory in conjunction with anthropological thinking. The results of this work will give us an understanding of how social complexity emerges and changes in middle-range society and offers a more in-depth understanding of the Prehistoric Bronze Age on Cyprus.

[248] *Sourcing the Clay: LA-ICP-MS Analysis of Ceramics from the Programme for Belize Archaeological Project, Northwestern Belize*

This poster presents results of recent provenance research of Lemon Cream ceramics from the Programme for Belize Archaeological Project (PFBAP) region located within the Rio Bravo Conservation Management Area in Northwestern Belize. We used laser ablation inductively coupled plasma mass spectrometry (LA-ICP-MS) on Lemon Cream wares from four different sites within the PFBAP region to determine the elemental signatures and compared them to the elemental signature of clay deposits uncovered in a chultun. The resulting elemental data bear on the nature of possible specialization of ceramics from Hun Tun, a small community located within the hinterlands

of La Milpa.

Swenson, Edward (University of Toronto)

[237] *Rethinking the Urban Microcosm in the Ancient Andes: The Extended Neighborhoods of the North Coast of Peru*

Anthropologists have argued that early urban neighborhoods were equivalent to small villages that maintained kinship relations and economic dependencies characteristic of the rural sphere. Other scholars have noted that different urban centers (including in Mesoamerica, Angkor, and New Kingdom Egypt) were similarly configured as “sociograms” of larger territorial and ethnic boundaries. The political landscape of the North Coast of Peru offers important comparative data by which to assess the social, spatial, and symbolic divisions of pre-industrial cities. An analysis of the residential sectors of a number of Moche settlements in the Jequetepeque Valley reveals that distinct neighborhoods can be tied to rural and likely kin-based affiliations. However, the diversity between these centers and the non-fixed and extended nature of Jequetepeque neighborhoods reveal that North Coast urbanism defies reduction to an Asiatic mode of urbanism (Marx’s “ruralization of the urban”) or related village-state models. Instead, the distinctive neighborhood configurations are best explained in terms of historically specific religious and political ideologies.

[239] *Fire, Forests, Climate and People in the Jemez Mountains: A 500-Year, Landscape-Scale Perspective*

Forests and human communities are now extremely vulnerable to large, severe wildfires during droughts as a consequence of fire exclusion and other land use practices. The extent to which this vulnerability is influenced by extreme climate events and past land-uses remains unclear. Combined studies of climate, fire and human histories from the same landscape can help reveal the relative roles of people and climate variations in driving spatial patterns and temporal trends of wildfires. The Jemez Mountains of north-central New Mexico are an exemplary case of the influences of long-time human occupation of fire-prone, forested landscapes. The southern Jemez Plateau is unique as a case study landscape because it contains many ancient Puebloan village and “field house” ruins located within ponderosa pine forests and pinyon-juniper woodlands. This landscape also contains the densest network of tree-ring reconstructions of fire and climate histories combined in the world, which we have assembled over the past 30 years. In this presentation, I will explore the trends and patterns of fire, climate and human history over the Jemez Plateau during the past 500 years, utilizing these tree-ring reconstructions and the chronology of human occupation of these landscapes from archaeological investigations.

Swidler, Nina (Annulare Consulting, LLC), Johna Hutira (Northland Research, Inc.) and Joyce Francis (Arizona Game and Fish Department)

[197] *Amity Pueblo: A Different Sort of Horror*

In 2011, a portion of Amity Pueblo, located in northeastern Arizona on State land, was extensively damaged by a federally-funded development project. After heavy equipment disturbed features and burials, exposing over 40,000 cultural items, it was no surprise that Arizona permanently cancelled the project. While archaeologists previously evaluated the Pueblo as eligible for listing on the National Register under Criterion D for its scientific research potential, four tribes countered that Amity is a TCP, eligible under Criteria A, B, C, and D. State and federal agencies, tribes, and interested parties are currently trying to develop a research design/treatment plan that satisfies everyone’s concerns. These discussions underscore two seemingly divergent worldviews and interpretations of NHPA’s intent, creating a quandary all too familiar to indigenous communities and

one that is endlessly debated by Academy members. Namely, considering Amity's eligibility under Criterion D, most archaeologists advocate for a standard archaeological data recovery approach, despite the State's commitment to preserving Amity in perpetuity. In contrast, the tribes and a few others favor a less physically invasive approach, including site burial and conducting ethnographic assessments with the culturally affiliated tribes. Here we examine the debate to ascertain the most reasonable, ethical, and prudent treatment strategy.

Swift, Jillian (UC Berkeley) and Patrick Kirch (UC Berkeley)

[339] *The Rat's-Eye View: Tracing the Impacts of the Human-Introduced Pacific Rat (*Rattus exulans*) on Mangareva through Stable Isotope Analysis and Zooarchaeology*

Early Polynesian voyagers transported a suite of plant and animal species to each new island they colonized, forming the foundation of the Polynesian subsistence economy and leading to long-lasting transformations of island landscapes. The Pacific rat (*Rattus exulans*) was nearly ubiquitous on these journeys, perhaps as a potential food source or simply an inadvertent stowaway. With few natural predators, rat populations multiplied quickly after arrival and spread across island landscapes. Their introduction was potentially devastating to native forests and their consumption of small birds and eggs may have led to or exacerbated avifaunal extinctions and extirpations. The limited home range of Pacific rats offers potential to investigate changing environmental conditions on a localized scale. Recent excavations on Mangareva (Gambier Islands) uncovered three sites with continuous well-stratified deposits dating from colonization to European contact (~A.D. 950-1650). Dietary reconstruction of Pacific rat remains from these sites via bone collagen stable isotope analysis reveal an archipelago-wide pattern of rat dietary change postdating the disappearance of most avifaunal species from the zooarchaeological record. Inter-site analysis indicates variation in the nature of these dietary changes, suggesting rat dietary reconstruction provides a new outlook on localized environmental change and adaptive response in island systems.

Swoger, Christopher

[91] *Obsessively Opacifying Obsidian: Adapting Three Dimensional Laser Scanning Techniques*

Three dimensional (3D) imaging technologies are being increasingly utilized by archaeologists to improve the accuracy of material analysis. To facilitate the development of these technologies, it is crucial to determine the limits of different devices and materials. This project focused on the challenge of scanning obsidian blades with the Next Engine HD 3D Laser Scanner, a popular and inexpensive choice among researchers. The Next Engine device was used to scan six small obsidian blades from several Late Holocene sites in northern Kenya. In order to probe the limits of the technology when confronted with dark and reflective surfaces, several simple non-permanent surface treatments and scan techniques were tested on the obsidian blades including the application of an opacifying powder, a coating of cornstarch, and the use of the multidrive object stand. Results are compared with images created using standard lithic illustration methods, photography, and 3D photogrammetry to determine their usefulness in analysis.

Swords, Molly (University of Idaho)

[45] *Unearthing Sandpoint's Chinatown: the Archaeology of Sandpoint, Idaho's Overseas Chinese*

Established in the early 1880s, Sandpoint, Idaho became a bustling railroad and lumber town with commercial businesses sprouting up along the Northern Pacific railroad tracks. Overseas Chinese came through the town when building the railroad, but quickly moved on along with the construction. Who then, were the Overseas Chinese that came and settled, making Sandpoint their home? Archaeological investigations of the original town site uncovered a structure referred to as Sandpoint's "Chinatown" within the city's historical records. While this "Chinatown" area may be small, excavations yielded a plethora of artifacts that give a glimpse into the lives of these Sandpoint residents. This paper will discuss the artifacts recovered from this "Chinatown," and shed more light on the lives of Overseas Chinese in northern Idaho.

Sykes, Naomi (University of Nottingham) and Holly Miller (University of Nottingham)

[339] *Animal Diaspora and Culture Change*

Animal introductions are frequently equated with the introduction of new dietary ingredients; however, this paper will argue that access to 'meat' is seldom the motivation for the importation of exotic species. By examining a number of case-studies pertaining to Britain it will be proposed that many faunal introductions were both inspired by, and resulted in, social, economic and ideological change. Many species were associated with specific deities and because they were imported from beyond the 'known realms' of Britain, were viewed as cosmologically powerful. In this way, the arrival of new species brought real changes for human behavior, impacting upon the way in which identities and relationships were negotiated.

Szpak, Paul (University of British Columbia), Christyann Darwent (University of California, Davis) and John Darwent (University of California, Davis)

[166] *Historical Marine Ecology in Northwestern Greenland: Insight from Stable Isotope Analysis*

This study presents stable carbon and nitrogen isotopic compositions for zooarchaeological specimens from three sites in Inglefield Land (northwestern Greenland) representing approximately the last 1,000 years. Isotopic compositions for planktivorous seabirds (little auks, *Alle alle*) reveal general stability in biogeochemical cycling at the base of the food web since the end of the Medieval Warm Period. On the other hand, marine mammals (ringed seal, bearded seal, walrus) exhibit variable foraging habits across time, with surprisingly high amounts of niche overlap relative to other regions in the Arctic. The results are discussed in light of prehistoric human settlement and subsistence in the region and the potential effects of anthropogenic perturbations on the marine ecosystem.

Szremski, Kasia (Vanderbilt University)

[227] *Entangled Encounters between the Chancay and Chaupiyunginos in the Huanangue Valley, Peru*

This paper builds off of recent calls to re-evaluate Murra's model of verticality and explores the utility of entanglement theory as an alternative way to understand the different relationships that developed between groups living on the western slopes of the Peruvian Andes during the Late Intermediate Period (1100-1470 CE). Entanglement theory is increasingly being used in Old World archaeology to examine the complex types of interdependencies that develop between groups when exotic goods are inserted into local systems of value (Dietler 2010). Recent data from the Huanangue Valley suggests that similar processes may have occurred between the Chancay and chaupiyunginos during the Late Intermediate Period; however the mechanisms through which entanglement occurred in the valley are still being defined. This paper will examine botanic and faunal data from excavation at the sites of Campo Libre and Salitre in conjunction with least cost path analysis in order to reconstruct the dynamics of interaction between the Chancay and Huanangue valleys and to show that the Chancay settlers living in the Huanangue Valley were doubly entangled as they were dependent upon local chaupiyunginos for access to irrigation water as well as on their coastal counterparts for access to peanuts and marine resources.

Szumilewicz, Amy (Southern Illinois University, Carbondale), Izumi Shimada (Southern Illinois University, Carbondale), Carlos Elera Alvarado (National Sicán Museum, Ferreñafe, Peru) and César Samillán Torres (National Sicán Museum, Ferreñafe, Peru)

[371] *Biography and Symbolism of Sicán Painted Textiles: First Approximation*

Simple cotton cloths primed as canvases and painted with complex imagery are the rarest group of fiber arts found in the Andes. Long-term excavations of Middle Sicán (900-1100 CE) elite cemeteries at the site of Sicán on the North Coast of Peru, however, have shown that high quantities of these paintings, often in polychrome and over 10m in length, decorated the interior surfaces of elite tombs. In this paper we present evidence for their manufacture and use, as well as approaches to preserving and reconstructing their rich iconographic content. The use of cane or wooden frames and supports, as well as the portability and varied imagery, size and shape of cloths suggest that

they were used as situationally adaptable means of creating appropriate ritual spaces in the world of both the living and the dead. Additionally, using the documented examples from attached cemeteries of two major temple mounds at Sicán, we compare painted textiles from two distinct contexts as a new line of evidence for understanding how deceased individuals in tombs associated with each temple may have differentiated their socio-political station, economic roles, or familial ties through visual culture in death.

Szymanski, Ryan (Washington State University)

[176] *Nested Proxies: Multi-scalar Approaches to Interpreting Human-Landscape Interactions*

Interpretive challenges involving issues of equifinality and causation can chronically hamper environmental reconstruction efforts, as numerous physical, environmental, or anthropogenic processes may potentially be responsible for creating observed raw data patterns. Nested multi-proxy and multi-scalar analyses offer potential means of approaching these difficult conceptual issues which can plague interpretations reliant on single lines of proxy evidence. A dataset comprised of multiple paleoecological proxies, including pollen, phytoliths, and fungal spores, derived from a five meter sediment core from Mtwapa Creek, Kenya, is presented in order to illustrate these issues and means of resolution. Using the different origin points, production, distribution, deposition modes, and associations of these proxies, I argue that discord in data between these sources can aid in isolating some of the possible environmental scenarios which may have produced particular data patterns, and may enable researchers to more effectively separate anthropogenic versus climatic impacts on past environments. It is proposed that more intensive study of the microbotanical content of sediments is critical to improving paleoecological, and by extension, archaeological knowledge of ancient landscapes and their inhabitants.

Tackney, Justin [238] see Fitzpatrick, Scott

Takamiya, Hiroto (Sapporo university) and Hitoshi Yonenobu (Naruto University of Education)

[115] *Transition from Hunting and Gathering to Food Production on the Ryukyu Archipelago, Japan*

It has been suggested that in order for *Homo sapiens* to colonize islands, food production is necessary. Indeed most islands were successfully colonized by farmers. However, some islands were colonized by hunter-gatherers. These islands are characterized by 1) large areas 2) close proximity to a continent or large island 3) consistent availability of sea mammals 4) Dispersal of edible plant and/or animal resources from the mainland or 5) a combination of these features. Recent archaeological studies have revealed that the islands of the Ryukyu archipelago, especially Amami and Okinawa archipelagos, do not possess any of the above mentioned features but were successfully colonized by hunter-gatherers. In this region, like other regions of the world, archaeologists have been interested in the transition from hunting and gathering to food production. Accordingly, several hypotheses have been proposed. This paper will present intensive paleoethnobotanical studies together with latest radiocarbon C14 dates to discuss the timing and development of this transition.

Takaoka, Ian (Northern Kentucky University) and Jozie Banas (Northern Kentucky University)

[52] *Nukubalavu 1: A Preliminary Examination of Mid-Sequence Ceramics and Culture Change on Vanua Levu, Fiji*

We present new data from the ceramic assemblage from the site of Nukubalavu 1 in Natewa Bay on Vanua Levu, Fiji. The site was excavated in the summers of 2013 and 2014; it is one of the only excavated sites on the island of Vanua Levu. Over 29,400 sherds were analyzed, many of which are diagnostic, typical of stylistic phases in the Fijian ceramic sequence. The assemblage includes Late Lapita (ca. 2500 BP), Fijian Plainware (ca. 2500-2100 BP), and Navatu (ca. 2100-900 BP) phases of the Fijian mid-sequence, representing what are considered distinct culture historical periods in Fijian prehistory. In the summer of 2014, we discovered an increased amount of grog, white sand, and coarse black sand used as tempers. Arc dentate decoration is visible on some fragments, and a previously unrecorded style of surface decoration, a fish-hook shaped design, was discovered on

shallow bowl fragments from excavations during both years. Concurrent to these designs are highly everted vessel forms, extremely sharp or rounded lips, and entire vessel sections with firing clouds, soot residue, and red ochre paint, which have the potential of yielding detailed information about manufacture and use by Fijian communities during the mid-sequence period.

Talcott, Susan, Jelmer Eerkens (University of California, Davis), Eric Bartelink (California State University, Chico) and Ken Gobalet (California State University, Bakersfield)

[293] *Stable Isotope Perspectives on Diet and Mobility in the California Delta*

Isotopic variation in individuals allows us to track differences in diet, mobility, and migration between various demographic categories including age, status, and sex. We use stable isotopes of carbon and nitrogen to analyze diet and oxygen to examine human mobility from a range of sites in Yolo and Solano counties, with a focus on how marine vs. freshwater aquatic resources were exploited. Stable isotope results are compared to faunal remains from the same sites to establish baseline data for interpreting human diet and mobility patterns. Preliminary isotopic results show significant heterogeneity among individuals in regard to access to high trophic-level marine protein.

Anadromous fish such as salmon and sturgeon are presumably the primary contributors to high trophic level marine protein, though residential shifts or logistical mobility to coastal locations is also possible. Heterogeneity in aquatic resource use has important implications for understanding food procurement and fishing practices in the California Delta.

[274] *Exploring Technological Organization through Time: Mimbres Pottery Production*

For some time, archaeologists have sought to characterize the manner in which ceramic technology was organized in the Mimbres area of southwestern New Mexico. Recent syntheses of INAA compositional data allow for a more thorough characterization of the organization parameters associated with ceramic technology in the Mimbres region. Here, we present a more contemporary analysis of the manner in which ceramic technology was organized in the Mimbres area using Costin's (1991) organization of production parameters coupled with extant compositional data derived from over 3000 samples submitted for chemical characterization by means of INAA. The results of these analyses demonstrate that ceramic technology in the Mimbres area became increasingly organized at the community level through time. We then offer a few suggestions as to why this pattern possibly emerged.

[145] *Wide-Range Regional Interaction Prior to State Formation in Late Prehistoric Eastern Japan*

In Japan, pottery of various regions was transported for long distances in different directions at the same time and was incorporated into local pottery assemblages from the late second to third centuries A.D. This happened prior to the appearance of the highly-standardized keyhole-shaped burial mounds all over Japan and, in western Japan, local adoption of the type of pottery typical of the Kinki region where the central polity emerged. In eastern Japan, the type of pottery under the influence of the Tokai region, an eastern neighbor of Kinki, was locally adopted in various regions. Because of these observations, archaeologists have focused attention on the move of people from Kinki and Tokai. Results of analyses of settlement patterns, pottery, and micro-geography in eastern Japan reveal that settlements at that time were located along the routes of water transportation and that local people in eastern Japan moved along the routes for short distance but not in

neighborhood. The nature of the wide-range interaction in eastern Japan in the late second and third centuries was a chain of such short-distance interactions among local people.

[49] *Neolithic development in eastern Dongbei region, China*

Dongbei region, an inclusive name for three provinces of Heilongjiang, Jilin, and Liaoning in Northeast China is distinguished from the Huanghe culture (Yellow River) by a distinct cultural sequence beginning in the Early Holocene. Compared to Liaoning region, which is better known outside China, Jilin, a province bordering North Korea has been left mostly unknown despite its critical geo-political importance throughout prehistory and history. Jilin is a home of multi-cultural interactions, flowing different cultural customs, goods and idea throughout prehistory and history. This paper presents the sequence of the early Neolithic occupations from 10,000 – 8,000 BP to the later Neolithic period, locally known as the Hamin culture (6,000 – 5,000 BP), based on ecological and archaeological studies in two sites, Houtaomuga and Shuangta. Our research focuses on changes in diachronic changes settlement and subsistence changes as well as differences in two settlements.

[155] *Quaternary Chronostratigraphy and Archaeology of Big Bone Lick, Kentucky, USA*

Big Bone Lick in northern Kentucky has been a critical site in the historical development of North American Quaternary vertebrate paleontology and archaeology since the 1700s. Solid-sediment cores, stream profile excavations, vertebrate paleontology, archaeology, accelerator mass spectrometry radiocarbon and optically stimulated luminescence dating, and stable carbon and nitrogen isotope analyses were undertaken to address the lack of a modern study of the Quaternary chronostratigraphy and to provide a framework for past and future paleontological, geoarchaeological and paleoenvironmental studies at BBL and elsewhere throughout the US Midwest. Three major geomorphic surfaces are recognized at BBL, which represent significant periods of floodplain aggradation, since the Last Glacial Maximum. These date to the Early Woodfordian Tazewell (25-19 ka), the Late Woodfordian Cary (14-12 ka), and the Late Holocene (5 ka to the present). Unconformities suggest that significant periods of degradation occurred during the transitions between cold and dry to warm and moist climates from the Older Dryas to Bølling Oscillation and again from the Younger Dryas to the Holocene Climatic Optimum. Increased anthropogenic activities since ~5 ka led to increased soil erosion and floodplain aggradation. Stable isotopes demonstrate that the landscape was dominated by C3 vegetation since the Last Glacial Maximum.

[194] *The Birth of Ehecatl: The Cultural Origins of the Avian Wind God OF Central Mexico*

One of the most striking deities of the Aztec pantheon is Ehecatl-Quetzalcoatl, a duck-billed being embodying such ethereal concepts as rain-bringing wind and the breath of life. He is in jarring contrast to Quetzalcoatl, who although embodying the same concepts of wind, is a quetzal-plumed rattlesnake in Aztec thought. This study argues that in contrast to the plumed serpent, Ehecatl-Quetzalcoatl constitutes a relatively recent introduction of an avian wind deity from eastern Mesoamerica into Central Mexico during the Postclassic period. Similar duck-billed human figures appear as early as the Early Formative in coastal Chiapas, and continue in Middle Formative Olmec and Late Formative Isthmian and Maya iconography, including the Tuxtla Statuette and the West Wall mural at San Bartolo. For the Late Classic Maya, there is explicit epigraphic and iconographic evidence of a duck-billed wind deity, and in striking contrast, such a being is completely unknown in the rich corpus of documented imagery from Teotihuacan, Cacaxtla, Xochicalco and other sites of Classic Central Mexico. I will note that the Initial Series Group at Chichen Itza provides a remarkably detailed corpus pertaining to this wind deity during the Early Postclassic, quite probably when this being was introduced into highland Mexico.

[250] *The Presence of a Gallinazo Component During the Middle Moche Period In the Lower Jequetepeque Valley*

This work seeks to characterize the presence of the Gallinazo component in the lower Jequetepeque valley during the Middle Moche period through an analysis of funerary contexts from the sites of San José de Moro, Mazanca, Dos Cabezas and Pacatnamú. Using bibliographic sources and excavation data, this project searches for indicators within burial traditions of interaction between two different cultural groups that coexisted spatially on the north coast of Peru. Through an analysis of a number of grave contexts, this work aims to illuminate the interaction of possible distinct populations with similar cultural traditions, but with distinct stylistic developments. The ultimate objective is this study is to assess whether Gallinazo local elites were subordinated to Mochica elites using the frequency of ceramic styles corresponding to each cultural group within the funerary contexts from the Middle Moche period.

Taylor, Geoffrey (UC Berkeley)

[347] *Middle Formative Plant Use on the Taraco Peninsula, Bolivia*

The Middle Formative (800-250 B.C.) on the Taraco Peninsula was a period of burgeoning status and wealth differentiation that saw the rise of platform mound construction and the intensification of quinoa farming nearby the shores of Lake Titicaca. This paper will present data from a macrobotanical analysis of the site Alto Pukara, a 3.25 hectare village excavated in 2000 and 2001. A thorough examination of the distribution of charred plant remains across all contexts of a single structure will be undertaken with the goal of explaining use of space and general patterns of plant use. These data will be compared to those generated from prior analyses of two other villages on the Taraco Peninsula: Chiripa and Kala Uyuni. Through this, the paper will contribute to a regional chronology of plant use spanning the entire Formative period (1500 B.C. - A.D. 500), with particular attention to how fuel and foodways shifted in relation to status differentiation and farming practices. Due to an absence of botanical data from the heavy fraction for Alto Pukara, the paper will also focus

on the statistical analysis of how the heavy fraction of flotation samples affects the archaeobotanist's view of past plant use.

[245] *Exploring the Effects of Endemic Warfare and Violence on Women and Children at Casas Grandes*

Bioarchaeologists have consistently explored the role that males play in warfare and raiding but the impact of warfare on women and children has been less of a focus. Other studies have shown that women sometimes play a role in fighting, and that women and children suffer from things such as declining resources, losing males from the household, and forced relocation. Casas Grandes provides a case study for the examination of women and children during what was likely to have been a period of endemic warfare. Data regarding age-at-death, burial location, indicators of morbidity, and preliminary trauma are examined in order to compare sex and age subgroups throughout the occupation. The analysis of the skeletal remains show that both men and women show evidence of trauma and poor health, and that children show instances of physiological stress. Data derived from the Casas Grandes burials are compared with health profiles from other contemporaneous groups not involved in warfare. These results suggest that warfare and its effects go far beyond what happens to the male combatants.

[27] *A "Lost" Collection Makes Its Way Home: The Long Road of the Lost Village of Encino*

When a major village site was encountered during construction monitoring in the early 1980s, newspapers declared that the "Lost Village of Encino" had at last been found. In reality, archaeologists suspected its presence since the 1950s based on descriptions of the Portolá expeditions of 1769 and 1770. The resulting archaeological data recovery produced a large collection of artifacts, as well as human and animal burials. Subsequent disputes between the developer, archaeologists, the Native American community, the State Department of Parks and Recreation and even the California Legislature tested the limits of relatively new cultural resources laws in California, and the Encino Village collection remained in limbo, without a complete analysis or a permanent home. This paper will discuss the current efforts to address the situation and to bring this important San Fernando Valley collection back home, so that both researchers and the Fernandeno people have an available connection to the past.

[185] *Palaeo-Eskimo Exploitation of Inland Chert Quarries on Southern Baffin Island, Nunavut, Canada*

The southern Baffin Island chert sourcing project was initiated in 2007. Eight years of fieldwork and geochemical analysis have allowed us to refine our chert characterization technique and its instrumental application. We have successfully characterized two large chert quarries in the interior of southern Baffin Island using solution ICP-MS trace element analysis. We have also linked chert artifacts from one of these quarries to a nearby Paleo-Eskimo occupation site, demonstrating

transport of quarried material to the site for further reduction, rather than direct exploitation of locally available secondary cobbles. Our present four-year project is now entering its final stage and is focused on applying our refined characterization technique to coastal chert samples from previously investigated Paleo-Eskimo archaeological sites. With the obtained geochemical signatures, we aim to link the coastal materials to inland quarries to provide another line of evidence to reconstruct and evaluate ancient seasonal land use patterns in this region of the Arctic. Much of the lithic landscape of southern Baffin Island remains undocumented. We expect that some artifacts will fall outside the chemical distribution of known quarries. Future field and laboratory research will be directed at documenting and characterizing as yet unknown sources represented by these artifacts.

[25] *Transport Jars at the Mycenaean Citadel of Tiryns, Greece: New Evidence from Petrographic Analysis of Trade in the Late Bronze Age Eastern Mediterranean*

The analysis of Transport Stirrup Jars in the Aegean world has been seen as a test-case for the relative effectiveness and reliability of chemical and petrographic analysis in terms of provenance. These jars are important as they moved in large quantities between the 'Minoan' and 'Mycenaean' worlds and because they sometimes feature inscriptions in Linear B, reflecting elite control of production and consumption in Crete, as well as in a variety of mainland 'palaces'. This makes the vessels key to our understanding of palatial Bronze Age economies, their modes of control, their collapse and successors. Encouraged by recent successful work in Kommos, Crete, which revealed large scale commodity exchange, this project looks to the Mycenaean world and specifically at the fortified citadel of Tiryns. After an important macroscopic study previously reported at SAA, a large number of TSJs and also a range of Canaanite Jars of Levantine style, which are known to have transported commodities such as resins and oils, have been analyzed by thin section petrography. The provenance of the jars provides important new evidence for trade and exchange in a period thought of as the twilight of the Mycenaean Palaces.

[53] *Obsidian Access and Territoriality at the Upper Paleolithic Shimaki Site, Hokkaido, Japan*

Although Hokkaido Japan boasts a rich concentration of obsidian resources, studies focusing on its role within Paleolithic hunter-gatherer subsistence and territorial systems are in their infancy as high-quality geochemical analysis is just emerging. Combining XRF geochemical obsidian sourcing analysis coupled with qualitative and quantitative data on individual artifacts, we are able to conduct fine-grained exploration of tool stone procurement, consumption, and use of an entire artifact assemblage (tools and debitage) from the Last Glacial Maximum occupation (21,400 14C years ago) of the Shimaki site. We first compile XRF geochemical obsidian sourcing data on all artifacts to map the abundance of obsidian sources utilized at the site. Next, we correlate obsidian source and tool/debitage type to reveal underlying preference patterns based on specific raw material characteristics (e.g., size, shape). Consumption rates of tools are then compared to construct behavioral scenarios of how the obsidian resources were managed after procurement or exchange, as well as group mobility patterns in relation to subsistence resources. Finally, we speculate about the possible extent of and influence of geographic barriers on Shimaki hunter-gatherers' foraging territory.

Testard, Juliette (Paris 1 / UMR 8096 Archéologie des Amériques)

[39] *Women, Metaphors of Alterity. Expressing Elites Interactions at Cacaxtla-Xochitecatl (Tlaxcala) and Xochicalco (Morelos)*

Recent strontium analyses have revealed that many women buried in the Feathered Serpent Pyramid in Teotihuacan changed their environment at least two times during their lifetimes. This suggests that their role, especially in cultural interactions, was particularly important, a hypothesis already presented by Gillespie and Joyce (1997) for Maya societies. An iconographic study of mural

painting, figurines, and sculptures from Cacaxtla-Xochitecatl and Xochicalco, two Epiclassic cities well known for their eclectic styles, sheds on light an important concern in representing women, not only as fertility metaphors, but also as leaders, warriors, captives and ritual specialists. The evidence presented leads us to ask whether this figurative transformation reveals a real resurgence of intermarriages, or if it is a metaphoric way to express a relationship between political entities.

Testolini, Veronica (University of Sheffield)

[79] *Cooking Vessels of the Early Medieval Village of Miranduolo, Tuscany: A Petrographic Study*
Excavations at Miranduolo, Tuscany revealed a substantial Medieval settlement and castle, with a rich architectural and ceramic sequence from the 7th-13th century. The ceramic record is dominated by coarseware, mainly cooking pots, which offer a reliable indicator of date at the site, but also a window on everyday life, of choices regarding food preparation equipment. Petrographic analysis has been employed in order to understand if these coarsewares were produced by the village inhabitants for their own use in a household context, or whether they are the product of one or more external centers, with subsequent distribution of their products. Changes in these patterns over the six centuries of occupation are of interest, as the site developed from a small village to a local center of power. The study demonstrates that during the early middle ages Miranduolo was a consumer of cooking pottery, apparently not a producer. Several different fabrics were identified, some of which correlate to geology and analyzed material produced at other centers in Tuscany. Specific raw material choices, such as calcite temper, are also of interest. One of the main sources for the Miranduolo cooking vessels is a nucleated workshop active since the late Roman period.

Thakar, Heather (Temple University)

[41] *Evidence of Specialization and Intensification of Small Seed Exploitation on Santa Cruz Island, California*

This paper reconstructs shifts in botanical foraging behavior on Santa Cruz Island, California and quantitatively demonstrates specialization and intensification in the exploitation of small oily and starchy seeds from the terminal Early Period (ca. 3000 cal. BP) through the late Middle Period (ca. 1000 cal. BP). This shift accompanied an increased reliance on terrestrial food resources overall. A recently recognized climatic transition (2800 cal. BP-1800 cal. BP) likely altered the geographic distribution and productivity of marine and terrestrial resources across the Northern Channel Islands of California. The data presented in this paper suggests that increased reliance on terrestrial plant food resources reflects adaptation to decreased productivity of the nearshore marine environment and increased productivity terrestrial food resources.

Tharalson, Kirsten (University of Oklahoma)

[166] *X-Ray Analysis of Mandibles from a 2000 Year-Old Bison Kill Site in Western Oklahoma*

The seasonality of the kill events from Certain site in Beckham County, Oklahoma is determined through x-ray analysis of bison mandibles. The distribution of bison dentition at archaeological sites has been studied extensively to provide information about seasonality, age, diet, and migration patterns. Because bison calf at roughly the same time during the year, understanding the age at death determines the seasonality of the kill. Knowing the seasonality of a bison kill reveals when a site was utilized and where on the landscape people were at different times of the year. Through x-ray analysis of several Bison mandibles from the Certain site, an age profile of the individuals analyzed can be created and the seasonality of the kills can be determined. The age profile created from the dentition is compared here with the age profile created from epiphyseal fusion rates of the bones from the same site. In addition, the seasonality of the kills as determined by x-ray analysis is compared with previous seasonality estimates.

Thomas, David (American Museum of Nat History)

[341] *Alpine Adaptive and Paleoenvironmental Change at Alta Toquima (Central Nevada)*

Why did some Great Basin foraging families spend their summers atop the very highest place in their world? Julian Steward briefly considered this question in the 1930s, but the issue resurfaced with the chance discovery of Alta Toquima, a 31-pithouse residential site at 11,000 feet. More than 150 14C determinations from Alta Toquima and nearby Gatecliff Shelter permit fine-tuned comparisons of cultural and paleoclimatic change spanning the last 7000 years. The Alta Toquima residences track both short- and long-term xeric signals (meaning that people lived in alpine houses mostly in times of drought). Conversely, Gatecliff Shelter tracks short-term mesic pulses when Monitor Valley foragers stayed at lower elevations during wetter intervals.

[3] *Mistaken Identity?: A Reassessment of the Angel Mounds Historic Cemetery Site Using Anthroposcopic and XRF Analyses*

In 1940, a collection of human skeletons were excavated from a historic cemetery on Mound F at Angel Mounds State Historic Site, near Evansville, Indiana. Based on the presence of a single historic grave stone, these remains were determined to be Euroamerican. However, after further study of morphological characteristics and copper staining, we suggest that several individuals are of Native American descent. An evaluation of the elemental composition of the copper staining using a portable X-ray fluorescence spectrometer (XRF) suggests that the copper objects placed within the burials were composed of native copper as opposed to European copper. The results of this research have implications for the future of these individuals, as a reassignment of 'Native American' to these human remains will place the collection under the purview of the Native American Graves Protection and Repatriation Act. The study underscores the importance of re-investigating human remains identified decades ago, and questioning 20th century assumptions about ethnic and cultural identity.

[72] *Bridging the Great Cultural Tourism Divide: Working with the Tourism Industry*

A growing public interest in archaeotourism has resulted in greater numbers of visitors to archaeological sites as well as tourism being increasingly being seen as a use for sites for both social and economic reasons. While additional visitors can generate more revenue for local interests, they also increase human impact on the site. Tourism operators, archaeologists, and heritage managers frequently work at the same sites, but they often work in isolation. While many sites are preparing for tourists, collaboration between these groups would greatly strengthen the sustainability of the cultural assets and the amenities provided. A few years ago, the Archaeological Institute of America (AIA) worked with the Adventure Trade Travel Association (ATTA) to put together a manual on responsible tourism for visitors, site managers, and tour operators. Collaborations of this nature provide ideal starting points for cooperation and for archaeologist and cultural heritage managers to express their needs and concerns. This paper discusses the advantages of working with the tourism industry and provides insights into the positive nature of the collaboration between the AIA and ATTA.

[311] *A Comparative Analysis of a Potential Tavern Site in Jackson, North Carolina*

Residents of Jackson, North Carolina in Northampton County have found what they believe to be an 18th century tavern site. The area was inhabited by the Tuscarora until the Tuscarora War ended in

1715, after which European settlers began to move into the region. The residents of Jackson believe this to be a tavern owned by Jephtha Atherton. This research assesses this claim by comparing those artifacts to the artifacts at two other contemporary taverns: Dudley's Tavern in Halifax, North Carolina and Wetherburn's Tavern in Colonial Williamsburg. This will also provide a chance to create an artifact pattern for North Carolina's colonial taverns.

Thomas, Colin

[371] *Smelting and the Sacred at Dos Cruces: Technological and Ritual Activity at a Chimú Era Smelting Site*

In November 2013 the Las Minas Archaeometallurgical Project completed excavations at the Chimú Era copper smelting site of Dos Cruces in the Zaña valley. Dos Cruces is an artificially terraced hill located near a river and several known copper mines. The site was divided into 4 distinct sectors, each of which was put to a different use. This paper focuses on excavations and preliminary laboratory results from the industrial or smelting sector of Dos Cruces, an area filled with slag, furnaces, and other smelting remains. Large areal exposures revealed a system for producing metal significantly different to earlier smelting sites in the region including wall systems for directing wind toward furnaces and an absence of blow tubes; indicating a discontinuity in technological tradition following the Chimú occupation of the region. In addition, multiple indications of ritual activity were found including animal sacrifice, ritualized killing of furnaces, feasting and production of chicha, offerings of imported ceramics, and at least 3 episodes of site burial and rebuilding. These discoveries provide some of the first insight into the non-technical aspects of the poorly understood topic of smelting in the Andes.

[406] *Parallel Practices: The Importance of Joining Creative Action and the Sciences in the Work and Legacy of Diane Gifford Gonzalez*

As a scholar, novelist, and poet, Diane Gifford Gonzalez's contribution to archaeology is proof that the pursuit of the arts as a personal endeavor enriches practice. Artistic practice fosters perception of associative relationships, develops a trust in the intuitive, and cultivates personal skill sets linking material media, form and meaning. In engaging in such parallel practices Gifford Gonzalez has fostered an approach to archaeology that has bridged the gap between positivist and post-modern approaches, to create an enriched discipline of multivocality and resonance. This paper explores the importance of a personal engagement in the arts for the growth of the discipline as a whole.

[52] *Early Settlement of Atolls in Eastern Micronesia: Investigations on Mwoakilloa Atoll*

While atolls are the most ubiquitous island type in the Pacific, there has been a general dearth of archaeological research to help elucidate when they were settled prehistorically and how they fit into regional systems of exchange and interaction, particularly in Micronesia. Recent fieldwork on Mwoakilloa Atoll in the eastern Caroline Islands have shown that settlement of the island ca. 1700 cal. BP coincides with the earliest occupation of larger high islands in the region (1700-2000 BP). Investigations also demonstrate the anthropogenic creation of a mound on the main islet, suggesting long-term occupation and more intensive food production strategies. Preliminary zooarchaeological analysis also indicates the incorporation of several well-known commensals (dogs, rats, and chickens). Results show that dogs and rats were brought to the island around the time of initial occupation. As would be expected, however, major protein sources consisted primarily of marine foods, with a heavy reliance on nearshore fish supplemented by mollusks and several terrestrial animals.

Thompson, Kerry (Northern Arizona University)**[97]** *"Soundcheck": On the Status of Native American Oral Histories in Archaeological Practice*

Many archaeologists support the inclusion of Native American oral histories in archaeological practice; however, the use of oral histories in archaeology is not systematic or singular. In order to develop a clearer picture of the application of oral history in American archaeology, I quantified and analyzed the use of oral histories in peer-reviewed articles. This poster presents the results of an analysis of journals in American archaeology from 1980 to the present that demonstrate the different uses to which oral histories are put, the frequency with which oral histories are used in archaeological practice and the contributions oral histories make to our archaeological understanding of the past.

[97] *Chair***Thompson, Victor (University of Georgia)****[105]** *Discussant***[178]** *Chair***Thompson, Jessica (ConocoPhillips), Christopher Merriman (University of New Mexico), Clayton Meredith (University of New Mexico), Keith Prufer (University of New Mexico) and Megan Walsh (Central Washington University)****[155]** *Human-Climate-Landscape Interactions within the Rio Blanco Basin, Southern Belize*

Excavations of alluvial terraces along the Rio Blanco, near the Maya site of Uxbenká in southern Belize, Toledo District, record Holocene human impacts and sediment aggradation from the pre-ceramic through the modern period. Assuming sediment aggradation rates on the terraces are inversely related to basin-wide hill slope erosion allows us to develop a landscape evolution model during the Holocene and investigate possible anthropogenic vs. climatic effects on the landscape. Radiocarbon dates and soil profiles from several units on the Holocene terraces adjacent to the Rio Blanco define periods of landscape stability followed by rapid aggradation. Our results suggest that sediment aggradation rates, and hence erosion of the landscape, was highest during the Middle Holocene and is coincident with the transition to sedentary communities and the adoption of agriculture. Erosion rates and the consequent sediment aggradation rates on the terraces were lower during the Classic Maya period until the present. Our study suggests anthropogenic influences, rather than climate alone, lead to widespread erosion of the landscape during the Middle Holocene.

Thompson, M (Arizona State University)**[372]** *Ancestors and Ancestral Spirits: Understanding the Spirits of the Dead in Prehispanic Settlements of the American Southeast and Southwest*

This paper addresses the social memories and identities of the spirits of the dead in the Prehispanic American Southeast and Southwest to consider their involvement in socio-political affairs. I argue that archaeology can begin to identify different kinds of spirits in the mortuary record, and that these spirits play different, unique roles in respective communities. I describe an effort to recognize ancestors, ancestral spirits, and/or collective groups of the dead in a Mississippian period village on the Georgia coast and two Protohistoric period towns at Zuni. The study involves a comparative mortuary analysis that examines the performance of mortuary ritual at the Irene Mounds site in Georgia and at the Zuni towns Hawikku and Kechiba:wa. Here, I focus on a multivariate statistical approach for characterizing and interpreting body treatment in the mortuary record. Analysis results highlight the memories and identities that the living created for the spirits of the dead in these settlements and emphasize the relationships that people maintained with these beings. This work encourages us to recognize that Prehispanic communities of the Southeast and the Southwest were composed of both the living and the spirits of the dead.

Ancient Maya Centers of Uxbenká and Ix Kuku'il, Toledo District, Belize

This paper compares two ancient Maya centers in the Toledo District of Belize, Central America. The two Classic Period (A.D. 250 – 800) Maya polities of Uxbenká and Ix Kuku'il are located ~ 7 km apart in the southern foothills of the Maya Mountains. Ongoing work at Uxbenká suggests that it is both the earliest established and the longest occupied site in the southern Belize region. Thorough radiocarbon dating and ceramic sequencing by the Uxbenká Archaeological Project has resulted in a detailed occupational history of Uxbenká beginning in the Late Preclassic (400 B.C. – A.D. 250), with abandonment of the site during the Terminal Classic period (A.D. 800 – 1000). Ix Kuku'il, which was first excavated in 2014, appears to have been occupied during the Late Classic (A.D. 600 – 800) period, with some evidence for local settlement predating the establishment of monumental architecture. GIS analysis of settlement patterns suggests variations in spatial organization between the two centers, and preliminary artifact analysis hints at variations in material goods and production as well. This presentation will compare Uxbenká and Ix Kuku'il through an analysis of settlement patterns and the distribution of resources and artifacts associated with the two sites.

[356] *Tortoises as Indicators of Diet, Site Formation, and Paleoenvironments in the Middle Stone Age Record of the Southern African Coast*

Tortoises are one of the most common faunal components at many Middle Stone Age (MSA) sites on the southern coast of South Africa. They provide protein, fat, and other 'animal' resources in a 'collectable' package, which gives rare insight into the collected component of MSA diet. At most MSA sites, tortoise assemblages are dominated by *Chersina angulata*, a medium-sized tortoise with sufficient calories to provide approximately 20 – 30% of the daily energetic requirements for an active adult hunter-gatherer. *C. angulata* have distinct sexual dimorphism and allometric growth stages that allow past population structure and human predation patterns to be reconstructed quite specifically by pairing zooarchaeological and taphonomic data with data collected from tortoises killed in recent bushfires. Tortoise assemblages from Pinnacle Point Cave 13B and Blombos Cave show distinct differences in skeletal element abundances, taxonomic composition, and bone surface modification. This indicates differences in human and non-human predation patterns, although processing sequences were likely similar. The distinct ecologies and sizes of the tortoise species found at each site also highlight potential differences in paleoenvironmental conditions.

Thompson, Daniel

[418] *Exploring the Ethics of Archaeological Site Prospection in Google Earth*

With the release of Google Earth for consumer use, archaeologists were an early professional group to begin exploiting this resource for identifying potential archaeological sites around the world. However, it seems as though the ability to detect sites using this powerful tool might have advanced faster than the ethical considerations of site detection, validation and protection that most countries require today. This paper will explore the history of site prospection via Google Earth and the ethical considerations that arise when potential archaeological sites are detected using this widely accessible platform. Case studies will be presented in which such work is conducted within the framework of legitimately permitted surveys as well as examples where potentially significant sites have been identified without any official permission at all. The ultimate goal will not be to present a set of ethical guidelines for those who use Google Earth for site prospection but rather to begin a conversation to determine what those ethical guidelines might be moving forward as the satellite imagery improves and the ability to identify potential sites increases.

Thornton, Taylor [230] see Wiewel, Adam

Thornton, Erin (Washington State University) and Arthur Demarest (Vanderbilt University)**[338]** *At Water's Edge: Ritual Maya Animal Use in Aquatic Contexts at Cancuen*

Excavations at the Late Classic Maya site of Cancuen (Petén, Guatemala) uncovered small-scale hydraulic systems including stone-lined canals and reservoirs within the site's architectural core. The abundance of other nearby potable water sources, along with the elaborate form of the system demonstrate that it served an ideological rather than practical function. This interpretation is supported by the artifactual material deposited in the reservoirs, as well as by the fact that the hydraulic system connects and flows between several of the site's ritual architectural complexes. Moreover, the reservoir located in front of the site's royal palace contained the remains of at least thirty slain individuals, who may represent members of the royal court massacred during the site's collapse. This paper reports the animal remains found within the site's reservoirs to further explore the nature and extent of ritual and disposal activities within these aquatic contexts. Inter and intra-site comparisons are also used to contextualize the results within broader discussions of how we identify ritual activity in the zooarchaeological record, and the role of water in ancient Maya ideological and political systems.

Throgmorton, Kellam (Binghamton University) and Richard Wilshusen (History Colorado)**[82]** *A Historical-Processual Approach to Household Architecture in the Northern U.S. Southwest*

The transition from lightly built, short-term or ephemeral structures to substantially built, sophisticated dwellings occurred between A.D. 400 and 1400 in the Ancient Pueblo Southwest. At the early end of this period, most dwellings were occupied by a single household and may have only been occupied for about a decade. By the end of this period, nearly the entire population of the northern Southwest lived in multi-household, apartment-style dwellings that housed entire villages for generations. This 1000 year architectural transition obviously evinces many concurrent changes in Ancient Pueblo society. Our paper focuses on the middle portion of this period of architectural and social development from A.D. 650-1150. During this interval, both more and less substantial dwellings were simultaneously constructed by households with different social and cultural backgrounds. We consider these differences in houses and households from the perspective of historical process, which include population movement and dialectical relationships within Ancient Pueblo society.

Thulman, David (George Washington University)**[80]** *The Use of Bayesian Statistics to Increase both Precision and Accuracy in Radiocarbon Dating*

Many archaeologists struggle to make sense of radiocarbon dates, especially those with large overlapping sigmas. Even with modern analytical techniques that increase precision, the results can be confusing. Bayesian statistics, which employs prior information to constrain posterior results with sets of radiocarbon dates, can lessen confusion and increase precision without using ad hoc measures, such as averaging or ignoring dates with large errors. The power and utility of Bayesian analyses is demonstrated using the suite of dates from Dust Cave and sets of related dates from several Paleoindian and Early Archaic cultural phenomena in North America to clarify their relationships and infer population dynamics.

Thurston, T.L. [63] see Shaffer Foster, Jennifer

Thurston, T. (SUNY Buffalo) and Aadel Franzén (Jönköping Läns Museum)**[154]** *Opulent Harvest in a Kingdom of Stones: Landscape and Livelihood in a Marginal Upland Zone*

Relationships between subjecthood and rulership in northern European societies changed significantly between the late prehistoric and early modern eras, as long-extant nations were absorbed by emergent states. Using a landscape approach to food production and livelihood affordances, we study changing conditions and production strategies of forest agropastoralists in a marginal Swedish upland, through episodes of climate change and turbulent interaction with

governing powers. Perspectives on relationships between farmers and kings have long been dominated by top-down theories, suggesting that subject populations are forced or coerced into submission by 'rising' states. In contrast, we argue that governments are supported by the productive capacity of their constituents, and rulers are held in place (or not) based on the authority granted by their subjects, even in authoritarian states.

[58] *Granite and pXRF: An Experimental Approach to Nondestructive Sourcing of Ground Stone Tools*

Portable x-ray fluorescence (pXRF) is a rapidly spreading yet controversial technology in archaeology. Current research on pXRF technology has produced marked improvements in calibration standards and accuracy of results. Previous studies using pXRF have focused primarily on obsidian and basalt; however with current advances in technology it is possible and necessary to test the applicability of pXRF to accurately characterize heterogeneous materials. This research proposes a methodology for analyzing heterogeneous materials, specifically granite, via pXRF with the aid of international standards for calibration. Preliminary data obtained from Maya ground stone tools collected from Belize indicate pXRF can be successfully employed as a method for distinguishing between granitic plutons. Belize ground stones present an ideal case study due to the isolated nature of granitic outcrops within the Maya Mountains. The Maya Mountains are composed of three petrographically distinct but visually similar two-mica granite plutons. By collecting multiple data points per granite artifact it is possible to obtain an average geochemical composition that is an accurate reflection of the material. This will allow for possible locating of source regions and production sites within and near the mountains as well as a more thorough reconstruction of ancient exchange patterns.

[132] *Osteoarthritis in the Elbow and Knee from a Modern Documented Cemetery Collection in Cyprus: Using "New" Bones to Understand "Old" Ones*

Osteoarthritis is one of the more ubiquitous and abundant forms of pathology seen on ancient material. Osteoarthritis (OA) has a complex etiology with variable clinical characteristics. Documenting it is important because it may shed light on aspects of lifestyle (e.g. occupational), and social and cultural habits. Osteopathology studies conducted on modern, documented skeletal collections can add an important dimension. The aim of this paper is to present patterns of OA in the elbow and knee associated with both primary and secondary causal factors related to the development of the condition in a modern skeletal collection. Additionally, this paper discusses how different factors may contribute in the development of OA, and how these should be considered by the bioarchaeologists when interpreting OA in ancient populations. The objective of this paper is to showcase that advanced age is not necessarily the only causal factor, nor is it the only reason for the presence of OA.

Tichinin, Alina (California State University, Chico), Eric Bartelink (California State University, Chico), Gunita Zarina (Institute of Latvian History, the University of La), Sabrina Sholts (National Museum of Natural History, Smithsonian In) and Sebastian Wärmländer (Division of Biophysics, Stockholm University)

[207] *The Relationship between Cribra Orbitalia, Zinc Deficiency, and Dietary Habits in Children from 17th-18th Century Jēkabpils, Latvia*

In this study we investigated 28 skeletons of children (age 0-18 years) from a 17th-18th century cemetery in the city of Jēkabpils, Latvia. The cemetery is located in the city center, and was part of a salvage excavation effort in 2011 due to ongoing construction work. It is still unclear to which church and Christian denomination the cemetery belonged. Bioarchaeological evidence indicates high mortality for children: half of the burials were children under the age of 14, while a third were under the age of four. Life expectancy at birth is estimated to have been only 21.6 years. Seven of the 28

children (25%) showed evidence of cribra orbitalia lesions in the superior eye orbits, providing possible evidence for nutritional stress. To investigate the causes of this condition, stable isotope (C, N, O) and trace element analysis was carried out for all subadults. Individuals with cribra orbitalia displayed lower zinc levels in their bones than individuals without this pathological condition. Stable isotope data are further used to explore dietary variation between affected and non-affected individuals. These results allow us to identify a possible connection between cribra orbitalia, zinc deficiency, and food consumption patterns.

[31] *The Human/Animal Continuum in Nasca Sculptural Ceramics (c. 1-450)*

Studies of Nasca polychrome ceramic iconography from many phases identify shamans in various roles. In ceremonial scenes shamans drink from cups filled with the entheogenic pulp of the San Pedro cactus, dance, play instruments, don costumes as supernatural imitators, and preside over rituals related to agriculture. Rarely however, is less immediately understandable ceramic imagery interpreted through the lens of shamanism as a Nasca worldview. Shamanic thinking privileges ambiguousness, trance states (i.e. existence in the “in-between”) and, most importantly here, overlap between the human and natural worlds. If shamans were a vital part of Nasca culture, as depicted in narrative ritual scenes, then we must begin to decipher how shamanic modes of thought infused other representations, as well. This paper examines a group of early period (c. 1-450) sculpted polychrome vessels that represent the shaman in transformation. These vessels, in particular, offer unique examples of how Nasca artists solved the visual problem of depicting the visionary experience of a shaman, who is at once human and animal. A wide range of representations along the continuum of human/animal embodiment and perception exist within the early Nasca ceramic corpus; human/bird and human/marine animal combinations appear to be most common.

Tiesler, Vera (Universidad Autónoma de Yucatán)

[158] *Forms and Meanings of Human Fire Exposure among the Northern Lowland Maya*

This paper explores some of the forms, occasions, and meanings of human fire exposure among the Northern Lowland Maya during the Classic period. Conceptual points of departure are native concepts of heat, smoke and fire, together with their transformative powers in human beings, ritual enactment, and physicality. These notions provide blueprints for the spectrum of treatments documented in the area's mortuary record, spanning veneration, profanation and/or sacrifice. Combining forensic anthropology with archaeoethnology, and advocating sequenced pathway reconstructions, I first untangle and pattern broader, evolving trends in heat uses in the area's material register, which include peri- and postmortem exposure by boiling, smoking, roasting, charring, and cremation of fresh corpses vs. decomposing vs. fully skeletonized bodies. The regional survey shows not only the elites but also the broader commoner sectors to have engaged extensively in heat treatments of their dead already by the first millennium A.D. Selected case studies from big-site cores —concretely, Yaxuná, Dzibanché, and Calkmul— grant a deeper understanding of the broader ritual charts that involved heat exposure by and for nobility.

[312] *The Dogs of Housepit 54: A Taphonomic Analysis of Recovered Canine Remains at Bridge River, British Columbia*

Since 2003 the excavations at the Bridge River site have exponentially expanded our understanding of the communities that inhabited the Fraser River Canyon over 1,000 years ago. The most current excavations at Housepit 54 have provided further evidence of the many facets of Fraser River life,

among these is the role of dogs. The possession and use of dogs in the Fraser River Canyon is well documented through excavations and traditional knowledge. Remains of domesticated dogs in Bridge River households have been interpreted as markers of inter-household wealth and status. The present study is conducted to develop a better understanding of the role dogs played in Housepit 54 during its various occupations. A close analysis of all skeletal remains of canines recovered from Housepit 54 is undertaken with a focus on taphonomic processes. We then consider implications for interpreting human behavior regarding dogs.

[85] *The Bluff –Twin Rocks Community: Community Formation, Persistence and Evolution in the Northwestern San Juan Region*

The valley of Bluff, Utah, is one of many localities in southeast Utah where the archaeological record may show evidence of a succession of Puebloan community centers from the A.D. 500s through the 1200s (Basketmaker III – Pueblo III periods). These remains can be (1) the formation and dissolution of successive, independent, econocentric communities that came and went in a location with economically advantageous qualities (water and arable land); or (2) a single, persistent, sociocentric community whose configuration and community center shifted through time across the valley. We briefly discuss the archaeological implications of these alternative scenarios, and suggest that Puebloan cultural tradition might favor the latter over the former.

[299] *Thinking and Theory in the Bioarchaeology of Care*

The bioarchaeology of care is a case-study-based, contextualized approach for inferring and interpreting the experience of disability and health-related care response in the past that is based on evidence for experience of disease found in human remains. It is supported by the Index of Care, a non-prescriptive online instrument intended to assist researchers in working systematically through the four stages of bioarchaeology of care analysis. This presentation opens with an overview of the bioarchaeology of care methodology, covering the principles shaping its design as well as its potential and limitations. It goes on to address the most commonly-voiced objections to the archaeological inference of care, before discussing the conceptual foundations on which the new approach was constructed (focusing particularly on theories of agency and on the role of osteobiography). Finally, this presentation will consider why it is important for archaeology to acknowledge the implications of the giving and receipt of care wherever evidence permits in terms of enriching academic knowledge, realizing our ethical obligations to the individuals whose remains we analyze and whose lives we (re)produce, and providing the general public with a perspective on past life and behavior that may help inform debate in the present.

[90] *Beach Ridges, Sand Dunes and Buried Sites : Recent CRM Investigations at Inverhuron, Ontario*

In the 1950s avocational archaeologist Fritz Knechtel discovered several important archaeological sites near Inverhuron Bay, Ontario, on the eastern shore of Lake Huron. Early professional investigations were conducted by Tom Lee and J.V. Wright of the National Museum of Canada and Walter Kenyon of the Royal Ontario Museum. In 2014 a proposed infrastructure project provided an opportunity to re-locate and test several of Knechtel's sites. This paper presents the results of this project and discusses the challenges of conducting an archaeological assessment in an area of raised cobble beaches and shifting sand dunes overlain by recent development. Despite extensive 20th century cottage development in the area, portions of three previously documented sites were found preserved under up to two meters of windblown sand and road fill.

(UCL)**[191] *The Evolution of Farming and the Boom and Bust of Culture***

Occam's razor judges the success of any model by its ability to explain the evidence with the greatest simplicity. We present two powerful yet simple models; the first evaluates the transition from hunting and gathering to farming within an evolutionary framework, by considering farming as a phenotypic mutation under positive selection. This allows us to estimate the selection coefficient and map local times of first appearance and fixation. The second evaluates the appearance and eventual disappearance of cultures through time, revealing a fundamental shape in the distribution of cultural traits. Both models provide textbook examples of simple patterns that underlie complex processes.

Ting, Carmen**[147] *The Production and Exchange of Early Postclassic Elite Wares in the Eastern Maya Lowlands***

This paper investigates the role played by Marco Gonzalez in the production and exchange of elite wares, as represented by the Zakpah ceramics, during the Early Postclassic period. Located in Ambergris Caye off the coast of northern Belize, Marco Gonzalez was occupied continuously throughout the Classic to Postclassic transition, with strong Early Postclassic (ca. A.D.950/1000–1200/1250) evidence yielding one of the largest Zakpah ceramic assemblages alongside Lamanai. By using various archaeometric methods (e.g. thin-section petrography, pXRF, and SEM-EDS), the resultant compositional and technological data reveal that the community at Marco Gonzalez was not actively engaged in the production of elite wares. All Zakpah ceramics recovered from Marco Gonzalez were imported from multiple producers in mainland northern Belize. In fact, such concentration of Zakpah ceramics from diverse sources at Marco Gonzalez can be argued to be evidence indicating the involvement of the community in redistributing elite wares. It is further suggested that Marco Gonzalez could have acted as the link between local and regional markets, thus promoting greater socio-political, economic, and ideological integration among elites in the eastern Maya lowlands during the Early Postclassic period.

Tokovinine, Alexandre (Peabody Museum, Harvard University)**[244] *Holy Lords and Holy Lands: Territory in Classic Maya Inscriptions***

One of the significant challenges in dealing with indigenous classification systems is establishing continuities and discontinuities between Pre-Contact, Colonial, and Modern situations. The present paper addresses this question with respect to the concept of territory among the Ancient Maya, specifically, the speakers of Ch'olan and Yukatekan languages. It considers the corpus of Classic period inscriptions from the Southern Maya Lowlands as well as sixteenth and seventeenth century

documents and dictionaries from a wider region. Textual sources indicate that the term kab “land” referenced political and ritual landscapes and would be distinct from lum “earth” which carried agricultural connotations. At the same time, Classic period texts were ambivalent to how political institutions such as the royal court and its subjects were linked to kab. Moreover, nearly all place names in the inscriptions apparently did not belong to the kab or lum categories. These findings are of direct relevance to understanding Ancient Maya territories based on archaeological evidence. The results caution against applying indigenous toponyms to spatial entities of certain scale and using terms with territorial connotations (e.g., “kingdom”) in reconstructing Ancient Maya political geography.

[31] *The Body and the Ancestor: Comparing Evidence Of Individual Biograph and Social Representation at Paracas Necropolis*

Until recently, our understanding of Paracas Necropolis was based on objects divorced from their contextual data. Research in archives and museum collections has allowed us to re-link object with context, and a complete restudy has been carried out for some gravelots. In these cases, systematic bioanthropological observations have provided more reliable and more detailed information on the persons at the center of the mortuary bundle. Age and biological sex have been re-evaluated based on current methods. Therefore, observations of funerary practice and the garments, tools and weapons that adorn one or more display layers can be more usefully interpreted as expressions of gender identity and social status. Information on diet, health and habitual activities of the deceased individual can be compared with the symbolic expressions of identity in ritual contexts and the layered construction and reconstruction of an ancestral personage. We will evaluate the ways in which information on the life of each person coincides with or contradicts a social model based on the effigy later constructed around their body.

[282] *Combatting the Erosion Menace: The Enduring Legacy of the CCC Within the Silver City Watershed*

By the summer of 1933, the Civilian Conservation Corp (CCC) had constructed over 3000 checkdams within the Silver City Watershed. Men working in Little Walnut CCC Camp located a few miles outside of Silver City, New Mexico were focused on rehabilitating the Silver City Watershed from 1933-1940. Many of these features are still visible and functioning on the lands administered by Gila National Forest, Silver City Ranger District. These water and erosion control features are not only a testament to the craftsmanship of the CCC men who constructed them, but also a testament to conservation ethic that in large part began with Aldo Leopold's assertion that soil erosion was a “menace” to the social and economic future of the Southwest. The CCC built upon this ethic and rapidly acquired the techniques in building checkdams throughout the Silver City Watershed so that by the end 1934 over 15,000 erosion control features had been constructed within the watershed.

This paper explores the enduring legacy of these features within the Silver City Watershed and explores how to manage these CCC landscapes.

Tonoike, Yukiko (Yale University)

[402] *Interactions during the Iron Age in the Lower Khabur Basin of Northeastern Syria: Insights from Ceramic Petrography*

The semi-arid steppe of the Lower Khabur Basin of northeastern Syria is a climatically marginal zone for agriculture, yet there have been episodes of settlement over the past 9,000 years. Archaeological surveys have recorded more than 300 sites whose age, type, and distribution on the landscape are reflections of changing socio-natural systems. The region is particularly suitable for detecting changes in both environmental and socio-political spheres because of its environmental marginality, yet centrality to the political needs of states and empires. Focusing on the Iron Age, evidence for internal and external sources of changes in the settlement and abandonment of the landscape will be examined through stylistic and technical materials analyses (mainly ceramic petrography) of ceramics, as well as the nature of the sites and their distribution on the landscape. In view of historical sources that describe changes from town-based local polities to state and imperial installations through the ages, as well as the importation of populations to implement these plans, this will be the first step in assessing how known historical events are reflected in the ceramics.

Topi, John (University of Missouri) and Philip Leflar (University of Missouri)

[245] *Geometric Morphometric Approaches to Casas Grandes Ceramic Specialization*

Previous studies of the Casas Grandes region have suggested that several craft items, including ceramics and ground stone, were produced by part or full-time specialists. In this study, we build upon previous approaches to ceramic specialization by conducting geometric morphometric analysis on an extensive collection of scaled digital photographs of Viejo and Medio period whole vessels. Geometric morphometrics allows for the statistical analysis of shape as indicated by the relationship between landmark and semi-landmark points on the outline or surface of artifacts; these methods allow for the examination of shape and size, gathered from linear measurements, and can be used for both 2D and 3D analyses. Application of geometric morphometrics to ceramics has developed slowly but allows for greater understanding of variation in vessel form and decoration. Our results suggest a change in the variability of vessel form and decreased variability in certain aspects of ceramic decoration, including a decrease in the width of painted line on some vessels types, from the Viejo to the Medio period. Decreased variability in vessel form and decoration suggest increased specialization in ceramic production and has implications for broader questions of social organization and leadership strategies in the Casas Grandes area.

Torpy, James (College of Wooster) and P. Nick Kardulias (College of Wooster)

[51] *Religious and Mortuary Landscapes in Archaic Cyprus*

During the Archaic period (750-480 B.C.) the island of Cyprus underwent a dramatic transformation as new city-kingdoms rose to dominate its political landscape. This shift resulted in increased competition for resources, establishment of political boundaries, and emergence of a pronounced social hierarchy within the new polities. The site of Athienou-Malloura, surveyed and excavated by the Athienou Archaeological Project, includes a Cypro-Archaic sanctuary and nearby tombs on the hill of Maghara-Tepesi, four of which have been excavated. The present study compares the site of Athienou-Malloura to other comparable sites from around the island, in order to ascertain the distribution and role of rural sanctuaries and cemeteries during this period of increasing social complexity and political competition. The sites are compared in relation to locations of the city-kingdoms, as well as access to natural resources such as arable soil and copper ore. It has been proposed both on Cyprus and elsewhere that grave monuments and religious sites partly functioned to create and enforce various status claims during turbulent periods. Building from more abstract speculations on Archaic Cypriot political boundaries, this study attempts to map a more nuanced view of the interplay between topography and human use of the landscape during this time.

[402] *CAMOTECER: Beyond the Shard. Modeling and Simulating Variability in Central Asian Pottery Technology*

Pottery technology is a well-studied field of archaeological research. However, particular contributions are often limited to a partial characterization, due to the technical and theoretical backgrounds of the researchers involved. Pottery samples are interrogated separately through chemical analyses, petrographic characterization and the assignation to both decorative and functional classes. In most cases, the results of such myriad of studies remain relatively unconnected up to a general archaeological discussion. Despite the radical methodological differences, all aspects of pottery studied by archaeologists were defined by a single system of decisions and constraints of potters, which is partially universal and partially contextual. We propose modeling methodology to integrate and explore data on pre-industrial pottery, which we applied on a pottery data set from the Surkhan Darya region, Uzbekistan. We designed a synthetic pottery ontology to enclose different aspects related to a single pottery data set. Next, we create a measure of difference between pottery samples and relatively characterize the context of pottery-making in different places and periods. Furthermore, in order to explore the logical relationships between the variables measured, we build a Bayesian model that can generate virtual samples given certain constraints during pottery production.

Torrence, Robin (Australian Museum)

[412] *More than a Pretty Face? Exploring the Allure of Obsidian Valuables from Papua New Guinea*

Brilliant, shiny, translucent, black. On the surface, everything made from obsidian is inherently attractive. So why are some obsidian artifacts more highly valued than others? Using the example of obsidian use in West New Britain, Papua New Guinea, properties that go beyond physical attributes are explored as potential factors in the creation of valuables: e.g., exoticism; ownership of resources; social links; symbolism; performance; staged production; specialist makers.

[21] *Refinement of the La Quemada Chronology and Its Implications for Inter-polity Interaction along the Northern Frontier of Mesoamerica*

During the Epiclassic period (A.D. 500-900), the northern frontier of Mesoamerica consisted of a regional network of polities focused on large, hilltop centers including the site of La Quemada in the Malpaso Valley of Zacatecas, Mexico. While extensive archaeological research has been conducted at the site, a seriation of the La Quemada-Malpaso Valley Archaeological Project ceramic assemblage remains to be finalized. Establishing the chronology of La Quemada is essential for two reasons: (1) to ensure the occupational history of La Quemada is accurately integrated into the regional chronology of the northern frontier; and (2) to establish the chronological control necessary for addressing changes in the social interactions in which La Quemada residents engaged. Previous analyses found that red-on-buff and incised-engraved types predominate in most proveniences

through the entire occupation of La Quemada; therefore, the type-based analysis will be informed by an attribute analysis focused on seriating design motifs (e.g., frets, steps, zigzags, and life forms). Such an approach may allow us to identify fine-scale variations in the frequency of red-on-buff and incised-engraved ceramics through time, which will enhance our ability to order proveniences based on their assemblage composition.

[183] *Entre ollas y metates: exploraciones en la cocina real de Kabah, Yucatán*

Una de las partes más importantes dentro del espacio residencial, ya sea que se trate de la gente común o de la elite, es sin duda alguna el área donde se preparan los alimentos (K'óoben). En este trabajo hablaremos sobre la cocina encontrada en el Grupo Este de Kabah, el cual interpretamos como el complejo palaciego donde residió la familia gobernante al menos durante el Clásico Tardío-Terminal. Un análisis de las características del espacio construido, así como la presencia de 30 metates y cientos de fragmentos de vasijas de diferentes formas, nos dio la pauta para proponer que en la cota más baja se localizaba el K'óoben del conjunto palaciego. Las exploraciones efectuadas a lo largo de cuatro años ampliaron la evidencia y junto con los análisis de suelos nos han permitido asomarnos a la compleja organización que implicaba preparar abundante comida para satisfacer el delicado paladar de la elite.

Tostevin, Gilbert (University of Minnesota) and Luke Premo (Washington State University)

[191] *The "Taskscape" and Its Effects on Cultural Diversity: A Spatially Explicit Model of Mobility and Cultural Transmission*

Ethnoarchaeology has shown that culturally learned behavior is structured in its performance in many ways. For archaeologically-visible artifactual behavior, this performance is structured both geographically, in terms of where the artifacts are made and used on the landscape (what Ingold calls "the taskscape"), as well as temporally, in terms of the sequential nature of operational chains which can be distributed among taskscape locations. Yet cultural transmission theory has not yet explored how behaviors of mobile foragers are learned differently due to their enactment at different locations, what Tostevin calls "taskscape visibility." Here, we show how mobility affects the diversity of two selectively neutral cultural traits that differ only in the parts of the taskscape in which they can be transmitted between foragers. The trait transmitted only from residential bases shows greater diversity than the trait transmitted from residential bases and logistical camps. In addition, the former shows a positive effect of increased logistical mobility while the latter shows little to no effect. Without an appreciation for the ways in which mobility and taskscape structure cultural transmission in space, the differences in the diversity of the two traits might be incorrectly interpreted as resulting from qualitatively different mechanisms of cultural transmission.

[380] *Bioarchaeology of the Arabian Bronze Age: Humeral Entheseal Changes and Burial Patterns at Tell Abraq*

Tell Abraq is an archaeological site from the Arabian Bronze Age, located near the Persian Gulf Coast of the modern-day country of the United Arab Emirates. A sealed, two-chamber mud-brick tomb on site, in use from approximately 2200 – 2000 B.C., yielded a 1.4-meter-thick matrix of commingled human remains, soil, and artifacts, representing a MNI of 403 individuals, of which nearly three quarters are adults. Although the remains are fragmentary, they still offer rich insights into the biocultural interactions of Bronze Age society in this population. This aim of this study was to categorize enthesal changes at the sites of major muscle attachments on the humerus, and to look

for intersections of musculoskeletal stress marker category, biological sex, and burial location within the tomb at Tell Abraq. The presence or absence of specific patterns in these intersections helps to shed light on the degree of social stratification represented in the bodies of those buried in the tomb, and possibly on Bronze Age formulations of gender at this site.

[354] *Tree-Ring Dating the Gallina: The Herb Dick Collections and Beyond*

The 1970s were a period of intense activity in the Gallina heartland of north-central New Mexico. Excavations by James Mackey and Sally Holbrook and by Herb Dick documented dozens of Gallina sites and structures in the Llaves Valley alone. Unfortunately, analysis and publication did not always follow excavations, particularly in Herb Dick's case. His untimely death in 1993 left much of his excavated material in disarray. Through the efforts of several individuals and institutions, however, his tree-ring samples have been transferred to the Laboratory of Tree-Ring Research in Tucson for analysis and curation. Here, we present the results of dendroarchaeological analysis of his collections from the Dam Ridge, Hacha Ridge, and Huerfano Mesa locales. These samples, combined with a synthesis of all Llaves Valley dendroarchaeological samples, help delineate the spatio-temporal variability and social organization of the Gallina occupation in the heartland of this enigmatic culture.

[78] *The Bravery and Beauty Within: Skeletal Analysis of the Ancient Chachapoya People at Kuelap*

In early 17th century historical descriptions, Garcilaso de la Vega describes the Chachapoya people of Peru as "very brave", "the men well-formed and the women extremely beautiful". While the archaeological remains cannot address the veracity of these statements, the analysis of the skeletal remains from important Chachapoya complexes, such as Kuelap, provide the only direct means of reconstructing a biological profile of these ancient people, including aspects of their physical morphology, health, diet, and mobility. Kuelap is one of the largest sites in the area and the mortuary contexts are diverse, including individual burials, collective tombs, and secondary deposits, yet the preservation of skeletal materials is good. These preliminary osteological data synthesize the skeletal collection from Kuelap observed to date (n=589), including partial and complete individuals. Here we highlight the estimated age-at-death profile, stature estimates, patterns in cranial modification, and patterns in traumatic injuries in order to model the physical nature and local biology of the Chachapoya peoples compared to others in the region and the broader Andes.

[361] *Not so Exotic After All?: Results from A Characterization of "Puebloan" and "Micaceous" Ceramics from Dismal River Aspect Sites*

Small numbers of supposedly "Southwestern" sherds appear at many sites on the Great Plains. Some Dismal River aspect (A.D. 1650-1725) people living on the Central and High Plains had

extensive contact with people in northern New Mexico and may have lived with Puebloan migrants in the late 1600s. Exotic ceramics appear at several Dismal River sites including red slipped wares and micaceous sherds. Using a combination of NAA and petrography, we characterized a sample of these sherds from several Dismal River aspect sites in Kansas and Nebraska to better determine the origin of these northern Rio Grande ceramics. Using NAA, we determined that some of the micaceous sherds were likely made in northern New Mexico while others were made elsewhere. A lack of comparative data from mica sources in Colorado and Wyoming make further sourcing difficult. Red slipped sherds from sites in Scott County, Kansas that look similar to Tewa Red wares, were instead constructed from materials available to potters in western Kansas. Northern Rio Grande potters living with Dismal River aspect groups maintained culturally specific ceramic technologies such as the use of red slips while also importing micaceous vessels from both their traditional homeland and from other sources.

[113] *Household Shrines, Caches, and Burials: The Role of Ritual in Domestic Economy at Dos Hombres, Northwestern Belize*

Household economies have been addressed from several perspectives in northwestern Belize. The resource specialized community model (Scarborough and Valdez 2003; 2009) emphasizes locally available resources in production and consumption at the community scale. The model has great validity in the hinterland communities and is clearly evidenced in household investigations near Dos Hombres Belize in the form of the raw materials utilized in stone tool production. In addition, the function of those tools is clearly related to manipulating mostly local resources. While this economic model is still being tested in the Dos Hombres civic ceremonial center, it is also possible that many local resources are being utilized for producing much of what was needed in the kingdom. What this paper is concerned with is the proportion of both local and non-local material culture recovered in domestic contexts that are specifically related to domestic ritual: burial goods, shrines, and caches. These ritual assemblages make up a significant proportion of the overall domestic assemblages both at Dos Hombres and its hinterlands highlighting the importance of ritual goods in the domestic economy of northwestern Belize.

[155] *Human Impact on a Monumental Landscape at the Microscopic Level: An Ancient Maya Community and Its Temple*

This paper discusses the results of geochemical and micromorphological analysis of sediment samples in and around a monumental temple structure at the site of La Milpa, northwest Belize. This analysis forms part of a project that aims to examine community agency and practice in public monumental spaces, in particular how the actions of diverse groups of agents influence the functions of monumental architecture. Artifact and architectural evidence gathered over five field seasons at Structure 3 has indicated that the Late Classic period (550-850 CE) constituted a time of intense access and use of the areas surrounding the temple structure. However, this dataset was found to be insufficiently fine-grained to enable the identification of specific types of activities, necessary in understanding how Structure 3 functioned in relation to the La Milpa community. In order to identify and differentiate between discreet activity areas, geochemical characterization of sediments through ICP-MS and sediment micromorphology were employed in over 100 loose sediment and 20 sediment core samples taken from and around Structure 3. Both these techniques are considered to be highly successful in the study of activity areas in the archaeological record, but have had a relatively limited history of application in the Maya Lowlands.

[123] *Unlocking the Data behind the Chora of Metaponto Publication Series: "On-The-Fly" Solutions for Sharing and Archiving an Evolving Collection*

As archaeological research moves from the traditional model of print publication (as the definitive word), to a larger continuum of interpretation and reinterpretation, access to the supporting data is crucial. To do so, however, adds extra burden on academic units with large legacy collections, publication backlogs, and dwindling budgets. Digital repositories provide a home for static collections, but are not ideal for dynamic collections generated and evolving throughout the research lifecycle, nor do they provide an interactive space for ongoing discussion. The Institute of Classical Archaeology and Texas Advanced Computing Center have developed a set of lightweight solutions to prepare the ICA collection for preservation and sharing without interrupting ongoing work.

Leveraging existing University of Texas system cyberinfrastructure and expertise, we have streamlined our processes and provided a team of international collaborators the ability to enhance our full collection, while preparing it "on-the-fly" for archiving and providing a portal to the data through which a continuing dialog can be conducted. This poster illustrates our model of a distributed "collection architecture" that integrates archival and presentation instances of the ICA collection, presented via a set of web-based digital companions to the Chora of Metaponto book series.

[302] *Iyatayet Revisited: Oh Giddings, What Have You Done?*

This paper presents the results of our reinvestigation of Iyatayet, a multicomponent mid-late Holocene site located in northwest Alaska. Iyatayet is well known as the type site for both the Denbigh Flint Complex and the Norton Tradition in Alaska. Originally, excavated by J. L. Giddings from 1948-1952, this national historic landmark was retested in 2012 and 2013 to assess site condition, threats and disturbances, its current research potential, and to re-evaluate Giddings' interpretations by collecting samples using modern excavation methods. Our team mapped the site using a total station, excavated a series of controlled shovel tests to ascertain the extent of Giddings activities, and placed seven 1x1-meter tests in key areas to ground truth Giddings work and to fill in missing data deemed unessential at the time. One of our major revelations is that little is left of the Denbigh occupation, but Norton deposits are well preserved. Additionally, this work allowed us to update the site chronology using AMS radiocarbon dating methods on twelve organic samples. Collection of over 10,000 artifacts including, stone tools, obsidian flakes, microdebitage, ceramic sherds, organic tools and faunal remains allow for us to confirm some of Giddings original assertions and to refine others.

Tremblay Critcher, Lori

[299] *Potential Applications of the Bioarchaeology of Care Methodological Approach for Historic Institutionalized Populations*

In the 19th century, mental institutions were created in the United States to provide care for the mentally ill. These state institutions of care were designed to serve as cultural buffers to protect mentally ill individuals from the harsh conditions that they would have otherwise been exposed to in other state institutions, such as prisons or poorhouses. In this paper, I examine whether and to what extent Tilley's (2012) "Bioarchaeology of Care" methodological approach provides a means to evaluate the efficacy of these state institutions to serve as cultural buffers as well as the limitations of this approach in doing so.

[249] *Urban Agriculture within the Valley of Oaxaca: Investigations and Implications of Agricultural Terracing at Monte Albán*

The use of GIS to determine the spatial boundaries between terracing and the ceremonial center at Late Classic Monte Albán (250-700 C.E.), will validate or falsify current Late Classic population estimates. The determinants for what defines agricultural versus residential terracing and whether both types are present at Monte Albán has been highly contested. Archaeological investigations yielding residential debris, does not indicate the total sum use of an individual terrace, nor does it indicate a totally unilateral application of agricultural and residential space. However, agricultural terracing can be positively identified through the spatial determinations employed by digital mapping software. The successful identification of agricultural terracing is a step towards the calculation of potential carrying capacity and a look into urban sustainability within an ancient city. This study investigates the interplay between terracing and population density within a confined urban space and also validates the existence of agricultural terracing at Late Classic Monte Albán.

Trigg, Heather (Univ Massachusetts Boston) and Stephanie Hallinan (University of Massachusetts Boston)

[311] *Investigating Activities in Spanish Colonial Ranches in 17th-Century New Mexico*

In 17th-century New Mexico, Spanish colonists' households were an important location for ethnogenesis as colonists and indigenous Pueblo peoples together labored at basic subsistence activities. LA 20,000, a Spanish ranch located about 12 mi southwest of Santa Fe, has the potential to shed light on colonists' activities and their interactions with indigenous Pueblo and Plains peoples. This site is the most complex rural ranch of the period, with extensive architecture and material culture. Using GIS, we explore the distribution of various artifacts, imported Mexican majolica and Pueblo ceramics, lithic tools and debitage, and other material remains, within the domestic structure and associated buildings to explore the nature and types of activities that occurred in this multi-ethnic household. This sort of analysis is key to understanding the incorporation of Spanish, Pueblo and perhaps Plains peoples' knowledge into the new cultural frontier that such households represented.

[327] *More than a Rusty Nail: Archaeometric Analysis of Wrought Iron Nails from Fallen Tree, St. Catherines Island, Georgia*

Computed Tomography (CT) scanning empowers researchers to analyze the physical properties of archaeological materials beyond their superficial qualities. Micro CT enables one to non-destructively observe and measure interior features of an artifact with high precision. It also allows one to segment conjoined materials by their relative densities. The processed images can be exported as 3-dimensional models and analyzed in an array of open-source software applications. In this case study we use CT scanning to analyze a collection of wrought iron nails from the Fallen Tree site (9Li8), a 16th-17th century Indian pueblo situated just south of Spanish Mission Santa Catalina de Guale on St. Catherines Island, Georgia (USA). CT scans of rusty iron nails were virtually filtered to remove obscuring oxidized concretions. Although a lack of standardization in their production makes

fine dating wrought iron nails difficult, our case study demonstrates how information derived from CT scans can contribute contextual details that may otherwise be obscured by preservation factors.

Troncoso, Andres

[318] *Período Formativo como Ontología: una discusión desde los Andes Septentrionales (30° Lat. S)*

Para el centro norte de Chile (valle de Limarí, 30° lat. S.) se ha propuesto un período Formativo anclado en la noción de progreso y domesticación de plantas y animales, el que marcaba un salto evolutivo dentro de la secuencia histórica de los grupos prehispánicos de la región, evidenciado en la aparición de la alfarería. Aunque en los últimos años se ha discutido la relevancia de la incorporación de la alfarería en la vida de estas comunidades, lo cierto es que se continúa entendiendo este momento como un tiempo esencial en los procesos de complejización social de la región. En este trabajo discutimos la noción de Formativo aplicada a la región, evaluando los cambios acaecidos en el registro material y espacial de la localidad (asentamientos, arte rupestre, cultura material), los que no coinciden con los ritmos temporales tradicionalmente propuestos, proponiendo entender a este tiempo más bien como un momento de transformación ontológica que fusiona elementos del animismo y analogismo sobre el que se reconstruye la red de relaciones sobre las cuales se establece la articulación entre humanos (vivos y ancestros), objetos y paisaje.

[386] *Prehistoric High Elevation Seasonal Use in Wyoming: Results of Flaked Stone Analysis from High Rise Village*

The analysis of flaked stone procured from 10 of High Rise Village's 52 habitation features provided a unique glimpse into high-elevation prehistoric hunter-gatherer behaviors in western Wyoming, including occupational intensity, and settlement and subsistence behaviors. Rather than a hunting-focused and/or intensive logistical-residential settlement-subsistence strategy described throughout the Rocky Mountains and Intermountain West, High Rise Village was evidently targeted for specific resource patch(es) by small residually mobile family groups, who foraged for predictable resources for short periods of time. This pattern thereby conforms to previous models for seasonal transhumance-based adaptations in the Rocky Mountains. Furthermore, this research provides evidence for the integral importance of high elevations to prehistoric hunter-gatherers in western Wyoming's Late Prehistoric period.

Trowbridge, Meaghan (Statistical Research, Inc.) and Lori Stephens Reed (Aztec Ruins National Monument)

[324] *Looking through the Local Lens: Recognizing Southern Chuska Valley Production of Mesa Verde Style Pottery*

Recent analyses of ceramics from the Southern Chuska Valley (SCV) have suggested that vessels commonly identified as imports from the Mesa Verde region in fact largely represent locally-produced variants of Mesa Verde White Ware rather than actual imported vessels. Data collected from the US 491 Highway mitigation project (SRI) and the El Paso Pipeline project (WCRM) provide a baseline from which we plan to further investigate the presence of locally-manufactured Mesa Verde variant types in the SCV. Types such as McElmo and Mesa Verde Black-on-white have been used for decades to classify ceramics in this region based on stylistic elements, paint composition, and surface treatments; however, a review of the literature and results of these recent analyses indicate that definitions of these well-known and oft-recorded types commonly disregard discrepancies in paste and temper that suggest production loci in the SCV rather than the Northern San Juan region. This presentation will explore the issue of Mesa Verde style white ware classification across the San Juan Basin, including a review of existing literature and a preliminary proposal for upcoming research targeting the investigation and description of southern variants of Mesa Verde white ware.

[278] *Experimental Archaeology: Insights from the Construction of an Adobe Room*

Experimental archaeology is a useful tool for improving our understanding of prehistoric technologies and testing archaeological interpretations. The “Hands On Archaeology” project at the 2014 Archaeology Southwest / University of Arizona Upper Gila Preservation Archaeology Field School focused on the experimental construction of a single-story adobe pueblo room in the style of the Cliff phase (A.D. 1300-1450+). This project was done in conjunction with limited excavation in three Cliff phase rooms at the Dinwiddie site, which provided information on building materials and construction styles. Experimental studies during construction of the adobe room improved our understanding of both labor effort and the construction techniques required to produce the types of walls and features observed in the excavated rooms. A full-scale adobe room and a portable small-scale model allow us to share what we learned with the public in different venues. This ongoing project will continue to generate data on the durability and maintenance required for this type of structure.

[16] *Ritual Consumption? Exploring the Staging of Ritual Acts through the Deposition of Ground Stone Tools in Building 77 at Neolithic Çatalhöyük*

The destruction of buildings by fire, either deliberately as a ritual act or accidentally, is among the most interesting elements of Neolithic Çatalhöyük, in central Anatolia, not least for the patterns of deposition of material culture at the time of destruction. Burnt Building 77, a well-preserved structure excavated by the current project, stands out in many respects, but one of its intriguing features is the large number of clustered grinding tools and other stone objects that seem to have been left or placed just before the abandonment and burning event. Particularities of this assemblage in terms of number, size, type of tools and preservation raise questions about what these clusters represent. In this paper I argue that the deposition of large quantities of often rare stone objects prior to the abandonment of the building should be seen as a deliberate act, a socio-ritual mechanism, which in tandem with other larger-scale ritualized acts was aimed at maintaining and reinforcing group cohesion and establishing social memory. The sheer quantity of material amassed in Building 77 seems to represent a powerful statement, an act of conspicuous consumption involving larger social groups beyond a single household.

Tsukamoto, Kenichiro (School of Anthropology, University of Arizona)

[103] *The Preliminary Results of Topographic Mapping at El Palmar*

El Palmar is known as one of the major Classic Maya polities in the central Maya lowland, but the nature of its spatial configuration has remained underexplored. This paper presents the preliminary results of topographic mapping carried out from the 2007 through 2014 field seasons. Using two total stations, our topographic mapping has covered a total of 100 hectares, including the site core and three outlying groups. In the field we documented not only architectural features and carved monuments but also reservoirs and caves. By integrating these natural and cultural features into GIS-based analysis, this paper attempts to identify the spatial organization of the El Palmar polity.

[365] *Negotiating Identity through Food Choice in the Precolumbian Mid-Continent*

Recent research has deepened our understanding of intergroup interactions in the Mid-continent of North America during the late prehistoric period, and archaeological investigations have revealed evidence not only for conflict, but also for cohabitation and cooperation between the migrant Oneota people and local, maize-reliant Middle Mississippian groups. This poster utilizes the broadly defined framework of foodways and explores dietary changes in this interaction through time along with post-migration shifts in Oneota serving vessels. Information gathered from the analysis of stable isotopes in human remains from Norris Farms 36, a mortuary site associated with Morton Village (11F1), is used to shed light on how food choice was used to manipulate ethnic identity. Several years of excavation at the Morton Village site continues to enhance the faunal assemblage, demonstrating the diverse faunal resource base that was available to the Mississippian and Oneota population at the Morton site. The data produced by these investigations suggest that social boundaries between the two groups were permeable and actively manipulated. The evidence for the creation of hybrid ceramic types and diet suggest the development of a new ethnic group in the region, incorporating aspects of both Oneota and Middle Mississippian identity.

Tudor, Jessica and Brendon Greenaway (California Office of Historic Preservation)

[392] *Archaeological Landscapes and Districts and Section 106 of the NHPA - Examples from California*

Archaeological sites have traditionally been considered only as potentially eligible for listing on the National Register of Historic Places under Criterion D (data potential) of the NRHP, but professionals in the field of Cultural Resources Management have begun to push for archaeological sites to be considered under Criteria A (significant events), B (significant people), and C (artistic value or method of construction) as well. Furthermore, archaeological sites are increasingly considered using a landscape approach, often incorporating multiple sites into a district. This approach breaks the traditional boundaries of archaeological site analysis to incorporate cultural importance to Native Americans and the general public, as well as highlighting how archaeological sites may represent important people and major events of the past. This poses an interesting challenge when archaeological districts or landscapes fall within the Area of Potential Effects for a federal undertaking that may alter or destroy portions of the constituent sites. This presentation uses examples from the California Office of Historic Preservation's Section 106 review units to discuss practical applications of landscape archaeology approaches to prehistoric and historic period archaeological sites in the Section 106 process.

Tune, Jesse (Texas A&M University)

[150] *Defining Cumberland Lithic Technology: A Study of Biface Technological Variation and Land Use Patterns*

Cumberland fluted-bifaces are recognized as being lanceolate, full fluted points that immediately post-date Clovis in the Mid-south United States. A review of the existing literature reveals brief descriptions of morphology, preliminary explanations of production technology, and speculation about regional fluted point chronologies. This study examines Cumberland fluted point technology and regional land use patterns to develop a greater understanding of human adaptive behaviors during the Younger Dryas. Cumberland biface technology is characterized here based on data collected throughout the entire Mid-south region. Additionally, a model of Cumberland regional land use was constructed and is compared to Clovis and Dalton land use patterns. The results of this research help to formally define Cumberland fluted bifaces as a distinct late Pleistocene technological complex based on aspects of point morphology and land use patterns.

Tung, Tiffany (Vanderbilt University, Department of Anthropology), Molly Shea (Hillsboro High School, Nashville) and Larisa DeSantis (Vanderbilt University, Department of Earth & Envir)

[202] *Stable Isotope Analysis of African Slave Burials from the Grassmere Plantation, Nashville, Tennessee*

Carbon and oxygen isotope analyses of dental apatite from a captive slave population (ca. 1840s) from the Grassmere Plantation (now the Nashville Zoo) in Tennessee is examined to reconstruct childhood diet and determine whether individuals were local to the Middle Tennessee region or forcefully moved from another locale. Among the 19 burials recovered, enamel apatite was obtained from 11 individuals, representing 3 juveniles and 8 adults (3 males, 4 females, and 1 unsexed). At least two teeth per individual were sampled to examine dietary changes through childhood. Preliminary results show that the $\delta^{13}\text{C}$ values range from -9.8 to -1.7; mean $\delta^{13}\text{C}$ = -4.18. Agricultural census data for the Grassmere Plantation in 1850 shows that maize, a C4 plant, was the primary crop (2,590 bushels), followed by oats (600 bushels) and potatoes (150 bushels). The $\delta^{13}\text{C}$ data suggest that while most of the captive slave individuals had access to maize, it was not equitably distributed. The $\delta^{18}\text{O}$ values range from -5.4 to -3.4; the mean $\delta^{18}\text{O}$ = 4.15. This suggests a shared water source that was likely of local origin.

Turck, John (Geoarcheology Research Associates) and Joseph Schuldenrein (Geoarcheology Research Associates)

[155] *The Geoarchaeology of Two Riverine Sites in New Jersey*

In dynamic environmental settings, various ecological processes can affect the landscape, the people living on those landscapes, and the subsequent archaeological record. Further confounding the situation is human-induced landscape change, which evidence indicates has occurred recently, historically, and prehistorically. Our efforts at two riverine locations in northern and central New Jersey reveal the efficacy of a geoarchaeological approach to understanding the archaeological record. Through remote sensing, coring, and sediment analysis, synthesized within a GIS, we were able to determine the location of intact landforms, as well as areas of disturbance, targeting specific areas for further study. Our findings suggest that an efficient, cost-effective, investigation begins with a geoarchaeological approach.

Turkon, Paula (Ithaca College), Sturt Manning (Cornell University), Carol Griggs (Cornell University) and Alexandra Jiggetts-O'Neill (Ithaca College)

[21] *Dendro-14C-Wiggle-Match Contributions to Northwestern Mesoamerican Chronology*

This paper reports on the progress of the Dendro-14C wiggle-matching project begun in 2013. Initial work established the feasibility of the methods and availability of the data. This paper will report on the ways in which the data can aid in cultural interpretation in northwestern Mesoamerican regions. A focus will be on dating the construction of high status areas at the sites of La Quemada and Los Pilarillos in the Malpaso Valley, Zacatecas, and their chronological relationship to construction in public areas at both La Quemada and at the site of Alta Vista, a culturally related and roughly contemporaneous site about 150 miles northwest of the Malpaso Valley, located in Chalchihuites, Zacatecas. Though this project is initially geographically narrow, because the methods used here are cumulative, additional data and research can provide great advances in our knowledge of Mesoamerican culture-history in larger-scale regional interactions.

Turnbow, Christopher (New Mexico Gas Company)

[273] *Projectile Point Temporal Trends During the Mimbres Georgetown Phase*

Past excavations of Mimbres Georgetown phase occupations at the Diablo Village and Cuchillo sites produced assemblages critical to the refinement of the Mimbres projectile point chronology. Derived from structures and tightly dated contexts ranging between the late A.D. 500s and the 600s, these assemblages reveal evidence of diachronic technological and morphological changes not clearly represented in currently established Mimbres typologies. Of particular interest, a new arrow type called the Diablo Corner Notched is believed to be diagnostic of the phase.

Turner, Andrew (University of California, Riverside)**[88]** *Religion, Ritual, and Ideology in Epiclassic Highland Mexico*

Studies of the visual systems of the major sites of Epiclassic Highland Mexico have tended to focus on their common writing system and similarity in art styles. There is much to be gained from these lines of inquiry, but relatively few works have investigated the shared religious content conveyed in Epiclassic artwork. This paper evaluates preexisting theories concerning Epiclassic pan-Mesoamerican cults and argues that religious and ideological beliefs concerning Flower World, a solar paradise inhabited by the souls of deceased warriors, were widespread, as represented in Epiclassic art and iconography. Imagery related to Flower World is prevalent in the artwork of Cacaxtla, Xochicalco, and Teotenango, but beliefs concerning the flowery paradise also spread along routes of exchange to more distant parts of Mesoamerica. This set of beliefs was inherited from Teotihuacan, but was adapted to suit the needs of the smaller Epiclassic polities. The Flower World complex valorized warfare and linked elites through shared ritual practice, identity, and exchange of exotic prestige goods. Investigation of the development of the Flower World complex is crucial for understanding broad-scale interactions during the Epiclassic.

[88] *Chair***Turner, B****[295]** *The Role of Environment in the Collapse of the Ancient Maya*

Understanding the socioeconomic demise and depopulation of much of the Maya lowlands from the eighth to tenth centuries has been influenced historically by environmental evidence and human-environment frameworks emanating from beyond archaeology. Climate change was involved as early as 1917, but subsequently muted by the excesses of environmental determinism. The role of environment was subsequently reinstated in the latter parts of the 20th century, especially influenced by compelling evidence from paleoecology. More recently, this role has been amplified as attention turns to past analogues of human-environment "tipping points" to inform sustainability science. The weight of the evidence increasingly indicates that the Maya collapse coincided with prolonged aridity and profound landscape changes, the feedbacks of which affected temperature, precipitation, and soil nutrient conditions, seriously challenging human-environment relationships in the Maya lowlands. It is a simplification, however, to invoke environment alone or primarily as the source of the collapse. Research attention must begin to address the collapse-period human-environment conditions relative to those in other periods of Maya hiatuses, raising the question why previous stress points were successfully tackled by the Maya as well as the extended paucity of occupation of much of the Maya lowlands.

Turner, Elaine [396] see Garcia-Moreno, Alejandro

Turner, Michelle (Binghamton University)**[418]** *The Appropriation of Native American Cultural Property: Comparing the U.S. and French Contexts*

When Native American sacred objects were recently auctioned off as art in Paris, many Americans were shocked by the headlines. American institutions and archaeologists continue to face their own histories of appropriation of Native American culture and objects, but many in the U.S. still seem surprised by the extent to which European institutions resist calls for more sensitive handling of cultural property. Others see a disparity between a widespread acknowledgement of the need to repatriate Holocaust-looted objects, while similar issues are not always acknowledged when it comes to objects that originated from indigenous groups. But are there genuine differences between American and European responses to appropriations of cultural property? If so, is Europe just catching up, or are there significant legal and cultural factors that account for the differences? This paper will explore understandings of cultural property in the U.S. and in France and compare relevant aspects of the legal frameworks in each country. It will discuss how these frameworks protect, or fail to protect, Native American interests in what happens to cultural property and will also

consider how we can move forward towards increased, and more just, protection for sacred objects and other cultural property.

[364] *Pot Hunting, Artifact Collection and Site Destruction: A Study of a Multi-Generational Pot Hunting Family on the Colorado Plateau*

Both historic and prehistoric archaeologists rely on oral history as a powerful tool for understanding archaeological context. Although traditional archaeological research can provide useful information about the past, gathering information from ethnographic or historical sources can shed light on past uses of material culture. Oral history can also provide useful information about traditions, belief systems and origin stories. The focus of this project has been to interview people with ties to the archaeology of the Petrified Forest National Park and the surrounding areas. By documenting these oral histories archaeologists and future generations may be able to better understand the interaction between the archaeology in and around Petrified Forest National Park and the local community and how this relationship has changed through time. One family interviewed for this project gave detailed accounts of artifact collection on private land over a period of four generations. The focus of this study is to interpret the collection strategy of one family over generations. By understanding the "who, what, where, when and why" of one family's approach to prehistoric material culture researchers can begin to solve the problem of looting on both public and private land through the process of education and engagement.

[65] *The Evolution of Sociopolitical Organization in Northwestern California*

Northwestern California has long been recognized as a unique area at the margin of both the Pacific Northwest Coast and California. Recent excavations at sites along the Smith River in Tolowa ancestral territory can help us elucidate long-term evolutionary trends among affluent foragers in the region. This paper will examine some of the profound alterations in human organization that occur at Red Elderberry (CA-DNO-26), a site located along a portion of the Smith River known as a highly productive salmon procurement location. Included is a review of recent analyses of Red Elderberry site materials and comparisons to recent excavations at a series of coastal sites along the Del Norte and Humboldt County coast. Together these investigations provide new insights into settlement and subsistence, in particular a better understanding of the evolution of sociopolitical organization during the Late Holocene after the rise of sedentary plank houses villages.

[50] *Far Northern Queensland: Cape York and Aboriginal Historical Archaeology.*

This poster outlines the initial findings of the first phase of fieldwork conducted in the central Cape York region of Queensland. The Cape York region of far northern Queensland has been the focus of intercultural interaction on the Australian continent for many years. It was not until the mid-19th century that colonial expansion in this area flowed up from the south and was the cause of major conflict between Europeans and Indigenous Australians. This history of invasion, genocide, mining and pastoralism has been explored by a number of Australian historians. Very little archaeological work has been conducted in the area of central Cape York, none of which has focused on the Aboriginal inhabitants of the area. The Kuuku I'yu (northern Kaanju) people of Cape York have provided the impetus for this research. The themes that will be explored in this study are: the European settlement in Cape York, frontiers and conflict, contact and colonialism, Aboriginal resistance and labor. These themes will be examined through the lens of Aboriginal historical archaeology. The three potential sites under investigation include the Wenlock (Batavia) Goldfields, a Native Police Camp at Clayhole Creek and the remains of the Mien Telegraph Station.

[406] *Ecology, Ceremony, and Animal Bones from Southern Mesopotamia*

Diane Gifford-Gonzalez has written numerous zooarchaeological papers that wonderfully balance attention to both the ecosystemic and the cultural influences that shape how humans interact with animals. In a 2008 essay exploring zooarchaeology's potential contributions to the study of daily life, she wrote that pastoralists' herd management strategies are constructed in the contexts not only of regional ecosystems and animal biologies, but also of human economies, ideologies and politics. At the same time, Gifford-Gonzalez has never discounted the importance of ecology and ethology in shaping human-animal interactions: her widely-read papers address topics from cattle diseases to fur seal ecology. This paper honors Diane Gifford-Gonzalez's demonstrations of the impacts that both nature and culture have on zooarchaeological assemblages. It discusses ecosystemic and ideological factors that shaped the patterning of animal remains from the 2nd millennium B.C. site of Tell Sakhariya in southern Iraq.

[411] *Long Distance Material Movement in the Mediterranean: Obsidian Transport, Trade, and Technology*

In the Mediterranean Neolithic, obsidian often traveled over 100 kilometers from the geological island sources. The capabilities of interregional maritime transport of many foreign materials by the late 7th millennium B.C. is demonstrated by the settlement of these islands and with the neolithic package of animals brought from the mainland. The quantity, quality, accessibility, and physical and visual features of obsidian from each source has been well studied, and chemical analysis distinguishes not just each island, but specific subsources, while some primary production areas have been identified. Extensive analyses of obsidian artifacts from many archaeological sites in Italy, France, Croatia, Malta, and Tunisia has enabled interpretations about the chaîne opératoire, and how production, transport, and use changed over thousands of years. Results of my research on the geological sources and subsources, and chemical analysis of more than 6000 obsidian artifacts, show that obsidian was used in clearly discriminatory patterns, with selected use of certain subsources; there was inter-regional and intra-site variation in source utilization and frequency of transport; and there were likely socioeconomic changes over the course of the Neolithic which affected access to the sources, the scale of production, and the parallel movement of knowledge, ceramics, and other materials.

[145] *Settlement Expansions during the Yayoi Period, Japan*

This paper intends to explain how a small number of small-scale Jomon societies in western Japan evolved to large-scale agricultural societies that characterized the Yayoi Period. Traditionally, Japanese archaeologists have approached this issue from the standpoint of settlement archaeology. This paper contributes to understanding this phenomenon based on lithics and their contexts of discoveries. By analyzing the assemblages of chipped stone tools and debitage, it becomes possible to approach the procurement of raw material rocks, their transportation, their use at settlements, and ultimately relationships among human groups. The results of author's analyses of data in the central Osaka Prefecture suggest that ties among settlements became clear in the late phase of the Final Jomon Period (ca. tenth to sixth centuries B.C.), and these ties were maintained in the Early Yayoi Period (ca. fourth to third centuries B.C.). In the Middle Yayoi Period (second and first centuries B.C.), ties formed among settlements close to one another. It is possible to interpret that a cluster of several units of settlements tied one another seemed to be a large-scale agricultural society. In other words, the large-scale Yayoi settlements were a "descendant" of evolving Jomon society.

[84] *Complexity in Space and Time: Spatio-Temporal Variability and Scale in Simulations of Social-Ecological Systems*

Over the last decade, the Mediterranean Landscape Dynamics Project has integrated complex systems concepts with computer simulation and empirical data in research on early farming systems. We have developed a computational laboratory, composed of multiple interacting models that are dynamically and recursively linked. to study how small-holder Social-Ecological Systems (SES) grow and change over time, how they react to major system state change, and how specific system variables affect the trajectories of these SES over space and time. Here, we apply this approach to questions of temporal and spatial scale related to the drivers and consequences of long-term change in SES. In particular, we examine how spatio-temporal "misalignment" between sub-systems can generate social-environmental variability and feedbacks in early SES. We present a theoretical framework for the development and consequences of these mismatches over the long term, with particular attention paid to the development of early farming SES. Related to this, we also consider how the scale of observation affects our interpretation of apparent change in these SES. We use examples from experiments conducted in our modeling laboratory to illustrate these concepts.

[141] *Estudio Arqueozoológico del sitio precerámico de San Gregorio, Xochimilco, México*

Uno de los sitios del Precerámico tardío más explorados en los últimos 25 años es San Gregorio Atlapulco, Xochimilco, Distrito Federal, México. En el mismo se han realizado varias temporadas de excavación por diversos grupos de investigadores, y entre los materiales que se han estudiado están los arqueozoológicos. La más reciente excavación no fue la excepción, se obtuvo una

colección de animales que nos permiten tener una idea más clara de lo que fue el paisaje y el paleoambiente hace 6200 años a. p. y hasta temporalidades más recientes, ya que existe una mezcla de animales silvestres y domésticos, incluidos los europeos. Entre los primeros, hay una gran diversidad al tener mamíferos como venados, mapaches y tuzas, así como anfibios, particularmente ajolotes, reptiles (tortugas) y aves, acuáticas principalmente como distintos anátidos. El estudio de restos permite dimensionar el aprovechamiento animal en la escala temporal que tiene el sitio y compararlo con otros similares, y además nos permitirá reconocer las relaciones de los humanos con el medio ambiente en que vivieron.

Umberger, Emily (University of Arizona)

[194] *Warrior Regalia and Questions of Inalienable Possessions in the Aztec World*

A fascinating aspect of Frances Berdan's new text, *Aztec Archaeology and Ethnohistory* (2014), is the section in Chapter 8 on warrior regalia as inalienable possessions. This topic is explored by Berdan in a rich discussion that merges Annette Weiner's framework with Berdan's own exhaustive knowledge of written and pictorial manuscript sources on the Aztecs. I would like to take this exploration into the realm of material evidence, by examining particular sculpted examples in the Aztec World. The examples are depictions of shields: rock art depictions representing the Aztec Empire in conquered areas and relief depictions representing the Matlatzinco polity (the Toluca area) before Aztec conquest. How were these shields to be understood locally in both pre-and post-Aztec times, and how did they function in inter-ethnic relations between the two groups?

Underhill, Anne (Yale University)

[335] *Urbanization and Ceramic Change: An Exploration of the Relationship*

Previous studies about the production, distribution, and consumption of craft goods in complex societies emphasize social relations at the household, site, and regional scales. An often neglected component is the nature of economic organization within different neighborhoods of large settlements. This paper argues that we should attempt to understand neighborhoods as meaningful communities for inhabitants of urban centers. These smaller communities can have a major impact on the nature of social demand for different kinds of craft goods, methods of circulating items, and the organization of labor to produce goods. This presentation describes an assessment of social demand for especially valued ceramics and patterns of access to these goods in different neighborhoods of the late prehistoric regional center of Liangchengzhen in southeastern Shandong province, China. It then describes an analysis of the degree of standardization for different kinds of ceramic vessels. It is argued that investigations about the strategies of potters in urban centers to produce different kinds of vessels should consider the nature in which such centers are organized and grow over time.

[162] *Changing Foodways in Precolumbian Illinois*

Precolumbian Native Americans of Illinois have had a long history of plant production from foraging to cultivation via horticulture to domestication via agriculture. Isotopic analysis has been used as a standard for comparing diet from different sites and isotopic ratios are given as parts-per-mil (‰), and reflect the consumption of types of food. Carbon isotopes ($\delta^{13}\text{C}$) can indicate the types of plants eaten and nitrogen isotopes ($\delta^{15}\text{N}$) indicate the trophic level of protein sources in the diet. The Archaic people of Illinois are viewed as being highly mobile hunter and gatherers, but with the advent of horticulture, their mobility began to decrease as they centered their movements around seasonally based camps. During the Woodland time period, horticulture was intensified and the people became semi-sedentary with permanent settlements. Mississippian people were considered sedentary with

the arrival of agriculture and the formation of towns. Hunting and fishing continued to be a regular activity. Regional variance does exist, but overall, through the history of the Precolumbian Native Americans of Illinois, there is a general trend in increased $\delta^{13}\text{C}$ levels as maize is adopted as a staple diet. Nitrogen levels did not change drastically over time, indicating a consistency in protein intake.

[365] *The Role of Public Space in Identity Making at Morton Village (11F2)*

The circa 1300 A.D. Morton Village site in west-central Illinois lies at the intersection of Mississippian and Oneota worlds. High levels of violence and social stress witnessed in the site's nearby Norris Farms #36 cemetery suggests that regional social interaction was marred by internecine conflict and raiding. The multi-ethnic nature of cohabitation at the site, on the other hand, suggests that ritual and cultural convention were creatively modified to reflect a new multi-cultural reality. This is reflected in novel uses of public space and unique public structure architecture. Morton Village lacks the typical public buildings and spaces seen in Mississippian contexts elsewhere such as a plaza, large chiefly structure, or rectangular council house. It is instead marked by a large, repeatedly rebuilt circular wall trench structure, a large single post public structure, and an open village layout. The novelty of these public spaces and structures will be contextualized via comparisons to similar spaces and structures at two other Late Prehistoric sites in west-central Illinois: Crable and Orendorf.

[8] *Geophysical Investigation of the Slaven's Roadhouse Site, Yukon-Charley National Preserve, Alaska*

The Slaven's Roadhouse Site in the Yukon-Charley National Preserve, Alaska, is a multi-component archaeological site with historic-age buildings and a prehistoric record dating to at least 4,000 B.P. The site is located on a deep, stratified river terrace along the Yukon River. Work conducted in 2008 revealed a mid-Holocene age cultural component at a depth of 0.5 m, however, the stratified deposits extend as deep as 6 m and have good potential to contain significant archaeological deposits dating to as early as 14,000 B.P. Locating cultural deposits at such depths posed a challenge for conventional invasive testing, which we attempted to surmount with the use of a battery of geophysical methods. The 2014 investigation included ground-penetrating radar, electromagnetic induction methods at two transmitter-receiver offsets, magnetic gradiometry, and DC resistivity. Preliminary results, presented here, revealed a number of potential archaeological features, some of which are deeper than 4 m.

[314] *Variations in Late and Terminal Classic Ceramic Firing Facilities within Southeastern Mesoamerica*

Research conducted in the adjoining Naco and Middle Chamelecon and Cacaupala River (MCC) valleys of northwestern Honduras has revealed a wide array of ceramic firing facilities and implements used in fabricating pottery vessels during the Late (A.D. 600-800) and Terminal Classic (A.D. 800-1000). The diversity of manufacturing processes is especially well represented at two major workshops, one located at the Naco valley center of La Sierra and the other at the site of Las Canoas in the MCC. The presentation illustrates and describes the variation observed among these ancient firing structures, highlighting the ways in which differences in production scale and complexity might have been implicated in the area's Terminal Classic political economy.

Urcid, Javier (Brandeis University)**[39]** *Teotihuacan and Post-Teotihuacan Writing in the Central Highlands as seen from NW Oaxaca and Southern Puebla*

The Ñuiñe script from NW Oaxaca and Southern Puebla was an eclectic writing tradition that spanned the 5th through the 9th centuries A.D. Its users shared scribal practices with Zapotec, Teotihuacan, and post-Teotihuacan Highland urban centers, deploying them in novel ways. In this paper the script is used as a proxy to ascertain its shared features with Zapotec and Teotihuacan writing, as well as the extent to which Central Highland polities that thrived politically and economically after the balkanization of Teotihuacan, related to it. In doing so, several societal implications of writing practices are highlighted to better understand the dynamic stage of ancient Mesoamerican history that straddles the political demise of Teotihuacan.

Uribe, Mauricio**[184]** *Cabuza y Maytas (Norte de Chile): ¿Tiwanaku, Post-Tiwanaku o No-Tiwanaku en Arica?*

A partir de nuestros estudios de la cerámica de Arica en la década de 1990, propusimos la existencia de dos tradiciones de producción local que se desarrollaron a lo largo del período Medio, en mayor o menor grado, por el impacto de Tiwanaku en los Valles Occidentales. En aquella oportunidad, definimos una Tradición Altiplánica tecnológica, estilística y contextualmente integrada a Tiwanaku, por lo que llegó a desaparecer junto con esa entidad. En gran medida paralela, aunque un poco más tardía, diferenciamos luego una tradición de Valles Occidentales, la que se impuso a fines del período Medio y evolucionó durante el Intermedio Tardío. Esto lo entendimos como expresión de una reacción a la influencia altiplánica de parte de la población local, dentro de un proceso generalizado en el extremo sur del Perú y norte de Chile que involucró a valles y costa. Resultado de lo anterior, sería el surgimiento de la Cultura Arica en los valles septentrionales chilenos. A casi 15 años de esta propuesta y en homenaje a Oscar Espouey, acogemos la invitación a este simposio para revisar nuestros datos cerámicos y retomar la discusión originalmente planteada por Dauelsberg, Lumbreras y Núñez sobre la problemática Tiwanaku y Post-Tiwanaku en Arica.

Urquhart, Kyle, Christopher Fisher (Colorado State University) and Stephen Leisz (Colorado State University)**[21]** *Ireta and Vapatzequa – Applications of the Alteptl Model to the prehispanic P'urépecha*

At the time of Spanish contact, Michoacan was under the control of a large empire centered at the capital of Tzintzuntzan in the Lake Pátzcuaro Basin. Prior to the rise of the Postclassic empire, the P'urepecha were organized into a series of small- to mid-scale polities known as ireta, which could be considered roughly analogous to the Nahuatl altepetl. These polities consisted of a series of nested territorial divisions composed first of named barrio-level units called vapatzequa followed by smaller complejos formed from groupings of individual households. This paper outlines the historical basis for this model of government and explores its archaeological applications and implications for the formation of the empire in the Late Postclassic.

Urton, Gary (Harvard University)**[78]** *"Hierarchy, Power, Identity and Time: Building a Khipu Simulacrum of Chachapoya Society at Laguna de los Cóndores"*

In 2005, the author published a study of a large khipu found in the plundered remains at the rock overhang site at Laguna de los Cóndores. That publication focused on the calendrical features of this khipu, showing that it was composed of cord groupings that constituted a two-year calendar. Subsequent study of the large sample and other, smaller khipus also found at the site show evidence of a process of the collection of information from several smaller cord records (perhaps from subordinate khipukamayus in the region) and their synthesis, perhaps by a head khipu-keeper residing at the lake, into the large khipu. This paper explores the evidence in these materials for a

process of constructing a khipu model – a simulacrum – of the hierarchical Chacha/Inka society that was emerging in the area at the time.

Uruñuela, Gabriela (Universidad de las Americas Puebla) and Patricia Plunket (Universidad de las Américas Puebla)

[303] *The Virtual Reconstruction of “Los Bebedores Mural” from Cholula, Puebla, México*

Almost half a century has gone by since the discovery of Los Bebedores (The Drinkers) in 1969, and it still has not received the attention that one of the most extensive large format murals in Mesoamerica deserves. Poor preservation, a hasty recording because the Cholula Project was ending, an unfortunate later restoration, and the repetitive selection of the more obvious personages to illustrate the few publications on the theme, are just some of the factors responsible for the scarce attention paid to this more than 50 m long by 2.5 m high work of art painted in the third century A.D. Using high definition images and over-contrasting them allow us to appreciate not only details but even whole figures that are almost invisible to the naked eye, and thus to make the drawings to reconstruct a scene much more sophisticated and realistic than the cartoon-like images that have been published. The data revealed by this process offer the opportunity to make a new reading of this neglected work of art and to use it as another window to enhance our view of Early Classic Cholula.

Vacca, Kirsten (University of California, Berkeley)

[113] *Social Interaction through Structured Use of Space in the Early Hawaiian Household*

Archaeological investigations of pre-European contact Hawai'i rarely consider gendered space within the household—specifically, female spaces. Some scholarship addresses male spaces, yet few researchers currently attempt to understand the household and the landscape in terms of complex gendered interactions. In addition to this lack of household research, issues of androcentrism and historical linearity plague many Hawaiian ethnohistories, leaving fundamental gaps in knowledge that can be filled through concentrative archaeological research. This paper presents research from Nu'u, Kaupō, Maui in the Hawaiian archipelago, focusing on a gendered analysis of the archaeological record through engagement with oral traditions and gender and feminist theory. The central question to be addressed is the formal organization of space and how this structured social interaction within late pre-European contact Hawaiian house complexes. The research privileges archaeological remains, analyzing placement and construction of residential architecture as well as artifacts and ecofacts recovered from residential landscapes. The integration of feminist theory and oral traditions with the carefully collected archaeological data paints a more nuanced picture of gendered social relations and the use of space in the household.

Vadala, Jeffrey (University of Florida)

[316] *Using VR Phenomenological Landscape Analysis to Explore Diachronic Ritual Space at Cerros, Belize*

The Oculus Rift virtual reality headset used alongside 3D site reconstructions provides a huge potential for a phenomenologically based landscape analysis. This presentation explores the methods and results of a study using these technologies that focuses on understanding the diachronic changes in the construction of ritual space at the Maya site of Cerros, Belize. Site maps were modeled in 3D according to each historic phase and converted for use in a highly immersive and interactive video game engine compatible with the Oculus Rift. When combined with virtual reality, Cerro's 3D recreated monumental site core creates a sense of spatial immersion that virtual reality specialists call “presence,” a sense of being in another place. Phenomenological considerations of embodied movement in space could thus be analyzed in tandem with the active generation of visual fields. With this capability, the built and unbuilt landscapes were diachronically analyzed, focusing on how changing spatial orientations affected embodied movement, emerging visual fields, and the experiential capacities of public and private ritual events.

[191] *No Strength in Numbers After All? Demographic Explanations of Cumulative Culture Re-Examined*

Cultural-evolutionary models of scientific and technological change enjoy growing popularity. This family of mathematical and agent-based models purportedly explains how cultural change results from a 'demographic' effect: complex traits accumulate in large groups, and disappear in smaller groups. We use agent-based modelling to reveal hidden contingencies in these findings. We show that the demographic effect is sensitive to assumptions regarding social learning mechanisms and skill distributions, and particular definitions of complexity, for which there are empirically plausible alternatives. Further, we examine in what sense demographic models of cumulative culture, even if exhibiting robust results, can be said to explain particular transitions, e.g., the loss of culture in Holocene Tasmania, the Upper Paleolithic transition, or the growth of scientific knowledge since the Industrial Revolution. We consider various proposals offered in the philosophy of science, and demonstrate that none of them is satisfactory. From this we conclude that either we need a new account of explanation, geared specifically to cultural evolutionary models, or we need to let go of the idea that these models can do much explanatory work.

Vail, Gabrielle [158] see Duncan, William

Vail, Gabrielle (New College of Florida)

[303] *Gender Ideologies in Zapatista Maya Murals and Postclassic Mural Programs from the Eastern Maya Seaboard*

Zapatista murals focusing on the autonomy of Maya women and their connections with the earth have strong ties to prehispanic iconographic programs that emphasize the role of female supernaturals and ancestors in nourishing and sustaining the cosmos. This presentation examines ideologies of the Zapatista movement, particularly those related to gender, as represented in the artwork associated with the movement, and draws comparisons to ideologies represented in mural programs such as those from Postclassic Tulum, as well as the Maya codices, which evidence strong notions of gender complementarity. Sculptural representations from Classic period sites in the Usumacinta region will also be examined, as they appear to form a particularly potent symbol for contemporary Zapatista artists, as do polychrome ceramic vessels featuring birthing scenes.

Valcarce, Ramon

[353] *Riders on the Stone*

Horse riding scenes are arguably about the most emblematic representations within post-paleolithic open air rock art in Galicia (NW Iberia). They have been used as a controversial chronological milestone, setting them somewhere between the Final Neolithic and the Iron Age. Such an iconography may be related to a shift in the Human/Nature relationship that we see in later prehistory. While not discarding that they are showing real activities, we believe the riding scenes could be emphasizing a new interventionist attitude of the human groups on the environment. Such an empowering stance would be well reflected in the otherwise bizarre representations of deer riding. Moreover, horse riding images - together with the carvings of metallic weapons - seem to underline the rise of the male warrior in the framework of an increasingly divided society.

Valdez, Lidio (MacEwan University)

[411] *Cultural Interaction and Cultural Change in the Peruvian Central Highland Valley of Ayacucho*

Human societies are not isolated islands; instead, they are part of a complex web that links them with distant communities who are not only culturally different, but also inhabit different environmental settings. In the distant past, cultural interaction was a window that enabled the exposure to previously unknown cultural customs and the flow of ideas, in addition to access to foreign exotic

goods and the establishment of new kinship ties. Contact with more complex societies and important locations likely also resulted in the enhancement of status and prestige of specific individuals. Archaeological evidence coming from the Peruvian central highland valley of Ayacucho indicates that as early as the late Early Intermediate Period (ca. 450 – 550 C.E.), the ancient inhabitants of the region were already part of a large network that linked them with their neighbors of the eastern tropical rain forest region as well with the inhabitants of the dry Pacific coast region. Interaction among members of different cultures precipitated not only the acceptance of previously unknown products and associated cultural practices, such as the use of coca leaves, but also significant cultural transformation in the Ayacucho Valley that ultimately culminated in the establishment of the Wari State.

Valentin, Norma (Instituto Nacional de Antropología e Historia)

[346] *The Art of Preserving Skins in the Great Temple of Tenochtitlan*

The use of animal fur in ancient Mesoamerica is well known due to the historical records, sculpture and painting. Archaeologically, it has been inferred by some evidence, as the presence and absence of certain animal bones and the cultural traces they present (abrasions, cuts and perforations, for example). In the offerings of the Sacred Precinct of Tenochtitlan, Mexico, there has been found a large number of skeletal remains of four classes of vertebrates (fishes, reptiles, birds and mammals) which traces allow us to tell that these are vestiges of preserving hides. Detailed analyses of the bird bones has allowed to find a group with strong similarities in their manufacturing traces, that can be proposed to pertain to a tenocha style, in contrast to others that are thought to be of foreign origin.

[231] *Paleogenomic Perspectives of Archaeological Human Samples from Durango, Mexico*

Despite the great number of methodological obstacles, the molecular biology applied to the field of Archaeology has proven to be an important complementary tool to interpret the population dynamics of ancient populations. The mitochondrial DNA, as it is inherited in a matrilineal way, has information about the relationships of the human groups under a population context. In collaboration with LANGE BIO, several archaeological human samples from Durango Mexico have been subjected to ancient DNA analysis, identifying the mitochondrial haplogroup of eight individuals from the valley and mountains regions. The new challenge of this data is to infer the genetic relationship between different groups of samples, related with the archaeological hypothesis about them, and the analysis of more samples in order to gain statistical power for population analyses. The main focus of this talk is to present our current results and the perspectives regarding ancient DNA analyses in Durango, and discuss the future population analysis.

[217] *Local or Foreign? The Technological Styles of the Lapidary from Tamtoc*

At Tamtoc, an archaeological site located at the Huastec region in San Luis Potosi, the archaeologists found hundreds of lapidary objects in the offerings and burials. Some of them were crafted in raw materials that were available locally, like the calcite, while others came from distant areas, like the jadeite. But, was their provenance the same of their production? The purpose of this paper is to show how the technological analysis with Experimental Archaeology and the characterization of the manufacturing traces with SEM, allowed us to identify and distinguish at least two lapidary styles, one local and the other foreign. Finally, we compare the results with other lapidary collections to appreciate the relationships with other regions and cultures.

[48] *Using Building Information Modeling Programs to Understand the Built Environment of the Virgin Branch Puebloan Culture*

Architecture has always been a key focus in archaeological research. This is because it dominates the context where the investigation takes place. However, there is a dearth of research concerning the vernacular architecture within the built environment of the Virgin Branch Puebloan (VBP) people on the Shivwits Plateau. This stems from the sediments of the area, which have obliterated most floor features and thus have limited the amount of architectural information that can be recovered. To compensate for this lack of structural evidence, this research utilizes architectural Building Information Modeling (BIM) programs, in conjunction with ethnographic and archaeological data, to model the construction of a VBP pueblo digitally. The BIM model, however, goes beyond visual imagery. Once constructed, the model makes it possible to carry out a variety of architectural, structural, thermal, and solar analyses. In this study, the BIM model is used to obtain information on the type of construction materials used, the labor requirements needed to construct the pueblo, and the thermal dynamics of each room. This case study demonstrates the potential of BIM programs to substantially contribute to our understanding of prehistoric lifeways.

Van Der Leeuw, Sander (SHESC)

[288] *Learning from the Past about the Present and for the Future*

This paper argues that we would massively increase the value of our archaeological understanding of the past for the present if we cast it differently. Rather than use a reductionist, 'ex-post' approach (which explains the present by invoking the past, looking for origins), we should be using an "ex ante" approach that looks at the emergence of change, allowing us to learn from the past about the present and for the future. The paper first briefly summarizes some of the difficulties encountered in implementing such a different approach, at the level of our cognition, our scientific practices, and our paradigms, and then illustrates some of the changes in perspective such a shift would bring about. In particular, rather than see the Maya world as a unit, and look at regional differences within it, this would create a perspective in which different, initially more or less independent, rural regional developments converge in a long-term socio-environmental co-evolution to create an urbanized Maya world. As part of that co-evolution, new 'tools for thought' are conceptualized, and new values are discovered which enable new adaptations.

Van Der Reijden, A. Jay (IoA, University College London)

[132] *A Global Classification System for Cultural Dental Modification: Created and Assessed*

Culturally modified teeth are one of the few personal identity markers to survive into the archaeological record, have modern comparatives, and exist as a global deep-time behavior. Typology and description, however, have suffered from a multitude of, often misinterpreted, classification systems usually restricted to specialized geographical areas and local publication. With the high variation of designs, a lack of consistent codified definitions makes cohesive discussion frustratingly difficult, highlighting that a new, clear global classification system is overdue. Expanding on the frequently-used works of Romero (1958-1986), a renewed classification model is presented, supplying continuity between past and future work. It provides an integrated system synthesizing

previously temporally and spatially scattered examples, located via the literature and online museum collections. Pursuing a logical structure, modifications are integrated by more precise, defined descriptions and clear drawings. Usability and successfulness were assessed via both standardized participant evaluations and examples held at the Natural History Museum, London; results were adjusted and improved the classification. This classification system provides a functional tool for global comparisons, supplying a framework to discuss designs in clear, unified codes rather than confusing or imprecise descriptions, while also removing the necessity to access scattered, rarely reprinted classifications.

Van Der Voort, Madeline (University of Nevada, Reno)

[92] *An Analysis of an Early-to-Mid Holocene Projectile Point Assemblage from Little Steamboat Point Rockshelter, Warner Valley, Oregon*

Little Steamboat Point 1 (LSP-1) is a small stratified rockshelter in Warner Valley, Oregon. It contained an early-to-mid Holocene component consisting of faunal remains, lithic tools, and debitage. My use-wear analysis of 20 Great Basin Stemmed and Cascade projectile points examines how those tools were used via macroscopic and low-power microscopic techniques. Since the shelter seems to represent a short-occupation activity site, this analysis provides insight into the hunting and processing practices employed in the area. The use-wear results are compared with XRF data for the specimens to explore toolstone procurement and use at the shelter. These results contribute to reconstructing broader mobility and technological organization strategies of prehistoric groups in the region.

[354] *Friends in High Places: Windes, Shrines, and Lines of Sight*

In the 1970s, Tom Windes began documenting shrines and stone circles around Chaco Canyon. Decades before landscape archaeologists spoke of viewsheds, Tom recognized the significance of visibility at Chaco. He observed that J-shaped Windes' shrines create intervisible connections among great houses, and he pointed out that stone circles in Chaco are always within sight of one or more great kivas. Today, GIS is a useful tool for examining intervisibility across large areas. Inspired by Tom, and utilizing data he collected and graciously shared, we employ GIS line of sight and viewshed analyses to assess intervisibility among great houses, shrines, stone circles, herraduras, and high places across the Chacoan world. As Tom originally postulated, we demonstrate that shrines on high places create a network of intervisible connections linking outlier communities and landforms. It is possible that the boundaries of Chaco are defined in some sense by intervisibility.

[17] *Investigating the Toolkit for Building a Neolithic House: Microwear and the Missing Majority*

Many microwear studies focus on one material category. Instead we explored the technological and functional interconnectivity of different tools used in one chaîne opératoire. During the experimental reconstruction of a Late Neolithic houseplan excavated in the Dutch wetlands, we made use of a variety of implements: stone axes and adzes, bone and antler objects, and tools of wood. In total 120 tools were used for almost 20,000 minutes during the four week construction period. We recorded the entire biography of each tool, making Provil casts each time the object switched function. Relevant attributes of the contact material as well as of the tool user were noted. All of the tools were studied for traces of wear, the Provil casts allowing us to follow the history of wear development. Some tasks are well represented in the identifiable weartraces, whereas other phases of the building

process are not reflected. Some tools, notably those of wood, are not likely to survive at all, yet they constituted 25% of the total worked time. In this paper the results of the microwear analysis will be discussed in the light of behavioral and taphonomical perspectives related to the chaîne opératoire of house construction.

[347] *To Feed the Miner and to Feed the Mine: Some Thoughts on the Macrobotanical Assemblage from Mina Primavera, Nasca Region, Peru*

Mina Primavera was a hematite mine exploited during the first part of the Early Intermediate Period by members of Nasca society. Its exceptional preservation conditions have led to the recovery of a large assemblage of botanical remains. Recent analysis of the ubiquity and diversity of botanical species allow us to reconstruct consumption practices that took place as part of mining activities. However, observation of taphonomic processes and stratigraphic distribution of the hundreds of maize cobs recovered open possibilities for different interpretations of the activities that occurred within the mine during and after the peak phase of exploitation. We outline different hypotheses to explain the state of the maize remains and the contexts in which they were encountered.

[239] *Time and Technology at Kwastiyukwa, a Large Classic-Period Pueblo in the Jemez Mountains, New Mexico*

This paper is part of an ongoing study associated with the FHiRE Project, which examines the interaction of fire, landscapes, and people in prehistory in the Jemez Mountains of New Mexico. Before we can examine higher-level questions of demography and interaction through time, it is necessary to firmly establish time with as much precision as possible. This paper represents the first step toward building and anchoring a detailed chronological framework for occupation at Kwastiyukwa, a large Classic-period pueblo in the Jemez Mountains. Technological analysis of the two most abundant kinds of ceramics in the Jemez region, the ubiquitous utility wares and Jemez Black-on-white, provides a data set from which many questions can be addressed. A large sample of the approximately 20,000 sherds obtained through systematic surface collection at Kwastiyukwa allows us to seriate these ceramics according to multiple technological attributes, both in isolation and in combination, achieving a finer-grained understanding of temporal change. This analysis provides insight into the occupation of the pueblo, as well as temporal patterns and technological change in ceramics. This ceramic analysis will be replicated at several other large pueblos targeted by the FHiRE Project, expanding this temporal framework to the broader Jemez region.

[74] *Expansion and Extinction: the Collapse of the Mammoth Steppe Fauna*

The fossil record shows how extensive the impact of climate change on the natural environment can be. The woolly mammoth, a prominent member of the animal kingdom during the Late Pleistocene, dominated the fauna of Eurasia for thousands of years. However, rather recently in human history, the woolly mammoth, together with the woolly rhinoceros and the giant deer, became extinct. Other species flourished due to the latest changes in climate and expanded their territories to more northern latitudes of Eurasia. This was a dynamic and fascinating process of species contraction and expansion that was driven by climate change. During this time, humans followed their own path, expanding to the east and crossing Beringia on their way to the Americas. Russian scientists, in close cooperation with Dutch scientists from Leiden University, studied the natural changes in the fossil record during the past 40,000 years. The results of the joint research projects illustrate the impact of changes on the environment in the past as well as in the future.

Van Vlack, Hannah**[407]** *Khao Toh Chong Rockshelter, Krabi: A Reflection on Human Behavioral Adaptations Driven by Environmental Change during Prehistory*

Human behavioral adaptation to environmental change (i.e., sea level rise, monsoonal events) in Southern Thailand is an area of archaeology that has not yielded much study due to the preservation issues or sampling techniques. In a case study approach, geoscience and archaeological methods were utilized to trace environmental and cultural shifts at a rockshelter site occupied throughout the late-Pleistocene and Holocene. Results from this case study begin to answer questions about the foraging strategies employed by hunter-gatherer populations who occupied Khao Toh Chong Rockshelter (KTC). The eco-artifacts preserved at KTC reveal continuous occupation at the site and nuances of environmental and cultural change. Shifting foraging patterns, informed by the zooarchaeological remains deposited at KTC, marks cultural change at the site. Shifts in stable carbon isotopic ratios indicate that flowering plants were more available during the Holocene, when foraging practices shifted. Paleobotanical data suggests poor soil condition, and the need for further analyses of the phytolith assemblage. The articulation of these data sets suggest that foragers focused hunting and gathering around the availability of riparian resources in the estuary, an indication that the transition into wet-rice cultivation was a natural transition possibly adapted from experiential knowledge of the estuary environment.

Vanderslice, Allison (San Francisco Planning Department) and Randall Dean (San Francisco Planning Department)**[416]** *Assessing Archaeological Sensitivity in San Francisco*

The San Francisco Planning Department archaeological staff reviews hundreds of projects for archaeological sensitivity each year as part of the California Environmental Quality Act review process. To aid this review, the Department has begun a long-term GIS project creating thematic maps and related datasets to inform archaeological site identification, to determine interrelationships between archaeological sites and historical land uses, and to direct research designs. Over the last 8 years the Department has created maps for Yerba Buena San Francisco, Hispanic Period San Francisco, San Francisco Chinese resources, San Francisco Maritime resources, and Prehistoric Period San Francisco. This paper uses the Department's Yerba Buena Period San Francisco (1836-1848) project to illustrate how this tool improves identification of archaeological site sensitivity and significance evaluation. The paper outlines the research undertaken to create the map, how that data is symbolized, and the problems encountered. The paper ends with a discussion of challenges faced by project-specific review and the need for additional thematic layers and historic-period archaeological districts in San Francisco.

VanDerwarker, Amber [172] see Alvarado, Jennifer

VanDerwarker, Amber (UCSB)**[226]** *Social Spaces between Diet and Foodways*

PEB practitioners are increasingly drawing from social perspectives which allow them to shift between concepts of diet and foodways. This increasingly social paleoethnobotany is bolstered by rigorous quantitative analyses of large datasets that facilitate the exploration of temporal and spatial nuances in ancient plant assemblages. This marriage between social theory, analytical rigor, and

large datasets is further strengthened by the trend towards integrating multiple proxies of food data (e.g., starch, phytoliths, macroremains, faunal remains). Ultimately, an integrated, multi-proxy analysis of large plant datasets informed by social archaeological approaches allows PEB to lead research in areas related to gender, identity, warfare, culture contact, and many more.

[334] *Chair*

Vandiver, Pamela (Materials Science and Engrg., University of Arizona)

[241] *Reverse Engineering Ancient Pyrotechnologies*

Technological change is driven by social context and perceived needs, but technological changes are also driven by seven other factors: materials constraints, especially composition and microstructure and availability and ease of processing raw materials, as well as the properties of the materials and the finished products, the nature and complexity of the materials transformations, the methods and sequences of processing, and the suitability to use and performance. Examples will be drawn from some extreme cases of unusual processes and properties that required development of an intimate knowledge of the possibilities and constraints of unusual materials and processes: ceramic farming tools from Iraq, Tibetan braziers, Kazakh drinking cups, decorative Corinthian Greek slips. Variability in the practice of a technology that is available for study on an archaeological site involves observing and reasoning through the errors in manipulation, transformation and use, much as a consultant would find, define and assess problems in a modern factory. To establish and develop an understanding of the behavior represented in craft and workshop evidence, the pace of excavation should slow to allow consideration of the microscopic evidence as intensively as the artifactual, contextual and stratigraphic evidence.

[305] *Gardens and Forking Paths: A Genealogy of Landscape and Subject Formation in the Zaña Valley, Peru*

Recent archaeological research has called attention to the performative dimensions of imperial built environments, shedding new light on how regimes and subjects emerge (and persist) in acts of place-making, urban planning, and monumental construction. However, our focus on clarifying the semiotics of imperial architecture has drawn attention away from longer-term process of subjectification and elided the role that landscapes play within them. The study of landscapes in Peru's Zaña valley between the 11th and 18th centuries CE demonstrates that subject formation followed a forking path, taking shape not simply through overt acts of construction and domination but also unanticipated demographic and environmental transformations and halting engagements between subjects and imperial institutions.

Varillas, Rosa Maria (Proyecto Arqueológico Cerro de Oro)

[134] *Technique and Style in Textiles from the Cerro de Oro Site*

This paper focuses on the analysis of textile material obtained in three areas (one funeral and two domestic) investigated within the archaeological site located in Cerro de Oro Cañete Valley. This research is embedded within the framework of the Cerro de Oro Archaeological Project, which has

been working on this archaeological site since 2012 and which has among its objectives to determine the cultural affiliation of the site, especially its relationship with the Wari phenomenon.

The material has been studied by analyzing manufacturing techniques and iconography. The objective of this study was to determine, first, what were the general characteristics of the textile material in this site and its relationship with Wari or other geographically closer societies such as Lima and Nazca. Second, we seek to establish whether these features were changing over time or if there are differences between the findings in the different units. Comparing these results with those of other sites studied, we expect to find similarities in the highland textiles associated with a foreign elite and variety in the coastal textiles, domestically produced according to the specific characteristics of each site.

[62] *A Burial in the Bay: Evidence for Environment and Diet 7500 Years Ago*

Microscopic and macroscopic evaluation of samples associated with a 7570 CAL BP burial recovered on the west side of San Francisco Bay provides multiple proxy records representing the environment at the time this person was interred and possibly foods consumed by this individual. The pollen and macrofloral records indicate evidence of coastal or littoral plants, one of which, soaproot, also contributed abundantly to the macrofloral record. A wide variety of trees grew in the bay area, as did shrubby and herbaceous plants and cool season grasses. Plants that might have been part of this individual's diet include California huckleberry, elderberry, prickly pear cactus, members of the mustard and mint families, manzanita, mustards, and perhaps other plants. The most abundant diatoms in both samples are marine to brackish, epipelagic species, adapted to live primarily in tidal and supratidal mud flats and salt marshes that are frequently, perhaps diurnally, flooded. The diatom record provides direct evidence of conditions in the bay mud as it accumulated around the burial in the estuary. Together these proxies represent the local environment at 7570 CAL BP as well as for an indeterminate time after interment when the lower bay muds accumulated.

[241] *Lithic Technology Transfer and the Mesolithic-Neolithic Transition in the South Caucasus*

Recently, several discoveries in Armenia, Georgia, and Azerbaijan have shed new light on the processes involved in the development of food production economy in the South Caucasus. If a series of excavations using modern techniques have provided an improved chronological and cultural framework for this complex phenomenon, several interrogations remain. What is the role of the hunter-gatherer population in the domestication process? Is the presence of Neolithic cultures in this area the result of a demic diffusion from food producing societies? If so, how (if at all) have the two populations interacted in the South Caucasus? Some of these questions can be answered through the study of technological variability and raw material management in lithic assemblages. We will look at how technological behaviors in assemblages from four mesolithic, neolithic and endolithic sites can inform us about the mechanisms underlying these group interactions, as well as the location of those interactions in the socio-economic landscape. Comparison of patterns in technological behaviors in Mesolithic, Neolithic and Eneolithic groups can then help us determine models of group interaction and establish a diachronic picture of the transition toward a food production economy in the South Caucasus.

[90] *Managing 50,000 Acres of Private Land in Texas: Results of a Recent 2,000 Acre*

Pedestrian, UAV, and Vegetation Survey in the Sierra Diablo Mountains

A comprehensive landscape survey covering 2,000 acres of private property was conducted this past May in the Sierra Diablo Mountains of far west Texas. The survey targeted a previously unsurveyed portion of the mountain range and surrounding alluvial fan environments adjacent to Sierra Diablo Cave with the goal of assessing the relationship between settlement and landform. The landforms included wooded juniper pine uplands at nearly 6,000 ft AMSL to the lower foothills and basin margins at 4800 ft AMSL. The results of the study identified a number of temporally sensitive occupations assigned to specific landforms, most notably middle to late archaic settlements aligned with upland locales. The results and findings of the study are discussed in relation to the regional prehistory and to the more local Sierra Diablo Cave project.

[244] *A Multiproxy Investigation of Maya Socio-Political Territories: A Case Study from the Yalahau Region, Northern Quintana Roo, Mexico*

The Yalahau region in northern Quintana Roo, Mexico constitutes a unique physiographic landscape in the Maya area. The region is characterized by abundant freshwater wetlands, known locally as sabanas, which stand in marked contrast to the dry karstic plain of the northern Maya lowlands. The paper combines the results derived from surveys of the region's settlements and its wetlands along with remote sensing data (in particular LANDSAT and LIDAR platforms) to highlight how multiple methodological approaches must be employed if we are to understand the dynamic nature of Maya territories. Specifically, we address both the challenges and advantages inherent in integrating remotely sensed data sets with other survey methodologies. We also discuss the contradictory nature of varying datasets (i.e. ceramics and architectural styles) often used to define territories in the Maya area. While focused predominately on the Terminal Preclassic period, the changing nature of sociopolitical boundaries in the Yalahau region during the Terminal Classic and Postclassic periods will be addressed.

[31] *The 2014 Excavations at Cerro Tortolita, an Early Intermediate Period Ceremonial Center in the Upper Ica Valley*

This paper reports on the 2014 field season at Cerro Tortolita, a predominantly Early Intermediate Period (EIP) site in the Upper Ica Valley. While the site has been known archaeologically for at least four decades, no systematic investigation has ever been undertaken there. Our work documented the numerous sectors of the site and through vertical excavations established a preliminary chronology. We found that the site has an extensive ceremonial/ritual component including a U-shaped platform mound, several plazas, terraces with numerous activity areas, and a large residential sector. Chronologically, the site dates mostly to the EIP, and predominantly Early Nasca. Analysis of ceramics suggests that many appear to be a local derivation of the classic Nasca style. We hypothesize that Cerro Tortolita served as a secondary ceremonial/pilgrimage center, one that attracted residents primarily from the Ica Valley and aim to further test this hypothesis with future work.

[29] *Where the Buffalo Still Roam: Archaeology of a Buffalo Jump and Prehistoric Village Site at Wind Cave National Park*

In 2011 Wind Cave National Park acquired new lands that include an important prehistoric site where American Indians once made their homes and practiced communal hunting. Two seasons of work at the site have resulted in the discovery of drive lines, rock cairns, processing areas, stone circles, ceremonial features and much more. What has been found at the site is equally as important as the way the work has been conducted, including the involvement of tribal monitors and volunteers, tribal consultation in development of park interpretive plans, and outreach to the local community about the importance of archaeological site preservation and respect for cultural traditions. While our research is important to the advancement of archaeological understanding of prehistoric use of the Black Hills of South Dakota it also provides us with the information to tell the story of plains tribal history to National Park visitors.

[242] *The Roles of the Figurines of Oaxaca*

Figurines were an essential part of prehistoric people in Mesoamerica. In Oaxaca, these figurines were essential for daily and religious life in the village stages of cultural evolution. Figurines have been subject to several hypotheses in their role and significance in life due to their same range and presence in most places in the Oaxaca region. However, we were unable to determine their specific role for each stage of cultural evolution in the valley or for a decisive site because we need to carry out further excavations in contexts that include them. In this presentation the objective is the review and comparison of figurines of the Preclassic and Classic periods in the Southern Isthmus and central Valleys of Oaxaca demonstrating the possible roles that these have in the region. In addition, this presentation will introduce a new vision in the role and use of the classic figurines in the South Isthmus, such as a female representation of ballplayers.

Vázquez De Ágredos Pascual, Marisa (Universidad de Valencia)

[242] *Las Fragancias Rituales del Preclásico en Tak´Alik Ab´Aj*

La arqueología, la iconografía y la epigrafía maya han identificado desde hace décadas la importancia que tuvo el aroma entre los antiguos mayas, en especial como parte de la escenografía simbólica que envolvió distintos acontecimientos políticos y religiosos de profunda significancia en la cosmovisión de esta antigua cultura prehispánica. Más recientemente, la arqueometría ha empezado a caracterizar algunas de estas antiguas y simbólicas fragancias, lo que nos permite entender con mayor acierto las prácticas socio-culturales y el significado ritual que tuvo el uso de unas fragancias u otras en el seno de estos acontecimientos y escenarios. En esta comunicación se analizarán los resultados que se han obtenido al examinar con LM, SEM/EDX, TEM, FTIR, Pyr-GC/MS y HPLC las ofrendas rituales de pigmento y aroma halladas en el entierro nº2 de Tak´Alik Ab´aj, hecho que dará la posibilidad de remontarnos a la tecnología de estas antiguas fragancias desde tiempos del Preclásico.

Vazquez De Arthur, Andrea (Columbia University)

[187] *The Expression of Human Identity on Wari Faceneck Vessels*

For the Wari civilization of the ancient Andes, the production and distribution of prestigious ceramics painted with religious and secular iconography likely functioned as a type of materialized ideology that contributed to the Wari agenda of imperial expansion. One particular ceramic form favored by the Wari was the faceneck vessel: a tall-necked globular vessel with a human face sculpted onto the base of the neck. These anthropomorphic vessels have been found in elite tombs and offering deposits across the greater Wari region, and careful study of these objects can offer insight into the practice of human representation in Wari society. This paper examines how human identity is expressed on faceneck vessels through differences in facial markings and hairstyles, as well as through the iconography presented on the vessel's body. Variance in facial markings and hairstyles,

paired with the vessels' provenience, may point to regional subdivisions of Wari society. Groups of identical faceneck vessels excavated from Wari sites invite investigations into the relevance of individual versus group identity among the types of people represented on faceneck forms. A better understanding of how the Wari expressed their own identities could potentially revise how we view and define the Wari as a society.

Vega-Centeno, Rafael

[227] *Ethnic Interaction and Settlement Composition at Huacramarca*

The Late Intermediate Period (LIP) is usually considered as the time of ethnic diversity in the Central Andes and representations of ethnic boundaries in maps illustrate this scenario. However, these representations offer a synchronic perspective of ethnic configuration as a consequence of their reliance on XVI Century sources. Nevertheless, Andean chronologies demonstrate that the LIP covers more than 500 years (from A.D. 900 to 1450) in which several dynamic phenomena, including expansion, migration, alliances, warfare and constant ethnogenesis, should be expected. Evidence from Huacramarca, a LIP settlement of the Yanamayo Basin, enables us to approach these dynamics. Excavations in Huacramarca revealed a settlement composed of a dozen patio groups that were built gradually following households' growth. In one patio group, two distinct wares were recovered (Wares A and B), also corresponding to different vessels' repertoires. XRD and XRF analyses support the distinction between wares, also revealing differences in temper and clay sources. Ware A seems to be local, while Ware B appears to have been brought to the site. If Ware B was coming to the site with their owners, it might point towards migration processes and a multi-ethnic composition for Huacramarca's population.

Veit, Richard, Sean McHugh (Monmouth University) and Adam Heinrich (Monmouth University)

[405] *A Forgotten Town on a Forgotten Road: The Archaeology of Pine Barrens Heritage at the Storied Cedar Bridge Tavern*

New Jersey's Pinelands (aka the Pine Barrens) is the largest preserved natural space in the Boston-Washington megalopolis. Fabled as the home of the Jersey Devil, endless pine forests, lost ghost towns, cranberry bogs, and "Pineys," the region has long drawn the attention of writers, researchers, and folklorists. Many of these authors have emphasized the distinctive way of life present in the region. This paper brings the archaeological lens to bear on the Pinelands. Have the Pinelands long been home to a distinctive regional culture, or are the regional distinctions so heavily emphasized by 20th-century authors a literary device used to create rather than describe a place? Here these questions are examined through a collaborative, interdisciplinary, public archaeological project. This work draws upon the rich archaeological deposits found at the Cedar Bridge Tavern in Barnegat Township. The intersection of history, geography, folklore, and archaeology is explored in order to better understand the region's heritage and the importance of that heritage for researchers and residents, both past and present.

Velasquez, Veronica (The University of Sheffield/ Instituto Campechano)

[76] *Potters' Signatures and Changes in the Maiolica Craft from Colonial Mexico as an Expression of the Doctrine of Blood Purity*

The aim of this paper is to explore the potential that the potters' signatures on maiolica vessels have to gain insights to the shifts in the craft industry from the mid-seventeenth century and onwards. It will be argued that the modifications that are observable on the personal imprints of the potters may have been related to changing attitudes towards their cultural identities. The analysis of archaeological samples from different sites in Mexico City enabled the identification of a variety of potters' signatures. This allowed the identification of several workshops that were active during the seventeenth and eighteenth centuries. These intriguing elements were then correlated with different ceramic types in order to obtain glimpses into the complexity of the production, distribution and consumption of different table sets. The analysis of this kind of material culture in conjunction with data obtained from documentary sources enabled exploration of shifts in the craft industry. It will be argued that these shifts were related to the reorganization of the guild and the reaffirmation of cultural identities and social status within the context of miscegenation and blood purity.

[183] *La Vida alrededor del Río Holmul: Patrón de Asentamiento de Cival y la Región de Holmul*
Las investigaciones sobre el patrón de asentamiento en la región arqueológica de Holmul analizan el relieve terrestre y los cambios en el paisaje observados en el registro arqueológico, a través de la comparación de los emplazamientos, de los distintos tipos de grupos arquitectónicos y la relación entre sus distintos componentes naturales y culturales. La topografía de la región es de naturaleza caliza con abundancia de fenómenos kársticos, localizada en un amplio terreno de bajos rodeada por secciones elevadas del terreno y ambientes variables con sus propios nichos ecológicos. El rasgo geográfico dominante de la región es el Río Holmul, determinando la organización del territorio y condicionando su ordenación y ocupación variando en tamaño y período de ocupación, distribuidos a una distancia entre 3 y 7 km, siendo Cival el primer gran centro rector de la región con una ocupación desde 850 a.C. hasta el 200 d.C. mientras que Holmul fue el más tardío de una serie de centros primarios de la región.

Velazquez, Adrian

[346] *Crafting the Tenochca Imperial Identity through Manufacturing Shell Objects*
Recent investigations about the Tenochca objects have shown that the mexica produced many of the pieces that they deposited inside of the offerings they buried in their Great Temple and its surrounding buildings. It seems that it was during the reigned of Axayacatl (1469-1481 A.D.) that the mexica decided to create their own imperial style not only in terms of forms and decorations but also in the technological aspect. In the present paper it is presented new data that supports this hypothesis with respect to the mollusk shell objects that have been found in the Tenochca offerings.

[207] *Fluctuating Asymmetry, Developmental Stress and the Socioeconomic Structure of a Great Moravian Early Medieval Society*

Fluctuating asymmetry (FA) is thought to reflect the ability of an organism to cope with genetic and environmental stress during its development. As there is substantial literature discussing this property of FA, we evaluated additional stress indicators (enamel hypoplasia, cribra orbitalia, Harris lines) in non-adult individuals of the Middle Ages. The socioeconomic structure of an early medieval society from the Mikulčice settlement (Czech Republic) was studied by applying the FA methodology to skulls. We expected to find Mikulčice castle specimens to exhibit the greatest FA among higher socioeconomic groups. The material comprises 170 adult and non-adult crania from what is presumed to be a higher socioeconomic class (Mikulčice castle) and 71 crania from middle and lower socioeconomic classes (Mikulčice sub-castle). As a comparative sample, lower socioeconomic classes (Pachner Collection) were evaluated. The three-dimensional coordinates of 68 landmarks were analyzed using shape asymmetry analysis (Bigoni et al., 2013). In males, no differences in FA were detected between Mikulčice castle and sub-castle, whereas in females the differences were significant, as the Mikulčice castle females tended to have higher values. Their FA values were similar to the highly stressed Pachner Collection sample. Supported by the project GACR 14-22823S.

[207] *Sexual Dimorphism and Morphological Variability with Regard to the Socio-Economic Structure of the Early Medieval European Population (6th–9th Century)*

The socio-economic conditions of past societies can be studied with the help of the biological characteristics of human skeletons. We intend to focus on the early medieval Central and Western European populations. The subject of our contribution is a study of sexual dimorphism and biological diversity on the basis of non-metric and metric traits in relation to socio-economic conditions. We focused primarily on the traits associated with the locomotor apparatus. The aims were to establish: (1) morphological variability, (2) the sexual differences of trait incidence, and (3) verification of the assumption that sexual dimorphism is more pronounced in groups living in optimal living conditions. We evaluated skeletons from (1) Great Moravian and (2) Merovingian burial-grounds. Approximately fifty non-metric and twenty metric traits have been evaluated. Marked differences were found between the medieval populations of Central and Western Europe. The least pronounced differences were found among the individuals within the territories. The individuals with a higher social standing are evidently different from other, socially lower groups in the lower incidence of traits associated with physical loads. Our conclusions confirm the biological heterogeneity of the early medieval European inhabitants. Supported: GACR 14-22823S, Barrande – Mobility/7AMB13FR012, DKRVO 2014/18, 00023272.

[376] *Patrones de desecho en los grupos domésticos de la Hacienda San Pedro Cholul*

A partir de 2009 la Universidad Autónoma de Yucatán ha realizado exploraciones arqueológicas al interior de la hacienda henequenera San Pedro Cholul, teniendo como principal enfoque el estudio de la vida cotidiana de los antiguos pobladores. Como parte del proyecto, hasta el momento se han intervenido 3 solares habitacionales y sus respectivas viviendas. Mediante la recolección de superficie y la excavación de dichos espacios se han recuperado diversos elementos materiales que nos han permitido identificar algunas actividades domésticas, aspectos económicos, modos de alimentación y las distintas estrategias de subsistencia que llevaron a cabo los trabajadores y sus familias hacia la primera mitad del siglo XX.

El presente trabajo tiene como objetivo llegar a conocer los patrones de desecho a partir de la cultura material dejada por las familias de trabajadores que habitaron en la hacienda. De igual manera se busca identificar las respectivas áreas de deposición y las conductas con respecto al desecho de la cultura material dentro de los espacios habitacionales de los trabajadores henequeneros.

Venter, Marcie (University of Kentucky)

[144] *Introduction to the Matacanela Archaeological Project: Collapse and Political Reorganization in a Lowland Mesoamerican Society*

The Matacanela Archaeological Project is a two season effort to more fully understand the transformation of lowland Mesoamerican society at the end of the Classic period. Our particular

focus is Classic collapse and Postclassic reorganization in the Tuxtla Mountains of the southern Gulf lowlands. Like other lowland regions (e.g., the southern Maya lowlands) that experienced political decentralization, demographic upheaval, environmental, and climatic change, collapse was not complete or uniformly experienced. This project interrogates differential cultural response to collapse and the creative adaptations that characterized transformations in this lowland society. In this opening presentation, I highlight some of the challenges to understanding this period of transformation in the southern Gulf lowlands, layout the interpretive framework that informs the study, discuss the hypotheses that our work is testing, and consider what we have learned from this first season of fieldwork. I conclude by anticipating what we hope to learn from subsequent research at the site.

[403] *Modeling Bronze Age Isoscapes in the Eurasian Steppe: Identifying Subtle Variation in Pastoral Diet and Mobility*

Isotopic investigations of ancient materials often lack the robust isotopic baselines necessary for comparative analyses. A paucity of isotopic data for baseline ecology creates gaps in our knowledge and allows for multiple interpretations of prehistoric practices. This is especially true for the Eurasian steppe, where isotopic values have been used to consider long-distance human migrations without sufficient baselines. Therefore, the aim of this paper is to use an innovative approach in ecological modeling to create comprehensive isotopic reference maps, or isoscapes, for two local zones. Isoscapes model patterned variation in isotopic ratios of landscapes by linking environmental variables through predictive modeling. To create isoscapes, comparative baselines were built using $\delta^{18}\text{O}$, $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ ratios of modern biosphere samples for two archaeological sites in northern Kazakhstan. These included spot testing of modern water, plant, and animal samples in a 15km zone surrounding each site. Isoscapes were used to link modern environmental variables with isotopic change which was then compared with isotopic ratios of prehistoric animal and human samples to investigate subsistence and mobility practices. Through the compilation of robust ecological data can we identify subtle variation in pastoral lifeways; particularly subsistence practices, herding strategies, and movement within the landscape.

[46] *Goods That Moved between the Forest and the Highland Andes in the Inca state. The Eastern Valleys of North Argentina*

The eastern valleys of the Cordillera Oriental, in north Salta, Argentina, were a sector of the eastern frontier of Tawantinsuyu. We propose that the Inca created a state enclave with mining and metallurgical goals in that sector. To accomplish this, populations (*mitmaquna*) were moved from other parts of the empire, which required the implementation of a significant agrarian system to support them. These valleys may have been producing goods of great value that might have comprised a single system of macro-regional interaction. The exotic materials found in funerary contexts in these valleys were analyzed, and it was inferred that they may have been the result of the reciprocity and redistribution structures, as well as the systems of gifts and contra-gifts imposed by the Inca state.

Verdugo, Cristina (University of California, Santa Cruz)

[355] *Sinking Archaeological Teeth into the Dental Modification Issue: An Examination of Midnight Terror Cave*

Evidence for dental modification practices have been found throughout Mesoamerica since the Early Preclassic Period and were noted by Diego de Landa in the 16th century. Examples for these practices have been found not only among human remains, but also in iconography and in architecture. Investigations into the aesthetic or ritual purpose for dental modification have yielded a

number of possibilities. These possibilities include its use as an indication of social status, defining local family organization, as a rite of passage or as having religious connotations. The recovery of eighty five examples of modified teeth from Midnight Terror Cave provides a sufficiently large sample to allow for me to draw some tentative conclusions on varied hypothesizes regarding social status, social organization, and ritual of passage thought to attribute function to the practice of dental modification.

[362] *Numic Fire: Modeling the Effects of Anthropogenic Fire on Foraging Decisions in the Great Basin*

Ethnohistoric accounts suggest that fire played a significant role in Great Basin foraging strategies; however, there is little quantitative data on why, where, or when people burned. To begin to fill this gap, we develop a behavioral ecological model designed to test predictions about the impact of anthropogenic fires on hunter-gatherer diet breadth. We conduct an ethnographic test of the model using historic band-level variation in prey choice coupled with ecological data on variation in the abundance of high ranking resources across the region. The results of our study will help to explain the evolution of anthropogenic landscapes and lay the foundations for future archaeological studies examining the dynamics of anthropogenic fire regimes in the Great Basin.

Vesteinsson, Orri (University of Iceland)

[18] *Environment and Identity in the Viking Age North Atlantic*

The cultures that arose in the North Atlantic during the Viking Age - the Scottish Isles, Faroes, Iceland and Greenland - were emphatically Norse in their ethnic signaling. Yet the environments of these islands, especially the more westerly ones, were significantly different from Scandinavia or Britain and supported quite different lifeways, different economic strategies, settlement patterns and material cultures. Focusing on Iceland and Greenland the paper aims to highlight the tension between environment and cultural identity asking whether there is a point at which a peripheral environment becomes so different from that of the core that it cannot sustain the same culture. Based on the study of settlement patterns the paper suggests ways in which archaeological data can be used to assess cultural divergence.

Veth, Peter (The University of Western Australia)

[152] *Pleistocene Maritime Economies of Northwest Australia*

This paper will critically assess new evidence for the antiquity of maritime economies from North West Australia. Northwest Australia has evidence for hunter-gatherer occupation from 50,000 years ago from sites now located in the interior. The evidence for antiquity of coastal resource use extends back to over 41,000 cal BP; however, this is soon expected to approach the earliest dates from these interior sites. Recent research on continental islands of the Northwest Shelf illustrates rich early Holocene middens with records extending back to the low sea stands of the Last Glacial Maximum. There is now clear evidence for economic reliance on coastal resources procured from procumbent shorelines through the marine transgression from 17,000 BP to the Present from the Carnarvon Bioregion of North West Australia. Shellfish assemblages and hearth charcoals provide direct evidence for use of estuarine and mangrove communities. It is not clear whether the oldest marine remains are dietary, however. Current propositions about delayed maritime adaptations due to precipitous and depauperate coastlines and the early depletion of high-ranked coastal resources by colonizing groups are examined with this new data from North West Australia.

[346] *Copal Offering Objects: Manufactured in Tenochtitlan*

There is an abundance of archaeological literature that highlights the amazing ritual offerings made by the mexica people in the late Postclassic period. The studies show a high diversity of both organic and inorganic material used in offerings. Some materials are local, while some were brought from foreign lands, like the copal case resin. The use of this resin was verified by historical documents and ethnographic studies that document its import as a raw material. The resin was brought to Tenochtitlan where it was transformed into different objects like bars, spheres, conglomerates, knives bases of sacrifice, anthropomorphic figurines and diverse amorphous fragments, and these objects would be their gifts to their gods. Thanks to the macroscopic and microscopic study of more than 300 objects of copal from the offerings of the Archaeological Zone the Great Temple ("Templo Mayor"), it was possible to establish a constant in the processes of manufacture of each formal group; that was corroborated by the Axial Computed Tomography (TAC), a non-invasive radiological technique.

[318] *Agriculturas formativas del desierto tarapaqueño*

Se discuten los nociones de progreso y complejidad social arraigados en la concepción del Formativo, a partir de la evidencia de antiguos campos de cultivo, hoy en desuso, asociados a las aldeas formativas (sensu. 1000 a.C- 1000 d.C) de Caserones, Pircas, Ramaditas y Guatacondo, localizadas en la región de Tarapacá, Chile. Se presentan la coexistencia de al menos dos sistemas agrícolas diferenciados, uno que denominamos continuo o anual y otro discontinuo o estacional que requirieron del manejo de complejos sistemas irrigación y variadas tipologías constructivas. Los asentamientos de Pircas y Caserones, evidencian una ocupación doméstica continua, asociada a una agricultura diversificada con manejo de melgas que se ubican sobre terrazas fluviales y en pampas abiertas, con riego permanente garantizando una producción agrícola continua o anual. En cambio, en la quebrada de Guatacondo se evidencian ocupaciones muy acotadas asociada a melgas emplazadas junto a conos aluvionales en la pampa desértica, aprovechando las aguas superficiales por escurrimientos estivales y las napas, mediante el desarrollo de norias, permitiendo una producción agrícola discontinua o estacional. Ambas estrategias agrícolas probaron ser efectivas produciendo una interesante cantidad de recursos agrícolas y demostrando el manejo de los espacios desérticos por parte de las comunidades tarapaqueñas.

[318] *The Formative Process as Discourses of Nature and Culture: The Case of Tarapacá, Atacama Desert (Northern Chile)*

The purpose of this paper is to contribute to a critical review of the concept of Formative (ca. 2800-1000 AP) and its ontological and epistemological assumptions through our studies in Tarapacá, in the Atacama Desert (Chile). Through this case, our purpose is to complicate the notions or radical distinctions between nature and culture, farming and gathering, mobility and sedentism, among other

categorizations upon which the Formative period as Neolithic Revolution has been defined. The materiality that we have studied so far indicates that such divisions are not efficacious to fully grasp the complexity of this phenomenon, often imposing Western logics to non-Western historicities. As a sociohistorical process, the Formative did not represent an ideal of progress or of technological development, often explained through economic transformations that presumed an "efficient" use of resources. We propose, instead, a view that underlines the inherent contradictions between individuals, society and culture, in the hopes of contributing to an alternate view of these transformations.

[339] *Islands and Invasives: The Archaeology of Plant and Animal Translocations*

This presentation discusses how the progress of biological knowledge allows archaeology to take advantage of paleontological and archaeozoological documentation accumulated during the last 40 years on islands. This information will be applied to indirectly understand early sea travel in the Mediterranean. It presents a brief review of the geographical and paleogeographical frameworks as well as the basics of island biogeography and focuses on the different ways in which mammals were able to colonize remote islands. The review of the extinctions and immigrations of mammals since the Late Glacial on the five larger Mediterranean islands, which have stayed isolated since that time, highlights the major role that human beings played in the construction of modern mammalian communities on these islands. In turn, this phenomenon is a remarkable source of information for investigating early seafaring in the Mediterranean.

[189] *Materiality of Death at Cerro de Trincheras, Sonora: A Comparison of Ceramic Urn Funerary Practice in a Macro Regional Scale*

Funerary vessel urns represent a unique variety among other manners of treatment of the dead in the North American Southwest (SW) and Northwest Mexico (NW). The ritual practice of packing human remains in ceramic vessels is considered as a well-defined cultural accomplishment. Particularly, the urn funerary practice, although with local variation in time and space, represents a wider social action that reflects a particular worldview in the conception of death. Depositing human remains in vessels has been recorded in different regions of the SW/NW. This paper is based on recent excavations at Cerro de Trincheras, Sonora, where a complex funerary practice in ceramic urns has been archaeologically recorded. A detailed analysis of funerary urns at Cerro de Trincheras has pointed out some aspects of materiality and symbolism. A broader framework is useful to compare the presence of funerary urns in other regions in the SW/NW. A macro regional analysis is made in order to comprehend the more essential aspects of the materiality of death. In this paper some archaeological sites in the SW/NW are analyzed in order to highlight the macro scale significance of this funerary practice.

Villalpando, Elisa (Instituto Nacional de Antropología e Historia, Sonora)

[189] *The Sound of Dancing in the Desert Northwest/Southwest. Copper Bells from Trincheras, and the Casas Grandes Connection*

Since the 1963 Sprague and Signori's tabulation on copper bells, to Vargas 1995 or Wilcox et al. 2008, there is no question that copper bells in the Southwest/Northwest were trade items produced

in West Mexico. Different kinds of exchange networks were responsible for the distributional patterns of the very “rare” items (copper bells and macaws) as opposed to those exhibited by the more common shell and turquoise. Few central communities exchanged copper bells and macaws; being macaws (*Ara militaris*) the most restricted in terms of numbers and associated settlements. I will explore the relation of copper bells and Ramos Polychrome in Sonoran Prehispanic settlements as an exchange network that connects West Mexico to the desert Southwest/Northwest through the Casas Grandes World.

[184] *Diáspora y Etnogénesis durante el Tiwanaku Terminal en el la región de Cohoni, La Paz, Bolivia*

Esta ponencia se centra en las poblaciones del Tiwanaku Terminal – Intermedio Tardío Temprano (ap. 900 – 1200 d.C.) en la región de Cohoni, en los valles orientales del río La Paz, en Bolivia. Se resumen los antecedentes investigativos de la región, y especialmente las excavaciones realizadas por nosotros en contextos habitacionales del sitio de Chullpa Loma, uno de los más grandes y complejos de Cohoni. Consideramos datos sobre la arquitectura habitacional y funeraria del sitio, así como los patrones cerámicos detectados, en comparación con otras zonas de la influencia Tiwanaku. Mediante estos patrones, sugerimos que la región de Cohoni fue poblada consistentemente a partir de la desintegración de Tiwanaku en la cuenca del Titicaca, y que la motivación podría vincularse al potencial agrícola por irrigación de deshielo y a la microverticalidad ecológica de la zona. Asimismo, sugerimos que la población de Cohoni, originada en esta suerte de “diáspora” altiplánica, generó con el tiempo dinámicas de interacción con otras zonas de altiplano y yungas, y dio lugar a procesos de etnogénesis que, posiblemente, tengan un reflejo parcial en la situación étnico-política de la región en el siglo XVII.

Villanueva Ruiz, Denia Berenice

[217] *Zoomorphic Representations of Figurines in Tamtoc, SLP, Mexico*

From the beginning, man has always tried to understand nature. Mostly because their survival depended on it, the Prehispanic societies conceived it as one of their best allies. The perception of animals was always influenced by mysticism and the belief that every living thing belonged to an order, which at the same time harmonized a universal context. Tamtoc was not the exception. Along all the excavations that had been performed, various distinct representations of zoomorphic figurines were found, which will be mentioned in this following paper. In order to show the relation they held with the atmosphere, the possible species that are represented in each will be identified and interpreted, as well as their archaeological birth contexts, looking to create a close symbolic discourse to the one they probably have. This could represent an important document for the study and interpretation of the ancient scenery the Tamtoquian people used to lived in.

Villarreal, Margarita (CSULA), Lindsay Jacoby (CSULA) and Karimah Richardson (The Autry National Center of the American West)

[27] *An Exploration Into a New Method of Skeletal Inventory in a Curatorial Setting*

The Standards for Data Collection from Human Skeletal Remains has been the standard for inventorying skeletal collections around the country, as well as most recently adopted by the Autry National Center of the American West. In 2011, a new digital method of inventory was developed by the Smithsonian Institution, called Osteoware. Osteoware is intended to be a common set of core observations between different researchers and incorporates The Standards. This project looks over the merits and drawbacks of using each method and how Osteoware compares with The Standards as a replacement for inventorying curatorial collections. It also compares the usefulness of these methods in relation to the collections and curation departments, since each of these departments has different needs, as well as with the bigger question of whether Osteoware is useful institutionally

wide or is it specialized to osteologists and archaeologists. This exploration will utilize legacy collections from the American Southwest. The collection at the Autry National Center of the American West has been untouched, and with a new team of osteologists we will utilize both methods and see which is more beneficial.

[171] *Early Cultural Developments and Adaptations in Hunter/Gatherer Communities: A Case Study from Keatley Creek on the Canadian Plateau*

The emergence of socio-economically complex hunter/gatherer communities has been identified as one of the most critical theoretical issues in the study of early cultural evolution. In North America, one key geographical area for studying the emergence of complex hunter/gatherer societies has been the Northwest Coast and Plateau. The village site of Keatley Creek, one of the largest sites of complex hunter/gatherers in Western Canada, has featured prominently in understanding the emergence and evolution of socioeconomically complex hunter/gatherers. Research has been conducted at the site since 1986, representing one of the longest running research programs for any site in Canada. Models of population dynamics and the evolution of the village site are undergoing re-evaluation in the current research program. The specific timing and conditions surrounding the emergence, evolution and organization of early cultural developments have been the focus of some debate. This paper discusses key aspects of the updated methods and results as applied to specific complex and fine-grained stratigraphic contexts, and how this has advanced insights and understanding of the initial stages of village development, and the co-evolution of ritual structures and social complexity. The results have implications and utility for investigations of hunter/gatherer adaptations elsewhere in the world.

Vilsack, Laura (Texas State University)

[357] *Archaeological Investigation of the Stone Feature Located at Area 12, Gault Site Bell County, Texas*

A 2x2 meter fractured limestone cobble surface was excavated in February of 2001 through May of 2002 at the Gault Site in Bell County, Texas; the feature dates to either the Clovis or pre-Clovis period. Current research indicates two toss zones associated with the 10-centimeter thick stone floor. One toss zone is illustrated through the faunal assemblage as arcing around the southwestern corner of the feature and the second toss zone is associated with lithic artifacts concentrated around the northeastern corner. Research will further identify any activities that may be associated with the stone feature based on the technological, morphological and spatial analysis of the recovered archaeological materials. This research will also fine-tune the cultural association of the feature and its associated materials.

Vint, James (Desert Archaeology, Inc.)

[55] *Refinement of Early Agricultural Site Chronology in the Tucson Basin*

A sample of 140 radiocarbon dates from 14 Early Agricultural sites was used to model the chronology of settlements in the Tucson Basin using OxCal v.4.2.3; one site in northern Sonora was also included in this analysis. The sites range in age from about 2100 B.C. to 700 B.C., spanning two phases of the Late Archaic/Early Agricultural period: the "Silverbell Interval" (ca. 2100-1200 B.C.) and the San Pedro Phase (ca. 1200-800 B.C.). Most dates are AMS assays of maize kernels, cupules, or cobs, other annuals, and only a few are on wood charcoal. Results of the analysis

provide a detailed site-specific chronology for the site of Las Capas, and places the 13 other sites in temporal space with each other that is not possible using simple calibrated ages alone. Significant patterns in site age and occupation duration are revealed that relate to changes in settlement patterns, the adoption and florescence of irrigation agriculture, and responses to change in environmental and riverine conditions that adversely affected irrigated farming along the Santa Cruz River during this time period.

[192] *The Montague Harbour Underwater Archaeology Project: Final Conclusions and Prospects for Future Research on the Northwest Coast*

Twenty-one years ago we completed our last of four field seasons excavating inter-tidal and sub-tidal sediments in Montague Harbour, Galiano Island, British Columbia. While a permit report describing basic results and several analytical publications ensued, a final summary concluding publication remained to be completed. Here we present the essential elements of this forthcoming publication, which will discuss methodology, provide a comprehensive database on recovered artifacts and ecofacts, present sedimentological and facies analyses, radio-carbon dates, and a set of conclusions and propositions arising from our findings. We will conclude our presentation with some thoughts on the future of practical prehistoric underwater archaeological fieldwork on the northwest coast within the context of contemporary research.

Viselman, Abby [143] see Wienhold, Michelle

Vitale, Adam

[248] *Putting Xultun on the Map*

This poster shall illustrate the several different mapping phases of the archaeological site of Xultun, Guatemala in order to demonstrate how the mapping process has significantly altered our understanding of the site. Xultun was first surveyed by Sylvanus Morely in the 1920's whose maps included a handful of structures and stelae. The site remained largely uninvestigated for the next 50 years until Von Euw expanded the map, through his epigraphic work for the Peabody Museum. Xultun's map did not undergo major changes until 2008 when an archaeological team led by William Saturno began to remap and digitize the previously documented structures. During this past field season, our survey team expanded the map by an additional 800m². Due to the survey work at Xultun, what was once considered a mere handful of ruins deep within the Petén is now viewed as a large, "traditional" Classic period site, with long king lists, ball courts, precise astronomical counts and even a colorful mural. This site is now thought to have supported a population into the thousands and could have had significant interactions with other major centers in the Maya lowlands.

Vivian, Richard

[354] *Windes Matters*

Chaco Matters because Windes Matters. There are few subjects in Chacoan prehistory for which Tom has not contributed thoughtful analysis - from ants to Zuni spotted chert. His insights regarding agriculture in the Chaco Core are basic to understanding the long history of farming in this area. Some of those insights are reviewed.

Vlaskamp, Roosmarie (Leiden University)

[246] *Ethnic Identities in Central Nicaragua: Perspectives from a Habitational Site*

Archaeological research in Central Nicaragua has traditionally focused on the recognition of different ethnic groups in prehispanic times and their interaction through the evidence of trade wares. However, a reconsideration of the available data has revealed that there is an absence of knowledge on the habitus of these groups, a central concept in the recent discussion on understanding ethnicity. Therefore, over the next four years a prehispanic habitational site in Central Nicaragua will be investigated in order to substantiate the discussion on ethnic identities in this region.

Vlemincq Mendieta, Tatiana**[250]** *Anura in Moche Iconography*

The topic of this work is the anura, i.e., frogs and toads, in Moche iconography. Its primary aim is to establish if the anura were, in Moche cosmovision, associated with rains and agricultural fertility. During the early stages of this project, I gathered data and interpretations about the anura, while at the later stage, I built upon these findings to establish a classification system for these amphibians. The objectives of the classification are: first, to create a comprehensive database of anura, and secondly to create a flexible framework that can be used for future research and developed further. In order to reach the objectives and, because of the lack of written sources, an adaptation of the Panofsky method was employed. The outcome of this research illuminates links between the anura, and specific characteristics and concepts underlying Moche culture, e.g., agricultural fertility. The different anura depictions, in particular the "sapo botánico", show a direct connection between these animals and plant growth, water, rain and fertility.

Voeller, Sarah (North Carolina State University) and Ann Ross (North Carolina State University)**[132]** *Using GIS to Re-Associate Commingled Skeletal Remains*

One problem forensic archaeologists have encountered during the investigation of mass graves is the commingling of human remains. Commingling can consist of disarticulated body parts, and can be more complex when remains are skeletonized or fragmented. Methods exist to address this problem; however, some are costly while others are time consuming. It has been shown that mapping the three dimensional location of body parts in a mass grave is useful for re-association based on proximity of the closest missing element. This study investigates a way to re-associate commingled skeletal remains in a controlled context using readily available GIS technology that is low cost and time efficient. A mass grave with skeletal commingling was re-created using domestic pigs. The provenience of skeletal elements was mapped with a total station. Spatial relationships were then analyzed using both ArcGIS and GRASS. Tools within these programs allow for statistical calculations such as spatial autocorrelation which can be used to identify groupings of associated small bones such as phalanges or fetal remains, as well as simple proximity queries for the closest missing element. The capabilities of GIS for analyzing dispersed remains as well as a detailed replicable methodology will be presented.

Vogel, Howard (Hamline Univ. Sch. of Law)**[30]** *The Clash of Stories at Sacred Sites: Reframing the Task of Protecting Indigenous Sites*

Efforts to recover and protect indigenous sacred sites in the United States by framing conflicts over them in adversarial terms that employ the vocabulary of conventional legal doctrine on religious liberty and property rights have failed to succeed despite the creative efforts of many advocates. One cannot understand these failed efforts and move toward the development of a more hopeful approach to these conflicts without taking seriously the contrast between Indigenous views of the land and the view of land embedded in the legal vocabulary of individual property rights. These different views of land are not susceptible to resolution in decision-making bodies shaped by the dominant conception of land found in the principles of property law. This paper describes these difficulties and offers a constructive proposal for addressing the conflict in a non-adversarial setting through collaborative dialogue that takes seriously the clash of master stories underlying these conflicts. Such an approach takes the narrative dimensions of these conflicts as of utmost importance and reframes these conflicts by asking the following questions: (1) "What is sacred?"; (2) "What is authentic knowledge for the purpose of determining what is sacred?"; and (3) "Who gets to decide these questions?"

Volta, Beniamino (University of California, San Diego)

[24] *Household Activities, Status, and Social Organization at Uxul, Campeche, Mexico*

The physical remains of ancient buildings and activity areas provide an important archaeological window into the lives and practices of past households. In the Maya region, patio groups composed of multiple structures housing extended families have long been recognized as the fundamental units of settlement. At a very basic level, patio groups were both the primary locus and one of the most tangible material outcomes of household activities. Variations in their size and spatial configuration can therefore be analyzed as indices of inequality and differentiation within communities. This talk presents the results of recent research on status and social organization at Uxul, Campeche, Mexico. I analyze data from elite and non-elite architectural groups in the settlement in order to trace a broad outline of economic, political, and ritual activities carried out by the inhabitants of the site throughout its history. The incorporation of Uxul within the Calakmul regional state in the first half of the Late Classic (roughly A.D. 600–750) offers a convenient turning point for discussing possible strategies employed by different social actors in response to changing political circumstances.

Von Hagen, Adriana

[78] *Tracing Stylistic Influences in Chachapoya Art and Imagery*

The art style of the people who occupied the territory called “Chachapoyas” by sixteenth century chroniclers and modern scholars reflects the region’s location straddling the eastern slope of Peru’s northern Andes and Amazonia. At various times in Andean prehistory the Chachapoya interacted with cultures to the north, east and west of their territory, while at other times they seem to have flourished in relative isolation. Given Chachapoyas’ location and apparent sporadic contacts, especially with cultures to the west of the Marañón river, it is no surprise that its art style reveals an eclectic and anachronistic mixture of stylistic features and influences drawn from many cultures and periods. A trove of well-preserved burial offerings from Laguna de los Cóndores, including textiles and gourds, as well as artifacts from a handful of other burial sites, are helping researchers clarify the origins and pinpointing the geographical range of recurring Chachapoya imagery.

Von Holstein, Isabella (Christian Albrechts Universität, Kiel)

[403] *Geographical origin assignment of sheep wool textiles using light stable isotopes*

Identifying groups of material cultural objects that are non-local has long been part of artifact analysis in archaeology. Tracing the movement of objects and the movement of ideas about how to make and use objects is important to understanding physical and ideological links between sites. This work has relied on data from typological, technological and chemical analyses of object construction and use. Textiles made from sheep wool were a highly valuable commodity traded long-distance in the Middle Ages in Europe. This presentation will demonstrate the use of light stable isotopic analysis (carbon, nitrogen, and hydrogen) to identify the origin of textile samples (n=92 from 5 locations in Northern Europe), by comparison with a baseline isoscape constructed from samples of modern sheep wool (n= 171 from 16 flocks) and archaeological sheep bone collagen (n=62 from 5 sites) isotope data. The presentation will discuss how to integrate isotopic data with existing typological understanding of the artifacts, and sources of uncertainty deriving from farming practice variability (both past and present), keratin diagenesis, and site type. The application of the method to textiles from other regions and in other raw materials will be explored.

Von Petzinger, Genevieve (Dept. of Anthropology, University of Victoria)

[353] *Following the Signs: Tracking Geometric Rock Art across the Landscape of Upper Paleolithic Europe*

Geometric signs are found at nearly all Upper Paleolithic rock art sites in Europe. Created between 10,000 and 40,000 BP, the signs are one of the major thematic categories of art from this era, however, they are often not as well-documented as their figurative counterparts. While there are some sites (e.g., Grotte Chauvet) where detailed inventories have been created for all of the imagery, there are many other sites where this has yet to be carried out. The geometric signs have the potential to offer new insights into the development of symbolic thinking and the beginnings of graphic communication during this time period, but more accurate data is required before any large-scale studies can be successfully undertaken. The goal of the project discussed in this paper was to begin rectifying this lack of data by doing on-site inventorying and visual documentation at fifty-two sites in France, Spain, Portugal and Italy over the course of two field seasons. These sites were selected specifically because of the limited information currently available about the non-figurative imagery present. This paper will present the results of this study and will discuss some of the challenges faced when completing a project of this size and scope.

Von Schwerin, Jennifer (German Archaeological Institute)

[100] *Show Me the Data!: Structuring the MayaArch3D Digital Collections for Research Queries in a 3DWebGIS*

Archaeological projects are increasingly acquiring 3D data sets of individual finds, as well as whole cities. The archaeologist receives the model as a 3D PDF, video, point cloud or object file. Views of the model are published in a journal, shown in an exhibition and the pipeline usually ends here. Typically, archaeologists do not use the 3D model for much more than visualization purposes. The MayaArch3D project is building a 3DWebGIS to enable archaeologists to do more with these models –to store, share and analyze their 3D models online in the context of geographically referenced archaeological data within an online, virtual research environment (VRE). To do this, we use the models as visual storage containers and link them to spatially-referenced archaeological data. As the archaeological partner in the project, our challenge at the German Archaeological Institute (DAI) is to not only to determine for which objects 3D models should be made, but then to conceptually segment and structure the 3D models as well as their associated archaeological data so that they can be linked together in our 3DWebGIS for both visualization and analysis. This paper introduces the MayaArch3D collections and explains the data structuring pipeline.

[182] *Ethnographer Stewart Culin and "Games of the North American Indians"*

This talk appraises the contribution of Stewart Culin, a self-taught ethnographer, to the study of games of indigenous North Americans. His exhaustive survey, published in 1907 by the Bureau of American Ethnology, remains the single comprehensive resource for archaeologists seeking to examine games in the prehistoric record and as such is well exemplified by the presentations in this symposium. Culin's study, initiated in collaboration with Frank Hamilton Cushing, began in 1891 in connection with the 1893 World's Fair in Chicago and eventually led to the encyclopedic publication *Games of the North American Indians*. This invaluable publication can easily be viewed as a paragon of the meticulous research methodology typical of the peak period of ethnological collecting and museum exhibition.

[137] *Sacred vs Secular: Prehispanic Village Landscapes in Southwest New Mexico*

In the prehispanic Southwest, it is well known that certain places on the regional landscape were considered sacred or ritually charged, such as summits, springs, and caves. Less understood is the way that sacred and secular spaces were partitioned within prehistoric villages. In this paper we examine the relationship among secular and sacred spaces during the PIII/PIV periods at two villages along the Rio Grande. Each village includes roomblocks, agricultural features, resource processing areas, shrines, and petroglyphs. One village is the previously recorded Yarborough Site, on Tierra Blanca Creek, in the eastern Mimbres region. The second village, the newly recorded Sato Pueblo, is located just northeast of Socorro. Despite having only distant social connections, we find remarkable similarities in the organization of sacred and secular spaces. This suggests that there was a regionally shared cosmology that guided local village planning.

[305] *Subjectification and the Archaeology of Violence: The 19th-Century Anti-Chinese Movement in San Jose, California*

Communal violence is often central to subjectification and the process of creating and sustaining social difference. Preliminary results of archival studies and archaeological research trace the relationship between violence and subject formation among participants of the anti-Chinese movement in 19th century San Jose, which enacted campaigns of harassment and direct violence against Chinese immigrant and Chinese American residents of the city. What material practices and social performances transform neighbors into enemies? What rhetorics and materialities legitimize and rationalize the use of force? What archaeological traces can aid in reconstructing victims' responses and persistence in the midst of routinized violence? Overall, this investigation seeks to forge connections between anthropological theories of communal violence and what Paul Mullins has termed the "archaeology of the color line" in North America.

[297] *From Russia with Love: Ruth Tringham and the Early Days of Microwear*

It was the early 1970s and a time when the Cold War directed the geopolitical scene worldwide. It was also a time when a young British archaeologist brought to the USA a new approach to the study of material culture. Professor Ruth Tringham landed at Harvard in 1971 together with the technique of microscopic analysis of traces of use on chipped stone tools, a technique which she had studied in the USSR. There were other scholars pursuing this scientific approach to lithic study but Ruth clinched it, developing a solid program of experimentation, observation, documentation, and dissemination that is a cornerstone of subsequent advancements. This paper revisits those early years of microwear analysis at Harvard. The author was an undergraduate then and provides a firsthand look at a time of discovery, fun, and to some extent, revolution in archaeological research.

[309] *Does Phytolith Analysis of Archaeological Soil Thin Sections Account for Archaeobotanical Data?*

Whilst phytoliths are plant microfossils, due to their formation process they differ markedly from any other plant remains. Consequently, their incorporation within archaeological deposits relies on specific taphonomical processes. It is here assumed the phytolith analysis of archaeological soil thin

sections allows to document these processes and as such to discriminate between in- and exsitu phytoliths. However and accordingly to the context you consider, as such analysis do not involve any concentration of the phytoliths, one needs to question how far such analysis are reliable in terms of spectra composition. Present contribution intends to explore this issue.

Waber, Nicholas (UB.C.)

[122] *3D Photogrammetry and GIS for Tracking Edge Wear Accumulation in Lithic Experiments*

Digital photogrammetry is fast becoming a popular method for 3D landscape, feature, and object modelling. The ease with which photogrammetrically-derived models may be analyzed with conventional GIS software has streamlined archaeological landscape analysis. These same tools are eminently scaleable, facilitating comparable analyses of much smaller surfaces: those of lithic artifacts. Using 3D digital photogrammetry and GIS software, I propose a method to locate, define, and quantify edge damage on experimental lithic tools. By periodically recording each artifact throughout its experimental use, it becomes possible to determine the rate of wear for an edge engaged in a specific task. This will provide a useful technique for lithic analysts to establish comparative benchmarks and characteristics for application to archaeological lithic artifacts around the world, enabling a better understanding of tool curation and discard practices, as well as artifact use lives.

[9] *Mössbauer, XRD and XRF Study of Roman Amphorae and Amphora Kilns from the Roman Provinces of Baetica and Lusitania and Clays*

Roman Haltern 70 type amphorae found at Castro do Vieito, an archaeological site in the north of Portugal, in the former Roman province of Lusitania, were studied by 57-Fe Mössbauer spectroscopy, X ray diffraction and X ray fluorescence with the aim of elucidating their firing conditions and their site of production. For comparison, sherds found at eight kiln sites in the south of Spain, in the former Roman provinces of Baetica and Lusitania, were studied. Moreover, clays collected near the kiln sites were fired in the laboratory for comparison with the amphora material. The amphorae from Castro do Vieito as well as the sherds from the kiln sites were found to have been fired at temperatures around 800 oC in atmospheres that changed between reducing and oxidizing at least once during the firing cycle. Oxidation during the final stage of firing often lead to sherds with more divalent iron in the core than on the surface. The amphorae found at Castro do Vieito appear to have been produced in southern Spain and used to transport agricultural produce to the north, but a definite location for their production cannot yet be given.

Wagner, Stephen

[289] *Manufacturing the Gap: Discrete Data, Archaeological Sites, and Cultural Resource Management*

Archaeology in cultural resource management uses methods designed to cover large areas of land, however the results are rarely interpreted as part of a landscape. Instead, the focus is usually on the densest areas of artifacts, without consideration for the types of data that might lie within the less-dense areas. This is primarily a problem of interpretation, although it is exasperated through the use of discontinuous sampling units and through the continued requirements of out-dated methods through contracting requirements. Alternative methods can be implemented to help mitigate these interpretive issues, both immediately and over the long term.

[353] *Islands in the Stream: A GIS Study of Prehistoric Ritual Landscapes within Southern Illinois*
Native Americans recognized unique natural features as representing parts of ritual landscapes imbued with power that also contained cultural elements including rock art and mortuary sites. One such landscape within Illinois consists of a three mile long isolated bluff segment located on the now-drained Mississippi River floodplain that prehistorically was surrounded by a mosaic of lakes, ponds, and swamps. In this paper we use GIS, LIDAR, and archaeological data to reconstruct the ancient lacustrine environment and the relation of prehistoric rock art, mortuary, and habitation sites to each other, the bluff, and the now-vanished natural landscape in which they once were contained. In combination these data indicate that the bluff, which would have appeared as a mound-like landform extending skyward out of the Mississippi River during periods of intense flooding, represented a loci of ritual activities in southwestern Illinois for over 2,000 years from the Middle Woodland to Mississippian periods.

Waguespack, Nicole

[87] *When Charismatic Megafauna Meet: The Relationship between Archaeologists and Proboscideans in North America*

Archaeologists have a unique relationship with the faunal record of proboscideans. The interpretative histories associated with mammoths and mastodons, particularly in North America, are wholly unlike those of other zooarchaeological species both extinct and extant. Distinctively divisive, consequential, and enduring, the interpretive attention and rhetoric focused on proboscideans has proceeded largely independent of the known inventory of sites and assemblages in Pleistocene North America. Tracking temporal trends in proboscidean site discovery and subsequent professional attention in the literature reveals the disjuncture between the faunal record of extinct charismatic megafauna and the charismatic megafauna who study them.

[350] *A Late Holocene Environmental Reconstruction from a Wetland in the Northern Holmul Region: Preliminary Results from Laguna Ek'Naab, Peten, Guatemala*

Environmental change, caused by either human activity or climate variability, has been posited as a contributing factor in causing widespread demographic shifts in the southern Maya lowlands at the end of the Preclassic and Classic periods. Here we present preliminary results of analyses examining environmental change during and after the period of Precolumbian Maya settlement. Environmental reconstructions are based on a multi-proxy approach, including pollen, macroscopic charcoal, stable isotopes, and loss-on-ignition. Analyses were performed on a 7 meter sediment core from Laguna Ek'Naab, a relatively small wetland associated with the Holmul River. Laguna Ek'Naab is near two major Maya settlements, the Preclassic period center Cival and the Late Classic site Witzna'. Extensive archaeological mapping around the study site provides a basis for interpreting the results in the context of local settlement history. Coupling the local archaeological record of settlement and land use with limnological reconstructions of environmental change enables us to test models suggesting that anthropogenic and/or natural (i.e., climate) impacts played a role in shifting Precolumbian demographic patterns. Results from ongoing analyses will provide a foundation for drawing broader conclusions about the dynamic human/environment relationship in the Laguna Ek'Naab watershed during the Maya period.

[145] *Wars and Battles as Cultural Phenomena in Bronze and Early Iron Age of Japan*

Several lines of archaeological evidence indicate that numerous battles took place during the Yayoi Period or Japanese Bronze and Early Iron Age. So far, Japanese archaeologists have argued that

these battles occurred as results of competition for agricultural lands or taking initiatives over exchange system. Many of the Japanese archaeologists have speculated that wars were a part of the social process for evolving toward an early state society. However, archaeological evidence for wars, such as injured skeletal remains, weapons, and settlements at defensive locations, are all dated to the fourth to third centuries, B.C. contemporaneous to the Warring States Period China. This suggests to me that widespread warfare in Japan was a part of many cultural influences from China. I would argue that wars took place not as a factor for social evolution but as a cultural phenomenon.

Wake, Thomas [79] see Lawrence, John

[182] *Ritual and Divination in Ancient Maya Dice Games*

In this presentation I examine the dice games played by the ancient Maya and investigate the interpretation proposed by several Mayanists that these games were used primarily for divinatory purposes. I examine the archaeological contexts of these 'patolli' boards and review the substantial body of ethno-historical and ethnographic material from broader Mesoamerican contexts in order to scrutinize the interpretation that these games served as divinatory devices and to offer other interpretations and possibilities. This body of evidence is then compared with both ethno-historic and ethnographic accounts of Maya shamanistic divination in order to further query the claim that these dice games were used in divinatory rituals in the ancient Maya world

Walder, Heather (University of Wisconsin-Madison)

[140] *"A Thousand Beads to Each Nation:" A Social Interpretation of Glass Trade Bead Distribution in the Upper Great Lakes Region of North America*

Through LA-ICP-MS elemental analyses of 874 glass trade beads from 31 early colonial-era archaeological sites in the Upper Great Lakes region of North America, and from late 17th century contexts historically associated with French exploration of the Gulf Coast of Texas, I identify patterning in the spatial and temporal distribution of European glass-bead recipe groups. Trading relationships among Indigenous peoples and outsiders in this French "Upper Country" took place on a complex "middle ground" organized and navigated by an "Infinity of Nations" (White 1991; Witgen 2012), who maintained social and political autonomy through gift-giving and forging fictive kinships. Therefore, patterning of glass recipe groups may reflect: socially-structured exchange networks circulating goods across a diverse ethnic landscape, dynamic population movements, and groups' changing access to materials over time. In this case study, archaeometric analysis of glass beads supplements standard archaeological methods, like stylistic analyses of ceramics and other "Native-made" artifacts, to clarify ethnic groups' interactions and boundaries as reflected in material culture. This regional examination of glass bead exchange highlights the usefulness of investigating archaeological glass recipes beyond simple chronology-building or clarifying historical manufacturing processes, demonstrating potential for illuminating social connections of ethnic groups interacting on a dynamic past landscape.

[229] *New Genetic Perspectives on Early Maize Cultivation in the American Southwest*

Following the initial domestication of maize (*Zea mays* ssp. *mays*) from a teosinte grass in Mexico, human populations dispersed the cultivar through trade and migration. Despite a long history of archaeology in the American Southwest, many questions about maize remain, including how the crop was dispersed northward from Mexico and how maize was acclimated to new environments. These unresolved questions can be explored in new ways, thanks to next-generation DNA sequencing technology and targeted enrichment of important genetic loci. By testing genetic markers in archaeological specimens, it is possible to determine genetic relationships between ancient samples and extant landraces, as well as tracing the routes by which maize was spread in North America. Furthermore, ancient DNA evidence can be used to explore what genes have undergone selective pressures, providing insights into past agricultural preferences and adaptations to local environmental settings. Here, we report findings from multiple maize samples from different archaeological sites, and in the process obtain a more nuanced understanding of the prehistoric use of maize in the American Southwest.

[166] *Episodic Habitation in an Eolian Environment, 1350 B.C. - A.D. 900, Useppa Island, Coastal Southwest Florida*

Excavations (2012) on southwest Florida's subtropical Useppa Island revealed a stratigraphic sequence of alternating eolian-sand and shell-midden layers, mostly dating from 1350 to 1000 B.C., with the highest midden dating to A.D. 900. Predictably, the Late Archaic artifact assemblages (pottery, shell artifacts, etc.) differ greatly from the younger Caloosahatchee IIB one. However, surprisingly the invertebrate faunal assemblages also differ. And there is a general dearth of fish remains in the five earliest middens. Among the sparse vertebrate remains, scattered within those Late Archaic middens, were 31 specimens (NISP) of domestic dog, *Canis lupus familiaris*, the first record of dog for the Calusa heartland. Findings suggest that much of the sequence represents a record of people who may have faced difficult subsistence conditions in the context of changing environments.

Walker, Sarah (Oregon State University), Leah Minc (Oregon State University) and Christina Elson (Science Visualization CEO)

[216] *Zapotec Economy in Late Classic Jalieza: Through the Lens of Ceramic Analysis*

The site of Jalieza, during the Late Classic, was the second largest community in the Valley of Oaxaca. But in spite of its position in the regional settlement hierarchy, the position of this site in the regional economic system is largely unknown. To ascertain this, we have examined patterns of ceramic consumption and exchange utilizing three contexts of an elite house, a semi- elite house, and a systematic surface survey to obtain 250 samples of ceramics from household and ritual vessels. Additionally, 10 samples of figurines were also analyzed. Using trace element analysis, we determined the ceramic provenance and utilized this information to identify the trade partners associating with Jalieza. The results of this provenance testing have also been combined with GIS using a travel time-cost analysis to show whether the trade patterns resulted from least cost considerations or political connections or conflicts. Taken as a whole, this study shows a snapshot of the economic and possible political realities influencing trade with Jalieza during the Late Classic.

Walker, Chester (Archaeo-Geophysical Associates, LLC), Nathaniel VanValkenburg

(University of Vermont) and Mark Willis (Archaeo-Geophysical Associates, LLC)**[287]** *Architecture in Negative: Mapping Social Space at Carrizales, Peru, Using Low Altitude Aerial Photography and Photogrammetry*

In the late 16th century CE, Spanish administrators and clergy sought to reconstitute indigenous Peruvian subjects by forcibly resettling them into planned towns called reducciones. Mapping domestic space in these new settlements (and those that preceded them) has been a crucial element of archaeological research that seeks to understand reduccion's impact on native households. However, on the Peruvian coast, where both late prehispanic and early colonial period domestic structures are dominated by highly perishable quincha (unburnt wattle and daub) constructions, the absence of standing architecture presents significant challenges to efficient mapping of settlement and household structure. Our research at the site of Carrizales has addressed these issues by employing several modes of data collection (pole- and kite-aerial-photography, as well as fixed wing UAVs) to generate microtopographic models of quincha wall foundation trenches and other "negative" impressions of architectural elements, allowing for robust reconstructions of how indigenous domestic space was reconfigured following the reducci3n process.

Walker, Debra (University of Florida)**[306]** *Branching Out: Cerro Maya as a Strategic Link in a Preclassic Maya Exchange Network*

Ours is the first generation of Maya archaeologists to be fully rooted in Maya history. Thanks to our mentors, and especially cooperation between epigraphers and archaeologists, we have come to know the faces, names and life stories of important figures in our own New World history, epics that rival those of the Old World. The telling of these stories is a work in progress, however, our mentors, Linda Schele and David Freidel, provided a courageous and insightful first effort at embodying the color and complexity of Maya history in prose through the publication of *A Forest of Kings* in 1990. While our understanding of Cerro Maya (Cerro) has evolved since the volume was produced, the site remains an early royal tree in the Maya forest. Rather than inventing kingship de novo from a prospering fishing and trade economy, recent research suggests Cerro Maya, the place, was strategically selected to co-opt an existing trade network. In short, the site was probably founded as a branch of a larger Preclassic polity with a substantial capital investment from that site. Material evidence points to Quintana Roo as the root of that royal tree.

Walker, William (New Mexico State University)**[343]** *Discussant***Walker, John (UCF Department of Anthropology)****[350]** *Forest Islands and Raised Fields in the 2nd Millennium B.C.E. Amazon*

Precolumbian earthworks in the Llanos de Mojos show discrete spatial patterns, at different scales. For example, large mounds and causeways are found in the southeast, causeways and raised fields in the south, and large raised fields in the center and to the north. Recent excavations in forest islands associated with raised fields in Central Mojos identify occupations dating to the second millennium B.C.E. This raises the question of how to integrate different elements into histories of landscapes. Flood regime and climate can be shown to vary considerably over time, and on the flat landscapes of Mojos, such changes are reflected across many thousands of square kilometers. Spatial patterns are the result, not of stable feedback cycles of rainfall, vegetation and soils, but of flexible and sustained ways of life, organized at the scale of the community. Differences between forest islands and raised fields within the large raised field area suggest that decision making about the landscape was organized at several scales, but that the scale of the community, represented by individual forest islands and ring ditches was more important over the long term than any smaller or larger scale.

Walker, Mark (Anthropological Studies Center-SSU) and Whitney McClellan (Anthropological Studies Center-SSU)**[416]** *Maritime Households in San Francisco*

In its work in the neighborhoods in the South of Market area of San Francisco the Anthropological Studies Center of Sonoma State University acquired a database of 14 assemblages from households associated with the maritime sector of San Francisco's economy. Because of this sector's centrality within the city's economy, maritime workers are a dominant element in social and labor histories of the city. They are not, however, so visible in the archaeological record. In this paper, we present recent work at a sea-captain's household, and then a comparative neighborhood-level analysis of the maritime households. This work indicates the complexity of the organization of labor in the maritime sector and some of the large gaps in the archaeological record that we confront in dealing with certain kinds of labor.

[245] *New Perspectives on Casas Grandes Mortuary Practices*

The diversity of Casas Grandes mortuary practices has often been cited as strong evidence for hierarchy and political centralization at Paquimé. Initial mortuary analyses argued that variability in grave furniture, corpse treatment, and burial location represented the social identity of the deceased. A central finding of these analyses was that mortuary variability cross-cut age and sex categories, supporting inferences of ascribed vertical status differentiation. In this study, we use recent theoretical perspectives emphasizing the performative aspect of mortuary practices, and new bioarchaeological techniques for age and sex estimation to re-examine the Casas Grandes burial dataset. We also expand upon these analyses by incorporating paleoepidemiological datasets to examine the influence of individual well-being in burial practices. Our results suggest that mortuary practices at Paquime may map onto several social dimensions, including graveside social negotiations by the living and lived identities of the deceased. We discuss the implications of these results for Casas Grandes identity, ritual practices, and social organization.

[328] *Assessing Mobility and Social Interactions through Integrated Analyses of Complicated Stamped Pottery in the American Southeast*

In the Deep South of the American Southeast, regional scale social interactions burgeoned alongside the growth of nucleated villages, widespread mound-building projects, and conspicuous mortuary ceremonialism during the Middle and Late Woodland period (ca. A.D. 100 to 800). A premier material for understanding the significance of social interactions across the southern landscape comes from Swift Creek Complicated Stamped pottery, a ubiquitous class of material culture that provides direct evidence of connections between specific sites at a multitude of scales and in myriad contexts. The impressions of wooden paddles carved with an array of unique designs serve like maker's marks in documenting vessels finished with an individual identifiable tool. By combining design data, patterns of vessel form and use, determinations of vessel provenance through NAA and petrography, and absolute dating, this research ascertains types of social

interaction and their predominant directions and levels of intensity across multiple ecological, social and cultural contexts. The results are considered in terms of the efficacy of models of migration, residential mobility, post-marital residence, and exchange, and their implications for better understanding major regional trends in village aggregation and ritual practice.

Walsh, Megan [155] see Thompson, Jessica

[312] *Variation in Animal Predation and Processing Strategies at the Bridge River Winter Pithouse Village (EeRI4) Thru Time: A Zooarchaeological Analysis of Subsistence Change*

Late Holocene occupants of Housepit 54 at Bridge River participated in complex strategies of food acquisition that were much more varied than the oft-cited reliance on storable anadromous fish resources practiced throughout much of the Pacific and inland/riverine Northwest of North America. While acquisition and storage of fish, particularly salmon, was (and is) a vital part of aboriginal subsistence, permeating many aspects of indigenous lifeways, seasonal and spatial variations in animal procurement were common and increased through time as environmental conditions and village demographics changed. Indigenous people inhabiting the Bridge River Village sought a variety of terrestrial mammals as food sources, as well as birds, ubiquitous fish, and an extensive array of wild plants. The faunal assemblage from Housepit 54 suggests strong evidence for widespread utilization of a variety of animals, including canids (most probably domesticated dogs), whose consumption is apparent in the earliest occupation floors of the house and continues throughout the life of the house. This study emphasizes the zooarchaeological assemblage as a whole, as well as by discrete living floors and activity areas, in order to assess how subsistence changes played out on a near-generational scale in response to various conditions, including village demographics and ecological change.

Walters, Michael (University of Oklahoma) and Rebecca Storey (University of Houston)

[206] *Juvenile Death and Ancestor Veneration: Comparing Child Burials of the Preclassic Maya at K'axob and Cuello, Belize*

Recently, children have been a growing focus of mortuary analysis as archaeologists have been interested in how past societies responded to childhood mortality. This study is a comparative analysis of two Preclassic Maya sites, K'axob and Cuello, and the child burials, 25 and 19 burials respectively. The age ranges of the individuals are infant, child, and adolescent. Placement of the burial, burial offerings, type of grave, and other variables are analyzed to determine how children were incorporated into ancestor veneration and a part of ensouling the house among the Early Maya, perhaps as a precursor to the practice in Classic Maya mortuary ritual. The study contrasts patterns between children inside domiciles and children buried with an adult versus children buried outside residences and not with adults. It is hypothesized that children buried with adults and inside domiciles provide evidence that children were part of ancestor veneration during the Preclassic.

Walth, Cherie (SWCA Environmental Consultants)

[52] *Mortuary Practices of the Pre-Latte and Latte People of Guam Based on Data from the Naton Beach Site*

The large sample of Pre-Latte and Latte period burials from the Naton Beach Site on Guam offers an opportunity to examine the differences and similarities in the mortuary practices. This poster examines several research questions: What is the pattern of burials in terms of location within the site? Do the patterns relate to potential residence areas? What is the pattern of internment in terms of orientation, position, placement, age, gender, and grave goods? A cluster analysis was completed by affiliation to identify spatial units using a k-means algorithm in the ArcGIS program. The results indicate that both groups had some cohesive clusters that likely represented burial beneath or adjacent to a structure. There were similarities in the body position and orientation, suggesting a similar world view. In terms of horizontal social positioning, both groups are primarily kin based with the Latte having some residence based groups. Vertical social positioning based on the presence and quantity of grave goods, indicate that both have some individuals of a higher social position than

others. For both groups, there are a number of individuals that were not in or near a cluster. Further research on the social organization and ethnicity is underway.

[249] *Lithic Production and Consumption at Tzintzuntzan, Mexico*

Tzintzuntzan was the political capital of the Tarascan Empire and home to the royal uacúsecha dynasty during the Late Postclassic period (A.D. 1350-1525). This study presents the technological analysis of 1,155 lithic artifacts recovered during excavations at Tzintzuntzan from 1977 to 1978 and places these findings in context with prior lithic studies based on survey data. The excavation contexts include a palace, storehouse, residential structures, and the five ceremonial Yácatas located on the Grand Platform and a lower elite residence and chapel located to the southeast. The consumption pattern of the Grand Platform is characterized by a high proportion of obsidian blades used for ceremonial display and burial offerings and lower proportions of obsidian scrapers and lapidary objects. The consumption pattern of the lower elite residence is characterized by a higher percentage of green obsidian and greater technological variety. The scales of production in both locations are very low, which indicate that earlier models of lithic production at Tzintzuntzan may require revisions. Finally, the spatial distributions of lapidary tools, preforms, and highly polished fragments in this assemblage suggest that lapidary production was conducted on or nearby the Grand Platform by lower elite members of Tarascan society.

Walz, Jonathan (Rollins College)

[340] *Healing Archaeology*

In this paper, I discuss alternative interpretations of findings from an interdisciplinary archaeology project in East Africa. I share the way in which my experiences as an archaeologist among people and on landscapes enriched and altered my original understanding of communities and the region's history. Interactions with Zigua healer-historians alerted me to indigenous concepts of time and space and the role and significance of ancestors and healing, which inevitably offered more robust and ethical explanations for emergent material signatures. I draw on items, landscapes, oral sources, and community healing practices through which people in Tanzania understand their pasts and forge new futures. In a sense, my original approach - less aware of local practices and ways of knowing - was healed by my experiences with healer-historians.

Wandsnider, LuAnn (University of Nebraska)

[228] *Big House on the Prairie? Signal Quality across Multi-ethnic Homesteading Contexts in the Central Plains (USA)*

Homesteaders colonizing central Nebraska (Central Plains, USA) in the late 1800s constructed communities that varied in terms of ethnic heterogeneity as well as across other dimensions. Costly signaling tenets explored to date suggest that for multi-lingual and multi-ethnic communities, we expect material culture, in this case, homestead size and ornateness, to index family capacities; in linguistically and ethnically homogenous communities, such a material signal may have had less saliency. Relying on lidar data and historic documents, I evaluate this proposition and also consider confounding factors, such as the rapidly unfolding nature of the homesteading experience, homesteader mode of production and the homesteading exit strategies implemented by some homesteaders.

Wang, Yanxi (University of Georgia)

[26] *The Landscape and Regional Integration of the Guan River Valley in the Eastern Zhou Period (770-221 B.C.)*

The regional full-coverage survey at the Guan River Valley, China, reveals a highly integrated, hierarchical and structured settlement system in the first millennium B.C. This settlement system centered on a walled city on the broad alluvial plain of the middle stream. However, a supra-settlement, which was more than twice as large as the city, located at the mountainous area more than 25 km to the upper stream. The nature of this supra-settlement and its relation to the middle stream settlement system is difficult to interpret. Neutron activation analysis (NNA) shows that the chemical signature of ceramics, which includes both domestic pottery and architectural material, are similar between settlements in the upper and middle stream. This suggests that despite the landscape obstruction and occupation vacuum between the upper and middle stream, a regional economic network, as manifested by the production and distribution of ceramics, connected these two areas closely. The regional settlement pattern and historic background implies that this regional integration was caused by a reorganization of political and economic landscapes of a macro-region.

[37] *Ritual animal use of "Qijia Cultural", evidence from Mogou Cemetery, Lintan County, Gansu Province, China*

Animal bones were frequently recovered from burials at the Mogou site. Researchers commonly assumed that they were related to specific ritual or sacrificial activities. With application of different zooarchaeological methods and approaches to the animal bones recovered from burials at Mogou, this study attempt to understand human behavior patterns behind this phenomenon, and how they change through times. Pig mandibles were recovered in large quantities from Mogou cemetery. With detailed analyze of these bones, the following issues will be address in detail: Did humans have any preference, e.g., specific age or sex of pigs? Whether this specific cultural phenomenon has influenced pig husbandry strategies at the site? Whether these pigs came from one or two populations? Other issues, such as how these mandibles have been processed and their taphonomic history, are also questioned. Whether these pigs were obtained for mass killing before the ritual activities will also be considered.

WANG, Hui (Gansu Provincial Institute of Archaeology and Cultural Relics)

[37] *The Evolution of the Qijia Culture and Its Contacts with Other Cultures*

The Qijia culture originated in Loess Plateau of East Gansu and rose to a dominant culture in the vast region of present Gansu and Qinghai with its territory stretching as far as Huanghe hetao area, Guanzhong Plain and NW Sichuan. Its continuity in material culture offers great scope for archaeological research into its varying material manifestations. This article takes a comparative approach to enhance our understanding of the evolution of the Qijia culture and its contacts with other cultures. First, the development of the Qijia culture is reviewed and outlined. The early phase of Qijia culture derived from the Lower Changshan culture with a contribution from the Majiyao culture. Then it exchanged with neighboring cultures, i.e. Banshan and Machang cultures during its middle phase. While at the late period, the Qijia culture interacted with distant cultures, i.e. the Eurasian pastoralist groups and the Erlitou sedentary society; at the end it divided into four Bronze cultures as Siwa, Xindian, Siba and Kayue. Second, the centers of the Qijia culture are explored as westward extension from Tao River, Daxia River, upper Wei River, east Qinghai and Hexi corridor.

[179] *Experimental Research Concerning the Production of Early Holocene Ostrich Shell Beads at the Shui Donggou Site, Ningxia, China*

The appearance of art is an important development in behavioral modernity. In this paper we address the production of early Holocene ostrich eggshell beads. Such beads have been found in many Chinese late Paleolithic sites and also the early Holocene site of Shui Donggou. The study of

these ancient beads will help us to better understand early craft production and the role art played in the development of society. In this paper, we present the results of our experimental ostrich shell bead replication analysis. In order to obtain the use-wear signatures, Synchrotron Radiation Micro CAT Scans were used to document the use-wear formed on modern beads produced by two drilling methods. The results indicate that 1) the perforation shape and drilling marks are distinct between the different methods; 2) the outer and inside surface of the shell could be non-destructively identified and drilling direction could be determined and 3) Ostrich species distinction could be determined. Similar methods were then employed to examine the early Holocene beads from the Shui Donggou site. We propose that by the early Holocene China a couple of different drilling techniques were occurring and our methods can be applied to other areas.

Wang, Qiang

[179] *Ancient Human Herbivorous Diet Reflected by the Analysis of Starch Grains from the Xijincheng Site, Bo'ai county, Henan province, China*

The analysis of starch grains from the Xijincheng site showed that most of the starch was from barley (*Hordeum* spp.) which accounted for about 70% of the total starch grains. Other starches included foxtail millet (*Setaria italica*), broomcorn millet (*Panicum miliaceum*), sorghum (*Sorghum* spp.) and a small amount of starch grains from Leguminosae and root tuber plants. Combined with the analytical results of carbonized remains, we conclude that ancient Xijincheng people adopted the pattern of utilizing a combination of mixed crop farming along with some gathering. The discovery of abundant *Hordeum* spp. starch grains demonstrates that the ancient occupants of the Central Plains began to use this kind of plant beginning as early as 4000 B.P. during the Longshan Culture period. This is of great significance to ongoing research concerning the origin, evolution and diffusion of *Hordeum* spp. in China. In summary, we found that the results of the starch (microfossil) results differed from carbonized (macrofossil) results and we present explanations as to why these two methods can cause different results.

[345] *The Use of Inner Bark as Food in Prehistory: A Case Study Based on Roll Carbonized Remains Unearthed from Hulijia site, Qinghai Province, Western China*

Hulijia site is located in Minhe County, Qinghai Province, western China and is the earliest Neolithic site (5000 BP) in Qinghai Province. Two pieces of carbonized roll remains similar to steamed twisted rolls made of wheat were unearthed from this site. The remains were analyzed by means of stable carbon isotope analysis and showed that the value of $\delta^{13}\text{C}$ was -25.1‰, suggesting that the "roll" remains were actually tree-derived. The anatomic structure of the remains, observed by microscope and scanning electron microscope, suggests that they were inner bark. Through comparison to those of archaeological sites in northern Sweden around the town of Arjeplog, as well as a consideration of the climatic conditions at the time, it is inferred that peeling tree bark might have been a subsistence strategy unique to Hulijia site and its long winters.

Wang, Youping

[407] *The Late Pleistocene Environment and Lithic Technology in South China*

During the last two decades an increasing number of Paleolithic sites have been found in South China. Those provide much more new information on Pleistocene human adaptations in this region, especially Late Pleistocene sites in the Valley of Changjiang River to Lingnan region. New studies on those excavations indicate that pebble tool industries had been dominated this huge region before the MIS3. However, small flake tool assemblages emerged suddenly during the MIS2 time period. The pebble tools with polished tool together came back to this area again by the end of Pleistocene. This paper will briefly introduce some new excavations and discuss the environment changes and developments of the lithic technology in Late Pleistocene South China.

[332] *Direct Evidence of Milk Consumption from Ancient Human Dental Calculus*

Humans have exploited animal milk as a food resource for at least 8,500 years, but the origins, spread, and scale of prehistoric and historic dairying remain poorly understood. Indirect lines of evidence, such as lipid isotopic ratios of pottery residues, faunal mortality profiles, and LP allele frequencies, imply a complex history of dairying at the level of populations. However, in order to understand how, where, and when humans consumed milk products, it is necessary to link evidence of consumption directly to individuals and their dairy livestock. Here we report the first direct evidence of milk consumption, the whey protein β -lactoglobulin (BLG), preserved in human dental calculus from the Bronze Age (ca. 5000 BP) to the present day. Using protein tandem mass spectrometry, we demonstrate that BLG is a species-specific biomarker of dairy consumption, and we identify individuals consuming cattle, sheep, and goat milk products in the archaeological record.

[121] *Corrosion Concerns and Metal Soap Formation in Shea Butter-Containing Forowa Brass Vessels from Ghana*

Twenty-three forowa metal vessels from Ghana, housed in the Fowler Museum at UCLA, were investigated with regard to manufacture and deterioration. Technical examination revealed that all vessels were manufactured from skillfully hammered brass sheets, and purpose-built for storing shea butter, a multi-purpose substance derived from shea nuts. Most vessels contain remnants of shea butter, which has become discolored: while shea butter extracted using native methods is off-white to yellow, the current vessel remains display different shades of green. Typically, such discoloration is caused by diffusion of metal ions into the organic substance. Spectroscopic analysis of the discolored material using XRD, FTIR, and GC/MS techniques indicated formation of metal soaps, i.e. metallo-organic complexes formed between shea butter fatty acids and copper and zinc from the brass vessels. In order to investigate possible corrosion concerns, the interactions between shea butter and test coupons of copper, zinc, brass, and tin were monitored. Furthermore, the GC/MS data quantified the chemical compositions of shea butter from various sources, allowing us to evaluate the usefulness of such data for geographic shea butter provenancing. Together with the technical metal examination, these results increase our understanding of the uses, manufacturing, and other properties of forowa vessels.

[66] *Rethinking and Refining the Activities Associated with the Monumental Compounds of Jatanca, Peru*

The Late Formative Period site of Jatanca is located in the southern sector of the Jequetepeque Valley, Peru. The five architecturally intricate monumental compounds that make up the core of this site housed sociopolitical, economic, and ritual activities that operated at a variety of interdependent scales. Recent excavations in 2014 within Compound I have further refined our knowledge of the relationships between the complex multiscale activities that took place within these important spaces. This paper will discuss how our interpretation of compound-specific activities has developed over the last ten years of continuous research at this important North Coast site.

[247] *Breaking Down the East-West Dichotomy: Toward an Understanding of Intercultural Interactions in the Saipurú Region under the Inkas*

In the last decades prior to the Spanish conquest, the Inka Empire expanded its frontiers into the ethnically and culturally diverse region of the Bolivian Chaco, ushering in a brief period of limited colonial control over its indigenous inhabitants. In a geographically isolated area far from the imperial heartland, the Inkas and their imperial allies established settlements in the vicinity of Saipurú; in this context, several disparate highland and lowland cultures met, interacted, and created a unique, multiethnic colonial space. This poster will address complementary and often contrasting forms of archaeological and ethnohistoric evidence for (1) the possible cultural affiliations of the various groups that came together at Saipurú, including lowland Arawak- and Guaraní-speaking groups, the Inkas, and at least one altiplano population; (2) the creation of hybrid ceramic styles, and the socioeconomic factors involved in such processes; and (3) the artificial dichotomy between the highland Andean west and the lowland east that was consciously formulated and reproduced by the Inkas. While ethnohistoric sources attest to this enforced ideology of difference and its implications for the structure of colonial relations between the Inkas and lowland groups, archaeological evidence from the Saipurú region supporting such claims appears somewhat tenuous.

[253] *3,065 Sherd Disks and their Potential Uses in Calixtlahuaca in the Toluca Valley*

Among the artifacts found at the site of Calixtlahuaca, excavations recovered an unusually large quantity of sherd disks. Calixtlahuaca is an Aztec Postclassic (A.D. 1130-1530) site located in the Toluca Valley of Central Mexico. These sherd disks, or tejos, were created from bowls and pots broken during antiquity. The potsherds were worked until they were circular in shape. Other researchers have suggested potential uses for these worked sherds, including gaming tokens (for the game patolli), net weights, and spindle whorls. This poster describes the sherd disks found at Calixtlahuaca and addresses the suggested uses by analyzing the size distribution, morphology and contexts of recovery of these artifacts.

Wasiolek, Maryann (Hydroscience Assoc., Inc.)

[180] *A Better Understanding of Ancient Farming through Hydrology*

Physical evidence that ancient people manipulated their environment in order to better manage water resources for the purpose of facilitating agriculture has long been recognized. Remnants of canal systems indicate diversion of the flow of streams and springs and the direct application of surface water to irrigated fields. Terraces and check dams provide evidence of the diversion of overland runoff, while mulched fields, pumice patches, and dune fields imply that early farmers sited fields so as to take advantage of retained soil moisture. Excavated pits and possibly augmented karst features suggest use of shallow groundwater in conjunction with captured runoff. The probable operation of these systems has been noted by many investigators, and the types of cultivation techniques have been described and classified. However, relatively little quantitative assessment has been done to determine how the systems actually worked to move and distribute water, or what effect they had on the availability of water to crops. Physical measurements of surface and sub-surface flow using standard hydrologic instrumentation could provide answers to these questions. Understanding the engineering of the systems could determine under what hydrologic conditions the systems were effective, and might also identify unique, spatially or temporally traceable engineering techniques.

[53] *The Influence of Prey Availability on Ice Age Hunting Strategies: Tracing Magdalenian Reindeer Migratory Patterns Using Strontium Isotope ($87\text{Sr}/86\text{Sr}$) Analysis of Reindeer Teeth from Verberie (Oise, France)*

The Magdalenian (18-11kya) marked a time of dramatic climate instability in western and central Europe, ushering in changes in the predation strategies of late Paleolithic groups who hunted migratory reindeer herds. For Magdalenian populations, a clear understanding of migratory patterns was crucial for survival, particularly when Epipleistocene climate fluctuations were causing previously unseen types of resource distribution. Here we present the results of strontium isotope ($87\text{Sr}/86\text{Sr}$) analyses of teeth from 34 reindeer from the Magdalenian hunting camp at Verberie, located in the Paris Basin near the Oise River. The goal of this analysis was to better understand how Magdalenian peoples exploited reindeer populations and to ascertain if changes in hunting strategies related to reindeer migratory patterns are reflected in the stratigraphic record at Verberie. The results of this study found that reindeer from younger stratigraphic levels often exhibit more wide-ranging $87\text{Sr}/86\text{Sr}$ isotope ratios that may correspond to the Cretaceous and Jurassic age formations east of the Paris basin or of the northwest coast. This may indicate that during later times hunters were relying more on farther-ranging migratory animals. Further mapping of $87\text{Sr}/86\text{Sr}$ isotope ratios in the Paris Basin will help to clarify these results.

[55] *Vertebrate Faunal Assemblages and Bone Tool Use in the Early Agricultural Period*

Researchers have recovered large faunal assemblages containing several hundred bone artifacts at Las Capas, a San Pedro phase site in Tucson, Arizona. Artifacts include utilitarian and non-utilitarian objects with a variety of technical and symbolic uses. Excavations at Los Pozos, a large Cienega phase site in the Tucson Basin, yielded a very large collection of animal bone with a rich bone artifact assemblage. Bone technologies were often used to make items from plant fibers, wood, animal hides, or other perishable materials. These less durable artifacts often decay and disappear from archaeological sites, but the bone tools remain. The collected assemblages provide exceptional information not only on the extent to which pre-ceramic era peoples relied on bone, but clues to other activities and the availability of resources. Comparisons between the two assemblages show many similarities in the animal taxa used for bone tools. However, there are important differences that reflect variability in the use of available resources and economy of manufacture through time. The correspondence between the bone tool assemblage and the greater faunal assemblage at large provides insights into life in the floodplain during the Early Agricultural period in southern Arizona.

Waters, Michael (Texas A&M University)

[80] *Building a Meaningful First Americans Radiocarbon Chronology*

Chronology is key to understanding the story of the First Americans. Accurate and precise ages from sites are necessary to develop chronological relationships and overlaps among different Paleoindian complexes. Proper dating of any Paleoindian horizon requires an understanding of the geological context, geochemical environment and potential contamination factors, material and chemical fraction dated, number of ages obtained, and many other variables. Without understanding these factors of radiocarbon dating, the age of sites can be inaccurately dated and result in overestimates or underestimates of the true age of a site. Several examples will be used to illustrate these points.

[304] *Hohokam Fieldhouses and Agricultural Labor*

Construction, operation, and maintenance of the extensive prehistoric irrigation systems of the Phoenix Basin required a significant input of labor. The ethnographic record suggests that the organization of agricultural labor among smallholder irrigation farmers can be varied and complex. Hohokam householders had a variety of labor arrangements at their disposal, and were flexible in their application of different strategies to meet changing environmental and cultural conditions. Hohokam agricultural labor was operationalized in fieldhouses, and I look to these features for evidence of variation in labor strategies.

[157] *Scales and Visibility of Human-Environment Interactions in Western Amazonia: The Case of the Geoglyph Builders*

A debate that has received much attention in recent years is the nature and scale of precolumbian impact in the Amazon lowlands. While the notion that Amazonia is a “pristine wilderness” has long been rejected, several papers have proposed that human impact in western regions was more sporadic and on a smaller scale than impacts in central and eastern regions, and that western Amazonia supported sparse precolumbian populations. The discovery of over 400 geometrically-patterned earthworks in Acre (western Brazilian Amazon), which until recently lay under in-tact tropical forest, has raised important questions about the kind of societies that built them and their impact on the terra firme, and offers an ideal case study to test this hypothesis. This paper presents results from the first investigations into human-environment interactions in the geoglyph region, and offers insights into the mechanisms and spatial and temporal scales of landscape transformations associated with the earthwork-building cultures. The data call for a re-appraisal of what we mean by “scales” of human impact in Amazonia, and propose that an understanding of the diversity of human-environment interactions must be considered through studies that closely combine archaeological and paleoecological proxies.

Watrall, Ethan (Michigan State University)

[235] *MBRIA: A Platform to Build, Serve, and Manage Mobile Public Heritage Experiences*

The spaces we inhabit and interact with on a daily basis are made up of layers of cultural activity that are, quite literally, built up over time. While museum exhibits, archaeological narratives, and public archaeology programs communicate this heritage, they do not generally allow for interactive, place-based, and individually driven exploration by the public. In recent years, mobile and augmented reality applications have offered both platforms and models for mobile heritage experiences that partially address these issues. Unfortunately, the bar for developing mobile heritage applications is getting increasingly more difficult to reach for many heritage institutions and projects. Quite simply, building robust mobile applications is too technically complicated and specialized for many in the heritage community. It is within this context that this paper will introduce and explore mbira. Currently being developed at Michigan State University, mbira is an open source platform that empowers cultural heritage institutions, archaeological projects, and heritage landscapes to create, serve, manage, and sustain engaging mobile heritage experiences. Special attention will be paid to the design metaphor of “space and place as museum” that is woven into the fabric of mbira. In addition, the paper will explore mbira’s features that support multivocality and public discourse.

[55] *Bioarchaeology at Las Capas: Uniformity and Continuity within the Early Agricultural Period*

Investment in cultigens and early irrigation in the Sonoran Desert (circa 3600 BP) signal a major shift in subsistence strategy identified as the Early Agricultural Period (EAP). The EAP is also recognized as a period of significant social transformation, and Las Capas (LCA) has played a critical part in our redefinition of this period. We examine how biocultural signatures from the LCA mortuary sample compare over the site's occupation and within broader patterns of the EAP. Our results indicate broad-scale uniformity between the early and late components at LCA, and across the entire temporal and spatial distribution of the EAP. Burials are often placed in domestic space, in close proximity to others. Mortuary features are dominated by primary, flexed, inhumation burial; however, body treatment is variable and the placement of funerary objects infrequent. Biological signatures vary in a few cases, likely reflecting subtle difference in behaviors or circumstances at specific sites. Taken as a whole, biocultural signatures at LCA mirror larger trends within, and throughout, the EAP and represent the culmination of significant changes in subsistence strategies and the foundation of technological and social systems of subsequent Formative period societies in the area.

Watson, Jessica, Nathan Hamilton (University of Southern Maine) and Robin Hadlock Seeley (Cornell University)

[61] *Historic Use of Native Avifauna during the Hotel Era (1847-1914) on the Isles of Shoals, Maine*

Interactions between traditional European culinary practices and North American fauna have been the focus of several archaeological studies during the past few decades, but have not been explicitly examined in northern New England, especially during later colonial occupation (ca. 1800-1900). The Lighton hotel on Smuttynose Island (Isles of Shoals, ME), site of nineteenth- and twentieth-century activity, reveals how domestic practices were changed during the later hotel era (1847-1914). Preliminary examination of bird remains from Smuttynose Island reveals that visitors to the hotel were fed a mixture of local and domesticated birds in addition to ungulates and fish. The taphonomic study of the assemblage includes calculation of NISP and MNE for each taxon in addition to the recording of surface modifications, such as fracture patterns, skeletal element patterns, cutmarks, and gunshot holes. The presence of several pelagic or extinct species, including the Great Auk (*Pinguinus impennis*), suggests that residents of these islands utilized a wide range of resources to thrive during the later hotel era.

[243] *In Too Deep: Excavations of a Partially Inundated Ancient Maya Salt Works at Witz Naab, Paynes Creek National Park, Belize*

Underwater survey and excavation in a large salt water lagoon between 2004 and 2013 revealed ancient Maya wooden buildings with briquetage—the broken pots from evaporating brine in pots over fires to make salt. Unexpected in the tropical landscape of Belize, the wooden buildings were preserved below the sea floor in mangrove peat, which created an anaerobic matrix. Elsewhere, historically and in modern times, the salt content of the brine was enriched by pouring it through salty soil—reducing fuel needs. The Paynes Creek salt works are underwater, so that any mounds of soil at the underwater sites would have been deflated by wave action. In 2012, excavations were carried out in an earthen mound at the Witz Naab site in the mangroves. The purpose was to determine if the mound resulted from the leaching process—perhaps providing an analog for the now submerged salt works. Trenching revealed the lower levels of Witz Naab mound were inundated, but that most of the mound was above water, providing evidence for its use. We evaluate whether the stratigraphic evidence within the mound is discarded soil from brine enrichment, remains of a residence, or a non-residential structure.

[273] *In the Footsteps of Frank H. H. Roberts: Continued Explorations at Roberts Great House, Chaco Canyon, New Mexico*

During the 2014 field season, investigations continued at Roberts Great House, a Late Bonito Subphase (1100-1140 CE) site in Chaco Canyon, New Mexico. Severely threatened by erosion, the site was originally explored by Frank H. H. Roberts in 1926. The aims of the 2014 season of fieldwork were to assess the pace of erosional processes and resolve questions concerning the duration of the site's occupation and the nature of its abandonment. After thoroughly mapping and imaging arroyo down-cutting, exploration targeted two areas of the site for excavation. These excavated areas contained deeply-buried architecture, the remains of trenches excavated by Frank Roberts, and a striking absence of occupational surfaces and intramural or plaza features. The data continues to strongly support Roberts's interpretation that this structure was not completed and that the site witnessed, at most, a short period of use. Soil stratigraphy visible in the test units indicates a highly dynamic fluvial environment and enables researchers to formulate a testable model of landscape development in the surrounding Rincon and thus a possible explanation for the lack of occupation at the site.

Watts, Christopher (University of Waterloo)

[108] *Mutable Materials and Gathering Worlds*

Owing to a plethora of recent and ever more divergent scholarship on materiality, the lens through which we view the ontological status of things has become increasingly opaque. New thinking about the ways in which materials are always and already in flux compels us to consider how seemingly obdurate things can, paradoxically, transcend their own solidity. To this we may add a budding concern with the immaterial – regimes of light and sound, for example, and their mutability – and the extent to which such phenomena imbue and inform wider material meshworks. In this paper, I think through these themes with reference to the earthen enclosures of the central Great Lakes, which I argue were intended to gather together particular topographies, celestial objects, and materials as part of a broader commitment to place.

Watts, Joshua (Center for Social Dynamics and Complexity, Arizona State University)

[304] *Pots, Middlemen, and the "Shopkeeper" Hypothesis in the Hohokam Sedentary Period*

While ceramic analysts now report with some confidence where most Phoenix Basin Hohokam pottery was manufactured and where it was eventually discarded, we simply cannot use those two data points on their own to describe the exchange rules and distribution networks that moved pottery from specialist producers to consumers throughout the region. Agent-based modeling methods provide a powerful toolkit for interpreting complex spatial and distributional patterns in the archaeological record, and for identifying hypotheses to test with empirical data. To that end, I implemented a relatively simple agent-based model of pottery exchange informed by the Hohokam case and compared the output from many simulations to ceramic data from 39 sites in the Phoenix Basin occupied during the Middle Sacaton. Unexpectedly, the model configurations most consistent with the actual archaeological record relied on market-based rulesets for trade and village-based middlemen retailers who acquired pottery wholesale from producers and distributed it to nearby households. Current interpretations of the Middle Sacaton economy hypothesize periodic marketplaces linked to Hohokam ball courts. The modeling approach adopted for this research instead encourages investigating the middleman retailer hypothesis. What would a Hohokam "shopkeeper" look like, and what archaeological evidence would be needed to assess that hypothesis?

Watts-Malouchos, Elizabeth (Indiana University) and Zarko Tankosic (Norwegian Institute at Athens/Indiana University)

[289] *Sighting Sites: Viewshed Analysis and Site Boundaries in Archaeological Survey*

The identification, designation, and definition of the ubiquitous archaeological "site" are foundational to archaeological survey. These standard classificatory practices frequently emplace rigid spatial and

temporal boundaries around human activities and portray past landscapes as simply consisting of “sites” and the unoccupied spaces outside of “sites”. However, the people, places, and material things that constitute physical and social landscapes are dynamic, and the boundaries between them are fluid and permeable. Utilizing data from the Norwegian Archaeological Survey of the Karystia (NASK) Project in southern Euboea, Greece, we investigate the utility of employing visibility analysis, specifically GIS viewshed analysis, as an analytical tool to mitigate the arbitrary boundaries between site and non-site that are often the result of conventional survey methods. Although certain aspects, or rather shortcomings, of visibility analysis have remained unsatisfactory, we suggest that viewshed analysis can be a productive means for shifting focus to the everyday sensory experiences at sites and, importantly here, resituating sites and their human and nonhuman constituents back within their larger social, spatial, and temporal landscapes.

Weaver, Brendan (Vanderbilt University)

[31] *Connecting the Precolumbian Past to the Present in South Coastal Peru: The Archaeology of the Colonial and Republican Haciendas of Nasca*

The fertile desert middle-valleys of South Coastal Peru's Grande Basin offered resources for great productive potential which supported a large population since the Formative Period and attracted intense agro-industrial interests during Spanish colonization. Historical archaeology offers tools for understanding regional processes of population replacement, highland/coastal exchange and migration, and the radical transformation of social processes during the last five centuries of intense manipulation by Western power, connecting the precolumbian past to the ethnographic present. Although indigenous populations in the basin, and particularly in the Ingenio and Grande Valleys, were replaced by mestizos and afro-Andeans, prehispanic sacred sites, settlements, and irrigation technologies continued to be used and modified. This paper makes the case that a better understanding of both prehispanic and historical contexts in the region must consider an integrated diachronic approach which takes into account the early and later use histories of sites and technological apparatus.

[232] *The Organization of the Lower Lurin Valley During the Late Intermediate and Late Horizon Periods*

The rank size analysis of the archaeological sites inhabited during the Late Intermediate and Late Horizon periods located in the Lower Lurin Valley of the Peruvian Central Coast presents a comparison of power politics and the possibility of a hierarchical organization among the different inhabitants of the respective sites. The Lurin Valley is located on the Peruvian Central Coast, and the mouth of the Lurin River is located in close proximity to the site of Pachacamac. This site is an important religious center according to historical accounts. Of all the sites along the Lurin Valley, Pachacamac is the most well-studied. However, there is little knowledge of the remainder of the hierarchical relation among the sites in the valley. Based on a rank size analysis of the areas of each site along the valley, the political and social organization of the Lower Lurin Valley during the Late Intermediate and Late Horizon periods will become clearer. The rank size analysis is based upon the comparison of satellite imagery and site maps compiled to compare the area and therefore relative power based upon geographical territory of each respective site.

[162] *Analysis of Microbotanical Remains from Chavín de Huántar*

Chavín de Huántar is well-known for its ritual significance in the Andean world, however the nature of both subsistence and temple offerings remain unclear. Though previous research has been carried out on the Chavín de Huántar botanical assemblages, much remains a mystery due to poor overall preservation of carbonized remains. In order to obtain a more complete understanding of Formative

Period subsistence, residues extracted from potsherds from sealed Chavín contexts were analyzed for starch granules and phytoliths. This analysis reveals previously unidentified food resources including manioc (*Maniot esculenta*) and yam (*Dioscorea ssp.*), as well as maize (*Zea mays*) which is uncommon in the Chavín de Huántar macrobotanical record. These results demonstrate the necessity of multiple types of archaeobotanical techniques.

[315] *Irish Immigration and Urban Transformation in a Boston City Neighborhood*

When working class European immigrants first arrived on American shores, they had a profound effect on American cities. Throughout the nineteenth century, the processes of industrialization coupled with Boston's position as a shipping hub created an influx of low-income laborers in need of housing. The Clough House, a colonial home built around 1715, functioned as a single-family residence for a century before being converted into a tenement for the working class. This poster explores the impact Irish, Irish-American, and other groups had on the development of Boston's North End neighborhood. It combines historical, archival, and archaeological approaches to analyze the changes that took place on both a household and community level, focusing on: 1) demographic changes, 2) architectural changes, and 3) changes in ceramic consumption.

Webster, Chris

[322] *The CRM Archaeology Podcast: Podcasting the Profession and Educating the Public*

Since the first podcasts were available on Apple's iTunes in June of 2005, podcasting has become a powerful way for anyone to deliver information to the world from the comfort of their home. Podcasts can be informal conversations to expensive productions from major networks. Archaeology podcasting has seen shows come and go and has had a rocky past. The only podcast focused on issues related to CRM Archaeology has been recording since February of 2013 and has tackled everything from ethics on the job to issues specific to women in archaeology and in the workplace. We've found that podcasting is a great way to engage with thousands of professionals and the public alike. We don't run conversations, we start them. Podcasting is a medium that is here to stay and the archaeological community should recognize it as a valuable and useful resource.

Weerasinghe, Jagath (Postgraduate Institute of Archaeology)**[340]** *Conserving the Buddhist Stupas and Religious Nationalism in Sri Lanka*

Surveying, excavating, and conserving Buddhist stupas have been major activities undertaken by Sri Lankan archaeologists since colonial times. Conservation of Buddhist stupas holds an important place in the archaeological agenda of the national institutions in Sri Lanka. I present the elusive concept of 'authenticity', treated as the most important criterion in conserving architectural heritage and examine the crisis that emerged when this centerpiece of the Authorized Heritage Discourse was applied to conserving Buddhist stupas. The crisis took a political dimension when the ceremonial reopening of the recently conserved Abhayagiriya Stupa had to be postponed when custodian monks lodged a petition with the President of Sri Lanka maintaining that the stupa should be restored by complete rebuilding and white washing. This action contradicts the World Heritage Convention regarding the integrity and authenticity of heritage and it departs from a 30 year old agreement that included the religious community. Today the religious nationalist rhetoric that dominates Sri Lanka is being used to challenge theories of conservation and restoration based on the idea of "authenticity", suggesting that concept of 'authenticity' needs to be revised and reconfigured if it's going to be of utility in a context like Sri Lanka, where religious nationalism prevails.

Wegener, Corine (Smithsonian Institution)**[254]** *Smithsonian's Role in Cultural Heritage Disasters*

The environment for cultural heritage disaster management has grown increasingly complex; destruction of heritage during ethnic and sectarian violence is on the rise and global climate change threatens to increase extreme weather events. Few organizations are positioned to help our colleagues with disaster response and recovery efforts. The Smithsonian Institution proposes to establish the Cultural Crisis Recovery Center (CCRC), an operational organization to provide emergency response for cultural heritage disasters along with a multidisciplinary approach to training, scholarly research, and long-term preservation strategies. The Smithsonian CCRC will help reduce the risk of permanent loss of humanity's cultural heritage by: 1) serving as a principal resource for endangered cultural heritage information, research and policy; 2) educating and training public, private, and non-profit professionals and volunteers to prepare for and respond to cultural crises; 3) developing and deploying professionally-trained disaster response teams that can execute independent or coordinated efforts both at in the U.S. and internationally; and 4) keeping recovery efforts at the forefront by advising partners on long-term strategies, undertaking specific preservation projects, and offering training on special exhibitions and programs.

Wegter, Bruce [10] see Rubinstein, Emily

Weiland, Andrew (The Ohio State University)**[373]** *Practical and Social Storage among the Ohio Hopewell: Archaeobotanical and Ethnoarchaeological Evidence for Delayed Return of Pre-Maize Crops*

Social storage and social complexity indicated in the scale of Hopewell earthwork building, craft specialization and mortuary goods, suggest surplus created through subsistence intensification. However, artifacts and features associated with practical storage of such a surplus are uncommon at most Ohio Hopewell habitation sites. This study takes a step toward resolving this apparent contradiction by developing a predictive model from descriptive and quantitative characteristics of storage facilities archaeologically and ethnographically documented in eastern North America. These predictions are then compared with a newly analyzed botanical assemblage from features at a Hopewell habitation site (Overly Tract near Hopeton earthworks). Results indicate that traces of storage features may remain as palimpsests that require detailed analysis, and feature morphology may not always be a reliable indicator of storage function. Comparison of features suggests a dichotomy in Hopewell culture between social storage at earthworks and immediate surrounds, and practical storage at habitation sites. Organization of various forms of storage in Hopewell societies provides insight to land management, settlement patterns, and social organization at large.

Weinberg, Camille (University of California, Los Angeles), Benjamin Nigra (Cotsen Institute of Archaeology, University of Cal), Maria Cecilia Lozada (The University of Chicago), Charles Stanish (Cotsen Institute of Archaeology, University of Cal) and Henry Tantaleán (Cotsen Institute of Archaeology, University of Cal)

[169] *Demographic Analysis of a Looted Late Intermediate Period Tomb, Chincha Valley, Peru*
Ethnohistorical and archaeological sources establish that the Chincha Valley on Peru's south coast hosted a populous and economically complex polity during the Late Intermediate Period (1200-1470 CE). A 2013 survey of the middle valley revealed more than 40 cemeteries containing over five hundred highly visible, above-ground collective tombs resembling highland chullpas. To establish a baseline demographic profile for this mortuary tradition, we conducted an osteological analysis of one looted commingled tomb. Analyses indicate that the tomb was a primary burial with a minimum of 63 occupants and nearly equal proportions of male and female individuals ranging from infants to adults. Juvenile remains comprised more than half of the collection, suggesting that in death children shared a community identity with adults. Cribra orbitalia, cranial modification, and red pigment application were also observed in the collection. This preliminary study revealed the potential for further research on coastal Chincha collective tombs to explore osteological and mortuary ritual patterns.

[192] *Identification and Assessment of Subsided and Drowned Prehistoric Archaeological Sites, Lakes Borgne and Pontchartrain, Southeastern Louisiana*

From 2010 to 2014, archaeologists from Coastal Environments, Inc., conducted several remote-sensing surveys within Lakes Borgne and Pontchartrain in an effort to locate the remains of drowned prehistoric terrestrial sites that once existed prior to subsidence and shoreline transgression. In this effort, it has been critical to interpret the remote-sensing data within the established geologic and geomorphic contexts of the region. Several submerged and buried high-probability landforms and potential shell middens have been identified, with one site in particular, 16SB153 in St. Bernard Parish, examined through a program of offshore probing and vibracoring. Subsequent geophysical survey at 16SB153 resulted in further delineation of the offshore portion of the shell midden as recorded on subbottom profiles. When coupled with research on the small part of the site still extant onshore, it was possible to piece together a hypothetical sequence of site deterioration and movement resulting from both natural and human causes.

[77] *Determining Geochemical Variability of Fine-Grained Basalt Sources/Quarries for Facilitating Prehistoric Interaction Studies in Polynesia*

William "Bill" Dickinson has long been interested in tracking interaction between Pacific Island societies by comparing temper sands of prehistoric ceramics and, more recently, thin section descriptions of basalt adzes. Fine grained basalt sources or quarries anchor ancient interaction spheres, yet few of the dozens of adze quarries found throughout Polynesia are known in sufficient detail to understand intra-source variability. This fundamental data is essential for confidently assigning transported artifacts to quarries. Using a geologically informed protocol in concert with statistical applications, we document the intra-quarry geochemical variability of oxides, trace elements, and isotopes for the large fine-grained basalt source on Eiao, Marquesas Islands, East Polynesia. Incorporating this methodology with sourcing studies at the geographic scale of island, archipelago, and region will provide more credible artifact source assignments and thus enhance our understanding of prehistoric interaction networks throughout Polynesia.

[305] *Drinking Power: Moche Tombs as Sites of Subjectification*

In the ethnohistoric record of the Andes, the bodies of the dead feature as key material objects through which living rulers claimed power over people and territory, especially irrigated land. This was true for the highland Inka, and also for coastal societies such as Chimú. In the archaeological record for earlier societies such as Moche, we see evidence for a similar complex of practices involving tombs, entombed bodies, and associated artifacts and offerings. These mortuary assemblages were not just significant for religious reasons or to memorialize the past, but as sites where living elites consolidated control over labor and resources. The ceramic effigies of elite human bodies placed in tombs materialized this political-economic message. The affordances of these ceramics as vessels, together with evidence that the tombs were open for long periods of time and were re-entered periodically, suggest that important drinking rituals held at tombs linked members of elite corporate kin groups across time: the dead, ruling and rising generations. These rites reinforced emergent and existing systems of stratification, and embodied lessons about inequality and inheritance that shaped elite understandings of themselves and their own bodies, and of the North Coast ecosystem and their right to rule it.

Weiss, Elizabeth (San Jose State University)

[132] *Kneeling Difficulty and Osteoarthritis: What Data from the Osteoarthritis Initiative Can Tell Us about Prehistoric Californians*

An essential part of California hunter-gatherer diet was ground foods, such as acorns. Grinding food with the use of mortars and pestles likely required extensive kneeling. Most of the food grinding among prehistoric Californians was likely accomplished by females. In Ryan's Mound (CA-Ala-329; N = 284), for instance, 33% of females were buried with mortars or pestles whereas 14% of males were buried with mortars or pestles (Chi-square = 10.48, $P < 0.001$). A rich literature on kneeling effects on skeletal remains in past populations exists, but research concerning kneeling difficulties has been absent. This study examines kneeling difficulty in relation to body mass index (BMI), age, and osteoarthritic osteophytes using the OAI public use database (N = 3588). Knee osteoarthritis was based on osteophyte length on a four point scale for femora and tibiae. BMI was based on a height and weight ratio. Age and kneeling difficulty were self-reported. In females with osteoarthritis, kneeling difficulty increased in females with higher BMIs (F-ratios = 10.389, right; 7.962, left; P s < 0.01). These results imply that females in CA-Ala-329 were unlikely to have experienced difficulty kneeling and, thus, could engage without difficulty in food processing even with knee osteoarthritis.

[186] *The Trajectory of Early Rice Intensification and Cultural Change in the Lower Yangtze Valley Revealed by an Ecological Analysis of Archaeological Phytoliths*

Using data from modern and archaeological phytolith assemblages we follow the trajectory of wild rice cultivated on wetland margins at 5000 B.C. through early domestication and the first artificial arable systems in dug out fields at c. 4000 B.C. to fully developed irrigated paddy fields in the Lower Yangtze Valley. Using multivariate analysis with phytolith assemblages from ecological communities of rice weed flora across a range of arable systems, we create modern analogues of ancient systems which are used to interpret our archaeobotanical samples. In addition we interpret our data from ancient rice fields and archaeological sites using a physiologically-based wet versus dry model of grass morphotype silicification. These data reveal how rice cultivation changed alongside cultural development in the Lower Yangtze Valley, moving from wet to dry and back to wet systems. This sequence of changes in cultivation ecology inferred from phytoliths fits with available plant macro-

remains and can be understood as agricultural intensification alongside growing social complexity.

Weitzel, Elic (University of Utah)

[163] *Diet Breadth Narrowing at the Pleistocene/Holocene Transition: Faunal Evidence from Dust Cave, Alabama*

Paleoenvironmental data from the Younger Dryas and Early Holocene indicate that plant and animal communities in the southeastern United States changed substantially between these periods. These reconstructions indicate that during the Early Holocene, climatic amelioration and changes in forest composition may have led to increases in populations of large-bodied animals that were depressed during the Younger Dryas. Based on these data, I hypothesized that there would have been a narrowing of diet breadth during this transition as foraging efficiency increased in the Early Holocene and human foragers exploited increasingly abundant high-ranking prey items. I tested this prediction using the faunal dataset from Dust Cave, Alabama. This site was inhabited from 12,650 to 5,700 cal BP, spanning the Late Pleistocene, Early Holocene, and Middle Holocene periods. I applied abundance indices based upon prey body size as well as measures of richness, equitability, and diversity to quantify dietary changes that occurred during this time period. My analysis demonstrates that there was a general narrowing of diet breadth from the Late Pleistocene to the Early Holocene at Dust Cave, with later diets focusing on large-bodied taxa that were most likely to have provided the highest caloric return rates.

[183] *Understanding Residential Space through Soil Chemistry in the Northern Maya Lowlands*

Soil chemistry in the Northern Maya Lowlands has been an effective method at a variety of sites and in a range of contexts such as households, ball courts, causeways, and ceremonial plazas. Recent chemical analyses of the Ucí-Cansahcab Regional integration Project (UCRIP) also revealed that the soils of the Yucatán, México, are testable using the in-field Olsen bicarbonate method to measure levels of extractable inorganic phosphate. When supplemented with distributional analyses of artifacts on and off the residential platforms, phosphate tests prompt synchronic and diachronic observations of differential discard patterns and possible areas of food serving and preparation from Preclassic to Postclassic. From these observations, we compare similar and dissimilar residential contexts, consider the various functions platforms have over time, and discern trends related to broader changes in the social, political, and economic dynamics of Ucí and the construction of its associated 18km intersite causeway.

Welch, John (Simon Fraser University), Paul Tosa (Jemez Pueblo), Francis Vigil (Zia Pueblo and State Of New Mexico) and Rachael Loehman (United States Geological Survey)

[239] *Toward a Sovereignty-Driven Paradigm for Transdisciplinary Research on Social-Ecological Systems*

In addition to substantive findings about changing relations between Jemez communities and forest ecologies, our multidisciplinary project is suggesting some promising strategies for enhancing research engagements with American Indian tribes. In spite of due diligence in consulting with Jemez Pueblo leaders in the course of project planning and in engaging Jemez people and interests in project processes, we are concerned that the project's scientific contributions outweigh its beneficial effects on Jemez Pueblo and the forests it depends on. Because science seems less imperiled than Jemez Pueblo and Jemez forests, we are proposing a sovereignty-driven research paradigm as an alternative to science- or discipline-driven research. Investigative programs tailored to understand and fortify the five 'pillars' of sovereignty—self-sufficiency, self-determination, self-governance, self-representation, and peer-recognition—offer constructive and locally grounded complements to science in the extractive-consumptive colonialist tradition as well as to decolonizing reactions to that tradition. Sovereignty-driven research entails, first, the identification of a tribe's (or

other Native nation's) sovereignty interests and goals then the formulation of research questions, methods, practices, and outcomes crafted specifically to advance those goals. Sovereignty-driven initiatives to understand and perpetuate vital and definitive links among people, territory, and cultural traditions define and require transdisciplinary research programs.

Welker, Martin (Penn State University), Jonathan Burns (Penn State University) and Sarah McClure (Penn State University)

[165] *Investigating Diet Variability at Early Fortifications in the American Colonies*

Variability in historic faunal assemblages is believed to be related to niche construction effects associated with the establishment and cultivation of Old World domesticated flora and fauna in the New World. Fort Shirley, a French and Indian War period fortification in Central Pennsylvania occupied during the mid 1750's, is an important case study in this picture as it was occupied during the introduction of domestic livestock to Central Pennsylvania. Published zooarchaeological analyses of historic fortifications elsewhere in the New World highlight significant contributions of locally abundant wild fauna to military diets. Statistical comparison of faunal assemblages from military installations dating to the French and Indian War (1754-1763), including that from Fort Shirley, the American Revolutionary War (1775-1783), and the War of 1812 (1812-1815) will test the hypothesis that diet breadth narrowed through time and was accompanied by increasing reliance on Old World domesticates.

[211] *From Materiality to Space: Monumental Enclosures, Exploited Mineral Resources and Territoriality during the Michelsberg Culture (Neolithic, 4200-3700 B.C., France and Germany)*

The Michelsberg Culture saw the onset of major economic, social, technological and cultural transformations in agricultural societies around 4200 B.C. Cal. The most striking feature is without doubt the appearance in the landscape of large sites enclosed by complex systems of ditches and palisades. On the other hand, different modes of production and the exploitation of flint and salt show not only networks of raw material procurement but also a new organization of territories and the role of specialized sites. The models produced and described at different scales show complex and structured networks, covering an extended area and suggesting that settlements are inter-dependent on one to the other at the regional and supra-regional scales.

[163] *Ancient DNA, Zooarchaeology, and the Case for Whale Hunting on the Northern Oregon Coast*

Pre-contact whaling on the northern Oregon coast is an issue that has received limited attention from archaeologists. The discovery of a humpback whale (*Megaptera novaeangliae*) phalanx with an embedded elk (*Cervus elaphus*) bone point from the Par-Tee Site (35CLT20) in Seaside, OR precipitated a discussion of ethnographic and archaeological evidence for whaling in the area. Previous genetic and archaeological research suggested that opportunistic whaling may have occurred in this region. We expanded on earlier work by inventorying and identifying previously unanalyzed whale elements from the Par-Tee faunal collections. We also used ancient DNA analysis to identify 28 additional whale bones to species. Here we present the species and the zooarchaeological data on skeletal element representation and butchery from the Par-Tee whales. While the species data align with those previously found in archaeological deposits from active whaling areas, the zooarchaeological analysis, butchery patterns, and element representation were inconclusive, and deviated from patterns at known whaling sites in the Washington/Vancouver Island region. We concur that incipient whaling potentially occurred at Par-Tee, but was likely supplemental to the scavenging and utilization of beached or drift whales.

Wells, Joshua (Indiana University South Bend)

- [200]** *Beyond Sharks and Laser Beams: Lessons on Informatics Needs, Open Behaviors, and Analytics Practices to Achieve Archaeological Big Data, as Learned from the Digital Index of North American Archaeology (DINAA)*

Demands for archaeological “big data” must move strategically beyond buzzwords. Sciences and humanities that are successfully augmenting their workflows with ubiquitous computing are necessarily dealing with issues of accessibility, interoperability, and fundamental questions about the intended utility of core collection strategies at massive scales. Fortunately for archaeology, solutions to these issues are achievable through emphases on existing research networks and readily “open” solutions. The Digital Index of North American Archaeology (DINAA) is the largest index of research descriptors on archaeological sites in the Americas that is completely public and open, covering almost two million square kilometers and over half a million archaeological sites in 15 US states. The construction and future of DINAA is only possible through workflows that emphasize openness (open source, open data, open science, and open government), because its function is to assist the research community in finding and organizing available information resources (not warehousing data, nor listing specific site locations). Each of these “open” philosophies affords the only realistic opportunities for archaeologists to begin analytical engagement with big data, including: emergent pattern recognition within the almost overwhelming variety of recovered information; massive qualitative and quantitative modeling; and successful integration of legacy, future-proofed, and non-anthropological information sources.

- [176]** *Integrated Anthrosol Prospection at Betty's Hope Historic Sugarcane Plantation, Antigua, British West Indies*

Multi-elemental geochemical prospection of soils and sediments has become a highly useful technique for understanding past activity areas and the behaviors that produced them. However, this technique has limited interpretive potential, because it can only identify possible locations of different classes of activities. More importantly, there has been little research to evaluate the processes and elemental loadings that characterize different types of spaces. By studying known contexts and integrating geochemical data with other kinds of information about soil properties, which often co-vary in informative ways, the interpretive potential of this approach can broaden significantly. In this paper, we compare the results of a multi-elemental analysis using ICP-MS with extractable inorganic phosphate, organic matter and carbonates, pH, particle size, and magnetic susceptibility from anthrosols collected in a horse stable from Betty's Hope, a former sugarcane plantation that operated continuously from 1651-1944. We use this case study to demonstrate how integrated anthrosol prospection from established behavioral contexts can provide evidence-based inferences for past human activities and land use in other settings.

Wendrich, Willeke (UCLA)

- [36]** *Concurrences and Discrepancies in Ancient Egypt*

Studying ancient Egypt, with its rich textual, iconographic and archaeological records, requires an interdisciplinary approach. Any research along these lines will at some point find both concurrences and discrepancies in the information. Especially the latter require further analysis, involvement of yet other sources and lead to the realization that we need to theorize the fundamentally different types of information, audiences, purposes, and sometimes cross-purposes, of the things we study. Examples are the discrepancy between written and iconographic sources that heavily stress the continuity of Egyptian religion and world view, and the sometimes quite radical change in meaning that particular symbols and tropes actually go through; the discrepancy between the iconographic presentation of foreigners, and the embedding of foreigners in Egyptian society; the discrepancy

between the textual prescriptions and the material reality, such as the required materials to be used for particular amulets; the discrepancy between the descriptions of the trade goods of Roman-Indian trade and the items that are actually retrieved archaeologically; the discrepancy between Egyptian and Foreign textual sources about the political prowess of particular rulers.

Rather than bemoan such discrepancies, the question of why they occur provides powerful heuristic social, political, religious, methodological and theoretical avenues.

[172] *Olmec Archaeology in the Arroyo Pesquero Region*

Studies on the Olmec frequently focus on the ostentatious nature of the society such as large centers and monumental works of art, often ignoring the important role of smaller sites in regional hierarchies. In order to remedy this bias, we initiated the Proyecto Arqueológico Arroyo Pesquero, which is investigating sites in the Eastern Olmec Heartland. This project is unique in Olmec studies in that it takes a bottom-up approach to the study of the Middle Formative Olmec by collecting household-level data from a range of domestic and ritual contexts to address questions and test hypotheses on Olmec domestic organization, subsistence patterning, ritual, and regional resource control. This research builds on the body of theory and method on domestic activities (e.g., production), ritual, and subsistence organization. Through this research we are beginning to generate a clearer picture of Middle Formative Olmec daily life, exchange networks and procurement systems, the organization domestic craft production, and how people adapted to and modified their tropical lowland environment. In this paper, I present an overview of the nine years of our field investigations.

[155] *Micromorphological Studies from the Clear Lake Basin California*

Geoarchaeology has a wide range of applications for the understanding of the past. Since the 1980s micromorphological analysis has become a more common worldwide research tool for the study of soils from archaeological sites. This analytic tool can play an important role in understanding site formation through the research of human waste, occupation debris, fuel residues and animal waste. It can serve as an aid in the reconstruction of human occupation and help identify economic activities and dietary habits. Several environmental factors can affect soil structure and they must be considered in micromorphological analysis. For instance, soil fauna activities such as feeding, reproduction and protection (burrowing), affect both soil components and therefore soil structure arrangement. As part of the South Main Street Water Line Archaeological Project, soil profiles were made for five archaeological sites. Each site was sampled using Kubiena tins for soil micromorphological analyses. In this instance, samples were taken from paleosols identified from a soil coring project (Redmond 2009) with the goal of assessing whether any possessed evidence of prehistoric occupation. Results of this investigation will help guide Phase 2 studies.

[301] *Molecular Identification of Mycobacterium Tuberculosis in the Milwaukee County Institution Grounds Cemetery*

Whether or not the identification of Mycobacterium tuberculosis in skeletal remains is possible has been a debated topic for many years. In order to shed more light on the issue, a study has been carried out on the remains from the 1991 and 1992 excavations of the Milwaukee County Institution Grounds Cemetery, a collection of skeletons ranging from the mid-1800s to the mid-1900s, of

various ages and sexes. To show the utility of the previously discussed methods of osteological identification of tuberculosis, the collection has been analyzed for the IS6110 repetitive element marker using molecular biological techniques, including Polymerase Chain Reaction (PCR). Eighty-six skeletons from the collection were selected for analysis based on completeness of remains and identification of age and sex. Out of the analyzed remains, nine skeletons showed skeletal signs of tuberculosis infection. PCR was also carried out with the oxyR marker to rule out *Mycobacterium bovis* contamination. The goal of the study is to show whether or not osteological identification of *M. tuberculosis* is possible and whether it can be confirmed using molecular biological techniques.

[81] *Ordering Buildings, Building Order: Place Production in a Planned Colonial Town in Highland Peru*

In the 1570s, the Viceroy of Peru Francisco de Toledo instituted one of the largest forced resettlement programs in world history: the Reducción General de Indios (General Resettlement of Indians). Some 1.4 million native Andeans were forcibly resettled into over 1,000 planned colonial reducción ("reduction") towns built on gridded street plans throughout the viceroyalty. Through the media of the built environment, the Reducción was to be a means of generating a new social order from the ground up. Despite the scale and pace of this program, its implementation and effects over such a vast and diverse area remain poorly documented and understood. This presentation begins to address a key question about the resettlement process itself: how were the reducciones built? Intensive mapping, architectural survey, lichenometric dating and systematic intensive surface artifact collections at a 40 ha reducción town in highland Peru demonstrate its intrusive placement on a major Inka center, and the recycling of that prior settlement's core ceremonial spaces. Analysis of relationships between the urban blocks of the settlement and domestic compounds indicates considerable local autonomy in the construction of internal domestic spaces. These insights point to the limits of microscopically-attuned viceregal panoptics boasted in official textual sources.

[110] *Cultural Landscape Assessment for the San Luis Valley-Taos Plateau*

In support of the Bureau of Land Management's (BLM's) recent shift toward a regional landscape-scale approach to resource management on public lands, Argonne National Laboratory is conducting a pilot cultural landscape assessment in the San Luis Valley-Taos Plateau region of Colorado and New Mexico. The cultural landscape assessment is a paradigm shift from looking at individual cultural resource locations on a project-by-project basis to a more holistic approach of land use patterns at a regional landscape scale. A landscape approach considers the connectivity among traditionally defined archaeological sites and culturally important places and will likely lead to development of a new suite of research questions, as well as new ways of approaching the protection and mitigation of these culturally important landscapes. The assessment will consider the current conditions and trends of these landscapes in light of several change agents, including human use and development, climate change, fire, and invasive species. The methodology follows closely with that for the Rapid Ecoregional Assessments BLM has been conducting throughout the Western United States. The cultural landscape assessment will be used to support development of Solar Regional Mitigation Strategies for the Colorado Solar Energy Zones, as well as other planning and development activities.

[103] *Taking High Tech Back to Basics: GIS and the Three Dimensions of Archaeology*

In many ways, Willey and Phillips's (1958) *Method and Theory in American Archaeology* still sets the parameters for how we conceptualize the units of North American archaeological classification. The authors defined three types of units, in theory independently based on time, space, and material content. Integrative units juggled the three dimensions to create local sequences, which then built into larger and larger constructs. Wide use of various dating mechanisms and detailed studies of material culture have developed our understanding of the temporal and material dimensions substantially, but substantive systematization of spatial units has lagged. GIS offers a rigorous technique for the definition of spatial parameters. This paper will consider Willey and Phillips' unit concepts, particularly at the area and regional level, with data from Mississippian and Medieval European case studies. The primary challenge at this point is obtaining the data.

[299] *Caring for Bodies or Simply Saving Souls: The Emergence of Institutional Care in Spanish Colonial America*

During the early 16th century, the recent appearance of institutions specializing in care in Europe spread to the Americas. Unlike our modern perceptions of these healthcare institutions where you can seek help for illnesses that affect the body, the colonial period institutions were primarily run by religious groups and may have been more preoccupied with providing spiritual care for the indigenous populations. While this divergence of caring for bodies to caring for the souls may seem contradictory from our modern perspective, it had important consequences for the broader social transformation that occurred during the early colonial years in which the local population was understood to be on an equal level with Europeans and therefore worthy of all kinds of care. This paper analyses this emergence of institutional care through examination of the Hospital Real San José de los Naturales, the first royally sponsored hospital for the indigenous population in New Spain. Utilizing both ethnohistorical sources and skeletal remains recovered from the within the architectural remains of the hospital, I will highlight how the idea of care and how adequate care is characterized at certain times and in certain places may in fact be disembodied.

[335] *More than a Matter of Scale: Exploring Relationships Between Households and Communities*

Increased use of remote sensing techniques in archaeology has afforded researchers unparalleled opportunities to examine the spatial dimensions of ancient settlements. At the same time, we have witnessed a dramatic increase in archaeological research directed toward the examination of households. Although both scales of inquiry are capable of producing meaningful archaeological insights, distinct theoretical perspectives have developed out of attempts to reconstruct past social relationships when starting at either end of this continuum. This paper examines the difficulties we face when bridging these scales, suggesting that new theoretical perspectives must be developed in examining relationships between households and communities.

[339] *Invasive or Endemic? Management Implications of Archaeological Data in the Alaska Maritime National Wildlife Refuge*

The Alaska Maritime National Wildlife Refuge maintains more than 2000 islands, where invasive species management and eradication are the focus of conservation and landscape reconstruction efforts. While written records from the Russian and American eras document the introduction of many species, including red fox (*Vulpes vulpes*), arctic fox (*Alopex lagopus*), and cattle (*Bos taurus*), little is known about the introduction and dispersal of the arctic ground squirrel (*Spermophilus paryii*) in this island region. The ground squirrel has, however, been the focus of eradication efforts in the Gulf of Alaska. Here, we move beyond written records by using AMS dating and ancient DNA analysis of archaeological faunal material to describe the long-term history of the ground squirrel on Chirikof Island, Alaska. The results suggest that rather than a being recent introduction, the ground squirrel has been on Chirikof for at least 2000 years. Furthermore, aDNA analysis demonstrates genetic continuity between archaeological and modern specimens, suggesting the population of squirrels on Chirikof arrived before Russian or European occupation. These data have altered the eradication plans for Chirikof and demonstrated the significance of archaeological data in the context of contemporary landscape management.

[31] *A Second Room of the Posts? Ceremonialism at La Marcha during Late Nasca and the Middle Horizon*

Preliminary investigations of the La Marcha site have revealed a key residential, mortuary, and ceremonial locale in the Las Trancas Valley. While initial use of the site occurred during the late Formative, here we report on the considerable Late Nasca and Middle Horizon occupation. In addition to residential zones, we documented large plazas with huarango post features similar to those at Estaquería and Cahuachi. These include complexes of up to 9 posts, oriented in rectilinear clusters along the cardinal directions. Test excavations of huarango features revealed a ceremonial space constructed by Late Nasca people and ritually interred by Loro people during the Middle Horizon. These data illustrate a region-wide tradition associated with huarango posts that emerged during the cultural reformation at the end of the Early Intermediate Period and continued in local Middle Horizon culture. In addition to illuminating ceremonial practices during this important transition, these data also demonstrate that Loro traditions had deep roots in Late Nasca society.

Whalen, Kathryn (University at Buffalo)

[63] *Be Our Guest: Tablescapes in Early Modern Ulster*

The ethnic relationships found in colonial settings are complicated and varied negotiations that are hard to decipher in the present, much less in the past. Performance of ethnic allegiance may be influenced by oppressive legal structures, systemic racism, reformation or resistance movements, and personal taste. As archaeologists have adopted more nuanced readings of material culture and its relationship to ethnic performance, such as the use of Homi Bhabha's concept of the third space and hybridity, we have developed a new interpretation of life in a colonial setting. The area known as Ulster is one such region where complex ethnic relationships are evident in the past, as well as in the present. This paper presents some preliminary results of my dissertation which seeks to understand better the relationships between native Gaelic Irish residents, Plantation English colonists, and immigrant Scottish settlers in Northern Ireland through their use of tablescapes and ceramics as markers of ethnicity, economic class, and market opportunity. This study looks specifically at the trade of ceramics in Early Modern Ulster, to see if there are patterns that can be discerned and related to ethnic affiliations through XRF data about parent materials, and archival information about land ownership.

Whalen, Jess (The University of Edinburgh)**[417] *Feasting, Shared Drinking, and Social Complexity in Early Bronze Age Anatolia***

The Early Bronze Age II-III in Anatolia (2700-2000 B.C.) is a period of intensifying personal distinction. New tin-bronze metallurgy yields exquisitely crafted jewelry, ceremonial weapons, and drinking vessels, sumptuary activities appropriate to an emerging elite class. Yet it is difficult to characterize the structure of EBA settlements; a lack of writing and sealing practices suggest that there was no central administration. This contrasts with contemporaneous sites in southeastern Turkey and in Mesopotamia, whose metallurgy, craft production, exchange, and other developments were overseen by temple and palace complexes. Drinking activities offer a unique window into the social lives of Anatolian community members. In the west, double-handled tankards are designed to share drink together with others in a setting in which drinking does not stop. On the north-central plateau, small cups and shallow bowls are balanced upon fingertips in a display of drinking prowess. Feasting contexts and the spread of drinking shapes in different regions provide insight into the activities that characterized drinking events. Together with settlement architecture and other indices, this evidence can be used to reconstruct different options for the role of elites within settlements and different possibilities for how settlements of the period were structured.

Wheeler, Sandra (University of Central Florida), Lana Williams (University of Central Florida) and Tosha Dupras (University of Central Florida)**[240] *Death at Birth: Changing Mortuary Practices from the Late Ptolemaic to the Romano-Christian Period in Egypt***

Human burials and mortuary practices are the result of cultural attitudes and ideological beliefs that have been selected and shaped by the living for the dead. These beliefs and concomitant mortuary practices have changed through time, thus the treatment, space, and place for the dead varies, particularly in the context of the very young. While it is likely that adults were given the opportunity to make decisions about their own place of burial, treatment of the body, or grave assemblage, in the context of infants and children, these decisions were made for them by adults. The changing mortuary practice of burying fetuses, infants and children in and around the Late Roman period village of ancient Kellis are examined. Fetuses and infants are severely underrepresented in the earlier, Ptolemaic period rock-cut tombs, while their numbers are abundant in the cemeteries during the later, early Christian periods, suggesting a shift in beliefs concerning the space and place of these burials. This paper emphasizes the need to explicitly address the mortuary treatment and context of fetuses, infants and children during the period of shifting ideological beliefs and practices from the ancient Egyptian to those recognizable as early Christian in Egypt.

Whelan, Carly (University of California, Davis)**[138] *Hunter-Gatherer Storage and Settlement: A View from the Central Sierra Nevada***

Though optimal foraging theory is useful for examining hunter-gatherer subsistence decisions, food storage falls outside the scope of traditional models, because it separates foraging effort from consumption. The time that foragers spend accumulating a surplus for storage has the potential to conflict with the time they need for other activities during seasons of abundance, creating opportunity costs to storage. Changes in settlement strategies can alter these opportunity costs and affect decisions about which foods to store. An examination of the Middle to Late Holocene archaeological record of the central Sierra Nevada indicates that a residentially mobile settlement strategy was replaced by a semi-sedentary one, prompting a shift in focus from gray pine nuts to acorns for storage. This suggests that the relationship between storage and sedentism is more complex than previously believed.

[32] *Making Ancient Birds Sing: Avian Archaeology on the California Channel Islands*

Terrestrial and marine environments of the California Channel Islands harbor a wide array of residential birds and provide breeding grounds and layovers for migratory species. Avian remains have been uncovered in paleontological and archaeological contexts, providing a long and continuous record of their presence. Although some species have persisted, others have disappeared at various points in time due to extinctions or alterations in migratory pathways. Though avian remains contain abundant cultural and environmental information, few detailed studies have been conducted on archaeological assemblages from the Channel Islands. We discuss taxonomic distributions on the islands and focus on patterns that developed across the Holocene, including the extinction of a flightless bird, the general decline of migratory species, an increased reliance on local nesting birds, and the effects of historical ranching activities on the overall decline of terrestrial species. Ecological associations and human harvesting patterns will be used to reconstruct aspects of island paleoecology and paleoenvironment and investigate changes in human selection choices through time. Examining bird remains allows archaeologists to address a variety of issues regarding the perceived marginality of islands and their resources, human/environmental dynamics, and the roles birds played in the everyday, social, and spiritual lives of native islanders.

Whitaker, Jason

[113] *Hinterland Household Economy: A Preliminary Analysis of Data from the San Lorenzo Settlement Cluster*

This paper is a summary of recent archaeological investigations at the San Lorenzo settlement cluster in the Mopan River Valley of Western Belize. The primary objective of current research at this ancient hinterland settlement is to better understand the dynamics of ancient Maya household economic organization and integration during the Late and Terminal Classic periods (A.D. 670-890). Households are fundamental units of economic organization in both past and present societies. The examination of ancient household remains enables archaeologists to better understand micro-scale economic activities, and to situate those activities within larger societal contexts. Excavations in the 2014 field season focused on the investigation of the area south of structure group SL-22. This fieldwork documented numerous features associated with both the Preclassic and Classic occupations of San Lorenzo. Ongoing analysis of lithic macroartifacts suggests that the Classic period residents of SL-22 produced informal tools primarily with locally available raw materials. Examination of these materials further suggests that these ancient people also acquired chert from sources outside the San Lorenzo settlement cluster. This paper will also include a discussion of the relationship between macro and micro artifacts in the areas surrounding structure groups SL-22, SL-23, and SL-25.

Whitaker, Adrian (Far Western Anthropological Research Group, Inc.) and Brian Byrd (Far Western Anthropological Research Group, Inc.)

[293] *An Ideal Free Settlement Perspective on Residential Positioning in the San Francisco Bay Area*

We present an Ideal Free Distribution Model to explore the successful establishment and spread of hunter-gatherer residential settlements around the perimeter of San Francisco Bay, California. Our objective is to illuminate underlying ecological and social factors that best explain the spatial distribution of occupation in the region. Our model determines relative habitat suitability based on a series of environmental factors including drainage catchment size, rainfall, terrestrial productivity, and littoral productivity. In doing so, we also account for diachronic shifts in shoreline location and its impact on resource distribution. Then we test this model using a robust database of more than 500 prehistoric residential sites around the Bay (of which more than a third have produced chronological data), and ethnohistoric insights into settlement location by linguistic group. The talk concludes with consideration of the effect of social as well as ecological factors in structuring temporal trends in settlement configuration and subsistence strategies that formed the basis of this rich archaeological record.

[25] *Microfossils and Micro-XRF: Sourcing Raw Materials for Iron Age to Romano-British Pottery Production at Burrough Hill Hillfort, UK*

Burrough Hill hillfort, east Leicestershire, United Kingdom, is an example of an Iron Age settlement of the Corieltauvi people who occupied the East Midlands in the millennium prior to the Roman occupation of Britain in A.D. 43. The hillfort is set in a sedimentary landscape with few distinctive rock types. Objectives of the current study are to determine signatures of the local sedimentary deposits, building materials and pottery using ceramic petrography, micropalaeontology, WDXRF and micro-XRF. To this end 100 samples were taken of scored ware, calcite-gritted ware and mixed-gritted ware from the site dating from mid- to late Iron Age through the transition into the Romano-British period. Shell and quartz rich pottery fabrics are present in each phase of occupation. There are, however, differences in composition, sorting and packing of inclusions that reflect the use of particular sources or methods of clay processing. The microfossil assemblage points to a raw materials source in glacial deposits of the Oadby Till, which crops out east of the hillfort. The pottery is compared with contemporary shell-tempered wares from the neighboring eastern region.

White, Devin (Oak Ridge National Laboratory)

[84] *Reconstructing Large-Area Ancient Transportation Networks to Support Complexity Research*

Understanding and explaining the flow of people across landscapes through time, and the transportation networks that flow creates, has long been of interest to archaeologists focused on the origin, development, and inner workings of complex societies. Reconstructing these networks is extremely challenging due to data scarcity. Existing desktop GIS tools allow you to generate point-to-point routes via least cost analysis, which can then be compared to documented routes (which are very rare), used to find undocumented ones (rarer still), or to suggest possible pathways when none are visible, but this approach is not scalable to large landscapes or large numbers of origins and destinations. More importantly, archaeologists rarely know all possible starting and ending points for travel within a transportation network, formal or otherwise. This paper will highlight ongoing projects that leverage a custom high performance geocomputing application, known as From Everywhere To Everywhere (FETE), which can generate theoretical flows across landscapes of any size, as well as suggest potential networks, without having to specify any origins or destinations. It will also discuss how these data are highly beneficial to researchers who are attempting to understand social complexity through the use of computational modeling and simulation techniques.

[154] *Food from the Hinterlands: Integrated Faunal and Archaeobotanical Studies at a Classical Emporion, Thrace*

The movement of goods, information, and people across the Classical world has been a subject of intense archaeological investigation for over a century. Established trading outposts, known as Greek emporia, contained a multitude of cultural elements from indigenous communities, Classical Greece, the eastern Aegean, and beyond. The ongoing excavation of a coastal site in northern Greece as part of the Molyvoti Thrace Archaeological Project has revealed a Classical Greek settlement dating to the fourth century B.C. While this community may have supplied grain and possibly animals to the powerful island of Thasos, we concentrate here on identifying the seasonal foodways of local residents to better understand daily life at the site. Combined faunal and botanical evidence reveals a diverse seasonal diet, which included resources from the Rhodope mountains, Thracian plain, freshwater marshlands, and coastal sea. These results indicate that the routine activities of processing, cooking, and storing food were remarkably complex and that patterns of resource acquisition during the Classical period were substantially different from later Roman occupations of the site.

White, Randall (Center for the Study of Human Origins, New York U)

[181] *Paleoethnographic and Chronostratigraphic Perspectives on the Aurignacian of the Vézère Valley : Abri Castanet, Abri Blanchard, Abri Cellier*

New excavations at three historically important Vézère Valley sites provide insight into the spatial organization of Early Aurignacian campsites and the nature of the late Pleistocene landscapes surrounding them. These excavations provide new and robust data on fire-use, activity areas and the context of the production and use of symbolic materials (graphic imagery and personal ornaments) among early modern humans in SW Europe. Molecular filtration dates raise new questions about the chronology and variability of Early Aurignacian assemblages in the classic zone.

[296] *Ethnoarchaeology: More than Cautionary Tales*

Rather than being just a set of warnings, ethnoarchaeology has made major contributions to a range of archaeological endeavors, especially in Papua New Guinea and Australia. These include broadening our view of stone and wood technologies, of site formation processes and of human-environment relations.

White, Samuel (PhD Program, Anthropology Department, The University of Montana)

[300] *Anzick Site Lithics: A Study of Concave Margin Scrapers as an Integral Part of the Clovis Tool Kit*

An assemblage of lithic and osseous artifacts, associated with the fragmentary remains of a child was discovered in Montana at the Anzick Site (24PA506). The remains and assemblage, all covered with red ochre, are thought to represent the only known burial from the Clovis Culture. Found on several lithic artifacts in the assemblage are unique flaking patterns which form "margin scrapers", possibly utilized as an integral part of an osseous tool crafting technology overlooked in western Clovis toolkits. These flaking patterns resemble those found on lithic artifacts from other known western Clovis sites. In this study, I compared the margin scrapers directly with ovoid bone rods, also from the Anzick assemblage. I propose that these margin-scrapers were drawn along the edges of bone shafts to create a predicted and uniform ovoid configuration required by design with variable margin scraper sizes shaping the "shoulders" and the "body" of the linear shafts. This consistency in shaft manufacture ability would allow for efficient replication of a specific and desired bone shaft tool size and shape as is found in multiple examples within the Anzick assemblage.

White, Carolyn (University of Nevada Reno), Elizabeth Bennett (University of Nevada Reno) and Laura Sechrist (University of Nevada Reno)

[394] *Granite Creek Station: Site of Massacre and Memory*

Granite Creek Station was one of several significant stopping places for emigrants, travelers, saddle trains, and stagecoaches passing through the Black Rock Desert region of Northern Nevada on their way to California in the mid-19th century. The site functioned as a campsite, trading post, ranch, stagecoach station, and military camp. As a site along the emigrant trail, it was the locus of extraordinary pain and suffering by travelers, described in their own words through diaries and letters. The site was also the location of several episodes of violence, including one described as "The Butchery at Granite Creek Station," between local Paiutes and western settlers. This paper will present the results of excavations of this site and will explicitly examine the role of the site as a place of hardship and conflict.

Whitehead, William (SWCA Environmental Consultants)

[162] *Prehistoric Plant Utilization in Southeastern New Mexico: A Unique Publication Merging Academic and Public Interests*

The investigation of plant use, in southeastern New Mexico, in prehistory has been widely covered.

This project continues this tradition by synthesizing and compiling all of the information to date in the region. The Carlsbad Field Office of the Bureau of Land Management, administrators of the Permian Basin Mitigation Program, is sponsoring the publication of a reference book on prehistoric plant use in Southeastern New Mexico. This free text will bring together recent work in radiocarbon dating, range plant community studies, testing and data recovery reports, academic sources and modern uses in one location on over 100 taxa. Images of whole plants, seeds, pollen, phytoliths and other plant parts will make this text a must for paleoethnobotanists, while information on culinary uses, landscaping, gardening, and summary data of the prehistory of each plant will be of interest to a more general audience. An emphasis will be placed on modern uses of native plants, and how each plant can fit into landscape management and habitat restoration.

Whitley, David (ASM Affiliates, Inc.)

[138] *Setting and Function of the Pahrnat Valley, NV, Petroglyphs: Archaeological and Ethnographic Perspectives*

Rock art is landscape art, but what may be inferred from its setting and associations? It is commonly believed that function directly follows from setting and locational association, but the assumptions underlying this inference are not examined. The Lincoln County Class III rock art inventory is partly directed at the landscape implications of the Pahrnat Valley, NV petroglyphs, providing an opportunity to consider this question. Associational inference, appropriately applied, combined with ethnographic accounts of the location, nature and use of Great Basin rock art demonstrates that many simplistic interpretations are unsupportable, with a more nuanced understanding required.

Whitney, Kristina (University of New Mexico)

[12] *Historic Pueblo Canteens: How were they made and how were they used?*

Historic Pueblo potters formed ceramic canteens that have one flat and one bulbous side. This form posed unique issues for construction. The form is symmetrical along only one axis, and while other Pueblo ceramic forms exhibit this feature, such as duck effigies, these flat-sided canteens are unique in that they were made to carry water. The shape suggests it was designed to be transported against a flat object. 19th century ethnographic research suggests transportation against a human back, with a tumpline attached to the handles. This research investigated the construction and use of flat-sided canteens in museum collections. The relationship of this form to canteen forms in other parts of the world is explored.

[237] *Urban Planning, Neighborhoods, and the Organization of Residential Space at the Early Horizon Center of Caylán, Coastal Ancash, Peru*

This paper examines and compares the spatial organization of residential compounds in order to reconstruct patterns of neighborhood and urban life at the Early Horizon of Caylán (800-1 B.C.), Nepeña Valley, north-central coast of Peru. Systematic surface mapping combined with limited horizontal excavations indicate that the urban core of the ancient city was composed of more than 40

residential complexes articulated through a series of streets and corridors. Detailed first-hand mapping of streets and accessways indicate that each compound had an independent entrance linked to one of the dozen or more cross-cutting streets at the site. In this paper, we analyze the location, spatial organization, and architecture of the different residential compounds in order to evaluate intra-site variability and potential social differences between Caylán co-resident neighborhoods. Results from test units and block excavations from various compounds help in assessing the contemporaneity of the different sectors of the site and possible changes through time. Gamma analyses of the depth and complexity of residential complexes across the co-resident neighborhoods shed light on the heterogeneity of Early Horizon cityscapes in the Central Andes.

Whittle, Alasdair (Cardiff University)

[348] *The Long and Short of It: Timescales for Cultural Change and Transmission in the Vinca Complex of SE Europe*

The Times of Their Lives project has produced modelled date estimates for the major phases of the Vinca complex in SE Europe, spanning the later sixth to mid-fifth millennium cal B.C. That is a considerable advance in our understanding of the broad rate of cultural change. But site-specific date estimates within the complex also allow detailed comparisons of the timing of the introduction of novel material forms, especially in pottery, down to a much more precise scale. Examples from the beginning especially of the Vinca complex (Vinca A) will be discussed, drawing on our work at among other sites, over an area with a radius of some 100 km, Vinca-Belo Brdo, Serbia; Uivar, western Romania; and Szederkeny and Versend, south-west Hungary. Other possibilities for examining the further development and the end of the Vinca complex will also be briefly discussed, providing further reflection on how best to combine varying timescales.

[105] *The Centrality of Small Islands in Arctic Norway from the Iron Age to the Recent Historic Period*

The definition of island marginality in northern Norway was radically altered by the advent of motorized fishing vessels in the early 20th century. Prior to this development, small offshore islands were of central importance for settlement and marine related activity due to their proximity to fishing grounds. In this paper I discuss three settlements on small and 'marginal' islands in Arctic Norway from 68°19' to 71°05' N latitude that illustrate the centrality of such locations since the Early Iron Age (ca. 500 B.C.). From south to north, these include Borgvær (1.8 x 1 km) in the Lofoten Islands, Grimsholmen (1.4 x .7 km) in northern Troms, and coastal settlement on the larger island of Ingøy (18.6 sq km) near Norway's northernmost point. Although these islands are inhospitable, barren and exposed to the open ocean, they were the focus of intensive fishing related settlement by the Viking Age (A.D. 800-1000) with substantial settlement mounds from the medieval period (A.D. 1200-1500). The significance of these specialized island settlements viewed in relation to larger networks of interaction and exchange is critically examined and assessed.

Widga, Chris (Illinois State Museum, Landscape History Program) and Dennis Lawler (Illinois State Museum)

[28] *The Earliest Domesticated Dogs in the Midcontinent: Chronology, Morphology, and Paleopathology*

The Midwest has the earliest and possibly richest record of dog burials in North America. We use 2D and 3D geometric morphometrics to assess variability in the morphology of wild and domesticated Canidae from midwestern Archaic assemblages (10,000-6000 cal BP). Health and life history characteristics of these animals are also described on the basis of gross pathology, radiographs, and computed-tomography. Preliminary results indicate a strong geographic trend in the characteristics of archaeological dogs. A wide-variety of dog morphologies are found in the eastern Great Plains associated with bison hunting sites. These include large, wolf-sized dogs (>60 lbs), medium-sized

terrier-like dogs (40-60 lbs) and possible wild/domestic hybrids. Healed trauma is more common in these populations. Dogs from the central part of the Midwest, on the other hand, show a limited size range (40-60 lbs) and lower rates of trauma. We will explore how these emerging trends fit into the evolving picture of dog domestication in the eastern US.

Widmayer, Elise (Smithsonian Institution), Joseph Gingerich (Smithsonian Institution) and Harry Iceland (Smithsonian Institution)

[357] *A Paleoindian Heavy Stone Analysis at Shawnee-Minisink*

Cobbles, natural rock, and unflaked lithics are rarely subjects of study at Paleoindian sites. The lack of available literature on this topic may be due to an absence of these artifacts in Paleoindian levels, insufficient sample sizes, or an over emphasis on more aesthetic flaked stone. Within the Smithsonian's Shawnee-Minisink collection, there are a number of stones from the Paleoindian level that appear to be manuports. Considering these stones are isolated, not found in cobble clusters, and occur in loess sediments, it is unlikely they were brought into the site by natural causes. This site's spatial integrity and abundance of piece-plotted artifacts make it an ideal sample for heavy stone analysis. Each stone was examined for modifications and traces of use wear to deduce probable function. Additional attributes including weight and material type were also considered when relating spatial data in pre-existing GIS maps. This poster presents our efforts to explore the significance of heavy stone analysis in Paleoindian studies. This work also contributes to our understanding of Paleoindian activities and the spatial organization of sites.

[143] *Cache Cave in Context: 3D Scanning Complex Cave Environments for Mapping and In-Situ Documentation of Artifacts*

The spatial documentation at Cache Cave entailed the mapping of the cave's interconnecting passages and shelters, its taphonomic environment, and the archaeology present at the site. Due to its complex formation and small spaces, the overall cave structure could not be recorded by more traditional mapping methods. Through the use of three-dimensional (3D) scanning during the Spring and Summer of 2014, a multi-scalar, high resolution approach was used to capture both the interior structure and depositional environment of the cave and map artifacts both in context and in-situ. Scanning, therefore, took place during excavation to document archaeological assemblages and artifacts as they were uncovered. This paper discusses field methodology and procedures for scanning Cache Cave and its archaeology and outlines future analyses beyond simple 3D visualization. One of the main goals of the scanning project is to use the outputs to provide a more accurate, visual context for post-excavation analyses to inform research elsewhere. Finally, the data will provide the opportunity for in-depth spatial analysis to aid in the investigation of the archaeological remains, both in context and in-situ, to provide clues to Cache Cave's relevance to hunter-gatherer storage, use of space, and complexity.

Wiewall, Darcy (Antelope Valley College)

[38] *Peopling the Landscape: Scott Fedick and His Contributions to Household Subsistence Strategies*

Over the past several decades, Scott Fedick's pedagogical approach to understanding local-scale environmental and biological diversity has inspired and influenced numerous students and colleagues perspectives on Maya household subsistence strategies. The first part of my presentation will discuss my participation in the Yalahau Regional Human Ecology Project and how Scott's heterogeneous approach to resources management strategies influenced my later research on local subsistence strategies employed by Maya commoner households in the community of Lamanai, Belize. Scott Fedick continues to influence my current research moving beyond the boundaries of the Maya culture area and, interestingly, into research being conducted by community college students focused on hunter and gatherers in the Western Mojave Desert. As before, research is motivated by identifying the diverse strategies of resource use and management available to ancient people in a

heterogeneous landscape. Here I highlight how Scott's emphasis on collaborative, interdisciplinary research and his strong sense of mentorship is influencing a new generation of future archaeologists.

Wiewel, Adam [8] see Simon, Katie

Wiewel, Rebecca (Arkansas Tech University)

[109] *Protohistoric Social Dynamics in the Central Arkansas River Valley*

The Protohistoric period in the southeastern United States is known for being a time of social upheaval and transformation. Groups living in the Central Arkansas River Valley during the early seventeenth century had to contend with the aftermath of the De Soto entrada, severe drought conditions associated with the Little Ice Age, and perhaps widespread population movement accompanying the dissolution of chiefdoms in the Mississippi Valley. Societal coalescence is one strategy that many later Southeasterners adopted during times of social stress. This paper considers the possibility that the protohistoric Carden Bottoms community in Yell County, Arkansas is an early example of coalescence. I draw evidence from recent excavations of complete households at site 3YE25 and a newly completed compositional analysis of ceramics from the Carden Bottoms locality and comparative collections from surrounding regions in Arkansas. Given the similarities in artifact assemblages among nearby Carden Bottoms phase and Menard Complex sites, these findings may have widespread implications for Protohistoric studies across the region.

Wiewel, Adam

[230] *Remote Sensing Investigations at Midipadi Butte (32DU2) and Nightwalker's Butte (32ML39), North Dakota*

As part of a flood assessment effort in collaboration with the US Army Corps of Engineers and the South Dakota State Historical Society, archaeo-geophysicists from the Center for Advanced Spatial Technologies at the University of Arkansas performed remote sensing investigations in 2014 at fifteen sites along the Missouri River in North and South Dakota. Among these are Midipadi and Nightwalker, two related late eighteenth to early nineteenth century Hidatsa sites located on opposite sides of Lake Sakakawea. We performed magnetic gradiometry, electromagnetic induction (yielding conductivity and magnetic susceptibility), and UAV-based aerial surveys at the sites. The integrated datasets provide contrasting results. At Nightwalker's Butte the imagery clearly indicates the extent of Smithsonian Institution River Basin Surveys excavations as well as the presence of unexcavated features. The impact of erosion is made apparent at Midipadi. However, our geophysical surveys reveal many previously unknown features, including numerous lodges as well as a possible palisade, significantly changing our understanding of the site. Remote sensing efforts such as this one demonstrate how spatial technologies may be implemented in large-scale resource management and research contexts.

Wigley, Sarah (University of Texas at San Antonio), Antonia Figueroa (University of Texas at San Antonio) and Laura Levi (University of Texas at San Antonio)

[66] *Space, Ritual, and Production at Wari Camp*

This paper examines the construction of residential and ritual space at the prehispanic Maya site of Wari Camp, located in northwestern Belize in the Rio Bravo Conservation and Management Area. We explore the productive activities of temple and pair groups at the site through examination of lithic and ceramic material recovered from excavations conducted at the northern satellite of the site in 2012. In addition, environmental and soil data from the site provides insight into the relationships between the natural landscape and residential groups. This variety of data assists in creating a broader understanding of the Wari Camp landscape through exploration of connections between architecture and cultural material of residential groups and the environment in which they are situated. By exploring the association of residential architecture and the natural environment we can gain a better understanding between space, ritual and production and their connection to place and landscape.

Wilcox, David (Itinerant Scholar)

[26] *Cumulative Survey: Defining Coalescent Communities in the American Southwest*

The fundamental shift from artifacts to settlements as the basic units of archaeological inquiry required a rethinking of methodologies. Now the basic questions were about measuring interactions of people deployed differentially on cultural landscapes. At a more abstract level it required adoption of the logic of relations in preference to the typological logic of entities and their qualities. If settlements are portrayed as variously colored dots on a map, interactions can be expressed as what connects those dots. Full coverage survey of whole cultural landscapes on larger and larger spatial scales, in the end, is essential for mapping the relationships that provide the data for discovering and testing models of those interactions. Cumulative survey, however, the assembling of information on all known sites larger than farmsteads on macro-regional scales, while not an alternative to full coverage survey, does allow at least preliminary studies of coalescent communities in the late prehistoric American Southwest. Distance parameters of potential interactions can then be studied, and the addition of ceramic data from those sites opens the door to analyses based on network theory. In my professional lifetime, Stephen Kowalewski has been a friend, a sounding board, and an inspiration for many such studies.

[193] *Public or Private: Adaptations in the Use of Public Space During the Maya Late Classic Period*

Are all open spaces public spaces? What factors influence how 'public' a space is? How did the population increase during the Late Classic period impact the use and design of open spaces in the Maya lowlands? To understand how the Maya adapted their built environment in response to high populations, I examine the architectural features of plazas and patios in a ritual-residential group at Xultun. In the Late Classic period, residents erected additional buildings within patios, reducing the amount of space available for quotidian activities. At the same time, two large open spaces were constructed adjacent to this group. This paper explores the possibility that the Maya adapted some open spaces for activities normally conducted within patios and that lowland plazas may exhibit greater diversity than we currently recognize.

Wiley, Kevin (SUNY Buffalo)

[289] *Networks through Time: Filling in the Gaps*

The Middle Neolithic circular ditched enclosure of Goseck in Central Germany was built and used during the Stichbandkeramik period. Subsequently, during the Gatersleben period, another ditched

feature was constructed, which intersected the earlier enclosure. However, between these two periods, in the intervening century, during the Rössen period, the site was not in use. This temporal gap has been glossed over in narratives of the site that stress continuity. This paper will examine the possibility that Goseck functioned as an intentional non-site, a forbidden place, during the Rössen period. Looking at sites in the region not as dots on a map but as networks of connected places, patterns of movement can be discerned. These patterns change diachronically and may indicate that during the Rössen period this place was intentionally avoided.

Wiley, Nancy and Rezenet Moges (Scientific Resource Surveys, Inc.)

[310] *Stone Geometrics: An Inclusive Typology Matrix for Californian and Chilean Cogged Stones*
Drawing on recent studies of cogged stones by Scientific Resource Surveys, Inc., comparisons can be made between the artifacts found along coastal Southern California and morphologically similar artifacts unearthed in the Coquimbo region of Chile. This poster will describe a new method of calibrating typological shapes for describing both Californian and Chilean cogged stone artifacts. Several caches containing unconventionally shaped cogged stones were discovered by SRSinc during archaeological investigations on the Bolsa Chica mesa. Instead of describing them with an arbitrary label, a matrix was developed to provide a standard descriptive typology incorporating any odd-shaped cogged stone into a new typology of Stone Geometrics. Borrowing an identification system from Paleontology, this matrix registers two-dimensional shapes [or plan views] by three levels of radiates based on the length of extensions from the body of the artifact. SRS studied approximately 1000 specimens from both Southern California and Chile, documenting them photographically and collecting appropriate data including number of cogs (or sides), diameter, thickness, and geometric shape. The model also provides a diagrammatic aid for basic three-dimensional shape descriptions.

Wilke, Detlef

[3] *Using Spiked, Fired Clay Samples for Developing Robust Quantification Algorithms for pXRF of Pottery*

Absolute concentrations rather than relative, instrument and setting specific values are requested as scientific standard in publishing provenancing results. Recent publications suggest that there is no reliable vendor software for elemental quantification of pottery with pXRF. It is unclear whether this is due to a lack of precision in the given trace element values of reference standards, or uncorrected matrix effects, or both. We faced similar problems when using >30 reference standards for quantification by direct comparison of counting rates. To get a better understanding we prepared fired clay samples spiked with Ti, Fe, Ga, Rb, Sr, Y, Zr and Nb. Using different commercial clays we recognized a strong impact by Fe absorption/enhancement, which needs correction if a meaningful comparison of pottery from different production sites is intended. Furthermore we were able to use the concentration range of the spiked samples to improve the deconvolution software provided by the vendor for spectral interference, which we did not even recognize before. To underline the necessity of a diligent calibration of pXRF instruments we present data with and without the established correction algorithms for separating medieval waster assemblages which have partially overlapping trace element patterns, but differ in its Fe content.

Wilkins, Cory

[30] *Archaeological Preservation*

The Archaeological Conservancy (TAC) is the only national non-profit organization dedicated to preserving archaeological sites across the United States. In the late 1970s the founders of TAC recognized the threat and lack of protections to archaeological sites on private lands. In response,

TAC was organized and incorporated. Often, TAC is contacted by archaeology firms, state agencies, and landowners with requests to explore the possibility of preserving a specific site. Many landowners find their sites to be sacred and feel obligated to preserve them. Some, feeling it is their duty to respect significant cultural places, avoid disturbing archaeological sites for generations. State laws are trending toward preserving archaeological sites on private lands. In many cases, landowners and developers are required to mitigate for the loss of a cultural resource and turn to TAC to preserve their archaeological site in situ, thus avoiding destruction of sites. The Archaeological Conservancy has over 480 archaeological preserves across the United States. Many of these sacred sites would have been completely destroyed, if not for the preservation efforts of this effective organization.

[356] *A High-Resolution ~110,000 Year Middle Stone Age Lithic Technological Sequence from Pinnacle Point, South Africa*

The Pinnacle Point sites on the south coast of South Africa preserve a long, high-resolution sequence of human occupation spanning 162-51 ka. The lithic assemblages provide a unique opportunity for examining Pleistocene technological change because they are linked to robust age estimates and multiple proxies for paleoenvironmental change. Recent lithic technological investigations aim to standardize analytical procedures across the complex of Pinnacle Point sites, and maximize comparability to other Middle Stone Age (MSA) sequences. The Pinnacle Point sites show both similarities and differences to other long MSA sequences, and add to what is becoming an increasingly complex picture of MSA technological change and continuity. At Pinnacle Point, major technological shifts occurred at ~90 ka and ~74 ka. Some aspects of technology show surprisingly continuity across these periods of pronounced change. Diverse core reduction strategies were used throughout the sequence with little temporally-vectored patterning. Some technological shifts appear correlated with drastic paleoenvironmental change, but not all. Overall, the Pinnacle Point record is consistent with human patterns of adaptability to new and fluctuating environmental conditions, as well as stylistic choice independent of environment, and in those respects is similar in nature to more recent records of hunter-gatherer adaptation in South Africa.

Wilkinson, Toby

[14] *Synchronizing Highland and Lowland Rhythms of Material Exchange*

From an archaeological point of view, interconnectivity between highlands and lowlands of the ancient Near East is undeniable. The differential distribution of natural resources (particularly metals and precious stones which are sourced predominantly in highland regions), and the evidence for circulation of these resources from at least the Neolithic, is the most obvious sign of this interdependence. Too often, however, our models of this interdependence have tended to create abstract zones – consuming ‘centers’ and producing ‘peripheries’ – with highland regions normally characterized as ‘periphery’, perhaps unsurprising given the urban perspective of academic enquiry. These models are also a result, in part, of our techniques of visualization: the trusty black-and-white line map has its place, but it also constricts our understanding of landscape (including topography, climate and seasonality) and the human movements which took place across them. Using case-studies from the highland area(s) north of Mesopotamia in the 4th and 3rd millennia B.C., this paper sets out to examine how rethinking the visibility of maps can start to break down the ‘zonal model’ into a more rhizomic picture of highland-lowland interdependence as well as incorporating important factors such as cultural rhythms and seasonality into our models of ancient trade.

Wilkinson, Ian [25] see Whitbread, Ian

Wilkinson, Darryl (University of Wisconsin-Madison)**[142]** *Theorizing Infrastructure*

Accounts of ancient infrastructure are very common. Almost every archaeologist who deals with complex polities regularly encounters infrastructure in some form - including roads, irrigation canals, bridges, harbors, aqueducts, recording systems and forts - just to name a few of the most common varieties. That said, the concept is rarely explicitly theorized or defined within the discipline - and is usually identified on the basis of "we know it when we see it". In contrast, this paper seeks to reflect on infrastructure as a theoretically rich category. Thus infrastructures will be elaborated upon as, 1) networks where political and technological projects are fused and 2) as material apparatus that mediate relations between political subjects and states.

[142] *Chair***Wilkinson, Patrick (University of California, Merced)****[153]** *Cave Vodou in Haiti: An Ethnoarchaeological Approach*

Haitian Vodou is a syncretic religion that combines elements of West African beliefs and indigenous Taino culture overlaid onto a rigid framework of forced Catholicism. One aspect of the religion that has not been investigated is the modern use of caves as a specialized local for various types of rituals, each having a specific purpose. This paper will discuss the use of both ethnographic and archaeological investigative techniques to differentiate the various purposes of cave ceremonies and attempt to determine whether different spaces within the caves are associated with specific aspects of the religion, with emphasis on the ephemeral material remains left behind by Vodou Houngans or Mambos (Vodou priests or priestess). These material remains include cave iconography, ritual deposits, and ceremonial paraphernalia belonging to both practitioners and adherents. This paper reflects the results of the 2014 Summer field season in northern Haiti.

Willerslev, Eske [337] see Raghavan, Maanasa

Willett, Alyssa (University of Alaska Anchorage) and Ryan Harrod (University of Alaska Anchorage)**[299]** *Cared for or Outcasts? The Bioarchaeological Analysis of Two Individuals with Potential Disabilities from Aztec Ruins*

This project focuses on the assessment of individuals who appear to have held a lower status, worked harder, and been at more risk for trauma than other members of the same community. The West Ruin site of Aztec Ruins is an important site in the U.S. Southwest that came into prominence after the decline of Pueblo Bonito in Chaco Canyon. Within this site there are two individuals who appear to have suffered significant traumatic injuries that healed. Both individuals were young adults; one appears to be a female while the other is likely a developing male. The question we had is what if any care in the form of treatment and provisioning was provided for these individuals. Using standard osteological methods and archaeological context the individuals were entered into the newly created web-based instrument known as the Index of Care. The data generated allowed us to assess if the injuries these individuals suffered during their lifetime were sufficient enough that they would have needed caregiving by other members of the community.

Williams, Mark [25] see Whitbread, Ian

Williams, Justin (Washington State University)**[99]** *Teaching Archaeology through Games: Bringing Interactive Lessons into the Classroom*

When teaching archaeology, it may sometimes be challenging to incorporate group work and interactive lesson plans. Due to the sensitive and time consuming nature of archaeological field and lab work, it is difficult to provide a true archaeological experience during allotted class periods. One way in which archaeological lesson plans can become more interactive is through the use of board games. Board games provide an interactive activity which causes students to work together, and the

rules can be adapted to solve archaeological themed problems. This poster demonstrates methods for encouraging interactive learning and engagement via the use of board games.

Williams, Lana (University of Central Florida) and Jane Masségia (Center for the Study of Ancient Documents, Ioannou)

[205] *Tending the Vines: Biomechanical Evidence of Laterality and Gendered Labor Division in Viticulture at Pessinus, Turkey*

Skeletal remains from Sankuş Mevkiinde Tomb (Late Roman, A.D. 200–300) at Pessinus, Turkey included 12 adult males with asymmetrical, robust definition of the peroneal trochlea extending outward (>1 cm) from the lateral calcaneus and situated between the peroneus longus and brevis tendons, nine of which are on the right calcaneus. Adult females did not exhibit this variation. Asymmetrical variation suggests repeated biomechanical eversion of the foot and plantar flexion of the ankle on the side affected when recovering from crouching and kneeling on one knee. Biomechanical stress laterality is also reflected in knee, wrist, and elbow joints of the same individuals, but not in shoulder joints. Right-preference laterality (90-92%) in humans indicates primary use of the right hand-right leg for a specific kneeling task. Roman tombstones for local males depict vine-hooks and handpicks but weaving apparatus for females. Intensive use of these tools in tending vines is consistent with stresses in male wrists and elbows within the sample. Enduring local practices of tending untrained vines at ground-level account for indications of repetitive kneeling in the same individuals. This holistic view of biomechanical stress and ancient iconography reconstructs ancient viticultural practices and the gendered division of labor.

[264] *Decoding the Swahili: Ancient DNA Studies on the Kenyan Coast*

Our project examines the role of migration in the development of the large autonomous Swahili towns and city-states that grew out of small fishing, agrarian, and pastoral settlements on the East African coast in the late first millennium CE. Our sample is comprised of 97 individuals from three sites on the Kenya coast: Mtwapa (N=72; 900-1732 B.C.E.) near Mombasa, and two sites in the Lamu archipelago, Manda (N=16; 800-1400 B.C.E.), and Shanga (N=9; 800-1400 B.C.E.). The teeth were well preserved and about 80% of the samples yield genetic material. We sequenced the HVRI of the mitochondrial control region. We found that, while early Swahili populations were primarily of African origin and consisted of haplogroups commonly found throughout East Africa and in Bantu speaking groups in sub-Saharan Africa, but the Swahili were much more diverse than has been commonly supposed and included haplotypes less commonly found in the area today.

Williams, James (Renmin University of China)

[283] *Local and Regional Economics in Northeast China*

Food production and other forms of economic activity manifest at both local and regional scales. In some instances population density within one community may lead to stress at the local scale. The region can, however, mitigate local stresses through regional exchange between small polities. In the same way that household exchange mitigates the risk of a single community, inter-community exchange mitigates risk for many communities regionally. This paper will explore both regional and local subsistence strategies in Northeastern China and the degree to which inter-community exchange may have been necessary. Population density and carrying capacity are two essential variables in understanding the role in which exchange would have been a necessary element in the subsistence economy. This paper will focus on a region of roughly 200 km² and the subsistence shift theorized to have taken place at about 1200 B.C.E. The paper will outline the shifts in population density and carrying capacity in this region with respect to a variety of economies. This research is in contrast to the macro-regional exchange and pan-continental networks most often associated with Bronze Age Archaeology in Northeast China. This paper attempts to demonstrate the variability in the subsistence strategies of Bronze Age communities.

[294] *Paleoenvironmental Implications of Stable Isotope Analyses of Micromammal Teeth from Pinnacle Point (Mossel Bay, South Africa)*

Paleoenvironmental proxies sample past environments at a number of geographic scales including regional, sub-regional, and local. Given species' small home ranges and often-specific habitat requirements, isotopic data from micromammal fossil teeth are increasingly recognized as abundant potential reservoirs of local-scale paleoenvironmental proxy data. Elucidating differences between local and regional vegetation provides a context for understanding landscape-scale environmental variation, which is important for modeling a number of aspects of the behavioral ecology of past human populations. We present an overview of the results of LA-GC-IRMS sampling of fossil micromammal teeth recovered from three localities at Pinnacle Point (PP) South Africa (PP30, PP9C, PP13B) spanning 380-90 ka. Analysis of the $\delta^{13}\text{C}$ and $\delta^{18}\text{O}$ data suggests some interspecific differences in the isotopic ecology of the small mammal taxa. Taxon-specific analysis of the isotopic composition of the micromammal data set over time is suggestive of small but probably significant changes in the composition of vegetation immediately local to the sites. Comparison of the micromammal stable isotope data with other proxy records suggests that, although there are small differences in the environments different proxies sample, there is concordance between these data sets that capture local (speleothem, micromammal) and regional (large fauna) environmental signals.

Williams, Patrick Ryan (Chicago Field Museum)

[335] *Andean Irrigation Communities: A Comparative Study of Household and Society in Ancient Peru*

Households and community structures in ancient Peru were key to developing irrigation systems and reproducing a social order. Tensions between communities and within them are often written on the landscape in the form of water distribution structures and community placement. Household level strategies may also be evident in the material structure of the house and its belongings. I undertake a cross-temporal and cross-cultural study of household and community level interfaces around agricultural production from the sixth to sixteenth century Peru within a single valley. I examine changing patterns of integration through two imperial regimes (Wari and Inka) and two periods of local autonomy (Huaracane and Estuquina) to evaluate how household and community interdigitate as social circumstances change. I argue that the relationship between households, communities, and landesque capital increases in complexity as regional forces enter the stage. The picture is complicated, though, by ecological circumstances and contingency on historical precedents in the study area.

Williams, Courtney (University of Massachusetts Boston)

[397] *Changing Environments and Economies: A Zooarchaeological Study of the Eastern Pequot*

This zooarchaeological study examines the recovered faunal remains from a mid- to late-18th century household site on the Eastern Pequot reservation in North Stonington, Connecticut. The results of this study indicate the residents' incorporations of European-introduced practices and resources with traditional subsistence practices. The site yielded a mixture of faunal remains from domesticated and wild species. Over the course of the 18th century, the residents came to rely on European-introduced domesticated animals, off-reservation employment, their connections to the coast, and local trade for English goods. The selection and combination of foodways practices allowed residents to maximize their resources and persist throughout the challenges and hardships that resulted from European colonization.

Williams, Veronica (CONICET- UBA)

[411] *Wares in Moving: People, Technology and Political Issues in Northwest Argentina*

Results obtained from fabric analysis using thin-section microscopy (TSM) and various other analytical strategies (e.g. Raman micro spectroscopy, FTIR, XRD –microX ray diffraction- XRF,

SEM-EDAX, and INAA) provide insights into production technology and the provenance of selected pottery sample from Prehispanic archaeological sites in Northwestern (NW) Argentina, North of Chile, and Bolivia (A.D. 900-1530). Iconographic and morphological analyses sustain the idea of interregional contacts that reflect hybrid ceramic styles like La Paya and Yavi Chico polychrome also. Those analyses helped us to know how the Inca state managed raw material sources and pottery manufacturing along Southern Andes according to the idea of interregional contacts, regional production, consumption, and distribution of local, non-local or foreign styles (e.g., Pacajes) and products, and Inca styles.

Williams-Beck, Lorraine (Universidad Autonoma de Campeche)

[338] *The Center as Cosmos in Early Colonial-Period Campeche*

The center, as the Maya universe's fifth direction, is a little understood component of the Colonial-period Maya cosmos. This paper will explore a diachronic notion of function and form for center as umbilicus, placing particular emphasis on prehispanic Canpech and Chakanputun provinces, and Early Colonial contexts at Dzaptun/Ceiba Cabecera, Campeche. Prehispanic Dzaptun, renamed "la Zeiba" and Ceiba Cabecera in later Colonial sources, had served as central cog in a hypothesized regional ritual religious pilgrimage circuit prior to European contact. As one of the earliest "pueblos de indios" in the Champoton and Campeche Missions region, Ceiba Cabecera's congregational town layout and its more prominent architectural features follow prehispanic directional primacy. Two churches, a diminutive sixteenth-century open "visita" chapel and later eighteenth-century massive "iglesia mayor", and unknown period water well, are central points of orientation placed strategically adjacent to "Main Street", whose westerly limit ends in the town's cemetery. Iglesia Mayor's architectural components and secular iconographic contents reiterate its place as umbilicus for Campeche's Early Colonial Mayas' ritual religious universe. Ceiba Cabecera's reign as a Colonial religious center ceased around 1795 and the town was later abandoned by 1860.

Williamson, Ronald (Archaeological Services Inc.) and Martin Cooper

[182] *"He Must Die Unless the Whole Country Shall Play Crosse:" The Role of Gaming in Great Lakes Indigenous Societies*

Lacrosse, Canada's national sport, originated with the pre-contact racket and ball games of the Iroquoian and Anishinaabeg peoples of northeastern North America. Like many traditional Indigenous games, racket and snow snake events represented much more than sport, involving aspects of physical prowess, warfare, prestige, gambling, dreaming, curing, mourning and shamanism. Gambling, in particular, was an important cultural activity that according to seventeenth century accounts, resulted in some participants returning to their villages naked, having wagered and lost all their possessions, including their clothes. This paper examines the ethnohistoric and archaeological evidence for gaming in the Great Lakes Region and explores the roles these games played in people's lives.

[324] *The Potential Role of Water Salinity in Limestone Tempered Logandale Gray Ware Ceramic Production in the Moapa Valley, Nevada: An Experimental Approach*

Limestone has been shown to be an advantageous temper to use in utility vessels due to its ability to affect factors that mitigate problems caused by heat expansion and thermal shock during the use cycle of ceramics. Specifically, limestone alters the characteristics of the clay, allowing for the manufacture of thinner walled vessels. Additionally, it has similar thermal expansion characteristics as clay itself. However, it has been noted that limestone temper has a propensity to spall, thus compromising the structural integrity of the vessel. It has been demonstrated that the use of salinized water in the manufacturing process precludes such spalling. Through experimental means, this

paper explores the potential use of salinized water sources in the production of Logandale wares that appear during the Basketmaker III period in Southern Nevada. The question of whether the Muddy River contains enough salt to counterbalance the spalling of limestone temper during firing is investigated, and the constraints around the necessary salinity of water needed for optimum results is explored.

Willis, Mark (Blanton & Associates, Inc.), Eleanor Harrison-Buck (University of New Hampshire) and Chester Walker (Archaeo-Geophysical Associates, LLC)

[409] *Rapid Survey, Salvage, and Mapping Using Drones in an Ancient Maya Landscape: New Settlement Revealed at the Crossroads of Saturday Creek, Belize*

Saturday Creek is a sizeable Maya site center with an elite residence, three large pyramids, and two ball courts. While much of the site core is in bush, most of the surrounding area has been cleared for agriculture. While the clearing makes for good visibility, the hinterland settlement has been subject to extensive bulldozing, repeated plowing, and removal of stone over the years, obscuring the smaller mounds and making it difficult to discern them on the ground. In less than two days, we flew two different drones more than 7km² around Saturday Creek. The drone imagery revealed hundreds of previously unrecorded mounds, particularly dense in the vicinity of a complex resembling an "E-Group" or Maya solar observatory. A systematic surface collection is planned for next season, but a cursory inspection of the mounds shows that many of these structures were continuously occupied with ceramics dating from Preclassic to Postclassic times, suggesting that Saturday Creek was a major focus of population aggregation throughout its long history. The drone results leave little doubt that this locale was a central node in the landscape, arguably because it marked an important crossroads between east-west and north-south trade and communication networks from Preclassic times onward.

[354] *Tracing the Growth of Historic Preservation in the U.S. and the Arc of Tom Windes's Career*

The passage of the National Historic Preservation Act (NHPA) in 1966 and the conferring of Tom Windes's M.A. in Anthropology in 1967 appear to be causally independent, but thereafter the arc of historic preservation and Windes's archaeological career are intertwined. We distinguish three major stages in cultural resource management over the last 50 years, each of which tracks almost seamlessly with the changing focus of Windes's work. The challenges of defining the intent of the act, enforcing its legal mandate, and demonstrating the act's public benefit were central elements of federal preservation's first phase. Windes's early career in southeastern Utah demonstrates the enforcement challenges, and his work with the Chaco Project in the 1970s illustrates how archaeologists increasingly expanded the research potential of Section 106 work. By 1980 to 1985 it was clear that implementation of the NHPA would require multidisciplinary specialists and a wide-ranging set of skills available only through a large CRM firm, or Tom Windes. Federal agencies and SHPOs focused on management issues and CRM firms took over many of the research and publication duties. As the NHPA and Windes both matured, the emphasis has shifted to balancing research and management needs with limited funds and time.

[185] *Lithic Sourcing Using Laser Induced Breakdown Spectroscopy*

Laser Induced Breakdown Spectrometry (LIBS) has been used in Colorado and Wyoming for identifying and sourcing lithic materials for the last ten years. These have primarily focused on chert and silicified sandstone materials and quarry-derived artifacts. During 2012-2013 the LIBS was used to assess whether Bridger chert from sources in northwestern Colorado and southwestern Wyoming could be distinguished from each other. It was found that with greater than 80% accuracy, chert from these areas were distinguishable from each other. To enhance the LIBS capability a new field portable LIBS system has been developed with better spectroscopic resolution, broader wavelength coverage and an ability to reliably sample small inclusions in material down to a 0.1 mm spatial resolution for more detailed analysis. The analysis of collected samples can be done in the field within minutes/hours of collection. Quarry samples from the Bridger assessment and from other quarries on the Colorado Western Slope have been resampled with the new LIBS system. The results have demonstrated an increased ability to source lithic materials from quarries; even from ones only a few hundred meters apart. The results suggest that LIBS can be considered a candidate for field analysis and sourcing of lithic materials.

Wilson, Katherine**[275]** *Examining the Ceramic Assemblage from Washington Mounds: An Early to Middle Caddo Site in Southwestern Arkansas*

The Washington Mounds site is an Early to Middle Caddo period (A.D. 800-1300) mound site with 11 mounds, some of which contain burials; two village areas are associated with the site surrounding the mounds. It is located in southwest Arkansas between the Red River and Little Missouri River Basins. Some level of ritual activity occurred at the site, but what types or scale of ritual is unknown. Two excavations have been done at the site: one in the early 20th century by M. R. Harrington, and a second in 1981 by the Arkansas Archaeological Society and the Arkansas Archaeological Survey. Whole pots and potsherds from both documented excavations are considered in the analysis. This study is a thorough analysis of the ceramic assemblage through the theoretical perspective of ceramic ecology. As this is the first ceramic analysis done on artifacts from this site, the goals of the research include establishing information on life, status, and ritual activities of the people who occupied this site as well as contextualizing these findings within the broader geographical and cultural regions.

Wilson, Nathan (Arizona State University)**[277]** *Data Recording Strategies for Nuvakwewtaqa Repatriation*

This poster presents a discussion of the various data recording methods implemented in the NAGPRA Repatriation of materials from Nuvakwewtaqa, Chavez Pass, Arizona. A number of different artifact types were analyzed in processing this collection, and artifact analysis associated with this project used a multi-stage approach. As this analysis required data recording following each stage, a well-organized, comprehensive multi-stage data recording strategy was constructed. This strategy, including extensive photography and comprehensive data entry, necessitated a continuous interplay with artifact analysis. Protocols for each stage of data recording will be presented, discussed, and evaluated.

Wilson, Andrew (University of Bradford), Keith Manchester (University of Bradford), Jo Buckberry (University of Bradford), Rebecca Storm (University of Bradford) and Karina Croucher (University of Bradford)**[299]** *Digitised Diseases: Seeing beyond the Specimen, Understanding Disease and Disability in the Past*

Digitised Diseases is a major web-based 3D resource of chronic disease conditions that manifest change to the human skeleton. The resource was established through funds from Jisc, the University of Bradford and Bradford Visualisation. The multidisciplinary team involving project partners MOLA (Museum of London Archaeology) and the Royal College of Surgeons of England undertook a program of mass digitization of pathological type specimens from world-renowned archaeological, historic and medical collections at the University of Bradford, in London and York. We continue to

augment this resource through ingestion of new content. The resource was always envisaged as needing to appeal to a diverse user community, having impact not just among academic and clinical beneficiaries, but also enriching the wider understanding of public health in the past. From the outset, our focus was on making sure that the digitized paleopathological exemplars were represented and understood within a broader clinical context. In essence we wanted to emphasize the impact of living with disease and disability in an era before modern therapies were available and the significance of care provision that would have been required at a societal level, given the longevity of many of these conditions.

Wilson, Suzi

[396] *Homo Cognitive Development (Contextualized in Middle Paleolithic Burials)*

The cognitive developments that occurred in the Homo genus over 100,000 years ago enabled expansive forms of consciousness, facilitated increased creative capacities, and in so doing allowed hominins to consider concepts that were previously unimaginable. These developments are rooted in social origins, possibly extending back to the Australopithecines, and their emergence is expressed through the first burials of the dead – both by Neanderthal and Homo sapiens. However, these burials from Europe and the Near East do not necessarily indicate the provenance of spirituality or the belief in an afterlife or after-person. These burials only indicate a shift in thinking with respect to the corpse – one that I have termed “postmortemism”. Postmortemism is a concept or sentiment that transforms the corpse into something other than waste. By affording special treatment to the corpse, it becomes imbued with agency regardless of the underlying motivation for this treatment. In its simplest form, postmortemism might prompt burial as a means to honor and/or mourn the dead, or perpetuate the dead’s existence as part of the community. It is from the sentiment of postmortemism that burial practice developed, and it was only after postmortemism that spiritual beliefs grew from these embodied mortuary practices.

[85] *Turkey Domestication and Utilization in an Ancestral Puebloan Community*

The archaeofaunal remains left by the Ancestral Puebloan people who lived in the Goodman Point community provide a chronological record of their interaction with turkey (*Meleagris gallopavo*). Domestication can be regarded as a co-evolutionary relationship between a plant or animal species and humans that varies in the intensity of mutual dependence. We examine how the Goodman Point residents' relationship with turkey evolved from the late A.D. 900s to the 1280's. Our research involves the analysis of temporal fluctuations in relative abundance of turkey remains in diet, shifts in turkey mortality patterns, and changes in the context of turkey utilization and consumption. Our results demonstrate that a complex relationship existed that was shaped by growth of the community over time and by human adaptation to environmental change. An extended temporal examination of this community's relationship with turkey enhances the narrative for the larger Northern San Juan region regarding cultural change leading up to regional abandonment.

Winter, Marcus (Centro INAH Oaxaca), Robert Markens (Instituto de Investigaciones Estéticas, UNAM) and Cira Martínez López (Centro INAH Oaxaca)

[39] *The Epiclassic in Oaxaca (600-900 C.E.)*

The centuries from 600 to 900 CE were unusually dynamic times in prehispanic Oaxaca. In the Valley of Oaxaca, population increased and elite Zapotec culture flourished as city-states formed at Monte Albán, Cerro de la Campana, Macuilxóchtli, Lambityeco and Jalieza, and then suddenly collapsed. Surprising connections with the Maya area appear such as Fine Orange and Plumbate pottery as well as possible iconographic and architectural elements, some of these channeled through Southern Isthmus sites like Paso Aguascalientes. While the term Epiclassic is not used in Oaxaca archaeology, changes and innovations in Oaxaca are related to characteristics of the Epiclassic elsewhere in Mesoamerica, and presage in part the subsequent Postclassic period.

[155] *Using Geoarchaeological Methods to Evaluate Site Integrity at Dali, Kazakhstan*

Dali, a site located in the Bayan-Zherek Valley in Semirech'ye, Southeastern Kazakhstan, is a multi-phase Bronze Age pastoralist settlement (3rd-2nd millennia B.C.). Recovered artifacts include combustion features, bones, ceramics, lithics, bronze metals, and potentially in situ wall constructions. Radiocarbon dates cannot conclusively suggest that the stratigraphic sequence is in situ due to geological unconformities and high energy colluvial system. Thus geoarchaeological methods were employed to distinguish between anthropogenic and geogenic deposition. This research integrates micromorphology, geochemistry, sedimentology and site stratigraphy to identify timing and tempo of depositional history, landscape stability, and site formation processes. These data allow us to evaluate the integrity of the site and its archaeological contexts to provide a more secure interpretation of cultural activities.

[136] *Faked But Not Forgotten: The Enduring Appeal of the Crystal Skulls*

Supposedly originating from precolumbian Mesoamerican sites, the crystal skulls are one of the most iconic sets of fake artifacts which have graced museum shelves and the public's imagination. The first crystal skulls appeared in collections during the late 1800's, and well-known specimens are housed today as modern fakes at the Smithsonian and British Museums. Most media coverage of the skulls has revolved around the privately owned, so-called "Skull of Doom", claimed to be of Mayan origin and possessing psychic powers. A recent surge in media coverage of the crystal skulls occurred surrounding the 2008 movie release of "Indiana Jones and the Kingdom of the Crystal Skull" which included ancient Peruvian artifacts with extraterrestrial ties. That same year the Quai Branly Museum in Paris announced that tests conducted on their crystal skull revealed it to be a forgery likely made in the late 19th century. News articles at this time focus on the known skulls as fraudulent artifacts; yet sensationalized television shows and cinema reiterate the appeal of the objects as psychic connectors to ancient knowledge. Despite the best known artifacts being thoroughly debunked, the mystery of the crystal skulls still provides enduring fodder for new-age spiritualists and science-fiction writers alike.

Wissler, Amanda (Arizona State University)

[240] *Shaping Health: An Examination of Health, Social Identity and Burial Practices in the Egyptian Predynastic*

Patterns of disease manifestation in individuals and within a community reveal how health is affected by social and economic identity. Differences in wealth and social status can lead to disparities in diet, living conditions and healthcare. This interaction is explored using data from skeletal remains and grave architecture from the Predynastic Cemetery N7000 at Naga-ed-Der, located in Upper Egypt. In his Ph.D. dissertation, Stephen Savage (1995) organized individuals into six spatial clusters or "descent groups" he believes represent discrete competing social groups and categorized them by additional mortuary elements such as grave structure type and grave materials.

If health is affected by social identity in the Naga-ed-Der sample, one expects differences in disease frequencies among the six descent groups. The presence of porotic hyperostosis, cribra orbitalia and osteomyelitis was examined in 143 individuals and compared across descent groups and grave styles. Results show a much higher proportion of disease in sub-rectangular graves versus other types. Furthermore, a higher percentage of individuals from descent group 6 exhibit stress indicators, especially compared to descent group 1. These results suggest health status in Cemetery N7000 was affected by differences in political, ideological or economic power between the competing social groups.

[382] *The Nature and Extent of Chacoan Hegemony in the Middle San Juan Region*

The Chacoan polity of northwestern New Mexico exercised hegemony throughout the San Juan Basin and surrounding highlands during the Pueblo II (A.D. 900 – 1140) period. Hegemony is defined as the predominant influence in ideological, political, military, and/or economic matters exercised by one culture over another. Furthermore, it is an historical process, and as such is theorized as "eventful," along the lines of Sewell (2005) and Beck et al. (2007). The extent and nature of this hegemony on thirteen sites comprising nine communities within the Middle San Juan Region is discussed, illustrating multiple ways local and migrant communities influenced and interacted with the expanding hegemony during the late Pueblo II. This interaction between

communities and Chaco includes instances of trade, emulation, migration, and coercion. The incorporation of these events allow for further refinement of Paul Reed's (2011) cultural history of the Middle San Juan Region. This paper is the result of dissertation research on the nature of Chacoan hegemony in the Middle San Juan Region, New Mexico, as well as associated research on borders and boundaries in the area.

Witt, Brian (SOAS, University of London) and Nadia Johnson (Pennsylvania State University)

[393] *Us vs. Them: Identity Formation in Prehispanic Tlaxcala*

Tlaxcala occupies a unique position in the history of New Spain, due both to its alliance with Cortés against the Aztec and to its mid-16th century flourishing as a model *republica de Indios*. Spanish and indigenous chroniclers throughout the colonial period spoke of the *tlaxcaltequidad*—the strong regional identity and patriotism that characterized the state. We believe that this is not merely the product of Spanish favoritism and elite opportunism post-Conquest, but rather, the development of a robust Tlaxcaltecan identity occurred over the course of their long and successful resistance to Aztec domination. Drawing from political psychology and group dynamics, we hope to showcase how the Tlaxcaltecan elite used the omnipresent threat of the Aztec “Other” to create a form of inclusive civic nationalism, focused on military success, that overcame linguistic and class barriers and allowed the small Tlaxcaltecan state to survive decades of warfare against a much more powerful foe. We also present comparative examples from other political entities – contemporaneous and modern – which experienced similar processes of identity formation.

Wohlgemuth, Eric

[41] *Environmental Constraints and Plant Food Intensification in the Sacramento Valley*

The Sacramento Valley bottom is a rich environment for faunal resources, notably fish, but lacks staple nut crops found elsewhere in interior central California. The absence of key nut resources appears to be the key factor in intensified production of geophytes and the early intensification of small seeds, especially *Chenopodium* spp. These features are absent in other regions in the rich archaeobotanical record of central California.

[87] *Scenes of Spectacular Feasts: Gravettian Hunters' Sites in Central Europe*

The Gravettian technocomplex arose about 30,000 years ago and expanded into nearly all of Europe during the next millennia. The most distinctive features of the individual stages of Gravettian cultures are backed bladelets, shouldered points, and zoomorphic and anthropomorphic art objects. Complex early Gravettian sites are found in South Moravia (Czech Republic), dated about 27-25,000 BP.

Pavlov I and Dolní Věstonice I and II are long-term open-air campsites. Gravettian sites of a later phase are located in Poland, Slovakia, and the Czech Republic, dated 24-20,000 BP. In the older sites, the human diet was diversified, shown by the presence of bones of different animal groups. At these sites, prey that was small (birds, hares, foxes) and medium size (wolf, reindeer, wolverine) dominate the osteological material, but large mammals (bears, cave lion, horse, mammoth) are also present. Taxa representation is roughly equal, showing that the prey spectrum was wide. In contrast, faunas from the younger Gravettian phase are strongly dominated by woolly mammoth or reindeer, suggesting a specialization in hunting those animals. Gravettian people were efficient and skillful hunters, not afraid of confronting large and dangerous representatives of Pleistocene fauna. They also well utilized other resources of their environment.

Wolf, Marc (GC CUNY)

[183] *The Pivotal House: Individual, Community, and Environment Context at Cancuen, Verapaz, Guatemala*

An obvious foundation of archaeology is that of the often mundane-seeming house. Insights into any culture are most recognizable at the intimate house level. Simultaneously, this focused view is simply a snapshot into the multi-scalar chain that links the individual with an activity, an activity with a

house, the house as an integral component of an architectural compound, etc. These linkages continue into the neighborhood, community, regional and global scales. Other concepts become more relevant as the scales are cycled from close-up to landscape panoramas or greater. Artifacts are contextualized by a strata or feature, but it is as important to understand the associations between locations within that house as well as its relation to other architectural and natural landform features. Cancuen, located at the interface of the Northern Guatemalan Highlands and the Petén Southern Lowlands, is a Classic Maya archaeological site that reflects these multi-dimensional aspects of the house. Topographic setting is crucial; architecture cannot be disentangled from its environmental backdrop. Slope and aspect patterns, associations with other structures and compounds, and relations to the surrounding landscape of rivers, mountains, and other water bodies are only a few of these necessary frameworks.

Wolff, Sarah (University of Arizona) and Tracie Mayfield (University of Arizona)

[147] *Recent Historical-Archaeological Study of the Late-Colonial Period at Lamanai, Belize*

Very few studies have focused on eighteenth- and nineteenth-century Northwestern Belize, and to this end, the relationships between people, space, and objects operating within this region during the late colonial period are poorly understood. Previous archaeological investigations at Lamanai recovered data that clearly indicated the presence of materials associated with day-to-day behaviors generally linked to late-colonial industrial and residential activities, such as cooking and eating, building maintenance and construction, health and hygiene, and sugar agriculture and production. These data drove the most recent investigations into the material, social, and technological dialectics active at Lamanai, Belize during the nineteenth-century when British colonists established a short-lived sugar plantation at the site. This presentation will outline the overarching problem orientation, on-site work experience, and data recovered during the 2014 summer field season, which focused on late colonial residential lifeways at Lamanai, Belize.

[254] *High-Resolution Satellite Imagery for Comprehensive Monitoring of Cultural Heritage in Conflict: Syria and Iraq Methodology*

The growing availability of high-resolution commercial satellite imagery provides unprecedented capabilities for monitoring events in conflict zones- areas that are often inaccessible through traditional methods. This capability is particularly needed when conflict creates long-term inaccessibility and multiple actors overlap in space and time, leading to conflicting accounts, and incomplete or inaccurate information. Proactive monitoring of cultural heritage sites, coupled with time-series historical analysis, can bring much needed clarity to these situations. This presentation will discuss the methods and means by which the American Association for the Advancement of Science's (AAAS) Geospatial Technologies Project is monitoring sites across Syria and Iraq as a part of the National Science Foundation-funded project "Developing a Research Community and Capacity for the Study of Cultural Heritage in Conflict" in collaboration with the Penn Museum's Penn Cultural Heritage Center and the Smithsonian Institution. The systematic monitoring currently underway identifies damage to cultural heritage sites and also documents and quantifies risk to sites. The difficulties encountered while conducting large-scale satellite imagery analysis will be discussed, from data storage and organization, to coordinating analysis. This paper includes methods used for the verification of analysis results, both via peer review and compilation of corroborating data sets.

Deng (Institute of Archaeology, CASS)**[67]** *Preliminary Results from the Bioarchaeological Investigation of Human Sacrificial Victims from China's Late Shang Dynasty*

Ongoing archaeological investigations at the Late Shang capital of Yinxu (ca. 1200 – 1050 B.C.E.) in China have resulted in the location and partial excavation of thousands of sacrificial pits with an estimated 10,000 individuals interred within. Evidence of human sacrifice during this period includes contemporaneous oracle bone inscriptions, mortuary contexts, weaponry, and the skeletal remains of these individuals. We are presenting our preliminary interpretation of the osteological analysis of over 60 individuals who were excavated from the Late Shang royal cemetery in the fall of 2013. Basic analyses such as age, sex, diet, health, trauma, and stature were carried out on this sample. Our results provide important insight into the lives of the victims themselves, thought to be war captives, and their post-mortem treatment by the Shang. Our study also highlights the importance of a bioarchaeological approach, which we hope to encourage through continuing collaborations with our Chinese colleagues.

Wollwage, Lance**[38]** *Scott's Snails: Freshwater and Wetland Gastropods as Indicators of Environmental Change in the Yalahau Region, Quintana Roo, Mexico*

Sediment cores from a cenote (sinkhole) at the center of T'isil, an archaeological site in the Yalahau region of Quintana Roo, Mexico, held a great abundance of well-preserved snail and clam shells in stratigraphic context. Many snail species are sensitive to water quality and depth, or otherwise inhabit specific environmental niches. Their shells are easy to identify and quantify, and where preserved may serve as sensitive paleoenvironmental proxies. At T'isil, variation in snail abundance curves and diversity indices from times before, during and after Postclassic Maya occupation reflects changing water levels, sediments, and water chemistry related to Maya land clearance and modification of the cenote environment.

Wolverton, Steve (University of North Texas), Andrew Barker (University of North Texas), Jonathan Dombrosky (University of North Texas), Barney Venables (University of North Texas) and Stanley Stevens (University of South Florida)**[166]** *Application of Protein Mass Spectrometry to Zooarchaeological Bone*

Protein residues were identified from zooarchaeological turkey (*Meleagris gallopavo*), rabbit (*Leporidae*), and squirrel (*Sciuridae*) remains from ancient pueblo archaeological sites in southwestern Colorado using a non-targeted LC-MS/MS approach. Results indicate that protein residues preserve well in tissues of origin, such as bone. Trace levels of protein residues from artifacts are more problematic to characterize because of poor preservation and due to several methodological challenges. Improvement of highly sensitive targeted LC-MS/MS approaches is an avenue for future method development related to study of protein residues from artifacts such as stone tools and pottery.

Wolynec, Renata (Edinboro University of Pennsylvania)**[136]** *Rock Art and Aliens*

Some archaeologists remember reading articles which link rock art with alien or extraterrestrial visitors to earth. However, an examination of English language newspapers suggests that although rock art is a popular topic, the extraterrestrial connection is less commonly made. The World Wide Web, however, is full of entries which eagerly make this connection. There appears to be a niche audience which will believe what it wants to believe.

[37] *The Cemetery at Qijiaping: New Insights into the Production and Use of Ceramics Vessels*
Excavated in 1975, the cemetery at the Qijia Culture type-site of Qijiaping in southern Gansu province, China, provides a wealth of data on life and death in Qijia society. Up to this point however, the production and use of the most common type of burial good, ceramic vessels, has never been fully researched. This paper will explore production organization and methods likely used to produce several classes of vessels through statistical analysis of vessel standardization. Ideas of what constitutes standardization and what that means for our understanding of the Qijia Culture will also be addressed. Possible functions and contents of these vessels will then be discussed based on the initial results of use-wear analysis. This will allow for new insights into production and consumption of vessels and their contents at Qijiaping.

[166] *Environmental Reconstruction at Pueblo Grande, Arizona through Stable Isotope Analysis Of Leporid Bone*

Stable isotope analysis of faunal bone can provide valuable information about the environments in which the animals lived. Reconstructing paleoenvironments at archaeological sites permits a better understanding of the factors that influenced their social development and decline. In this poster we present results of stable isotopic analyses ($\delta^{13}\text{C}$ apatite, $\delta^{18}\text{O}$ apatite, $\delta^{13}\text{C}$ collagen and $\delta^{15}\text{N}$ collagen) of leporid bone apatite and collagen to investigate temporal changes in environmental conditions at Hohokam site of Pueblo Grande, Arizona, USA. We analyze bone samples from the Gila Butte (725-825 A.D.), Santa Cruz (825-1000 A.D.), Sacaton (1000-1100 A.D.), Soho (1100-1300 A.D.), Civano (1300-1350 A.D.), and Polvoron (1350-1450 A.D.) periods and examine differences between them. Our results demonstrate significant changes in the environmental landscape over time. This study improves our understanding of the culture history of Pueblo Grande, and furthers our knowledge on the social-environment dynamics across the North American Southwest.

Wood, M. Jared (Georgia Southern University)

[124] *Mi Datos Su Datos? Opportunities and Challenges Posed by Data Sharing*

Rapid technological advancements and increased availability of hardware and software are boons to archaeologists gathering and interpreting spatial data from anthropogenic landscapes. These datasets are increasingly unmatched in quality and quantity, allowing for visualization, analysis, and explication of built and modified environments reflecting human behavior. While these advancements are clearly well-received by individual archaeologists, the enduring question remains: When (and how) should data be shared? This poster explores this question with a focus on site documentation and interpretation through terrestrial LiDAR, and addresses potential opportunities and challenges posed by creating, curating, and sharing hard-won spatial data.

Wood, Marilee (Honorary research associate University of the Witwatersrand) and Laure Dussubieux (Field Museum, Chicago)

[140] *Chemical Analysis of Chinese and Other Lead Glass Beads from Songo Mnara, Tanzania*

A number of potash lead silicate glass beads have been recovered from excavations at the 14th to 16th century Tanzanian site of Songo Mnara, a small but wealthy stone town on an island just south of Kilwa Kisiwani. LA-ICP-MS analysis has shown that two groups of Chinese beads are present, one that dates to the early 15th century, when Zheng He's fleets visited the East Coast, and the other from around the turn of the 17th century when European glass beads began to be traded in that region. These beads will be compared to related assemblages from Southeast Asia and chemical and morphological characteristics that can be used to separate and identify these groups will be discussed. The analysis also identified several high lead beads that do not belong to these groups and that are probably modern intrusions.

[355] *The Ritual Reuse of Maya Cave Shrines after Abandonment*

Caves are among the most sacred geographic features in Mesoamerica and have been used throughout history as the setting for multiple ritual events. In this paper, the author looks at several shrines in central Guatemala that were rediscovered long after they were abandoned by the original ritual practitioners and regained importance. The renewed activity often reflects very different functions of the rituals performed there—in caves along a major trade route cutting through the region, for example, later ritual focuses on public performance and community cohesion instead of earlier petitions for safe passage. The ritual practitioners involved in the latter ceremonies do engage with the paraphernalia from earlier ceremonies, however, performing ceremonies and leaving dedicatory offerings adjacent to ancient caches and occasionally removing objects, likely to serve as heirlooms to be venerated.

Woods, Aaron (University of Nevada, Las Vegas), Barbara Roth (University of Nevada, Las Vegas) and Katelyn DiBenedetto (University of Nevada, Las Vegas)

[138] *Evaluating Land Use in the Mojave Sink: Survey Data from Afton Canyon, San Bernardino County, California*

The primary objective of this research project is to assess the function of sites located on the rim and plateau above Afton Canyon in the Mojave Desert to determine how they fit into regional patterns of subsistence and settlement defined during previous work in the area. Archaeological sites identified during a recent survey include multi-component artifact scatters, lithic reduction areas, and hunting blinds. These sites provide new information on prehistoric use of Afton Canyon. We present the survey results, discuss site locations and function, and reconstruct patterns of occupation in the canyon. The connection between sites in Afton Canyon and other sites in this portion of the Mojave Desert is explored as part of an on-going effort to better understand regional prehistoric land use in the Mojave Sink.

Woodson, Kyle (Gila River Indian Community)

[225] *Tribal Heritage Management in Action at the Gila River Indian Community, Arizona*

Many Native American communities have developed their own archaeology programs and taken over management of cultural resources from Federal agencies. The formation of Tribal Heritage Management programs has increased interactions between non-tribal archaeologists and members of native communities, and resulted in greater numbers of Native Americans becoming trained archaeologists. This synchronism has fostered new understandings of the past and has led to research that is scientifically valid while also reflecting tribal cultural concerns. Archaeologists have benefited from increased exposure to traditional knowledge and beliefs, and Tribes have developed new avenues for communicating their knowledge of the past in ways that will reach a broader audience. This paper provides an overview of the diverse investigations undertaken by the Gila River Indian Community's Cultural Resource Management Program and Tribal Historic Preservation Office in south-central Arizona. These two tribal departments developed out of a program that began 20 years ago under funding by the U.S. Bureau of Reclamation. Other papers in the symposium examine recent findings from archaeometry investigations, controlled experimental studies of traditional technology, wildland fire archaeology program deployments, rock art preservation efforts, and large-scale cultural resource management investigations.

[225] *Chair*

Worman, F. Scott (Missouri State University), Anastasia Steffen (Valles Caldera Trust and University of New Mexico) and Jeffrey W. Hall (University of New Mexico)

[319] *Fires, Landslides, and All Manner of Varmints: Site Formation Processes at High Elevations in the VCNP*

The Valles Caldera National Preserve in northern New Mexico encompasses a diverse landscape of grassy valleys, forested mountainsides, and rocky peaks, almost entirely more than 2600 m (8500 ft) above sea level. People have visited the area regularly for millennia to access large obsidian quarries and other resources. The long history of human activities has left us a rich archaeological record, but interpreting that record is complicated by the dynamism of the landscape; physical and biological as well as cultural processes have altered it in many ways, in some cases dramatically. We present the results of multiple seasons of investigations at two large sites where we focused on site formation processes. Combining standard techniques with detailed pedostratigraphic recording, clast size distribution analysis, and obsidian hydration dating, we have begun untangling the complicated history of human activity, erosion, deposition, turbation, and other processes that formed the archaeological record. Contrasts between the sites both illustrate the range of alterations present and provide preliminary indications of the effects of large-scale landscape factors such as slope and aspect. While broadly applicable, our research should be especially useful for archaeologists working in montane and high-elevation settings.

Worth, John (Univ. of West Florida)

[178] *Precursors of Missionization: Early European Contact on the Georgia Coast, 1514-1587*

Beginning not long after the Spanish discovery of the Florida peninsula in 1513, indigenous groups along the Georgia coast were increasingly subject to sporadic maritime visits by Spanish and later French ships. By the time Georgia's coastal chiefdoms were assimilated into the expanding Franciscan mission system of Spanish Florida after 1587, they had already experienced more than seven decades of occasional interaction with European slavers, colonists, soldiers, missionaries, traders, and shipwreck survivors. While direct evidence for such contact is limited and sometimes ambiguous, combined documentary and archaeological data provide an informative glimpse into the still poorly-known period between first contact and missionization along Georgia's coast and adjacent regions of the interior.

Wren, Colin (McGill University)

[84] *Humanizing Wave of Advance Dispersal Models*

Since Ammerman and Cavalli-Sforza (1971) introduced Fisher's (1937) wave of advance equation to archaeology, it has been the most commonly used method to model the complex dynamics behind human dispersals in a variety of regional and global case studies. The standard form of the model involves an initial population growing and spreading randomly outwards from an origin. Studies use the model to calculate expected arrival dates and expansion velocities based on population growth rate, inter-generational dispersal distance, and carrying capacity, which are estimated from archaeological and ethnographic data. This paper outlines a primary limitation of the standard model, namely that it is not very human. Cognitive capacity is largely unaccounted for, as is the breadth of hunter-gatherer environmental knowledge. Using agent-based and numerical modelling, I demonstrate the effect of several modifications to the standard wave of advance model that highlight the complex relationship between expanding populations and their role within, and perception of, the social and physical environment. These modifications are more consistent with our understanding of hunter-gatherer mobility and foraging patterns, and with the archaeological record, than the standard model. The result is a humanized model of dispersal.

Wright, David (Seoul National University)

[80] *Accuracy vs. Precision: Understanding Potential Errors from Radiocarbon Dating on African Landscapes*

Primarily located in the tropical latitudes with a diverse array of unique flora and fauna, there are unique challenges for obtaining a reliable chronology for archaeological sites on the African subcontinent. Radiocarbon dating is the most frequently employed method for gaining age control on Late Quaternary sites. However, aspects affecting the accuracy of the method are rarely considered. Carbon recycling from reservoirs in old sedimentary structures may uptake into ostrich eggshell or mollusk aragonite. And much of Africa is hot and arid, which promotes bone collagen diagenesis. Cultural factors also affect the accuracy of radiocarbon dating. The use of shells and organic materials as currency throughout prehistory has ensured such items are transported long distances and recycled intergenerationally. In arid and heavily grazed regions, wood can be scarce and there is a tendency to use "old wood" for construction materials. Finally, wiggles in the radiocarbon calibration curve coincide with some of the major cultural transitions in Africa: the beginning of the Later Stone Age, the advent of agriculture, and migration of Bantu speakers into the southern regions of the continent. Given these issues, a multiproxy age control strategy is advocated to ensure a healthy blend of accuracy and precision.

Wright, Alice (Appalachian State University)

[177] *Labor, Materials, and Ritual Knowledge: Erecting and Erasing Middle Woodland Enclosures in Southern Appalachia*

Middle Woodland geometric enclosures are among the most complex earthen monuments ever built in Eastern North America. Well-known 19th century maps have long provided archaeologists with a view of their shape, size, and scope in their final forms. However, because relatively few of these enclosures have been systematically excavated, their early life histories and the ways they may have evolved through time remain enigmatic. In this paper, I seek to document a more complete biography of enclosure by combining the results of geophysical survey and excavation of a pair of small geometric enclosures at the Garden Creek site in western North Carolina. There, in the first century A.D., raw materials, human labor, and specialized ritual knowledge were marshalled at different stages of these enclosures' life histories, from the earliest construction of ditches and possible embankments, to the emplacement of an associated post alignment, to the eventual dismantling of the earthwork and posts and the effective erasure of the monument from the landscape. Specifically, I consider the labor energetics of earth-moving and post-setting alongside the precise layout and possible astronomical alignments of the enclosures themselves to show the diverse ways in which Middle Woodland architects shaped these biographies of enclosure.

Wright, Joshua (Oberlin College), William Honeychurch (Yale University) and Amartuvshin Chunag (Institute of Archaeology of the Mongolian Academy)

[234] *Into the Distance: Initial Observations from the Dornod Mongol Survey*

We will report on the initial fieldwork of the Dornod Mongol Survey, an ongoing project in Southeastern Mongolia. This paper will discuss inhabitation, integration and construction of social landscapes through time based on the survey's recovery methods and analysis. The structure of our project allows us to challenge the frontier identity of this region in several time periods through chronological frameworks, scales of interaction and integration. Our focus will be particularly on two periods; the Bronze Age and its scalar and typological variations across a large area, and Medieval periods with integration and seeming homogeneity over even wider regions.

Wright, Holly (University of York) and Michael Charno (University of York)

[235] *Mobile App Development at the Archaeology Data Service*

The Archaeology Data Service (A.D.S) continually explores new ways to make the data we hold more useful and accessible. One of these avenues has been the development of a mobile app called

"Archaeology Britain", which we recently created in partnership with the British Library. This paper outlines the development of this partnership, and our attempt to create an iPad app with unique and interesting content from both organizations. The app presents antiquarian drawings, paintings and maps for some of Britain's most important archaeological sites, and provides rarely seen perspectives for a wide range of sites and periods, including castles, churches, megaliths, settlements, and the sites associated with the defense of Britain through the ages. The audience is the general public, and provides a window to content provided by The British Library from some of its most treasured collections, much of which is not publicly accessible. This has been combined with content from the A.D.S archives and other sources to provide greater context. This paper will also discuss the app development currently underway within the NEARCH project; an EU Culture Programme funded partnership, exploring new ways of working and interacting with archaeology, communities and the public.

Wright, Véronique (Instituto Francés de Estudios Andinos, Lima (UMIFRE 17 MAEDI/CNRS USR 3337))

[303] *Archaeometry and Mural Paintings in Ancient Peru: A Transdisciplinary Approach to Apprehend the Prehispanic Artisan Painters*

Mural art is an artistic expression common to most of the Prehispanic societies, and it was often investigated through an iconographic perspective. Nevertheless, recent research, particularly on Moche mural paintings (1st-8th century), has demonstrated archaeometry's contribution to the study of these polychromic vestiges. Indeed it constitutes a valuable tool to comprehend these ancient societies and to preserve their exceptional painting patrimony. In 2012, a new research project was developed within the program named "Origines, Héritages et Dynamiques" of the French Institute of Andean Studies in Lima. It aims to comprehend the origins of Prehispanic mural art and its spatiotemporal evolution up to the Spanish Conquest. Thanks to a transdisciplinary approach, the main objective is to characterize the pictorial technology in order to reconstitute the "chaîne opératoire" established by the painters through time. Through several studies from Ventarrón (2500-1600 B.C.) with the oldest murals in Peru, up to Tambo Colorado Inca fortress, it is possible to draw up a panorama of this artistic expression. The results obtained allow us to understand the significance and the interest of using such a protocol to investigate mural paintings, as well as patrimony conservation and technical and anthropological issues.

Wriston, Teresa (University of Nevada, Reno) and Gary Haynes (University of Nevada, Reno)

[87] *Environmental Conditions of Northwestern Zimbabwe during the Transition from Foraging to Farming: Using Isotopes, Sediments, and Soils to Reconstruct Late Holocene Climate Change in Hwange National Park*

Hunting-and-gathering in northwestern Zimbabwe was largely replaced by pastoralism and farming between ca. 2,000 and 1,200 years ago. In order to understand whether climate change influenced this transition, we collected environmental and archaeological data during a multi-year research program that included: rockshelter excavation, salvage excavation along eroding stream cuts, and geomorphological and soils analyses of various locales in Hwange National Park. The strontium, carbon, and oxygen isotope ratios for a sample of ostrich eggshell recovered from excavations were also analyzed and dated. Strontium isotope ratios were used to identify whether the samples were of local or non-local origin. Local sample's carbon and oxygen isotope values were then coupled with soils data to reconstruct Late Holocene environmental conditions. Comparison of this reconstruction with archaeological data examines how changing environmental conditions affected human landscape use throughout this culturally dynamic period.

[53] *Phytolith Analysis and Micromorphology of Neandertal Combustion Features at Roc de Marsal, SW France*

Phytolith analysis can be used to investigate the relationship between hominins, plants, and environmental change. It has proven useful in understanding specific hominin behaviors (e.g., use of

fire and fuel composition), and diachronic changes in plant species for paleoenvironmental reconstructions. The integration of phytolith analysis with soil micromorphology allows for an identification of the ways phytoliths were deposited in archaeological sites, and addresses both site formation processes and diagenesis. This combination of analytical techniques can also be used to better relate phytolith assemblages to other archaeological datasets and to hominin behavior. This poster presents an integrated phytolith and geoarchaeological study of plant remains and sediments from Roc de Marsal, a Middle Paleolithic cave in southwest France. Phytoliths have been recovered from the site, recording changes in both plant species and environmental schemes. We specifically address how the analysis of phytoliths and micromorphological thin sections from fire features can be used to provide a more detailed understanding of Neandertal pyrotechnology and spatial differentiation. We also present samples from throughout the profile to compare diachronic change in both the environment and anthropogenic activities.

Wu, Xiaohong (Peking University)

[37] *Radiocarbon Dating of Qijiaping Site in Gansu Province, China*

Qijiaping site is one of the most important sites of Qijia culture. It was found by Swedish scholar J. G. Anderson in 1924 and excavated by Gan Su Museum in 1975. Few absolute dating results have been published since then. We collected more than 30 human bone and animal bone samples from the 1975 excavation. 25 radiocarbon dates were produced after the processes of sample pretreatment, preparation and AMS measurement. The result is that most of the dates give ages not older than 3900 BP.

[234] *Contact and Exchange in Northern China: A Case Study on the Tomb of a Zoroastrian Priest, Kang Ye (512-571 C.E.)*

In 2004, the grave of Kang Ye was discovered in present day Xi'an, China. According to the epitaph, Kang Ye was a descendant of the kings of Kangju (Kang state, modern Samarkand) and a Zoroastrian priest living in the Northern Zhou kingdom. Inside the tomb were traces of ashes suggesting that Zoroastrian fire ritual had been performed. The skeletal remains were placed over a stone couch-shaped deathbed embellished with ten scenes in linear Chinese-style carvings. Currently, these individual scenes are being interpreted as representations of Kang Ye's travels and meetings with his visitors, but their sequential order is yet to be reconstructed. In this paper, I will argue that these scenes had illustrated the funerary rite, which was consistent with the Kang Ye's religious belief. I will reference both Chinese and Sogdian funerary depictions in archaeological and textual materials to explore the underlying factors that had led the Sogdians to selectively adopt Chinese artistic style to furnish the grave. I propose that the Chinese visual languages on Kang Ye's funerary furniture had provided settings for expressing Zoroastrian beliefs, using a distinct iconographic program to depict the continuous stages of the journey of the deceased's soul to afterlife.

[87] *Three Phases of Initial Human Colonization in Southern Alaska*

Once heavily glaciated during the Late Pleistocene, southern Alaska became ice-free just as the First Americans were entering the Bering Land Bridge. This makes the Susitna River in Southcentral Alaska a perfect laboratory for understanding how and why small-scale foraging societies spread throughout Beringia and ultimately the New World. While first explorers undoubtedly made decisions based on previous experience, initial occupants probably had different cultural expectations of their

environment and may have moved on to the next valley before becoming intimately familiar with any single place. It is this sense of wanderlust that is so intriguing about Late Pleistocene foragers. In unfamiliar places, especially high latitude locations, cultures adapted by mapping onto large terrestrial herbivores with frequent residential moves because specific knowledge of the landscape had not yet accumulated enough to inform more sedentary economies. Exploration of uncharted valleys must have been routine for these early Alaskans but it rarely left an archaeological trace. At the Trapper Creek Overlook site, three phases of the settlement process are represented archaeologically including exploration, pioneering, and finally colonization of southern Alaska.

Wylde, Michael (University of Florida)

[212] *The Faunal Assemblage from the Cañada Alamosa, New Mexico*

The Canada Alamosa Project in southwestern New Mexico has generated a faunal assemblage of over 24,000 elements that span 4000 years. The assemblage is the result of 13 years of excavations by Human Systems Research at four archaeological sites located on the privately owned Monticello Box Ranch. The bulk of the material was derived from pithouse and pueblo components at the Montoya Site (LA88891), the Kelly Canyon Site (LA1125), the 450 room Victorio Site (LA88889), and the Pinnacle Ruin (LA2292) but includes Archaic and Apache materials as well. Located on an ecotone and benefiting from the perennial waters of the Ojo Caliente, the location is also a frontier between Northern and Southern Pueblo cultures, with groups from both areas occupying the canyon over time. The discussion will focus on a general synthesis of the collected data and its implications to the temporal and cultural relationships between the four sites. Comparisons between key species will be used to discuss the effects of environmental and anthropogenic change in the Rio Alamosa.

[303] *Classic Veracruz Mural Painting*

Mexican iconographer Sara Ladron de Guevara identified three distinct Classic Veracruz mural painting traditions centered at El Tajin, Las Higueras, and El Zapotal. In this paper I examine how canons of representation, color palette, and architectural planning reveal regional and inter-regional artistic preferences. Beyond aesthetic considerations I analyze these same attributes from the perspective of semiotics. I will focus on what the art and architecture at the three sites tells us about cosmology, social structure, historical change, and ethnic identity in Epiclassic period Veracruz.

Wynn, Thomas

[33] *The Handaxe Aesthetic*

Perhaps the most intractable puzzle of the Paleolithic is the Acheulean handaxe. Despite a century and a half of scrutiny by several generations of archaeologists, a comprehensive understanding of these enigmatic but ubiquitous artifacts remains out of reach. The typological approach that dominated Paleolithic studies for a century arguably generated more puzzles than it resolved ('stasis', the 'Movius line') and the functional/materialist approach simply confirmed that they were tools. Cognitive archaeologists have made some headway by treating handaxes as vehicles for studying issues in cognitive evolution, but many questions remain. One is the question of aesthetics. Though the term is avoided by many Paleolithic specialists, it is nevertheless possible to document the emergence and development of an aesthetic component to handaxes. The nascent field of neuroaesthetics and the perspective of embodied/extended cognition combine to suggest a scenario in which the manufacture of handaxes provided the primary scaffold by which aesthetic appreciation evolved.

Wynne, Clive (Arizona State University)

[28] *Insights into Dog Domestication from Psychological Studies on Dog and Wolf Behavior*

The nature of the cognitive similarities and differences between dogs and wolves is highly relevant to considerations of possible mechanisms for the origin of dogs. I shall present results which show that wolves possess the potential to match dogs' levels of responding adaptively to human actions if the wolves have been carefully hand-reared by people skilled in raising wild animals. Hand-reared wolves match pet dogs' ability to follow human points to a desired object and to interpret the implications of human gaze being occluded by objects. Thus it is unlikely that dogs' ability to perform well on human-guided tasks is a newly evolved aspect of canine cognition. However, there are important behavioral differences between dogs and wolves which make it unlikely that wolves served humans in the roles typical of dogs – such as hunters' assistants and peoples' pets. These differences include wolves' far more rapid behavioral development, making it very difficult for people to adopt wolf pups, and dogs' reduced effectiveness as hunters, making them more motivated than wolves to accept human assistance in capturing prey.

[179] *The Kuahuqiao and Hemudu Bone Spades: Use Contexts and Beyond*

Bone spades crafted from large mammal scapulae recovered from archaeological contexts have generally been assumed to be earth-working implements, based on analogies with ethnographic artifacts. On the Ningshan Plain in eastern China, hundreds of scapular spades have been discovered. The majority of these scapular spades belong to the early Hemudu culture (7,000-6,000 BP), with a few earlier examples dating to the last stage of the Kuahuqiao culture (7,200-7000 BP). To identify the use contexts of the implements, we conducted over 20 experiments in 11 fields so as to evaluate the implements' performance characteristics and collect use-wear samples. Our experimental fields included both modern and ancient sediments used for agriculture and residential constructions. In this paper, we report our experimental results of soil signatures on the scapular implements across soil types and the application of the results to identify the use contexts of the archaeological specimens. Based on these results, we discuss Kuahuqiao and Hemudu land-use strategies.

Yacubic, Matthew (University of California Riverside)

[219] *Postclassic to Contact Period Economic Patterns in the Central Peten: The View from Zacpeten*

The purpose of this paper is to examine how Zacpetén, an important center for the Kowoj, functioned to meet its economic needs while creating and sustaining a communal identity between the Late Postclassic (A.D. 1200 to 1525) and Early Contact (A.D. 1525 to 1700) periods. At this time, a complex political economy existed across the Central Petén. However, these connections varied across the Central Petén according to the degree of political integration. In this paper, it is argued that the acquisition, production, and distribution of stone tools at Zacpetén during the Late Postclassic and Early Contact periods were highly autonomous, community-based activities. Most of the stone tools at Zacpetén were produced and used by individual households, though several cottage industries in the community specialized in the production of obsidian blades, chert bifaces, and millstone tools. Through community interactions, the Kowoj at Zacpetén made clear attempts to maintain their own identity despite regional influences exerted by the Itzá during the Late Postclassic and the Spanish during the Early Contact Period.

[238] *Global Connections: Beads and the Interaction Network of the Ifugao, Cordillera, Philippines*

Grave goods have been especially useful in the archaeological examination and determination of political economy and levels of inter-group interaction. Among the Ifugao of the northern highland Philippines, ethnohistoric and ethnographic datasets indicate that the group can be considered a ranked society. Dominant Philippine historical narratives also suggest that the Ifugao were in isolation during Spanish colonization. Our excavations at the Old Kiyangan Village provide material support for the presence of unequal access to resources (particularly, imported beads). The presences of these exotic materials, however, refute the idea of isolation. Our paper presents a preliminary examination of glass, clay, and stone beads found in the 2012 and 2013 field seasons of the Ifugao Archaeological Project. Our presentation deliberates on possible exchange networks connected to the village. Additionally, we explain the application of beads in neonatal burial practices and its cultural importance among the Ifugao.

[179] *Plant Resource Utilization at the Shunshanji Site in Jiangsu Province Based on the Analysis of Plant Remains*

Shunshanji is an important Neolithic age archaeological site in Jiangsu province. However, until now hardly any paleo-ethnobotanical research has been accomplished. In this paper, microbotanical remains such as starch grains and phytoliths were used to investigate the ancient plant utilization at this site. In addition, carbonized seeds from portulacaceae, rumex, chenopodiaceae, asteraceae were recovered through flotation analysis. Both stone tools and pottery vessels yielded plentiful starch grains. The grains included oryza, triticeae, quercus, coix and the root of snakegourd. Phytolith analysis further verified that rice had been exploited by Shunshanjie people. All findings above indicate that the Shunshanji people had utilized rice as their food resource; however gathering was still an important way to gain plant foods. This research result is very significant for understanding ancient human diets, origin and development of prehistoric agriculture in the mid-low Huaihe River Valley during 8.5-7.0 kaBP.

Yanicki, Gabriel (Department of Anthropology, University of Alberta)

[182] *Reinventing the Wheel Game: Intergroup Trade on the Plains/Plateau Frontier*

In Piikáni oral tradition, the namesake of southern Alberta's Oldman River is a place in the Rocky Mountains where Napi, or Old Man, taught the various nations how to play itsewah (lit. 'wheel game') as a way of making peace. In the centuries since, travelers, adventurers, and scholars have recorded several accounts of Old Man's Playing Ground and of the hoop-and-arrow game that was played there; this gaming tradition is shared by peoples on either side of the continental divide, with gambling usually accompanying it. Stories of the wheel game being played as an alternative to warfare reaffirm the observation made by authors such as Bill Brunton and Marshall Sahlins that gambling games are associated with high social and kinship distance; they thus offered otherwise hostile groups a peaceful mechanism for intergroup trade. When oral tradition, history, ethnography, and an archaeological assessment of the playing ground's most probable location—a floodplain scoured and rebuilt by floodwaters of the Oldman—are brought together, the locale can be understood as a nexus for cultural interaction and trade, through the medium of gambling and games, on the natural frontier between peoples of the Interior Plateau and Northwest Plains.

[365] *The Spatial Distribution of Domestic Facilities in the Multiethnic Morton Village Site*

With mounting evidence demonstrating cohabitation between Mississippian and Oneota groups at the Morton Village site, data regarding domestic facilities are crucial for examining how these two distinct groups interacted and influenced one another in their daily lives. The distribution of house types (wall trench versus single post) provides interesting evidence for some degree of segregation between the two, while data from features suggests a more complex and intermingled relationship. This poster will explore and compare these two distinct data sets, discussing several possible explanations for how these groups navigated the complex social atmosphere created by the Oneota migration into the central Illinois River valley.

Yano, Kenichi

[80] *Demographic Fluctuation in Jomon Period of Japan*

This paper surveys our recent studies on regional prehistoric population fluctuations during the Jomon or Japanese neolithic period. Historically, archaeological demographic reconstruction in Japan has been based on numbers of archaeological sites or structures such as pit dwellings. Our approach uses the Japanese pottery chronology, which has been established in detail. In recent years, many 14C dates of various pottery types from the Jomon period (14000B.C.-2800B.C.) have been acquired from carbonized residues on Jomon pots and vessels. As a result, we know the duration of time for each pottery type in detail, and also the number of sites in a local area per roughly every one hundred year time period. In this paper, we reconstruct observed demographic fluctuations based on numbers of archaeological sites in specific areas of Japan. And we compare them with each other to discover common tendencies and contradictory ones. If the population of all areas were declining, we can expect a common reason such as a decrease in food products of a broad area. We specify such events and conclude some events coincide with radical changes in subsistence and settlement style and/or in environmental change.

[349] *Grounding an Underground Survey: Paddy Fields and Monumental Bronze Age Shell-Scapes in the Dian Basin, Yunnan, China*

Regions under paddy cultivation often present limits on site detection. In addition to deep plowing and continuous flooding of the fields, which intensify erosion and weathering of cultural remains, paddy fields are constructed and managed through field leveling and canal dredging. These processes raze and displace sites, leaving behind a fragmentary settlement record consisting primarily of sites defined by raised mounds and/or standing architecture. Oft used survey techniques that seek to document sites through surface finds and distributions are not always suitable for subtropical zones such as Southeast Asia and southwest China where such regimes have existed continuously for millennia or longer. Focusing on the lake basin identified as the core of Bronze Age Dian polity, this paper assesses the possibility and limits of total coverage survey and explores complementary surface and subsurface applications used in our survey. The findings reveal a hierarchical Bronze Age settlement system but also highlight distinctive natural and artificial arrangements which transformed this wetland landscape into a politically contested space.

[313] *Indigenous Migration, Diaspora, and Transculturation in Colonial Cuba*

For nearly half a millennium, Cuba served as an outpost, key to the defense of the Spanish American empire, and one of the first centers for slavery in the colonial Americas. At the same time, Cuba also served the interests of various continental and isthmian American Amerindian groups and individuals, many who, from the sixteenth through nineteenth centuries, journeyed to the island colony voluntarily for trade, diplomacy, and refuge. At the same time, thousands were also transported involuntarily as victims of forced migrations. In both cases, many of these indigenous peoples settled in Cuba. The source territories of these journeys included Florida, New Spain/Mexico, and Central America. Evidence to date strongly suggests that the most continuous and substantial sources for Indigenous movement, migration, and settlement in Cuba originated in the Mesoamerican and isthmian regions, and included, for example, Maya and Nahua peoples. This study examines the diasporic and multicultural indigenous presence in Cuba, with particular emphasis on the early colonial period as, on one hand, suggestive of continuity with pre-colonial migration dynamics, and, on the other, as the springboard for mobility and extra-continental migrations of Amerindian peoples during the colonial period to the largest island in the Caribbean.

[115] *Starch and Stone: Preliminary Evidence from Jomon Period Ground Stone in Southwestern Hokkaido*

Lithic assemblages from Jomon Period sites contain a wide variety of artifacts that were chipped or ground from a number of raw materials. Typological frameworks exist to aid interpretations about function and use, but many details are still unknown when it comes to how Jomon people incorporated this array of stone objects into their lives. The place of ground stone implements within Jomon lithic technology and society is particularly intriguing, as questions about the quantities and variations in form have not been highlighted in recent discussions. In terms of resource use and food production, ground stone has become an increasingly popular line of study at sites around the world. Microscopic analysis of residues and use-wear have the potential to explore the resources that were being processed by Jomon communities, but also to shed light on whether some tool forms were linked to particular tasks and the wider implications of processing activities. The results of a preliminary study of the starch and phytolith remains extracted from ground stone implements from the Yagi site will be presented here, and discussed within the wider setting of the Jomon Period in southwestern Hokkaido.

Yates, Donna (Scottish Center for Crime and Justice Research, University of Glasgow)

[279] *The Ruin of the Maya Heartland: Successes, Failures, and Consequences of Four Decades of Antiquities Trafficking Regulation*

For 40 years the trafficking of Maya antiquities has been at the forefront of debate over the most effective way to discourage the illicit antiquities trade. Images of mutilated Maya stela and jungle-covered temples pitted by looters' trenches epitomize the effects of the global demand for looted artifacts. National and international measures have been introduced to protect Maya sites on the ground, prevent looted artifacts from crossing borders, or effect the repatriation of stolen cultural property. Each of these measures has had successes, failures, and unforeseen consequences. I will discuss the on-the-ground effects of attempts to control the trade in Maya antiquities since 1970, particularly the contrasting effects of national and international regulation introduced outside of the UNESCO convention and regulation introduced under the convention framework. A move away from object-specific import restrictions towards country-specific bilateral agreements and repatriation has not substantially contributed to the on-the-ground security of Maya archaeological sites or to the prosecution of antiquities traffickers. By approaching antiquities trafficking as a criminal enterprise that is separate from other illicit activities and by attempting to control the flow of looted cultural property without addressing underlying structural failures (e.g. insecurity, poverty, conflict), current international regulation is inadequate.

[125] *Built to Last: The Paleoindian Database of the Americas (PIDBA) and Openly-shared Primary Data Meet the Digital Index of North American Archaeology (DINAA)*

The Paleoindian Database of the Americas (PIDBA) freely shares primary and detailed attribute data on tens of thousands of ancient lithic tools spanning the Paleoindian and early Archaic time periods. As technology has changed over the last 25 years, research team volunteers work diligently to continue providing access to data through ever-more accessible and stable formats. Additionally, efforts concentrate on delivering data in formats that other researchers can deploy easily in their own analyses. Data, when presented in visual form, is minimally transformed and high-resolution distribution maps are regularly updated and made available freely. As PIDBA gears up for its third decade as a research collective, the Digital Index of North American Archaeology (DINAA) provides an exciting new venue to share, link and visualize the PIDBA ancient stone tool database. DINAA provides the infrastructure to link primary research to a rich universe of archaeological information. Using stable URIs to provide persistent web identifiers, open-access and open-source protocols, PIDBA's new partnership with DINAA enters the realm of machine-readable sharing, APIs, and, hopefully, another 25 years of successful data sharing.

[211] *A Tale of Two Tells: Variation in Neolithic Nucleated Settlements in Southeastern Europe*

Ongoing investigations by the Körös Regional Archaeological Project at two Hungarian tells located 7 km apart, Szeghalom-Kovácsalom (SzK50) and Vésztő-Mágor (V15), exposed different dimensions and settlement layouts. The 4.25 ha Vésztő-Mágor tell is 9 meters high, while the 0.5 ha Szeghalom-Kovácsalom tell rises 3.5 m above an old Körös River meander. The first settlers at both tells were Middle Neolithic groups (Szakálhát phase 5200 B.C., cal), but their growth and development diverged during the Late Neolithic (Tisza culture, 5000-4500 B.C. cal). Surface collections, geochemical and geophysical investigations and excavations at SzK50 exposed a 60 ha nucleated settlement complex surrounding a small tell that expanded rapidly at ca. 4800 B.C. (cal). The SzK50 tell also rose rapidly inside a "moat," but social differentiation between Neolithic families living on and off the tell was limited. Investigations at V15 revealed a different settlement layout at the larger tell. While it was enclosed by encircling ditches, there was no adjacent flat settlement. The 2.5 m of Tisza occupation levels at V15 show it was expanding at the same time as SzK50, however, occupations were confined within the ditches, and there is more evidence for ritual activities and emerging elites at that nucleated tell settlement.

[302] *Caribou Exploitation Dynamics and Antler Tool Production in Late Thule Occupation of the Kvichak River Drainage, SW Alaska*

Late Thule occupation of the Kvichak/Naknek River drainage systems has been attributed to northward migrating human populations deriving from the Kodiak archipelago region, assumed to be

salmon fishers and sea mammal hunters displaced by human population growth at the end of the Medieval Climatic Optimum and beginning of the Little Ice Age (LIA). However, caribou hunting seems also to have played an important role in some areas, particularly at the intersection of appropriate habitat and migration routes along the Kvichak drainage. Here, late Thule populations, representing ancestral groups to contemporary Yup'ik peoples, appear to have developed intensive hunting of all ages and sexes of caribou, following a classical catastrophic (non-attritional) pattern. Intensive antler and bone workshops for organic tool production may reflect centers of widespread trade networks, perhaps involving both Yup'ik and Athabascan groups in this cultural periphery zone. These patterns became attenuated with post-LIA climatic change.

[90] *Interpreting the Fifty-Year Rule: How A Simple Phrase Leads to a Complex Problem*

For over 40 years some archaeologists have labored under a distorted interpretation of the fifty-year rule in which anything over 50 years of age becomes "archaeological" and therefore must be recorded and evaluated for eligibility to the National Register of Historic Places. A re-examining of federal law shows that this is a mistaken interpretation. Data from the Intermountain Antiquities Computer System indicate that if this practice continues the number of featureless historical sites requiring documentation in the West will greatly increase at a large expense to the public, and that most of these costs will be associated with sites not considered significant in American history, architecture, archaeology, engineering, or culture. Solutions are presented that will give archaeologists greater flexibility in recording material culture over 50 years of age, allowing us to redirect our efforts to resources of greater interest while making the practice of archaeology more defensible to the public. These problems are symptomatic of a larger issue that relates to how cultural remains from the latter part of the 20th century and beyond will be valued. The discipline of archaeology must begin candid conversations about the relative importance of such recent material culture and its management implications.

[55] *Phytolith Analysis of Sediments from Early Agricultural Fields at Las Capas, Arizona*

Phytolith analysis of field sediments at the Early Agricultural site of Las Capas document a rich microfossil record of the plant communities that grew in farmed irrigated soils and the local environment. Although irrigation water tapped from the Santa Cruz River carried a significant load of naturally derived phytoliths, the signature of cultivated and encouraged plants was clearly recognizable among the diverse identified genera and species. Maize is well-represented, but there is a strong indication of encouraged, if not cultivated, cool-season C3 grasses, likely *Hordeum* sp. (little barley); this suggests that these grasses were incorporated into the agricultural cycle, perhaps extending seasonal production of the field system. Other identified economically useful plants include sedges, common reed, composites (sunflower family), and bottle gourd. Species from the surrounding natural environment, ranging from the bajada to montane zones, include pine and

hackberry. One unusual indicator of the local stream environment is the identification of freshwater sponge spicules and gemmoscleres. These demonstrate that water in the Santa Cruz River flowed consistently and cleanly for extended periods of time in the reach that irrigated Las Capas fields. The phytolith record complements and expands other "conventional" environmental studies such as pollen and macrobotanical analyses.

Young, Michelle (Yale University)

[2] *An Early Horizon Temple in the Tierra del Mercurio: Preliminary Results from Atalla, Huancavelica, Peru*

This presentation will put forward the preliminary results of the first season of the Proyecto de Investigación Arqueológica Atalla. The project represents a first step in clarifying the role of the Early Horizon period site of Atalla, located in the district of Yauli, region of Huancavelica, in the south-central highlands of Peru. Atalla is of particular archaeological interest as the earliest recorded monumental ceremonial site in the region of Huancavelica. The site is also distinguished by its unprecedented size and the unusually high density of the archaeological materials visible on the surface, including ceramic styles that suggest connections to the south and central coasts as well as to Chavin. These factors, and its location 15km from the rich source of cinnabar known today as the Santa Barbara mine, suggest that the site played a prominent role and may have exerted far-reaching influence during the Early Horizon period. Recent findings from the 2014 season support the hypotheses of previous investigators who have proposed connections between Atalla and distant regions of the Central Andes. This research contributes to filling in gaps in our understanding of interregional interaction during the Early Horizon period in the virtually unknown region of Huancavelica.

[323] *Architecture and Its Reflection of State Organization and Settlement Pattern in the Cochuah Region during the Terminal Classic Period*

A change in architectural style is often a result of changes in power structures and political organization. During the Terminal Classic Period, the Cochuah region not only experienced a construction boom and increase in population, but also exhibited changes in settlement patterns, site layouts, and architectural components. During this period, when all of the registered sites in the Cochuah region were occupied, there were changes in the organization of space, as well as orientation, location, and architectural design of buildings. Through analyzing preliminary data, I examine how these changes relate to the dynamic nature of political organization in the Cochuah Region during the Terminal Classic Period.

Young, Lisa (University of Michigan)

[343] *Community Spaces at Pueblo III Pithouse Villages in Northeastern Arizona*

Southwestern archaeologists identify the pithouse-to-pueblo transition as a fundamental change in the social and economic organization of small-scale farming communities. This interpretation implies that pithouse villages were organized differently than pueblos. In northeastern Arizona, pithouses were used after this transition and were the preferred form of housing in certain areas, such as Homol'ovi during the A.D. 1100s. However, systematic research on these "out of phase" pithouse villages is limited. I analyze the design and layout of community spaces, especially plazas and public structures, from well-documented 12th century pithouse sites in northeastern Arizona to investigate the organization of Pueblo III pithouse villages.

[171] *Early Human Occupation at Healy Lake: A Study of Lithic Technological Organization at the Linda's Point and Healy Lake Village Sites*

Under the collective organization of the Healy Lake Working Group, renewed investigations into the

prehistory of the Healy Lake region over the past five years have allowed for new insights into terminal Pleistocene human activity in the Alaskan interior. This paper reports the detailed assessment of curated materials from the Village site, originally excavated in the 1960s and 1970s. Using original field notes, drawings, and photographs, the lowest component was stratigraphically separated from Holocene occupations, and found to correlate closely with the Chindadn occupation originally proposed by John Cook, with some exceptions. Lithic reduction patterns seen in the debitage, tools, and bifaces are comparable to recently excavated data from the nearby Linda's Point site, and reflect patterns of mobility, raw material usage, and lithic technologies throughout their 13,000-13,500 year history of occupation.

Yu, Pei-Lin (Boise State University)

[300] *Archaic Women in the High Country: an Ethnoarchaeological Framework*

All-male hunting parties of the Middle Holocene are an important concept in the archaeology of America's western mountains. The dichotomy of later high mountain family villages (repeat occupations of high density and diversity) versus specialized hunting sites and 'man caves' (sensu Thomas) are cited to argue that Archaic women never saw, or ventured into, remote high mountain landscapes. Yet the ethnographic literature of mobile foragers contains interesting evidence of women, usually young and without dependents, participating in a variety of hunting situations — some of them arduous. In these cases dense or diversified cultural deposits typical of a 'family group' would not be expected. This paper uses ethnoarchaeological and evolutionary frames of reference to develop expectations about ancient women travelling the high mountains for hunting and other activities, and establishes that absence of evidence for family groups in the archaeology of Archaic hunting camps does not constitute evidence for absence of women per se.

[46] *The Arrival of the Incas and Its Consequences in the Transformation of the Sociopolitical Landscape of the Lower Lurin Valley*

Lately, several research projects have been taking place in the Lurin valley, central coast of Peru, in archaeological sites dating to the Late Intermediate Period (s. XVII-XV) and the Late Horizon (s. XV-XVI). This work has been complemented with recent studies focused on the presence of a segment of the Qhapaq Ñan and its importance as an articulating axis between these settlements during the Late Horizon. Preliminary results of these research studies have allowed us to reevaluate hypothesis about the type of sociopolitical organization of these communities during the Late Intermediate Period and the transformations that may have occurred with the arrival of the Inca state. This paper presents the results of a series of surveys that took place in different settlements of the lower Lurin valley. The data is then compared with data obtained from excavations in some of these same settlements in order to establish in what way their sociopolitical organization would have changed during the Inca occupation.

Zan, Luca [201] see Shoup, Daniel

Zaneri, Taylor (New York University)**[154]** *Food and Identity In the Urban Landscape*

Landscapes and foodways are intrinsically connected. Food practices act as a frame of reference to impose social, historical, and cultural meanings on places and vice-versa; their materiality provides a sense of stability in shifting demographic settings. Culinary activities can help structure the experience of place and through repetition become involved in the creation and transmission of collective memory. However, memory is far from stagnant, it continues to be challenged and reworked in everyday life; material culture is an essential part of this process. This is exemplified by some neighborhoods in New York City, such as Little Italy in Manhattan and Arthur Avenue in the Bronx, areas that received an influx of immigration from Italy in the early twentieth century. After 1920, Italian immigration largely subsided, though, and new waves of Chinese, Hispanic, and Eastern European immigrants settled in these neighborhoods. Yet, both are still thought of as "Italian neighborhoods," due to the large number of Italian food establishments that remain. The paper uses an ethnohistorical approach to examine how food as artifact of the past, helps maintain a particular Italian identity in a social landscape where it is no longer a demographic reality.

Zanotto, Hannah, Will Russell (School of Human Evolution & Social Change) and Jeffery Ferguson (University of Missouri)**[278]** *Reading between the Lines: Salado Polychrome and (In)organic Paint Variability*

During the late thirteenth century, the Salado Phenomenon swept across much of the U.S. Southwest, leaving its most indelible mark in the form of Salado Polychrome pottery. Chemical sourcing indicates that this pottery was produced in many of the areas in which it is found and many researchers now associate production areas with the settlement of Kayenta migrants. Archaeologists frequently use stylistic analyses to infer shared socio-cultural backgrounds. For example, some colleagues have noted similarities between earlier Kayenta pottery designs and those found on later Salado Polychromes. High-visibility attributes like motifs, however, are easily replicable. Low-visibility, technological attributes serve as better indicators of shared social backgrounds. In addition to decorative similarity, researchers suggest that black paint on Salado Polychrome vessels is almost exclusively organic in nature and thus consistent with earlier Kayenta production. Ongoing work at the Dinwiddie Site provides an opportunity to further explore this model. We use macroscopic and chemical analyses to characterize paint composition, thereafter exploring variability through space and time. Our results speak to the scale of integration among production communities and emphasize the role of cultural diversity within the Salado Phenomenon.

Zaragoza, Diana (INAH)**[198]** *Digging into Mesoamerican History in the Huastec Region*

La Huasteca en el noreste de México ha sido estudiada por muchos científicos, entre ellos lingüistas, arqueólogos, etnólogos y etnohistoriadores quienes la establecieron como un área cultural dentro de Mesoamérica; en esta presentación quiero hacer una síntesis de lo que sabemos sobre ella y aclarar ciertos aspectos. El conocimiento que tenemos de la Huasteca se basa principalmente en los datos recabados en una veintena de sitios arqueológicos y en sólo dos áreas mayores, por lo tanto aun cuando se han realizado investigaciones intensivas, estas aportan una visión parcial. En las exploraciones recientes los estudiosos de la Huasteca han tomado como dogma lo que se ha dicho sobre la existencia de una cultura Huasteca lo cual confunde su comprensión, ya que dentro de su amplio territorio se desarrollaron diversas manifestaciones que fueron expresadas a través de su cultura material, no siempre apegadas a las normas mesoamericanas. Es por ello que se requiere revisar, en forma crítica, el desarrollo de esta región.

[231] *Seeds of Memory: A Long-Term Study of Life and Plant Use in the Sextin River Valley of Durango, Mexico*

The relationship between people and plants is basic to all of human existence. Many archaeologists have considered this relationship as primarily economic, yet ethnographic accounts reveal important social aspects of human-plant interactions. In this paper we consider the long-term relationship between certain plant species (both wild and domesticated- beyond the triad of corn, beans and squash), botanic knowledge and memory in the Sextin valley. Here we present macrobotanical, phytolith and pollen data from the excavation of the archaeological site of Corral de Piedra- an almost 1000 year old, 70 room hilltop village- and compare and contrast findings with information recorded through ethnographic interviews with local plant use experts. This analysis points at interesting continuities, as well as changes, brought on by both social processes and major environmental shifts. Furthermore, we show how the relationship people have with plants is linked inexorably and serves as an entry point to memory evoking the lived experiences of places thusly endowing them with meaning and often repopulating them with people from the past.

[188] *Moctezuma, King David, and a Gentile Meet on a Mountain: Religious Factionalism and Indigenous Perceptions of Archaeological Sites, Archaeology, and Archaeologists*

The state of Oaxaca in southern Mexico has long been famous for its archaeological tourism, aimed mostly towards urban-based national and international publics. But while this is also the state with the largest indigenous population in Mexico, the contemporary descendants of those archaeological and historical cultures present an important yet mostly unrecognized public whose perceptions of their own past remain poorly studied. Concomitantly, the complex relationships between cultural heritage and stewardship within this dynamic and multicultural landscape often transcend a simplistic dichotomy between 'academic' vis-à-vis 'public' audiences. This presentation will draw from a decade-long archaeological and ethnographic research in the Chontal highlands, where archaeological sites, archaeology, and archaeologists are perceived differently by diverse indigenous publics, even within the same community. These, in turn, directly shape archaeological research designs and outcomes. A particular emphasis will be placed on the role contemporary religious factionalism plays in these public perceptions of the past, and some of the community-wide outreach initiatives developed to overcome such factional tendencies.

As early as the terminal Pleistocene, the northern Rockies witnessed human movement across mountain passes and high terraces overlooking expanses of boreal forest, tundra, and melting ice. Applying lessons learned from David H. Thomas' work in the central Great Basin, we combine the archaeology, geomorphology, and ethnohistory of the St. Mary River Bridge Site (24GL203) and other sites in the vicinity of east Glacier National Park to discuss how mobile groups colonized a landscape characterized by dramatic altitude gradients. Places at the junction of slope and valley and of forest and prairie were sought after for their year-round resource potential as well as their strategic location in long-distance travel networks. Whether to hunt, trade, seek visions, or make war, people of various cultures and ethnicities traversed remote mountain routes and paused at this ecotone, on and off for millennia, to stage their transitions. We further ponder the significance of staging places in the evolution of hunter-gatherer cultural landscapes.

Zeder, Melinda (Smithsonian Institution)**[414] *Feast or Famine: The Broad Spectrum Revolution Revisited***

Widely accepted models for the diversification of subsistence economies that preceded the domestication of plants and animals in the Near East frame this key transition in the context of demographically induced resource pressure following a diet breadth model of forager decision making. Many of the supporting arguments for this scenario are open to an alternative view that casts these developments within the context of resource abundance and enhanced predictability. Contrasting explanatory models based in Optimal Foraging Theory and Niche Construction theory are evaluated in light of emerging empirical data from the region.

[414] *Chair***Zeferjahn, Tanya (California State University, Long Beach), Michelle Baroldi (California State University, Long Beach), Chris Lee (California State University, Long Beach), Carl Lipo (California State University, Long Beach) and Matt Becker (California State University, Long Beach)****[52] *Rapa Nui: The influence of Freshwater Sources on Prehistoric Settlement Distribution***

One of the many mysteries of Rapa Nui (Easter Island, Chile) is how the ancient inhabitants survived with so few sources of freshwater. The scarcity of freshwater suggests that water resources may have been a constraining factor in settlement growth, patterning, and distribution. As a first step of addressing this hypothesis, we conducted field work to identify classes of terrestrial sources of

freshwater and compared them to early settlement distribution. From May-June, 2014, we generated field data on the prehistoric hydrology of Rapa Nui. These data consist of images and GPS locations for observable surface water features and field measurements of temperature and electrical conductivity to identify fresh versus saline water sources. Each identified water source was described in terms of source type, location, persistence, and accessibility. Using these water resource data and archaeological settlement evidence, we created a map to examine whether settlement patterns are spatially autocorrelated to island hydrology. Preliminary analysis suggests that coastal seeps and springs were a vital resource for ancient peoples as evidenced by the systematic co-occurrence of archaeological features such as statue platforms (ahu) with active groundwater seeps.

[367] *Message in a Bottle: Assessing the Impacts of Looting on the Archaeological Record of the Jama River Valley, Coastal Ecuador*

Northern Manabí Province of coastal Ecuador has long been a center of archaeological looting and illicit trade in antiquities derived from successive cultural occupations of the Formative Period Valdivia and Chorrera cultures and the long Jama-Coaque cultural tradition, a sequence spanning some 3,500 years. The ceramic artifacts from this trade are some of the most complex and elaborate found anywhere in Ecuador. They grace the shelves of national and regional museums, and numerous private collections throughout the country, as well as private museums throughout the world, yet surprisingly little comparable material has been found in scientifically documented archaeological contexts. This paper assesses the negative impacts of this unabated looting on the regional archaeological record based on the results of systematic archaeological survey in the Jama River Valley, a major locus of Jama-Coaque culture. Special emphasis is placed on the use of these unprovenanced materials for interpretations of prehispanic iconography and religion. Finally, some suggestions for curtailing this illicit activity are also addressed.

[173] *Investigation of Biological Relationships at the Late Woodland/ Mississippian Transition in the Northern Mississippian Hinterlands*

The Mississippian period is exceptional for the fast and wide ranging influence it had on the mid-continent. Processes behind the Mississippianization of the Midwest are often derived from explanations of trade or religion as inferred from the presence of material culture and site organization. It is unknown to what level direct contact occurred. Biological distance investigation using odontometrics and dental discrete trait analysis was conducted on individuals from Late Woodland and Mississippian sites in three sub-regions of the Midwest at the northern periphery of the Mississippian cultural landscape. General results show each population in the analysis was significantly different from the others, including Late Woodland and Mississippian individuals within the same sub-region. The most northern sites are the most biologically distant from all other sites in the project. Results also show that there was more biological population variation in the Late Woodland period than the Mississippian period for the sub-regions examined. Reduced biological variability may be the result of geo-social boundaries established during Mississippianization of some areas. By comparing three, non-neighboring sub-regions across the northern landscape, a wider look at Late Woodland and Mississippian interaction is achieved.

[103] *Archaeological Survey through the use of Remote Sensing (LiDAR, Photogrammetry and Satelital Imagery) and GIS*

The aim of this paper is to show how remote sensing (LiDAR, photogrammetry and satellite imagery), along with GIS are changing the ways in which archaeological resources are being identified, recorded, and researched. Traditional methods and techniques are not enough to prevent the potential risks that these resources face due to the accelerated pace of growth of a globalized world. Thanks to the development of Information and communications technologies (ICT), archaeologists now have a technological tool that will assist them in the better management of these resources. How these technologies can transform not only archaeological practice but also public policies in Mexico is a matter of concern that should be addressed. In this paper we present a couple of case studies (Palenque's Signoury, El Tajín) in order to reach some conclusions about the use of these technologies in our discipline, their benefits, limitations, and recommendations.

[67] *The Ritual System of the Zhongli King's Bronzes*

Since the Zhongli King's tomb in Anhui (China) was excavated in 2013, various types of bronze artifact were found which can be sourced to different regions in the Late-Chunqiu period. By examining these bronzes, this paper analyzes their origin, how they were arranged in the tomb and the kind of ritual system referenced by the Zhongli King, which accordingly would be helpful to get a better understanding of the exotic funeral structure of this tomb. It can be found out that the Zhongli state was creating its ritual system through the Jin and Chu states and mixing respectively two different bronze sets together to form a new bronze repertoire. Similar phenomenon was also seen in some other elite tombs, which showed shifts in ritual practices after Middle-Chunqiu period. By examining the ding-cauldron vessel in this tomb, this article is hoping to give some new insight about the Lie-Ding issue in the Zhou Dynasty, especially about the differences and similarities of Lie-Ding system between northern and southern China.

[67] *Gained Bioarchaeological Insight from the Skeletal Human Remains at Dabaoshan, South Central Inner Mongolia, China*

South central Inner Mongolia, China has been defined as an area where two economically diverse prehistoric cultures interacted: northern nomadic pastoralists and southern sedentary agriculturalists. Earlier archaeological work suggested that cultural exchanges between these two groups occurred prior to the early Iron Age. Dabaoshan cemetery was recently excavated in this area, and contains approximately 44 individuals. Human remains from this site represent one of the earlier settlements in this region, and analysis of this material may potentially illuminate the prehistoric lifeways and relationships of ancient peoples in East Asia. However, little attention has been given to this cemetery by way of archaeological research. This study takes a bioarchaeological approach to provide a better understanding of the ancient inhabitants at Dabaoshan. Three main tasks were set: (1) compare and contrast the morphological traits of Dabaoshan against other archaeological sites in northern China in order to gain insight into population affinities, (2) investigate the living and health conditions of communities residing in the Great Wall area of northern China during the Eastern Zhou period, and (3) clarify the internal relationships between the health, social distribution system, and special geographic environment of this early stratified society.

Zhang, Liangren

[102] *The Dispersion of Early Painted Pottery in Northwest China*

The dispersion of resource-based goods, such as obsidian and metals, has been a common subject in world archaeological literature and various mechanisms such as migration, gift exchange, and trade have been conjured up to explain it. The dispersion of painted pottery, by contrast, has been glaringly understudied. Although the raw materials for this product are less geographically constrained, its dispersion has not been well appreciated and explained. This paper aims to address the movement of the painted pottery of the Siba culture in the Hexi Corridor to the Tianshanbeilu

culture in Eastern Xinjiang, and the Qijia culture in eastern Gansu and Qinghai provinces. The dispersion to Tianshanbeilu has been well noticed but an explanation is wanting. This paper argues that a group of Siba migrants brought the painted pottery technology to Eastern Xinjiang. The painted pottery found in the Qijia culture, however, has been traditionally conceived as an integral element of a regional variant. Given the fact that Qijia has a tradition of making grey pottery, whereas the Siba culture has a tradition of making painted pottery, the motion of the Siba pottery is apparent and this paper will further entertain the ideas of gift exchange and trade.

[115] *What Was Erlitou? Social Transformations from the Longshan Period to the Erlitou Period in a Network Perspective*

This article detaches Erlitou from the paradigm of “state formation”, and argues for an alternative approach: investigating the continuities and shifts in the multiple networks of politics, ideologies, and economics from the Longshan period to the Erlitou period. The development of political networks featured massive population relocations into the Luoyang basin to stabilize the new social order in the Erlitou polity. Transformed political and ethnographic patterns went hand in hand with changes in Erlitou’s funerary rituals, which bolstered the legitimacy and authority of the Erlitou polity. Moreover, societies participating in the exchange of elite assemblages shifted their networks as Erlitou rose to prominence, which fundamentally changed the patterns of economic activity.

[179] *Analysis of Plant Micro-botanical Remains from the Jiahu, Peiligang and Tanghu Sites in the Upper Reaches of the Huaihe River*

Since 2010, we have extracted plentiful plant micro-remains from the surfaces of both stone artifacts and pottery recovered from the Jiahu (9000-7500 cal. yr BP), Peiligang (8500-7000 cal. yr BP) and Tanghu sites in central Henan Province, China. Through micro-morphological examination, starch grains and phytoliths from *Oryza*, *Triticeae* Dumort and millet were identified. These remains reflect the existence of mixed farming of rice and millet in the upper reaches of the Huaihe River 7000 years ago. We also found plentiful plant micro-remains from *Dioscorea*, *Vigna*, *Quercus*, *Coix*, *Trapa* and lotus root. However, the composition ratios of micro-botanical remains in these three sites are significantly different. This finding indicates that the geographical and climatic conditions were different in these three sites. These conditions have affected human’s selection and acquisition of the plant resources. In conclusion, we believe that a mixed farming agricultural pattern of rice and millet had formed in the upper reaches of the Huaihe River between 9000 to 7000 BP. However, this pattern was initial and in the primary stage and gathering activities still played an important role in the ancient subsistence practices.

[126] *Revised Drying Conditions in Rehydroxylation (RHx) Technique for Dating Ceramic Artifacts*

The Fired Clay Ceramic Rehydroxylation Dating (RHx) technique shows potential for establishing date of manufacture for archaeological ceramics, however for certain samples, such as those recovered at Umbro Greek and Sant’ Ancieto sites, the calculated ages were outside of the expected range by many thousand years. The observation of this over-shooting issue suggested that either the non-refractory mass (M_{nrc}) or some strongly bonded physical water were left during the ordinary drying process at 105°C. XRD analysis of the samples eliminated the possibility that other minerals retained extra crystallized water. FTIR analysis of the samples between 100-700°C indicated that only water and CO₂ were lost from the samples, allowing researchers to rule out mass loss from carbonizing organic compounds. Combined FTIR and TG analysis indicated that overshooting age

calculations derived from the release of physical water. By retesting the samples using a dehydroxylation firing at 300 °C, all those less stable components were dried leaving only hydroxyl water contributing to the RHX mass. With the newly measured dehydroxylated mass, the RHX dating formula produced better dates. Calculated dates for two samples, 2,732 and 2,646 years) are now very close to their expected age ranges (2400-2300 and 3210-2850 years respectively).

[307] *Turning a Blind Eye: Thoughts on an Archaeology of Disability*

Since the 1990s, archaeologists have increasingly become interested in teasing apart the varied experiences of the past. Feminist and critical race frameworks have forced a reconsideration of the stories that have been told and whose viewpoints have been privileged in historical interpretation. One area that remains undertheorized and poorly understood across the discipline is the role impairment has played and its effect on people and society. This paper considers what an archaeology of disability would look like. Moving beyond biomedical perspectives on impairment, it offers ways in which attending to ability can further research into material culture studies and the archaeology of war. Finally, it discusses the life of David Ruggles, a blind African American abolitionist, journalist and doctor, from a landscape perspective noting that central to understanding his experience of the western Massachusetts environment was his position as a visually impaired person. In closing, the paper offers thoughts on how a focus on disability can improve archaeological practice with fellow practitioners as well as the general public.

[285] *Identity and Specialization in the Urartian Settlement at Ayanis*

From its beginning in the 9th century B.C. the infrastructure of kingdom of Urartu was built around fortresses. In the early 7th century, the fortress network was enhanced by the construction of a new group of massive fortified administrative centers associated with extramural settlements. Of the latter, Ayanis is the most extensively investigated. Survey and excavations conducted from 1997 to 2009 investigated the relationship between the inhabitants of this settlement and the controlling institutions in the fortress. The settlement appears to be diverse, constructed with a mixture of planned and agglutinated houses, with elements of material culture suggesting mixed traditions in different areas. The settlement existed solely to serve the fortress and was abandoned, without perceptible destruction levels, when the citadel was destroyed.

[146] *On the Need for More "Gut Theory" in Academic Archaeology*

If we want archaeology to matter we need to get back to some basics. Processual archaeology got archaeologists drunk on theory. Post-Processual archaeology offered what appeared to be a hangover cure, but was really just the "hair-of-the-dog." In its theory addiction, the discipline seems to be hooked on a "philosophy du jour," stimulating in the classroom, a dissertation, or a monograph, but which quickly gets stale and unsatisfying. Academic archaeologists in particular seem to lose sight of what they have and its real power, material culture in its contexts. Artifacts don't lie; they are there or they are not. All we have to do is to figure out what they are, who put them there, when, possibly why, and maybe even how that information might be applied. Most of that is nothing fancy, requiring only some decent technology and common sense—gut theory—to figure out. Much of what we do relies on straightforward pattern recognition, not some philosophical perspective that even

philosophers argue about and have a tough time communicating. Several examples from activist archaeology demonstrate that archaeology's publics have little use for what they see as abstruse, ivory-tower silliness and how we might do things better.

[130] *Games and Foodstuffs at Chichen Itza: Relating Patolli and Starch Grains at Structure 2D6*
Structure 2D6 is a gallery-patio type building situated within Chichen Itza's site core right north of the Temple of the Warriors and the Temple of the Big Tables. Its gallery was excavated in 2009 and discoveries included a C-shaped bench following the buildings walls with just one exception — an altar right next to the passage that leads to the patio — as well as several column caches and a possible sacrificial stone. The removal of roof debris also freed up a well-preserved stucco floor that covers the structure's interior. Detailed cleaning of the gallery's southern half unraveled the presence of three patolli or bul fields carved directly into the plaster surface. The same kinds of graffiti had already been identified in a series of other Mesoamerican sites and are usually interpreted as the result of male-exclusive gambling activities. Chemical residue analyses performed on floor samples from Structure 2D6 showed distinctive enrichment patterns in the patolli's immediate vicinity. Our paper reports on starch grains recovered from that area, linking what seems to be a specific activity with particular foodstuffs.

[8] *Unmanned Aerial Vehicles in Archaeological Survey: Results from Portugal and Mozambique*

Any technological advance that can save archaeologists time, money and manpower should be explored thoroughly. This poster presents the use of Unmanned Aerial Vehicles (UAVs), or Drones, as a supplemental tool to traditional archaeological survey. Examples from Portugal and Mozambique are included to give visual representations of the possible uses of drone technologies. We used a commercially-available Phantom 2 quadcopter with a GoPro camera for coastal survey in Praia Ray Cortico, Portugal. Specifically, we used the drone-mounted camera to visually inspect largely inaccessible cliff deposits in order to evaluate their archaeological potential. In Mozambique, we used the drone to conduct aerial survey in advance of pedestrian survey teams in the roadless landscape of Ncuála Valley, in northern Mozambique. The drone enabled the inspection of potential

areas for rock shelters and other open-air site locations. The drone-mounted camera was instrumental in being able to target specific areas and eliminate others from further consideration thus saving valuable time. This poster also includes discussions on methodologies of specific uses of the drone and attached camera. Potential future uses include LiDAR and GPS mapping to create small-scale DEMs.

[215] *The Preferential Collection and Use of Ochre Pigments and Iron Ores at Twin Rivers Kopje, Zambia*

Twin Rivers Kopje, Zambia is a Middle and Later Stone Age site first excavated by J. Desmond Clark that has yielded extensive evidence of mineral pigment collection and use dating to as old as 300,000 years ago. In this study, we sampled pigment sources within 25 km of Twin Rivers for digital colorimetry and trace element fingerprinting using Laser Ablation - Inductively Coupled Plasma Mass Spectrometry. In addition, all pigment excavated from the site by Clark was analyzed for sourcing. Multiple ferruginous minerals are represented in the pigment assemblage; notably, the visually striking mineral specularite was found to have been preferentially abraded in contrast to hematite and other iron minerals which were predominantly flaked. We propose that this is due to the metallic reflective qualities of specularite and its red-purple streak which contrasts with the dull red-brown of hematite. Surveys identified a major source of vein mineralization specularite 19 km northwest of the site at Sanje Hill. Multivariate statistical analysis of trace element fingerprints assigned a number of pigment artifacts to this source with high confidence, suggesting that other iron oxide deposits closer to the site were ignored in favor of this prominent source of high quality pigment.

Zovar, Jennifer (Whatcom Community College)

[184] *Post-Collapse Change and Continuity in Bolivia's Desaguadero Valley*

There is often a discontinuity between studies of 'collapse' and studies of post-collapse periods. This can lead to the periods following collapse being defined by a "lack" of what came before. In the southern Titicaca basin, for example, the period following the collapse of the Tiwanaku state has been defined by a lack of monumental construction, raised fields, large-scale feasting events, or Tiwanaku-style iconography. Nevertheless, recent explorations have demonstrated that while "collapse" is generally understood as a relatively "rapid" sociopolitical shift, it does not necessarily lead to abrupt discontinuity in the lives of individuals or communities, especially in non-elite circles. In Bolivia's Desaguadero Valley, for example, significant continuities are noted in utilitarian ceramics and everyday domestic architecture at the same time that there were major changes in ceremonial patterns and larger-scale settlement organization. This paper interrogates the multifaceted nature of these changes and continuities through the process of collapse and subsequent post-collapse reorganization in the Desaguadero Valley.

[201] *Digital Solutions in an Imperfect World: Digital Asset Management, Outreach and the Crisis in Curation*

Difficult realities have set in for some cultural resource professionals. Space (and funding) to protect cultural materials is at a premium, causing some curators and archaeologists to think about heritage preservation and site conservation in new ways. Using the presenter's experiences developing an archaeology outreach website, this paper explores how digital asset management has become a useful addition to traditional methods of artifact and site conservation in Louisiana, a state with a rich but endangered archaeological heritage. Digital asset management may offer curators and site managers some assurance and enhanced opportunities for outreach, even if it is not an ideal solution to the existing crisis in conservation.

[298] *Marine Mollusks as Evidence of Mexica Imperial Expansion*

Of the approximately 175 offerings uncovered in the Templo Mayor Project excavations (1978–present) of Tenochtitlan's sacred precinct led by Eduardo Matos Moctezuma, 60 reportedly contained marine mollusks. Among them, 47 offerings, dating from 1440 to 1521 CE, were explored between 1978 and 2006, while 13, dating from the reign of Ahuitzotl (1486–1502), were recovered between 2007 and 2013. In the first group, 180 species were identified, including 119 endemic to the Caribbean, 41 to the Pacific, and 5 to both areas. The second group added 71 new examples for a total of 251 taxa, including 130 Caribbean, 112 Pacific, and 5 endemic to both coasts. As one can see, these data reveal a notable increase of Pacific species coming to Tenochtitlan during Ahuitzotl's reign. This preponderance and the presence of species such as *Terebra brandi*, *Nassarius luteostomus*, and *Hipponix grayanus*, whose distribution includes the modern-day Mexican states of Colima, Jalisco, Nayarit, and Sinaloa, and others such as *Corbula chittyana* and *Noetia magna*, respectively from the Yucatan Peninsula and Nicaragua, would suggest Mexica imperial expansion to the north and south during this period.

[176] *An Ethnoarchaeological Study on Anthropic Markers from a Shell-Midden in Tierra del Fuego: Lanashuaia II*

Hunter-gatherer sites constitute often challenging research contexts within the discipline of archaeology; identifying and even defining whom Tierra del Fuego constitute an optimum arena for studying anthropic markers in hunter-gatherers sites for two reasons: a) good preservation of archaeological remains; b) a rich ethnographic record about hunter-fisher-gatherer societies who inhabited this region. The aim of this work is to present the first results of an intrasite spatial analysis, based on the distribution of different proxies and archaeological materials, carried out on a layer from the site Lanashuaia II, a shell midden located on the Beagle Channel coast (Tierra del Fuego, Argentina). Ethnoarchaeology is used as a methodological tool to give content to the concept of anthropic markers by means of formulating archaeological hypothesis on the basis of ethnological information. Geostatistical results are expected to be representative of the social uses of space, such as productive or consumption areas within the habitat and its surroundings.

[302] *Digging Deep or Just Scratching the Surface: Challenges and Successes with Labrador Inuit Archaeobotany*

Over past decade, I have assembled a reasonable variety of archaeobotanical data sets from 17th and 18th century Labrador Inuit sites, which includes both macro- (seeds, wood) and micro-botanicals (phytoliths and starches). The recovery and interpretation of these remains, however, has met with many challenges. I will discuss a number of these challenges along with the successes of this work and provide some guidelines to further archaeobotanical research and other work of this type in the Arctic.

[182] *Rock and Roles: The Chunkey Experience in the Mississippian World*

Games have the ability to change the course of relationships between people, whether through direct engagement as participants or spectators. This paper explores the peripatetic nature of the pre-contact Chunkey game and its role in the initial and sustained spread of Middle Mississippian lifeways from the greater Cahokia region near modern day St. Louis, beginning around A.D. 1050.

While Middle Mississippian culture quickly spread throughout the midcontinent at this time, the Chunkey game itself became grounded in the movement of people and objects through meaningful physical and social landscapes, providing opportunities for individuals and communities to engage in the shared experiences of this sport. Stone discs used in the game survive in the archaeological record as remnants of this sport; objects of a material practice that facilitated the creation of new social memories and identities every time the game was played. Through these stones and the spread of Chunkey, spectators and players incorporated new collective (or perhaps diverging) mythic histories into this game tied to the distant place of Cahokia. Citing past events, these histories reconfigured and united communities within a common historical identity, while simultaneously constructing differences between opponents.
