

ABSTRACTS OF THE SAA 80TH ANNUAL MEETING

THE ANNUAL MEETING of the Society for American Archaeology provides a forum for the dissemination of knowledge and discussion. The views expressed at the sessions are solely those of the speakers and the society does not endorse, organizers, not the society.

SYMPOSIUM ABSTRACTS

[1] Symposium · PRESIDENTIAL FORUM: ORDERLY ANARCHY IN PREHISTORIC CALIFORNIA
(SPONSORED BY SOCIETY FOR CALIFORNIA ARCHAEOLOGY)

In his recent book, *Orderly Anarchy: Sociopolitical Evolution in Aboriginal California* (U.C. Press 2014), Robert Bettinger develops a provocative new model to explain the emergence of the exceptionally small socio-political units observed in most of Native California at the time of contact. He proposes that the key development that promoted the evolution of California's unusually small polities was privatization of stored plant food, which incentivized the intensive use of abundant but costly plant foods (pinyon and acorn). Such privatization is argued to have resulted from the appearance of bow and arrow technology which permitted the formation of smaller, family-centered social units more inclined to invest in costly resource procurement because proceeds went directly to offspring and close relatives. Over time, these developments led to decreased opportunities for movement and inter-group alliance, encouraging instead extremely small-scale, family-size units that interacted via a system that Bettinger terms "orderly anarchy." In this session scholars from inside and outside California will discuss and evaluate Bettinger's case for socio-political evolution in indigenous California.

[2] General Session · SITES, SETTLEMENTS, AND SPATIAL ANALYSIS IN SOUTH AMERICA

[3] General Session · ARCHAEOLOGICAL APPLICATIONS OF X-RAY FLUORESCENCE

[4] General Session · ADVANCES IN ARCHAEOLOGY TECHNOLOGY

[5] Forum · DIVERSE DIGITAL ARCHAEOLOGIES - A CAA-NA & DDIG EVENT
(SPONSORED BY DDIG AND CAA-NA)

The Digital Archaeology community is growing. The methods, practices and research activities drawing on and contributing to the domain continue to expand, including everything from geophysical surveys to agent based modeling to text mining to ontology development to multimedia presentations of public heritage projects. This forum takes advantage of the diversity and breadth of interests of the digital archaeologists present at the SAA to exchange ideas and discuss key developments and new directions. In this forum discussants will briefly present their digital archaeology research and articulate how their work contributes to the broader domain. Presentations will be followed by a general discussion of the advantages and challenges of the diversity of digital archaeology, focusing on ways to bring together digital archaeologists working on different types of projects and promote communication. This forum aims to create the foundations for ongoing conversation between various specialists, interest groups and stakeholders within the SAA, CAA and the Digital Archaeology community at large.

[6] Poster Session · GEOARCHAEOLOGICAL AND SOURCING STUDIES IN THE AMERICAN WEST

[7] Poster Session · GIS MODELING AND GEOSPATIAL ANALYSIS: STUDY OF LANDSCAPES AND SETTLEMENT PATTERNS

[8] Poster Session · REMOTE SENSING AND GEOPHYSICAL SURVEY

[9] Poster Session · XRF IN ARCHAEOLOGY

[10] Poster Session · GEOARCHAEOLOGY AND GEOCHEMISTRY**[11] Poster Session · GEOPHYSICAL SURVEYS, GIS, AND SETTLEMENT PATTERNS IN PERU AND BOLIVIA****[12] Poster Session · MATERIAL CULTURE / OBJECT STUDIES****[13] Symposium · ARCHAEOLOGY AND THE STATE**

The relationship between archaeologists and the State is subject to significant debate. Depictions range from Trigger's colonialist, nationalist and imperialist to the utilitarian conceptions of State responsibility for the past as present in the day-to-day of cultural resource management, if one could even consider these as opposite ends of a spectrum at all. This session seeks to collate contemporary conceptions of archaeology's connection to and representation within wider State objectives and structures. Does archaeology persist as a tool for the formation and maintenance of nationalist and capitalist narratives or does it serve to resist, even overcome, State mechanisms of control? The potential answers to this question are diverse, nuanced and critically engage with some of the fundamental elements of archaeological identity. Examples from different jurisdictions, from the past and the present, contextualize the ongoing exchanges between archaeologists and the State as reflective of wider social movements and philosophical horizons. Archaeology's very inclusion within and/or resistance to State structures emphasizes the broader political arenas to which the products of archaeology are applied. Ultimately this session seeks a heightened awareness of archaeology's position within the dynamics of governance to better grasp the broader implications of archaeological practice.

[14] Symposium · CONNECTING HIGHLANDS AND LOWLANDS – TOWARDS A HOLISTIC APPROACH TO UPLAND AND LOWLAND SYMBIOSIS IN THE PAST, PRESENT AND FOR THE FUTURE

Highlands and lowlands, in many parts of the world, are presented in past and present political and popular discourse as fundamental dichotomies. With few exceptions, our narratives of civilization cast highlands and their societies in the light of lowland ideologies of power and identity. Mountain people, despite much de facto demographic fluidity and cultural and economic interdependence, are invariably portrayed in unfavorable terms in texts and iconography, where they become the 'other' to ordered, urban and agricultural lowland life. This has shaped not only historical and modern perceptions of highland societies but also archaeological practice. Archaeologists have tended to shy away from the investigation of transitional/highland regions as methodologically difficult and culturally marginal. Anthropologists and cultural ecologists, by contrast, have become more concerned with highland societies as their lifestyles and landscapes are increasingly threatened by current political and economic regulations and the realization that lowland ecosystems can only be understood and preserved in conjunction with surrounding uplands. In this session, we want to engage a wide variety of scholars, practitioners, photographers and documentary makers in a rare transdisciplinary dialogue that will facilitate the development of a holistic approach to the study of highland-lowland interconnectivity today and in the past.

[15] Symposium · NEW DIRECTIONS IN HISTORICAL ARCHAEOLOGY: THEORY, METHOD, AND PRACTICE

One of the strengths of historical archaeology is its inherent interdisciplinarity. As a result of its multidisciplinary nature, historical archaeology is quick to adapt cutting edge social theory hand-in-hand with methodologies from the environmental and geosciences while maintaining a political and intellectual commitment to collaboration with descendant communities. These synergies result in more holistic archaeological interpretation. The papers in this session, demonstrate how historical archaeology with its interdisciplinary nature and close ties to modern communities is ideally suited to developing collaborative projects that integrate a diverse array of disciplines and perspectives.

[16] Symposium · RELIGION, HISTORY AND PLACE IN THE ORIGINS OF SETTLED LIFE IN THE MIDDLE EAST.

This session explores the role of religion and history making in the origin of settled life in the Middle East. There are three particular foci that the session will address. The first concerns the repetitive building of houses or cult buildings in the same place. It can be argued that the long-term social relationships that are characteristic of delayed return agricultural systems need to be based on historical ties to place and to ancestors. At Çatalhöyük history houses have been identified, but repetitive building constructions throughout the Neolithic of the Middle East could have played similar roles. The second focus concerns the possible cosmological layout of settlements. Many Natufian, PPNA and PPNB sites in the Middle East demonstrate a degree of organized layout and sectors have been identified. At Çatalhöyük there is a clear north-south and west-east significance to house and settlement layout. How widely is cosmological patterning found? Third, what is the timing of the emergence of a concern with history making in place and cosmological layout? At what point in regional sequences do such features emerge and with what does their appearance correlate? Can such correlations be used to suggest the causal processes that produced such features?

[17] Symposium · INNOVATIVE INTERPRETIVE APPROACHES IN MICROWEAR AND RESIDUE ANALYSES

There have been major advances in microwear and residue analyses in recent years regarding method development. Interpretive methods, however, have not been in step with these new methodological developments. In this symposium we present new ways of applying microwear and residue analysis for the study of human culture, economics, social organization, and site formation. With greater understanding of the potential contribution of these techniques, we hope to extend the breadth of their use and further expand their applications in archaeology.

[18] Symposium · IDENTITIES IN THE VIKING WORLDS

In the past decade a number of projects have brought the concept of identities to the forefront of Viking Age research. Projects have focused on how identities are created, maintained, and manipulated in both the Scandinavian homelands and the wider world of the Viking diaspora. Closely related is a better developed understanding of relationships between the various nodes connected as part of networks created by trade, migration, settlement and conquest. These relationships allowed for a flow of people, resources, objects, and ideas both out of and back into homelands new and old. With the increased use of scientific techniques the nature of Viking research is becoming increasingly multidisciplinary; genetics, isotopic analyses and network theory have been added to the existing repertoires of archaeology, history, linguistics and toponymics and more. The aim of this session is to take stock of current research, and to evaluate how new evidence may challenge, confirm or corroborate both former research into Viking identities and the different approaches.

[19] Symposium · FORENSIC ARCHAEOLOGY

This session aims to highlight recent projects from those active in forensic research and case work. As forensic archaeology continues to grow as a discipline and is utilized with increasing frequency by law enforcement officials, case studies are of great use to those engaged in forensic field work. In addition, research is essential to strengthening the theoretical foundations of forensic archaeology. This session also features research projects that will be of benefit to future forensic work and criminal justice. Those involved in research have the opportunity to address areas untouched by current practitioners. By bringing together researchers and practitioners, this symposium aims to create meaningful dialog and spur collaboration.

[20] Symposium · UNTANGLING THE INTANGIBLE: RECONSTRUCTING IDEOLOGIES, BELIEFS, AND RELIGION IN THE PAST

Identifying the material expression of beliefs, ideology, and religion has in recent years become a topic of increased importance to archaeologists seeking holistic explanations for past human behavior. Studies of ideology, beliefs, and religion have wide-ranging applicability. For example, since beliefs and ideology are integral to economic, political, and religious power, focus on prehistoric and historic belief systems is particularly apropos to studies of social complexity and the emergence of socio-economic inequality. Further, elucidating the immaterial and reconstructing prehistoric cosmologies is central to interpreting landscapes and worldviews of prehistoric hunter-gatherers and pastoralists. Here, participants are asked to present their methodological and theoretical approaches to ideology, beliefs, and religion in archaeology with the aim to build on emergent scholarship on ideology and religion in the past; demonstrating how they are empirically identifying and studying the intangible. Potential topics include, but are not limited to, memory making, material culture as metaphor, landscape creation, materiality, mortuary studies, symbology and iconography, and the link between sacred narratives/texts and the archaeological record. Discussions on how ideology and belief systems in political, economic, and/or religious contexts may cross-cut traditional concepts and disciplinary boundaries are especially welcome.

[21] Symposium · ADVANCES IN THE ARCHAEOLOGY OF WEST MEXICO AND THE SURROUNDING AREAS

Since it is difficult to clearly define the geographic extent of West Mexico and the interactions in which social groups in this region participated, this session includes archaeological research taking place both within the classic area of West Mexico, as well as the surrounding areas. Paper topics include ethnoarchaeological studies of pseudo-cloisonné and negative ware ceramics, analyses directed at more clearly defining the regional chronology of the northern frontier area, studies of interaction within the Río Verde-San Pedro, Los Altos de Jalisco, El Bajío, and the Basin of Mexico, mortuary practices in Colima, the study of ritual fire and political organization in Postclassic Michoacán, and recent efforts involving the negotiation of archaeology and local politics in the Lake Pátzcuaro Basin. The range of topics in this session illustrates the diversity of archaeological projects currently being conducted in Jalisco, southern Zacatecas, Colima, and Michoacán.

[22] Symposium · HOUSEHOLD RITUALS IN THE ANCIENT AMERICAS – FROM PATIO GROUPS TO PUEBLOS

In this session we would like to explore the role of household ritual practices in society, specifically their role in social change. We are interested in the reflexive relationship between domestic and public rituals in ancient American societies. For instance, how do rituals performed at different scales and in different contexts affect or structure socio-political relations? Archaeologists working in different regions of the Americas have approached such issues from various theoretical perspectives and employing various methodologies. They have addressed ritualization, resistance, kinship, and gender, among other anthropological themes. By bringing together a diverse group of scholars, we hope to provoke new ideas, questions, and debates about ritual activities carried out in residential contexts.

[23] Symposium · INTERROGATING IDENTITY: THE FLUIDITY OF SOCIAL BOUNDARIES IN AFRICAN ARCHAEOLOGY

The concept of identity within archaeological discourse is sometimes uncritically linked to modern or historically-known ethnic groups and political entities. At the same time, archaeologies of identity that consider multiple scales of identification (tied to gender, kinship, locality, subsistence regime, status, religion, mobility, and ethnicity, to name a few) have made important contributions to the field, moving us far beyond the old “pots equal people” paradigm. In African archaeology, for example, there is growing recognition that the human past is characterized by intricate socio-economic mosaics, where foragers, herders, agriculturalists, and individuals who transcended these categories can be essential constituents of complex polities. In these environments, interpersonal and intergroup interactions both reify and erode various social boundaries, demonstrating that identities are both enduring and highly mutable. The papers in this session seek to further this discourse by interrogating the twin issues of interactions and identity within Holocene African archaeology. Presenters use a broad range of methodological techniques and cover topics from throughout the continent.

[24] Symposium · ELLOS FUERON LO QUE HICIERON: ACTIVIDADES DE LA ELITE Y GRUPOS NO ELITARIOS EN LAS TIERRAS BAJAS MAYAS

En 2012, Douglas y Gonlin definieron los grupos domésticos con base en las diversas actividades llevadas a cabo por sus miembros, resaltando de esa manera la importancia de estudiar tales actividades para entender la vida de los Mayas antiguos. Como es bien sabido, los antiguos Mayas desempeñaron una mirada de actividades de carácter económico, ritual y político. Lo que la gente hizo y cómo lo hizo, sin embargo, varió con base en varios factores, tales como tiempo, geografía y estatus.

Esta sesión tiene como objetivo explorar las actividades económicas, políticas y rituales llevadas a cabo por grupos de diferente estatus (por ejemplo, grupos de élites y grupos no elitarios) que habitaron las diversas regiones que integran las tierras bajas mayas para poder entender como la conducta de estos grupos fue similar o diferente. Las organizadoras buscan un amplio rango de metodologías para esta sesión.

[25] Symposium · ADVANCES IN THE METHOD AND APPLICATION OF CERAMIC PETROGRAPHY: INTERNATIONAL PERSPECTIVES ON KEY ARCHAEOLOGICAL QUESTIONS, PART I

(SPONSORED BY GEOARCHAEOLOGY INTEREST GROUP (GIG))

Over the last 30 years the archaeological application of petrographic analysis has gained methodological and theoretical traction. Ceramic petrography, in particular, has emerged as a key methodological tool because it provides insights into technological practice, the choice and manipulation of raw materials by ancient potters, and methods of forming and firing conditions. Petrography has the advantage of being a visual technique whose observations are easily combined with macroscopic study of fabric, form, and decoration. A holistic approach that combines such observation with chemical (e.g. INAA, ICP-MS, XRF), mineralogical (especially XRD), and microstructural (SEM) data, in addition to geological information provides a powerful analytical strategy for understanding the social, political, economic, and environmental contexts of ceramic production, distribution, and consumption. Such information is vital for developing robust interpretations of ancient social organization and change. We have invited a group of scholars whose work highlights advances in ceramic petrography for understanding, technological traditions and change, identity, ceramic production and exchange, migration, and the social context of consumption. Many of the papers highlight new methods for combining petrography with other analytical strategies to address social process. As such, the session provides an analytical exchange among researchers with diverse intellectual backgrounds and research interests.

[26] Symposium · STAYING OUT OF SMALL, SQUARE HOLES: THE CONTRIBUTIONS OF STEPHEN KOWALEWSKI TO THE UNDERSTANDING OF HUMAN SOCIETIES AT REGIONAL AND GLOBAL SCALES

Stephen A. Kowalewski is best known for his work in Mesoamerica, especially the full-coverage regional surveys in the Valley of Oaxaca and the Mixteca Alta that have increased our understanding of Zapotec and Mixtec societies. Kowalewski's broadly comparative research has advanced understanding of the long-term and diachronic trajectories of multiple societies across the world. In this session we invite fellow archaeologists to gather, reflect upon, and discuss the great intellectual and personal influence that Steve and his work have had on our lives, our work, and our continuous attempts to gain a large scale, "big picture" understanding of the societies and the social phenomena we investigate. The invited papers in this session showcase current research taking place in various world regions with a special emphasis on how Steve's wit and wisdom continue to guide and resonate in our research, our development, and our professional careers.

[27] Symposium · CRISIS AND OPPORTUNITY: LEGACY COLLECTIONS AND ARCHAEOLOGICAL RESEARCH IN THE 21ST CENTURY

(SPONSORED BY MUSEUMS, COLLECTIONS AND CURATION COMMITTEE)

Museum curators, archaeologists, and researchers are forging ahead with creative and innovative ways of dealing with the day-to-day realities of the curation crisis in the 21st century. This crisis is a national phenomenon. However, recent collaborations between museum staff, academic and professional archaeologists, students, and local archaeological organizations, presents an opportunity to demonstrate the research and curation value of connecting students and researchers with existing scholarly assets – such as legacy collections - in lieu of creating new collections. This session highlights current research with existing archaeological collections from the American Southwest, and provides a forum to continue the dialogue on addressing the curation crisis.

[28] Symposium · NOSE TO TAIL: AN INTERDISCIPLINARY LOOK AT DOGS IN THE PAST

The relationship between humans and dogs has long been a focus of archaeological inquiry and continues to capture the interests of researchers from different disciplines and the general public. This session takes an interdisciplinary approach to understanding the human-dog connection in the past by presenting research from archaeology, ethnography, cognitive psychology, genetics and biology. Presentations will provide insight on the complexity of the human-dog relationship by exploring the deep history of this connection. From understanding wolf cognition as a template to dog domestication, genetic variation, ancient dog health, dogs as technology, and the more sacred dog-human bond, a broad analysis of dogs in the past will be presented.

[29] Symposium · ARCHEOLOGICAL STEWARDSHIP AND SCIENCE IN THE NATIONAL PARK SERVICE

In fulfilling its near century-old mission, the National Park Service (NPS) preserves, protects, and interprets archeological sites of breathtaking diversity throughout the United States. These range in scale and type from Paleo-Indian quarries to historic plantations and homesteads to submerged aircraft. NPS archeological programs are implementing education and civic engagement projects for diverse audiences across the country. At the same time, they are responding to new fiscal realities and significant challenges including climate change, increased looting and vandalism of sites, and energy development. This session demonstrates the depth and diversity of recent NPS archeological practice by presenting a sample of park-based recent research, outreach, and planning by the agency's archeologists.

[30] Symposium · THE INTERSECTION OF SACREDNESS AND ARCHAEOLOGY

As more and more of our physical landscape is being altered through rapid growth and development, the cultural landscape is also being changed and challenged. These changes often reflect the interests of some members of society, while the interests of others, including those of Native communities and many archaeologists, environmentalists and others who understand the importance of knowing the past, are disregarded. The latter group is dedicated toward preserving special places, and continuing to provide for Native people the ability to celebrate their traditions and focusing on defining the sacred landscape. What is sacred? Who defines sacred, and with what parameters? And, how is sacredness determined? Is it a legal term that is defined by the courts? And, are there degrees of sacredness? Can sacred and profane co-exist? What role do Native oral traditions play in defining a sacred landscape? Is a sacred landscape static, or can it be fluid and change? The term sacred can be applied to rock art sites, formations on the physical landscape, rituals, artifacts, evidence of past activities, and even, intangible oral traditions. This symposium will explore the many facets of sacredness that challenges the participants to view sacredness with an emic perspective.

[31] Symposium · FROM FORAGERS TO EMPIRES: RECENT RESEARCH ON THE SOUTH COAST OF PERU

From Paracas and Nasca to the Inca Empire, for thousands of years the South Coast of Peru was a hub for the evolution of indigenous societies in the Andes. This symposium focuses on the most recent research undertaken on the South Coast. From the dry Nasca Valley to the Paracas Peninsula, from the coast to the highlands, and from the Middle Preceramic through the colonial and Republican period, participants focus on

foodways, ritual, pilgrimage, exchange, production, identity and a host of other issues that shed new light on our understanding of this region's prehistory.

[32] Symposium · RE-EVALUATING THE MARGINALITY OF CALIFORNIA'S ISLANDS: IMPLICATIONS FOR ARCHAEOLOGICAL INTERPRETATION

Compared to the mainland, the islands off the Pacific coast of Alta and Baja California have long been considered marginal habitat for ancient hunter-gatherers. Marine and terrestrial island ecosystems were changed considerably, however, by severe overgrazing and overfishing during historic times, and are only beginning to recover under modern management practices (removal of grazing animals, etc.). The perception of marginality has greatly influenced our interpretation of a variety of archaeological issues including the antiquity of first settlement; productivity of island floras, freshwater, and mineral resources; human population density; and the nature of regional exchange networks. Recent advances in archaeological and historical ecological research, combined with field observations of recovering ecosystems suggest the islands may not have been the marginal habitats they once appeared to be. While older models developed through the perspective of island marginality may hold true, it is important to reconsider our interpretations of past and present archaeological data, and re-evaluate long-held assumptions, given these new insights. Ultimately, a reexamination of the effects of perceived marginality on the history of archaeological interpretations on California's islands may have broad implications for other island archipelagos worldwide.

[33] Symposium · COGNITIVE ARCHAEOLOGY

The study of cognitive archaeology began to emerge in the 1970s, and is now becoming a discipline in its own right. Cognitive archaeology aims to understand the mental abilities of past human ancestors through rigorous application of scientific techniques in archaeology, psychology, neuroscience, anthropology, and primatology. One of the main goals of cognitive archaeology is to develop new ways to interpret prehistoric cognition from the archaeological record. We are now in an exciting phase of cognitive archaeology as many disciplines come together to create new synergies. In the process of developing this new cross-disciplinary field, it is important to establish legitimate and replicable research methodologies. Collaborations between disciplines can help to validate methods and results.

This symposium aims to bring together established and emerging cognitive archaeologists to showcase their latest research and theories, consider the range of potential for the discipline, and clarify misconceptions. At the end, participants will discuss at length to create a manifesto of best practice for cognitive archaeology.

[34] Symposium · ARCHAEOLOGIES BY COMMUNITY MANDATE: PRACTICING COLLABORATIVE AND COMMUNITY-ENGAGED RESEARCH

(SPONSORED BY INDIGENOUS PEOPLE'S INTEREST GROUP AND COMMITTEE ON NATIVE AMERICAN RELATIONS)

Postcolonial archaeologies, the entanglements surrounding the conservation and management of cultural resources, and the frictions of legislative compliance have made pushing research for research's sake increasingly unsustainable. As a result, many archaeologists have sought to practice an archaeology in which descendant communities, as well as other sectors of the public with vested interests, play an active role. Descendant and public involvement in archaeological and historical research is of particular importance among historically overlooked or disenfranchised communities as these groups are increasingly identifying opportunities for empowerment through collaborative projects and community-based activities. This session seeks to explore the challenges and rewards of practicing collaborative and community-engaged archaeologies. Issues we seek to address include collaborative successes, failures, resolutions to contentious situations, and the theoretical underpinnings of engaging with community and public archaeologies.

[35] Symposium · THE FRISON INSTITUTE/GEOARCHAEOLOGY INTEREST GROUP SYMPOSIUM: ARCHAEOLOGY AND GEOARCHAEOLOGY OF ROCKSHELTERS AND CAVES

(SPONSORED BY THE FRISON INSTITUTE/GEOARCHAEOLOGY INTEREST GROUP)

Archaeologists have targeted rockshelters and caves for more than a century because they are easy to find, are often less affected by regional erosion and have better preservation than open-air sites. In its early history, archaeology treated caves and rockshelters as artifact mines and, later, as sources of artifact chronology. But, as fixed, sheltered places on the landscape, rockshelters and caves also offer a window onto how settlement systems shift from the point of view of a particular class of sites. At the same time, rockshelters and caves can be geologically complex and their contribution cannot be tapped without acknowledging this fact. Papers in this session examine the archaeology and geoarchaeology of rockshelters as a class of sites whose characteristics can inform about more general properties of the changing cultural system(s) using those sites.

[36] Symposium · DIFFERENCE IN ARCHAEOLOGICAL THEORY AND PRACTISE

The programs of processual, contextual, and symmetrical archaeology have sought to inter-relate the material and the social components of community life in various ways that either prioritise or equalise their respective roles. An alternative, however is that they are inherently non-correspondent, functioning in different ways that can be both complimentary and in conflict. This session seeks a way of approaching the material past that systematically recognizes the differences between textual and archaeological sources of information and incorporates the role of the friction inherent in the social world between verbal meaning, social action and the material. A systematic inquiry is required which incorporates the principle of potential non-correspondence allowing for the possibilities both of correspondence and friction and disjunction between materiality and sociality. The aim is to approach the archaeological record as a relational phenomenon derived from potential non-correspondence between the social and the material, across many spatial and temporal scales. The session will explore theoretical issues, applications and methodological extensions of the issues of material – social dissonance. The inertia of the material, costs of maintenance, the creative effects of non-correspondence and the disjunctions between textual and archaeological sources of information are explored as crucial components of the archaeological process.

[37] Symposium · THE QIJIA CULTURE OF NORTHWEST CHINA – ENTERING A NEW ERA OF RESEARCH

The Qijia Culture plays a central role both in terms of the history of archaeology in Northwest China and as a tradition that occupies a critical time and place in the social and technological transitions that underlie the "origins of Chinese civilization." Occupying a vast territory covering much of the modern province of Gansu, as well as adjacent areas of Qinghai, Ningxia and Shaanxi, the Qijia Culture dates to the end of the third and early second millennia BC and witnessed important transformations in subsistence practices, the adoption of new plant and animal domesticates, developments in metallurgy and pottery production, dramatic environmental events and climate change, the introduction of new types of prestige goods, among other shifts. This panel includes presentations of new research on various aspects of the Qijia Culture that reflect renewed interest in this cultural tradition and provide new insights on the important transformations that occurred.

[38] Symposium · THE MANAGED MOSAIC: PAPERS IN HONOR OF SCOTT L. FEDICK

For the last thirty years, Scott Fedick's research has changed the way that we view how the ancient Maya engaged in agriculture and managed forest resources. He is also the epitome of how to conduct collaborative and interdisciplinary research. This session includes the "managed mosaic" of Fedick's career: a number of his current and former students, mentors and collaborators, who will present on their research as part of the Yalahau Regional Human Ecology Project, and the way in which Fedick has informed and influenced their work.

**[39] Symposium · RECONSIDERING THE "EPIC" IN THE EPICLASSIC PERIOD OF MESOAMERICA
PART 1: REGIONAL INTERACTIONS**

The Epiclassic period (AD 600-900) embodies “epic” in both its noun and adjective forms, referring to heroic narratives and something that is impressive and grand in scale. The volumes “Mesoamerica After the Decline of Teotihuacan” and “Twin Tollans” (both Dumbarton Oaks) illuminated this period, yet given a recent resurgence of scholarship devoted to the Epiclassic, further assessment is timely. The declines of Teotihuacan and the Classic Maya cities were nuanced processes, as were the growth and development of the cities that arose in response to new economic and political opportunities. Papers will address specific aspects of the Epiclassic period, including the evolution of new population centers, exchange patterns, language, and other symbol systems; the value of visual culture in helping to discern social change; archaeological evidence that affirms or suggests new chronologies; and archaeological evidence that expands the original idea parameters of the Epiclassic. Finally, some papers will offer theoretical models for approaching this crucial era in Mesoamerica and ponder the validity of the Epiclassic period as it is currently understood. The first part of this two-part symposium focuses on regional developments and interactions in Mesoamerica.

[40] Symposium · HUMAN ADAPTATIONS TO ENVIRONMENTAL CHANGE DURING THE TERMINAL PLEISTOCENE AND EARLY HOLOCENE - PART 1

Climate change at the end of the Pleistocene was both rapid and global in extent, with important consequences for the human environment. This symposium will draw together regional perspectives on the patterns of environmental change and human adaptation that marked the last glacial-interglacial transition, against a background of continuing improvements in the quality and temporal resolution of the archaeological and paleoenvironmental records. Participating scholars will explore whether, and to what extent, a causal relationship can be documented between environmental instability and changes in demographic patterns, subsistence strategies and social organization at different temporal and geographical scales during the Late Pleistocene to Early Holocene.

[41] Symposium · THE EVOLUTION OF INTENSIVE PLANT USE BY COMPLEX HUNTER-GATHERERS: ARCHAEOBOTANICAL RECORDS FROM CALIFORNIA

Subsistence systems in California have been greatly elucidated in the past two decades through study of the continually expanding archaeobotanical record. This symposium presents recent research by scholars working in coastal, island and inland settings of California. The California archaeobotanical record offers insights into the evolution of intensive and sedentary hunter-gatherers who maximized their use of a well-endowed but highly varied environment. The breadth of papers will demonstrate the range of research issues that have been addressed using California archaeobotanical data, and what this record can offer to archaeological problems elsewhere in similar contexts.

[42] Forum · 3D MODELING AND PRINTING IN ARCHAEOLOGY: TRANSFORMATIVE INNOVATIONS/APPROPRIATIONS

(SPONSORED BY SUSTAINABLE ARCHAEOLOGY/IPINCH)

Burgeoning digital technologies are rapidly, and radically, transforming the practice of archaeology. 3D modeling and printing, in particular, are seen as a democratizing access to human heritage, allowing fragile materials to be handled and displayed in proxy, allowing complete replicas to be assembled from digitized fragments, and offering new ways to interpret the material record. But 3D models can be shared and disseminated broadly online, altered and appropriated, and distance the application and use of these printed forms from original heritage. So what are the challenges to this material equivalent of mp3s? Who gets to decide what can and can't be printed, when, or when access should enable commodification? 3D digital technologies pose new challenges to transformative archaeologies, ethical re-alignments of practice, and working together with descendant groups, while making tangible in new ways old assumptions about ownership of archaeological material. This forum will explore the implications of the emerging ease of creating, using, and re-purposing digital assets and representations for Intellectual Property and Cultural Property rights discourse, and will provide an opportunity to discuss the “constituents” of claim and ownership in archaeology within the context of broader discourses emerging now over 3D digital modeling, printing, and distribution of material.

[43] Symposium · CREATIVE PUBLIC-CENTERED APPROACHES TO COMPLIANCE ARCHAEOLOGY

(SPONSORED BY SAA PUBLIC ARCHAEOLOGY INTEREST GROUP)

Public engagement is an important component of compliance projects. The involvement of the public in compliance archaeology is inherent in the National Historic Preservation Act as well as many state historic preservation programs. The benefits of such involvement are numerous and provide an important opportunity to inform the public about the importance of archaeology and stewardship of the archaeological record. However, the integration of diverse constituencies in such efforts is not without its challenges, and it has long been recognized that when involving the public in such projects, there is no such thing as a single public engagement model that fits all situations. This symposium provides an overview of the ways that American archaeologists have engaged the public in compliance work and the creative archaeological programs that have been developed as a result of publicly funded archaeology projects.

[44] General Session · HISTORICAL ARCHAEOLOGY OF PLANTATIONS AND ENSLAVED PEOPLES**[45] Symposium · NEW AND INNOVATIVE APPROACHES TO OVERSEAS CHINESE ARCHAEOLOGY**

In the last half of the nineteenth century nearly 400,000 people emigrated from Southern China to the United States. Upon arriving in the country these "Overseas Chinese" individuals lived and worked in myriad places, from the bustling streets of large, urban Chinatowns to sparsely populated rural railroad and mining camps. While there is no single Overseas Chinese narrative the efforts of these individuals has left lasting marks including large and small Chinatown communities, the expansion of industries such as agriculture and mining, and even the completion of the Transcontinental Railroad. This session explores the material traces of the Overseas Chinese who came to the United States in the nineteenth century. Rather than focusing on a particular aspect of life or region of the country, this session instead draws its strength by highlighting the diversity in geographic location, community scale, and daily practices experienced by Chinese people in the United States. Paper topics include in-depth single-site analyses, broad surveys of related sites such as railroad camps, thematic inquiries along lines such as health and diet, and novel theoretical and methodological strategies for Overseas Chinese archaeology.

[46] General Session · ARCHAEOLOGY OF THE INCA EMPIRE**[47] General Session · ARCHAEOLOGICAL SURVEY AND LANDSCAPE ARCHAEOLOGY IN THE EUROPE, ANATOLIA, AND AFRICA****[48] General Session · CONTRIBUTIONS TO MODELING IN ARCHAEOLOGY****[49] Poster Session · ARCHAEOLOGY IN ASIA****[50] Poster Session · GLOBAL HISTORICAL ARCHAEOLOGY****[51] Poster Session · ARCHAEOLOGY OF THE MEDITERRANEAN REGION AND CLASSICAL WORLD****[52] Poster Session · ARCHAEOLOGIES OF ISLANDS AND ATOLLS OF OCEANIA****[53] Poster Session · PALEOANTHROPOLOGY AND THE ARCHAEOLOGY OF THE STONE AGE**

[54] Poster Session · NEW PERSPECTIVES ON THE ROMANIAN BRONZE AGE

The Bronze Age was a period of dynamic social, economic, and political transitions in Europe. However, the archaeology of Romania has been significantly understudied and is often unaccounted for by Western scholars. With its varied physiographic and cultural zones, and situated at the crossroads of European-Eurasian interactions, Romania is growing in its importance to larger models of social change in the Carpathian Zone and Central and Eastern Europe. In this session, we bring together scholars working in the region on projects that explore different facets of social, economic, political organization at multiple scales across Romania.

[55] Poster Session · MULTIDISCIPLINARY STUDIES OF ANTHROPOGENIC CHANGE, SUBSISTENCE, SOCIAL ORGANIZATION, REGIONAL INTERACTION, AND TECHNOLOGY AT THE LAS CAPAS SITE, BC 1200-400, SOUTHERN ARIZONA

Recent research at the Las Capas site (AZ AA:12:111) near Tucson, Arizona, has resulted in discoveries about Early Agricultural Period (B.C.1250-A.D.50) foraging, horticulture, and hunting in southern Arizona, for which there exists no known ethnographic analog. To date, 3,153 excavated features have yielded thousands of analyzed flotation, pollen, and soil samples, tens of thousands of analyzed osteological specimens, and hundreds of thousands of artifacts. The combined effort makes Las Capas arguably the most intensively studied archaeological site in the United States. This publically-funded project encompassed a broad range of analytical efforts. This poster session presents the findings of specialists from the leading edge of the fields of AMS-dating, archaeozoosteology, ceramic analysis, lithic analysis, ground stone analysis, human archaeozoosteology, marine shell analysis, mortuary analysis, ostracode analysis, paleoethnobotany, palynology, pedology, and stratigraphic geochronology. The occupants of Las Capas were among the earliest practitioners of maize horticulture in the United States, and combined gardening and irrigation with a system of extensive foraging, logistical and residential mobility, and long distance travel or exchange.

[56] Symposium · PHOTONS IN THE FIELD: NEW APPROACHES TO THE USE OF PORTABLE X-RAY FLUORESCENCE (PXRF) IN ARCHAEOLOGICAL FIELDWORK

In recent years there have been many pioneering advances in the field of science that have led to a symbiotic relationship between scientific enquiry and archaeology that has significantly advanced current academic knowledge. However, many of these scientific methods must operate in a controlled laboratory environment and often necessitate the destruction—in whole or in part—of the artefact under investigation such as with isotope, DNA, X-ray Diffraction or Atomic Absorption Spectroscopy analysis. These factors, along with issues relating to time, finance, legality and/or the export of cultural heritage, inhibit the application of various scientific studies in numerous research contexts. Within this problematic scientific environment came a ground-breaking technology, portable X-ray Fluorescence (pXRF): a non-destructive, portable instrument for elemental compositional measurement. This symposium seeks to examine the viability of pXRF in the field and its potential employment to resolve these issues. It will focus on the benefits, scope and limitations of using this specific form of equipment, and investigate how this technology can contribute to quantitative analysis of anthropological and archaeological materials.

[57] Symposium · CONFLICT AND SOCIETY IN VIKING AGE SCANDINAVIA

Though significant advances have been made in the study of Viking Age Scandinavian societies, much of our knowledge continues to be governed by long-established theoretical and methodological approaches. Despite this, several aspects of Viking Age society have recently been subject to extensive re-evaluation. New and continuing developments in the isotopic, genetic and paleopathological analysis of skeletal assemblages have, for example, shed considerable light on the origins, demography and lifestyles of both Viking and insular populations. The reconsideration of material culture, historical and anthropological data has similarly provided new insights into the mechanisms underpinning the raiding, conquest, colonization and state formation that characterize the Viking Age both within and outside of Scandinavia.

This session provides a multi-disciplinary forum for the appraisal of new and innovative studies into the origins and evolution of the Viking Age in addition to the accompanying violence that so often defines the

period. The long-term implications of these developments will also be considered, providing further insight into the development of societies both in Scandinavia and across the Viking world.

[58] General Session · NEW METHODS IN ARCHAEOOMETRY IN MESOAMERICA

[59] Symposium · "DIY DIGITECH" IN ARCHAEOLOGICAL FIELDWORK: INNOVATIVE ADAPTATIONS OF LOW(ER)-BUDGET DIGITAL TECHNOLOGIES

The Do-It-Yourself (DIY) approach spans disciplines: typically associated with arts and crafts, hobbyists, and anti-consumerism, DIY adaptations and re-purposed implementations of extant digital technologies are gaining scholarly traction. In archaeological application, "DIY Digitech" amplifies this discourse. Archaeologists have long relied upon in-house solutions and adapting tools to solve logistical and investigatory problems, but only recently have low-cost digital technologies begun to reconfigure the archaeological toolkit. Consumer digital media devices offer new solutions for documentation and data manipulation, with metadata leveraged for organization, preservation, and knowledge-sharing purposes. Digital mapping tools are smaller, more precise, and linkable to server-based GIS technologies, and increasingly featured in multipurpose devices, such as tablets and smartphones. Remote sensing has taken flight, with home-built drones and modified point-and-shoot cameras facilitating low-cost mapping projects. Computing tools such as image filtering and audio analysis are enabling non-invasive research methods, additionally invaluable for site conservation. Fieldwork has always been where concept and reality collide; it requires yet another moment of DIY adaptation, and innovative collaborations with specialists. The wired-DIY ethic equips "techie" archaeologists to gain experience and knowledge at the speed of light. We highlight case study DIY innovations in archaeological fieldwork in diverse sites.

[60] General Session · ARCHAEOLOGY OF THE MOCHE

[61] General Session · ZOOARCHAEOLOGY, DIET, AND FOODWAYS AT HISTORIC PERIOD SITES

[62] Symposium · ONE OF CALIFORNIA'S EARLIEST VISITORS: THE DISCOVERY OF TRANSBAY MAN

(SPONSORED BY WILLIAM SELF ASSOCIATES)

The unexpected discovery of a well-preserved Native American burial 55 feet beneath the Transbay Transit Center site is incredibly exciting. The matrix surrounding the skeleton has provided unparalleled preservation of the human remains and the organic materials surrounding the burial. The adult male was wrapped in a large woven mat and fragments of a wood implement that resembles an atlatl were found at his hand. To date none of the burials recovered from San Francisco, the Bay Area, or central California, have preserved evidence of this nature. AMS radiocarbon dating indicates an age of 7570 cal BP, increasing the importance of this find in terms of the history of San Francisco and the history of native peoples throughout California. Burials from this time period are exceptionally rare, and the context in which the burial was found was deeper, older, and wetter than expected. This individual represents the potential to trace some of the earliest people to inhabit California, and to make a connection between them and the material culture and traditions that we know from historic period observations of living natives.

[63] Symposium · PROPER ID REQUIRED: DIFFICULTIES IN DISCERNING PAST IDENTITIES

Extrapolating identity from material culture has always been a complicated and challenging aspect of archaeological work. Over the past four decades, exploration of identity has evolved from primordialist roots to an understanding that this is a fluid social construct which varies significantly with place, time, and cultural references. The goal of accurately understanding and representing the past, instead of simply reflecting current social constructs or biases, continues to challenge archaeologists. Past communities created,

adopted, or appropriated diverse identities for complicated reasons which we may not understand. The objective of this session is to explore past and present interpretations of material correlates of identity in variable geographic, cultural, and temporal settings. Identity can be reflected in the use and creation of material culture, the spread and exchange of ideas and objects, as well as the construction or curation of monuments and the built landscape. However, identity can also be misrepresented, consciously and subconsciously, for myriad reasons. Therefore, we seek papers that reflect upon how we project the familiar present, be it nationalities, genders, or structures, onto the past, and how that past is reified in the present. There is no temporal or geographic restriction on this session.

[64] General Session · ARCHAEOLOGY OF THE PALEOLITHIC IN ISRAEL AND JORDAN

[65] Symposium · IT WAS THE BEST OF TIMES, IT WAS THE WORST OF TIMES: MOBILITY AND SUBSISTENCE IN A TALE OF TWO SITES IN THE SMITH RIVER BASIN OF NORTHWESTERN CALIFORNIA

This symposium will present information from several sites that have been investigated in recent years in the Smith River Basin of northwestern California, an area in which little archaeological work has been done in recent decades. Red Elderberry Place (CA-DNO-26), a habitation site in Jedidiah Smith State Park on a low terrace above the main branch of the Smith River, contains evidence of multiple occupations spanning the Early Holocene (ca. 9000 -7000 B.P.) to the late 19th Century Tolowa, including plank houses dating to several of these occupations. Approximately 25 river kilometers upstream from Red Elderberry Place, excavation at the Hurdy Gurdy Bridge site (CA-DNO-1028) at the confluence of Hurdygurdy Creek and the South Fork that contained evidence of intermittent occupation from the Early Holocene to the late Contact Period. This symposium will update the prehistory of the Smith River Basin and provide insight into how mobility and subsistence strategies changed through time and differed between points along the river in response to changing social and natural environments.

[66] General Session · ARCHITECTURE, RITUAL, AND TRADITION

[67] General Session · NEOLITHIC AND BRONZE AGE CHINA

[68] Forum · EVALUATING AND REWARDING 21ST CENTURY ARCHAEOLOGICAL SCHOLARSHIP

New forms of scholarly communications, especially open access data-sharing, have gained prominence in public policy and academic administration. Publishers increasingly provide support for data citation, data references, and comprehensive reporting, and funders expect and even require these behaviors. In February 2013, the White House announced a mandate for open access to data and publications resulting from federally-funded research. Data sharing and other digital contributions (including blogging and other social media) support many of the research, stewardship, community engagement, and pedagogical goals of archaeology. Innovative approaches to scholarly communications can advance many of the SAA's Principles of Archaeological Ethics, including stewardship, public understanding and outreach, timely reporting, and preservation of scholarly content. However, since we lack consensus on understanding and evaluating new forms of scholarship, digital contributions often remain on the margins of entrenched practice. To encourage advances in communicating archaeology, we need to recognize and reward quality and innovation in digital communications. This panel will share perspectives on promoting quality and professional recognition for new forms of archaeological communications, with an aim to develop recommendations for the SAA to review, endorse, and promote to universities (including search and promotion committees) granting agencies, and others who evaluate digital archaeological scholarship.

[69] Forum · THE PROSPECTS AND CHALLENGES OF FAUNAL DATA INTEGRATION AND COMPARATIVE ANALYSIS

This forum provides an opportunity to briefly present the methodological and substantive results of a National Science Foundation-funded project that integrates faunal data from more than thirty projects. The integrated data are being used to explore the relationships of demography and environment to resource depression and turkey intensification in the late prehistoric (AD 1200-1500) US Southwest. Each short presentation will be followed by questions and discussion with attendees at the forum. Kintigh will introduce tDAR (the Digital Archaeological Record) and its tools that enable the integration of multiple datasets; Clark will discuss a taphonomic protocol that she has developed and we have implemented to evaluate the degree to which the project datasets are sufficiently similar to permit meaningful comparative analysis; Spielmann will summarize the results of the resource depression analysis, and Schollmeyer will discuss an analysis of lagomorph distribution that she undertook with the integrated Southwestern data. Neusius and Styles will discuss their recently funded NSF grant that expands research on taphonomic processes and changes in the use of fauna to the eastern US.

[70] Forum · INTEGRATING AND INNOVATING: EFFECTIVE USES OF TECHNOLOGY IN ARCHAEOLOGICAL MANAGEMENT IN MILITARY SETTINGS.

(SPONSORED BY MILITARY ARCHAEOLOGICAL RESOURCES SUBGROUP (MARS))

The management of cultural resources in military installation settings provides a number of challenges, ranging from fiscal constraints to safe and routine access to resources and urgent mission timelines. To effectively work within this challenging environment, it is necessary to find creative strategies to tackle identification, evaluation, and monitoring of archaeological resources. While new technology always carries a risk of becoming a Pandora's box, this particular path can be avoided by following a thoughtful process in management needs and can even be cost effective by exploring available technologies existing within the organization. This forum will focus on technological innovations and collaborations in the unique management environment of military settings.

[71] Forum · GENDER DISPARITIES IN RESEARCH GRANT SUBMISSIONS

(SPONSORED BY SAA BOARD OF DIRECTORS)

In 2013 a SAA Task Force on Gender and Rates of Research Grant Submissions was created to understand why "senior" (i.e., post-Ph.D.) women were not applying for research grants at the same rate as men. The rates were particularly striking for National Science Foundation (NSF) Archaeology Program grants but the pattern was also true for those applying to the Wenner-Gren Foundation for Anthropological Research over a shorter period of time. A number of different hypotheses to explain the disparities have been generated, including those suggested by attendees at last year's SAA forum. This forum will present the results of the SAA Task Force's research, which includes quantitative and qualitative data collection and analyses, to better understand why the disparities are present. Also participating in the forum are program officers from NSF, Wenner-Gren Foundation for Anthropological Research, and National Geographic Society, who will provide data they have collected on their respective programs.

[72] Symposium · ARCHAEOLOGY AND TOURISM

On a national and international level archaeological sites have great social, cultural, and economic value. Archaeological sites are integral parts of regional histories, heritages, and identities. They are also often major tourist attractions. The economic potential has increased the pressure on archaeological sites to accommodate greater influxes of tourists and on the authorities in charge to open up more sites to tourism. Tourism expands local opportunities and brings in revenue but it can also have serious impacts on sites. Archaeotourism must be considered carefully and entered cautiously. Steps must be taken to maintain the integrity of the site as both a cultural resource and as a subject for research and scholarship. If negotiated properly, many future possibilities lie in the cooperation between cultural managers and tourism experts. In this session we will explore the possibilities and best practices of presenting archaeological research and communicating the importance of archaeological heritage to an interested public as well as share innovative approaches to archaeotourism involving local communities, technology, and more.

[73] Symposium · SIMULPAST -- SIMULATING THE PAST TO UNDERSTAND HUMAN BEHAVIOUR

Social and environmental transitions represent key aspects to better understand human behavior. From a complex systems perspective, the most decisive questions about human societal systems are related to the transitions between phases of equilibrium. Therefore, the study of these transitions is extremely interesting in order to move forward with our current understanding of human behavior at macro-, meso- and micro-level. In that respect, ancient societies present a great opportunity to build a virtual laboratory in which to model, explore and simulate different hypotheses and theories about social and environmental transitions. This session will act as a showcase of the final results of the SimulPast project (www.simulpast.es). The philosophy on which SimulPast is based is transdisciplinary, evading the traditional division that sees the Humanities and Social Sciences and the often-called “Hard Sciences” as mutually impermeable areas of knowledge. Indeed, the research strategy on which the project has worked crossed many disciplinary boundaries to create a holistic approach.

[74] Symposium · HUMAN ADAPTATIONS TO ENVIRONMENTAL CHANGE DURING THE TERMINAL PLEISTOCENE AND EARLY HOLOCENE - PART 2

Climate change at the end of the Pleistocene was both rapid and global in extent, with important consequences for the human environment. This symposium will draw together regional perspectives on the patterns of environmental change and human adaptation that marked the last glacial-interglacial transition, against a background of continuing improvements in the quality and temporal resolution of the archaeological and paleoenvironmental records. Participating scholars will explore whether, and to what extent, a causal relationship can be documented between environmental instability and changes in demographic patterns, subsistence strategies and social organization at different temporal and geographical scales during the Late Pleistocene to Early Holocene.

[75] Symposium · CONSTRUCTION OF A COMMUNITY: RECENT FINDINGS FROM CEREN, EL SALVADOR

Archaeological research at Cerén continues to contribute to key questions within Mesoamerica and beyond regarding how quotidian practices both constructed and were impacted by the social and political landscape of this community. The fortuitous sudden burial of the site beneath meters of volcanic ash resulted in the preservation of structures, artifacts, a sacbe, and agricultural fields. This session explores the variety of data collected in the 2013 field season, with specific focus given to the exploration of the Cerén sacbe, associated artifacts, and paleobotanical discoveries. Additionally, various papers within the session situate Cerén in a comparative perspective with other research throughout Mesoamerica.

[76] Symposium · CAPITAL, CRAFT, AND CONSUMPTION IN MESOAMERICA AFTER THE SPANISH INVASION

The contributors to this session examine the archaeological consequences of uneven capitalist development for urban and rural communities in Mesoamerica over the last 500 years. As Thomas Piketty has claimed, industrial capitalism generally widens the gulf between rich and poor. Yet, natural disasters, economic depression, and warfare often diminish available capital and disrupt its accumulation, thus leveling economic disparities in some periods. In Spain's former American colonies the periodic economic upturns and downturns of the global economy severely affected generation of wealth, the development of monetary and debt instruments, market growth, and the organization of commodity chains from the sixteenth century down to the present day. These vicissitudes created uneven trajectories of local and regional development as Spain's American colonies became severely undercapitalized in the wake of the European invasion and again following the wars of independence. The papers in this session focus on the archaeological consequences of shifts in capital, commodity and craft production, and consumption at regional, local, and household scales. Shifts in the social construction of class, identity, and place are manifest in the archaeological record — in landscape configurations, architecture, ceramics, tools and technology, zooarchaeological and paleoethnobotanical remains, and mortuary patterns and ritual practices.

[77] Symposium · AN ARCHAEOLOGIST'S GEOLOGIST: A SYMPOSIUM IN HONOR OF WILLIAM R. DICKINSON

No other geologist has contributed more to Pacific Islands archaeology than William "Bill" Dickinson. His pioneering work in the 1960s on identifying sources of temper sands in prehistoric pottery provided a rigorous technique for understanding modes of ceramic production, interaction and exchange. His continuing pursuits in this field across the spread of Oceania provide an archaeological service and insights that truly are outstanding. His research on sea level change, paleo-shoreline documentation and island geomorphologies are central to our modeling of human colonization in the Pacific, and fundamental to our discovery and understanding of associated sites. And despite his parallel career as an internationally renowned and decorated geoscientist, he has been a prolific author/co-author of over 125 publications on geoarchaeology and ceramic petrography. This symposium honors Bill's five decades of interdisciplinary collaboration with Pacific archaeologists, and the many significant contributions he has made.

[78] Symposium · WHAT WAS CHACHAPOYAS?: TOWARDS A CULTURAL GEOGRAPHY OF THE NORTHEASTERN PERUVIAN ANDES

Like other areas of the eastern Andes, the region of Chachapoyas in northeastern Peru holds great potential for understanding the relations that took place over time between Andean and Amazonian societies. While research has lagged behind neighboring regions, Chachapoyas archaeology has now reached a point where it is possible to contribute to these and other topics. Nevertheless, many questions must still be addressed, first and foremost of which concerns basic chronology and cultural geography: to what and to whom do we actually refer with the terms "Chachapoyas" and "the Chachapoya"? Others include: what was the relationship between better documented Late Intermediate Period societies (post-AD 900) and earlier ones? Did cultural or biological connections exist between these populations? How should we interpret sub-regional variations in material culture such as residential architecture, ceramics, and mortuary treatment? Is variation so substantial as to impair the argument that greater "Chachapoyas" was a meaningful concept to pre-Inka populations, or to undermine its worth for contemporary scholars? Are persistent characterizations of Chachapoyas as "remote" and/or "isolated" supported by archaeological data? By responding to these core questions, we aim to finally bring the archaeology of this important region into dialogue with broader scholarship across prehispanic South America.

[79] Symposium · ADVANCES IN THE METHOD AND APPLICATION OF CERAMIC PETROGRAPHY: INTERNATIONAL PERSPECTIVES ON KEY ARCHAEOLOGICAL QUESTIONS PART II

(SPONSORED BY GEOARCHAEOLOGY INTEREST GROUP (GIG) OF THE SAA)

Over the last 30 years the archaeological application of petrographic analysis has gained methodological and theoretical traction. Ceramic petrography, in particular, has emerged as a key methodological tool because it provides insights into technological practice, the choice and manipulation of raw materials by ancient potters, and methods of forming and firing conditions. Petrography has the advantage of being a visual technique whose observations are easily combined with macroscopic study of fabric, form, and decoration. A holistic approach that combines such observation with chemical (e.g. INAA, ICP-MS, XRF), mineralogical (especially XRD), and microstructural (SEM) data, in addition to geological information provides a powerful analytical strategy for understanding the social, political, economic, and environmental contexts of ceramic production, distribution, and consumption. Such information is vital for developing robust interpretations of ancient social organization and change. We have invited a group of scholars whose work highlights advances in ceramic petrography for understanding, technological traditions and change, identity, ceramic production and exchange, migration, and the social context of consumption. Many of the papers highlight new methods for combining petrography with other analytical strategies to address social process. As such, the session provides an analytical exchange among researchers with diverse intellectual backgrounds and research interests.

[80] Symposium · ISSUES IN BUILDING RADIOCARBON CHRONOLOGIES

The use of radiocarbon dates to reconstruct historical patterns of demography and behavior proceeds via processes of sample selection, measurement, calibration, compilation, exploratory data analysis, analytical statistics, and interpretation. This session brings together scholars refining facets of these processes in an effort to advance the overall ambition of making history visible via c14 dating. Topics include marine reservoir calibration, population dynamics via summed probability, Bayesian analyses of c14 data sets, methodological issues in measurement, calibration issues and systemic biases, taphonomic effects, and the potential for developing continental databases.

[81] Symposium · WORLDS FOREVER CHANGED: THE IMPACT OF CONFLICT AND COLONY IN THE "NEW WORLD"

The first contact between non-native foreign colonizers and indigenous peoples of the "New World" unquestionably resulted in permanent and widespread impacts. These impacts varied widely depending on the structure of existing native social organizations, the make-up and motivation of the colonizing groups, and the type or extent of the contacts. This session will explore the effect of, and activities surrounding, some key examples of first contact in the New World. Case studies drawn from a broad geographic range from the American northeast, southeast, and southwest are offered in comparison to other studies from central America and the Andean region.

This session will explore indigenous relations, colonizing strategies, and evidence of conflict and resistance. Independent lines of evidence range from changes in subsistence, architecture, various technologies, inter-societal relations, and settlement systems. This session will examine the ultimate outcomes that various regional contacts had on both the affected indigenous groups and their colonizers. Some studies will describe impacts upon less commonly discussed indigenous groups on the margins of contact areas. In particular, the long-lasting consequences of conflict and colonization resulted in profound cultural reorganization and produced effects that still resonate in present-day societies even after a span of nearly 500 years.

[82] Symposium · THE "NEOLITHIC HOUSE": WORLDWIDE COMPARISONS

The archaeological records of many regions of the world show transitions from sites with either no recognizable shelters or rare small ephemeral ones, to settlements with substantial domestic architecture; this shift is typically, though not always, associated with the adoption of agriculture and increased social complexity. Decades of research have demonstrated examples of parallels in these transitions worldwide. However, these developments also show major differences in the specifics of their architectural and domestic patterns, their economic and social contexts, and equally importantly in the theoretical frameworks within which the developments are analyzed.

This session aims to build inter-regional archaeological and ethnographic comparisons of these architectural transitions, asking authors to examine data on the shift to substantial structures in their regions, and to consider how such shifts may best be approached. The aim is not to reach a single grand synthesis, but to take advantage of the diversity among the regional cases and theoretical approaches to elucidate differences as well as meaningful commonalities. Similarly, this multi-regional approach will allow exploration of where contrasting theoretical traditions in archaeology hinder comparison or alternatively may suggest benefits of applying complementary theoretical approaches to cases where they have not previously been applied.

[83] Symposium · PRESERVATION, PROTECTION, AND OUTREACH PROGRAMS IN NATIONAL PARK SERVICE ARCHAEOLOGY

For nearly 100 years, the National Park Service (NPS) has preserved, protected, and interpreted archaeological resources throughout the United States. While many such efforts take place in park units, NPS also conducts programs and initiatives that are national and international in scale. NPS archeologists are responding to the threats posed by climate change, reaching out to youth and other constituencies, supporting enforcement of the laws that protect archaeological sites, and working with partners to develop solve pressing problems in heritage conservation. This session demonstrates the depth and diversity of recent NPS archeological practice by presenting large-scale initiatives mounted by NPS parks and programs.

[84] Symposium · SIMULATING SOCIAL COMPLEXITY TO UNDERSTAND THE ARCHAEOLOGICAL PAST

The large scale patterns that we commonly detect in the archaeological record are often not a simple sum of individual human interactions but a complex interwoven network of dependencies among individuals, groups, and the environment in which they live. Unraveling this web is a hard task. Complexity science's answer to the challenges of understanding such non-linear, unpredictable, complex systems is computational modelling. Tools such as Agent-based Modelling, System Dynamics Models, Network Analysis or Equation-based Models are extensively used in virtually every scientific discipline and in the last decade have also gained ground in social sciences, anthropology and archaeology.

In this session we present computational approaches to understanding the past, showcasing the innovative ways archaeologists have used simulation and model building to understand the complex societies they study. The session aim is to provide platform to discuss the potential and limitations of computational modelling in archaeology and highlight specific areas where it can be linked to more traditional empirical research.

[85] Symposium · COMMUNITIES THROUGH TIME: SOCIETAL CONTINUITY AND TRANSFORMATION IN THE NORTHERN SAN JUAN REGION

Decades of archaeological research in the northern San Juan region have yielded an abundant, rich, and complex body of data regarding the Pueblo occupation of the region, which was underway by 500 B.C. and continued until the complete depopulation of the region by Pueblo peoples late in the thirteenth century. During that occupation of this challenging landscape, communities formed and evolved, varying from clusters of family farmsteads to aggregated communities to large nucleated villages, with concomitant societal adaptations and innovations. These developments were key in enabling Pueblo farming families to survive for many centuries on this semi-arid landscape plagued with climatic variability and periodic drought. Myriad facets of Pueblo society and lifeways transformed in profound ways and then coalesced into a cohesive and enduring foundation for the centuries of Pueblo culture that followed in regions to the south. The papers in this session draw upon the rich body of empirical data for the northern San Juan region to produce diachronic syntheses that elucidate—within the context and setting of the community—long-term adaptation, transformation, and continuity in settlement patterning, subsistence systems, technologies, intra- and inter-regional interactions, regional chronology, and the increasing complexity of social, political, economic, and ritual systems.

[86] Symposium · CIRCULATION OF PEOPLE, THINGS & IDEAS: PRACTICES OF MOBILITY IN THE UPPER USUMACINTA BASIN

Several lines of research in the Upper Usumacinta Basin have recently expanded what we know about its kingdoms and the changing relations with their surrounding regions in pre-Hispanic times. What has emerged from these studies is a highly geographical and politically fragmented landscape in which circulation of people, things and ideas was a highly politicized practice too. Furthermore, different historic periods witnessed different practices of mobility due to seasonality, regional alliances or conflicts, and boundaries which left traces in the archaeological and epigraphic record. The idea for this symposium originated from the need to address these practices from anthropological and archaeological perspectives bridging the divide between transport and social research. Specifically, what this symposium wants to discuss is how people, things and ideas circulated through this fragmented landscape and dissect the issue of transportation into three main questions: 1) How can archaeology ground the experience of moving through this landscape from a phenomenological, geographical and political perspective? 2) How did people organize movement in the Upper Usumacinta basin in terms of transport technologies and social organization? 3) What is the evidence for materials and ideas circulating in the Upper Usumacinta basin?

[87] Symposium · FROM TAPHONOMY TO HUMAN ECOLOGY: PAPERS IN HONOR OF GARY HAYNES

Since beginning his career in academia nearly 40 years ago, Gary Haynes has pursued a wide range of interests that have taken him all over the world to places across the continental US, Canada, Alaska, Australia, Russia, Poland, England, Spain, France, and Zimbabwe. Thematically, his research interests run the methodological-theoretical gamut from basic field archaeology, taphonomic and actualistic studies, environmental archaeology, and animal behavior, to Pleistocene human dispersals in Africa, Eurasia and the Americas, human foraging behavior, transition to agriculture in southern Africa, and paleoecology and human-environment interactions. His research endeavors in Africa have also acquired an applied character that focuses on recording and preserving a rich rock art tradition, archaeological sites, studies of elephant behavior and conservation biology to inform on human-animal interactions in Hwange National Park Zimbabwe and beyond.

With this session colleagues, former students, and friends come together to present on research topics encompassing a broad spatial and deep chronological perspective, thereby highlighting Gary Haynes' multifaceted interests. We acknowledge his propensity for critically evaluating the archaeological record and maintaining an open mind. We celebrate his contributions to prehistoric archaeology and the subfields of taphonomy, environmental archaeology, human dispersals studies, and human-environment interaction research.

[88] Symposium · RECONSIDERING THE "EPIC" IN THE MESOAMERICAN EPICLASSIC PERIOD PART 2: INTERREGIONAL INTERACTIONS

The Epiclassic period (AD 600-900) embodies "epic" in both its noun and adjective forms, referring to heroic narratives and something that is impressive and grand in scale. The volumes 'Mesoamerica After the Decline of Teotihuacan' and 'Twin Tollans' (both Dumbarton Oaks) illuminated this period, yet given a recent resurgence of scholarship devoted to the Epiclassic, further assessment is timely. The declines of Teotihuacan and the Classic Maya cities were nuanced processes, as were the growth and development of the cities that arose in response to new economic and political opportunities. Papers will address specific aspects of the Epiclassic period, including the evolution of new population centers, exchange patterns, language, and other symbol systems; the value of visual culture in helping to discern social change; archaeological evidence that affirms or suggests new chronologies; and archaeological evidence that expands the original idea parameters of the Epiclassic. Finally, some papers will offer theoretical models for approaching this crucial era in Mesoamerica and ponder the validity of the Epiclassic period as it is currently understood. The second part of this two-part symposium focuses on broad-scale interactions involving multiple sites and regions of Mesoamerica.

[89] Symposium · MICRO-WORLDS, MATERIALITY AND HUMAN BEHAVIOUR: MAGNIFYING MATERIAL SCIENCE IN EXPLANATIONS OF TECHNOLOGY

Studies of innovation and cultural transmission in material culture are scholarly obsessions as well as fundamental building blocks for regional and global archaeological narratives. The traditional emphasis on macroscopic artefact traits to explore shifting patterns of cultural variation remains dominant whilst the use of material science data to examine these questions, particularly in the context of production technology, has been slow to develop. Traits that define style and form take precedent over composition and texture. This session explores how we can better utilize material science data in building explanatory models for the evolution of technologies worldwide. It brings together a range of cross-disciplinary research projects that span different materials and continents, yet all using elemental and microscopic analyses to investigate variability in artefact production processes. Participants will demonstrate the utility of micro-scale characterizations for exploring themes ranging from purely aesthetical and sensorial to environmental and mechanical stimulants of change. Seeing no fundamental difference in the abilities of micro- and macro-scale artefact traits to address archaeological problems, we wish to probe the extent to which materials science data can generate new insights on patterns of technological behavior.

[90] General Session · PRACTICES AND PRODUCTS OF CULTURAL RESOURCE MANAGEMENT IN NORTH AMERICA

[91] Poster Session · GLOBAL STUDIES OF OBSIDIAN: ANALYTICAL TECHNIQUES AND ARCHAEOLOGICAL INTERPRETATIONS

[92] Poster Session · LITHIC MATERIALS AND TECHNOLOGIES IN NORTH AMERICA

[93] Poster Session · SOCIAL CONTEXTS OF ARCHAEOLOGICAL PRACTICE IN THE FIELD, LAB, AND CLASSROOM

[94] Poster Session · MUSEUMS AND COLLECTIONS

[95] Poster Session · ARCHAEOLOGY IN COMMUNITIES: HERITAGE, PRESERVATION, AND ENGAGED ARCHAEOLOGIES

[96] Poster Session · COMPARATIVE ARCHAEOLOGY OF URBAN SITES

[97] Poster Session · CRM, KINTEEL, AND THE COMMUNITY OF WIDE RUINS

Northland Research, Inc. completed excavations on the Wide Ruins Road on the Navajo Nation in the summer of 2014. Excavations yielded important archaeological data and provided tangible public benefit to the community of Wide Ruins. Project data also generated research questions that had not been fully considered prior to the beginning of the project. These posters cover a range of topics related to the Wide Ruins project including; its important public benefit, the social significance of recovered fauna, an assessment of the role of oral history in today's archaeology and commentary on significance testing for this road project.

[98] Poster Session · PROJECT ARCHAEOLOGY STATE PROGRAM HIGHLIGHTS: CELEBRATING 25 YEARS

Project Archaeology started 25 years ago at the Bureau of Land Management in Utah. Since then, it has grown with established programs in 36 states. This poster session celebrates the diversity, complexity, and partnerships of Project Archaeology with submissions from a selection of state programs, including Florida, Colorado, Oklahoma, Iowa and Montana. Some state programs are 25 years old and have gone through a generation of changes. Some are very new and bring vital energy that feeds this synergetic network. In addition to geographic diversity, the Project Archaeology products developed by each state vary as the educational goals and archaeological resources differ. Come meet the people representing Project

Archaeology in your state and learn how to get involved.

[99] Poster Session - TEACHING ARCHAEOLOGY IN THE TWENTY-FIRST CENTURY: ACTIVITIES FOR THE COLLEGE CLASSROOM

(SPONSORED BY COMMITTEE ON CURRICULUM)

Hands-on activities are one of the best tools available to promote complex problem-solving in student-centered archaeology classrooms. Yet, original activities are difficult to devise, requiring a substantial time commitment and, frequently, multiple iterations before maturing into a productive learning tool. Ideally activities that originate within a limited circle of colleagues can be adapted and revised to fit diverse academic situations and instructors. This poster session is designed to share effective activities developed by the presenters over the years. Activity handouts, along with ancillary materials, are provided and each activity is explicitly connected to the Principles for Curricular Reform of the SAA Committee on Curriculum: Stewardship, Diverse Pasts, Social Relevance, Ethics and Values, Written and Oral Communication, Fundamental Archaeological Skills, and Real-World Problem Solving.

[100] Symposium - MAYAARCH3D: BUILDING A 3DWEBGIS DOCUMENTATION AND ANALYSIS SYSTEM FOR COMPLEX ARCHAEOLOGICAL SITES

The MayaArch3D project is developing a new research tool that offers the possibility to combine 3D-Models and the functions of Geographical Information Systems (GIS) for the documentation and analysis of archaeological sites on one internet platform. This symposium will present the project goals, pipeline, and results of this international, interdisciplinary project led by the German Archaeological Institute, and funded by the German Ministry of Education and Culture from 2012- July 2015. The first several papers present the technical pipeline: from data collection and post-processing, to data structuring and segmenting. Following papers will present the system architecture, system tools, and demos of the online tool. Another set of papers presents the first archaeological use cases and two discussants round up the session.

[101] Symposium - GLASS AND GLASS TECHNOLOGY: MULTI-DISCIPLINARY APPROACHES TO ARCHAEOLOGICAL RESEARCH

Glass is not as ubiquitous as other archaeological materials, such as ceramic, but when present it provides important clues about the community that left it behind as it participated in many different aspects of its life. Indeed, this material was used to manufacture prestige objects, architectural elements, personal ornaments or utilitarian items. The study of ancient glass participates in the general understanding of ancient societies, their structure, interaction and evolution. Inferences are made by studying the composition of glass assemblages, the typology of objects, the recipes and manufacturing techniques. This session aims at presenting exemplary case studies that involve many of the interdisciplinary approaches recently developed to study ancient glasses, glass technologies and the people that used them. These approaches combine and integrate archaeology with anthropology, art history, chemistry, materials science and other fields. The goal is to stimulate discussion about the unique contribution of ancient glass studies to the understanding of our past, and demonstrate how glass studies have matured in recent years to provide conclusions with broad interpretation.

[102] Symposium - NEW INSIGHTS INTO PAINTED POTTERY FROM NORTHWEST CHINA

This panel considers the origin, context, production, and circulation of painted pottery from Northwest China with broad perspectives. Used by people of varied backgrounds and in different contexts, these objects are dated around 8000 to 2000 years ago, from the Neolithic through Early Iron Age. Today, many museums throughout the world hold these ancient pots in their collections. Previous studies provide limited knowledge beyond chronological typologies of vessel forms and decorations. With new methods and data, participants of this panel develop and rethink hypotheses of population movement, cross-regional connection, material

exchange, technological diffusion, stylistic imitation, and cultural identity behind these well-known objects. New studies consider the ceramics as well as other findings, such as millet, textiles, leather vessels, and cowrie seashell. As comparable motifs can be noticed among painted pottery from China, Central Asia, Southeast Europe, and Southeast Asia, the geographic scope of discussion includes China and other regions of the Eurasian Continent in regional and cross-regional perspectives.

[103] General Session - GIS, REMOTE SENSING, AND ARCHAEOLOGICAL MAPPING STUDIES

[104] Forum - MAKING THE TOUGH CHOICES: FINDING WORK/LIFE BALANCE AS AN ARCHAEOLOGIST

As our culture changes faster than the archaeological profession, how do we make the best choices to balance the competing demands of our personal and professional lives? This forum aims to continue and broaden the discussion of such important work/life balance issues as: dual-academic couples, when and how to manage having children, childcare in the field, caring for elderly parent, when to retire, and how to keep your sanity along the way. Panelists come from across the discipline, seeking to clarify the issues and suggest creative solutions.

[105] Symposium - LIFE IN THE DIMINUTIVE REALM: HUMAN ADAPTATIONS TO SMALLER ISLAND ENVIRONMENTS

(SPONSORED BY JOURNAL OF ISLAND & COASTAL ARCHAEOLOGY)

In the archaeological study of islands worldwide, research has generally focused on larger land masses. This is primarily based on the assumption that human colonizing groups require certain necessities—suitable land for cultivation, easier access to resources such as fresh water, and room to expand as populations grow. However, it is becoming increasingly demonstrated that smaller islands within archipelagos were equally, if not more, attractive for settlers due to their superior marine and/or terrestrial resources, isolated locations for ritualized activities, and more manageable defense. Smaller islands, however, are also more susceptible to human impacts given myriad social and natural processes. In this symposium, we will explore how people settled and lived on small islands in various parts of the world, with an emphasis on how they differ from other settings. Potential topics are diverse and will encompass a range of issues and theoretical perspectives—from historical ecology and ethnoarchaeology, to more specific case studies and comparative analyses. The overall goal is to present how current research on smaller islands is changing how these seemingly peripheral and less important locales are pivotal to our understanding of human survivability in aquatic environments.

[106] Symposium - CALIFORNIA ARCHAEOLOGY AND CLIMATE CHANGE

(SPONSORED BY SOCIETY FOR CALIFORNIA ARCHAEOLOGY)

The impacts of anthropogenic climate change are currently eroding California's cultural heritage. Over the past three years, the Society for California Archaeology (SCA) has been organizing efforts to address these impacts and survey the state's coastline before thousands of archaeological sites are lost. Across the state, different agencies, tribes, university anthropology programs, avocational societies, and volunteers have been working collaboratively in conducting field studies and bringing their results to a larger public through different media venues. To date, over 80 volunteers from 7 universities, working on the lands of multiple state and federal agencies, have donated their time to survey public lands.

In addition, agencies and tribes have been conducting their own studies in the hopes of managing impacts at a local level through their site-specific expertise. Tribes in particular face special challenges in protecting ancestral collection and ceremonial areas on public lands and have created their own tribal preservation programs. This symposium presents a cross-section of these efforts and offers different models for preparing for climate change for archaeologists and cultural resource preservationists worldwide.

[107] Symposium - RECENT DOCTORAL RESEARCH ON COLOMBIAN ARCHAEOLOGY

In recent years there has been a renewed interest in the archaeology of the so-called "Intermediate Area" within American archaeology, leading to more doctoral students studying these cultures and areas with new ideas. Both American and Colombian archaeology students have been tackling new questions and using new methods to better understand the complex history of Colombia's ancient cultures. The purpose of this symposium is to bring together doctoral candidates and recent graduates conducting research in Colombia in order to facilitate engagement and discussion of the most recent work being done for this region. This session will highlight the research that students of Colombian archaeology are undertaking and include diverse projects and perspectives. Additionally, student researchers from both the USA and Colombia will be participating and will benefit from the exchange of ideas with one another and this platform provides an opportunity to meet, network, and potentially develop future collaborations with fellow archaeologists studying Colombia's rich history.

[108] Symposium - ARCHAEOLOGY AND THE NEW MATERIALISM

The papers in this session take up different engagements with "new materialism", demonstrating both the potential of archaeology to contribute to this transdisciplinary discussion, and some of the challenges inherent in a project that is far from unified and still emergent.

One touchstone of new materialism has been the redefinition of matter as something beyond any specific physical stuff, as active, in Jane Bennett's felicitous term, Vibrant Matter, engaged in what Karen Barad characterizes as "intra-active becoming", "a congealing of agency". While on the surface these statements seem close to archaeological glosses on materiality and the agency of non-humans, one of the goals of this session will be to explore how new materialism goes beyond these well-integrated themes in archaeological research, and what changes new materialism might demand.

Interrogation of boundaries between humans, other animals, and other things in the world in new materialism culminates in the pursuit of new ontologies, especially non-dualistic ontologies. This again has many connections with existing archaeological approaches to "relational" ontologies. Contributors to this session are challenged to specify how the ontological relations they pursue align with new materialism and its existing archaeological precedents.

[109] General Session - PROTOHISTORIC AND HISTORIC ARCHAEOLOGY IN THE NEW WORLD**[110] General Session - RESOURCE USE, ENVIRONMENTS, AND LANDSCAPES****[111] Symposium - REPRESENTACIONES GRÁFICO RUPESTRES EN EL ESTADO DE OAXACA, NUEVAS INVESTIGACIONES EN LA ARQUEOLOGÍA DEL PAISAJE**

El estado de Oaxaca es ampliamente reconocido por su amplia gama de contextos en el registro arqueológico, desde vestigios que dan cuenta del poblamiento americano hasta las grandes construcciones prehispánicas como Monte Albán. Uno de estos elementos que han sido relativamente poco estudiados en este estado son las representaciones gráfico rupestres, las que nos ofrecen elementos para el análisis de las sociedades antiguas desde puntos de vista como el arte, religión, tecnología, siendo una gran fuente de información sobre las sociedades que las crearon. Dentro de este gran tema, en esta sesión se presentarán trabajos recientes en relación a los contextos con representaciones gráfico rupestres que se han trabajado últimamente en el estado de Oaxaca, desde perspectivas relativas a su investigación, protección y difusión como patrimonio arqueológico.

[112] General Session - BERINGIA AND THE ARCTIC**[113] General Session - THE HOUSEHOLD AS ANALYTICAL UNIT**

[114] General Session · ARTIFACTS AND THEIR PRODUCTION IN PREHISTORIC NORTH AMERICA**[115] General Session · THE ARCHAEOLOGY OF EAST AND SOUTHEAST ASIA****[116] Symposium · ARCHAEOLOGIES OF COLONIALISM AND EVERYDAY LIFE IN THE INDIAN OCEAN WORLD**

This session draws together several case studies from the IOW that look at the experiences, environment and conditions of everyday life within colonial contexts, and engage with archaeology's dualistic role in understanding the complexities of the past and heritage in the present. Colonialism in the Indian Ocean world, on the surface, seems analogous to colonialism within the Atlantic world. The same European colonial powers established plantations and trading posts, often on remote islands, built by the labor of enslaved and indentured Africans, Chinese, and South/South East Asians. Yet, more than anything, the vast research and literature on the Atlantic has also taught us that there are a multitude of variables within each colonial context that make the experiences of both colonizers and the colonized distinct. These case studies are new explorations that offer unique comparisons for historical archaeologies that engage in particular with diaspora, indenture and post-slavery contexts.

[117] Forum · PERFORMING THE PAST/PRESENT

Enriching the metaphor of archaeology as craft, this session will embrace the role of the archaeologist as participant/performer in the process of data recovery and interpretation. Presenters—and the audience—are encouraged to 'perform their data, its analysis, its interpretation' during the session; collaborators working in disciplines outside of archaeology are especially welcome to join. Suggestions include dramatic readings, live music, and experimental replication. Presenters should offer remarks that justify the choice of particular media for the performance. These remarks and discussions throughout the session will serve as opportunities to consider the contributions of explicit performance to the general (session-wide) and particular (presenter) craft(s) of archaeology undertaken. Furthermore, critically examining the archaeology-craft metaphor, we will question the alignment of archaeology with technology; does archaeology have its own chaîne-opératoire, and, if so, what are its stages and their attendant products? We also aim to explore whether explicit performance can facilitate a re-orientation of the discipline as more three-dimensional, advocated in the past on behalf of emotion and materiality. Finally, we will recognize the ethical implications of archaeological performance: does it reify the objectification of archaeological materials? Alternatively, does it advance the conceptualization of archaeology as imagined and archaeologists as social constructions?

[118] Poster Session · SITE FORMATION PROCESSES AND TAPHONOMY**[119] Poster Session · ENVIRONMENTAL ARCHAEOLOGY AND HUMAN ECOLOGY****[120] Poster Session · PREDICTIVE MODELS, SURVEY, AND SITE DISTRIBUTIONS****[121] Poster Session · ARCHAEOLOGICAL TECHNOLOGIES, TECHNIQUES, AND METHODS****[122] Poster Session · EXPERIMENTAL ARCHAEOLOGY AND ACTUALISTIC STUDIES****[123] Poster Session · THE AFTERLIFE OF ARCHAEOLOGICAL INFORMATION: USE AND REUSE OF DIGITAL ARCHAEOLOGICAL DATA**

Archaeological projects generate a lot of data. High value, interpretable data are published in the final report or other publications, but a great deal of additional data remain inaccessible. What happens to these invaluable supporting data (e.g. field notes, photographs, raw data sets, GIS files, etc.) after the final product is complete? This poster session explores ways that archaeologists who practice in many different settings (academic, agency, CRM) preserve and make available their digital archaeological products for future use.

[124] Poster Session - CROWDSOURCING, CO-CREATION, AND COLLABORATION THROUGH VIRTUAL CURATION

In his 2010 book *Cognitive Surplus*, Clay Shirky writes that “The dramatically reduced cost of public address, and the dramatically increased size of the population wired together, means that we can now turn massive aggregations of small contributions into things of lasting value.” A similar sentiment can be extended to virtual archaeological curation—the creation of intangible digital models from tangible pieces of the past. The participants in this session are developing protocols and pooling efforts to create digital diagnostic type collections and other tools that aid will aid archaeologists with making quicker and more accurate identifications, and enhancing their analyses of existing collections. Crowdsourcing and directed collaboration reduces duplication of efforts while expanding the research and potential of digitally preserving the past. Virtual curation also encourages co-creation efforts at colleges and in the community.

[125] Poster Session - THE ACID TEST: EXPLORING THE UTILITY OF THE DIGITAL INDEX OF NORTH AMERICAN ARCHAEOLOGY (DINAA) FOR USE IN APPLIED RESEARCH

(SPONSORED BY DIGITAL INDEX OF NORTH AMERICAN ARCHAEOLOGY (DINAA))

The Digital Index of North American Archaeology (DINAA) develops interoperability models for large, administrative archaeological resource inventory databases. As of September 2014, DINAA has integrated fifteen US State Historic Preservation Program databases that contain information on a half-million archaeological resources. Sensitive attributes, or information that could potentially threaten a cultural resource, are systematically scrubbed and never shared. DINAA provides a web-based tile-map interface that can filter site attributes and cultural time periods across incompatible database systems. Data are rendered within a spatially decimated (ca. 20-km²) tile grid, and query results can be exported in several formats or linked through stable web identifiers (e.g. JSON, GeoJSON, CSV, Microsoft Excel). This poster symposium explores analyses of settlement patterning, spatial distribution, resource management issues, and record comparability using data provided through DINAA. Other presentations emphasize interoperability and the power of linked data applications by making primary datasets available and connecting to DINAA through Universal Resource Identifiers (URIs). The application interface is hosted and developed through the Alexandria Archive Institute (Open Context). The research team includes members from 15 preservation offices, the University of Tennessee, Indiana University, Open Context, Michigan State University, and Grand Valley State. The National Science Foundation provided initial funding.

[126] Poster Session - DEVELOPMENTS IN FIRED CLAY CERAMIC REHYDOXYLATION DATING (RHX DATING)

Michigan Technological University, California State University-Long Beach, and Arizona State University scientists have been collaborating on a critical assessment of the novel RHX Dating technique, pioneered by Wilson et al. (2009). The proposed technique asserts that the methodical process of mass gain in fired clay ceramics, as the ceramic fabric's remaining clay crystals form atomic bonds with hydroxyl molecules, can be measured and calculated as a clock to identify the number of years before present that the ceramic was last fired. The three laboratories have run dozens of trials with varied methods, gaining valuable insight into the problems and promise of development. The posters in this session present overviews of data analysis which support cautious optimism for future development of the technique.

[127] Symposium - ANTELOPE CAVE: A DRY ANCESTRAL PUEBLOAN (VIRGIN ANASAZI) SITE IN NORTHWESTERN ARIZONA

Antelope Cave was excavated in the 1950s by crews from the Museum of Northern Arizona and UCLA and in the 1980s by BYU archaeologists. Prehistoric peoples lived at the site intermittently for 4000 years, but the most intense occupation occurred during the Pueblo I Period (AD 800-1000). The dry environment inside the cave provided for the recovery of thousands of perishable objects in addition to ceramic, stone, and bone artifacts. This symposium, based on the materials recovered from Antelope Cave, presents new research that expands our knowledge of the Ancestral Puebloan adaptation to the semi-arid environment of the Arizona Strip.

[128] Symposium - HISTORICAL ARCHAEOLOGY OF THE AMERICAN WEST

The American West has been defined in myriad ways, including geographically, environmentally, historically, and culturally. Whatever definition is used, however, it is clear that common trends and themes, such as culture contact, colonialism, labor, migration, and identity, are visible through historical archaeological studies. This symposium will include papers from across the American West and throughout the historic period in order to explore some of these themes and survey the current and future state of research.

[129] Symposium - EL HOMBRE EN LA CUENCA DEL RIO LERMA. PASADO Y PRESENTE

El presente simposio, reúne a especialistas de diferentes campos disciplinarios cuyas investigaciones confluyen en el estudio de uno de los sistemas hidrológicos más importantes de México; el río Lerma. Este río cuyo origen está en el valle de Toluca, constituyó un escenario ideal para el desarrollo de las sociedades humanas desde tiempos pretéritos. A lo largo de un cauce de más de 1200 kms, existieron flujos de poblaciones que se trasladaron de una región a otra, en un proceso continuo que posibilitaron las relaciones interculturales desde al menos el periodo Preclásico. En efecto, el Lerma enmarcó el asentamiento y desarrollo de las primeras formas de organización social, hasta aquellas sociedades complejas que enfrentaron a los conquistadores europeos; así mismo hacia el periodo colonial dio cabida a las relaciones interétnicas que transformaron los paisajes otrora imperantes. Ha sido también un referente de desarrollo económico y político durante todo el siglo XIX y hasta los tiempos actuales. Los avances de investigación logrados a la fecha, permiten apreciar que a lo largo de los siglos, los pobladores asentados cerca de sus riberas desarrollaron estrategias para aprovechar su gran potencial como generador de recursos, incluido su propio caudal.

[130] General Session - RECENT METHODOLOGICAL ADVANCES IN MESOAMERICAN AND MAYA ARCHAEOLOGY**[131] General Session - ARCHAEOLOGICAL AND BIOARCHAEOLOGICAL PERSPECTIVES ON VIOLENCE, CONFLICT, AND WARFARE****[132] General Session - MARKERS AND METHODS IN BIOARCHAEOLOGY AND FORENSIC ARCHAEOLOGY****[133] General Session - ARTIFACTS AND ARTISANS IN ANCIENT MESOAMERICA****[134] Symposium - ARCHAEOLOGICAL RESEARCH IN THE CAÑETE VALLEY, PERU**

This session focuses on current archaeological research performed in the Cañete Valley located in the Peruvian south-central coast. Speakers will present results from excavations and/or surveys which took place in different archaeological sites pertaining to different temporal periods, mainly the Early Intermediate Period, Middle Horizon, Late Intermediate Period and Late Horizon (Inca) The objective of this session is to share and exchange information from the different research projects focused on the valley in order to obtain a more regional perspective on the historical trajectory of the area.

[135] Symposium - FORAGING SPECTRA: HUNTER-GATHERER DIVERSITY IN PREHISTORY

While the term hunter-gatherer refers to a mode of subsistence, disparate cultures fitting these economic criteria have traditionally been grouped together despite variation in demography, mobility, foraging behavior, and sociopolitical organization. This diversity is primarily known from ethnographic data and most investigations of hunter-gatherers tend to build detailed pictures of human society through ethnographic analogy rather than archaeological evidence. To take additional steps toward documenting the range of diversity in forager lifeways, this session is designed to honor and draw inspiration from Robert Kelly's *The Foraging Spectrum*. Its central goals are to contribute to anthropological theory generally, and archaeological methods specifically, by examining the range of variability in prehistoric foragers extending beyond the ethnographic record. Individual papers cover a broad array of geographic areas and time periods and draw upon topics raised in Kelly's original work. This explicit use of new archaeological data, methods, and theories will highlight novel forms of foraging and social systems available only in the deep past.

[136] Symposium - NEWS OF THE WEIRD (ARCHAEOLOGY)

(SPONSORED BY MEDIA RELATIONS COMMITTEE)

This exciting symposium examines the interplay between archaeological fact and fantasy. Archaeological discoveries contribute to the public's consciousness of the ancient world. Unfortunately, fantastic elements also merge with verifiable data in disconcerting ways. Fanciful elements of the ancient world will be addressed along with how the media perceives archaeological data. This symposium is sponsored by the Media Relations Committee.

[137] Symposium - ATLANTIC CROSSING: SIDE VIEWS ON ROCK ART

Rock art studies have followed different paths in America and Europe (and other world regions for that matter). The reason lies in the constitution of the discipline. In Europe prehistoric art was an integral – and, at times, controversial – part of the discovery of the fossil man and the approach to this artistic phenomenon was tinged with questions about chronology and sequence. In areas such as North America, prehistoric art does not seem to have played an equivalently conspicuous role in the academic development of archaeology. In addition, the persistence of native peoples favored a more anthropologically-informed approach to rock-art studies, allowing closer attention to issues such as the social significance of these carved and painted images. This session brings together a series of papers dealing with different conceptions about the analysis of rock art conducted by researchers from different parts of the world, in order to reflect on how different research traditions have informed approaches to this unique archaeological manifestation.

[138] Symposium - NEW RESEARCH AND EMERGING SCHOLARS WORKING ON PUBLIC LANDS ADMINISTERED BY THE BUREAU OF LAND MANAGEMENT

The Bureau of Land Management is responsible for the stewardship of more than 247 million acres of public lands, comprising 10% of the total area of the United States and containing some of the most significant heritage resources in the nation. Federal mandates require the BLM to manage these resources in a multiple use context that meet historic preservation goals while simultaneously providing for varied uses of the nation's land for present and future generations. An important element of this balancing act is proactive archaeological research to benefit both the academic discipline and the public. Archaeological research contributes vital information to develop effective management approaches through the identification of context, significance, and landscape level relationships. Investigations of the past also benefit the public as the basis for heritage values education by providing research opportunities for students and seasoned scholars. By jointly developing research programs that address these relationships, the BLM works to more effectively promote and support archaeological investigations that will be of the greatest value to the public. This symposium highlights recent and ongoing archaeological investigations conducted on BLM lands to underscore the significant role of public land management agencies in facilitating, conducting and sponsoring academic archaeological research.

[139] General Session - EXPERIMENTAL ARCHAEOLOGY**[140] Symposium - CHRONOLOGY, EXCHANGE, IDENTITY: ELEMENTAL ANALYSIS OF GLASS BEADS FOR ASSESSING REGIONAL INTERACTION**

Archaeologists working around the world now investigate population mobility, timing of movements and trade events, and other human interactions at various scales. Glass objects are an ideal artifact category for addressing these questions because of their portability and durability, their relatively homogeneous makeup, and, in many cases their known provenience information. Glass beads can also serve as material signifiers of class, ethnicity, age, and gender; therefore, clarifying basic chronologies of interaction and patterns of exchange can reveal aspects of social signification and identity performance in past cultures. Elemental analysis techniques such as laser ablation-inductively coupled plasma-mass spectrometry (LA-ICP-MS), portable X-ray fluorescence (pXRF), and scanning electron microscopy with energy-dispersive X-ray spectroscopy (SEM-EDS) unite the efforts of a geographically diverse group of researchers in this symposium. Shared analytical techniques provide data that archaeologists interpret to increase understanding of interaction on past landscapes in North America, Africa, Europe and Asia. They face similar challenges in assessing data sets, identifying chemical patterns, and archaeological interpretation. Convening these scholars provides an opportunity to contextualize findings through even broader inter-regional and global perspective informed with discussion of diverse theoretical approaches to the interpretation of exchange and use of glass beads.

[141] Symposium - PRECERAMIC AND EARLY AGRARIAN COMMUNITIES IN THE BASIN OF MEXICO: NEW PERSPECTIVES

In the spirit of encouraging new excavations at known sites and the discovery of additional evidence for early transitions to settled community life, the goal of this session is to share preliminary results from recent fieldwork in the Basin of Mexico, particularly relating to the extensive period between the Late Preceramic and Late Formative periods. In spite of the importance of this period of time, ranging between at least 7000 and 2000 14CYBP, relatively few new advances have been reported over the past four to five decades, particularly insofar as the preceramic is concerned. A limited number of sites in the Basin have been examined in a focusing on the transition from preceramic hunter/fisher-gatherer groups to the establishment of settled agricultural communities during the Middle and Late Formative periods.

Geoarchaeological and paleoenvironmental approaches, together with new excavations in preceramic occupations in sites such as Tepexpan, Texcoco, San Gregorio Atlapulco, and early settlements such as Altica and Cuicuilco, are contributing to the improvement of hypothesis concerning the transition from hunter-gather economies to agrarian communities. New techniques and methodological approaches afford an opportunity to broaden our knowledge of these earlier periods before they are transformed beyond our reach.

[142] Symposium - THE TECHNOPOLITICS OF ANCIENT INFRASTRUCTURES

Technopolitics rejects any essential division between technological phenomena and political phenomena as subjects for analysis. Realizing political goals is always a technological problem and vice versa. Traditionally, however, archaeology has tended to separate out the investigation of ancient politics from ancient technologies, and so it is this divide that this session seeks to challenge. And while infrastructure frequently does appear in narratives of ancient states – its analysis is often overdetermined by the abstract political goals and ideological frameworks for which it is a “vehicle”. Yet, the politics of any infrastructural project is far from exhausted in the initial moment of its design and construction. Infrastructure can endure for centuries, during which time it can undergo degradation, re-appropriation, renovation or collapse. Studying such phenomena requires a deep engagement with the material and technological fundamentals of all infrastructure, fully integrated with, rather than artificially extracted from, its political context. Papers are therefore sought which will engage with past infrastructural projects from a broadly technopolitical perspective – and so seek to undo the long-running relegation of technological problems to a space outside the realm of politics within archaeological theory.

[143] Symposium - CACHE CAVE IN CONTEXT: UNVEILING NEW DISCOVERIES IN SOUTH CENTRAL CALIFORNIA

This symposium presents the findings from two seasons of fieldwork at the site of Cache Cave, which contains the largest known assemblage of perishable artifacts yet recorded within the larger Chumash linguistic area or that of its immediate neighbors. While cache sites were once relatively ubiquitous across the greater Chumash area, due to antiquarian and other looting activities, no major cache site has ever been studied using modern archaeological techniques. Field work in 2012 at Cache Cave uncovered not only a cache cave site having remarkable preservation with material in context, but one that dwarfs any previously known site in the sheer quantity of its assemblage. Subsequent work in 2014 has defined and documented the extent of the cave complex, explored in detail some of the cave deposits, and further refined our knowledge of site structure and chronology. This allows not only the first in depth, systematic analysis of any kind on this important site type, but an investigation of the largest cache cave ever discovered in the region. Papers presented here offer our initial views of the site and its assemblage in various contexts, as well as findings from habitation and special-use sites in the cave's vicinity.

[144] Symposium - THE MATACANELA ARCHAEOLOGICAL PROJECT 2014

The Matacanela Archaeological Project is a two season effort to more fully understand the transformation of Gulf lowland society at the end of the Classic period and through the Postclassic period. The Classic-Postclassic transition throughout Mesoamerica and the southern Gulf lowlands was characterized by shifting political, economic, and ideological frameworks, climatic and environmental change, and migration. In this session, we present the findings of the first season of field research, situate Matacanela within its broader regional and temporal contexts, and consider avenues for future research. We incorporate the perspectives of archaeologists, iconographers, and members of the community.

[145] Symposium - TRIBES, CHIEFDOMS AND EARLY STATES IN LATE PREHISTORIC JAPAN

This session presents the results of recent research into the archaeology of chiefdoms and early states in late prehistoric Japan. The time period under consideration spans from ca. 500 B.C. to 600 A.D. During this time period, local societies evolved from tribal-level to chiefdom-level, and eventually from the third to fifth centuries A.D. several regional societies were united to form the central polity at an early-state level. The social and cultural evolution during this time period is characterized by strong regional differentiation in the speed and process of evolution and patterns of interaction with other regions, although the major subsistence base was wet rice agriculture. Moreover, interaction with the Chinese continent and Korean peninsula played a major role in the development of social complexity. In the middle third century, highly standardized keyhole-shaped burial mounds appeared in many regions of Japan, but strong regional differences remained. In this session, we want to emphasize this interplay between autonomous local polities and the central polity in the process toward more complex society.

[146] Symposium - THE ARCHAEOLOGY OF COMMON SENSE

Rather than colloquial wisdom, Clifford Geertz argued, common sense was culturally constructed, historically contingent, and in need of querying. As such, like myth or art or knowledge, common sense was a cultural system in need of anthropological attention. Though his concern was for the ethnographic present, investigators of ancient and historic remains have much to contribute to common sense's analysis. Their expansive time frames can reveal the processes that work so assiduously to turn history into human nature. In this session, contributors are asked to identify and interrogate contemporary commonsensical notions—about gender, sexuality, race, ethnicity, class, time, etc.—that find their way into scientific studies and/or popular presentations of the past. This naturalization of the cultural is not without consequences, and contributors may also deliberate about the socio-political effects, whether intended or not, of reifying common sense. Finally, as a counter to universalizing and presentist narratives of the past, contributors are encouraged to offer evidence from their contextualized archaeological and bioarchaeological studies that highlight the varied ways to be human.

[147] Symposium - HERE BE DRAGONS: ARCHAEOLOGY IN NORTH CENTRAL BELIZE

Starting in the 1970s with excavations at Altun Ha, and continuing into the 21st century with work at Lamanai, Ka'Kabish, Chau Hiix and sites in the Hillbank area, and other locations, North-Central Belize has been the focus of considerable archaeological work. This symposium is intended to highlight work done in this region of Belize. By bringing the work done by projects in this area together, along with research spanning the Middle Formative through to the Historic period, we hope to integrate the research produced by these projects into a larger regional discussion of Maya politics and society.

[148] Symposium - NEW PERSPECTIVES IN FOLSOM ARCHAEOLOGY

In the past decade, our knowledge of Folsom adaptations has improved dramatically. While Folsom peoples were undoubtedly highly mobile and hunted bison, work since the early 2000s has provided a much more nuanced view of their subsistence and settlement systems. Folsom sites located in a variety of environments (including the high elevation intermountain basins in the Rockies and the prairie woodlands east of the Great Plains) have shed new light on the diversity of Folsom lifeways, and analyses of new and extant collections have improved our understanding of Folsom technological organization. The primary goal of this symposium is to report on innovative recent research on Folsom technology, mobility, and settlement systems that adds insight to our reconstruction of Folsom adaptations. Individual papers within the session span a wide geographic range, include new methods for addressing variability in the Folsom archaeological record, and draw on concepts from a plethora of theoretical frameworks to contribute to a contemporary synthesis of how Folsom Paleoindians flourished during the Terminal Pleistocene.

[149] General Session - GLOBAL STUDIES IN ROCK ART ANALYSIS AND INTERPRETATION**[150] General Session - THE ARCHAEOLOGY OF THE PALEOINDIANS AND EARLY NEW WORLD OCCUPATIONS****[151] Symposium - NEW PERSPECTIVES ON THE IZAPA STATE**

Long-known as an important Late Formative political site, Izapa was one of a string of early states extending down the Pacific coast from Chiapas to El Salvador. Izapa's extensive sculpture, part of a pan-regional public art style, demonstrates ties with both the Guatemalan Highlands and Isthmian traditions. Philip Drucker first brought Izapa to world attention during the 1940s in the pages of National Geographic Magazine. In the 1960s, the New World Archaeological Foundation (NWAf) established a ceramic chronology and produced wonderfully detailed maps and drawings of the monumental architecture and sculpture that define the site core. Yet, despite these early efforts, surprisingly little is actually understood about how Izapa's residents lived or the world they inhabited. This session brings together a dozen scholars whose recent work provides new insights on Izapa. Reanalysis of NWAf data as well as recent excavations and regional settlement survey contribute to improved understanding of the chronology, demography, and economy of Izapa and its sustaining area. New perspectives on the site's iconography and writing place the site's public art and elite culture in regional context. These exciting new data situate Izapa and the Pacific coast as one of the centers of early Mesoamerican civilization.

[152] General Session - MARINE ZOOARCHAEOLOGY AND MARITIME ECONOMIES**[153] General Session - ETHNOARCHAEOLOGY, ETHNOHISTORY, AND ETHNOGRAPHY IN ARCHAEOLOGY****[154] Symposium - CONSUMING LANDSCAPES**

Landscape and foodways studies in archaeology and beyond have increasingly touched on social questions, but the former have mostly expanded our understanding of the management of past environments, while the latter have focused on discourses of social identity. This session aims to combine these two often separate perspectives in order to investigate how foodways and landscape are, and were, entangled. 'Consuming Landscapes' refers to the multiple ways in which historical trajectories of food, especially their relationships with particular geographies are used, called upon, and restructured in a social discourse. We welcome contributions across disciplines that investigate how people perceive and engage with their landscapes in different periods and places as revealed by the production, movement, consumption and/or disposal of food. Such a framework can be particularly productive in the examination of the ways social networks and power relationships are created, transformed, and altered along with territorial appropriation, expansion and conquest, and in highlighting ideologies related to such geographical movements. We bring together contributions from a wide range of specialists to expose and encourage a continuing interdisciplinary dialogue to foster the emergence of a more integrated practice in the study of food and social and cultural landscapes.

[155] General Session - GLOBAL STUDIES IN GEOARCHAEOLOGY

[156] Symposium - THE PRESENCE OF THE HUNTER AND GATHERER GROUPS IN THE NORTHWEST MEXICO REGION: RECENT FINDINGS

Due to booming development in the Northwest Mexico region and the presence of more archaeologists in these arid areas, several projects have unveiled interesting details about the presence and ways of life of hunters and gatherers groups that lived and died in this apparently desolate space. The material evidence left behind for us, is not much, but those material context provide a glimpse into how they interacted with their environment and how they built a cultural landscape. In this symposium we will present the latest discoveries regarding these groups in the Northwest Mexico region.

[157] Symposium - FROM POLLEN TO POTTERY: NEW INSIGHTS ON THE INTERPLAY OF SOCIETY AND ENVIRONMENT IN SOUTH AMERICA DURING THE LAST 2000 YEARS

(SPONSORED BY AHRC / FAPESP)

In this symposium we want to explore ecological changes in South America, and human engagement with those processes during the last two millennia, particularly around AD1000. To discuss these points it will bring together researchers from a range of disciplines including archaeology, environmental science and paleoecology. The main aim of the symposium is to advance our understanding of the complex interaction between society, its built landscapes and the wider environment, highlighting the effects of these factors amongst each other. Strong interactions between these components have been provisionally identified in South America by interdisciplinary studies combining archaeology and paleoecology. Key areas to be explored are the current resolution of paleoecological data, the methodologies used to investigate human-environment interaction and the extent to which relevant disciplines can convincingly argue that human responses to change are negligible, passive or exploitative. The symposium will provide a context in which regional research projects can be re-evaluated at a continental scale, and where future engagement between investigators can be developed. This is an invitation to participant to integrate both disciplines and data with the combined objective of advancing our understanding of the interplay between of society and ecology.

[158] Electronic Symposium - SMOKE, FLAMES, AND THE BODY IN MESOAMERICAN RITUAL PRACTICE

Papers in this electronic symposium address the evidence for the ritual use of smoke and flame in Mesoamerica, particularly as pertaining to the human body in life and death. In the past and contemporary indigenous worldview, heat and flame are animate forces and signify strength and vitality; the most powerful of individuals are embodied with immense heat. Moreover, fire is transformative; both a means to destroy but also to transport offerings to otherworldly places. The source of all heat is, of course, the sun, the central force in the Mesoamerican cosmos. Today, the importance of heat and flames is evident in a spectrum of ritual practices, which range from the use of sweat baths to the burning of incense and other offerings. In Pre-Columbian times, human bodies were among the most valuable substances burned. The papers in this

symposium represent a diversity of case studies pertaining to the application and meaning of heat and fire in ancient, historic, and modern Mesoamerica and are drawn from archaeology, bioarchaeology, epigraphy, iconography, ethnohistory, and ethnography. This session will be followed by a more detailed symposium to be held at the Dumbarton Oaks Research Library and Collection in October, 2015.

[159] Forum · RESILIENCE, ARCHAEOLOGY AND GLOBAL WARMING: WHAT WE CAN LEARN FROM PAST HUMAN RESPONSES TO CLIMATE CHANGE THAT CAN HELP US TODAY

What archaeologists are learning about past adaptations to climate change can help inform how society can become more resilient in the face of global warming. Climate impacts including sea level rise, coastal erosion, intense wildfires and extreme weather events – are a growing threat to archaeological sites and cultural landscapes, and are broadly challenging our society.

This forum will provide an opportunity to hear about and discuss cutting-edge thinking on what we can learn from archaeological studies of past societal responses to climate change. Equally we will look at the ways in which rapidly changing climatic conditions are threatening archaeological sites across the United States, as well as the cultural heritage of descendent communities including Native Americans, First Nations and Native Hawaiians, from whose traditional ecological knowledge much can be learned. The forum will address impacts in a range of coastal and mountain sites, as well as begin to explore the thorny question of prioritization of cultural heritage protection in a changing climate.

[160] Forum · TWENTY-FIRST CENTURY ISSUES AND CHANGES IN CURATING COLLECTIONS
(SPONSORED BY COMMITTEE ON MUSEUMS, COLLECTIONS AND CURATION)

This forum will be a moderated discussion highlighting exciting changes in technology that make accessibility and research more dynamic with curated collections, such as 3-D scans, interactive web database modules, and podcast exhibitions. While technology offers new avenues for engaging material culture in innovative ways there are still challenges to be confronted and overcome such as the curation crisis, orphaned collections, new deaccessioning regulations, exhibition language, managing digital data long term, and intellectual property rights. Panelists will present concrete examples to introduce these topics, allowing ample time for open conversation and interaction with the audience as we (archaeologists, museum professionals, descendent community members, and educators) face these issues together.

[161] Forum · BUILDING ARCHAEOLOGICAL RESEARCH COMMUNITIES WITH CYBERINFRASTRUCTURE

Effectively addressing compelling, large-scale research problems demands dramatically enhanced collaboration among researchers. This forum discusses successes and challenges in building research communities with online, digital platforms, such as the Digital Archaeological Record (tDAR). Forum panelists will consider approaches for creating these communities with existing infrastructure and strategies for building and maintaining these groups. In addition, they will explore opportunities to devise innovative collaborative research efforts with emerging technologies and tools.

[162] Poster Session · MACRO, MICRO, AND ISOTOPIC STUDIES IN ARCHAEOBOTANY

[163] Poster Session · ANIMAL EXPLOITATION IN ANCIENT NORTH AMERICA

[164] Poster Session · ZOOARCHAEOLOGY AND CERAMIC STUDIES IN THE CARIBBEAN

[165] Poster Session · FAUNAL ANALYSIS IN HISTORICAL ARCHAEOLOGY

[166] Poster Session - ZOOARCHAEOLOGY AND FAUNAL ANALYSIS**[167] Poster Session - THE ROBUSTNESS AND VULNERABILITY OF FOOD PRODUCTION AND SOCIAL CHANGE: AN EVALUATION OF INTERDISCIPLINARY CONCEPTS USING ARCHAEOLOGICAL DATA, MODELS AND ETHNOGRAPHIC OBSERVATIONS**

Our session is broadly focused on the production of food, which encompasses the beliefs, practices, technologies and resources that individuals draw upon to obtain food. Systems of food production create feedbacks between humans and ecosystems, which can lead to the coevolution of social norms and practices and the composition of ecosystems, path dependency and rapid social transformations (i.e. regime changes). Our session aims to bring together a geographically and conceptually diverse set of contributions to investigate feedbacks between social systems and ecosystems, with a central focus on how strategies of food production modify such feedback processes. In particular, we seek to critically integrate interdisciplinary concepts like robustness, resilience and vulnerability to investigate the recursive relationships between human food practices, ecosystem dynamics, and social changes documented through the long gaze of the archaeological record. Drawing on archaeological, ethnographic data and/or models, the contributions to this session are focused on: (1) examining the trade-offs between strategies designed to cope with environmental change over the short-term and the ways these strategies influence the resilience and create new vulnerabilities for societies over the long-term; (2) discussions of the data, methodologies, and infrastructure needed for research of such trade-offs in social-ecological systems.

[168] Poster Session - PRELIMINARY RESULTS FROM THE TSE-WHIT-ZEN PROJECT: ZOOARCHAEOLOGY AND GEOARCHAEOLOGY OF A 2000 YR OLD LOWER ELWHA KLALLAM VILLAGE ON THE STRAIT OF JUAN DE FUCA, WASHINGTON STATE

Tse-whit-zen, a large ancestral village of the Lower Elwha Klallam Tribe, located on the southern shore of the Strait of Juan de Fuca, Port Angeles, WA, was extensively excavated in 2004 as part of a transportation project. Multiple houses spanning the last 2,000 years were documented with exceptionally fine geo-stratigraphic control, and faunal samples were collected that allow for detailed reconstruction of animal use over this period. In 2012, our team began a project to study a large sample of Tse-whit-zen's faunal remains and synthesize its geo-stratigraphic records to address several goals: 1) evaluate the effects of abrupt and gradual environmental events (earthquakes, climate change, and shoreline development) on local animal populations during the past 2,000 years; 2) study sequences of faunal records from three different households of varying social rank to understand how social factors influenced response to environmental change; 3) train students in zooarchaeological and geoarchaeological analysis; 4) work with the Lower Elwha Klallam Tribe as they develop a museum and educational programs related to this important site. This symposium will provide an overview of the project and preliminary results.

[169] Symposium - ARCHAEOLOGICAL RESEARCH IN THE CHINCHA VALLEY, SOUTHERN PERU

In this symposium we focus on recent archaeological finds in the Chincha valley on the Peruvian South Coast, with a particular focus on the iconic Paracas culture. Paracas is the first complex society in this area. It was central to the work of such luminaries as Max Uhle, Luis Lumbreras, and Julio C. Tello. Paracas is named for the Peninsula less than 50 km to the south of Chincha. Paracas materials have been found in many valleys throughout the southern coast (from Chincha to Palpa). Our data from Chincha strongly suggest that this was the center of this culture. Likewise, the later Chincha culture is known from ethnohistorical sources as a large trading state (the Chincha Kingdom) that ultimately allied with the Inca Empire. In this symposium we will present and interpret a huge corpus of new data from four years' research at Paracas and later sites in the valley that refines and revises our understanding of the prehistory of this region.

[170] Symposium - TRADE, EXCHANGE, PRODUCTION AND CONSUMPTION IN PRE-COLUMBIAN AND COLONIAL LOWER CENTRAL AMERICA (PANAMA NICARAGUA AND COSTA RICA)

This symposium examines material manifestations and theoretical aspects of trade, exchange, production and consumption in pre-Columbian and colonial Panama, Costa Rica and Nicaragua. Both organic (plant and animal) remains and a variety of artifact classes (including, but not limited to, ceramics, stone tools and shell artifacts) are examined and discussed. The production, use and discard of material goods are examined with attention paid to evidence of craft specialization and long- and short-range trade and exchange. Production and consumption of perishables, especially plant and animal foods, is examined in terms of identification of regional consumption patterns and possible human effects on these resources and past environments. This symposium hopes to renew interest in this dynamic geographic region linking Mesoamerica and Andean South America.

[171] General Session · LITHIC AND TECHNICAL STUDIES IN NORTH AMERICAN PREHISTORIC ARCHAEOLOGY

[172] Symposium · HOUSEHOLD AND RITUAL IN THE EASTERN OLMEC HEARTLAND

The Olmec (1200-400) are one of the best-known early complex societies in Mesoamerica, yet scholars know very little about the organization of their social, economic, ritual, and political systems. This can be attributed to the fact that most fieldwork has been conducted in elite areas of large centers, and we lack household scale data from smaller sites. Recent investigations at the Middle Formative sites of Los Soldados and Arroyo Pesquero help resolve this bias by collecting household and ritual data at a medium sized site and a special purpose site in the La Venta region. The papers in this session utilize data from subsurface testing (GPR and augering) and excavations to reveal information on economic, ritual, and political organization of Middle Formative Olmec in the Eastern Heartland.

[173] General Session · MISSISSIPPIAN ARCHAEOLOGY

[174] General Session · EXPLORING TECHNOLOGICAL AND SOCIAL BOUNDARIES IN THE AFRICAN STONE AGE

[175] Symposium · THE FORGING OF COMMUNITIES IN COLONIAL ALTA CALIFORNIA, 1769-1834

Interaction between Native Californians and colonists, soldiers, and priests representing the Spanish state in Alta California after 1769 began a process of constantly fluctuating relationships between native and non-native people. The establishment of the missions and presidios—and the subsequent expansion of colonial settlements—created new and dynamic relations and communities within and between colonists and native people across California. These communities were dynamic at various scales, and were based, at least in part, on notions of mutual dependency and benefit amongst and between community members. As the colonial presence and reach expanded in Alta California, some of these communities became increasingly multi-ethnic. This session thinks about the nature of community in colonial Alta California. How were communities formed and re-formed? How did community members identify themselves and identify with the community? What criteria were used to create and reformulate community? When were communities homogeneous or multi-ethnic? How were these communities unique or overlapping with others? This session entails case studies of the concept of community, drawing from examples of colonial establishments (missions, pueblos, presidios, mercantile outposts) and Native Californian locales to better understand the nature of interaction, dependence and benefit, and identity.

[176] Symposium · ANTHROPIC ACTIVITY MARKERS: ARCHAEOLOGY AND ETHNOARCHAEOLOGY

People tend to recurrently use specific areas of their living space, producing an accumulation of evidences (chemical and/or physical) that represent the result of the activity performed. The possibility to identify and connect this evidence to the activity that generated the record is pivotal to our understanding of past human behavior. Ethnoarchaeology and experimental archaeology drive the inferential reasoning that creates the models connecting the distribution/concentration of proxies with specific activities. We define these models as 'anthropic activity markers' and propose a transdisciplinary approach to reduce problems of equifinality whereby the same pattern might be caused by several activities. In particular, the analysis of the spatial distribution of the fingerprints under study is considered fundamental for the definition of anthropic activity markers. This session aims to gather contributions from scholars in different fields, willing to challenge this issue from different points of view and at different scales (landscape and domestic or productive structures), going from a macro- to a micro-scale, from "space", to "place". We invite contributions that include different approaches, such as remote sensing, archaeological prospection, botanic analyses, chemical analyses, archaeozoology, microdebitage, and micromorphology. Archaeological and ethnoarchaeological contexts are welcome to show the potentiality of the approach.

[177] Symposium - BIOGRAPHIES OF ENCLOSURE IN GLOBAL CONTEXT

Cross-culturally, naturally occurring hilltops, terraces, and other prominent locations have been the focus for long-lived and/or recurrent human activity. These places have frequently been enclosed with ditches, ramparts and palisades, creating culturally-prescribed arenas for human action. The practice of enclosure frequently forms just one element in the complex biographies of such places and is not always necessarily related to defense. At various points in their biographies, such places might be social and/or political centers, elite residences, centers of exchange, liminal zones where communication could be made with the gods, spirits or ancestors, funerary sites, or places of refuge. Despite the potential interpretive gains to be derived from cross-cultural analysis of the biographies of enclosed places, attempts to critically compare sites in different temporal and geographical contexts have been generally lacking. This session will address this lacuna, drawing on research from several parts of the world. Papers will focus on biographical approaches, the agency of natural places, and the role of enclosure in materializing social memory and identity.

[178] Symposium - 2015 FRYXELL AWARD SYMPOSIUM: PAPERS IN HONOR OF DAVID HURST THOMAS

(SPONSORED BY FRYXELL AWARD FOR INTERDISCIPLINARY RESEARCH)

David Hurst Thomas is the 2015 recipient of the Fryxell Award for Interdisciplinary Research in archaeology. The Fryxell Award is presented in recognition for interdisciplinary excellence of a scientist who need not be an archaeologist, but whose research has contributed significantly to American archaeology. The award is made possible through the generosity of the family of the late Roald Fryxell, a geologist whose career exemplified the crucial role of multidisciplinary cooperation in archaeology. The 2015 Fryxell Award recognizes the area of general interdisciplinary studies. The fundamental nature of Dr. Thomas' research is, and has been since the beginning of his career, interdisciplinary. For over four decades, he has engaged in pioneering research that has incorporated human biology, history and ethnohistory, experimental archaeology, paleoethnobotany, zooarchaeology, and geoarchaeology. This approach has been at the heart of large-scale, long-term, research projects focused on broad anthropological questions. The scope of this work includes projects in the Great Basin, the Georgia Coast, and the missions of California and the American Southwest, and addresses core questions including inquiries into human mobility and foraging subsistence strategies, the transition to farming, the rise of social inequality, and the impact of colonialism on Native American societies.

[179] Symposium - USE-WEAR, EXPERIMENTAL ARCHAEOLOGY AND RESIDUE ANALYSIS IN THE PEOPLE'S REPUBLIC OF CHINA, A SESSION IN MEMORY OF GEORGE H. ODELL

This symposium is dedicated to the memory of George H. Odell and the influence his publications and friendship had on scholars around the world. The session's focus is on the analysis of use-wear traces and residue traces on various artifact types from the Peoples Republic of China. A number of scholars have been engaged in these types of analyses and their methods and results will be of interest to the international community. The topic is not restricted to a particular artifact class. Therefore papers addressing use-wear and/or residue analysis on bone tools, ground stone tools, flaked stone tools, ornaments, ceramics and other artifact types are encouraged. Papers should strive to integrate the analysis into broader interpretations of meaning in terms of the organization of production, production technology, function, style, chaîne opératoire, craft specialization or other appropriate theoretical constructs. Analytical approaches utilizing ethnoarchaeological and or experimental archaeological approaches are encouraged. There are no restrictions on time period or geographical area. Papers ranging from the analysis of *Homo erectus* remains to the Dynastic period are encouraged.

[180] Symposium - LANDSCAPES OF PRODUCTION: RECENT RESEARCH ON THE ARCHAEOLOGY OF FIELD AND IRRIGATION SYSTEMS

Archaeologists examine agricultural landscapes to address a range of questions on ancient ecologies and economies. At the same time, understanding the creation, management, expansion, intensification, and abandonment of field and irrigation systems can be hampered by problems of visibility, preservation, and chronology. This session highlights recent research in the archaeology of agricultural landscapes from areas around the world, and includes novel theoretical and methodological approaches as well as syntheses of long-term, interdisciplinary projects. The session brings together researchers with different study areas, training, and perspectives to share ideas and information and inspire new directions in research.

[181] Symposium - SPACE AND TIME IN THE UPPER PALAEOLITHIC: A MIXED TRADITIONS APPROACH TO THE STUDY OF PREHISTORY

The goal of archaeological research throughout the "history of prehistory" was chronology. While the construction of refined culture histories in any study area is necessary, it confines us to a diachronic vision that limits the construction of synchronic, and ultimately human, interpretations. Throughout the 1960s and 1970s two figures, Binford in North America and Leroi-Gourhan in France, turned archaeology on its side rather than on its head; diachronic process was not forgotten, but horizontal surface excavation, spatial analysis and paleoethnographic interpretation, as well as experimental and ethnoarchaeological research, removed the blinders from prehistory. This allowed archaeologists to start synchronically investigating prehistoric cultures rather than prehistoric timelines. The time has come to combine synchrony and diachrony and investigate the evolution of behaviors throughout the entirety of the Upper Paleolithic. This symposium will thus highlight horizontal approaches to the Upper Paleolithic, which often use spatial analysis at local and regional scales. This will allow us to evaluate progress made since Binford and Leroi-Gourhan, and highlight international research and projects integrating spatial, experimental, and ethnoarchaeological data. It will provide a first sketch of a synchronic and diachronic Upper Paleolithic, and present ways for advancing in the marriage of these two concepts of time.

[182] Symposium - GAMES PEOPLE PLAY: PREHISTORIC GAMES OF INDIGENOUS NORTH AMERICANS

Session participants will discuss evidence for games and gaming among selected ancient indigenous people of North America. Presentations will focus on the material evidence of ancient games in the archaeological record and/or the role of games and gambling in ancient North American societies. The inspiration for the session is Stewart Culin's (1907) monumental publication *Games of the North American Indians*, in which the author provides a comprehensive overview of the myriad of games played by traditional people in North America. The goal of the session participants is to investigate the deep roots of some of the traditional games documented by Culin.

[183] Symposium - EXCAVATING THE HOUSE: RESIDENTIAL ARCHITECTURE IN THE MAYA AREA

This session adds to the growing body of work on ancient Maya residential structures from the Preclassic through the Postclassic period. The archaeological analysis of Maya residences (including their refuse, offerings, architecture, and location) whether elite or commoner, is fundamental to understanding the basic structure of Maya societies. From houses we can learn about the sociopolitical and socioeconomic strategies of individual communities, and possibly even individuals, through documenting evidence of settlement structure, general consumption, trade, and ritual. In addition, the analysis of residential complexes is requisite to understanding the daily life of their users, and the manner in which they organized the surrounding landscape and exploited their environment. Defining differences between households within one polity at one place in time or over periods of time can provide crucial information on what supported the success of a given polity or contributed to its failure.

[184] Symposium - REGIONAL PERSPECTIVES ON THE TIWANAKU COLLAPSE: "POST-EXPANSIVE" CHRONOLOGY, CULTURAL TRANSFORMATION AND ETHNOGENESIS IN THE SOUTH CENTRAL ANDES

Tiwanaku-derived ceramic traditions and associated settlement systems are found throughout the south central Andes. This symposium focuses on the definition and dating of "post-expansive" Tiwanaku traditions in Bolivia, Peru and Chile. In the past, Tiwanaku-derived traditions were derided as epigones, representing artistic decadence and cultural and political decline. Recent research shows continuities in affiliation and practice, as well as cultural change and the genesis and expansion of autonomous successor groups through an era marked by conflict, political balkanization, iconoclasm, migration, hybridity, cultural transformation, and ethno genesis. We ask participants to consider regional patterns of continuity and change concurrent with the decline of the greater Tiwanaku system after ca. AD 1000. What elements of Tiwanaku style and lifeways show continuity across time and space, and which were not retained? Were post-expansive traditions associated with Tiwanaku descendants or local or transcultural populations? Does the dating of post-expansive styles and settlements suggest a timing and directionality to the Tiwanaku collapse? Through comparative study of Tiwanaku's successor traditions, we hope to open a wider conversation of both the collapse and the lasting heritage of the Tiwanaku civilization.

**[185] Symposium - CASE STUDIES IN CHERT SOURCING AND IDENTIFICATION
(SPONSORED BY PREHISTORIC QUARRIES AND EARLY MINES INTEREST GROUP)**

The purpose of this symposium is to provide an opportunity for researchers engaged in identifying and sourcing chert to present new data, methods, and techniques in the form of case studies. The ability to identify and source chert has experienced several advances in the last few years. This ability is focused around new methodologies and multi-technique approaches, rather than macroscopic identification alone. In particular, chert typology is de-emphasized in favor of determining formational and diagenetic processes through multi-technique approaches including instrumental analysis, petrographic thin sectioning, and exhaustive regional studies of macroscopic properties. Multiple instrumental techniques will be presented including Instrument Neutron Activation Analysis (INAA), Fourier Transform – Infrared Spectroscopy (FT-IR), Inductively Coupled Plasma - Mass Spectrometry (ICP-MS), petrographic thin section analysis, and many more. Each of these techniques has unique advantages for answering specific anthropological questions concerning human behavior. Case studies will focus on presenting methodological approaches to include sampling, technique, data, implications of research, and future studies.

**[186] Symposium - 'SIEMPRE A LA VANGUARDIA': A TRIBUTE TO DOLORES PIPERNO
CONTRIBUTIONS TO THE ORIGINS AND SPREAD OF AGRICULTURE
(SPONSORED BY COA)**

This symposium will present a collection of papers in recognition of Dolores Piperno honoring her leading contributions to paleoethnobotany and the archaeology of the Americas, as well as her inspirational mentorship. The symposium will celebrate Dolores' methodological and theoretical contributions to the study of plant domestication and ancient human impact on landscapes around the world. Dolores' cutting-edge innovations are innumerable and ground breaking; they range from the study of behavioral ecology, phytoliths, starch grains, pollen, molecular biology, dating, and much more. Papers from long-time

colleagues, former students, and friends will show how her major contributions to the discipline are of current and future relevance. Presentations will also focus on new data and cutting-edge developments in paleoethnobotany inspired by her work.

[187] Symposium - SEE HOW WE ARE: REPRESENTING IDENTITY IN THE ANCIENT AMERICAS

"Identity" is a broad term that can be used in a number of ways, with varying meanings. Focusing on the definition "presentation of a group or individual's perceived qualities to other members of the group or to outsiders," this session explores the way in which identity has been defined in the Pre-Columbian Americas. Identity types can be political, ethnic, social, gendered, or involve leadership, while strategies of representation may include landscape modification, architecture, body modification, costume, or visual arts. Chief among the questions to be explored is what kinds of identities were important, and what strategies for representing membership in an identity group were used. Issues of alterity, propaganda, and conflict, as well as the creation and maintenance of normative structures, are explored.

[188] Symposium - PUBLIC PERCEPTIONS OF ARCHAEOLOGY

Since the beginning of public archaeology, we, as archaeologists, have held both legal and ethical obligations to share information with the public in a way that promotes understanding and appreciation in a shared heritage. The development of various public heritage education and stewardship initiatives, such as Project Archaeology, USFS's Passport in Time, and Archaeology in the Community, has begun to provide archaeologists with thoughts on how to meet both legal and ethical obligations. Yet, we, as archaeologists, are increasingly asked to justify to the public the value in and importance of stewardship of the archaeological record. Although, many public perceptions of archaeology still dictate who archaeologists engage with, the use of the term and how we view the "public" varies. Understanding the needs and interests of the many publics interested in archaeology will help us understand the obstacles we face in sharing information. In this symposium we will explore innovative approaches and best practices for sharing information through various engaging public initiatives.

[189] Symposium - EXAMINING WEBS OF SOCIAL RELATIONS: NEW RESEARCH IN WEST MEXICAN ARCHAEOLOGY AND WEST MEXICO-U.S. SOUTHWEST CONNECTIONS

In the history of research on prehispanic Mesoamerican cultures, far West Mexico has long been relegated to a position as a peripheral backwater on the northwestern fringes of the complex cultures of highland and southern Mesoamerica. However, the rich diversity of cultural traditions and social developments in West Mexico also have been recognized as being distinct from yet connected to other indigenous societies in Mesoamerica and the U.S. Southwest. A surge in archaeological research in the past decade has begun to draw renewed attention to this often-overlooked region and this recent work has begun to clarify our understanding of the prehispanic history of the coastal lowlands and interior highlands of West Mexico. This session is a platform for highlighting new archaeological research by junior and senior scholars in West Mexico with a sub-focus on examining how the webs of social relations in far West Mexico intersected with the social webs of Pueblo cultures of northwest Mexico and the U.S. Southwest.

[190] Symposium - ARCHAEOLOGY IN CONTEXT: THE INFLUENCE OF THE GEOARCHAEOLOGICAL CAREER OF PAUL GOLDBERG

(SPONSORED BY SAA GEOARCHAEOLOGY INTEREST GROUP)

In May 2014, Dr. Paul Goldberg officially retired as Professor of Archaeology at Boston University. Over the past four decades, he has dedicated himself to collaborative research and the study of archaeological sites and landscapes at multiple scales. In the process he has helped revolutionize our understanding of site formation processes. Although he is best known for his work with micromorphology in archaeology, Paul has an exemplary record of geoscience-based research and teaching in all aspects of archaeology. In addition, he has participated in some of the key debates about the evolution of our own species. His influence has been considerable, not just in North America, but across the world. Typical of individuals who make innovative and remarkable contributions to archaeology, Paul has moved from being a lonely voice on the edge of the field to the center of a revolution in archaeologists' abilities to learn about human behavior from

imperfect records. This symposium seeks to honor Paul Goldberg's long career and demonstrate his numerous contributions to archaeology through the work of others.

[191] Symposium - EVOLUTIONARY THEORY AND ARCHAEOLOGY, PART I: CULTURAL TRANSMISSION, CULTURAL EVOLUTION, AND EVOLUTIONARY ARCHAEOLOGY

Once found only at the margins of the discipline, evolutionary theory has become commonplace in archaeological inquiry. Not surprisingly, evolutionary approaches to understanding past behavior from culture material have undergone an adaptive radiation, filling niches defined by different research questions and data. The research featured in this session is most closely allied with the subset of approaches that includes cultural transmission theory, cultural evolution, and evolutionary archaeology. We aim to make the powerful new methodological tools employed in these growing sub-fields accessible to a wider audience. A secondary goal is to bring together a large group of evolutionary-minded researchers to discuss outstanding problems of shared interest and to plant the seeds for future collaboration. Discussants will comment on the research presented in the context of their own ideas about where we as a group should focus our future efforts to benefit the discipline as a whole.

[192] Symposium - THE GEOARCHAEOLOGY OF SUBMERGED, INTERTIDAL, AND WETLAND PLACES: ADVANCES IN METHOD AND THEORY OF PREHISTORIC ARCHAEOLOGY UNDERWATER - 2015

This symposium is organized to exhibit recent advances and discoveries from prehistoric sites in fully submerged, intertidal, or now wetland places. These projects include both Academic and CRM projects. These examples are fully geoarchaeological in scope because such research is fundamentally involved with Pleistocene and Holocene sea level fluctuations, coastal and marine geomorphic processes, paleoclimatology, and geophysical remote sensing techniques. Topics will include both freshwater, wetland, intertidal, and fully marine or lacustrine examples, and presenters will discuss survey methods, sediment sampling and analysis, paleogeographic reconstructions, and site predictive models, agency issues for CRM, and Native consultations. A central theme will be the discipline-wide importance of these projects and how submerged prehistoric sites are contributing to our understanding of the past.

[193] Symposium - INTERPRETING CHANGES IN ANCIENT MAYA SOCIETY: FROM LANDSCAPE AND ARCHITECTURE TO EVERYTHING IN BETWEEN

The Maya are notorious for actively manipulating their natural and built environment. As complex cities developed, there was continuous alteration of core centers and surrounding spaces as well as of the material remains found within them. This tradition of constant change has led to theoretical questions of the meaning, in addition to practical questions of the function, of these spaces and artifacts. This session attempts to identify changes and interpret the meaning and functions of spaces, built and natural, and material remains found within them through a comparative Mesoamerican lens. At a macro level, some cases look at the changing layout in these organic cities attempting to understand the meaning of complexes. At a micro level, these investigations attempt to understand the meaning of change in material remain patterns. While the material remains archaeologists work with are static, this session attempts to identify the meaning of these materials in moments in time where they serve as evidence of change.

[194] Symposium - THE AZTECS AND THEIR WORLD: INTERDISCIPLINARY CONTRIBUTIONS OF FRANCES BERDAN

The past forty years have seen enormous advances in the scholarly understanding of Aztec society. There have been major methodological, conceptual, and empirical advances in historical scholarship, archaeology, and art history. This period also encompasses the first forty years of the ongoing scholarly contributions of Frances Berdan (Ph.D., 1975). Incredibly, Frannie has had her hand in most of the significant advances in all three disciplines. Like the Aztec glue she has studied, Frannie brings together diverse approaches in her work with diverse scholars. In this session, leading scholars take stock of these advances and the role

played by Frances Berdan. Because her perspective is broad and comparative, we also include some non-Aztec themes that bear on Aztec scholarship.

[195] Forum • CARING FOR HOMELANDS: TRIBAL HISTORIC PRESERVATION IN THE UNITED STATES

(SPONSORED BY INDIGENOUS POPULATIONS INTEREST GROUP, COMMITTEE ON NATIVE AMERICAN RELATIONS)

Since the 1992 amendments to NHPA over 154 federally recognized tribes now operate their own Tribal Historic Preservation program. In addition to these programs numerous other federally, state and non-recognized tribal communities operate similarly oriented cultural resources departments. These programs are charged with the responsibility of preserving, maintaining, and revitalizing tribal cultural resources for future generations. This forum brings together Tribal Historic Preservation and Cultural Resource Managers from across the United States to discuss the current state and future trajectory of tribal resource management. This forum is part of an ongoing attempt to highlight the unique issues that tribal communities encounter when attempting to care for cultural resources that extend well beyond the tangible remains associated with the archaeological record. Panelists will address how their offices and communities define tribal historic preservation; discuss how they developed their plan for managing tribal cultural resources; and share the strategies they use on the ground to implement these plans. Of particular focus is examining how each program balances the requirements of state and federal heritage preservation regulations with the specific needs and cultural values of the communities whose interests they protect.

[196] Symposium • PRECLASSIC KAMINALJUYU, GUATEMALA: NEW INTERPRETATIONS ON SOCIAL PROCESSES

Kaminaljuyu is one of the most important sites in Mesoamerica and has been a major focus of archaeological research by many scholars. The currently prevalent chronology of Kaminaljuyu, established mostly by relative ceramic dating, implies that various social and political institutions developed significantly earlier in the southern Maya area than in the Maya lowlands during the Preclassic period. Evaluations of new and existing data, however, suggest that this chronology needs to be revised substantially. Such a chronological revision indicates that scholars also need to question existing interpretations of the role that Kaminaljuyu and the Maya highlands played in the development of centralized polities in the Maya area. Session participants will discuss relevant data, including ceramics, radiocarbon dates, and stone monuments, and present new interpretations on social processes.

[197] Symposium • RESEARCH DESIGNS AND DAMAGE ASSESSMENTS: APPROPRIATE RESPONSE TO TREAT IRREVOCABLY EFFECTED PLACES

Despite efforts by regulatory and law enforcement agencies, damage to important places still occasionally occurs. Often this damage not only affects the scientific value of a place, but also the importance of that place to indigenous communities. The issue we explore here is what are the appropriate and ethical responses that can be employed to "mitigate the adverse effect?" Is further traditional archaeological research (e.g. excavation) a valid response to treat the already damaged portion of the place or site that retains integrity? And is it the only response? We explore the range of treatments available and address the need for regulatory amendments to insure that damaged places are treated appropriately.

[198] General Session • MESOAMERICAN ARCHAEOLOGY: CENTRAL MEXICO AND THE GULF COAST

[199] Symposium • DIGITAL ANALYSIS OF THE NATURAL AND CULTURAL INTERFACE

(SPONSORED BY ICAHM)

Powerful digital technologies support innovative new analyses of the interface between nature and culture, an interface that profoundly influences site distribution, landscape evolution, and ultimately the sustainability or degradation of our habitats and surroundings. In this session, we examine and analyze the natural/cultural

landscape at many scales, from site to region. We draw attention to a widening array of technologies and approaches, such as the analysis of data collected by satellite and aerial platforms, including drones; increasingly sophisticated applications of geographic information systems; on-ground geophysical methods; and incorporation of geoarchaeological and paleo-environmental investigations, ethnohistory, and archival research. Contributors have utilized diverse technologies and approaches to explore the dialectic between nature and culture, the understanding of which grows more crucial as our landscapes everywhere on earth are being modified at an ever-increasing pace. Case studies offer perspectives from many geographic locations, environments, and social settings.

[200] Symposium · MACROSCOPIC APPROACHES TO ARCHAEOLOGICAL HISTORIES: INSIGHTS INTO ARCHAEOLOGICAL PRACTICE FROM DIGITAL METHODS

The history of archaeology, like most disciplines, is often presented as a sequence of influential individuals and a discussion of their greatest hits in the literature. Two problems with this traditional approach are that it sidelines the majority of participants in the archaeological literature who are excluded from these discussions, and it does not capture the conversations outside of the canonical literature. Recently developed computationally intensive methods as well as creative uses of existing digital tools can address these problems by efficiently enabling quantitative analyses of large volumes of text and other digital objects, and enabling large scale analysis of non-traditional research products such as blogs, images and other media.

[201] General Session · MUSEUMS, COLLECTIONS, AND CURATION

[204] Poster Session · ADVANCES IN BIOARCHAEOLOGICAL METHODS

[205] Poster Session · GLOBAL STUDIES IN BIOARCHAEOLOGY AND MORTUARY ARCHAEOLOGY

[206] Poster Session · BIOARCHAEOLOGY AND MORTUARY ARCHAEOLOGY IN MESOAMERICA

[207] Poster Session · BIOARCHAEOLOGY AND MORTUARY ARCHAEOLOGY IN EUROPE: METHODOLOGICAL AND ETHICAL PERSPECTIVES

[208] Poster Session · MORTUARY ASSEMBLAGES FROM URACA, AN EARLY WARI-ERA CEMETERY IN THE MAJES VALLEY OF AREQUIPA, PERU

During the Andean Middle Horizon (600 - 1000 AD), the spread of the Wari Empire across the Peruvian Andes caused rapid political and economic restructuring, which in turn effected changes in diets, religious practices, and mortuary customs in many regions throughout Peru. Research so far in the south-coastal Majes Valley (Department of Arequipa) suggests that the spread of Wari influence did not change dietary practices. However, social hierarchization seems to have intensified during the Middle Horizon in the Majes Valley, and mortuary customs seem to have become more complex. Recent excavations at Uraca, a cemetery site with sectors spanning the Middle Horizon, show similarities in tomb construction, body position and treatment, and preference for certain types of textile offerings across sectors. However, the northern and southern sectors exhibit differences in ceramic types, animal offerings, textile implements, rates of cranial

trauma, and styles and methods of manufacture of human trophy head offerings. The differences observed may be due to different dates of use, or due to the cemetery sectors being reserved for different social groups (i.e., commoners vs. elites; warriors or priests vs. craftsmen, etc.) during the same time period.

[209] Symposium · THE DISCOVERY, EXCAVATION, AND LESSONS OF IRONWOOD VILLAGE, AN EARLY HOHOKAM BALLCOURT SETTLEMENT NEAR TUCSON, ARIZONA

(SPONSORED BY PALEOWEST ARCHAEOLOGY)

Encroached upon by the urbanization of the Tucson metropolitan area, what was thought to be a modest, nameless artifact scatter was archaeologically opened as part of a compliance-based mitigation project. What surprisingly emerged was Ironwood Village, a primary ballcourt community where hundreds of Hohokam lived, gathered around ballgames and communal feasts, and died between about A.D. 600 and 850. This remarkable site, the manner of its discovery, and treatment of its archaeological and consultative opportunities offer a variety of insights and lessons that aren't of the usual sort. This symposium views the rare discovery of Ironwood Village in its various contexts—prehistoric, archaeological, and methodological.

[210] Symposium · EXPLORING SOCIAL CHANGE IN THE EPIPALAEOLITHIC AND EARLY NEOLITHIC OF THE NEAR EAST

The Epipaleolithic and early Neolithic saw some groups of mobile hunter-gatherers become increasingly sedentary, cohabiting in larger, more stable groups and increasingly elaborate material environments. This change had significant implications not only for economies and environments at the time, but also for the social relationships between the people living in these earliest villages and between groups now 'fixed' in specific parts of the landscape. However, the nature and indeed even existence of social groupings at the time – household, social group ('village') or broader 'cultures' – remains contentious, as individual and group identities seem unlikely to have been static, clearly defined or internally homogeneous. Questions about social relations remain some of the most difficult to answer using archaeological data, and the potentially non-analogue nature of social identities and groupings is a further stumbling block to research in the area. This session will thus the breadth of archaeological proxies, methods and concepts that can be used to investigate social relations among people during this period of dramatic social change.

[211] General Session · NEOLITHIC SETTLEMENTS AND LANDSCAPES

[212] General Session · ZOOARCHAEOLOGICAL STUDIES IN THE SOUTHWESTERN UNITED STATES

[213] Symposium · CURRENT ARCHAEOLOGICAL RESEARCH: APPLICATIONS IN THREE-DIMENSIONAL GEOGRAPHIC INFORMATION SYSTEMS

The application of geographic information systems in archaeological research has become widespread over the past decade. Archaeologists focusing on Mesoamerica have discovered GIS and allied technologies including remote sensing and GPS have the potential to solve many questions regarding ancient locational decisions. The technology can also be used to perform analysis in three and four dimensions. This symposium includes papers on the advanced use of three-dimensional GIS to solve a variety of archaeological problems.

[214] General Session · ARCHAEOLOGY OF SOCIAL ORGANIZATION IN THE ANCIENT NEAR EAST AND LEVANT

[215] Symposium · CHERT SOURCING CASE STUDIES PART II: LANDSCAPE DISTRIBUTION AND PREHISTORIC SOCIETIES.

(SPONSORED BY PQEMIG)

The first part of this session explored the methods and techniques used to establish a chemical signature for chert. In the second part of the symposium, we explore how a wide range of raw materials – including chert as well as metals - are transformed into objects that, in turn, leave a signature in the material culture of past societies. Building on data generated from the geochemical analysis of chert and other raw materials, papers in this symposium will explore themes such as the site location and the availability and accessibility of sources of raw material; the scale of raw material procurement at quarries and mines; the “curation” of items and their meaning beyond utility; and sourced materials and their role in ritual.

[216] Symposium - MAPPING OUT POTTERY PRODUCTION AND EXCHANGE IN THE LATE CLASSIC VALLEY OF OAXACA, MEXICO

Over the past two decades, our understanding of craft production and exchange in the Valley of Oaxaca, Mexico has changed dramatically, in part owing to new excavations, and in part to the re-analysis of existing collections using robust chemical and mineralogical techniques. This symposium presents current research efforts to document the sources of pottery production during the Late Classic or Xoo phase (ca. 550-850 AD), and to track the movement of ceramic vessels from producers to consumers based on their trace-element composition. As part of a large regional study, natural clays were sampled throughout the Valley of Oaxaca and characterized via INAA to document spatial variability in clay composition. Over 1300 ceramic vessels from key Late Classic sites (including Monte Albán, Jalieza, and Dainzu-Macuilxochitl) have been similarly analyzed, and their locus of production determined based on similarities to clays and ceramic production debris. These trace-element studies provide a rigorous means for monitoring both the spatial organization and intensity of exchange among communities, and greatly enhance our understanding of the ancient Zapotec economy during the decline and/or political reorganization of the Zapotec state.

[217] Symposium - TAMTOC: CHARACTERIZING AN URBAN SOCIETY. RECENT INVESTIGATIONS.

Tamtoc is one of the most important settlements in Northeastern Mexico, wherefore it is essential to address the phenomenon of the urban society, which inhabited this ancient city, with an interdisciplinary approach. The aim of this symposium is to characterize the constituents proper of the historical and cultural development of this urban society which managed to develop one of the most distinctive settlements in the so called Huasteca region during prehispanic times. The contributors are going to present the results of a variety of recent investigations intended to promote the dialogue and increase the awareness of the issues discussed here.

[218] Symposium - SUSTAINING HERITAGE: NEW DIRECTIONS FOR ARCHAEOLOGY

(SPONSORED BY SAA HERITAGE VALUES INTEREST GROUP; ICAHM/ICOMOS)

Sustainability at its core depends on proactive engagement and a preemptive outlook that embraces durability, balance, and equity. As a concept and aspiration, it entered development and conservation well before archaeology or heritage studies. So, what does sustainability mean for the preservation of the past? How can current global needs be met without compromising resources for future generations? In well-documented ways, heritage is particularly vulnerable to the pressures of our globalized society. Archaeological materials in context provide unique sources of information and experience. They are under increasing threat, whilst methods and definitions that we employ in heritage studies concurrently constantly expand and produce new material. The focus of this session is 'sustaining heritage.' The challenge is to move beyond established epistemological approaches to consider how the heritage of the past can embrace a sustainable future, while accurately formulating and communicating these issues with necessary impact. What does it mean when the future is privileged or at least accorded the same degree of importance as the present, or indeed the past? Session papers address these issues and examine how balance, continuity, and inter-generational equity – enfolded in sustainability – apply to archaeological heritage.

[219] Symposium - CURRENT INVESTIGATIONS IN THE PETÉN LAKES REGION, GUATEMALA

The lakes region of Petén, Guatemala, an area stretching from Lake Sacpuy in the west to Lake Sacnab in the east, has been the target of archaeological investigation for the past two decades by a series of projects that began with the Proyecto Maya-Colonial in 1994. For the last six years (2009-2014), research has focused on the sites Nixtun-Ch'ich', Tayasal, Muralla de Leon, and Zacpetén, including both new excavation

and laboratory analyses. This session presents some results of this recent work. Survey at Nixtun-Ch'ich' has revealed evidence of complex city planning, while a separate survey project at Muralla de Leon has brought to light new details about the site's defensive system. Analysis of both human and faunal remains recovered from various sites in the region continues to aid in discerning how indigenous traditions changed after the area was conquered by the Spaniards in A.D. 1697. In addition, studies of obsidian and chert are helping us to understand exchange systems, as well as stone tool production and use, and recent ceramic analysis is revealing new details about the Preclassic period in the Petén Lakes region.

[220] General Session · ARCHAEOLOGY AND BIOARCHAEOLOGY OF THE SOUTHEASTERN UNITED STATES

[221] Electronic Symposium · OPEN METHODS IN ARCHAEOLOGY: HOW TO ENCOURAGE REPRODUCIBLE RESEARCH AS THE DEFAULT PRACTICE

(SPONSORED BY DIGITAL DATA INTEREST GROUP)

Scientific progress famously depends on the evaluation of findings through replication. Likewise, while social sciences and humanities subjects may not always espouse this exact vision of how we build knowledge, many researchers in these fields would argue that they too can benefit from greater discursive transparency. However, as archaeology and other research areas have become more complex, especially with the use of computationally intensive methods, it has become increasingly difficult to reproduce findings and efficiently build on past research. While exact replication of results is sometimes not feasible because of limitations of time and resources, minimal standards of reproducibility are emerging as a norm of practice in contemporary computational and biological sciences. These include opening methods up for inspection by sharing and recognizing code and data as citable research objects, and in some cases including them directly and at an early stage in the peer review process. However, there remain some significant and continuing impediments to enabling such transparency in archaeology. In this session, we therefore wish to discuss our prevailing norms in archaeology, showcase some current best practice in terms of open methods, and advocate future directions for improving the reproducibility of archaeological research.

[222] Forum · TELLING ARCHAEOLOGY: !WRITE!SPEAK!ENGAGE!#WINNING#BESTFORUMEVER
(SPONSORED BY STUDENT AFFAIRS COMMITTEE)

At a time when making our work accessible to the public is critical, we too often abdicate authority and responsibility to engage with our communities. We can no longer afford this. Developments in new technologies, requirements of granting agencies, and our own professional ethics necessitate a sea change in how we make our work accessible to the public. This forum brings together a panel of successful ambassadors for archaeology. Their skills are popular writing, public speaking and social media. Panelists will speak informally about their methods, successes (and failures), and give advice to students and young professionals as they engage with this essential professional skill. Followed by Q&A.

[223] Forum · CONS OR PROS? SHOULD ARCHAEOLOGISTS COLLABORATE WITH RESPONSIBLE COLLECTORS?

(SPONSORED BY ETHICS AND PUBLIC EDUCATION COMMITTEES)

Since the beginnings of professional archaeology, diagnostic points (e.g., arrowheads) have been a particularly informative segment of the North American archaeological record. For at least as long, they also were a favorite object of private collection. One aggregate result is that collectors held or hold many more points and other artifacts than archaeologists do. We cannot prevent private collection, although we can try to influence how well collections are documented and curated. Private collection is highly selective so affects the archaeological record disproportionately to the number of artifacts taken. If it impoverishes the record that archaeologists document in resource management, the question naturally arises: Should we consider those effects? Addressing the question engages ethical issues that can argue for or against documentation of private collections. This forum considers the pros and cons of documenting private collections in the course of preservation studies and explores positive and negative ethical implications.

[224] Forum · DIALOGS IN CALIFORNIA ARCHAEOLOGY

Since the 80th Annual SAA meeting will take place in California, it is an opportune moment for archaeologists and Californian Indian communities to reflect about the state of relations between descendant communities and the archaeological community. In this forum, we will hear from tribal community members and scholars as well as archaeologists who engage with tribal communities. This forum will explore the needs, challenges, and successes that California Indian communities experience when managing, protecting, and studying cultural resources. Some questions and topics that will be considered are as follows: What resources and training are needed in tribal communities to effectively manage cultural resources? What cultural training and sensitivities do archaeological researchers need to seek out to work collaboratively with California Indian communities? How can/do/should CRM companies, agencies, and academic researchers engage with communities? What improvements can be made within California cultural resource management laws such as CEQA? What are some examples of promising collaborative archaeological research projects in California today, and why? In answering these questions, this session will suggest how California archaeologists and California Indian communities can make archaeological research more relevant and beneficial to tribal communities.

[225] Symposium · TRIBAL HERITAGE MANAGEMENT PROGRAMS IN ACTION AT THE GILA RIVER INDIAN COMMUNITY, ARIZONA

Many Native American communities have developed their own archaeology programs and taken over management of cultural resources from Federal agencies. This has increased interactions between non-tribal archaeologists and members of native communities, and resulted in greater numbers of Native Americans becoming trained archaeologists. This synchronism has fostered new understandings of the past and has led to research that is scientifically valid while also reflecting tribal cultural concerns. Archaeologists have benefited from increased exposure to traditional knowledge and beliefs, and Tribes have developed new avenues for communicating their knowledge of the past in ways that will reach a broader audience. Papers in this session highlight the diverse investigations undertaken by the Gila River Indian Community's Cultural Resource Management Program and Tribal Historic Preservation Office in south-central Arizona. Presentations highlight recent findings from archaeometry investigations, controlled experimental studies of traditional technology, wildland fire archaeology program deployments, rock art preservation efforts, and large-scale cultural resource management investigations.

[226] Symposium · THE CUTTING EDGE OF AMERICAN PALAEOETHNOBOTANY

Retiring paleoethnobotanical scholars have gained a great deal of information about the archaeological past throughout their careers. The larger discipline is only now realizing how important this is to our understandings about the past. This session will both learn about some of these crucial discoveries as well as honor those who have made them. Five senior scholars will present what they believe have been the big issues in their research and also what they tackled within paleoethnobotany during their careers. A complimentary group of five younger paleoethnobotanical scholars then will address the same question, what is seen as the goals they seek in their careers within the discipline. A final discussion will allow all to consider how paleoethnobotany contributes to the bigger issues within our discipline as well as how the main research issues have developed over the past thirty years.

[227] Symposium · ENTANGLED ENCOUNTERS IN THE CENTRAL ANDES: PROCESS, OUTCOME AND LEGACY

The Andes are known for their ethnic and highly compressed ecological diversity, which has influenced the degree and kind of human population movements and interactions that defined sociopolitical developments for millennia. This is particularly true for the Central Andean coast and highlands, which were populated by various polities entangled in many different ways. Though interdisciplinary research has focused on this topic since the 1950s, archaeological studies have prioritized monumental sites and the publications have been sparse, thus limiting our understanding of the diverse geo-political interactions in the region. This symposium discusses the different types of interaction between different ethnic, residential, and/or political groups on the western slopes of central Peru. For this symposium, interaction is defined as the complex behaviors and processes by which different types of inter-group relationships, identities, and agencies were established through a range of competitive/cooperative behaviors including, but not limited, to raiding, warfare, trade, alliance-building, spouse exchange, co-residence, and any combinations of these and other practices. The goal of the symposium is to better understand the nature and outcome of distinct groups interacting across

the varied social and physical landscapes, and how these entanglements shaped their geo-political landscape throughout the pre-Hispanic and early Hispanic periods.

[228] Symposium · EVOLUTIONARY THEORY AND ARCHAEOLOGY, PART II: APPLICATIONS OF HUMAN BEHAVIORAL ECOLOGY, MACROEVOLUTIONARY APPROACHES, AND COSTLY SIGNALING

This session complements Evolutionary Theory and Archaeology, Part I. The research featured in this session explores applications of human behavioral ecology, macroevolutionary approaches, and costly signaling in archaeological contexts. As with the first session, we aim to examine new conceptual and methodological tools that allow for the conduct of evolutionary-based archaeology as well as identify appropriate domains of application. Furthermore, we aim to bring together a group of evolutionary-minded researchers to discuss outstanding problems of shared interest and to plant the seeds for future collaboration. Discussants will comment on the research presented in the context of their own ideas about where we as a group should focus our future efforts to benefit the discipline as a whole.

[229] General Session · ARCHAEOLOGY IN THE SOUTHWESTERN UNITED STATES

[230] Symposium · THOSE DAM SITES: RECENT ARCHAEOLOGICAL RESEARCH IN THE DAKOTAS

Historically, large federally funded projects have been a catalyst for archaeological inquiry in the Dakotas. In the middle of the 20th century, the construction of massive and numerous dams, used for hydropower, irrigation, navigation, and recreation, spurred salvage projects in the region. But the continuing legacy of the Missouri Basin Project is not the only story. With a combination of cultural resource and academic projects, archaeology is flourishing in the Dakotas. Whether using the tried and true methods or incorporating technological advances, archaeologists have utilized a diverse set of tools to solve problems, both from a research standpoint and in the development of unique approaches to heritage management.

[231] Symposium · ADVANCES ON THE INVESTIGATION OF CHALCHIHUITES CULTURE

A century ago, Manuel Gamio put the Chalchihuites area on the archaeological map, but since then, research there has been very sporadic and slow. Charles Kelley and his group of researchers at Southern Illinois University conducted the largest study on the limits of the current states of Durango and Zacatecas. They demonstrated the great potential for archaeological research in this region. At present, a wide range of studies have been conducted, but the results have been poorly disseminated. Therefore, it is the goal of this symposium to give an updated view of the Chalchihuites cultural tradition, through a balanced set of research perspectives.

[232] Symposium · LANDSCAPE AND SOCIAL ORGANIZATION DURING THE LATE INTERMEDIATE AND LATE HORIZON PERIODS IN THE LOWER LURIN VALLEY, PERUVIAN CENTRAL COAST

(SPONSORED BY INSTITUTO DE ESTUDIOS PERUANOS)

Landscape and Social Organization during the Late Intermediate and Late Horizon Periods in the Lower Lurin Valley, Peruvian Central Coast. This symposium explores changes in the social landscape of the Peruvian Central Coast during the Late Intermediate and Late Horizon Periods. Composed of a number of rural communities developed under the influence of Pachacamac, one of the most feared religious centers of the Andean world, this region experienced drastic changes when the coastal shrine fell under Inca control at the onset of the Late Horizon Period. Along with evidence of population increase, a previously unknown hierarchical organization emerged in the lower valley as the consequence of the Inka Empire's control of Pachacamac. Papers presented in this symposium will develop different aspects about the organization of the rural communities that formed the social landscape of the lower Lurin, their relationship with Pachacamac, and how it changed as a consequence of the Inca invasion. Data presented in this symposium was collected during the 2012, 2013 and 2014 field seasons of the Instituto de Estudios Peruanos (IEP)

Field School in Archaeological Methods.

[233] Symposium - EVOLUTION AND ECOLOGY IN OCEANIA

The diverse islands of Oceania are model locations for the study of human ecology and evolution. This session addresses the dynamic interaction between the prehistoric inhabitants of Oceania and their island environments. Papers in this session will address theoretical and substantive issues from a range of ecological and evolutionary approaches. We also welcome submissions with a focus on new methods used to address ecological and evolutionary questions. These may include, but are not limited to, geospatial techniques, genetics, geochemical and isotopic methods, paleoecological techniques, and simulation modeling. Geographically, the papers in the session will encompass the whole of Oceania. Session contributions will explore a variety of topics across diverse island ecosystems, for example, responses to climate change, social network and community analysis, human impacts on island environments, socio-cultural evolution, cultural transmission, niche construction, and settlement and mobility. Synthesis and review papers are also welcome.

[234] Symposium - THE DYNAMISM OF CONTACT AND EXCHANGE IN EARLY CENTRAL AND EAST ASIA

In recent years, an increasing number of new methods and analyses have been made available to assist in exploring issues pertaining to contact and exchange in the archaeological studies of the eastern Eurasian continent. Borderland and Frontier Studies, for instance, offer new ways of examining places where interaction and exchange created conditions that are neither exclusively of the steppe or sown. This in turn has led to the reassessment or abandonment of many paradigms that once dominated the archaeology of these regions. This session aims to bring together scholars working across regions such as these in Central and Eastern Asia. In looking at contact and exchange presenters in this session will not only focus on the movement of goods and raw materials, but will also explore spatial patterning in the transmission of ideas and technology, and the social behavior of objects throughout these regions during the prehistoric and early historic periods.

[235] Symposium - CURRENT PRACTICE IN DIGITAL PUBLIC & COMMUNITY ARCHAEOLOGY

Today, along with many other domains, archaeology has entered an age in which digital technology is having an undeniably transformative impact on all areas of disciplinary practice. Unfortunately, while the discussions about digital field, lab, and analytical methods are well developed, the discussion about the application of digital technology within the context of public engagement and outreach has been comparatively neglected. This is unfortunate as digital technology clearly holds enormous promise for new ways of meaningfully interacting with a wide array of publics. It is within this context that the papers presented in this session will serve two purposes. First, they will highlight key, exemplar projects that can act as models for the thoughtful application of digital technology within public and community outreach and engagement. Second, and perhaps more importantly, they will act as a platform to interrogate deeper, underlying issues and challenges that stem from the use of digital technology within a public archaeological context.

[236] Symposium - PROJECT ARCHAEOLOGY MAKES A DIFFERENCE: THE NEXT 25 YEARS

If every citizen understood archaeology and worked for the protection of sites and artifacts, how would it change the profession of archaeology? How would it change education? How would it change the world? Project Archaeology began in 1990 as an anti-vandalism education program for the state of Utah. Since then it has grown to serve 36 states and District of Columbia with archaeology education. More than 12,000 educators have participated in professional development events and used high-quality education materials in their classrooms or learning venues. Project Archaeology has grown far beyond its anti-vandalism roots and seeks to teach a deep conceptual understanding of scientific and historical inquiry, stewardship that is based on deep cultural understanding, and a long-term view of what it means to be human. This symposium traces the history of the program from its infancy to national acclaim and looks forward to a future of broad and

deep impact on archaeology, education, and the human condition.

[237] Symposium - THEORIZING AND EXCAVATING NEIGHBORHOODS

(SPONSORED BY ARCHAEOLOGY DIVISION OF THE AMERICAN ANTHROPOLOGICAL ASSOCIATION)

The 'neighborhood' encompasses complex social and analytical phenomena linking households, settlements, and regions. This session investigates the 'neighborhood' as a concept, a heuristic, and a social formation as well as the relationship between those dimensions. On a theoretical level, what anthropological concepts does the 'neighborhood' imply or highlight (e.g., kinship, space, economy)? How might we conceive of 'neighborhood' when planning, conducting, and reporting research? As anthropologists, we aim to examine and compare how neighborhoods are configured, produced, and supported at different times and places in human (pre)history. What emic forms of neighborhoods existed (e.g., the Aztec calpulli, Andean ayllu, and Old Babylonian batum)? How can archaeologists study neighborhoods as imagined as well as physically constructed or culturally practiced? Methodologically, we wish to examine how archaeologists can address neighborhoods in all the many formations and configurations that may exist. Of course, we also would like to examine the limitations of 'neighborhood' as a heuristic and to discover what directions might move us through and beyond the neighborhood. Contributors are encouraged to place the study of neighborhoods within broader analyses of urbanization, early towns, rural settlements, and the production of regional landscapes.

[238] Symposium - CROSS-CULTURAL ENCOUNTERS/ENTANGLEMENTS IN ISLAND SOUTHEAST ASIA AND THE WESTERN PACIFIC

Cultures in island Southeast Asia and the Western Pacific had intense encounters with neighboring groups as well as with European colonizers through time. These interactions had both benign and hostile aspects. For the islands in insular Southeast Asia and the Western Pacific, these interactions have shaped the history and identity of the peoples who inhabit the region. This session aims to discuss the archaeological signatures that have implications in how we understand the complex cross cultural interactions in this part of the world. We solicit submissions of papers that deal with Neolithic migrations, Islamization, pre-colonial slavery and trade, European encounters, and highland-lowland contacts.

[239] Symposium - FIRE AND HUMANS IN RESILIENT ECOSYSTEMS IN THE AMERICAN SOUTHWEST

Twenty-first century landscape fires transform ecosystems, damage heritage resources, and threaten human communities across the globe. Although policymakers tend to consider contemporary fire problems a unique feature of an industrialized and warming world, human communities have lived in fire-prone settings for millennia. Deep, place-based knowledge of fire impacts on ecosystems undoubtedly facilitated the sustainability of these human communities. Active research in the Jemez Mountains of northern New Mexico integrates ethnographic, archaeological, paleoclimate, paleoecological, and simulation data to reconstruct the dynamic histories of ecological and human communities, their fire regimes, and the vulnerability of these communities to climate changes. Presenters in this symposium articulate the research strategies and results of interdisciplinary investigations that underpin collaborative efforts to understand the long-term relationships between dense human settlements, land-use, climate change, and landscape fire dynamics to build a science and traditional knowledge-based framework for improved management of fire-prone Southwestern forests.

[240] Symposium - THE PRACTICES OF DEATH: THE ARCHAEOLOGY OF MORTUARY RITUAL IN ANCIENT EGYPT AND SUDAN

Excavations and surveys in Ancient Egypt and Sudan have provided archaeologists with a wealth of information about the practices surrounding death, unearthing not only the physical remains of the deceased and their grave goods, but also material related to mortuary ritual ranging from the written and visual to the environmental. This richness of material has fostered a long tradition in regional archaeology of focusing on conspicuous display as a direct reflection of deceased individuals. However, the social persona expressed through mortuary ritual may reflect less on the 'lived life' of the departed than it does the motivations of the

survivors who organized the funerary rites and the negotiated relationship between the dead as ancestors and society as a whole. To that end, this symposium will present diverse levels of analysis, with papers drawing from primary mortuary material such as osteological evidence and material culture, and larger contexts such as texts, iconography, architecture and landscape. Questions posed will serve to elucidate the recursive relationship between society and its members as presented in the mortuary sphere. Addressing these issues in Egypt and Sudan comparatively promotes discussion of the complexity of ancient northeast Africa as a whole.

[241] Symposium · NEW PERSPECTIVES ON THE ARCHAEOLOGY OF TECHNOLOGICAL CHANGE

In the last 35 years, technology has been reclaimed as a worthy focus of study in anthropological archaeology. Yet despite a broad consensus that technology is deeply intertwined with social and cultural processes, archaeologists have developed widely varying approaches to the analysis of technological behavior. Archaeologists studying technology are often divided by geographical scope, theoretical approaches, and materials specialization. The proposed session seeks to highlight the variety of perspectives on one dimension of this multi-faceted topic: the study of technological change. Drawing on their particular areas of research, participants will develop and explore common themes in the study of technological change. The papers will address the following broad thematic questions: (1) How is technological change addressed at different temporal and spatial scales? What methodologies do archaeologists use to analyze behavior from the level of individual decision making to macro-scale adoption patterns? (2) What features of technologies, their practitioners, and their social contexts affect spatial and chronological patterns of adoption? Conversely, how does the study of technological adoption patterns modify our understanding about the social structure of a society? (3) How does the spread of technology across significant social, cultural and geographic boundaries differ from the spread of technology within social groups?

[242] Symposium · THE DIMENSIONS OF RITUALITY 2000 YEARS AGO AND TODAY

The Mayan archaeological record has ceramic vessels containing remains of contents of food and beverage and other materials used in ceremonial and offering rites, as well as paint, such as cinnabar, hematite, plaster and bitumen, used in body preparation. The record also contains censers and braziers, designed for burning or heating different kinds of incense and copal; musical instruments, such as ocarinas, whistles, and ceramic drums, fabrics, robes, headdresses, jewels, fetishes and figurines, even bones. All these are vestiges of materials which strongly appeal to perceptions, such as sight, smell, taste, sound and touch. This suggests that those ritual events were a feast for all senses which represent plenitude and sensuality, rhythm, dance and theater -- an ode to life. This is particularly conspicuous when evident in funerary contexts, which translate funerary ritual into a feast of life, imbuing death with the power of giving birth to life, as a life bringer. This symposium presents papers which address and discuss some of these vestiges, which provide evidence for the dimensions of this ancestral rituality and its current manifestations.

[243] Symposium · THE GEOARCHAEOLOGY OF SUBMERGED, INTERTIDAL, AND WETLAND PLACES: ADVANCES IN METHOD AND THEORY OF PREHISTORIC ARCHAEOLOGY UNDERWATER 2015 -- PART 2

This symposium is organized to exhibit recent advances and discoveries from prehistoric sites in fully submerged, intertidal, or now wetland places. These projects include both Academic and CRM projects. These examples are fully geoarchaeological in scope because such research is fundamentally involved with Pleistocene and Holocene sea level fluctuations, coastal and marine geomorphic processes, paleoclimatology, and geophysical remote sensing techniques. Topics will include both freshwater, wetland, intertidal, and fully marine or lacustrine examples, and presenters will discuss survey methods, sediment sampling and analysis, paleogeographic reconstructions, and site predictive models, agency issues for CRM, and Native consultations. A central theme will be the discipline-wide importance of these projects and how submerged prehistoric sites are contributing to our understanding of the past.

[244] Symposium - LOWLAND MAYA TERRITORIES: LOCAL DYNAMICS IN REGIONAL LANDSCAPES

Postclassic Maya territories are considered by many to have been stable, but internally variable political units, retaining their integrity through time despite their incorporation into larger multi-polity networks. Given their temporal stability, territories were social and economic entities that transcended geopolitics alone. As cultural constructions, territories played an important part in structuring and shaping politics, identities, economics, and ritual practices. During the Classic and Preclassic periods, we suggest that territories were in flux, reacting and changing to both internal and external stimuli. This dynamism is exemplified by shifting political capitals, settlement patterns, and migration patterns through time within regional landscapes. In this session, we examine the ways archaeologists investigate the dynamics of Maya territories, including macro-analyses of regional surveys, aerial remote sensing, ceramic spheres, art and architectural styles, migration patterns, settlement patterns and hierarchies, as well as micro-analyses of site dynamics such as architectural histories, household demographics, and exchange relations. The papers in this session illustrate the importance of multi-scalar and multi-evidential perspectives to understand the boundaries and organizations of territories, how the locus of political power changed through time, and what factors contributed to their perseverance or assimilation.

[245] Symposium - MOVING FORWARD IN CASAS GRANDES ARCHAEOLOGY

Forty years ago, Charles Di Peso's ideas regarding the Casas Grandes Medio period were published in one of the most comprehensive, synthetic works in Southwestern archaeology. His interpretations were initially met with skepticism by Southwestern archaeologists, and were largely rejected. Since that time, archaeologists in the area have focused on increasing our empirical knowledge of the Medio period archaeological record. Our knowledge has grown to the point that region wide cultural historical syntheses are again being considered. Much of this research has prompted scholars to reevaluate many of Di Peso's ideas that seem to fit our improved knowledge, while also providing the basis for better arguments in many contexts. This session builds on this work, allowing participants using diverse theoretical perspectives and different data sources to explore the Medio period's social dynamics and chronology using recent field and laboratory analyses. Through these discussions, archaeologists working in the area can both illustrate the intense interest that has strengthened archaeological knowledge of Casas Grandes prehistory, and continue facilitating the alternative interpretations necessary to build upon Di Peso's initial work.

[246] Symposium - CAMINOS PERDIDOS Y VÍAS OLVIDADAS: TRADE ROUTES AND EXCHANGE NETWORKS IN LATE PRE-HISPANIC CENTRAL AMERICA

Twenty-first century archaeological research focusing on southern Central America is producing a substantial amount of knowledge concerning a culture area that has long suffered a reputation for being "poorly known." Despite an increase in data, scholars still have a comparatively limited understanding of how the various regions and polities within this culture area interacted with each other and with their more distant neighbors to the north, south, and east before the arrival of Europeans. Many discussions of trade and exchange among different regions remain largely speculative. Papers in this session will attempt to take a fresh look at archaeological and ethnohistorical evidence for the lost social networks and trade routes that once carried Maya jades to Costa Rica and copper bells from Panama to West Mexico.

[247] Poster Session - ARCHAEOLOGY AND ETHNOHISTORY OF THE INCA**[248] Poster Session - MAYA ARCHAEOLOGY****[249] Poster Session - ARCHAEOLOGY IN MESOAMERICA****[250] Poster Session - ARCHAEOLOGY IN SOUTH AMERICA**

[251] Poster Session - ARCHAEOLOGY IN PATAGONIA**[252] Poster Session - CERAMIC ANALYSIS IN SOUTH AMERICA****[253] Poster Session - COMPARATIVE APPROACHES TO POSTCLASSIC MESOAMERICAN CERAMICS**

The ability to compare data sets is vital for establishing frameworks for understanding human behavior within and between sites and time periods. Ceramic data sets can be difficult to compare because of differing classification schemes and sampling procedures. Importantly, however, ceramic production and consumption influence and are influenced by multiple aspects of human societies, including resource procurement and availability, political economy, and social status. In this session, we bring together scholars working on ceramic artifacts during the Postclassic period (AD 1000-1521) in central and western Mesoamerica to highlight research in comparative studies. The Postclassic in this region experienced widespread political changes, including the development and consolidation of the Aztec and Purépecha Empires, and distinctive ceramic traditions associated with the multiple social groups within these empires. The papers here present ongoing intra-site, inter-site, regional, and temporal approaches to studying Postclassic ceramics. This session contributes to an ongoing dialogue on how we can compare ceramics and the complex links between changing regional and local politics and production.

[254] Symposium - INTENTIONAL DESTRUCTION OF CULTURAL HERITAGE: EVIDENCE AND RESPONSES IN SYRIA AND IRAQ

Intentional destruction of cultural heritage during intrastate and ethnonationalist conflict is a well-known but little studied phenomenon often designed to erase the presence and history of a rival social or ethnic group. Cases of purposeful damage have been widely reported during recent events in Syria and Iraq. Yet despite considerable scholarship directed toward violations of civil and political rights during these and other conflicts, there is a general tendency to view damage to cultural heritage as an unfortunate collateral outcome, rather than as a common tactic of intimidation and subjugation. Although prior research suggests that the purposeful destruction of cultural heritage may escalate a conflict, few studies have identified factors leading to escalation or what practical measures may protect heritage sites and the people who care about them in a conflict situation. This symposium explores this problem in the context of recent events in Syria and Iraq. In looking at a series of cases of the intentional destruction to heritage sites, panelists will discuss the social dynamics involved, methods employed in documentation, interventions that have occurred or are currently underway, the legal implications of damage to cultural heritage, and the responsibilities of museums and other heritage professionals.

[255] Forum - FEAR (FEAR AND ITS EXPRESSIONS IN THE ARCHAEOLOGICAL RECORD)

Throughout human history we have found much more to fear than fear itself. Arguably, many important decisions in our lives are influenced, in part, by fear. But what impacts has fear, in its variable expressions, had on the development of human societies and their relationships with other groups and their environments? Can archaeologists investigate fear in the past through the material correlates of attempts to overcome the unknown and the known but loathed? Can we identify what people in the past dreaded? Can we examine early manifestations of fear, identify their roles in the emergence and transformation of social institutions, or provide new insights on contemporary issues?

This forum grows out of a symposium held at the 2012 annual meeting of the American Anthropological Association. In this forum, we seek to expand on that symposium's momentum and encourage public discussion of issues that emerged from that meeting. Among these are the social implications and definitions of different forms of fear (e.g. anxiety, dread, horror, loathing, terror, etc.), how these might be monitored archaeologically through materialized records of actions undertaken to reduce, encourage, or use fear in the past, and how fear contributed as a motivator to social change.

[256] Symposium - LOW IMPACT, HIGH RESOLUTION: ONGOING INVESTIGATIONS IN EAGLE NEST CANYON

Eagle Nest Canyon is a box-canyon tributary to the Rio Grande near Langtry, Texas in the Lower Pecos Canyonlands. This short canyon played an outsized role in 1930s-1980s Lower Pecos archaeology through seminal excavations at three of its rockshelters, most famously Bonfire Shelter. In 2013 Texas State University's Ancient Southwest Texas Project launched a long-term collaborative research program to investigate the human and natural history of Eagle Nest Canyon, share what we learn, and conserve the Canyon's rockshelters for future generations. The 2014 season focused on Skiles Shelter, Kelley Cave, Horse Trail Shelter, and Eagle Cave, while the 2015 investigations will concentrate on the latter. "Low impact, high resolution" characterizes our investigative philosophy and methodology. This symposium summarizes work accomplished to date, including investigative methods and results, 3D modeling, site formation processes, geoarchaeology, archaeobotany, and the ongoing spring 2015 field session.

[257] Symposium - THE LEGACY OF THE RÍO SONORA PROJECT AND OTHER EARLY RESEARCH IN SONORA, MEXICO

The 1960s and 1970s were a seminal period for archaeology in the state of Sonora, Mexico. These decades saw the first intensive large-scale research as well as the establishment of a regional office in Hermosillo of the National Institute of Anthropology and History (INAH), led by Beatriz Braniff and Arturo Oliveros. This session focuses on the work of Richard Pailes and his compatriots who coordinated archaeological research in the low sierra region of Sonora. These early investigators repeatedly ventured into archaeologically-unknown territory. Their efforts provided us with extensive knowledge about the prehistory of what came to be known as the Rio Sonora and Serrana regions. Many of the questions posed by the Rio Sonora project and related efforts remain salient today. Publications from this project continue to serve as the foundation for new research projects and constitute the definitive source material for those who conduct work in eastern Sonora. This session intends to acknowledge the work of this era. Papers are presented that reflect positively and critically on this early work. A special emphasis also is placed on recent investigations that build on this early research with new perspectives and techniques.

[258] Symposium - UNDOING AND REDOING ARCHAEOLOGICAL PRACTICE: ARCHAEOLOGY AS TECHNIQUE ACROSS PREHISTORY, HISTORY, AND THE CONTEMPORARY

Archaeologies of the contemporary have begun to rethink and repurpose the tools (material, methodological, and epistemological) of archaeological practice, in order to study the contemporary moment, responding to a variety of new theoretical and political commitments. Similarly, a motley crew of 'social archaeologists' (for lack of a better term), working in a wide variety of prehistoric and historic contexts, have been exploring their dissatisfactions with traditional archaeological methodologies (and their attendant epistemologies) and the constraints they place on our understandings of the past (and present). The purpose of this session is to open a conversation between these groups, centered on understanding how archaeological methodologies function as techniques (in the Foucauldian sense) that anchor and participate in the production of certain forms of knowledge. It welcomes contributions that explore the histories and genealogies of archaeological techniques and knowledges, re-think archaeological methodologies through their use in answering questions about the contemporary moment or the past, and/or consider the multiple, complicated temporalities and geographies that can be produced through archaeological practices. The hope is that this session will provoke conversations that transgress the boundaries of the contemporary and the past in fruitful ways, critically interrogating archaeology as a powerful technique of knowledge production.

[259] Symposium - INTERREGIONAL INTERACTION AND DYNAMIC CULTURAL PROCESS IN MESOAMERICA

Archaeologists have long recognized the crucial role of interregional interaction in the development and cultural dynamics of ancient societies. In Mesoamerica, however, an expanding awareness of details in the archaeological, art historical, and epigraphic records suggests that the relationship between interaction and shifting sociocultural processes is highly complex and nuanced. The aim of this symposium is to explore the multiple potentialities of movement, migration, exchange, and interaction as catalysts for dynamic variability in cultural systems, complementing standard approaches that often focus on unidirectional causation (i.e., the appearance of talud-tablero architecture or the tripod vessel form as unilaterally indicative of a specifically "Teotihuacan" or the more nebulous "Central Mexican" presence and influence). Although not

limited to specific temporal, spatial, or cultural contexts within Mesoamerica, papers examine the role that interregional exchange played in the creation of systems of shared ideologies, the production of regional or “international” artistic and architectural styles, shifting sociopolitical patterns, and dynamic changes in cultural practices, meanings, and values. The aim of this symposium is to contribute to contemporary debate by highlighting, engaging, and provoking questions pertinent to our understanding of the relationship between interregional interaction and dynamic sociocultural processes in multiple Mesoamerican cultural histories.

[260] General Session · MODELING LANDSCAPE USE AND CULTURAL DEVELOPMENT

[261] General Session · PUBLIC OUTREACH AND EDUCATION

[262] Symposium · RECENT ARCHAEOLOGICAL RESEARCH IN THE UPPER GILA

The Upper Gila cross-cuts a number of archaeological regions in Arizona and New Mexico and includes the area surrounding the Gila River and its tributaries east of the San Pedro River. The purpose of this symposium is to highlight the diversity of occupation and time depth in the region. Although the Upper Gila is rich with archaeological sites, archaeological research is lacking compared to neighboring regions. This symposium brings together researchers working throughout the Upper Gila to share their recent research efforts related to the Early Agricultural, Early Pithouse, Mimbres Late Pithouse, Classic, and Salado periods. These investigations showcase the research potential in the Upper Gila region.

[263] General Session · STUDIES OF MAYA SETTLEMENTS AND PUBLIC ARCHITECTURE

[264] General Session · MOLECULAR ANALYSIS IN BIOARCHAEOLOGY

[265] General Session · HISTORIC CEMETERIES IN THE UNITED STATES

[266] General Session · SACRED LANDSCAPES AND RITUAL SPACES AMONG THE ANCIENT MAYA

[267] General Session · THE LOOTING OF ARCHAEOLOGICAL SITES

[268] General Session · STUDIES IN ARCHAEOBOTANY AND PALEOETHNOBOTANY

[269] Symposium · QUEERING THE FIELD: ARCHAEOLOGIES OF SEXUALITY, GENDER, AND BEYOND

(SPONSORED BY QUEER ARCHAEOLOGY INTEREST GROUP)

Queer as a theoretical tool was formalized in the 1980's and 1990's as a result of the discourse concerning definitions of gender, sex, and sexuality. Although queer theory began as a way to interrogate heteronormative assumptions around sexual identity and sexual oppression, it more broadly questions any and all notions of fixed difference. The queer movement challenges the very notion that anything is “normal” or stable, from the construction of social identity to institutional structures and practices. In archaeology, this has led to a diverse body of research that includes topics such as family structure, kinship, intersectionality, chronology, social identity, and bodily performance. Although queer archaeology has grown enormously in the last 15 years, it remains at the outskirts (pun intended) of archaeological discourse. In this light, this session explores what queer is and its applicability to archaeological research. Session participants will explore recent archaeological case studies using the following questions as a frame: What is queer (queer theory) and why use it in archaeology? Is there a unified sense of what it means to “do” queer archaeology? In what ways has queer theory impacted the field and in what ways can it? And where do we go from here?

[270] Forum • THE ENGAGED CLASSROOM, CONTINUED: SELECTING TEACHING MATERIALS FOR ARCHAEOLOGY COURSES*(SPONSORED BY PUBLIC EDUCATION COMMITTEE)*

Archaeology courses offer ample opportunity to engage students by using a variety of resources, although the sheer volume of possibilities can become overwhelming. Our discipline is one of infinite curiosity and discovery, which translates well when bringing in reading materials, films, and websites. However, selecting these materials can be a challenge, particularly for new instructors. It takes time to review potential materials and ensure that they will enhance student learning and mesh with your own pedagogical approach. Following the same interactive, collaborative format as last year's Engaged Classroom forum, the goals for this year's session are (1) for participants to build a library of supplementary materials to stimulate student learning in archaeology courses; and (2) to develop strategies for selecting materials based on pedagogical principles rather than convenience. Our discussants will present some of their favorite resources and share tips for replicate their decision process. Forum attendees will then collaboratively outline ways to review course materials, allowing participants to learn from the successes and challenges others have experienced.

[271] Forum • ISSUES AND DIRECTIONS IN STARCH GRAIN RESEARCH

Over the past 30 years, starch grain analysis has developed into an integral component of archaeological and paleoenvironmental research and has begun to shed new light on many important topics. Many aspects of starch grain research remain unresolved, though, despite the proliferation of starch grain studies. Some of the issues that will be discussed in this forum include: quantification methods, testing the effectiveness of recovery practices, understanding modes of starch preservation and modification, and efforts to expand comparative studies. Researchers from around the world will offer their perspectives on how to address these issues and provide insights into how the discipline can move forward.

[272] Poster Session • THE ARCHAEOLOGY OF SUBSISTENCE STRATEGIES IN THE SOUTHWESTERN UNITED STATES**[273] Poster Session • PREHISTORIC ARCHAEOLOGY IN THE SOUTHWESTERN UNITED STATES****[274] Poster Session • CERAMIC ANALYSIS FROM SITES IN THE SOUTHWESTERN UNITED STATES****[275] Poster Session • PREHISTORIC ARCHAEOLOGY IN THE SOUTHEASTERN UNITED STATES****[276] Poster Session • STONES, BONES, AND CACAO IN THE PREHISTORIC SOUTHWESTERN UNITED STATES****[277] Poster Session • PUEBLOS AT THE PASSAGEWAY: A REASSESSMENT OF BURIAL COLLECTIONS FROM NUVAKWEWTAQA, CHAVEZ PASS, ARIZONA**

For several centuries (13th – 15th C AD) Nuvakwewtaqa was comprised of three large pueblos that harbored a large population of ancestral puebloan people. It has been argued that the location and size of the pueblos correspond with their position along a major trade route - a transitional zone between forest and desert ecotones on the Colorado Plateau. A recently completed Forest Service sponsored NAGPRA Documentation project presents reassessments of the burial assemblages excavated by ASU (Chavez Pass Project 1976-1982) in cooperation with the Coconino National Forest. The site had been subjected to decades of looting which made past analysis of the disturbed burial contexts and surface scatters challenging. New insights into the people and material culture of Nuvakwewtaqa are presented which demonstrate that extensive regional ties provided the necessary conditions for the establishment of a center of population and trade during the dynamic regional changes of late prehistoric times.

[278] Poster Session - NEW PERSPECTIVES ON SALADO

The widespread Salado phenomenon, largely defined by distinctive polychrome pottery, has perplexed archaeologists in the US Southwest for decades. Many current views associate this pottery with an ideology that helped integrate culturally diverse communities during the tumultuous late pre-contact period (A.D. 1250-1450). This session focuses on recent excavations and preservation efforts in southwestern New Mexico while bringing together perspectives from other regions to examine the intriguing variability and shared elements that characterize Salado communities. Examinations of architecture, ceramics, and ground and chipped stone from new excavations and past projects enrich our understanding of Salado at different spatial and temporal scales. This large data set allows for detailed consideration and debate on Salado at a synthetic level.

[279] Symposium - INVESTIGATING THE TRAFFICKING OF CULTURAL OBJECTS: NOVEL AND INTERDISCIPLINARY APPROACHES

Significant advances have been made in curbing the trafficking of cultural objects and regulating the illicit trade in this material. By embracing a multidisciplinary approach, scholars, practitioners, governments, and stakeholders are increasingly able to move beyond ethical and theoretical debates towards empirical research and valuable data gathering and analysis. As cultural property researchers are drawing upon new technologies and methodologies developed in such diverse fields as archaeology, law, computer science, criminology, development studies, policing, sociology, and beyond novel approaches to the study and, ultimately, the disruption of the illicit trade in cultural objects are emerging.

This session will contain current multidisciplinary research into the illicit trafficking of cultural objects. Topics of particular interest are use of new technologies to monitor either looting or the antiquities market, regulatory analysis and development, field work results, and applications of methodologies from outside archaeology to address this problem.

[280] Symposium - GREAT LAKES ARCHAEOLOGY: CURRENT RESEARCH AND PERSPECTIVES

There is a long history of archaeological research in the Great Lakes region, and much of that research has taken place in the last decade or is ongoing. A number of projects combine traditional and innovative methodologies to offer new insights into the once-obscure worlds of ancient hunter-gatherers' lives. This symposium brings together scholars studying Great Lakes archaeology to present their current and recent research investigating ancient daily practices through the study of a diverse range of topics, including: technological organization and innovation, craft production, subsistence and cuisine, cultural interactions, and human-landscape interactions.

[281] Symposium - NEW RESEARCH ON THE ARCHAIC PERIOD IN THE NORTHEAST: THE PAST 20 YEARS

Research in the Northeast over the past 20 years has contributed a wealth of new data and insights into Archaic Period lithic technologies and settlement patterns using interdisciplinary approaches and collaborative efforts among archaeologists, Native American tribes, geologists, geomorphologists, chemists, and paleoecologists to name a few. These new applications are allowing us to gain a better understanding of human agency on the landscape on a small-scale, local level, and a refinement of large-scale, multi-regional level models. New data from Archaic sites in Massachusetts, Connecticut, Rhode Island, Maine, New Hampshire, and New York are presented to highlight what we knew then, what we know now, and what it is we still want to know

[282] Symposium - A NEW DEAL FOR WESTERN ARCHAEOLOGY
(SPONSORED BY HISTORY OF ARCHAEOLOGY INTEREST GROUP)

The New Deal agencies established during the Great Depression were important 1930's economic programs that are a dynamic part of American history. This symposium will focus on analysis of these Alphabet Soup agencies, as they were commonly known, and the cultural heritage projects that were sponsored west of the Mississippi River, including those devoted to archaeology and to standing structures. These Western New Deal projects were supported by many of the Federal agencies: Civilian Conservation Corps (CCC), Civil Works Administration (CWA), Public Works Administration (PWA), National Youth Administration (NYA) and the Works Progress Administration (WPA). Contrary to what some scholars have implied, we show that New Deal archaeology is not confined to the southeastern United States.

[283] Symposium - NEW PERSPECTIVES ON THE ARCHAEOLOGY OF ECONOMICS IN CHINA

Archaeological research in China has traditionally focused on long distance interactions between groups of cultures. An unfortunate result of this approach has been to stress the movement of goods over the sociopolitical implication of the interactions. This session aims to draw attention to the anthropological aspects of economy by focusing on processes of production, exchange, and consumption at a local scale. Contributors will examine the relationship of subsistence and utilitarian economies to local systems of social organization. A focus on small-scale communities rather than large culture areas has required researchers to pursue innovative methods and theories. This session will thus also explore the application and significance of this scholarship to the broader field of Chinese archaeology.

[284] Symposium - 20 YEAR RETROSPECTIVE OF NATIONAL CENTER FOR PRESERVATION TECHNOLOGY AND TRAINING SPONSORED ARCHAEOLOGY.

(SPONSORED BY THE NATIONAL CENTER FOR PRESERVATION TECHNOLOGY AND TRAINING)

Since 1994, the National Center for Preservation Technology and Training, a component of the National Park Service (ncptt.nps.gov), has engaged in state-of-the-art research in archaeological treatments and technologies. The Center provides grants, education, research, and training opportunities in the areas of archaeology and collections, architecture and engineering, materials conservation, and historic landscapes. To date, over \$9 million dollars have been spent on sponsored research via our grants program. This symposium is a 20 year retrospective and is focused on the innovative contributions of the award recipients to the archaeological sciences and technologies. Specifically, the researchers will be re-examining their original work and addressing the impact to their respective fields, how their work has influenced their research, and progress in their study areas since the initial award. This seminar includes papers that cover topics ranging from the development and fielding of magnetic susceptibility, archaeogeophysics, multi-beam swath bathymetry, and a friction cone-penetrometer, to plasma extraction ^{14}C analysis, site location probability models, lithic characterization, ceramic thin-section analysis, freshwater shell artifact and temper sourcing, aerial archaeology, and Native American consultation protocols.

[285] Symposium - THE SOCIAL LIVES OF FORTS: RECONSIDERING THE SOCIAL CONSTRUCTION OF ANCIENT FORTIFIED SETTLEMENTS AND THEIR DIVERSE ROLES IN POLITICAL ORGANIZATION

In the past, populations often shifted their settlements to more defensive patterns, settling in nucleated, fortified villages and towns, or in the shadow of hilltop redoubts. The monumental scale and/or strategic position of fortified constructions have historically led to a limited view of fortresses as engines of war. In this session, we look beyond the walls to consider the underlying social, political, and ritual dynamics that are entailed by phases of defensive settlement. What were the sociopolitical ramifications of living in fortified communities? How did the diverse economic, territorial, and political stakes of conflict shape these communities? Were horizontal divisions in identity or specialization within fortified communities emphasized, or elided? While fortified communities may have afforded new opportunities for political leaders, they may also have been associated with resistance to vertical distinctions and an ethos of conformity and solidarity. Participants from a broad spectrum of geographic and theoretical positions explore the diverse ways in which past populations (re)organized themselves in contexts of threat, however constituted. Papers will advance the study of fortifications beyond military strategy, and into anthropological arenas of social practice, economic organization, political landscape production, and regional scale interactions that unfolded under the shadow of such conflict.

[286] Symposium · RECENT ADVANCES IN THE SETTLEMENT AND LANDSCAPE ARCHAEOLOGY OF SOUTHWEST CHINA AND SOUTHEAST ASIA PART I: THE MACRO PERSPECTIVE: SPATIAL ANALYSIS AND SUBSISTENCE SYSTEMS

Since the beginnings of archaeological research in Southwest China and Southeast Asia, the focus has largely been on burial material. Whereas the burial customs, personal decoration, and weapon and tool assemblages that accompanied the deceased are by now fairly well known, the world of the living is far less well explored. During the last few years, however, there has been increasing interest in the settlement archaeology of the region, ranging from smaller-scale investigations of sites, to a broader landscape approach. A considerable number of field projects throughout Southwest China and Southeast Asia have greatly advanced our understanding of the daily lives of prehistoric and early historic inhabitants of the area. This session assembles papers that introduce some of the results of these research projects, providing an overview of our current knowledge in this field and pointing out new avenues of research. The first part of the session takes on the macro perspective of large-scale spatial analysis and long-term developments.

[287] Symposium · ANCIENT ARCHITECTURE AND SPATIAL TECHNOLOGY: A GLOBAL PERSPECTIVE

Spatial technology is our primary tool for in-field and remote recording of ancient architecture. Advances in our ability to detect and record architecture as part of the archaeological record have come from greater access to high precision surveying instruments and a variety of remote sensing techniques, including laser scanning. In turn, spatial modeling to perform analyses and create 3D representations can provide insights in to the past. Since architecture is used as a metric to reconstruct social organization, identity, and other key elements of the past, it is crucial that we engage the question of how advances in spatial technology have shaped the ways in which we investigate and interpret architecture in the archaeological record. The purpose of this symposium is to bring together case studies and regional reviews that reflect on the myriad of ways we study ancient architecture. The geographical and temporal scope of the session is purposefully broad to encourage dialog between different regions and research problems.

[288] Symposium · IHOPE (INTEGRATED HISTORY AND FUTURE OF PEOPLE ON EARTH) - INTERNATIONAL AND INTERDISCIPLINARY PROJECTS WORKING TO MAKE THE PAST BETTER SERVE THE FUTURE.

(SPONSORED BY IHOPE)

IHOPE (Integrated History and Future of People on Earth, <http://ihopenet.org/>) works to mobilize the record of “completed long term human ecodynamics experiments of the past” for better integration of long-term perspectives into planning and scenario construction aimed at building resilience and future sustainability. A component of the Future Earth: Transformations Towards Sustainability theme (<http://www.futureearth.org/themes/transformations-towards-sustainability>), IHOPE provides archaeology with a voice in the acronym-rich realm of international Global Environmental Change research programs. IHOPE works to integrate regional-scale transdisciplinary approaches to cases of resilience, transformation, and collapse. This session provides a sampling of IHOPE projects and perspectives, including: environmental impacts of the Northern Crusades in the Baltic, the integrative work of the IHOPE Maya group, cross regional case comparisons connecting the Desert Southwest and North Atlantic islands, the connection of Local and Traditional Knowledge to millennial scale sustainable resource management, to archaeological consideration of early large scale human impacts in China as part of an investigation of the “roots of the Anthropocene”. IHOPE and its sister organization GHEA (Global Human Ecodynamics Alliance, www.gheahome.org) welcome new participants and perspectives to make past better serve the future.

[289] Symposium · MIND THE GAP: ARCHAEOLOGICAL APPROACHES TO NULL DATA SPACES

One of the basic tenets of archaeological practice is locating material remains and pinpointing their location. In doing so we often create arbitrary islands of data, both spatial and temporal; clusters on a map or timeline surrounded by blank space. Despite awareness that these 'empty' or null spaces were integral parts of past

landscapes, they are often left out of or dismissed by archaeological interpretations. When gaps in spatial knowledge are equated with gaps in cultural knowledge and/or landscape use, null data areas become cordoned off behind seemingly rigid boundaries. Instead, archaeologists can problematize these spaces and theorize about the methodological, cultural, and natural processes that create and perpetuate gaps. In this session presenters with different temporal, spatial, and methodological specialties will confront the gaps in their data in an effort to create a comparative dialogue of how we treat empty space.

[290] Symposium - MANY FACES, MANY PERSPECTIVES: ARCHAEOLOGY AND COMMUNITIES IN PRACTICE.

(SPONSORED BY PARA LA NATURALEZA, A DIVISION OF THE PUERTO RICO CONSERVATION TRUST, AND THE UNIVERSITY OF PR)

The concept of community archaeology often assumes a relationship between scientists and communities as short-term interaction driven by work recruitment and a one-sided transfer of knowledge. However the boundaries delimiting specific "communities", separated among themselves and from the "scientists", are created and often arbitrary. In this view, archaeologists or scientists often assume a hierarchical position in regards to the production and distribution of knowledge. Local people, grouped as communities, have a silenced perspective of the importance, value and reason behind these type of projects. In this session we emphasize on the importance of shared knowledge and the blurring of boundaries between scientists and communities of diverse compositions. This approach promotes for the identification of new faces and new perspectives, allowing a transformation of the interaction between the academic and non-academic communities, and a more fluid production, accumulation and transfer of knowledge. The presentations and discussions brought forth in this session seek to propose a new view on a topic that has many faces and many perspectives, using practice to enhance the potential contributions that community archaeology can make to scientists and to communities alike.

[291] Symposium - PEOPLE WITHOUT COLLAPSE: PERIPHERIES AS ACTIVE PARTICIPANTS IN CULTURAL TRANSFORMATIONS

Eric Wolf's seminal work, *Europe and the People Without History* (1982), drew our attention to the periphery as an important locus of anthropological inquiry. By examining "people without history," Wolf was able to show that social complexity before the modern era was not a process that laid solely in the development and decline of isolated societies. Rather, both ancient and modern forms of social complexity rest upon the interconnections among peoples at global scales. This perspective has especially significant import for the archaeology of collapse, as it suggests that our frame of inquiry needs to be much wider than it has traditionally been. Specifically, we must consider the "peoples without collapse" - those groups that are generally excluded from collapse narratives, either because their complexity is non-hierarchical, or because they lie on the periphery of hierarchically-organized states, city-state networks or empires. Some processes of collapse may be most visible in peripheral areas, and the actions and changes that occur in these areas may play important roles in collapse as experienced in political and economic core areas. Ultimately, a focus on periphery areas and peoples provides insight into the relative stability of different social institutions in societies experiencing cultural transformation.

[292] Symposium - GLOBAL PERSPECTIVES ON LITHIC TECHNOLOGIES IN COMPLEX SOCIETIES

The stone tools from later complex societies are usually dealt with by archaeologists in cursory ways or ignored completely. On the one hand, archaeologists working on such contexts generally view stone tool technology as epiphenomenal to the various theoretical issues that dominate modern research. On the other hand, lithic specialists are not inherently drawn to these contexts because they are generally characterized by either the production of expedient tools or by highly distinctive production sequences requiring further research specialization. This session aims to bring more attention to the diversity of stone tool technology produced within complex societies from around the world, showing that lithics can provide a wealth of information about the daily lives of people in complex societies. Furthermore, papers in this session

demonstrate that lithic analysis articulates with many aspects of modern archaeological theory in cogent ways. By presenting stone tool technologies from complex societies in cross-cultural perspective, this session will encourage the exchange of methodologies and interpretive frameworks in the interest of generating novel theoretical insights.

[293] Symposium - ANCESTRAL NATIVE AMERICAN ARCHAEOLOGY OF THE SAN FRANCISCO BAY AREA

San Francisco Bay is the second largest estuarine system on the west coast of North America. The remarkable biotic diversity of the bay, with its surrounding valleys, uplands and vast tidal delta supported a great mosaic of individual tribal polities for several thousand years. During the Late Holocene, dramatic trends toward more complex forms of social organization, economic diversification and extensification is abundantly evident in the archaeology of the region. This symposium, composed of a wide-ranging collection of presentations, explores aspects of social complexity, subsistence pursuits and economic diversity within an area that was one of the great population centers of Tribal North America.

[294] Symposium - BUILDING THE HUNTER-GATHERER'S PALEOSCAPE ON THE SOUTH AFRICAN COAST: ENVIRONMENT, LANDSCAPE, AND FORAGING RESOURCES

This symposium summarizes our climatic and environmental modeling, chronology, and experimental studies of resource productivity in the ancient paleoscape of the Cape Floral Region (CFR) of South Africa. Traditional paleoanthropological approaches to paleoenvironmental data seek to increase the resolution of both records in order to show meaningful correlations. Although heuristically useful, these strategies typically fail to illuminate causal relationships because they lack connective theory. To build that connective theory we need to 1) understand the links between our paleoenvironmental proxies and the distribution of resources relevant to foragers 2) construct "paleoscape" models of the distribution of those resources under different climate conditions, 3) simulate forager actions and decisions in those paleoscaping, and 4) compare the model output to empirical archaeological observations. The CFR, a floristically hyper-diverse ecosystem bordered by a super-rich coastal zone presents a useful laboratory for the development and testing of paleoscape models. Our project is a large international consortium exploring the co-evolution of people and ecosystem by creating the paleoscape models of the CFR, simulating how hunter-gatherers utilized this changing ecosystem, and then testing these models with high resolution paleoenvironmental and archaeological data, and here we focus on the contextual results.

[295] Symposium - FROM THE FIELDS TO THE PALACES OF THE PREHISTORIC MAYA: HONO(U)RING THE CONTRIBUTIONS OF THE LATE PETER D. HARRISON

As a young archaeologist Peter Harrison's main interest was in ancient Egypt, but a trip to Tikal at the age of 19 changed everything. He received his BA and MA in Anthropology from the University of Toronto and his PhD from Pennsylvania in association with the Tikal Project. He spent four years working on the Pennsylvania Tikal Project with a focus on the Central Acropolis. Subsequent fieldwork included the Uaymil Survey Project in Quintana Roo, Mexico, and groundbreaking research on Maya agriculture at Pulltrouser Swamp, Belize. His numerous publications on the Maya span more than fifty years and a wide variety of topics, including Maya palaces, architecture, settlement patterns, agriculture, and hieroglyphs, to name a few, and can be found in the bibliographies of virtually every publication on the prehistoric Maya. Additionally, beyond his intellectual contributions to Maya archaeology, Harrison established a foundation to help fund the work of young scholars. His sudden passing in 2013 has left a void in Maya archaeology, professionally and personally, and in this session we hono(u)r his numerous contributions to our discipline.

[296] Symposium - A SENSE OF QUESTION: PAPERS IN HONOR OF JAMES F. O'CONNELL

One of the enduring challenges in archaeology is the use and development of anthropologically informed approaches to the past. Pioneering work by James F. O'Connell has and continues to make significant contributions in anthropological archaeology across time and space. From early archaeological work in Surprise Valley under Robert Heizer, to ethnoarchaeological research among the Alyawara in central

Australia and later among Hadza hunter-gathers in Tanzania, his research scope is global. With significant and ground-breaking archaeological contributions focused on questions about site structure, function, and chronology, his contributions continue to shape the field as a whole. His archaeological and ethnoarchaeological research established human behavioral ecology as a working theoretical paradigm in anthropology and especially archaeology. His theoretical contributions span important, big-picture questions and include investigations of the foraging strategies of Plio-Pleistocene hominins, the colonization of Australia, megafauna extinctions, and the evolution of modern life histories. His work with Alyawara and Hadza hunter-gatherers refocused the field of ethnoarchaeology away from simple description and promoted the use of theory-driven testable hypotheses. Papers in this session include new and on-going research inspired by the work of James O'Connell, as well as overviews summarizing his contributions to specific domains.

[297] Symposium · LITHICS COWGIRL, HOUSEHOLD ARCHAEOLOGIST, DIGITAL DOYENNE: A SESSION DEDICATED TO RUTH TRINGHAM

Throughout her incredibly active, extraordinarily creative career as an archaeologist, Ruth Tringham has transformed experimental lithic technology, re-animated "faceless blobs" with her Neolithic narratives, and explored digital technology in archaeology from punch cards to virtual worlds. With field projects at Selevac and Opovo-Ugar Bajbuk, Serbia; Podgoritsa, Bulgaria; Çatalhöyük, Turkey; and the San Francisco Presidio, California, Tringham investigated fire and burning in household contexts, mudbrick architecture, senses of place, multimedia-driven fieldwork and embodied multisensorial interpretations of the past. Tringham taught at University College London, Harvard, and then at the University of California, fostering innovative pedagogical techniques and cultivating the careers of her students over 45 years of teaching. Her fearless, passionate, fun-loving approach to life fuels her research as well as her life outside of academia, as she is an accomplished singer, dramatist, kayaker and (would-be) bee-keeper. This session celebrates Tringham's wide-ranging impact on lithics, household archaeology, feminist practice, and digital archaeology with presentations from her colleagues and students throughout the years.

[298] Symposium · THE SEVENTH FIELD SEASON OF THE PROYECTO TEMPLO MAYOR: RECENT INVESTIGATIONS ON THE SACRED PRECINCT OF TENOCHTITLAN

The fortuitous discovery of the Tlaltecuhli Earth Goddess monolith in 2006 generated new investigations in the ruins of Tenochtitlan's sacred precinct. Since March 2007, an interdisciplinary and international team organized by the Instituto Nacional de Antropología e Historia has carried out topographic studies, geophysical prospection, microchemical analysis, and archaeological excavation in Mexico City's historic center. These activities have produced new data regarding the precinct's urban planning, the architectural and functional evolution of its religious structures, and the symbolism and economy of Mexica rituals carried out at the foot of the Templo Mayor in the decades prior to Spanish Conquest.

[299] Symposium · BUILDING A BIOARCHAEOLOGY OF CARE

'Bioarchaeology of care' is a formal framework for analyzing cases of past caregiving in a contextualized and systematic manner. In bioarchaeology, health-related care is inferred from evidence in human remains that indicates survival with a disabling pathology when the individual would likely not have reached the actual age at death without care. Caregiving practices can potentially reveal a society's norms, values and beliefs. Additionally, caregiving can provide insights into societal knowledge, skills and experiences as well as political, economic, social and environmental variables. Despite its potential for providing a window into such aspects of past behavior, caregiving has been neglected as a topic for archaeological research. To alleviate this problem the Index of Care was created as an on-line instrument supporting application of a bioarchaeology of care methodology. 'Building a Bioarchaeology of Care' consists of perspectives from three continents for developing theory and practice into a cohesive framework. Presenters will discuss the possibilities and pitfalls for Index of Care use, explore approaches for integrating care analysis in other areas of archaeology (e.g. mummification literature in context of caregiving), identify new directions for research, and propose strategies for communicating findings and stimulating debate.

[300] Symposium - SOLVING ARCHAEOLOGICAL RESEARCH PROBLEMS IN ROCKY MOUNTAIN AND PLAINS PREHISTORY

Rocky Mountain and Great Plains archaeologists utilize a wide variety of methods to solve research problems in regional prehistory. From lithics to fauna to ethnoarchaeological data and beyond, this symposium highlights current research that advances and solves problems across a wide variety of topics. From the peopling of North America to human adaptation during the altithermal to the rise of agriculture to the complexity of bison hunting, this symposium highlights the diverse state of prehistoric archaeological research in this vast region of the interior of North America.

[301] Symposium - PEOPLE THAT NO ONE HAD USE FOR, HAD NOTHING TO GIVE TO, NO PLACE TO OFFER: THE MILWAUKEE COUNTY INSTITUTION GROUNDS POOR FARM CEMETERY

Based on Wisconsin's Territorial Act of 1838 and state statutes enacted in 1849 provision for the welfare of the poor became the legal responsibility of local governing including the Milwaukee County Board of Supervisors. The various formal institutions of Milwaukee County were established to provide care for the indigent, sick, orphaned and homeless as well as the burial of individuals from those categories. From 1878 through 1974 Milwaukee County utilized four locations on the Milwaukee County Grounds for burial of more than 7000 individuals. Archaeological excavations in 1991 and 1992 and in 2013 resulted in the recovery of over 2800 individuals from one of those cemetery locations. This symposium presents historical, archaeological and osteological research related to those excavations. Specific paper topics include analyses of historical documents and material culture assemblages, spatial patterning within the cemetery limits, the relationship between Milwaukee County and local medical schools, molecular identification of *Mycobacterium tuberculosis* in human skeletal remains, evidence for autopsy or medical school use of individual corpses, a refined method of juvenile age assessment, the application of strontium analysis for the establishment of identity, and the application of portable X-ray fluorescence technology to the excavation and analysis of human remains.

[302] Symposium - CURRENT PROBLEMS IN ARCTIC RESEARCH

Given heightened coastal erosion, decreased permafrost levels and melting ice patches, Arctic archaeologists are facing issues not previously experienced even a decade before. In addition, circumpolar communities are beginning to take ownership of their history and more collaborative relationships are emerging. This symposium will showcase current archaeological research across the Arctic, highlighting new questions that are arising as we struggle to stay ahead of changing climatic conditions and addressing old questions related to human resilience in the North.

[303] Symposium - MURAL PAINTING AND THE ANCIENT AMERICAS

Artist and activist Judy Baca argues that: Muralism is a work made in relatedness. Related to the people that surround it; related to the place it is in and made in a public voice. Mural paintings made either in twentieth-century Los Angeles or in eighth-century Guatemala are works that are often time-, place-, and community-specific. A medium whose life can be brief, the ties between murals and the time, place, and communities make their ephemerality all the more poignant.

The last thirty years of archaeological research have uncovered extraordinary mural paintings throughout the Americas. Advances in technical, material and art historical research have provoked reassessments of long-known painted walls. This symposium seeks to generate interdisciplinary and inter-regional dialogue on the meanings and functions of mural paintings from diverse chronological, geographic, and cultural settings. The papers presented in this panel move beyond formal and iconographic descriptions to address the ways in which context matters in the production of meaning, and how archaeological inquiry might open new vistas on murals as temporally, spatially, and socially related works.

[304] Symposium - SOCIETY AND ECONOMY IN THE HOHOKAM WORLD: NEW EVIDENCE AND INSIGHTS FROM CANAL SYSTEM 2, PHOENIX, ARIZONA

Beginning in the A.D. 500s and continuing into the 1100s, the pre-Classic Hohokam established large agricultural villages along vast canal systems headed on major rivers in southern and central Arizona. One of the largest and best known of these systems is Canal System 2, which encompasses much of modern-day Phoenix on the north side of the Salt River. Linked by hundreds of miles of canals, the people residing in villages along Canal System 2 established long-lasting social and economic connections that facilitated sharing water for crops, pooling labor to maintain canals, and trading goods crafted by artisans, which were validated and bound together through shared social practices and obligations. The papers in this symposium cite a variety of data sources—including information obtained from recent excavations at two large Canal System 2 villages, La Ciudad and La Villa—to examine the social and ritual organization of pre-Classic villages, canal system integration, labor organization, canal construction and maintenance, agriculture, and regional-scale craft production and exchange. Leveraging new evidence and recent investigations, the symposium papers provide new insights into the social and economic fabric of Canal System 2 during the pre-Classic period.

[305] Symposium - ARCHAEOLOGICAL APPROACHES TO SUBJECTIFICATION

This symposium explores archaeological approaches to subjectification: the practices whereby people recognize authority and recognize themselves as subjects to authority. Archaeology can offer a novel perspective on subjectification because it is uniquely positioned to document the places and things (and their attendant practices) that, over time, manifest claims to identity, underline social boundaries, or undermine a political regime's claim to authority. But even though places and things are mainstays of the archaeological analytic, few archaeologists examine the roles that these materials have played in practices of subjectification. Papers in this symposium draw on recent archaeological data to discuss the contexts in which places and things, in both ancient and modern worlds, became powerful vectors of subjectification that authorized a person's actions, positioned people within social hierarchies, or defined what it means to be a kind of person. These papers contribute an archaeological perspective to contemporary theories that describe subjectification as a continual process by which social differences between authorities and subjects are created, reproduced, or fractured in particular settings and circumstances. The symposium therefore provides theoretical and methodological insights into how archaeologists might understand the political processes, everyday practices, and moments of crisis during which objects shape subjects.

[306] Symposium - CONTEXTUALIZING MAYA HISTORY AND ARCHAEOLOGY PART I: REFLECTIONS ON THE 25TH ANNIVERSARY OF FOREST OF KINGS

This symposium celebrates the 25th anniversary of the publication *Forest of Kings* by Linda Schele and David Freidel. This book was a landmark in Maya archaeology in several respects. It was the first book to synthesize the explosion of epigraphic and iconographic studies that began in conjunction with the first Palenque Mesa Redonda meetings and fuse it with archaeological research. Using data from a series of important sites as well as vignettes, Schele and Freidel created a broad narrative of ancient Maya society that had a wide ranging impact on the field for its innovative and sometimes controversial interpretations. Further, *Forest of Kings* was published in a format that was not only accessible to the scientific community, but to the general public, which had a tremendous influence on how the ancient Maya as an idea was consumed by the lay community. The symposium is divided into two sessions. Papers presented in Part I focus on several themes including Maya ideology and cosmology, rise of complexity, and the central Maya lowlands in the Classic period. This symposium is a reflection on the impact the book had on the field and how far we have come since its publication.

[307] General Session - ARCHAEOLOGIES OF IDENTITY AND HUMAN EXPERIENCE IN THE PAST

[308] Forum - CARING FOR KNOWLEDGE ON STONE: ROCK ART CO-MANAGEMENT WITH INDIGENOUS AND LOCAL COMMUNITIES

(SPONSORED BY INDIGENOUS POPULATIONS INTEREST GROUP AND COMMITTEE ON NATIVE AMERICAN RELATIONS)

Many indigenous communities hold responsibilities to care for, protect and preserve sacred sites and cultural places. Rock art sites around the globe are some of the most important of those places, and increasingly Indigenous communities expect to play a central role in their preservation, care, interpretation and management. In many cases, the concerns and challenges that indigenous communities have in relation to rock art are similar to or intersect with those of archaeologists. At times indigenous peoples' approaches to care, protection and preservation conflict with archaeological methods. Discussants in this forum are involved in the care and/or management of rock art in various locations around the globe. Participants include indigenous community members as well as historical preservation professionals, state and federal archaeologists, and academic researchers. We will discuss co- and joint management models, exchange strategies for effectively caring for rock art in ways that are in accordance with indigenous protocols, and share points of conflict and how they were/might be resolved. We will also consider cultural tourism and the implications of listing rock art sites as a Traditional Cultural Property or World Heritage Site designation.

[309] Symposium - THE STUDY OF BIOLOGICAL MICROREMAINS AS A TOOL FOR RECONSTRUCTING PALEOENVIRONMENT IN HUMAN TRANSITION PERIODS

Human evolution is closely linked to climate, environment and the way in which human populations utilized the available resources. In this session, we attempt to make a step forward in the current knowledge on the paleoecological and paleoenvironmental conditions using biological microremains (phytoliths, pollen, diatoms, starches, dung spherulites, fungi, etc.). The integration of these tools represents a new avenue of study in paleoenvironmental data analyses. We will focus on four decisive episodes for the history of humankind and we will examine the way in which these conditions influenced the evolution and development of human knowledge: a) the emergence of *Homo habilis*; b) appearance of *Homo erectus* c) anatomically modern *Homo sapiens* and d) first agricultural and herding practices. These four moments represent significant advances at the social, intellectual, and economic level and gave place to important changes that continue to modify our behavior.

[310] Poster Session - CALIFORNIA ARCHAEOLOGY

[311] Poster Session - FROM COLONIAL TO CONTEMPORARY: ARCHAEOLOGY OF THE RECENT PAST IN THE UNITED STATES

[312] Poster Session - THE HOUSEPIT 54 PROJECT AT BRIDGE RIVER, BRITISH COLUMBIA: ARCHAEOLOGICAL PERSPECTIVES ON DEMOGRAPHY, CULTURAL INHERITANCE, AND HOUSEHOLD HISTORY

The Bridge River Archaeological Project is a long-term research partnership between The University of Montana, Department of Anthropology and Xwisten, the Bridge River Indian Band. The project seeks to understand the long-term history of the Bridge River housepit village with a focus on demographic change, technological evolution, socio-economic variability, and household sociality. This research permits us to develop studies that impact discipline-wide discussions of the evolution and organization of complex forager-fisher communities. The current phase, supported by the National Endowment for the Humanities, focuses on Housepit 54, deeply stratified house feature at the north end of the village. With at least 14 anthropogenic floors dating ca. 1100 to 1450 cal. B.P. and excellent preservation of faunal and macrobotanical remains, Housepit 54 provides us with the remarkable opportunity to examine persistence and change in household traditions on an intergenerational basis. This poster session presents results of ongoing research developing from our 2012 through 2014 field seasons. Posters examine dating and stratigraphy, cultural inheritance, demography, food collection and processing, technological traditions, social relationships, and approaches to artistic interpretation.

[313] Poster Session - NEW PERSPECTIVES ON EARLY MIGRATIONS IN THE WESTERN CARIBBEAN

Building a regional picture of the early peopling of the Western Caribbean is a challenging task. One of the main issues is the lack of a consistent, large scale chronological framework that would allow us to reconstruct the timing, direction(s), frequency(s) and causes of past population movements. Our session

focuses on skeletal remains as ancestors that provide both biological and cultural information, and examines the identity of the early migrants, their mode of subsistence and reasons behind their migrations. We present research on ancient DNA (aDNA), archaeology of subsistence practices (including paleoethnobotany and isotope analyses), mortuary archaeology, paleoenvironmental reconstruction, and analyses of place names (toponymy) in order to contextualize ancestral remains within their historical, cultural, natural and ideational worlds. We particularly encourage discussion of data sets on chronometric and stratigraphic dating of relevant sites in the region. The presented results point to the multidirectionality of early migrations and to the complexity of interactions between the islands and the adjacent continental regions, calling for different scales of inquiry into the process of early peopling of the Western Caribbean.

[314] Poster Session - CERAMICS AS MEANS TO ENDS AND MEANS OF EXPRESSION IN TERMINAL CLASSIC NORTHWESTERN HONDURAS

As perhaps the artifact most commonly recovered from most Mesoamerican sites, ceramics have figured prominently in efforts to reconstruct culture history and describe sociopolitical and economic patterns at various spatial and temporal scales. Much of this work has focused on analyzing pottery vessel fragments for the information they can provide on manufacturing techniques, vessel functions, and meanings conveyed primarily through stylistic modes. As valuable as these studies have been they are often stymied by our inability to identify who fashioned ceramic containers, at what scales, and how manufacturing processes might have been implicated in the exercise of power over others or the power to resist such pretensions. The contributions other fired-clay objects might have made to these processes are often ignored because their rarity in assemblages frustrates efforts to investigate them systematically. This session addresses both issues by presenting evidence gathered in the Naco valley and its environs concerning: the diverse ways pottery vessels were fashioned here during the Terminal Classic (AD 800-1000); how that variation was possibly related to local political and economic processes; and, what technological, formal, and distributional studies of a very unusual ceramic artifact, the candelero, contribute to understanding these developments.

[315] Poster Session - MATERIALITY, EXPERIENCE, AND "IRISHNESS": THE IRISH AND IRISH-AMERICAN EXPERIENCE THROUGH TIME

Drawing upon archaeological research, oral histories and historical records, this session seeks to understand the long-term nuances of household and community change by way of diverse assessments stemming from a single region. Researchers working along the western coast in Ireland and among Irish immigrant communities in the United States seek to develop a multi-faceted understanding of the changing social and economic contexts of daily life on both sides of the Atlantic Ocean. The perspectives presented here utilize various comparative assessments produced from a range of methodologies and theories in illuminating local understandings and everyday life within coastal, rural and urban communities. This includes a range of studies from the Medieval through twenty first century which shed new light upon the cyclical habitation and abandonment of coastal Ireland and exploring the subsequent changes in household and community in Ireland and abroad as a byproduct of Irish migration. This research demonstrates the potential for developing nuanced interpretations for changing concepts about space, place and social/geographic landscapes in both coastal Ireland and urban United States.

[316] General Session - THE STUDY OF LANDSCAPES IN BELIZE: GIS, LIDAR AND VIRTUAL REALITY

[317] General Session - ARCHAEOLOGY OF CENTRAL MEXICO

[318] Symposium - NARRATIVES AND DISCOURSES ON THE FORMATIVE PERIOD: REFLECTIONS AND NEW EPISTEMOLOGIES FROM THE SOUTH CENTRAL ANDES

Almost ten years ago, L.G. Lumbreras stated that the concept of "Formative" was unable to account for the diversity of social processes occurring in the Central Andes during the last three millennia BCE. Through a genealogical review of the concept and a critique of its use in different contexts throughout South America, he argued for the existence of multiple "formatives" with different characteristics and timelines. Nevertheless,

this periodization has remained a key device for organizing archaeological data and for characterizing sociocultural transformations in the Andes, even while many archaeologists are aware of its implications. Often, modern notions of progress, evolution, adaptation, technological development, nature and culture — among others— serve as conceptual foundations upon which grand narratives about the past are constructed. These teleological accounts presuppose the existence of a universal rationality, firmly rooted in modern capitalism, engendering totalizing discourses that obscure local histories. The purpose of this session is to critically explore new approaches to the study of the “Formative” process in the South Central Andes. We encourage papers that offer alternate views to this phenomenon, reassessing the role of agriculture, technology, sedentism, and domestication in the history of these groups, while proposing other epistemological possibilities for constructing effective narratives.

[319] Symposium · NATURAL FORMATION PROCESSES
(SPONSORED BY GEOARCHAEOLOGY INTEREST GROUP)

This session provides a broad overview of natural formation processes that have affected the distribution of artifacts, ecofacts, and features. The main objective is the important task of calling attention to the identification and interpretation of natural formation processes and agents of postdepositional disturbance, and how they contribute to our conceptualization of past human behavior. Together these patterns build on strong theoretical and practical foundations in geoarchaeology, which posit a dynamic relationship between a site's systemic context and the physical and biological processes. Here contributors highlight examples of natural formation processes, postdepositional disturbance, and other natural factors that contribute to our understanding of the archaeological record, regardless of scale (from macroscopic to microscopic), or location (from the Arctic to the tropics) and how scientists from around the world are handling them.

[320] General Session · MODELING SITE LOCATION AND COMMUNITY ORGANIZATION ALONG THE NORTHWEST COAST OF NORTH AMERICA

[321] General Session · HUMAN ENVIRONMENTAL IMPACTS

[322] Symposium · NOT JUST BLOGGING ARCHAEOLOGY - MEDIA AND SOCIAL MEDIA'S INFLUENCE ON ARCHAEOLOGY

Since the time of Renfrew and Binford, archaeology as a profession has embraced both a scientific methodology and the new tools science offers. From radiocarbon dating and geophysics to 3D imaging, these tools have enhanced the way we understand and communicate the human past. Now, the internet and 21st century technology offers new, multivocal venues through which we can relay archaeological information to the profession, enthusiasts, and the general public. From blogging and podcasting to YouTube videos and television series, communicating archaeology has never been easier. Anyone can start a blog, shoot some video, or record a podcast. Technology has reduced the cost of access and can allow archaeologists to speak directly to the public and peers. This session seeks to ask the following questions: is the use of social media helping or hurting archaeology? Are there drawbacks? Have we created an easy resource of archaeological information for looters? How has social media, via Facebook, Twitter, LinkedIn, and Instagram, to name a few, influenced archaeology in practice and the public's view of archaeology? This session solicits input from bloggers, podcasters, and film producers, each with a unique perspective rooted in the medium they've chosen to represent archaeology.

[323] Symposium · TERMINAL CLASSIC TO POSTCLASSIC IN THE NORTHERN LOWLANDS

The Terminal Classic represents a time of change for the Maya of the Northern Lowlands. Major social, political, settlement and economic shifts accompanied the collapse of government under divine kings. This session will explore changes involving site organization, architectural tradition, and economic exchange that paved the way for a Postclassic that, while diminished in extent, was firmly rooted in ancient tradition.

[324] General Session - CERAMIC STUDIES IN THE SOUTHWESTERN UNITED STATES**[325] Symposium - POST-CONFLICT ARCHAEOLOGY**

Increasingly archaeological sites and artefacts are becoming ideological and opportunist targets for destruction and damage during conflicts. In what ways should archaeologists respond to these challenges to the archaeological record? The purpose of this session is to explore the minefield that is conflict-damaged archaeology: a subject which demands an effective response from archaeologists, but which can potentially place archaeologists themselves in conflict with concerned interest groups. Political and moral issues are always entangled in any response and emotions intensified, however such issues need to be faced, discussed and debated by archaeologists. Equally, questions around 'ownership' of archaeology and moral imperatives require reflection. What is clear however, is that archaeologists who work in areas where sites have been, or are being, damaged by conflict need to consider what their strategies and responsibilities are, and most importantly, how they can obtain information from these sites. The key issues this session aims to address are how might conflict-damaged sites be investigated, documented and safeguarded from further damage? We would like to encourage papers which seek to explore post-conflict archaeology; and particularly how archaeological material targeted and damaged in conflict situations can be assessed and how archaeologists can gather meaningful information from such sites.

[326] General Session - ARCHAEOLOGY OF THE AMAZON REGION**[327] General Session - STUDIES OF ARTIFACTS AND DOCUMENTS IN HISTORICAL ARCHAEOLOGY****[328] Symposium - MIGRATION AND MOBILITY IN THE NEW WORLD**

Migration has long been considered a major topic within archaeology due to its focus on the relationship between people, objects, space, and time. In more recent years significant advances in computer modeling, biomolecular methods, and other tools often used in archaeology have allowed researchers to explore new facets of prehistoric migrations and mobility. In this symposium, we will explore the various methods archaeologists utilize to examine migration and mobility in a variety of different environments, ranging from small islands to broader continental regions. Potential topics are diverse and will encompass a range of methodological approaches and case studies—from biomolecular analyses of bone to agent-based modeling. The overall goal is to present how these approaches can be used individually or in tandem to explore motivating factors, consequences, and trajectories of prehistoric human movement.

[329] Debate - ARTIFACT IDENTIFICATION AS OUTREACH

(SPONSORED BY PUBLIC ARCHAEOLOGY INTEREST GROUP)

Archaeologists have taken considerable strides in recent years to engage with the public about archaeology through outreach events. While the SAA Principles of Archaeological Ethics (and similar codes from sister organizations) espouse the importance of public outreach, very few guidelines are provided about appropriate forms of outreach. As professionals are frequently sought out by the public in order to identify artifacts owned or encountered by non-archaeologists, several individuals and organizations have considered hosting or have hosted events that invite the public to bring their artifacts to be identified. This session seeks to create a moderated professional debate about the merits and ethical challenges of artifact identification sessions as public outreach events.

[330] Forum - OUT IN THE FIELD: QUEER EXPERIENCES AND CHALLENGES IN ARCHAEOLOGY

(SPONSORED BY QUEER ARCHAEOLOGY INTEREST GROUP)

The Queer Archaeology Interest Group (QAIG) was officially established at the 2014 SAAs in Austin in part to provide a forum for the discussion of and action on issues of interest to LGBTQI members, allies, and archaeologists interested in studies of sexuality. Archaeologists who identify as LGBTQI---like other minority archaeologists---face many challenges in their careers including discrimination in hiring, tenure, partner

benefits, and promotion in academic and non-academic career tracks, sexual- and gender-harassment, and the under-representation of minority perspectives in archaeological training and practice. Additionally, LGBTQI archaeologists face issues of gender presentation and identity that have rarely been discussed openly. This forum, sponsored by QIAG, brings together LGBTQI archaeologists of diverse backgrounds and career tracks to discuss their experiences and to begin to develop action-items for improving queer experience in archaeology. The forum will follow a moderated Q&A format, with questions submitted by the SAA membership in the months leading up to the 2015 SAAs. There will also be a period for open discussion by the participants and questions from forum attendees.

[331] General Session - ARCHAEOLOGY AND ZOOARCHAEOLOGY IN THE MIDWEST AND GREAT LAKES REGION

[332] General Session - BIOARCHAEOLOGY AND MORTUARY ARCHAEOLOGY IN EUROPE

[333] General Session - CLIMATE CHANGE AS AN ARCHAEOLOGICAL SUBJECT

[334] Symposium - ENGAGING WITH THE PUBLIC AND THE PAST: THE ARCHAEOLOGICAL LEGACY OF BRIAN FAGAN

Throughout his career, archaeologist Brian Fagan has consistently marshaled an unparalleled amount of cross cultural comparative data to address social phenomena with roots that stretch deep into our human past. As one of the country's best known authors of popular archaeology, Brian's scholarship on a wide range of anthropological themes is exemplified in dozens of widely-read books. As an influential public intellectual, Brian has led the charge in making anthropology accessible to students, scholars and the public alike. In the spirit of his lifelong contributions to the discipline --and with an eye towards public engagement, papers in this symposium employ cross cultural data from archaeological hot-spots worldwide to address and problematize the nature of prehistoric human-environment interactions. In doing so, we acknowledge Brian's legacy of research on the environment and its role in shaping society--both ancient and modern, as well as inform on the history of human vulnerability in prehistoric populations across the globe.

[335] Symposium - FROM HOUSEHOLDS TO COMMUNITIES: BRIDGING SCALES IN SEARCH OF CONFLICT, COALESCENCE, AND COMMUNITAS

Archaeological examinations of households and communities have increased dramatically over the past two decades. Many of these studies examine the ways in which people define themselves while simultaneously shaping the social relationships, physical spaces, and material objects that comprise their world. Despite the considerable insights such studies have generated, it is often difficult to bridge the scalar and theoretical differences between individual case studies focused at either household or community level. Contributions to this session seek to bridge these distinct scales of investigation through the examination of specific archaeological case studies that explicitly recognize that communities are not simply the byproducts of households pursuing their own autonomous strategies nor are households merely passive reflections of social, political, and economic relationships within the communities of which they are a part.

[336] Symposium - COLLABORATIVE AND COMMUNITY ARCHAEOLOGY

Public/Community/Stakeholder archaeology - call it what you will, is here to stay. It is an important aspect of a paradigm we as a profession continue to embrace. This session focuses on archaeology projects involving varied and innovative collaborative efforts that focus on partnerships with local communities – the public service / value aspect of our scientific effort.

[337] Symposium - HUMAN-ENVIRONMENT INTERACTIONS & HUMAN ECOLOGY IN WESTERN ARCTIC PREHISTORY

Northern sea ice levels are at an historical and millennial low, and nowhere are the effects of recent climate change more pronounced and destructive than in the Western Arctic, with the erosion and subsequent loss of coastal archaeological sites in this area being yet another casualty. However, the remarkably well-preserved but threatened archaeology of the Western Arctic is shedding important new light on the dynamics of the complex relationship between prehistoric Inuit/Eskimo cultures and past ecosystems. Organic artifacts and bioarchaeological material from sites in this region are feeding diverse but complementary interdisciplinary studies of diet, population genetics, zooarchaeology, paleoentomology, climate change and culture history. Working alongside local descendant communities, archaeological research can also inform understanding of the impact of contemporary climate change on northern communities. This session aims to explore aspects of human-environmental interactions, human ecology and prehistory in the Western Arctic through the lens of contemporary climate change and recent archaeological research. Our objective is to include researchers from a variety of perspectives and methodological specialties in order to explore temporal and spatial variation and dynamism in human ecology and human-environment interactions in Western Arctic prehistory, and to consider the implications of such research for academic and indigenous stakeholders.

[338] General Session - MESOAMERICAN RITUAL, ICONOGRAPHY AND MORTUARY ARCHAEOLOGY

[339] Symposium - ISLANDS AND INVASIVES: THE ARCHAEOLOGY OF PLANT AND ANIMAL TRANSLOCATIONS

Globalization has led to the rapid spread of invasive species, but the movement of species through trade networks and human migration is an ancient phenomenon extending back at least 20,000 years. The time depth of ancient translocations of non-domesticated animals often blurs the division between natural and cultural worlds and challenges ideas of “pristine” land or seascapes. Islands, with bounded landscapes and limited resources, are particularly susceptible to dramatic environmental and cultural changes following the introduction or invasion of new taxa. This session explores the mode of dispersal, the impacts, and the methods used to study the translocation and invasion of wild and domestic plants and animals to island environments. The investigation of ancient species translocations by humans can help document the structure and function of both ancient and modern ecosystems, the evolutionary history of domesticated and wild plants and animals, human-environmental relationships in the past and present, and provide data for the conservation of contemporary ecosystems.

[340] Symposium - SOUND OF THEORY

The folk have sung, on YouTube: enough of personalities. This session brings in responsible scientists, responsible in that they respond to empirical data, to stakeholders, communities, and descendants, and to basic principles of the historical sciences, including IBE, inference to the best explanation. Evidence-based practices let theory flow from encountered data, evaluated not only from Western Enlightenment suppositions of universal regularities, but also from the realities understood by communities from other cultural epistemologies. Ethics as well as politics must not be magicked away from archaeologists' work toward inferences to the best explanations

[341] Symposium - EXTREME ALPINE FORAGING: EXPLAINING HIGH ALTITUDE RESIDENCES IN THE GREAT BASIN

Why would foraging families spend their summers atop the highest places in their world? Great Basin archaeologists have long believed that the extreme alpine heights were used almost exclusively for logistic hunting of bighorn in prehistoric times. This all changed with the discoveries at Alta Toquima (central Nevada) and the White Mountains (southeastern California), where multiple residential sites occur at elevations exceeding 11,000 feet. This session compares and contrasts archaeological evidence from both areas, and begs the question of why—despite decades of searching—no comparable alpine residential complexes have been located anywhere else in the Intermountain West.

[342] Symposium - BEDROCK FEATURES (MORTARS, SLICKS AND GROOVES): DOCUMENTATION, ANALYSIS AND INTERPRETATION

Recent advances in global studies of bedrock features (e.g. mortars, slicks, grooves, etc.), suggest that these reflect a more varied, multifaceted archaeological phenomenon than previously thought. Nonetheless, while there are an increasing number of studies dealing with these sometimes enigmatic features, we still understand very little about their archaeological, cultural and spiritual contexts. The complex nature of bedrock features suggests that changes in their basic attributes (morphology, metrics and context) across time and space reflect variation in production and utilization on the one hand and economic and social aspects on the other. We seek to include papers with various theoretical and methodological approaches to the study of bedrock features, with no geographic or chronological limitations. Papers can focus on functional studies of bedrock features (e.g. use-wear and residue analyses), methodological or documentation aspects, ethnographic or ethno-archaeological studies, and descriptive analysis of specific sites rich in bedrock features. Papers addressing the symbolic or ritual significance of bedrock features, such as their use in ceremonial contexts, or as shrines or landmarks, are most welcome.

[343] Symposium - HOMOL'OVI: A GATHERING PLACE

In 1985 the Homol'ovi Research Program (HRP) was established at Arizona State Museum (ASM) to focus on the late prehispanic occupation of the middle Little Colorado River valley, as expressed in the aggregated villages of the Homol'ovi Settlement Cluster. In 2011 research expanded to study use of the landscape going back to Basketmaker II to provide context to the large, late pueblos. This symposium presents recent analyses and syntheses of the extensive body of research conducted by ASM for the past 30 years. The symposium will represent the diverse research initiatives of HRP including identity of groups who established and populated the late 13th/14th century villages; the materiality of depopulation and room closure; social and ritual construction, practice and material expression; the pre-aggregation social landscape; regional exchange; innovation and the role of new technologies in community building.

[344] Symposium - CONTEXTUALIZING MAYA HISTORY AND ARCHAEOLOGY PART II: REFLECTIONS ON THE 25TH ANNIVERSARY OF FOREST OF KINGS

The publication of *Forest of Kings* by Linda Schele and David Freidel in 1990 was a landmark in Maya archaeology. It was the first book to synthesize the explosion of epigraphic and iconographic studies that began in conjunction with the first Palenque Mesa Redonda meetings and fuse it with archaeological research. Using data from a series of important sites as well as vignettes, Schele and Freidel created a broad narrative of ancient Maya society that had a wide ranging impact on the field for its innovative and sometimes controversial interpretations. Further, *Forest of Kings* was published in a format that was not only accessible to the scientific community, but to the general public, which had a tremendous influence on how the ancient Maya as an idea was consumed by the lay community. This session is a reflection on the impact the book had on the field and how far we have come since its publication. The participants are a mix of scholars who were participants in the debates and/or worked at some of the sites discussed in the book, students of Schele and Freidel, and younger generation scholars who are working with some of the same questions.

[345] Symposium - FOOD GLOBALIZATION IN PREHISTORY

Over the last decade, an unprecedented growth in research activity across Asia and Africa has brought to light substantial evidence of extensive movement of domesticated species prior to the 2nd millennium BC. Ten years ago, this critical episode of food globalization was simply not on record. New evidence has come from archaeology, genetics and stable isotope studies. A series of large, current research projects are exploring the nature of this early episode of food globalization, how it happened, what resources and communities were involved, the challenges to movement, and how they were mitigated. Prehistoric antecedents have been discussed in the context of 2nd millennium BC metalworking technology and the development of horse-drawn transport. These episodes constitute over three millennia of trade and exchange, first over land and subsequently over sea, that put people in contact, as well as their foodstuffs, technologies, ideas and diseases. Prior to that exchange-driven history, the default model has been one of isolated farming communities, arising from a series of similarly isolated centers of domestication.

[346] Symposium - CRAFTING THE TENOCHCAN IMPERIAL IDENTITY AND STYLE

Recent researches have demonstrated that a large number of objects found in the offerings from the Sacred Precinct of Tenochtitlan are local products and not foreign artifacts obtained by tribute, exchange, war prizes, or looting. Based on their formal characteristics, an important group of them were exclusive to Tenochtitlan and even to its Great Temple in comparison with Tlatelolco, Texcoco, or other sites of Mesoamerica, because identical elements have not been found in other settlements. The papers of this symposium will present the detailed studies of the stylistic attributes and the manufacturing techniques of these objects in different raw materials that support and confirm this assumption for most of the Triple Alliance period (AD 1440-1520). Based on these results, it is even possible to propose the existence of the Tenochcan Technological Imperial Style to reinforce their identity since Moctezuma I until Moctezuma II. The high standardization observed in the morphology, iconography, and technology of these pieces, and its restricted distribution in the offerings of the main ceremonies at the heart of the Empire, suggest that its manufacturing took place in a dependent context, probably even in the palace of the Tenochcan rulers.

[347] Symposium - LIKE FREJILES IN A POD: EXAMINING THE CURRENT STATE OF PALEOETHNOBOTANY IN PERU

In the last decade or so, the field of paleoethnobotany has witnessed a rapid rise in the number of Peruvian and foreign researchers conducting archaeobotanical inquiry in the country of Peru. The primary goal of this symposium is to open lines of communication among these scholars, many of them recently trained, and solidify the network of researchers actively involved in the study of macro- and micro-botanical remains in the region. Through this symposium, we also aim to raise awareness about the need for sharing information such as project-specific methodologies and the rationales behind them, seed/phytolith/starch grain databases, and analytical protocols. The specific goals for this symposium include (1) disseminating the results of recent archaeobotanical analyses, (2) pushing theoretically engaged and question-driven research, (3) critically examining methodological issues specific to Andean archaeobotany, and (4) discussing joint efforts in developing databases and guides for Andean macro- and microremains. By taking these steps towards developing an active and collegial network of researchers interested in the complex entanglements between peoples and plants, we hope to advance the field of paleoethnobotany in Peru.

[348] Symposium - THE SHORT AND THE LONG OF IT: COMBINING TIMESCALES

Many prehistorians in Europe have used the long term as their default chronological perspective. A current ERC-funded project, 'The Times of Their Lives', is applying radiocarbon dating and a Bayesian framework for the interpretation of results to a series of case studies across the European Neolithic (sixth to third millennia cal BC) to push chronological precision to the scale of lifetimes and generations. The creation of much more precise timescales, however, still leaves the challenge of how to combine much more individual perspectives with the long term, in multi-scalar analysis. So this session seeks to explore, first, how far archaeology can go with refining its timescales, and secondly, how to combine multiple timescales. Papers will combine coverage of some key results from 'The Times of Their Lives' with comparative studies from North America.

[349] Symposium - RECENT ADVANCES IN THE SETTLEMENT AND LANDSCAPE ARCHAEOLOGY OF (SOUTH)WEST CHINA AND SOUTHEAST ASIA PART II: THE MICRO PERSPECTIVE OF INTERNAL SETTLEMENT ORGANIZATION AND OBJECT PRODUCTION

Since the beginnings of archaeological research in Southwest China and Southeast Asia, the focus has largely been on burial material. Whereas the burial customs, personal decoration, and weapon and tool assemblages that accompanied the deceased are by now fairly well known, the world of the living is far less well explored. During the last few years, however, there has been increasing interest in the settlement archaeology of the region, ranging from smaller-scale investigations of sites, to a broader landscape approach. A considerable number of field projects throughout Southwest China and Southeast Asia have greatly advanced our understanding of the daily lives of prehistoric and early historic inhabitants of the area. This session assembles papers that introduce some of the results of these research projects, providing an overview of our current knowledge in this field and pointing out new avenues of research. While the first part of the session takes on the macro perspective of large-scale spatial analysis and long-term developments,

this second part of the panel presents the micro perspective of settlement structure and object production.

[350] Symposium - ADVANCES IN WETLAND ARCHAEOLOGY IN THE AMERICAS

Over the last several decades, studies in Central and South America have demonstrated that numerous wetland areas were modified in the Pre-Columbian past, transforming marginal areas into highly productive agricultural land and profitable centers of aquaculture. Scholars emphasize the diversity of these complex hydrological features, which include raised, ditched, and drained fields, canals for transportation and drainage, as well as dams and pools for managing seasonal flooding and trapping fish. Scholars continue to debate the chronology and use of wetland features, the technology and organization of their production, the populations these environments were able to support, and the role(s) wetlands may have played in both local and regional economies in the past. In recent years, research has shown wetlands provide a rich repository of sediments, fauna, and plant remains that offer important proxies for gauging climate change, such as drought, and for understanding human-environment interactions and adaptive responses to stress in pre-Hispanic times. In addition, our understanding of the nature and aerial extent of these features has improved through more advanced aerial survey and mapping techniques, including satellite imagery, unmanned aerial vehicles, and other spatial technologies. These and other advances in wetland research in the Americas are presented here.

[351] Symposium - RESILIENCE, SUSTAINABILITY AND COLLAPSE IN THE NORTH ATLANTIC

The North Atlantic has become recognized as a key research area in the circumpolar north. Long term Human Ecodynamics in the North Atlantic islands affected by human settlement impact, climate change, and early globalization and culture contact have become classic cases of resilience and collapse in the archaeology of global change literature. International, interdisciplinary collaboration coordinated by the North Atlantic Biocultural Organization (NABO, www.nabohome.org) during the International Polar Year (2007-11) and the NSF funded Comparative Island Ecodynamics Project (2012-15) has supported extensive new fieldwork across the region and innovative combinations of archaeology, documentary sources, high resolution multi-proxy climate reconstruction, modeling and data management initiatives are producing new insights. This session presents this new research from the Faroes, Orkney, Iceland and Greenland that report on new understanding of processes of Viking Age settlement, cases of both sustainable and ultimately unsustainable management of natural resources, impacts of sudden climate change after the Lombok eruption of 1257 with onset of summer sea ice ca. 1275-1300, the effects of growing trade and proto-world system impacts on local communities, and the integration of archaeology with use of heritage for place based sustainability education.

[352] Symposium - ROCK ART RESEARCH: A REGIONAL ANALYSIS

(SPONSORED BY SAA ROCK ART INTEREST GROUP)

Rock art research in the Americas has a long history. Thousands of rock art sites have been discovered and formally recorded and within these sites are countless images. The purpose of this symposium is to place rock art within a geographic and cultural framework. Various kinds or related information may be employed to help differentiate the rock art of one region from another, including rock art character and structure, comparative and historic linguistics, ethnography, ethno-history, population genetics, prehistoric cultural materials, and traditional knowledge. A combination of such data sets may be used to posit ethnic identities, population movements and cultural patterns. Through such efforts, these studies can illuminate meaning and function that captures salient cognitive and ideological elements of Native cultures and furthers rock art research.

[353] Symposium - METHODOLOGY AND INTERPRETATION IN THE ARCHAEOLOGY OF ROCK ART:

(SPONSORED BY ROCK ART INTEREST GROUP)

In the pursuit of innovative instrumental technique, enhanced interpretive insight, and successful approaches to preservation, this Rock Art Interest Group sponsored symposium is intended to provide a context within which recent archaeologically informed rock art research can be shared. Additionally, RAIG has invited papers focusing on (1) methodologies for the long term (100 years plus) management and storage of the "big data" sets (>50 GB) now common to rock art research and (2) the unique problems attendant to conserving and accessing digital visual archives on a similar multigenerational basis.

[354] Symposium - ITS ABOUT TIME: CONTRIBUTIONS IN HONOR OF THOMAS C. WINDES

Thomas C. Windes has been a prominent archaeologist in the American Southwest for the past forty years. He has produced seminal works on the prehistory of Chaco Canyon and has devoted immense amounts of time and energy to dendrochronological research from northern Mexico to southern Utah. But perhaps most important, he has been a generous and influential mentor to young archaeologists. This symposium recognizes Tom's achievements and acknowledges the profound impact that he has had on the development of a generation of professional archaeologists.

[355] Symposium - CAVES, SINKHOLES AND CHULTUNS: NEW EVIDENCE FOR THE IMPORTANCE OF EARTH OPENINGS IN ANCIENT MESOAMERICA RELIGION

When Mesoamerican cave archaeology began to take shape in the 1980s and 1990s an early consensus formed around using the term "cave" in the sense of the Maya word *ch'e'en* which indicates not simply a cave but also a large number of other holes that penetrate the earth. Additionally, indigenous peoples show far less concern for whether the hole is of a natural or human origin. Recent research continues to demonstrate that traditional caves are important landmarks in the landscape but, additionally, archaeologists have begun to show that many more features were marked by ancient peoples as having sacred significance. This session brings together fresh perspectives on the subject.

[356] Symposium - BUILDING THE HUNTER-GATHERER'S PALEOSCAPE ON THE SOUTH AFRICAN COAST: THE ARCHAEOLOGICAL RECORD

In this symposium, we present archaeological research from the Cape Floral Region (CFR) and other localities relevant to assessing the strength of the paleoscape model and contributing to a record important to understanding modern human origins. Traditional paleoanthropological approaches to paleoenvironmental data seek to increase the resolution of both records in order to show meaningful correlations. Although heuristically useful, these strategies typically fail to illuminate causal relationships because they lack connective theory. To build that connective theory we need to 1) understand the links between our paleoenvironmental proxies and the distribution of resources relevant to foragers 2) construct "paleoscape" models of the distribution of those resources under different climate conditions, 3) simulate forager actions and decisions in those paleoscapes, and 4) compare the model output to empirical archaeological observations. The CFR, a floristically hyper-diverse ecosystem bordered by a super-rich coastal zone presents a useful laboratory for the development and testing of paleoscape models. Our project is a large international consortium exploring the co-evolution of people and ecosystems by creating paleoscape models of the CFR, simulating how hunter-gatherers utilized this changing ecosystem, and testing these models with high resolution paleoenvironmental and archaeological data. Here we focus on the archaeological evidence.

[357] Poster Session - PEOPLING OF THE NEW WORLD AND ARCHAEOLOGY OF PALEOINDIANS**[358] Poster Session - ARCHAEOOMETRY IN THE WESTERN AND SOUTHWESTERN UNITED STATES****[359] Poster Session - PREHISTORY OF THE MIDWESTERN UNITED STATES****[360] Poster Session - ARCHAEOLOGY OF THE NORTHWEST COAST, ALASKA, AND THE ARTIC****[361] Poster Session - PLAINS ARCHAEOLOGY****[362] Poster Session - PREHISTORIC ARCHAEOLOGY IN THE INTERMOUNTAIN WEST****[363] Poster Session - CULTURAL RESOURCE MANAGEMENT ON MILITARY LAND**

This poster symposium will highlight archaeological sites on military land and the fieldwork that has been conducted on these lands. The Department of Defense manages over 21 million acres of land and in turn, 110,000 formally recorded archaeological sites. These agencies and individual installations must comply with all federal regulations concerning our nation's heritage and resources. Archaeological sites located on military lands range from the precontact of 13,000 years ago to historic sites of 50 years, and they all have

significance in our nation's heritage and military history. These sites must be managed in accordance with federal regulations which are essential in the field of cultural resource management, while not hindering the mission and training of our United States soldiers. The posters in this session will seek to highlight the types of archaeological sites found on military lands, fieldwork that has been conducted, and the obstacles that cultural resource professionals face when managing our country's historic resources while maintaining the mission of the United States military.

[364] Poster Session - RECENT ARCHAEOLOGICAL RESEARCH IN PETRIFIED FOREST NATIONAL PARK

Petrified Forest National park has been the subject of archaeological research for well over 100 years. In 2004 Congress authorized a boundary expansion, effectively doubling the protected land in Petrified Forest National Park. As these lands are slowly being purchased and added to the park, a three year project began in 2013 to inventory cultural resources. The results of the first two seasons of survey and recording work have found a stunning density and diversity of archaeological remains. Archaeological sites spanning the last 10,000 years of human occupation have been identified and recorded, including most notably extensive preceramic sites and lithic landscapes, large Basketmaker villages, and a densely settled Puebloan landscape. The National Park Service has taken this opportunity to use the boundary expansion project as a teaching laboratory and platform for future investigation, incorporating student interns and researchers into the project. This session presents an update of the recent archaeology completed in Petrified Forest, and highlights some of the independent student research projects.

[365] Poster Session - NEGOTIATING MIGRATION AND VIOLENCE IN THE PRE-COLUMBIAN MID-CONTINENT

A remarkable level of indigenous violence consisting of prolonged, intermittent, small-scale warfare documented at the Norris Farms 36 cemetery in Fulton County, Illinois impacts perspectives on relative levels of violence in the Mid-continent of North America. Understanding the larger social context for violence in the Norris Farms Oneota skeletal population and the attributed social stress has been the over-arching goal guiding research and excavation at the associated Morton Village for the past seven years. Building on prior research in the cemetery and village, current work positions the issue of social context within a migration framework. At A.D. 1300 there is clear evidence that a small group of Oneota migrated into the Central Illinois River Valley encountering a resident Middle Mississippian population. It is also clear that the migrants were engaged in a significant level of conflict. What is not clear is how migrant and resident populations negotiated their new, post-migration situation. New evidence points to co-habitation of the village site and ensuing cultural changes for both groups. Posters in this symposium present different lines of evidence addressing the negotiation of space and material culture to assess post-migration interaction thereby informing the particular social context for violence.

[366] Symposium - COMMUNITY DIVERSITY IN THE ARCHAEOLOGICAL PAST AND THE COMPLICATED PRESENT: ONGOING FIELD RESEARCH AND CIVIC ENGAGEMENTS IN THE COPAN VALLEY, HONDURAS

From its earliest days, the archaeology of Copan demonstrated clear evidence for the diversity of its population, who immigrated to the Copan Valley from different regions. The record is further complicated by great variation in the locations and longevity of the different immigrants' habitation areas. Ongoing programs of archaeological field research and community engagement have embraced this diversity in the archaeological past, and the complexity and contested nature of identity, claims to heritage, and economic interests among the diverse contemporary communities and stakeholders in the Copan Valley, the country of Honduras, and the "Mundo Maya." This session will highlight the ancient communities presently under active investigation in the Valley, and the varying theoretical approaches and research priorities of these active programs of fieldwork. The variation in goals and engagement with different sectors of the living population will also be explored, through discussions of present practice. As a World Heritage Site, Copan is home to new and innovative approaches to heritage management, to address the challenges and controversies that this complex set of communities has generated in the past and the present in the Copan Valley, in Honduras, and in the professional archaeological community.

[367] Symposium - CURRENT PERSPECTIVES IN ECUADORIAN ARCHAEOLOGY

Ecuador is experiencing a period of growth and increasing professionalization in the field of archaeology. Government investments for archaeological surveys have led to the identification of new sites, and new training programs provide Ecuadorians with the necessary training for the profession. The papers in this session represent current work in Ecuador that are part of this burgeoning wave of research. The papers collectively transcend temporal and spatial boundaries. Research spans from the Formative through the Colonial Periods, and includes work from the coast and the highlands. Papers also address ethical issues and the cultural context of archaeological practice in Ecuador. By transcending these boundaries, this session builds on six decades of research into the cultures of Ecuador and provides new directions for future study.

[368] General Session - ARCHAEOLOGY OF THE MEDITERRANEAN REGION AND ROMAN WORLD**[369] Forum - A MODEL FOR SUCCESS IN REPATRIATION: A COLLABORATIVE PROCESS BETWEEN THE STATE OF COLORADO AND AMERICAN INDIAN TRIBES**

Since the 1970s, the State of Colorado has worked collaboratively with Native peoples toward the repatriation of their ancestors. The process has been refined over the decades in response to implementation and changes in State and federal laws. Many efforts have been tribally led with extensive consultation between the State and tribes with ancestral ties to Colorado. This forum will address the successes and challenges we have had. Participants from state agencies and tribes will share their perspectives and experiences which may help other states seeking resolution to similar issues.

[370] Symposium - THE HOYO NEGRO PROJECT: RECENT INVESTIGATIONS OF A SUBMERGED PALEOAMERICAN CAVE SITE IN QUINTANA ROO, MEXICO

The cenotes and underwater cave systems of the Yucatan Peninsula are emerging as one of the most promising frontiers for Paleoamerican studies. Following the end of the last glacial maximum, rising sea levels flooded the region's maze of underground passageways and preserved a diverse Late Pleistocene fossil assemblage. A relatively well preserved female human skeleton found in spatial association with the remains of now-extinct fauna in a submerged subterranean pit of Hoyo Negro presents a unique opportunity for interdisciplinary Paleoamerican and paleoenvironmental research in Quintana Roo, Mexico. The young woman's skeleton is the oldest, most complete yet found in the Americas. Investigations have thus far revealed a range of associated features and deposits, which make possible a multi-proxy approach to identifying and reconstructing the processes that have formed and transformed the site over millennia. Recent and ongoing studies involve osteological and taphonomic analyses; absolute dating of human, faunal, macrobotanical, and geological samples; human DNA analyses; and a consideration of site hydrogeology and sedimentological facies. Additionally, innovative recording and imaging techniques are enabling researchers to analyze deposits and their contexts with minimal impact to the site.

[371] General Session - CONTEXTS OF ARTIFACT PRODUCTION AND USE IN SOUTH AMERICAN ARCHAEOLOGY**[372] General Session - MORTUARY ARCHAEOLOGY****[373] General Session - DAILY LIFE, RITUAL, AND ETHNOBOTANY****[374] General Session - ORAL HISTORY AND ORAL TRADITION IN NATIVE NORTH AMERICA****[375] General Session - MAYA CERAMICS****[376] General Session - HOUSEHOLD ARCHAEOLOGY AND MULTISCALAR ANALYSIS IN MAYA REGION: ACTIVITY AREAS, RITUAL, PRODUCTION, AND DOMESTIC ECONOMIES**

[377] General Session · APPLICATIONS OF THEORY IN ARCHAEOLOGICAL ANALYSES**[378] General Session · ARCHAEOLOGIES OF SOCIAL IDENTITY AND SOCIAL INTERACTIONS IN SOUTH AMERICA****[379] General Session · CERAMIC ANALYSIS****[380] General Session · BIOARCHAEOLOGY OF THE ANCIENT NEAR EAST****[381] General Session · ARCHAEOLOGY OF HISTORIC INDUSTRIAL FEATURES, LABOR RELATIONS, AND MILITARY INSTALLATIONS****[382] General Session · CHACOAN ARCHAEOLOGY****[383] General Session · CALIFORNIA ARCHAEOLOGY - LITHIC STUDIES****[384] General Session · BIOARCHAEOLOGY IN SOUTH AMERICA****[385] General Session · EDUCATION AND PEDAGOGY IN THE CLASSROOM AND FIELD****[386] General Session · DESERT AND HIGH ELEVATION ADAPTATION IN THE AMERICAN WEST****[387] General Session · PREHISTORY OF THE CARIBBEAN****[388] Symposium · CEREMONIAL ARCHITECTURE IN EASTERN POLYNESIA: DEVELOPMENT & VARIABILITY**

Ancient monumental remains in Eastern Polynesia include many types of structures. Among the most visually impressive category is the so-called “marae complex”: the defining element of traditional ceremonial sites. Despite an apparent cultural homogeneity within the Polynesian area, archaeological studies—as well as ethnohistorical accounts—have demonstrated considerable regional and local variation in the architecture of marae. Patterns have emerged, including a recurrence of several fundamental features, but the marae monuments have evolved unique regional characteristics (marae in central East Polynesia and New Zealand, heiau in Hawaii, ahu on Easter Island). This differentiation has traditionally been attributed to both internal and external factors, but can also be explained through an adaptation to specific, localized ritual and socio-political functions. Sessions contributions will explore various topics, including the appearance and chronology of the sites, their architectural diversity and subsequent interpretations, the functions and specializations of their structures, their place within a larger settlement pattern, etc. Regional and archipelago scale syntheses are encouraged. We are also accepting contributions related to other components of ceremonial sites, such as stone sculptures, petroglyphs etc.

[389] General Session · LITHICS IN THE PALEOLITHIC**[390] Forum · SITE STEWARDSHIP ALLIANCE: BUILDING THE FUTURE OF ARCHAEOLOGICAL SITE STEWARDSHIP PROGRAMS**

Over the last fifteen years, many states have established archaeological site stewardship programs in response to the increasing damage or destruction of cultural resources. Across the states, these programs are often organized differently due to the needs of their managing agency, the local community, and the particular resources that they steward. However, they all face many of the same challenges. This forum will bring together program coordinators from five different western states to discuss topics that are important to the longevity of cultural site stewardship programs. These topics include funding, information management,

and organizational structure. A preliminary survey of these topics will be conducted and the results will provide the focus of this forum discussion. Overall this survey and forum discussion will assist in building the framework for a National Site Stewardship Alliance by identifying parts of the programs that could most benefit through collaboration.

[391] General Session - ARCHAEOLOGIES OF TRADE AND CULTURAL INTERACTIONS

[392] General Session - THE PRACTICES AND PRODUCTS OF CULTURAL RESOURCE MANAGEMENT IN CALIFORNIA

[393] General Session - CONQUEST AND COLONIALISM IN MESOAMERICA AND SOUTH AMERICA

[394] General Session - GLOBAL HISTORICAL AND CONTEMPORARY ARCHAEOLOGIES

[395] Symposium - MAGDALENIAN SOCIAL GEOGRAPHIES IN WESTERN EUROPE

Known for its widespread and impressive art, the Magdalenian had been studied for over a century and a half. Extensive research on the period has provided us with a very comprehensive archaeological record, which still provides information on prehistoric hunter-gatherers' lifestyle, set in different environments. The objective of this symposium is to present current research on hunter-gatherers' social behavior, and inter- and intra-regional interactions in the context of the late glacial Upper Paleolithic Europe, and thus, to summarize our current knowledge of this important archaeological period. The presentations, encompassing research done via computational modeling, GIS, empirical studies, and experimental archaeology, will combine multi-disciplinary viewpoints into one comprehensive overview of the Magdalenian.

[396] General Session - ARCHAEOLOGY OF THE PALEOLITHIC

[397] General Session - ZOOARCHAEOLOGY AND SITE INTERPRETATION

[398] Symposium - THE IMPERIAL CRAFT: COMPARATIVE PERSPECTIVES ON PRODUCTION AND SOCIETY IN EMPIRES

While craft production has always been part of the discussion about the nature of empires, recent work pushes the debate in new directions. Current research emphasizes the agency of craft producers as influential in the development of overarching systems. Such research identifies variation in production technologies and labor practices. In refocusing our attention on the dynamic role of producers, previously held beliefs about the relationship between craft production and the state have been overturned. The symposium aims to create a dialogue between scholars working in different parts of the world on the intersection between craft and empire. A comparative perspective will privilege different strategies, techniques, technologies, and social practices, while advancing new perspectives on the production of empires. The diversity of the scholars committed to giving papers that span disciplinary, theoretical, chronological, and geographical, divides, will generate unique combinations of data and lead to new lines of investigation. Although seemingly divergent, these perspectives draw attention to the critical role played by materials and by production processes in imperial contexts. The session engages the issues of craft production and its relationship with political authority, the economy of states, and the role of material culture in the negotiation of power relations.

[399] Symposium - THE EXPLOITATION OF LIMESTONE IN ANCIENT MESOAMERICA

Limestone was a key resource for daily life throughout much of ancient Mesoamerica where it was used for a variety of purposes including construction, hygiene, and diet among others. This session brings together archaeologists and archaeometrists investigating different aspects of ancient limestone exploitation throughout Mesoamerica to shed light on current research concerning: 1) limestone quarrying; 2) construction technology and methods; 3) the processing of limestone into lime powder (or cal); 4) the multiple uses and functions of lime powder; and 5) the social and economic implications of the ancient limestone exploitation industry. A combination of papers spanning a wide range of technical and theoretical backgrounds will foster conversation and debate concerning the study of this crucial material resource.

[400] Symposium · ANARCHY AND ARCHAEOLOGY: CONTESTING HIERARCHY, POWER, AND AUTHORITY IN THE PAST AND TODAY

Archaeological conceptions of power, authority, and inequality have been undergoing significant changes in the last few decades, both in terms of how the discipline conducts itself as well as in how archaeologists interpret their study matter. To the level that researchers strive to create more balanced relationships with collaborators, develop openness to alternative ontologies, and investigate the active nature of egalitarian social systems, many in the discipline are turning towards policies, methods, and interpretations that emphasize decentralized leadership and more balanced social relations. This session questions whether the application of Anarchist Theory, a growing field of inquiry with deep historical roots, can be beneficially applied to both the interpretation of past cultures and how archaeologists apply our research within a wider political world. In the past, archaeologists rarely engaged with Anarchist Theory, although aspects of anarchism, such as the concern over alienation from decision-making and the need to constantly combat incipient power centralization, permeate the archaeological literature. Papers within this session will explore the ways in which a more explicit engagement with Anarchist Theory can open new avenues of research, inform novel interpretations, or affect relations with collaborators and other invested parties.

[401] General Session · NEOLITHIC AND CHALCOLITHIC ARCHAEOLOGY IN THE ANCIENT NEAR EAST

[402] General Session · STUDIES OF TECHNOLOGY, ECOLOGY, AND CRAFT PRODUCTION IN SOUTH, CENTRAL, AND WESTERN ASIA.

[403] Symposium · DIETARY BIOGRAPHIES: CHRONICLING PAST HUSBANDRY, MOBILITY, AND EXCHANGE PRACTICES THROUGH ISOTOPIC ANALYSIS OF PLANT AND ANIMAL TISSUES

The tissues of animal and plant remains recovered from modern and archaeological contexts provide a deep record of detailed dietary and environmental information that can be unlocked with stable isotope analysis. This session brings together advances in our understanding of the properties of mineralized, proteinaceous, and carbonized tissues and the distribution of carbon, nitrogen, oxygen and strontium isotopes in natural biomes to reconstruct individual dietary and mobility histories of animals and humans. The ways in which humans intentionally manipulate their plant and animal resources through management and exchange, and establishing the isotopic outcomes of these activities, is integral to documenting social and economic dynamics in ancient societies.

[404] Symposium · RECENT RESEARCH AND A CHRONOLOGICAL REEVALUATION OF THE VIRU-MOCHE-CHICAMA VALLEYS

The Viru, Moche, and Chicama Valleys, on the north coast of Peru, are home to many pioneering studies of Andean prehistory and Peruvian archaeology, including the work of Rafael Larco, the Viru Valley Project and the Chan Chan/Moche Valley Project. As the focus of some of the most significant fieldwork to be carried out in the Andes, these three valleys remain the focus of many ongoing archaeological projects. This symposium is an opportunity to present recent research, contributing to a chronological reevaluation of the prehistory of the Viru, Moche, and Chicama valleys. Session participants will present data from their recent research from one or more of the three valleys and explain how this data impacts previous interpretations or ideas about culture periods and our understanding of the prehistory of the region. This session will enable presenters to introduce their new perspectives and research agendas for one of the most traditional areas of Andean

Archaeology.

[405] Symposium - MANAGING ARCHAEOLOGICAL HERITAGE IN THE 21ST CENTURY

Archaeology has long been an important component of heritage management throughout the world. Iconic as well as mundane heritage sites have employed archaeology to celebrate and honor the past. As community archaeology has expanded over the past decade to involve various stakeholders who have a vested interest in the material remains of the past, it has become incumbent upon archaeologists to partner with others to manage archaeological resources in the interests of broad and varied constituencies. There is a global challenge to archaeological heritage management as a top-down endeavor in which archaeologists are seen as the arbiters in deciding which sites matter and to whom, which sites to preserve, and why and how. This symposium will showcase effective ways to manage archaeological heritage in collaboration with public partners by showcasing best practices, successes, and challenges to guide the archaeological enterprise in the 21st century.

[406] Symposium - "BONES ARE NOT ENOUGH": RESEARCH IN HONOR OF DIANE GIFFORD-GONZALEZ

Diane Gifford-Gonzalez was one of a generation of scholars who transformed basic faunal identification into the modern sub-discipline of zooarchaeology. In so doing she helped revolutionize our understanding of past human diets, the origins and implications of food production, and historical human ecology. Her research has focused on a number of different critical times and places in the global human experience, from Holocene adaptations in Africa and the Pacific Rim to Native responses to colonialism in the American Southwest. Gifford-Gonzalez has also made significant contributions to studies of archaeological epistemology and the role of actualistic research in archaeological reasoning. While her work is always technically rigorous and she has enthusiastically embraced new techniques and methodologies, such as isotope analysis and DNA studies, Gifford-Gonzalez' research has also explored the cultural and ideological significance of human-animal interactions. Drawing on her experience as a poet and novelist, she has been able to bridge humanistic and scientific approaches in archaeology with skill and creativity. But most importantly, Gifford-Gonzalez is a beloved teacher and mentor. The papers presented in this symposium highlight the influence of Gifford-Gonzalez' scholarship on the on-going research of several generations of her students and colleagues.

[407] Symposium - ENVIRONMENTAL ARCHAEOLOGICAL APPROACHES IN SOUTHEAST ASIA

The aim of this session is to report on recent environmental archaeological approaches to understanding human behavioral adaptations in Southeast Asia (mainland and island). We aim to survey the various ways that environmental conditions affected hunter-gatherer and agricultural societies throughout the late-Pleistocene and Holocene. Paper topics of this session may include research of subsistence regimes, technological change and/or development, forager efficiency, paleoecology, transition into agriculture, or any relevant research involving these themes. We welcome novel research, papers involving meta-analysis, or historical reviews.

[408] Symposium - THE MIRADOR BASIN: NEW INVESTIGATIONS AND CONSERVATION PROGRAMS

(SPONSORED BY FOUNDATION FOR ANTHROPOLOGICAL RESEARCH & ENVIRONMENTAL STUDIES (FARES); UNIVERSITY OF UTAH)

Major research programs in the Mirador Basin of northern Guatemala and southern Campeche, Mexico, have provided new data relevant to the origins, dynamics, and collapse of complex societies in the Maya Lowlands. Data suggests that the origins of sedentary societies began earlier than previously thought, and that the dynamics of complexity included complex agricultural sophistication, elaborate communication and trade systems, logistics development, and vast political, economic, and social dominance within the circumscribed region primarily in the Middle and Late Preclassic periods of Maya civilization. Furthermore, the factors that gave rise to socio-political complexity were damaged by a multitude of issues, including

climate change, inept leadership, and a conspicuous consumption of resources resulting in the collapse of the major centers of the Basin near the end of the Late Preclassic period (ca. A.D. 150). Research has demonstrated the roles and activities of subsequent inhabitants in the monumental sites within the Basin and clarified the settlement distribution and formation of Maya societies living within the ruins of the ancient Kan kingdom. New conservation strategies for art and architecture at several major sites within the Basin have also provided protective measures and consolidation practices that have proven useful and productive.

[409] Symposium · ARCHAEOLOGICAL APPLICATIONS OF UNMANNED AERIAL SYSTEMS (DRONES)

An emergent technology rapidly finding a niche in the archaeological toolbox is the Unmanned Aerial System (UAS), used as a platform to record and manage archaeological excavations and surveys. The falling prices of commercial UAS with high resolution passive sensors have made this flexible and portable equipment accessible to many archaeological projects. Advances in software have also made it possible to run many complex photogrammetric processes on personal computers at low cost and high efficiency. Archaeological projects can now produce accurate Digital Terrain Models, Digital Surface Models, high resolution ortho-photos and 3D models of archaeological sites close to real time. This session offers examples of UAS in action in a variety of field projects worldwide, as well as reviews of technological and software capabilities, implementation strategies, and the current state of FAA regulations.

[410] Symposium · THE BIOARCHAEOLOGY OF OAXACA: TALKING WITH THE DEAD FROM SOUTHERN MEXICO

Bioarchaeological research has become one of the main subdisciplines in both archaeology or in biological anthropology that has contributed to the information of ancient society through the study of human remains. Bioarchaeological research has focused on both individuals (osteobiographies) and populations. From its origin, bioarchaeology has positioned itself in diverse topics such as gender, identity, violence, ethnicity in different geographic areas. The main aim of this symposium is to put together diverse topics from bioarchaeological specialists who have been working in the area of Oaxaca, Southern México, among groups such as the Zapotecs, Mixtecs and the Chontal people. This symposium is the first academic forum either in the US, Mexico, or in other countries to bring together a diverse array of Mexican and foreign researchers to present, share, discuss and enrich the bioarchaeology of Oaxaca.

[411] Symposium · ITINERANT MATTERS AND HYBRID OBJECTS: RESEARCH ON MATERIAL TRANSFERS AND CONTACT PRODUCTS

Anthropological archaeology has moved beyond defining cultural geographical boundaries. Instead we understand the fluidity of territories and identities within and between geographic regions. The crossing of boundaries is often documented first through evidence of foreign products, foreign raw materials and foreign styles or practices. Another line of evidence for tracing boundaries and boundary crossings is hybrid styles or technologies. This session aims to bring together scholars spanning geographic, material and methodological specialties to discuss research on tracking and understanding the effects of interactions between different cultural or environmental worlds. The session participants will discuss transfers of knowledge, styles, technology, raw materials or material culture with a particular focus on the evidence and methods for recovering and interpreting this evidence for transregional and interregional interaction and the broader socio-cultural effects. Topics to be presented include evidence of transfer of raw materials beyond the expected ethnohistorically documented range; emerging and growing evidence of itinerant craftspeople who cross borders; interregional contacts reflected in hybrid ceramic styles or technologies; evidence of different modes of trade and how these are documented in the archaeological record and the evidence of the effects and role such transfers of materials, styles and knowledge played in the past.

[412] Symposium - EXOTIC, LUSTROUS, AND COLORFUL: OBSIDIAN IN SYMBOL, SOCIETY, AND CEREMONY*(SPONSORED BY INTERNATIONAL ASSOCIATION FOR OBSIDIAN STUDIES)*

The long distance movement of obsidian in many parts of the world is well documented in the archaeological science literature, but few scholars have seriously considered why this particular raw material was so popular in the past. Although its physical properties, particularly excellent conchoidal fracturing and extremely sharp cutting edges, must have played a role, the widespread popularity and variety of uses for obsidian demand additional explanations. The papers in this session will explore a broad range of factors, such as performance, symbolism, ritual, and exchange value, that significantly extend our understanding of the role of this black, shiny rock within past societies.

[413] Symposium - PORTS, TRAILS, AND WATERWAYS: TRADE AND ECONOMY IN THE ANCIENT MAYA WORLD

The role and importance of ports in the ancient Maya world has long been an object of study. However, for decades the principal focus was the nature and role of Caribbean and Gulf ports, particularly during the Terminal Classic and Postclassic periods. Recent investigations indicate a critical role for inland river and lake ports in the integration of Maya economies as well. In addition, current evidence demonstrates the significance of ports in exchange systems in Preclassic and Classic period economies. The importance of river and sea ports and transport routes can be seen in the historical patterns of war and alliance – in which ports and their routes were principal targets for conquest and alliances. This session brings together researchers from North America and Latin America to share results of investigations of Maya ports from coasts and rivers, and from all periods. The participants explore and evaluate the nature and dynamics of ports as critical nodes in ancient Maya political economy. Those dynamics were central to the Classic period apogee, were critical in the “collapse” and/or Terminal Classic transition, and were a dominant characteristic of the Postclassic recovery and florescence.

[414] Symposium - NEW PERSPECTIVES ON AGRICULTURAL ORIGINS*(SPONSORED BY ARCHAEOLOGICAL SCIENCE PROGRAMS, THE AUSTRALIAN NATIONAL UNIVERSITY; COMPARATIVE PATHWAYS TO AGRICUL)*

The niche constructing activities of humans are revealed quintessentially in agricultural origins, in which numerous species of plants and animals evolved into a domesticated category while human societies and demographics adapted to these new domesticatory relationships. The expansion of archaeological evidence, from many more regions of the world and through improved methodologies of archaeobotanical and faunal investigation, now offer an enriched basis for comparing and contrasting the pathways towards domestication and the transition to agricultural economies. The diversity of regional datasets raises new questions of ‘how’ and ‘why’ agriculture emerged in certain places at certain times, as well as providing a basis for the interrogation of different explanatory frameworks proposed to address these questions. The present session brings together studies from across the globe drawing on new data, new approaches to analysis and new explanatory frameworks to assess how far we have come in understanding agricultural origins and the priorities for further research.

[415] Symposium - CELEBRATING THE 100TH ANNIVERSARY OF THE DEATH OF PRIMITIVE ECONOMIC MAN: NUTRITIONAL ARCHAEOLOGY FOR THE 21ST CENTURY

In 1915, E. V. McCollum and Marguerite Davis published a seminal paper on the nutritional requirements of mammals under the unassuming title “The Nature of the Dietary Deficiencies of Rice.” This paper marked a turning point in the study of nutrition and demography. McCollum and Davis demonstrated that proper mammalian development and growth was not based solely on the quantity and variety of macronutrients, particularly proteins. Instead, mammalian nutrition required non-energy producing micronutrients that McCollum and Davis called “accessory substances.” This marked the beginning of a scientific push to isolate and understand these nutrients that would later be called “vitamines” in the 1920’s. McCollum and Davis (1915) can also be seen as marking the death of Primitive Economic Man (PEM), a paradigm based on the

premise that energy (or wealth) alone determines the outcome of human demographic trends, whether through Darwinian selection or capitalist markets. Although PEM died a century ago, his ghost continues to haunt archaeology. This symposium brings together an eclectic group of papers that utilize modern principles of nutritional ecology to understand ancient human nutritional challenges, including the consequences of specific diets to the health of individuals and cultures, and how these diets may have influenced demographic trends.

[416] Symposium · SPANISH TO THE SILICON: THE DIVERSITY OF SAN FRANCISCO HISTORICAL ARCHAEOLOGY

San Francisco, as the one of the oldest cities on the West Coast, has a multifarious economic and cultural history that encompasses an array of eras from its origins as a Spanish outpost beginning in the 18th century, through Mexican rule in the early-19th century, and United States statehood in the mid-19th century. The papers in this session will focus on the geographical area of the San Francisco peninsula and will feature a variety of topics that touch upon the cultural and social history of the city. The papers will discuss how historic archaeology has contributed to a more complete understanding of the lives of the many people who contributed to the city's continuing culture of diversity and progress.

[417] General Session · ARCHAEOLOGY OF THE BRONZE AGE

[418] General Session · ISSUES OF HERITAGE, ETHICS, INFORMATION DISSEMINATION, AND ARCHAEOLOGICAL PRACTICE

THE ANNUAL MEETING of the Society for American Archaeology provides a forum for the dissemination of knowledge and discussion. The views expressed at the sessions are solely those of the speakers and the society does not endorse, organizers, not the society.

Abatis, Stamos (Stamos Abatis Photography)

[14] *Perpetually on the Move from the Lowlands to the Highlands in Northern Greece*

"On the move" is a pan-Mediterranean project on transhumance implemented by the Mediterranean Consortium on Nature and Culture. As part of this project, I have produced a documentary that illustrates the life and experiences of transhumant pastoralists in Northern Pindos, Greece. The seasonal movement of these people with their flocks from the valleys to the alpine meadows of Pindos, although a practice currently in decline, has for centuries been the backbone of the economy of Greece and many other Balkan countries. Nomadic pastoralists not only provided the populations of Greece and the Balkans with milk, cheese, wool and textiles but also kept the mountainous areas alive both culturally and ecologically. Their routes have functioned as ecological and cultural corridors connecting the cities and towns of the lowlands with the most remote peaks of Pindos. This previously unscreened video seeks to shed light onto issues of connectivity and the complexities emerging from the cultural interactions of the people of the highlands with those in the lowlands. It also hopes to challenge long-held cultural and social prejudices about transhumant groups and individuals.

[101] *Beads, Bangles, and Glass: Historical and Ethnographic Insights into Glass Working in South India*

The contemporary glass bead making village of Papanaidupet in southern Andhra Pradesh has long served as the ethnographic model for understanding ancient South Indian glass working. Recent surveys, conducted as part of the project Production Landscapes of Southern Andhra Pradesh (PLoSAP), have yielded new data about contemporary and recent glass working in this region of south India. These data include a modern glass bangle making community with production links to Papanaidupet as well as an as-yet undocumented archaeological glass working site. A detailed exploration of the materials and processes at these sites will help archaeologists reconstruct early glass technologies in southern India.

[363] *"Left Behind": The Transition of a Farming Community into Camp Atterbury*

On 6 January 1942, the United States Army announced that it would build a 40,000 acre training camp in rural central Indiana. The residents of the farming community were given less than six months before they were displaced from their ancestral land for the construction of the camp. Once gone, several hundred vacated farmsteads were left behind. These farmsteads were demolished and

would in 50 years become archaeological sites. This poster will highlight some of the historic archaeological sites found within the boundaries of Camp Atterbury, archaeological fieldwork conducted, and the best management and compliance practices of the cultural resource program in regards to the historic history of Camp Atterbury.

[180] *Post-A.D. 1600 Origins of the Ifugao Rice Terraces: Highland Responses to Spanish Colonial Aims in the Philippines*

Local wisdom and nationalist sentiments would have us uphold the long-held belief in the age of the Ifugao Rice Terraces, pegged at ca. 2,000 years old. Recent findings by the Ifugao Archaeological Project (IAP), however, indicate that landscape modification (terraced wet-rice cultivation) intensified between ca. A.D. 1600 and A.D. 1800, suggesting increased demand for food, which could indicate population growth, a period that coincided with the arrival and subsequent occupation of the Spanish of the northern Philippines. This period also shows increased social differentiation and apparent elite manipulation to maintain their position in the society. It is argued that, although the Spanish colonial government never controlled the interior of the Philippine Cordillera, the economic and political transformations in the region were drastic and this was likely due to the Spanish presence in the lowlands. This presentation focuses on the impacts of colonialism on the development of agricultural terraces in the northern highland Philippines.

Acebo, Nathan (Stanford University)

[128] *Borderlands, Continuances and Violence: A Social Nexus at Black Star Canyon, San Juan Capistrano California*

Post European contact the historicity of the Santa Ana Mountain landscape of Orange County, California has been popularly constructed around the narratives of bucolic mission and ranch life, and that of the "wild frontier." The interplay between both histories has contributed to a memorialization of the Santa Ana Mountains as a borderland space during the Spanish, Mexican and American colonial eras that deemphasizes indigenous social life. This paper seeks to complicate the historical concept of a colonial borderland by exploring ways in which the mountain space enabled or disabled local and non-local indigenous practices of social and economic subversion. Lastly, this paper discusses the author's ongoing collaborative research on identifying multicomponent "runaway" sites, and indigenous movement through archaeological survey and the integration of oral history.

[411] *Alfarería en las fronteras de La Quebrada de Humahuaca, Jujuy, Argentina (Ceramics at the borders of the Humahuaca Quebrada, Jujuy Argentina)*

Los materiales cerámicos arqueológicos policromos denominados "vírgulas o comas" tienen una amplia pero desigual distribución espacial y son hallados en cantidades limitadas en sitios arqueológicos de las regiones de Puna central y Quebrada de Humahuaca, Jujuy, Noroeste de la República Argentina.

Estas regiones mantienen límites ambientales y geográficos fronterizos. En el pasado los habitantes de ambas zonas sostenían una fluida comunicación, manteniendo formas identitarias diferentes entre el "Ser Quebradeño" y el "Ser Puneño". Estas vasijas han transitado las dos regiones desde el 900 d.C hasta el postcontacto con el español. Lo que nos ha conducido a reflexionar sobre la circulación de piezas cerámicas entre fronteras con importante uso y consumo ritual y/o ceremonial.

En este trabajo se presentan los resultados del análisis sobre la caracterización de diseños y pastas de piezas y fragmentos de cerámica de sitios de la región de Puna y de Quebrada de Humahuaca,

Jujuy. La aplicación combinada de técnicas arqueométricas con las cuales se estudiaron los materiales permitió reconocer las dinámicas fronterizas dadas en el pasado entre poblaciones de la región del Noroeste de la Argentina. Las técnicas analíticas aplicadas fueron: microscopia óptica, espectroscopia Raman, DRX, análisis sobre cortes delgados, entre otras.

[141] *Early Agrarian Societies in the Basin of Mexico: Challenges and Perspectives*

Over the past three decades, there have been very few studies of the earliest agrarian communities in the Basin of Mexico in comparison with other periods. In this paper, we introduce the symposium with an evaluation of the state of knowledge concerning preceramic, archaic communities up to the Formative period in the Basin of Mexico, with particular emphasis on the dearth of information available concerning paleoenvironment and subsistence. We review some of the recent investigations in the region, especially in the context of "The Development of Agrarian Communities in the Basin of Mexico," and discuss the challenges and future perspectives for studies concerned with this period.

[244] *El Tintal in the Late Classic and Territorial Implications*

The archaeological site of El Tintal, known primarily as a large and important Late Preclassic ancient Maya city in northern Petén, Guatemala, also had a significant occupation during the Late Classic Period. Preliminary observations and an initial season of explorations at El Tintal indicate that this later occupation was quite substantial, yet unlike the southern lowland pattern of recording history on stone monuments, not a single carved stela that dates to the Classic Period has been identified at the site. In this presentation, I contextualize El Tintal in the Classic Period political geography and explore the reasons why a major center like El Tintal would deviate from what appears to be such a widespread and standard tradition among its regional neighbors. More importantly, what this means when we conceptualize ancient Maya territories and its implications for recognizing boundaries, political and otherwise, especially when considering its location between two competing polities, Tikal and Calakmul, that we know impacted so many other cities in the region of modern-day Petén.

Adams, Jenny (Desert Archaeology, Inc.)

[55] *Exploring Early Agricultural Technological Traditions at Las Capas with Experiments*

Experiments conducted in concert with the analysis of ground stone artifacts recovered from Las Capas, AZ AA:12:111, (ASM) explored important early agricultural activities including planting and harvesting maize, processing maize, and making stone and fired-clay pipes. Results from the experiments combined with models developed from ethnographic references created workable correlates for evaluating features and tools associated with these activities. Las Capas style fields were planted with two popcorn varieties, Chapalote and Reventador, and one flour variety of maize, Tohono O'odham 60-day. Maize ears were harvested when immature and mature, they were processed fresh, dried, and parched, and the stalks were juiced using replicas of the types of manos and metates recovered from Las Capas. Considering only the maize products, the Las Capas inhabitants had the necessary components for a varied and nutritious cuisine.

Descriptions of pipe manufacturing techniques in the archaeological and ethnographic literature of the U.S. Southwest are scarce. At Las Capas, pipes were made from stone and clay. Bifaces used to drill stone successfully replicated the marks on recovered whole and broken pipes. Clay was pressed

around wood molds in a successful attempt to replicate the types of fired-clay pipes recovered from Las Capas.

[127] *Quids with Wild Tobacco (Nicotiana) Flowering Stems Inside*

Unburned yucca (*Yucca*) quids with wild tobacco (*Nicotiana*) contents have preserved within Antelope Cave in northwestern Arizona. Although the cave was visited during the Archaic, Southern Paiute, and Euro-American periods, material culture remains and radiocarbon dates indicate heaviest use by the Virgin Anasazi (A.D. 1–1000). Quids are wads of fiber twisted or knotted into a ball for insertion into the mouth. Ten of the quids examined were clearly made from the fibers of *Yucca* plants, based on molecular analysis and comparison to the DNA of *Yucca*, *Agave*, and *Nolina* plants known from the surrounding region. Twenty-eight of thirty quids examined were wrapped around a range of wild tobacco (*Nicotiana*) flowering stalk plant fragments (capsule, seed, calyx, pedicel, main stem, leaf). Quids have been interpreted as serving a range of needs (food, ceremonial/ritual, other). The inclusion of tobacco and the scattered contexts of recovery of quids within Antelope Cave suggest these provided occupants with a personal narcotic experience.

Adams, E (University of Arizona)

[343] *Back in Time: Research at Rock Art Ranch*

In 2011 the Homol'ovi Research Program (HRP) launched a fieldschool at Rock Art Ranch (RAR) 8 km south of Chevelon Pueblo and nearly 25 km from the Homol'ovi core (Homol'ovi I-IV) to investigate (1) the relationship of the many small pueblos in the area to those occupied at the same time in the core Homol'ovi area and ultimately to the large Pueblo IV villages; (2) the location and age of sites associated with the major petroglyph panels at The Steps in Chevelon Canyon generally dating Basketmaker II and earlier to get a sense of land use and duration of occupation; and (3) the scope, nature, and date of Hopi visitation to the area based on the presence of yellow ware pottery. The investigation of these three goals has been approached through survey and excavation. Survey has been used to locate, map and relatively date sites on the ranch; whereas excavation has focused on small Pueblo III hamlets of 5-20 rooms on the ranch and 10 km southeast at Multi-Kiva site (AZ P:3:112). This paper will use survey data collected on the ranch and adjacent land to address the central research questions.

[362] *Paleoarchaic Occupations in the Eastern Great Basin: Results of GIS Predictive Modeling for Identifying Paleoarchaic Sites in Southern Nevada*

Within the Great Basin, site locations dating to the Pleistocene-Holocene Transition (PHT) are generally associated with specific geographical features. GIS is a useful tool for identifying geographical features likely to contain sites dating to the PHT period. Guided by previous Late Pleistocene/Early Holocene investigations in the Great Basin, a GIS predictive model combining topographical features likely to have been favorable for PHT period occupation was developed. Topographical features likely to have implications for PHT occupation included pluvial lake maximum extents and associated shore features, Holocene deposited alluvial sediments, drainages, predicted marsh zones, and current playa extents. These features were mapped and ranked; a sample of high-probability, medium-probability, and low-probability areas were then inventoried. Sample inventories were conducted within Delamar Lake, Dry Lake, and Kane Springs valleys, Lincoln County, Nevada, to identify cultural resources associated with the PHT period and test the accuracy of the GIS model. Here we present: 1) the methods used to develop the GIS model and sample inventory, and 2) the results of those inventories. Results indicate that model refinement based on additional environmental, topographical, and geologic inputs enables PHT site identification. Additionally,

results may provide more fine-grained information regarding PHT foraging behavior and occupation strategies.

Adler, Michael (Southern Methodist University)

[34] *Practicing Community Archaeology and Present Communities of Practice in Archaeology: A Southwestern Perspective*

Practicing archaeology as part of descendant community historical research necessarily addresses issues of cultural identity, concepts of historical continuity, political status and myriad other considerations. This case study focuses on the interplay of communities in the northern Rio Grande region of the American Southwest that are variously defined by Native American, Hispanic, and other identities, as they relate to ongoing negotiations over water rights and other natural resource uses. The study contrasts the dynamics of how communities are defined as political, geographic, historic and resource-using entities, with the realities of long-standing relationships between the various communities in the region.

[114] *Fremont Basketry: Redux!*

Decades of research have indicated that the basketry of the Fremont formative "culture(s?)" of the Eastern Great Basin is unique to and highly diagnostic of that (those?) prehistoric population(s?). Additionally, it has been repeatedly stated that the basketry of the Fremont exhibits few to no technical connections to that produced by neighboring Ancestral Pueblo groups. Recent reanalysis of literally all of the basketry recovered during the multi-year Glen Canyon Project corroborates the distinctive features of the Fremont basketry suite, but also suggests a very different relationship to, at least, some varieties of Ancestral Pueblo basketry than obtained previously. The results of this reanalysis are summarized and a revised perspective on Fremont-Ancestral Pueblo perishable relationships is offered.

[236] *National Network: The Strength of Project Archaeology*

We estimate that 275,000 students each year learn about archaeology and protecting the human past through Project Archaeology's high-quality educational materials. In 2009, I was lucky to attend a Project Archaeology workshop at the Little Bighorn Battlefield, living in a tipi for a week and

studying how to engage my students in discovering the culture and history of the Crow tribe. The workshop was taught by a passionate, knowledgeable archaeology educator and I was hooked! The next year, I guided my students through the investigation of a Crow tipi as they uncovered oral histories by living descendants, archaeological evidence, and the importance of preserving our shared heritage. My story is only one of 12,000. Teachers from across the nation have been inspired by passionate archaeology educators who are members of the National Project Archaeology Network in 36 states. This paper examines the strength of the Network, its impact on communities nationwide, and our plans to extend our network to all 50 states.

[129] *Transformaciones e historia entre Michoacán y Guanajuato a partir de las plantas hidroeléctricas en el siglo XX*

Se presenta una síntesis del uso del agua en la Cuenca del Lerma en su paso por el Bajío, en particular en donde se unen Michoacán y Guanajuato, así como su transformación en energía eléctrica. A partir de un repaso histórico, se toman en cuenta las obras realizadas para generar electricidad y sus transformaciones más significativas en relación con el paisaje que las alberga. Asimismo, se discute el cambio tecnológico implicado y el del paisaje que conllevó el uso social de la electricidad en la vida y el trabajo cotidianos. El periodo de estudio se centra hacia finales del siglo XIX y principios del XX, periodo en el que es posible encontrar diversas escalas en cuanto a la explotación del agua como fuerza motriz. Estas escalas se ven reflejadas en las transformaciones de la vida productiva ligada al entorno agroindustrial que imperó en la Cuenca. Entre las obras que se mencionan, se hallan aquellas para el desvío del curso del agua, por retención o desviación momentánea del cauce natural, y que transformaron también la manera de percibirlos en el paisaje por parte de la población.

Aguirre, Alejandra (Proyecto Templo Mayor/UNAM)

[298] *Images Represented in the Dressed Flint Knife Offerings from the Plaza West of Tenochtitlan's Great Temple*

During the seventh field season of the Templo Mayor Project directed by archaeologist Leonardo López Luján, twenty-two ritual deposits were found in the west plaza at the foot of the Great Temple of Tenochtitlan. Eight of the deposits (Offerings 123, 125, 126, 136, 137, 138, 141, and 163, dating to Ahuitzotl's reign, Stage VI, 1486–1502 CE) contained more than one hundred flint knives that were dressed with garments bearing the attributes of gods and deified warriors. Some of the knives were adorned with miniature artifacts related to warfare, such as darts, spear-throwers, and maces, while others were decorated with wooden masks, pectorals, marine shell and greenstone pendants, depictions of bloodletting implements, and round insignia made of gold. This paper will discuss the identification of the supernatural beings personified in the flint knives as images of deities or *ixiptlatin* (soul containers), as well as their symbolism in each offering, and thus contribute to our understanding of oblation rituals at Tenochtitlan.

Ahlman, Todd (Texas State University)

[44] *Costly Signaling, Risk Management, and Network Creation: Commodity Production and Exchange in the Historic Caribbean*

During slavery, enslaved and freed Africans throughout the Caribbean engaged in commodity production and exchange for many different but complementary reasons. Slaves and freedman raised crops and animals and produced crafts that they traded; they also engaged in rented labor. These practices allowed them to barter for other goods and earn cash. For some, this exchange allowed them to survive the hardships of enslavement and marginalization. Others were able to

accumulate goods and cash that allowed them to express their wealth within the confines of slavery and marginalization. Examples from slave contexts on the island of St. Kitts are examined and the different strategies used by enslaved Africans are discussed. The material remains suggest that enslaved Africans in the Caribbean employed multifaceted approaches to survive slavery, express their identity, and signal their wealth or some other attribute.

Ahlrichs, Robert (UW-Milwaukee)

[359] *Viewsheds and Variability: The Red Ochre Burial Complex Revisited Geographically*

The Red Ochre Burial Complex, like it's later and more intensively studied Adena and Hopewell counterparts faces questions about its usefulness in understanding the cultural prehistory of the Western Great Lakes region. Over 50 years ago the complex was defined using a "trait list" approach. These traits are, for better or worse, still the clearest depiction of what is and is not a Red Ochre mortuary site. This study utilizes GIS to bring together disparate cultural data on a variety of Red Ochre sites in Wisconsin. This will facilitate examination of the "nuclear" Red Ochre traits including: hilltop site preference, presence of burials with caches of bifaces made from exotic raw material and several other more "peripheral" traits. It will also elucidate any spatial patterning evident in these mortuary behaviors. The Red Ochre Burial Complex represents an important transitional period in Eastern North American prehistory. It lies between the earlier, more egalitarian hunters and gatherers of the Archaic period, and the later more culturally stratified foragers and horticulturalists of the Woodland period. This poster seeks to gather, organize, and present some of the significant material remains from that transitional period in Wisconsin prehistory.

[32] *Perishable but not Forgotten: The Potential Use of Seaweeds on California's Channel Islands*

California's Channel Islands are surrounded by some of the most extensive and productive kelp forests on the planet with nearshore environments containing more than 100 species of edible seaweeds. Archaeological deposits testify to the use of kelp forests by native islanders, but there has been little discussion of seaweeds as a food resource. Ethnohistoric evidence that Channel Islanders consumed seaweeds is limited, but accounts of islander foodways in general are minimal. Ethnographic and ethnohistoric accounts ranging from the Pacific Northwest to Baja California demonstrate considerable use of seaweeds by native coastal peoples. Archaeologically, the use of seaweeds is obscured by their perishable nature, but seaweed-associated mollusks can help infer

the extent to which they were used in the past and archaeobotanical identification may be an important avenue of future research. We summarize the biology, diversity, ecology, and productivity of seaweeds in the California Bight, highlighting ecological interactions with mollusks that can be used to infer kelp harvesting, and discuss nutritional data supporting the likely consumption of these resources in the past. As evidence for the use of endemic plants mounts on the Channel Islands, we provide suggestive evidence that “sea vegetables” were harvested as well.

Ainsworth, Caitlin (University of New Mexico)

[364] *13,000 Years of History in 990 Square Feet: Recent Undertakings in Public Archaeology at Petrified Forest National Park.*

Petrified Forest National Park boasts an archaeological record spanning 13,000 years of human history with occupations dating from the Paleoindian, Archaic, Basketmaker II and III, Pueblo I–IV, and Historic periods. This remarkable depth and diversity of archaeological sites has long drawn the interest and attention of researchers. Yet the public remains largely uninformed about many of the park’s unique cultural resources. Recent undertakings in public archaeology at the park are beginning to address this issue. A decommissioned former park entrance station dating to the 1930s has been selected and restored for the park’s first permanent archaeology exhibit in decades. Plans for the exhibit include highlighting the diverse implications and interpretations of the park’s cultural resources by incorporating modern Native American perspectives and both local and regional archaeological information. In addition, the exhibit will showcase the restored building, highlighting the long administrative history of the park. The opening of this exhibit marks a tremendous move forward at Petrified Forest towards better meeting obligations to the public which all archaeologists share; to inform and educate the public on the meaning and significance of the archaeological record and cultivate a desire to conserve archaeological resources.

Aiuvalasit, Michael (Southern Methodist University)

[239] *Through Fire and Water: The Vulnerability and Resilience of Highland Ancestral Puebloan Communities to Prehistoric Droughts in the Jemez Mountains, New Mexico*

Establishing causality between climate change and cultural history is often fraught by mismatched temporal scales and weak archaeological correlates. In the Jemez Mountains of New Mexico the abandonment of large villages on the Pajarito Plateau in the early 16th century has largely been attributed to drought, however the persistence of large communities on the adjacent Jemez Plateau, which shares similar climate histories, ecological settings, and prehistoric adaptations, has not been considered. Water storage features were built adjacent to large villages in both regions. I argue that the use-life histories of these features serve as a proxy for communal management strategies to buffer the vulnerability of water scarcity. I will present the preliminary results of geoarchaeological investigations of six reservoirs on the Jemez Plateau and a regional paleohydrological reconstruction to evaluate whether prehistoric “mega-droughts” induced periods of water scarcity for Ancestral Puebloan communities, and assess if the construction and use of reservoirs enhanced the resilience of communities to droughts.

Aju, Gloria (Proyecto Kaminaljuyu), Barbara Arroyo (Direccion General del Patrimonio Cultural y Natura), Lorena Paiz (Universidad del Valle de Guatemala) and Andrea Rojas (Proyecto Arqueologico Kaminaljuyu)

[196] *The Chronological Ceramic Sequence of Naranjo, Guatemala: A Revision and Relationship to Kaminaljuyu*

Recent research at the site of Kaminaljuyu and the revision of the ceramic sequence has promoted a revision of Naranjo chronology and ceramics. The site of Naranjo is located 3 km north of Kaminaljuyu and has a significant occupation during the Middle Preclassic. An abandonment of the site has been dated to around 500-400 B.C., the moment when the first rise of Kaminaljuyu has been identified. The results of analysis presenting the relationships of various ceramic types from Naranjo connected to later Kaminaljuyu examples will be presented to link both sequences of occupations during the Preclassic. A large data set of radiocarbon dates will be presented supporting the revised

sequence for both sites.

Akins, Nancy (Office of Archaeological Studies, Museum of NM) and John Schelberg (retired)

[354] *Chaco Legacy Studies: Archival Research, Archeomagnetic Dating, and the Role of Turkeys*

Part of the Chaco legacy includes early excavations that were under or unreported leaving large gaps in our knowledge of a considerable amount of work, especially during the University of New Mexico field school era. UNM constructed a research station with laboratory facilities and dormitories with the goal of training students and conducting long-term research on a concentration of small village sites opposite the great houses of Pueblo Bonito and Chetro Ketl. One of these excavations was at Bc 59, which was partially excavated in 1947 with additional excavations completed in conjunction with the National Park Service's ruins stabilization program. One of Tom Windes' legacies is his effort to refine dating throughout the canyon by collecting archeomagnetic and dendrochronological samples. Finally, 25 years of distance and research provides additional insights into the role of the turkey—the bird that inspired our Chaco Navajo crew's name for Tom—Tom Tazhii.

Akoshima, Kaoru (Tohoku University)

[389] *Evaluating Lithic Microwear Traces in Terms of Settlement Mobility Patterns and Raw Material Distributions*

The paper investigates concrete methods to evaluate lithic microwear data in conjunction with human mobility patterns and raw material distributions. The discovery of micro-polish variety reflects different worked materials, use-wear analysts have emphasized the reconstruction of individual behavioral episodes at the site location. However, actual wear traces reveal highly complex patterns, partially attributable to combined factors of mobility and raw material selection. Conventional methods of wear interpretation confront such problems as coarse-grained rocks, heavy surface patina, and superimposed traces. Therefore use-wear data tends to underestimate implements less suitable to high power analysis. Repeated use-wear on working edges of high quality rocks reflects gradient dichotomy between on-site consumption of local resources, and the technological strategy of retaining good quality materials of limited availability on the landscape. The proposed method would alleviate existent biases in traditional use-wear interpretations. Case studies in the Japanese Upper Paleolithic are discussed from the Tohoku University excavation projects of the Mogami River drainage, Shinjo Basin, where excellent quality materials of shale schist are locally abundant and utilized in blade based industries.

Al Kuntar, Salam (University of Pennsylvania)

[254] *Emergency Care Training Workshops for Syrian Museum Collections*

Amidst the atrocities of Syria's civil war, Syrian curators, heritage professionals, and activists courageously risk their lives to protect the country's cultural heritage. Working in areas outside of the Assad regime's control, these individuals have managed to safeguard collections salvaged from damaged museums, religious institutions, and looted sites. This paper discusses a workshop, held in Turkey, which brought together museum curators, heritage professionals, and other members of civil society from the Idlib and Aleppo provinces of northern Syria. The workshop offered training on how to secure museum collections safely during emergencies and provided participants with basic supplies for packing and securing museum collections. Furthermore, one of the outcomes of this workshop is an emergency plan to protect the Ma'arra Museum in the Idlib province. The museum holds a magnificent collection of well-preserved Roman and early Christian mosaics and has suffered collateral damage from aerial barrel bombings and repeated attacks from Jihadi militants. This presentation examines the steps required to undertake the workshop, its reception among the Syrian participants, and its subsequent outcomes.

Alaica, Aleksa (University of Toronto)

[60] *Companions or Counterparts: Considering the Role of Animal Depictions in Moche Ceramics from Northern Peru*

The Moche Period (1-850 A.D.) is well known for its iconography with naturalistic depictions of a variety of different figures and themes. One aspect of the corpus that has been under-analyzed is the common representation of plant and animal life. The ceramic assemblages of the Moche depict numerous animal species from coastal, highland and Amazonian locations. Recent work conducted at the Larco Herrera Museum reveals that various animal species may have been considered important symbols of group association and community identity. The patterns that can be ascertained from the vessels that have been analyzed reveal that dog and sea lions may have been key species used to aid in ritual and ceremonial practices. Furthermore, the representation of anthropomorphic figures with animal features suggests that Moche elites personified specific species as a means to heighten the effect and meaning of established ritual performances. This paper will also explore how animal imagery in Moche ceramics may have been expressive of totemistic and animistic ontologies. It will be argued humans and animals were not absolute categories in Moche worldviews and that the boundary separating humans from non-human entities often appears to have been blurred.

Aland, Amanda (Southern Methodist University) and R. Alan Covey (University of Texas at Austin)

[398] *Local Effects of Imperial Craft Production in Highland and Coastal Peru*

During the Late Intermediate period (LIP, ca. A.D. 1000-1400), longstanding traditions of specialized craft work and distribution of wealth goods on the north coast of Peru culminated under the rule of the Chimú Empire. In contrast, the same period in the highlands shows little evidence of specialization or large-scale access to wealth goods during the advent of the Inca Empire. This paper will compare the evidence for craft production and wealth consumption at sites located in valleys near the Chimú and Inca capitals. Using excavation data from Pukara Pantillijilla in the Cuzco region and Santa Rita B in the Chao Valley on the north coast of Peru, we examine craft production and consumption changes at the local level prior to imperial incorporation and how it changed under the rule of imperial states.

Al-Azm, Amr (SHTF Shawnee State University)

[254] *The Syrian Heritage Task Force and the Importance of Preserving Syria's Cultural Heritage*

Currently many of Syria's famous heritage sites are in territory outside of the control of the Assad regime and are at great risk from looting, damage as a result of conflict, or deliberate attack. This is not only causing irreparable damage to Syria's cultural heritage but also destroying the common history that provides Syrians with a shared sense of identity. In order to help protect this heritage and preserve it for the future, a Syrian Heritage Task Force (SHTF) was recently established. The SHTF provides an organizational framework for addressing emergency preservation concerns among heritage professionals and activists inside Syria, training, documenting and advocating for heritage protection among the international community. It is hoped that by working to protect and preserve Syria's threatened history and heritage we are safeguarding its future, too.

Albeck, María

[180] *Agricultural Landscapes in Northern Argentina*

Quebrada de Humahuaca is an important gorge in northwest Argentina, which lies between the altiplano-like puna to the west and the forested lowlands to the east. It has a long and interesting agricultural history spanning nearly three millennia from the settlement of the first farmers to the present. The prehispanic archaeological landscapes are best preserved in the northern part of Quebrada de Humahuaca, due to the strong erosional processes that cut deep into geological sediments. On the lower parts of the west facing slopes, ancient agricultural structures almost completely cover the surface, but belong to different moments of the prehispanic past. Three occupations are considered: the first farmers (pre-11th century), the societies that developed between the 11th and 15th century, and the Inca occupation (15th to 16th century). Different approaches were used to examine the construction, remodelling, and use of ancient agricultural

features in order to understand the nature of past agricultural landscapes. The most important include the type and placement of cultivation surfaces, the nature of the stone piles built when clearing the terrain, the irrigation systems, lichenometry, palynology, and others.

[294] *Paleoenvironmental Reconstruction Using Fossil Phytolith Assemblages at Pinnacle Point Caves 13B and 5/6 during Middle Stone Age, Mossel Bay, South Africa*

Climatic conditions played a key role in the evolution of modern human lineage and South Africa has been considered, based on genetics and fossil evidence, a suitable area. South Africa hosts the smallest of all-known biomes (Fynbos), characterized by hyper diversity with high species richness and large presence of edible plants. We present the phytolith record from the archaeological sites Pinnacle Point caves 13B and 5/6 spanning from ~160 to ~50 ka. This study aims at reconstructing the past environmental and climatic conditions at the central South Africa coast during this crucial period in human evolution. We assess fossil phytolith assemblages and the occurrence of grass subfamilies (C3 – C4) in order to achieve this objective. The phytolith record indicates changes in vegetation composition along the sequence indicative of climate shifts. Phytoliths characteristic of the Restionaceae family, a typical component of Fynbos vegetation, are present during most of the occupation moments. Grass phytolith presence varies along the sequence suggesting grasslands movements. Among grasses, there is a general dominance of C3 grass phytoliths with sharp increases of C4 characteristic phytoliths at specific occupation moments. These results correlate well with previously published and new paleo-reconstructions based on isotopic analysis from speleothems

[129] *Apropiación de recursos naturales, configuración territorial y paisajística en torno al río Lerma, Zona Metropolitana La Piedad-Pénjamo*

En este trabajo se analizan las formas de apropiación de los recursos naturales y el uso de los servicios ecosistémicos del río Lerma para las actividades cotidianas y económicas durante la época reciente, asimismo, se explican los procesos de configuración territorial y transformación paisajística en torno al río en la zona Metropolitana La Piedad-Pénjamo. Se analizan los procesos de degradación de la calidad ambiental del río que han alterado la provisión de servicios ecosistémicos, y se ponen en valor aquellos que se mantienen para algunos usuarios y actividades económicas. A partir de la explicación de los procesos se sugiere la interacción de múltiples actores y agentes para la gestión ambiental del río en la zona metropolitana.

[249] *A Spatial Analysis of Proposed Egalitarian Site Organization in Postclassic Tlaxcallan*

The Tlaxcaltecas are known as one of the few groups to maintain autonomy from the Late Postclassic expansion of the Aztec Triple Alliance in Central Mexico. This is particularly interesting given their location, surrounded by Aztec allies and tributaries. In their 2010 paper, Fargher et al. proposed that the success of the Tlaxcallan state was attributed to a political ideology that emphasized egalitarianism rather than imperialism. In a 2011 paper, Fargher et al. expanded upon this hypothesis following a full-coverage survey of the city of Tlaxcallan and the adjacent governmental complex of Tizatlan. The authors proposed that given its isolated nature, Tizatlan might have served as a neutral meeting place for government officials from the 20+ plaza groups of Tlaxcallan, as well as the rest of the state's territory. This poster presents a GIS cost-path analysis to explore the "neutral meeting place" hypothesis. Using a Digital Elevation Model of the site

topography and data for culturally constructed walking barriers (architecture, agricultural fields, etc.), this poster presents estimated walking distances and walking times from each plaza to and from Tizatlan. The results are compared between sites to understand how walking costs might define relationships between the city's plazas and Tizatlan.

[398] *Frontier, Inka Craft Production and the Kallawayá Territory*

In this paper I will evaluate the nature of Inka specialized craft production in the province of Kallawayá, and the ways in which the manufacture and distribution of imperial pottery was an avenue to enhance status. I have two goals in this presentation. First, using archaeological and ethnohistoric data, I will assess the nature of production in the ceramic workshop of Milliraya and the role of specialized mitmaquna colonies in such processes. Second, I will illuminate the ways in which the highly valued Taraco Polychrome imperial style was distributed in the Inka imperial centers of the Kallawayá region. Such comparison will provide a window to understand the intersection between specialized craft production, imperialism and power, and the importance of such goods in the Inka imperial frontier economy.

Aldeias, Vera (Max Planck Institute for Evolutionary Anthropology)

[190] *Sea Shells by the Sea Shore: microstratigraphic investigations of the Cabeço da Amoreira Mesolithic shell midden (Muge, Portugal)*

Cabeço da Amoreira is a long-known Mesolithic shell midden located in the shores of the Muge River in Portugal. Like in similar midden contexts, sedimentation is greatly influenced by anthropic inputs associated with an intensive exploitation of marine and estuarine resources. The abundance of shell-fish refuse favors an intricate and laterally variable stratigraphic succession of layers and lenses, which result in an extensive artificial mound. The complex stratigraphy of shell midden sites has been difficult to decipher and few studies have focused on the microstratigraphic record of midden formation. The present paper applies geoarchaeological and soil micromorphological techniques to investigate site formation and the nature of anthropogenic activities at Cabeço da Amoreira. Given the recurrent accumulation of similar types of components throughout the sequence (namely, shells, charcoal, bones and geogenic grains), we apply a microfacies analysis to distinguish between primary activities (such as discrete shell tossing events, trampled surfaces and combustion features), versus secondary position of the assemblages in dumped or reworked deposits. The complex superposition of events seen at Cabeço da Amoreira underlines the role of micromorphology for the identification of behavioral signatures and its relevance in understanding the formation of large shell midden sites.

Aldenderfer, Mark (University of California) and Laure Dussubieux (The Field Museum)

[140] *Regional Connections Identified through the Analysis of Glass Beads from Samdzong, Upper Mustang, Nepal, CE 500*

Samdzong is found in the Kali Gandaki drainage in Upper Mustang, Nepal, just to the south of Tibet. Known from historical sources that date to the 17th C., Samdzong was an important waypoint on the salt trade route between South India and the Tibetan Plateau. Aside from salt from the plateau, these documents say little about other materials that were exchanged, and virtually nothing about their places of origin. The antiquity of the salt route was simply assumed. Excavations at the site conducted over the past three years have added both a wider regional scope and a greater time depth to our understanding of trade in this region. Glass beads have contributed much to this improved understanding of regional trade and its local expression at Samdzong. Analyzed by LA-ICP-MS, the beads tell a story of far-flung ties: trade from the west with ancient Sassania (now in modern Iran), the Sindh to the south (now in modern Pakistan), and participation in the Asia-Pacific bead trade that may include production loci in far southern India or southeast Asia. We will describe

these results in greater detail and will compare them to the analyses of other artifacts that circulated in this region.

Alders, Wolfgang (University of California, Berkeley) and Jared Koller (Boston University)

[238] *Rice Terraces as Defensive Structures: Landscape Modeling in Hapao, Ifugao*

This paper investigates the potential defensive functions of rice terrace construction in Ifugao, Philippines, through an exploration of how landscape analysis and 3D modeling might contribute to established archaeological and ethnographic understandings of the region. While still under debate, a growing body of archaeological evidence suggests that the settlement of the Ifugao highlands and the development of intensive rice terrace farming may have been a strategy for avoiding political violence caused by Spanish colonial incursions on the island of Luzon beginning in the 16th century A.D. During the 2014 field season in Hapao, Ifugao, Philippines, we recorded over 150 rice terrace walls that form a single rice terrace system in order to gather a data set for our 3D model, which facilitates viewshed analysis and modeling of walking difficulty. We suggest that in addition to being part of subsistence management, a rice terrace construction could have played a secondary role as a defensive structure. This would have been difficult for large armies to effectively navigate, but would have still allowed for small-scale warfare practices to remain, such as the famed Ifugao head-hunters.

[236] *Making History Relevant and Sustainable: Listening to Descendant Communities through Collaboration and Partnership*

Project Archaeology is a heritage education organization devoted to curriculum development that gives students the tools to better understand the cultural landscape of the world they live in. One of our main goals is to collaborate and partner with descendant communities in all that we do to research, develop, and implement our programs. In this paper we will outline our collaborative theory and practice, and our goals to encourage multiple ways of knowing, validate tribal history, and support community empowerment. Through education we can show students the importance of a socially useful heritage, and they can make informed judgments concerning their own history and the history of others, leading to a world where archaeology is relevant and sustained.

Aleshire, Rachael and Olivia Navarro-Farr (College of Wooster)

[95] *Building and Debating National Identity: Three Case Studies of the Ownership of Ancient Artifacts*

Artifacts are crucial to the understanding of past societies. Archaeologists are able to learn about the values and cultural practices through material remains left behind by ancient civilizations. Museums display artifacts not only to educate the general public, but to make modern nationalistic statements connecting the country in possession of material to the ancient civilization which created it. The critical point with most of these exhibitions is that many of the artifacts are not excavated from sites within the nation itself, but rather have been collected over the years from distant locations. The problem with this is that the removal of artifacts from their site has not always been done by legal means, and many of the more popularly known cases involve artifacts taken from their sites before laws were created to address the ownership of artifacts. In discussing the ownership of artifacts and the cultural heritage associated with them, it is important to know the story behind an artifact's excavation and acquisition, as well as have an understanding of how laws display its placement in museums. This project examines three case studies: the Elgin Marbles, the Rosetta Stone, and the Trojan Treasure.

[64] *Chronology of Ahmarian and Levantine Aurignacian Occupations of Manot Cave, Israel*
Recent excavations of Manot Cave, in the Western Galilee, Israel, have revealed abundant Upper Paleolithic finds, including modern human fossils, in situ hearths, shell beads, bone and stone tools, and faunal remains. The two major Early Upper Paleolithic traditions of the Levant—the Ahmarian and the Levantine Aurignacian—are well represented at Manot Cave. The Ahmarian is thought to have developed from local Initial Upper Paleolithic traditions, while the Levantine Aurignacian may represent a back migration of peoples and/or ideas from Europe. At Manot, a Levantine Aurignacian assemblage overlies an Ahmarian assemblage. Here we present the challenges, methodology, and results of radiocarbon dating at Manot Cave. The dating of over 40 identified charcoals suggests that the Levantine Aurignacian tradition was present between 39- 35 kcal B.P. and Ahmarian occupations occurred between 46- 42 kcal B.P.

[98] *Enhancing Archaeology Education and Outreach in Iowa through Project Archaeology*
Iowa has been an active partner in Project Archaeology since 2002, joining at a time when the national program was redefining its mission, recreating its curriculum, and expanding its partnerships. This presented the opportunity to assist in determining the scope and direction of national Project Archaeology while remaining cognizant of the challenges Iowa would face as a state where curriculum decisions are locally determined. Thirteen years later, Iowa PA has a stable foothold with dedicated institutional resources, established statewide partnerships, and its own place-based curriculum. Promising new initiatives include environmental education and university-based partnerships.

Alexander, Rani (New Mexico State University)

[76] *The Gilded Age in Eastern Yucatán, Mexico: The Age of Betrayal or the Rise of the Middle Class?*

The social transformations produced by rapid industrialization and expansion of henequen production in the late nineteenth century in western Yucatan were not what happened in Maya-speaking communities further to the east. The Gilded Age in eastern Yucatan was attenuated because communities suffered the protracted aftershocks of the Caste War of Yucatan (1847-1901), which may have repressed wealth disparities instead of heightening them. In this paper, I examine the archaeology of haciendas and rural farming settlements situated southwest of Valladolid, Yucatan. Analysis of the distribution and architectural characteristics of haciendas and ranchos in this area reveals that small-scale cattle-raising was a key entrepreneurial strategy that enhanced social mobility and aided economic recovery in the region. Acasillamiento and debt peonage were practiced on only a few large haciendas, most dating to the early 20th century. Using documentary census data, I measure variation in inequality among households in rural settlements using GINI coefficients for the 1880s and 1900s. The trajectory of globalization in this region offers an important comparison to the pattern observed further west, near Mérida.

[134] *Wari funerary contexts: An Elite Funerary Chamber in Cerro de Oro, Cañete Valley*
Evidence of looted tombs from Conchopata and Huari—the capital of Wari—have allowed archaeologists to identify up to three formal types of funerary structures. Researchers also point out that variants of these types of funerary enclosures identified at both sites might have held local chiefs and provincial governors. Evidence of such elite Wari funerary contexts has also been found in Espítiru Pampa, in the high jungle of Vilcabamba, and Batan Urqo, in Cusco, among others. Although the information from looted funerary contexts is incomplete, there are grounds to believe

that these structures served as graves for local elites buried with luxury objects understood as symbols of Wari authority. However, Wari mortuary ritual is diverse in different regions and presents temporal variations.

A funerary enclosure was excavated at Cerro de Oro in the Cañete Valley containing a funerary bundle associated with over a hundred luxury objects, primarily textiles. Based on comparisons we can propose that this funerary context is analogous to the intrusive funerary contexts recorded at different archaeological sites belonging to the Middle Horizon along the southern and central coast.

[410] *An Osteobiography of a Oaxacan Chontal Young Adult Female*

Skeleton Sk-CV-01 is a female around 18 years of age, carefully buried in a stone cist in the Chontal Highlands of southern Oaxaca during the Late Postclassic or Early Colonial period. She is the first and only human skeleton known from controlled excavations in the area, and the archaeological context and historical documentation associate her with the Chontal people who still inhabit the region. In this presentation the results of the archaeological, osteological, and stable isotope analyses of this unique skeleton are presented. The skeletal and dental analysis revealed many pathological conditions, including porotic hyperostosis, cribra orbitalia, periostitis, a healed fracture, dental caries and abscesses, periodontitis, and possibly tuberculosis. Musculoskeletal markers indicate differential use of the arms, possibly related to activities such as grinding corn. The cranium shows evidence of modification, which we suggest occurred from the carrying of heavy loads via a tumpline from a young age. The stable carbon and nitrogen isotope data suggest that her diet was high in maize, and low in animal protein which came from terrestrial herbivores low on the trophic chain. These results provide us with a first glimpse into the health conditions, daily activities, and diet of this little known ethnic group.

[86] *El paisaje natural de la Cuenca del Alto Usumacinta*

Los estudios de las relaciones entre la Cultura y la Naturaleza son un aspecto importante en las relaciones espaciales entre recursos naturales y asentamientos humanos. En investigaciones sobre la distribución espacial de recursos y sitios arqueológicos es primordial definir los parámetros del mundo natural que establecen el potencial para que las comunidades humanas logren florecer. Esto se alcanza mediante la construcción, al nivel del paisaje natural, de unidades espaciales básicas de recursos. Las unidades básicas del paisaje se establecen primordialmente mediante estudios de la geología estructural de una región que incluye aspectos como topografía, pendientes, geomorfología, tipos de suelos, hidrología, así como distribución y tipos de vegetación y vida silvestre. La idea es establecer la distribución de aquellos rasgos que determinan patrones y sistemas del uso de la tierra. En este trabajo presentamos estudios básicos de la arqueología del paisaje en el Alto Usumacinta, con la intención de establecer el potencial económico de áreas y localidades. Se espera poder definir y establecer aspectos significantes entre las unidades básicas del paisaje y los asentamientos humanos como Piedras Negras y Yaxchilán.

Allard, Francis (Indiana University of Pennsylvania)**[349] *Settlement Archaeology in Southeast China during the Han Dynasty: Limitations and Approaches***

As with other regions of China with limited settlement evidence, our understanding of life and developments in Lingnan (present-day Guangdong and Guangxi) during the Han dynasty relies in large part on contemporary texts and burial evidence – over 3000 Han dynasty graves have been identified to date in Lingnan. Although a number of non-funerary sites are now known, they offer only limited information about internal organization and function, the exception being the impressive Nanyue palace in Guangzhou. Along with reviewing the available information about such sites, this presentation considers different approaches to the study of Han dynasty settlement patterns in the absence of sufficient numbers of non-funerary sites. Relevant sources of information include: 1. The spatial distribution Han period burials; 2. Environmental considerations; and 3. Later texts with references to the region's settlements and interaction with native populations. Together, these sources provide useful insights into a number of issues pertaining to the Chinese presence in Lingnan during the Han dynasty, including the extent of administrative and military control, and the nature of interaction with the many local groups that inhabited the region's mountainous landscape.

Allen, Melinda (University of Auckland), Alex E. Morrison (University of Auckland, New Zealand), Andrew M. Lorrey (National Institute of Water and Atmospheric Research) and Geraldine Jacobsen (Australian Nuclear Science and Technology Organisation)**[77] *Assessing Island Habitability and Land Use on Polynesia's Smallest Islands***

In a series of papers, Bill Dickinson has outlined the timing of late Holocene sea level fall across the Pacific and its effects on island habitability and human settlement. He proposed that island settlement, particularly in East Polynesia, was constrained, or in some cases impossible, during the mid-Holocene sea level highstand, when low-lying islands (e.g., atolls) were awash and shallow near-shore environments restricted. Stable islets of modern configuration only developed after declining high tide levels fell below mid-Holocene low tide levels (i.e., the crossover date), a process that was regionally variable. We examine his model, and build on his research on the near-atoll of Aitutaki, southern Cook Islands. Specifically we consider: 1) the timing of human settlement both on the Aitutaki mainland and at recently dated islet localities, 2) the elevation of dated cultural deposits across Aitutaki in relation to current shorelines; 3) the age of emerged microatolls that mark former sea level high stands; and 4) land availability at key points in time. The analysis gives insights into the timing and distribution of human activities in relation to the evolving land and seascape.

Allen, Kathleen [109] see Katz, Sandra

Allen, Mark (California State Polytechnic University, Pomona)**[138] *Pay Dirt in the Mojave Desert: An Assistance Agreement between Cal Poly Pomona and the California Bureau of Land Management***

This paper reports on more than a decade of archaeological fieldwork conducted at two archaeological landscapes in the western Mojave Desert by Cal Poly Pomona undergraduate students on lands managed by the Bureau of Land Management (BLM) Ridgecrest Field Office. The majority of funding for the project was provided by a multi-year BLM Assistance Agreement. It

represents an outstanding example of a “win-win” partnership between a university and government agencies. Students received training in archaeology and were provided with research opportunities in the “real world” of public lands stewardship. In turn, the BLM obtained archaeological data, analysis, and interpretation that will assist their mission of protecting cultural resources and educating the public. The third benefit is the detailed archaeological investigation and publication of two quite different archaeological landscapes that address important research questions in the western Mojave and southern Sierra Nevada. This partnership thus provides new insights on the most well-known archaeological resources of the region such as the Coso obsidian quarries, which supplied much of California and the Great Basin with volcanic glass for millennia, or the multitude of world-class petroglyphs in the Coso Mountains that still capture the imaginations of visitors.

Allen, Megan (The Catholic University of America)

[208] *Spinning in the Middle Horizon: Spindle Whorls from the Site of Uraca in the Majas Valley*

Textiles were a major economic component in the prehistoric Andes. Mortuary evidence indicates an association between women and textile production. While spinning may have been an activity undertaken by both men and women, women dominated the produced domestic textiles and therefore were often buried with textile related tools. Spindle whorls from mortuary contexts can be used to determine the quality of the final cloth. Smaller spindle whorls produce a finer quality of yarn for elite products while larger whorls produce yarn more suited for domestic use. This project will focus on the production of domestic and elite status textiles. From the Middle Horizon cemetery site of Uraca in southern Peru 87 spindle whorls have been recovered. Many of the whorls are associated with yarns either wrapped around the shaft or extending from the interior of the whorl. All of the yarns are single plied and Z spun, suggesting a non-specialized function. Using ethnographic and ethnohistoric accounts along with archaeological evidence I will seek connect the spindle whorls to domestic yarn production.

Allen, Susan (University of Cincinnati) and Kathleen Forste (Boston University)

[291] *On the Periphery of Collapse: An Archaeobotanical View from the Mycenaean Hinterland at Tsoungiza*

The site of Tsoungiza, situated in the Nemea Valley of southern Greece, offers a glimpse into processes of agricultural and land-use practices in the Mycenaean hinterland and their intersection with the waxing and waning of Mycenaean political, economic, and social control. After abandonment in the Early Helladic III period (ca. 2,000 B.C.), the site was re-occupied during the late Middle Helladic III (ca. 1,650 B.C.), at a time of regional population expansion associated with the rise of the palace center at nearby Mycenae. Similarly, this brief florescence of Tsoungiza ended with its re-abandonment at the end of Late Helladic IIIB/early Late Helladic IIIC (ca. 1,200 B.C.), coincident with the collapse of Mycenae. Although rarely considered in narratives of political emergence or collapse, archaeobotanical remains provide a unique view of the role of economic reorganization that accompanies these major cultural transformations. The view from Tsoungiza – the only peripheral village where systematic recovery of plant remains has been undertaken – illuminates diachronic shifts in land-use practices and economic organization at Tsoungiza over the course of the Middle and Late Bronze Age that are entangled with significant environmental and sociopolitical changes that accompanied the rise and collapse of Mycenae.

Allen, Jim

[296] *Overpaid, Over-Sexed, and Over Here: O'Connell in Australia*

Jim O'Connell arrived in Australia in 1973 to take up a five-year research fellowship at the Australian National University in Canberra. Although he returned to the US in 1978, O'Connell has not only maintained diverse interests in Australia and its archaeological record but has also returned there perhaps 25 times to carry out fieldwork, present papers at conferences and to interact with colleagues. It is clear that some of O'Connell's major contributions to world anthropology have been directly informed by his Australian experiences, but that equally he has remained a serious player in the development of Australian archaeology for the last 40 years. This paper reviews some of the major themes of O'Connell's interaction with Australia, Australians, and Australian archaeology,

including his early influence in a Cambridge (UK) dominated archaeology department, his promotion of the discipline and his practical and intellectual contributions to it. In parts irreverent, the paper acknowledges the unique role O'Connell continues to play in Australian archaeology.

Allen, Josh (PAR Environmental Services Inc.)

[392] *Settlement Patterns in Southeastern Sacramento County*

Twenty years of cultural resource management efforts have culminated in over four thousand acres of inventoried land in southeastern Sacramento County. With nearly one hundred recorded lithic scatters, middens, bedrock mortars, rock art, and rock shelter sites, this archaeological evidence offers the chance to better understand prehistoric settlement patterns along the Cosumnes River and Deer Creek drainages. The data, normally contained in fragmented surveys and limited testing, is an initial look at the potential offered by these studies with future hopes to expand research opportunities and knowledge in the area.

Allison, James [6] see Ferguson, Jeffrey

Allison, James (Brigham Young University)

[274] *Neutron Activation Analysis of San Juan Red Ware Pottery*

San Juan Red Ware pottery is most common in southeastern Utah, where most of it appears to have been made, but is widely distributed throughout the Four Corners region from about A.D. 750 to 1100. Neutron Activation Analysis of San Juan Red Ware potsherds shows that there were numerous production locales, and red ware pottery from southeast Utah falls into several distinguishable chemical groups. These chemical groups have distributions that suggest relatively little exchange among the production area sites. Despite differing from red ware producers in styles of material culture (ceramics, architecture, and settlement patterns), and probably social identity, Pueblo I people living to the east of the red ware production zone also obtained San Juan Red Ware. Most of the red ware on southwest Colorado Pueblo I sites appears to come from the eastern part of the production zone, but the distribution of the chemical groups varies from site to site. Red ware exchange thus appears to have linked Pueblo I people across the Mesa Verde region through complex networks of interaction that cross-cut apparent differences among social groups.

[72] *Ghost Tourists in Gondar: Sustainable Tourism and Archaeological Heritage*

Literature in heritage and tourism usually addresses the multiple benefits of visitors, their threats and the controversial concept of 'return'. As heritage managers we usually focus our efforts on these visitors, as the panacea for everything. In the context of postcolonial theory and public archaeology, there are two factors of this equation that we usually forget: local communities and the real recipients of the money. Working in Gondar (Ethiopia) I have come to define the concept of the 'ghost tourist' in the context of a World Heritage Site and a great affluence. The concept of tourism in local education is far from being sustainable and, therefore, the alleged benefits of this tourism are questionable. Trying to change the model is a challenge, but it can address the problems the current situation and help building new capacities and real benefits in the way other projects are already working. This paper will address the phenomenon of the 'ghost tourist' in Gondar and the solutions are being proposed to engage a sustainable model of tourism where archaeological heritage has a lot to say.

[62] *Health and Mortuary Analysis of the Transbay Skeleton*

During the 2014 geothermal trenching for the Transbay Transit Center Project, a single burial was

uncovered at approximately 1.8 meters below existing sea level, encased in estuarine clay. This anaerobic clay preserved the bone and associated artifacts almost perfectly. Radiocarbon dating placed this burial at ~7590 years B.P., making it one of the oldest burials within the region. The young adult male was wrapped in a woven fibrous mat with numerous wood artifacts surrounding the legs and torso. Patterns of mortuary practices, general health, and wellness during this temporal period are not well known due to the lack of available data. Very few burials dating to this time have been found, even fewer have been found with such a high level of preservation. This skeleton allows a unique perspective into life on the San Francisco Bay at a time before the large scale shell mounds were created. CA-CCO-637, CA-CCO-696, CA-SCL-065, CA-CCO-548, and CA-MRN-17 were all dated to a similar chronological time predating many sites within the greater San Francisco Bay area. The burials from these sites will be compared in order to try and glean information or distinguish patterns regarding styles of mortuary treatment, and overall health and wellness.

Alonso, Isuara Nereyda (PARACOPAN), Antonia Martínez (PARACOPAN) and César Antonio Martínez (PARACOPAN)

[366] *Retos de la conservación arqueológica: Una vista desde Copan*

Varios proyectos en marcha de capacitación e intervención están contribuyendo a la creación de un programa de conservación de campo sostenible para la arqueología de Copan. La construcción de un nuevo laboratorio para la conservación de la escultura y oportunidades para participar en talleres para personal local están ayudando a reforzar la misión del Instituto Hondureño de Antropología e Historia y las ONG en el resguardo y conservación de este Sitio de Patrimonio Mundial. En esta presentación hacemos hincapié en varios proyectos recientes en que los autores están involucrados activamente, y examinamos los retos de conservación sostenible del patrimonio mundial de Copán.

[399] *Selective Use and Technology of Limestone and Lime Products Employed in Mosaic and Stucco Decorations in Ek' Balam*

This study comprises preliminary results of analyses made on different type of limestones employed in models and stucco supports, and other stone products used by the ancient Maya of Ek' Balam. The ancient Maya technology results in high efficiency and durable materials appropriate for the architectural and decorative program at the site, which has positively influenced the preservation of this heritage. The study of mineral elements from various limestone, and lime products (sascab and kut) using petrographic analysis and x-ray diffraction and fluorescence, allows for a general chemical characterization and evaluation of their physical properties that made up the technology of the Late Classic architecture. These examinations are convenient to recreate methods and techniques replicating the technology of ancient materials for in situ preservation of this heritage

[315] *The Salmon of Knowledge: Determining the Influence of Marine-Derived Isotopes on the Diets of Medieval and Early Modern Irish Populations*

Many medieval and early modern villages and abbeys in County Galway, Ireland are situated directly on the coast. This study seeks to understand the pathways that marine resources follow as they enter diets of religious and lay Irish populations by using isotopic, ethnographic, and historical evidence. The isotopic portion of this study elucidates how marine-derived isotopes cycle through the coastal Irish landscape and are included in the diet. Ecological sampling on the Atlantic island, Inishark, addresses the impact of the little-understood Seaspray Effect on terrestrial resources. Because strontium isotopic ratios are theoretically constant throughout the world's oceans, sprayed ocean water coating plants and soil may mask terrestrial bedrock-based strontium isotopic ratios that are used to determine human diet and mobility. As one of the most westerly points of Europe,

Inishark experiences strong seaspray and is a prime location to evaluate the impact of ocean water on crops grown in coastal fields. A chemical mixing equation calculates the proportion of marine and terrestrial isotopic contributions to coastal Irish diets. This study provides a basis for interpreting strontium isotopes in other coastal regions, as well as a contextualized understanding of the marine component of early modern and medieval Irish diets.

Alonzo, Patricia

[249] *Disruption or Continuity?: Iconography on Portable Objects in Classic to Epiclassic Jalisco and Zacatecas*

This study investigates the rarely studied iconography of Pseudo-Cloisonné vessels from Jalisco and Zacatecas through a comparison with earlier portable imagery. Recent interpretations of the shaft tomb figures of the Formative/Classic periods have begun to interpret their religious and political content and contextualize them archaeologically. But imagery in western Mexico takes a radical new turn in the Epiclassic period (A.D. 500-900), when the most elaborate iconography is found on the complex Pseudo-Cloisonné ceramics. The manufacture of Pseudo-Cloisonné begins with a pre-existing vessel, to which is applied a thick gray slip. Cells are next cut through this new surface to create an image, and lastly brightly colored pigments are applied to fill each of the cells using an adhesive. The vessel is not fired once the decoration is complete and is very fragile, and few vessels have ever been published in their entirety. The complex iconography on these vessels includes depictions of people, eagles, serpents, and abstract symbols. This study compares the themes present in these two forms of portable imagery, to help understand the changes that took place in the transition to the Epiclassic in Jalisco and Zacatecas.

[254] *New Observations of Looting at Archaeological Sites in Southern Mesopotamia*

Archaeological sites in Iraq have suffered the consequences of unstable political conditions. Due to this volatile situation law enforcement has been inconsistent and allowed antiquities looters to vandalize southern Mesopotamian sites. This resulted in differential rates of damage among the country's cultural heritage sites. By focusing on the ancient archaeological site of Girsu (modern-day Telloh) and its hinterland, I used Digital Globe imagery, remote sensing techniques and recent ethnographic information to show that the social aspects in people's lives have effects on antiquities looting in southern Iraq.

Alsgaard, Asia

[193] *The Role of Offerings in Interpreting Architecture: Evaluating Human Remains at Xultun, Peten, Guatemala*

During the 2014 field season at Xultun, Peten, Guatemala, two sets of human offerings and a tomb were identified in the center of "Los Arboles" (XUL12F19); however, the relationship between the different sets of remains and the structure is unclear. While the Maya are known for placing offerings around tombs and in entryways as closing ceremonies, human offerings are a less-common subset. To date, their role in Maya society is not entirely understood although their presence has been claimed at numerous sites. The goal is to evaluate whether the human remains found at "Los Arboles" can properly be described as offerings through an examination of similar deposits in the Maya Lowlands. The following research will discuss the distinction between ancestral remains and sacrifices, the role of children in ancient Maya society, and mortuary practices at "Los Arboles." This evaluation of the human remains interred within the site aims to further the understanding of "Los Arboles" as a possible ancestral shrine.

[172] *Patterns of Plant Use at Los Soldados and Beyond*

There has been much speculation regarding the nature of agriculture and subsistence among the Formative Gulf Coastal Olmec, and regional subsistence reconstructions based on primary plant data are now beginning to bear fruit. Recent excavations in the rural Olmec heartland and the neighboring Sierra de los Tuxtlas have yielded pertinent archaeobotanical data that have revealed considerable local variation in plant foodways. We build on these studies by presenting archaeobotanical data from Los Soldados, a Middle Formative habitation site along the Río Pesquero, and present a comparative analysis with extant data. Results from Los Soldados reveal that local variation in daily foodways is the regional norm, rather than the exception.

Amador, Julio (UNAM)**[352]** *Animal Symbolism in the Rock Art of the Sonoran Desert*

In this paper we propose a line of interpretation referred to the symbolism attributed to the zoomorphic figures, present in the rock art of the Sonoran Desert. We confront the results of rock art analysis and classification with a systematic study of the myths and legends of the Uto-aztecan cultural groups that lived in the region, when Europeans arrived. We pay special attention to the traditions of the O'odham, who inhabited the Sonoran Desert where we can find the rock art that belongs to the Trincheras Culture of northwestern Sonora. Though, as several ethnographers that have studied the traditions of the Uto-aztecan groups of western and northwestern Mexico and of the Southwest have pointed out, we can find very important coincidences in all of them, as well as in the rock art figures of northwestern Mexico and the American Southwest. By these means we can begin to build a regional and cultural perspective of rock art analysis and interpretation.

Ambrose, Stanley (U. Illinois, Urbana-Champaign), Fiona Marshall (Washington University, St. Louis) and Steven Goldstein (Washington University, St Louis)**[406]** *Nutrient Hotspots and Pastoral Legacies in East African Savannas*

Negative impacts of pastoralists on African savannas have been largely debated, but the creation of nutrient hotspots may also have significant positive effects. African savanna productivity is largely nutrient limited, however, ecologists show corrals in abandoned Maasai pastoral settlements have high nitrogen and phosphate levels, and distinctive vegetation and grazing successions. Such hotspots may drive ecosystem structure and function, but little is known about how long-term or how widespread they may be. Two newly discovered Elmenteitan sites, Oloika 1, Oloika 2 and the Savanna Pastoral Neolithic sites of Indapi Dapo in SW Kenya and GvJm 44 at Lukenya Hill, revealed distinctive archaeological sequences, dung and offsite profiles. Nitrogen and carbon isotopic analyses are still ongoing but suggest long term nutrient enrichment. Repeated visits of herders and wildlife to ancient pastoral camps results the creation of distinctive anthropogenic landscapes in the

Serengeti-Mara ecosystem and other African savannas.

Ames, Kenneth (Portland State University)

[80] *Dating Pacific Period Settlement Pattern Dynamics in the Prince Rupert Harbor Region of Northern British Columbia*

In this paper, a large regional suite of radiocarbon dates are used to document changing Pacific Period settlement patterns in the Prince Rupert Harbor region of northern British Columbia. Late Pleistocene/Holocene sea level changes focus discussion on the last 5000 years. At that time, the settlement pattern appears to be one of small, one to four house communities, dispersed across the seascape. Non-residential middens are present throughout the Holocene with larger linear villages appear after 5000 cal B.P. and larger multi-rowed linear and curvilinear villages with marked variation in house form appear by 2500 cal B.P. While villages are still widely dispersed regionally, populations and villages were also concentrated in the Harbor after ca. 3800 cal B.P. This well-established pattern is disrupted ca. 1700 cal B.P. when the harbor and environs were abruptly abandoned. Upon reoccupation land use was significantly reorganized with populations aggregated in several large villages in the harbor and areas formerly occupied residentially exploited logistically by boat-borne task groups.

[35] *Revisiting Grassridge Rockshelter in the Eastern Cape Province of South Africa: Results of the 2014 Field Season*

Grassridge rockshelter is located at the base of the Stormberg Mountains approximately 200 km inland in the Eastern Cape of South Africa. Previous excavation by Dr. Hermanus Opperman in 1979 focused primarily on the Later Stone Age (LSA) and Holocene occupations at Grassridge, but he also identified an underlying Middle Stone Age (MSA, ~300-30 ka) sequence containing abundant typologically MSA lithic material, well-preserved faunal remains, and charcoal. With particular interest in the MSA deposits, we revisited the rockshelter in the fall of 2014 to relocate the 1979 excavation trench and re-evaluate the stratigraphy using modern geochronological and geochronological techniques. We also opened a new 2 x 1 m excavation adjacent to Opperman's trench, and conducted preliminary survey in the surrounding landscape to identify additional caves and rockshelters that contain MSA and/or LSA deposits, which is the first step toward building a regional record of Late Pleistocene occupation. In this presentation, we will discuss the results of our 2014 fieldwork, which was the first season of the Grassridge Archaeological and Paleoenvironmental Project (GAPP). Results of preliminary stratigraphic, sedimentological, site formation, and artifact analyses from the renewed excavation will be presented, as well as the paleoenvironmental and archaeological significance of our findings.

Ames, Kenneth [80] see Brown, Thomas

Ames, Nicholas (University of California, Berkeley)

[402] *In Smaller Things Forgotten: Using Microdebris to Enhance our Understanding of Middle Islamic Dhiban (Jordan)*

This paper presents heavy fraction data from the archaeological site of Dhiban, Jordan, dating to the Middle Islamic period of occupation (late 12th to late 15th centuries CE). Based on a comparative study between larger heavy fraction materials and microartifacts I argue for the importance of smaller material residues in interpreting specific use-space as well as understanding Dhiban in relation to larger regional trends. Using a systematic flotation sampling strategy that recorded volume and provenience, the material was collected from a barrel-vaulted room enclosing a "domestic" space that encompassed a series of successive layered floors. Analysis of the material revealed that smaller residue sizes often do not correlate with larger residue sizes in either abundance or presence of different materials. Ceramics are abundant in larger fraction sizes but relatively infrequently in smaller sizes. Faunal remains of marine vertebrates and invertebrates that provide

evidence for long-distance trade and water-resource use are rarely found in larger fraction sizes yet are ubiquitous in even the smallest fraction sizes. This research suggests that smaller fraction sizes are valuable sources of data to supplement archaeological interpretation concerning the material life-ways of past inhabitants.

[89] *On the Transmission of Pottery Recipes at the Dawn of the Metal Age: A Case Study from Pločnik and Belovode*

This paper focuses on the reconstruction of pottery recipes and their transmission in the Neolithic/Chalcolithic sites of Belovode and Pločnik (c. 5350-4650 B.C.; c. 5200-4650 B.C.). These two Vinča culture sites, located respectively in north-east and south Serbia, have recently yielded some of the earliest known copper artifacts in Eurasia. The rich material culture of these two sites, therefore, offers a unique opportunity for the study of the evolution of pottery craft technology during the transition from the Stone into the Metal Age. An interdisciplinary approach employing macro observation and analytical methods including thin section petrography XRF, XRPD and SEM was applied to a wide selection of ceramic samples representing the full spectrum pottery at Pločnik and Belovode. The application of material science methods in particular has allowed us to reconstruct different technological choices and shed new light on traditional argument about the relation between pottery and metal pyrotechnologies. A diachronic analysis of the data allowed us to trace and compare the evolution of pottery recipes in the two sites, as well as to elucidate different mechanisms of cultural transmission within two early Chalcolithic communities in the Balkans at a time of major technological change in this area.

[102] *Considering a 'Chinese Element' in Southeast Europe before the 2nd Millennium B.C.*

Evidence of millet in Europe before 2000 B.C. has invited questions about its material culture context, possibly related with external regions such as China. This study compares the material assemblages of distinctively painted pottery vessels associated with findings of millet in different regions, such as the Cucuteni-Tripolye Culture of Southeast Europe, the Anau Culture of Central Asia, and the Majiayao Culture of China. These painted pottery vessels have been argued to be similar to each other, resonant with the geographical distribution of millet across Eurasia. This paper looks at the millet evidence in relation to the technologies and artistic styles of painted pottery traditions, clarifies their chronological relationships, and considers if the geographic spreads of millet and specific painted pottery traditions were indeed correlated. I will discuss to what extent the pottery types are similar or different, homologous or analogous, and chronologically congruent or incompatible. I additionally will present findings of millet impressions on the Cucuteni pottery that contributed significant new information.

[86] *Show Me What You Have and I'll Tell You Who You Stick Around With: A Model of Economical-Political Interaction in the Upper Usumacinta*

Walking, although commonly seen as a simple activity, represents in fact, a very important aspect of the relationship that develops between human groups and the physical environment on which they live. In this way, the nature of this environment will bestow the singularities of the political, social and economic organization of societies. We can approach human mobility through the application of GIS in terms of the estimation of cost of movement. Various algorithms have been developed that allow

us to estimate cost in terms of time, distance, or calories consumed during the stride. In this context, the upper Usumacinta region constitutes an ideal scenario to model human movement over a rugged landscape, and, thus, estimating the territorial extent of its different regional capitals. In this paper we intend to delve deeper in the definition of the territorial limits of these centers by approaching, along with the characteristics of the terrain, the fluctuations in time to access of certain prestige goods. To this end it becomes necessary to quantify objectively the economic fluctuations in relation to the geopolitical adjustments throughout time, through the application of the contextual valuation methodology developed by Izquierdo.

Anderson, Patricia (CNRS, Nice, France)

[17] *Interpreting Uses of Cereal Threshing Tools and Straw Storage Structures from Neolithic, Chalcolithic and Bronze Age Sites in the Near East*

Optical reflected light and transmitted light microscopy, laser confocal analysis, SEM and EDX analyses, accompanied by field and laboratory experiments, were used to study surfaces and residues for stone and bone tools, soil deposits and mudbrick. Case studies presented here suggest two types of intensive threshing practices were occurring from the beginnings of agriculture. Bone tools from the early Neolithic in Iran show large amounts of cereals were threshed so as to leave long stems, perhaps for craft uses. In other instances, microwear of stone tools showed cereal crops were being threshed and stems cut using the threshing sledge, beginning in the late Neolithic in Syria and continuing in the Chalcolithic and Bronze Age of Syria, Iraq, and Israel, a practice that seems to diffuse initially as part of the "Neolithic package". Several sites had storage structures containing cereal straw cut by this instrument. Tools and remains of cereal threshing shed light on human cultural practices, as well as on site economy, showing intensive use of cereal straw treated with efficient instruments beginning with early agriculture, seemingly corresponding to feeding of domestic animals but also to crafts, particularly for building materials for ever larger villages.

Anderson, Emily (Johns Hopkins University)

[20] *In the Trail of Dancing Lions: Iconography and Community on Early Crete*

This paper examines the formulation of an early iconographic tradition on late third-early second millennium B.C.E. Crete as a means of gaining insight on the development of a novel scale and variety of community ideology. During this period stamp seals began to be crafted from imported ivory and engraved with figural motifs involving lions, each belonging to a highly distinctive iconography reproduced across the island. These changes coincide with evidence of other social developments, including establishment of new types of ritual site where people from numerous communities gathered. We thus have evidence of a new scale of social life taking form but its character remains difficult to ascertain. Moving beyond examination of symbolism alone, I investigate the innovative practices underlying and supported by the iconographic seals, from their crafting to use/performance. These indicate how people were actively establishing a point of social similarity that transcended the boundaries of local interaction by forging a common signifier of social identity. Moreover, analysis suggests that the seals were produced by itinerant craftspersons, whose travels wore in physical paths between communities that paralleled those established symbolically by the iconography. Through this multi-faceted lens, an ethos of social incorporation and connective distance begins to emerge.

Anderson, J. Heath (Minnesota State University)

[88] *Cerro Magoni: A Link Between Epiclassic Tula and the Bajío?*

In recent years, scholars interested in the processes and events involved in the formation of the Toltec state have turned their interest toward links that might have existed between the area immediately surrounding Tula Grande, the civic-ceremonial center of the Toltec state, and sites in the Bajío region to the northwest. Although several material culture affinities have been proposed to

demonstrate possible ethnic and economic ties between these areas, investigators have not arrived at a general consensus regarding the chronology and significance of these links. Recent work at Cerro Magoni, a hilltop Epiclassic site near Tula Grande, can provide a fresh perspective on these questions with new information on the timing of Epiclassic settlement near Tula Grande. Additionally, Magoni demonstrates unambiguous material culture similarities with sites to the northwest that will enable researchers to ask more sophisticated questions of the economic, political, and ideological factors involved in the movement of population and consolidation of power that led to the foundation of the Toltec state. In this paper, I review the newly available data from Magoni and discuss its implications for the regeneration of complex society in the Tula region after the decline of Teotihuacan.

[125] *Big Data/Big Picture Research: DINAA (The Digital Index of North American Archaeology) and the Things Half a Million Sites Can Tell Us*

The DINAA project allows archaeologists to explore archaeological questions at a large scale, facilitating big picture research. Information from >500,000 archaeological sites in 15 states in Eastern North America is used to examine the effects of climate and vegetation change on human existence, in the past as well as in the future. Distribution maps illustrate where people were concentrated on the landscape at various times in the past, as well as areas they avoided, and environmental factors that helped shape those patterns. The total dataset additionally highlights variation in archaeological survey coverage at a regional scale. How changes in sea level affected settlement in the past are examined, and the same data also document how even modest rises of from 1 to 3 m in the near future will affect tens of thousands of known sites, including thousands considered eligible for the NRHP. A multi-institutional collaborative effort, DINAA provides a framework for distributed linked open data initiatives in North American archaeology; promotes greater interaction between data generators, managers, and users; and helps promote a greater appreciation for archaeology among researchers, resource managers, and the general public.

Anderson, Shelby (Portland State University)

[302] *Maritime Adaptations and Arctic Ceramic Technology: Results of Residue Analysis*

Archaeologists have put forth various hypotheses to explain the adoption of pottery technology by hunter-gatherer groups. These include the efficiency of ceramics over other container technology, rising population pressure and related increased need for storage, and a change in food processing practices. Food processing shifts could include diet breadth expansion, particularly increased use of aquatic resources. The late adoption of pottery technology in the North American Arctic between 2500 and 2800 years ago coincides with the development and spread of an increasingly specialized maritime economy. As such, arctic ceramic technologies present an excellent case study for further examining the correlation between hunter-gatherer adoption of pottery technology and aquatic resource use. In this paper we review the timing and distribution of early pottery in Alaska and explore the link between changing diet and culinary practices through residue analysis of pottery vessels from northwest Alaska. The results of this study suggest changes in diet over time, and identify a direct link between pottery use and processing of marine resources. Although the sample size is small, this analysis further suggests a diversification in marine resource use between 1000 and 500 cal BP.

Anderson, Lars (Université de Toulouse II - Jean Jaurès/UMR 5608 TRACES)

[181] *Towards a Synchronic View of Aurignacian Lithic Economy*

The Aurignacian is considered a product of the first modern human groups in Western Europe. Nevertheless, we have approached this important moment in Prehistory with a diachronic vision, ultimately inhibiting us from investigating the synchronic organization of this archaeological culture.

By enlarging our field of vision to several sites in southwestern France we hope to characterize the variability of Aurignacian lithic industries on two scales: the inter- and the intra-site. At the intra-site level, through spatial analysis of refits and the evaluation of variability in lithic knowledge and know-how, we will go further in the interpretation of site function by identifying different skill levels of flint-knappers. The comparison of these results at the inter-site level, while taking into account their location relative to raw-material sources, will ultimately allow us to refine our understanding of variability, function, and respective roles in mobility patterns of Aurignacian sites. Here we present preliminary results contrasting four sites with presumed differing functions: the Bergerac flint workshops of Champ-Parel 3 and Corbiac-Vignoble 2, the open-air campsite of Régismont-le-Haut, and the cave occupation of La Tuto de Camalhot. This nuanced approach will help us determine whether variability in Aurignacian lithic-economy was, in reality, structural, or simply circumstantial.

[182] *Sport and Ritual as Social Bonding: The Communal Nature of Mesoamerican Ballgames*

For over a century, the Mesoamerican ballgame has received copious attention in the academic literature. Much of this attention, however, has focused on either the control and promulgation of the game by elite actors, or the game's interconnections with indigenous cosmogonies. Because of this intense focus on the game as elite and/or ritual practice, we often lose sight of the communal role it may have held. Anthropological research into the cultural role of sport suggests that while sport can create inequalities through the nature of competition, it can also serve as an integrative force within a community through team bonding. In this paper, we argue that archaeological evidence from our research in the Mexican states of Oaxaca and Yucatan, as well as data from additional sites throughout Mesoamerica, suggests that ballgames primarily served a community-building role and were not solely a function of elite political theater. This interpretation is further supported through both ethnohistoric and ethnographic evidence, ultimately bringing us to a new understanding of Mesoamerican ballgames as not simply a spectacle of elite ritual, but instead as an integrative communal tradition.

Anderson, Karen

[184] *Transformation and Continuity: Late Tiwanaku to Post Tiwanaku Traditions in the Central Valley of Cochabamba*

This paper presents evidence from the Central Valley of Cochabamba, a key peripheral region of the Tiwanaku state. It addresses Tiwanaku expansion, state collapse and post-Tiwanaku transformation and continuity using data from ceramic styles and other material culture traditions. Also presented are new radio-carbon dates from the Central Valley site of Piñami covering Tiwanaku expansion and collapse and how these dates fit into the larger regional context and suggest that Tiwanaku influence continued longer in Cochabamba than in other areas. I then discuss the implications of this data for understanding how state collapse impacted local and regional social identities, political economy and interaction networks.

Anderson, Mark

[185] *Rock, Paper,.....XRF.....: Continuing Improvements to the UI-OSA Lithic Raw Material Assemblage*

The University of Iowa Office of the State Archaeologist (OSA) has an expansive lithic raw material assemblage with a 30 year compilation history. The largest portion contains multiple samples of 75 in-state lithic types while the second portion contains multiple samples from the seven surrounding and 16 additional states. A revision and reorganization of the OSA collection was completed in 2006 to provide a more systematic and consistent approach to lithic identification and sourcing. This includes a web-based version affording access to our entire assemblage from anywhere. Originally a macroscopic identification system, we soon realized the need for expansion. We have recently posted multiple, 20x microscopic images for all in-state samples. Geologic thin sections of numerous samples are currently in production through collaborative research with anticipated application to the entire in-state assemblage. Using a portable XRF, we are building a chemical and elemental

database for all in-state samples. These expanded analytical tools will afford us the opportunity to investigate several geographically and stratigraphically problematic types within the in-state assemblage. Since lithic materials so often dominate prehistoric artifact assemblages, a well-developed comparative assemblage offering more than macroscopic analysis, could afford researchers the opportunity to address a myriad of anthropological questions.

Anderson, E. (UC Riverside)

[291] *Medieval Warmth: Did the Medieval Warm Period Sink the Maya but Make the Mongols?*

World temperatures are now back up to the range last seen in the Medieval Warm Period (MWP), a time known to have caused droughts in many areas, warmer moister weather in others. The droughts may have destroyed lowland Maya civilization, as well as Pueblo III culture, and may also have impacted Khmer civilization in Cambodia, and other tropical cultures. Recently, Mongolia has been shown to have had warmer weather, which would have made life easier for forest and grassland Mongols, though harder in the drought-stricken Gobi. Perhaps Genghis Khan could ride out with his hordes because of better horse-rearing conditions. On the other hand, not all of Mayaland fell, and not all Mongols rose. Social and human-ecological factors must have made some differences. The central Maya Lowlands were very fine-tuned, relying on delicate balance. Genghis Khan's eastern Mongol world was especially favored by both climatic improvement and proximity to north China (then controlled by nomadic states). These and other factors evidently mattered along with climate.

[387] *Recent Archaeological Excavations at the Aklis Site, St. Croix, U.S. Virgin Islands*

The Aklis site (12VAm1-42) is a multicomponent prehistoric conch shell midden containing cemetery and habitation components. Large portions of the site are currently subject to damage from rising sea levels and modern disturbances, including looting. Salvage excavations of two sets of human remains in 2012 led to the development of an archaeological field school in 2014, offered by Mississippi State University and in conjunction with the U.S. Fish & Wildlife Service. Survey and excavation focused on mapping the site, documenting, mitigating, and stabilizing the midden deposits, and recovering exposed features, including burials. This paper presents the preliminary results of human skeletal, zooarchaeological, lithic, and ceramic analyses, spatial and geochronological data, and discusses Aklis in a regional cultural context.

Anderson, Lysanna (U.S. Geological Survey) and David Wahl (U.S. Geological Survey)

[408] *Records of Holocene Biomass Burning, Environmental Change, and Human Occupation in the Southern Maya Lowlands*

Fire was arguably the primary tool used by the Maya to alter the landscape and extract resources. Opening of forest for agriculture, building, and extraction/production of construction material necessitated burning. While we understand the fundamental role of fire in Maya land use, there are

very few records of prehispanic biomass burning from the Maya lowlands. Consequently, a limited understanding exists of natural fire regimes and patterns of anthropogenic burning in the tropical seasonally dry forests of Central America. Here we report two new well-dated, high-resolution Holocene records of biomass burning based on fossil charcoal recovered from wetland and lacustrine sediment cores from northern Peten, Guatemala. These macroscopic charcoal data, coupled with previously published environmental proxy data from the cores, are interpreted in the context of regional archaeological records. Results show frequent fires occurred in the closed canopy forests of the region prior to occupation by sedentary agriculturalists. Following the arrival of agriculture around 4600 BP, the ecosystem transitioned from climate to anthropogenic control. Low fire frequency in the Early Preclassic period suggests that intensive agricultural strategies may have been employed earlier than previously thought.

[411] *Local and Inca Cross Regional Interactions: Studies from the Northern Ecuador frontier.*

This paper focuses on the importance of interregional contact along border zones as we seek to understand the nature and impacts of interactions between cultural worlds. We are particularly concerned with how archaeologists construct and methodologically recover evidence of these interactions. Ultimately, and not surprisingly, people within these zones show innovative ways of expanding, exploiting or resisting transfers of knowledge, styles, technologies, raw materials and material culture. Our case study involves the Pais Caranqui of Northern Ecuador during the Late and Inca Periods. XRF studies of obsidian and ceramics display the varied networks were created during these periods to obtain and exchange goods, while ceramic analysis shows the incorporation of non-local "thinware" from the oriente. While these trade networks were established primarily by the indigenous polities before the arrival of the Inca, some networks and products were heavily utilized by the Inca after their arrival in the Northern Highlands, while still others were dismantled or blocked entirely. We see these dynamics play out in particular at the important border zone site of Pukarito. Our paper will thus show the varied nature of these interactions along the frontier and their effect on the social, political and economic realms of Northern Ecuador.

[231] *spike scraper an approach to lithics from Durango*

In this paper, we present a study of one of the most important lithic artifacts used by the chalchihuiteños in Guadiana valley, the spike scraper, which might be the only representative lithic piece for this cultural group in the area. We describe our analytical methods and our typology for these tools and discuss the source of the materials used to its elaboration. Finally, we discuss the possible uses of this tool for the prehispanic inhabitants of Durango.

[36] *The Otherness of Objects? The Material Turn and Historical Archaeology*

The material turn in archaeology – and in humanities in general – has led to a new interest in the non-verbal and non-signifying aspects of the material world. Instead of discussing meaning of objects, issues such as longterm duration and agency of objects have come into focus.

Consequently, many archaeologists have turned away from the textual metaphor to a recognition of the otherness of materiality. However, this material turn has above all taken place in a dialogue with modern ruins and remains, and not in relation to historical archaeology in a broader sense. The aim of this paper, therefore, is to critically discuss some challenges of the material turn for historical archaeology in general.

[188] *The Countless Perceptions of Archaeology in Archaeological Societies: A Case Study Involving the Oklahoma Anthropological Society*

The public has a genuine interest in archaeology of which avocational and amateur archaeological groups are among the most vocal. The greatest area of interest among avocationalists is in participating in archaeological research, which has led eight states to develop and implement archaeology certification programs. These programs are designed to train avocationalists on how to contribute to the professional field and laboratory projects. However, while these state certification programs seek to provide avocationalists with increased archaeological expertise, some states, such as Oklahoma, are struggling to make it beneficial for both avocational and professional archaeologists. In this paper, I use the Oklahoma Anthropological Society's (OAS) recent shelving of and subsequent effort to revitalize its archaeological certification program as a case study. I explore how OAS's professional and avocational perceptions of archaeology have shaped the needs and interests in a collaborative program, such as certification. I also explore how these programs are innovative approaches to sharing information, while promoting public awareness on archaeological stewardship and literacy. This is because these programs demonstrate how, we, as archaeologists are willing to fulfill both our legal and ethical obligations to sharing information, while gaining an understanding and appreciation of our shared heritage.

[35] *Goodson Shelter: Recent Excavations at a Newly Discovered Deeply Stratified Rockshelter in Northeastern Oklahoma.*

Goodson Shelter was discovered by an amateur artifact collector and was first brought to our attention in 2012. The site is an approximately 20-x-7-m eroded sandstone rockshelter situated about 5 meters above a small tributary. Work in 2013 and 2014 consisted of excavation of a 1-x-7-m trench running from outside the dripline to the back wall of the shelter. Deposits are approximately 2 meters deep, and appear to be largely stratigraphically intact. Over 300 projectile points/preforms and tools were recovered from the test trench, and include fluted, Clovis-like bifaces, conical blade core fragments, and large blades from the lowest stratigraphic level. Overlying and stratigraphically distinct from this lower level are points ranging from late Paleoindian, Early-Middle- and Late Archaic, and Woodland time periods. Numerous bone, shell, and antler artifacts and tools were also recovered. Ongoing work at the site focuses on geoarchaeological analysis to resolve formation and chronological issues, analysis of stone tool technology and point morphology (with the immediate goal of determining the cultural affiliation of the fluted biface assemblage from the basal stratigraphic unit), and continued excavation.

[413] *An Intracoastal Waterway and Port System in Classic Period Northwest Yucatán, Mexico*

Archaeological and historical research along the northwest coast of the Yucatán peninsula during the last half century have led to a preliminary reconstruction of a 200 km-long navigable intracoastal waterway between the Celestun estuary and Dzilám de Bravo during the Classic period. Along this waterway are remains of settlements, ports, and port complexes that supported an extensive trade network that connected northern Yucatan to more distant trade networks to the south, via the coast of Campeche and rivers leading into the southern Maya lowlands and beyond.

Angelbeck, Bill (Douglas College)**[400] *Questioning the Capitalist Lens: Anarchism as a Critical Theory for Assessing Sociopolitical Dynamics in the Past***

Archaeologists can view the societies of the archaeological record through the lens of their contemporary experience. I will explore how archaeologists have viewed past societies in terms of their experience within states based in capitalism. Some identify “rational economic actors” primarily as pursuing individual gain, or others find “aggrandizers” as the active, entrepreneurial agents of change in past societies. These arguments propound the socioeconomic dynamics of capitalist societies as if state-market actions were cultural “laws” applicable to most societies, rather than reflections of their own socioeconomy. It’s worth questioning the applicability of Western modes of interaction to non-state societies. I will explore examples with cases from the Northwest past, wherein the capitalist-influenced arguments offered are often in marked contrast with indigenous descriptions and oral histories about their own modes of interaction politically and economically. Anarchism, with its theories explicitly concerning modes of interaction in small-scale or non-state societies, can provide a critical perspective for archaeologists, presenting analytical tools to think about the dynamics of anarchic societies in the archaeological record. For one, it can help us shift from considering historical processes that are individually pushed (centralized and capitalist) to those that are collectively driven (decentralized and communitarian).

Angelo, Dante**[261] *Not All Archaeology for the Public is Public Archaeology***

The concept of public archaeology has become ubiquitous since the last decade and, gradually, it seems to have been accepted as an important component of archaeological research. However, despite the wider popularization of the concept, its operationalization still poses challenges to archaeologists interested in surpassing the academic and professional sphere. Here, I reflect on the procedural guidelines and implications that public archaeology has recently attained and some of the challenges they raise considering study cases in northern Chile. My aims in this presentation are twofold: first, to briefly sketch some of the scenarios in which this concept is commonly thought of or applied to in northern Chile; and, second, to explore the use of public archaeology as a tool to approach the dynamics embedded in the relationships between past and present.

Angourakis, Andreas (University of Barcelona), Matthieu Salpeteur (University of Barcelona), Xavier Rubio-Campillo (Barcelona Supercomputing Center (BSC)), Bernardo Rondelli (SIRIS Academic S.L.) and Sebastian Stride (SIRIS Academic S.L., University of Barcelona)**[73] *Land Use Patterns in the Arid Eurasia: Models and Historical Examples***

The relation between the main variants of pre-industrial economic production in arid Eurasia, from nomadic pastoralism to irrigated agriculture, is known to have been unstable, with abundant examples of conflict and shifting patterns of land use right up to contemporary times. We present a brief review of our experience using Agent-Based models to identify mechanisms and system dynamics that could help explain the different land use configurations, which have been recorded archaeologically for all periods from the Bronze Age up until the contemporary period. Our models helped us to explore the conditions for the stabilization of land use, simplified as discrete portions of land reserved to either mobile livestock breeding and sedentary agriculture. Assuming there is a general economic growth, we experiment with different theoretical solutions to how local stakeholders may respond to a basic economic conflict: matching an ever pushing demand with a

limited resource. By simulating these mechanisms, we achieved insights on the role of environmental, technological and social constraints in land use dynamics.

[300] *Paleoindian Use of the Lake Fork Valley, Southwest Colorado*

For more than a decade, University of Oklahoma archaeologists have teamed with avocational archaeologist Mike Pearce to document Paleoindian use of the Lake Fork Valley (LFV), southwest Colorado. The Lake Fork of the Gunnison River flows from the town of Lake City approximately 50 km north to the Gunnison River in the Upper Gunnison Basin (UGB). Interestingly, however, the Paleoindian record of the LFV differs markedly from that of the better-known UGB. We hypothesize that treating the LFV as simply an extension of UGB Paleoindian occupation may be ill-advised. In this paper, we summarize the early archaeological record of the LFV, focusing on its suite of Paleoindian site types, projectile point technologies, and most importantly, chipped stone raw materials. We contextualize the Lake Fork of the Gunnison geographically and explore whether the proximity of its headwaters to those of the Rio Grande River—just 40 km to the southwest—could hold the key to understanding the role of the LFV in Rocky Mountain Paleoindian lifeways. The Rio Grande is a direct conduit to the San Luis Valley, which has a well-documented Paleoindian record that may share more in common with the LFV signature than does the UGB.

[241] *Horseback Riding and the Unintended Consequences of Innovation*

Every technological innovation carries a social agenda, usually one that was not intended or even foreseen by its inventors. The domestication of the horse in the Eurasian steppes probably was initially an attempt to secure winter-adapted meat animals, but horseback riding transformed the initial innovation into a revolution in transport. Riding made steppe herding more efficient, transformed tribal raiding, and eventually was combined with wagon transport to create a new way of life based on mobility that domesticated the steppe environment and transformed European populations.

Anthony, Alexander

[301] *The 1912 Grave Desecration of the Milwaukee County Institution Grounds Poor Farm's Cemetery*

This research looks at the institutional desecration of graves at the Milwaukee County Institution Grounds as overseen by Superintendent Ferdinand Bark, the reaction of the surrounding community to that disturbance, and the ensuing investigation. The paper also explores the relationship of this historical event to the evidence from the 1990s and 2013 archaeological excavations conducted at the location of the cemetery. The event will be viewed within the historical context in which it happened including a basic background of Ferdinand Bark and the circumstances of the Milwaukee County Grounds when he assumed control in 1904. The increasing need to find space in which to inter a growing number of deceased individuals from on the County Institution Grounds as well as the surrounding community within very limited cemetery bounds posed a significant problem for Bark. The paper also explores the community reaction to this desecration as related through local newspapers of varying readerships. Finally, the archaeological correlates of this event are examined, as are the difficulties in interpreting the archaeological record of expected mortuary behavior on the Milwaukee County Institution Grounds.

[237] *Intermediate Scale Socio-Spatial Units, Collective Action, and the State in Cross-Cultural Perspective*

Collective Action Theory posits that states are the outcome of bargaining among the individuals, groups, and factions that make up the political community. Thus, the nature of intermediate scale socio-spatial units or social organizations that exist hierarchically between individual households and the state (e.g., corporate groups, clans, neighborhoods, communities, patron-client networks, etc.) plays a key role in determining the political-economic strategies employed by the architects of the state. Because the social construction of and the relationship between these units and states take myriad forms across space and through time, we draw on systematic cross-cultural research based on archaeology, history, and ethnography from around the world to elucidate the forms that these units take and the ways that they pressure, resist, work with, or ignore the political agents of the state. We place special emphasis on illustrating how these units are physical materialized on the landscapes of states and cities and how these structures or spatial organizations shape larger patterns in settlements, production strategies, and monumental construction, and, thus, the materialization of power in premodern states.

[78] *Mortuary Variability and Chronology of the Cliff Tombs of La Petaca*

The Chachapoya of the eastern Peruvian highlands utilized various methods for disposing of their dead, but almost all involve highly visible spaces. While some regional variation is found among what are typically considered Chachapoya mortuary spaces, there is evidence for social cohesion within each site. While few mortuary complexes of the Chachapoya have been excavated, La Petaca provides the opportunity to scientifically study intrasite variation. On only half of the mortuary complex's massive vertical wall we documented 112 constructions including tombs, platforms and walkways, as well as several caves, niches and rock shelters, all of which contained mortuary remains. By using techniques of vertical archaeology, we collected cultural, skeletal and organic samples for analysis and radiocarbon dating. Unfortunately, many of the contexts had been damaged by looting and natural taphonomic processes. There was some variability in construction methods, materials, architectural design, and location across the site, yet generally common features suggest 1) mortuary style was adapted to the precarious location, 2) there was little change over time, 3) few builders were involved, or 4) they reflect a single cultural tradition. Overall, these new, firsthand data yield valuable information on the importance of mortuary spaces and the regional complexity of the Chachapoya.

[304] *We've Gotta Get Out of this Place: Formation and Resettlement of a Pre-Classic Hohokam Village*

It has long been thought that large Hohokam villages, once established, were long-lived and fixed in a single location. La Villa, a pre-Classic Hohokam village on Canal System 2, was one of the largest in the area. It has roots that stretch as far back as the Red Mountain phase and had achieved village status by Vahki times. The village continued to grow through the Pioneer Period, and much of the Colonial Period. Toward the end of the Colonial however, we see a sharp drop-off in both ceramics and residential structures. It is clear that residents were moving away from this long-standing settlement and few were still living there by the beginning of the Sedentary Period. When did La Villa

begin to shift from a village in florescence to one of diminishing importance, and where did its inhabitants go? One thought is that they moved downstream along the same main canal to Las Colinas, a Hohokam village thought to be established during the late Colonial Period – the same time that La Villa began to decline. Recent excavations by Desert Archaeology, Inc. provide data that can be used to address these important questions.

Arakawa, Fumiyasu (New Mexico State University)

[292] *Unraveling Sociopolitical Organization using Lithic Data: a Case Study from an Agricultural Society in the American Southwest*

Archaeologists that conduct research in agricultural societies of the American Southwest have contributed little discussions and interpretation regarding sociopolitical organization using lithic data; several negative factors may be at the root of the problem. These factors include (1) archaeologists in the American Southwest have developed a remarkable level of pottery analysis that allows for the reconstruction of some aspects of sociopolitical organization, (2) none has developed a comprehensive debitage analysis technique that allows for the understanding of sociopolitical organization using lithic data, and (3) archaeologists have not fruitfully developed research questions regarding sociopolitical organization using lithic data. In this paper, I demonstrate that the study of tool-stone procurement in agricultural societies has tremendous opportunities for archaeologists to understand and reconstruct sociopolitical organization. To support my points, I discuss the results from a lithic analysis conducted in the central Mesa Verde region of the American Southwest.

Araujo, Adauto (organized session) and Karl Reinhard (University of Nebraska, Lincoln)

[127] *Parasites in Antelope Cave*

Human and animal coprolites revealed an interesting group of parasites, some of which have never been found before in archaeological context. The Rocky Mountain Wood Tick, *Dermacentor andersoni*, was found in two human coprolites. These were probably crushed and ingested. Acanthocephalan eggs found in the human coprolites were consistent with *Macracanthorhynchus ingens*. This is the first well-documented infection among Ancestral Puebloans and suggests that people at Antelope Cave had different preferences in insect foods than at other sites in the Pueblo region. Eggs of the intestinal pinworm (*Enterobius vermicularis*) were found in the coprolites. This was the only species specific to humans found. Pinworm reached remarkably high levels at some Ancestral Pueblo sites. At Antelope Cave, 23 percent of the coprolites were positive for this species. This indicates that the people who used the cave lived in crowded conditions at least temporarily during parts of the year. Two of four dog coprolites were positive for the canid whipworm, *Trichuris vulpis*. This was the first find of this parasite in the archaeological record. In conclusion, the people who used the site show a unique mixture of the Great Basin paleoepidemiology dominated by acanthocephalans and that of the Ancestral Puebloans dominated by pinworm.

[208] *Variations in Cranial Vault Modification at Uraca, Majes Valley, Peru*

Cranial vault modification was a prevalent type of body modification practiced throughout the ancient Andes. It was achieved by binding the head during childhood, which left the crania permanently

altered into adulthood. Different methods of binding led to visually different forms of modification, which likely marked membership in different ethnic groups. Researchers have documented three major modification styles in the Andes: tabular oblique, tabular erect, and circumferential. Recent excavations at Uraca, a Middle Horizon (600-1000 A.D.) cemetery associated with the petroglyph site Toro Muerto exhibit a divergent, local style where only the occipital bone is modified. This project describes the range of modification forms encountered at Uraca as compared to other regions of the Andes. This project examines the level of diversity of cranial vault modification forms between Sector I, which is closer in proximity to Toro Muerto, and Sector II, which is further away. If modification styles are highly diverse in individuals buried near Toro Muerto, this would show that people from throughout southern Peru had access to the petroglyphs at Toro Muerto. If individuals consistently display the local style, this could reflect low migration rates, or that interment at Uraca was restricted to local Majes residents.

Ardelean, Ciprian (University of Zacatecas, Mexico) and Juan Ignacio Macías-Quintero (Universidad de Ciencias y Artes de Chiapas, Mexico)

[317] *Rockshelters and Caves of Central-Northern Mexico: Archaeological Potential and Limitations, Sources for Paradigms and Landscape Markers*

Caves and rockshelters throughout the highlands and sierras of Central-Northern Mexico have always represented an important point of reference for prehistoric archaeology and were traditionally targeted as the most reliable contexts for the understanding of hunter-gatherer societies and the establishment of cultural-historical models. However, the paradigms created on basis of the excavation of such sites affected rather negatively archaeological thinking in Mexican archaeology. Caves and rockshelters are unevenly distributed and poorly investigated. Modern re-occupations and disturbance are high and depositional processes are diverse and far from properly approached. A reconsideration of their potential and the acknowledgement of their particularistic cultural dimension is required. The use of such landscape features for funerary purposes is perhaps the better known and most expected function among local scholars. However, the actual use of caves among prehistoric societies of ancient Mexico is still far from being clear. Several caves and rockshelters in Zacatecas and Aguascalientes are presented in order to analyze their cultural importance and their paper as landscape markers, since the times of the first inhabitants until today.

Ardren, Traci (University of Miami)

[344] *Don Pablo, Cha Chaak Ceremonies, and Archaeological Interpretation*

Don Pablo Canul, a Yucatec Maya h'men living in the village of Yaxunah, appears in vignettes throughout *A Forest of Kings*. Participation in ceremonies led by Don Pablo was a regular component of the Yaxuna Archaeological Research Project under the direction of David Freidel, and these experiences provided a strong and vibrant example of 20th century Maya culture in Forest of Kings. Many archaeological projects in Yucatan have collaborated with or employed the services of Maya h'men since the earliest research projects of the 1940's. This paper will explore Don Pablo's biography within the context of the history of collaboration between archaeologists and Yucatec h'men with the objective of exploring how such partnerships have shaped the interpretation of ancient Maya archaeological materials. While such partnerships have a long history in Yucatan, few archaeologists included the voice of Maya people in their written interpretations prior to this landmark volume by Schele and Freidel.

[95] *Learning from the Past: Cinder Mulch Agriculture Past and Present*

Cinder mulch agriculture has been studied in relation to the archaeology of the Flagstaff, Arizona, area since Colton in the 1930s; with several experimental studies assessing the agricultural benefits

of this method. Recently, local gardeners in the Flagstaff area have begun experimenting with using cinder mulch on their own gardens. This provides an opportunity for public outreach and for archaeologists and the local gardening community to learn from each other. Gardeners gain the benefits of the archaeological studies of this and other agricultural methods. Archaeologists potentially reach a new and very engaged audience interested in understanding agricultural techniques adapted to the local environment, as well as gaining some qualitative information on the opinions of experienced gardeners. Cinder mulching has recently been implemented as a water conservation method at the Bonito Street Community Garden in Flagstaff, which has provided an opportunity to educate the public on the archaeology of their local area, as well as illustrating its relevance to the present.

Arguelles, Amaranta (Proyecto Templo Mayor)

[298] *A Model of the Universe at the Foot of the Templo Mayor of Tenochtitlan. An Approach to Its Meaning.*

In this paper I will present the study of five offering containers found during the seventh field season of Templo Mayor Project in Downtown Mexico City. The shape of these stone boxes buried in foundation of the main plaza of Tenochtitlan (around 1486 C.E.), is one of the most important aspects of this ritual complex. They were deposited in the shape of a cross: one was placed in the center, while the others were buried in the cardinal points, representing a Quincunx, a model of the universe. The central offering contained thousands of ritual goods and their distribution was also a schematic recreation of the shape of the world. Symbols of water, fertility, war and sacrifice were buried in this cosmic model. In this deposit the Mexica recreated their cosmology of the world and its future. In contemporary Mexico, it is possible to find memories of these type of rituals in some indigenous communities. Through the study of these practices I hope to contribute to the understanding of these cosmogonic performances in the past.

Arias, Pablo (Universidad de Cantabria) and Esteban Álvarez-Fernández (Universidad de Salamanca)

[74] *By the Seaside: The Role of Marine Resources in Northern Spain from the Late Paleolithic to the Neolithic*

Cantabrian Spain is a privileged area for a diachronic study of the relationship between human societies and marine resources. The region boasts one of the highest densities of Upper Paleolithic and Mesolithic sites in Europe, and a long and dense tradition of archaeological research, especially in the coastal areas. Moreover, its continental shelf is very narrow, so the preserved sites are closer to the late Pleistocene shoreline than in other parts of the Continent. This paper presents a summary of current research on the use of marine resources during the late Paleolithic, the Mesolithic and the Neolithic in northern Spain. Information on settlement patterns and on the exploitation of fish and marine invertebrates is summarized, and indirect evidence of other types of activity is discussed. Finally, the evolution of the economic relevance of the marine environment and its relationship with the rising of the sea level and the climatic change are assessed. Information on social and symbolic aspects of the relationship between the human groups and the sea are also discussed.

[107] *Alimentación y Sociedad. Paleodieta de una Población Muisca de la Sabana de Bogotá, el caso de Tibanica-Soacha*

El presente estudio fue llevado a cabo combinando información arqueológica, bioantropológica y análisis químico de hueso, específicamente de isótopos estables en una muestra muisca del sur de la sabana de Bogotá. Como objetivo principal se buscó la reconstrucción de la dieta antigua de la sociedad muisca tardía asentada en Tibanica y su relación con aspectos sociales. Específicamente, la investigación estuvo orientada a comparar la relación isotópica de una muestra de 200 individuos con el fin de buscar si existió alguna diferencia dietaria entre los individuos de élite y no élite. A su vez establecer semejanzas y diferencias en el acceso a los recursos de acuerdo a la edad, sexo y pertenencia a los diferentes grupos de distribución del sitio arqueológico. Los resultados de los

análisis isotópicos indican el consumo de dieta mixta por parte de todos los pobladores muiscas asentados en Tibanica. Adicionalmente, se puede decir que tanto los grupos de élite como los de no élite consumieron los mismos productos, pero en cantidades diferentes. La diferencia mas evidente se encuentra en relación al género. Esta información permite pensar acerca del modelo económico muisca que ha sido discutido ampliamente en el contexto colombiano.

Arjona, Jamie

[108] *Things that Queer: Disorienting Intimacies in Late Nineteenth Century Jooks*

This paper examines late nineteenth and early twentieth century jook joints as sites that generated queer African-American intimacies and animacies. Emerging in the 1880s throughout much of the rural United States, jook joints crafted a performatively queer medium within African-American communities. Particularly in the rural south, these jooks offered a haven for black music, dance, gambling, prostitution, and alcohol consumption that disoriented expectations of temperance and frugality. Drawing from affect theory, queer theory and ontological approaches to materiality, I attempt to understand how jook atmospheres generated intimate connections between people and things that were, in turn, condemned by a host of black leaders. The animate assemblage of performers and materials that once resided in these rural spaces contested models of reproductive futurity and craft a focal point for understanding affective disillusionment captured in material attachments.

Arksey, Marieka (University of California, Merced) and Holley Moyes (University of California, Merced)

[193] *Keeping it Natural: Ancient Maya Modifications of the Ritual Landscape Outside of Caves*

From as early as 1000 B.C., the Maya considered caves to be sacred features of the landscape and used them as ritual spaces. Performances associated with caves served not only the ruling elite in reaffirming their right to rule, but the entire community's confidence in their rulers. These performances became increasingly important in times of crisis, such as during the Late Classic Maya 'collapse' when a series of droughts aggravated the overcrowded, over-farmed, and deforested localities which grew increasingly dissatisfied with their rulers. While we know that modern Maya use the spaces outside of caves for rituals, no one has yet investigated how these spaces functioned for ancient people. Using a combination of both cognitive methods and traditional excavation techniques, I compare the modifications to the landscape outside of several different caves in Belize. These investigations have revealed that the spaces outside cave entrances were modified for the first time during the Late Classic period, providing an ideal paradigm to begin to address how these ritual spaces were used to reinforce social rules and norms during a time period associated with the rising political complexity and the subsequent failure of Maya kingship and social hierarchy in the Maya Lowlands.

[171] *Investigating Prehistoric Obsidian Source Utilization in Birch Creek Valley, Eastern Idaho*

The Birch Creek Valley of eastern Idaho lies just west of the Continental Divide in a region containing numerous obsidian sources. Although the rich archaeological deposits contained within this high desert area were first investigated more than fifty years ago, relatively little excavation-based research has occurred there since the late 1960s and our understanding of ancient lifeways within the Birch Creek drainage remains superficial. This paper presents the results of recently conducted obsidian provenance analysis from four sites that occur in three different ecozones (valley margin, foothills, and uplands) with emphasis on broad patterning in obsidian source use and settlement practices of Native peoples who occupied the area. We also address the challenge of determining

the most proximate procurement locations for obsidian from the Walcott Tuff, which yields artifact-quality volcanic glass of ash-flow origin exposed in numerous geological contexts across a broad swath (~ 35,000 km²) of the adjacent eastern Snake River Plain. Obsidian of this chemical type was commonly used by prehistoric Birch Creek residents, and may have been obtained from a number of highly dispersed deposits in eastern Idaho.

Arkush, Elizabeth (University of Pittsburgh)

[285] *Coalescence and Conformity at the Ayawiri Hillfort, Peru: A Social Experiment under Duress*

Defensive settlements are often places of relatively rapid, dense nucleation by people with few viable alternatives, resulting in the imperative need to establish new consensual rules for living together. In the Titicaca Basin of Peru, after the collapse of the Tiwanaku state, old political relationships were abandoned and defensive security became essential. In the post-collapse period, large hillfort towns formed by the aggregation of multiple families. What behaviors and attitudes were adopted in these forcibly nucleated places, and how did they mitigate scalar stress (or not)? I draw on Kowalewski's concept of coalescence, the aggregation of threatened populations into large new communities, a concept initially developed for historic Native American societies of the southeastern US. Coalescence creates the pressing, conscious need to rapidly reformulate the most basic, intimate logics of sociality and the material and spatial realm through which they work. Notably, it typically involves corporate leadership or collective decision-making rather than centralized political hierarchies. Recent investigations at Ayawiri (Machu Llaqta), a densely settled hillfort of the western Titicaca Basin, shed light on the process of coalescence, the nature of social life within the defensive community, and the workings of conformity, publicity, and social distinction.

[177] *Biographies of Enclosure: An Introduction*

The papers in this session explore the extended biographies of prehistoric enclosures, bringing together researchers from several geographical areas and periods. Although archaeologists have been drawn by the often monumental qualities of prehistoric enclosures, the act of enclosure was frequently just one episode in long-lived and/or recurrent patterns of human activity at significant places in the landscape. The European focus on the concept of the 'hillfort', for example, has tended to abstract many later prehistoric enclosures from their longer-term histories as special places whose meanings altered markedly through time. This presentation introduces these issues, drawing on evidence from the SE Scottish hillfort of Traprain Law. From the Late Neolithic onwards, Traprain Law was a place of primarily religious, funerary and cosmological significance. Archaeological evidence includes the creation of rock art panels in the Late Neolithic and Early Bronze Age, the presence of Early Bronze Age burials, and the deposition of fine metalwork in the Later Bronze Age. During two brief episodes, however, in the 9th century B.C. and 1st-4th centuries A.D., the hill became a focus of dense, high-status occupation. This paper examines how far each episode of human engagement with the hill drew upon earlier accretions of meaning.

Armstrong, Aaron

[356] *Taphonomic Evidence for Human Accumulation of Small Mammals from Pinnacle Point Site 5-6 and Other MSA Sites in South Africa*

Our capacity to detect the utilization of small prey resources by MSA humans can help shed light on subsistence strategies, cognition, and social organization during this critical period in human evolution. Recent analyses of South African MSA faunas suggest an expansion of dietary breadth after ~100 ka with the increase in the exploitation of small mammals (<5 kg) during MIS 4, but until now there has been little taphonomic evidence to support these conclusions. I present the results of

a taphonomic study of 6,051 faunal specimens sampled from throughout the 91-50 ka late Pleistocene occupation at Pinnacle Point Site 5-6. Small mammals account for just 3% of the sample and specimens are only moderately preserved; despite these limitations, there is some evidence of cutmarked and calcined bone suggesting human contribution. These results, which consider the origin, abundance, and preservation conditions of small mammals at PP5-6 support my dissertation work at Die Kelders where I have shown the MSA humans were recurrently exploiting small mammals. With rigorous taphonomic documentation of South African MSA small prey accumulations, causal factors such as environmental change, population pressure, and advanced technologies can be more thoroughly addressed.

Arneborg, Jette (The National Museum of Denmark)

[351] *Vulnerabilities and Failure of Building Resilience in Norse Greenland*

The Norse colonies in SW Greenland were established in the late 900s and depopulated in the middle of the second half of the 1400's. In the Nordic Temperate Zone, pastoralism clearly was at its environmental limits in Sub Arctic SW Greenland. Still, adaptation to the new environment has been described as successful, and depopulation in the late Middle Ages is considered a consequence of economic specialization. This adaptation left the Norse Greenlandic society less resilient and more vulnerable to cope with climate change and a changing world system (Dugmore et al. 2012). In my paper I will explore further the vulnerabilities of the Norse society and the failure of building resilience at a community level with particular respect towards different groups of the society.

Dugmore, A.D., T.H. McGovern, O. Vésteinsson, J. Arneborg, R. Streeter and C. Keller: Cultural adaptation, compounding vulnerabilities and conjunctures in Norse Greenland. PNAS 109(10)3657-3663.

[382] *The Group Within the Group: Carter Ranch Pueblo and the Chaco Regional System*

Fifty years ago Paul Martin and John Renaldo of the Field Museum of Natural History directed the excavation of Carter Ranch Pueblo in the Hay Hollow Valley of east central Arizona. Decades later, archaeologists recognized a regional system of settlements in and around the San Juan Basin linked to great houses in Chaco Canyon via roads and highly visible material cultural characteristics. Although Carter Ranch Pueblo displays typical Chacoan attributes, its inclusion within the Chaco regional system has not been widely accepted. I compare the architectural, material cultural and chronometric characteristics of Carter Ranch Pueblo to sites more commonly accepted as Chacoan outliers within a framework of historical processualism to infer the relationship of Carter Ranch Pueblo to the Chaco regional system. I conclude that, rather than a product of migration from areas closer to Chaco Canyon or emulation by outsiders, Carter Ranch Pueblo represents willing participation in the Chaco regional system by local populations.

Arnold, Jeanne (UCLA, Department of Anthropology)

[32] *It Takes a Village: Mainland and Channel Islands Population (Labor) Resources through Time*

This presentation traces population estimates of the Chumash peoples on both sides of the Santa Barbara Channel through several thousand years, examining how researchers have arrived at those estimates and where possible suggesting how we might need to adjust both some of our assumptions and some of the outcomes. This review should be useful in further examining other phenomena such as sizes of labor forces available for the intensive Channel Islands specialized craft production industries (microliths, shell beads) or dietary requirements for subregions experiencing stressors such as drought. Comparatively robust community sizes on both the south coast mainland and the larger islands, particularly during the late Holocene, make clear that labor pools and leadership were well-established but may have responded differently to ecological instabilities. In no phase is a characterization of the islands as 'marginal' in human resources appropriate.

Arnold, Bettina (U. of Wisconsin-Milwaukee) and Manuel Fernandez Goetz (University of

Edinburgh)**[285] *Building Community: The Heuneburg Hillfort as Monument and Metaphor***

Walls are assumed to serve as systems of containment and protection in response to social divisiveness, but they may also serve to reduce or mask conflict within a society. Their physical form may be entirely expedient, largely symbolic, or some combination of the two. Early Iron Age settlements in west-central Europe were often situated on promontories with wall and ditch systems encircling portions of the occupied terrain, but because of the daunting task of excavating such hillfort sites, which can have deposits of many meters, relatively few sites have been extensively documented and our picture of the significance, both functional and symbolic, of these sites remains incomplete. The Heuneburg hillfort on the upper Danube River in southwest Germany is one of the few such sites to have yielded decades of data and the most recent excavations there, together with the application of new technologies, including LIDAR and various forms of remote sensing, have produced intriguing new evidence for the complexity of the hillfort phenomenon in this region.

The Santa Clara Valley has an archaeobotanical record that spans from the central California Early, Middle, and Late periods. Sites CA-SCL-12, -478, -674, and -919 have robust plant remains assemblages from distinct periods that can be used to evaluate change in plant use and land-management practices. Temporal context and habitat will be compared for each site to understand variation in plant diversity and intensification.

Arpin, Trina (Independent) and Harris Greenberg (Boston University)**[190] *Where's the Beef? The Value of an Interdisciplinary Approach to PPN Features***

The anthropogenic landscape of a prehistoric site is made up of artifacts, structures, and features. However, the three do not receive equal attention. Features--by which we mean stationary but non-structural evidence of human activity--are usually the least analyzed. Inspired by Paul Goldberg's work on Paleolithic hearths, we hope to bring a new, more inter-disciplinary look at some of these less-studied elements of the anthropogenic landscape. To do so, we will expand the study to a later time period, the PPN of the Levant, with a special emphasis on the southern Levant. This paper accomplishes three goals: first, a summary and characterization of the types of features commonly found within the PPN of the Levant and a discussion of what they are, what information they contain, and how they are treated in the literature. Second, drawing on our own research, as well as already published results, we provide examples of the microstratigraphic study of selected features from PPN sites. These data will demonstrate the value these studies in expanding upon the interpretations made in the field. Third, we will use our results to suggest new protocol for documenting and sampling such features in the future.

The site of Naranjo, located in the Central Maya highlands of Guatemala has an important occupation that begins around 800 B.C. Here, many important rituals took place, some of them connected to the calendar and others as part of pilgrimage activities. Naranjo was part of a wider network of interaction as documented in the ceramics, site layout, sculptural practices, and figurine inventory. By 400 B.C.E., the site was abandoned and continued like that until the Late Classic when a specific ritual activity was documented. This paper will present evidence of ritual activities from the Middle Preclassic and Late Classic at Naranjo and the relationship of these activities with neighboring sites and others beyond its borders.

[370] *The Late Pleistocene Fauna of Hoyo Negro*

The fauna from Hoyo Negro Cenote preserves a diverse fauna represented by a large amount of bones from both human and animals. To date eleven species of extinct and extant animals have been identified. Extinct animals include the highland gomphothere (*Cuvieronius tropicalis*), two species of giant ground sloth (the Shasta ground sloth *Nothrotheriops shastensis* and a previously unknown member of the *Megalonychidae*), and the sabertooth cat (*Smilodon fatalis*). Modern species, include taxa that are now extralimital such as bobcat, (*Lynx rufus*) and coyote, (*Canis latrans*), as well as Baird's tapir (*Tapirus bairdii*) and the collared peccary (*Tayassu peccari*). Short-faced bears (*Tremarctinae*) also occur in the assemblage and may represent a new variation of this South American lineage. Based on the faunal composition there are elements representing both the Neotropical (large "Xenarthrans" and gomphotheres) and Nearctic (carnivores, perisodactyls, artiodactyls, lagomorphs) affinities, and probably some endemic animals, like the magalonychid ground sloth and the tremarctine bear, which warrant further studies. The presence of bobcat and coyote, as well as the easternmost occurrence of the Shasta ground sloth indicate a drier, cooler habitat during the terminal Pleistocene, which is supported by findings in dry caves in the Yucatan Peninsula.

[174] *Looking into the Dark: Investigating Four Holocene Shelter Sites in Southwest Ethiopia*

Preliminary excavations from the Gamo Ethnoarchaeological and Archaeological Research project in southwest Ethiopia include three caves and one rockshelter, located on the western escarpment of the Great Rift Valley. The analyses of these four mid-altitude (average 2135 m) sites will add to our understanding of the cultural, ecological, and technological transitions occurring within the last 6000 years. The cave and rockshelter sites indicate the use of a classic Later Stone Age lithic assemblage, the onset of pottery use, as well as changes in subsistence from a wild to domesticated fauna and flora. We hope to better discern how Holocene people constructed new landscapes and technologies utilizing lowland and highland resources such as stone, fauna and flora in their transition from foraging to a pastoral/agricultural way of life. Furthermore, we compare and contrast our preliminary research results from the Gamo region with extant published information from other shelter and cave sites within Ethiopia.

Arthur, Dr. Kathryn (USF St. Petersburg)

[340] *Instigating Technological Knowledge through an African Ontology*

This paper focuses on the relationship between material culture and living peoples as constructed through an African perspective of what it means to be in existence--ontology. It is critical that we precedent descendant theories of the human and nonhuman world to produce meaningful narratives of the past, to avoid alienation and ethnocentrism. The Borada-Gamo of southern Ethiopia offers that their worldview enlightens their knowledge of technology. Material culture as spiritually animated has the potential to earn status and worth through gestation in rites of passage. Ironworks, ceramics, stone tools, houses, and food transform through four ritual stages that include birth, maturation in seclusion, adulthood in private households, and elderhood in public marketplaces. These life cycle stages, reproduction, serve as the process for being and as the mnemonic structure for organizing complex farmer and artisan technological knowledge surrounding the production of resources critical for human welfare. Importantly, the life cycle structure births a dialogue between people and materials, such that each instigates metamorphism in the other.

[284] *Detecting Mounds Using Airborne LiDAR: Case Studies from Iowa and Minnesota*

Between 2009 and 2012, researchers at the the University of Iowa Office of the State Archaeologist (OSA) conducted a number of pilot studies in the application of airborne Light Detection and Ranging (LiDAR) to find and map prehistoric burial mounds. Studies were conducted in Iowa and Minnesota, two states that have invested in high quality, statewide LiDAR data. These studies began with the master's thesis research of OSA GIS specialist, Melanie Riley, and included the NCPTT-funded development of LiDAR Surveyor, a GIS-based model that processed LiDAR data looking for the characteristic conical topography of mounds. The studies have demonstrated that publicly-available LiDAR data from Iowa and Minnesota are capable of detecting mounds only 30 cm in height. We have found that LiDAR successfully detects a relatively high percentage of mounds known to exist at previously recorded sites. LiDAR Surveyor has proven successful at identifying previously unknown mounds, and is able to weed out "false positives," although we have found that field confirmation of results, no matter the method used, is absolutely essential.

[18] *Craft and Identity in the Viking World*

When considered at all, objects of bone and antler tend to be discussed in functional terms. Occasionally, ornate objects such as hair combs may be seen as communicators of information. In this paper I will argue that if such objects tell us anything about identity, it is not through their form or ornament, but through the tradition in which they were made. Crafts are grown out of tradition, which means that objects are reservoirs of important cultural and social information. For the early-medieval period, this potential remains largely untapped. I will focus on combmaking as an important community practice in Viking-Age Britain, Ireland, and Scandinavia, and will explore the ways in which novel approaches to technology, alongside leading-edge analytical processes that may illuminate questions of raw material supply and provenance, can help us to learn about the people who made and used these objects.

Ashmore, Wendy (University of California, Riverside)

[344] *Macaw Mountain and Ancient Peoples of Southeast Mesoamerica*

In *A Forest of Kings*, Linda Schele and David Freidel captivated readers with substance and inference about multiple Maya cities and their inhabitants. For Copan, they focused on long- and short-term developments culminating in the death of its last effective king, Yax Pasaj Chan Yopaat, whose death effectively coincided with the end of both dynastic rule and social cohesion at Macaw Mountain, Copan. Extraordinary finds and ideas have come to light since that 1990 publication, things those authors couldn't have known when they wrote. The time is right to explore briefly some theoretical, substantive, and methodological advances for interpreting people's lives and practices in culturally diverse societies of what are now parts of Guatemala, Honduras, and El Salvador. Freshly discriminating models and innovative analytic methods continue to enrich greatly our understanding of people, politics, and lived experience at Classic Maya Copan and its vexing subordinate Quirigua, as well as a growing range of their neighbors, whether allies, foes, subordinates, or other. Much remains as told in *A Forest of Kings*, and as its authors foresaw in their prologue, at least as much has augmented the narrative in the subsequent 25 years.

Asouti, Eleni

[414] *Climate Instability and the Origin of Farming in Southwest Asia*

Prevailing theories concerning the role of climate change in the transition from foraging to farming in SW Asia view socioeconomic change as a response to climate deterioration (push theories) or improvement (pull theories) which caused resource depression or abundance respectively. With this paper I propose that periods of socioeconomic and cultural innovation correlate with periods of climatic instability, which occurred at the timescales of direct human experience of the landscape (i.e., at the individual, generational and inter-generational scale). Climate instability generated suitable contexts for the development of inter- and intra-group information exchange and community interaction networks coinciding with the development of elaborate symbolism, laden with landscape themes and motifs that were widespread across the geographical and socio-cultural divides of early Holocene Southwest Asia.

[249] *A Study of the Role of Cannibalism in Aztec Culture*

It is generally agreed upon that the Aztec practiced cannibalism, but scholars have proposed various hypotheses explaining what function this practice had in the Aztec culture. This study focuses on the nature and ritualistic function of Aztec cannibalism. The Aztec would only consume the flesh of outsiders, mostly war captives, as part of religious rituals which provided a foundation for their culture. A detailed examination of the ethnohistoric and archaeological evidence for cannibalism among the Aztec considers the work of Bernadino de Sahagún and other contemporary authors, compares it to the archaeological record, and evaluates some of the theories that have been

provided by scholars in light of these data. The views of Marvin Harris, Michael Harner, and others are evaluated. The social unity provided by public ceremonies may provide a better explanation for cannibalism than does the argument for nutritional needs.

[294] *Wood Foraging in the Tree-Limited Environment of the Cape Floral Region of South Africa*

Wood is an essential resource for hunter-gatherers. It is necessary for cooking fuel, heat, and potentially safety, and hence influences site location choice and group size. Due to a low diversity and abundance of trees, wood may have been a limited resource for early humans in the Cape Floral Region (CFR) of South Africa. Drawing from behavior ecology foraging models, experiments with modern wood foragers were conducted to test this hypothesis. Foragers were observed collecting indigenous wood fuel species in the seven biomes present in the CFR and central place foraging models were applied. Experimental fires were also performed to assess the quality of the wood fuels. Preliminary results indicate that woody fynbos species provide sufficient fuel for human needs in a stable environment, despite the low abundance of tree wood. Future experiments will investigate how fire events and depletion due to human exploitation affect wood availability. Results will be built into an agent-based model of the paleoscape of the CFR.

[405] *Slavery and Memory in French Guiana: Designing the Commemoration of Memory at the Loyola Cemetery while Respecting Sensibilities of History*

Our paper reflects on the development of a commemoration concept which takes into account the sensibilities of descendants from the slave trade period in French Guiana. Memory of the trade period is indeed a very sensitive issue among residents of most Caribbean Islands, and we use sixteen years of research at one site to present the various questions with which we are confronted in order for the local population to appropriate the spirit of place. The Loyola Habitation was located at 10 km from Cayenne, and under Jesuit rule it comprised an area making slightly over 1000 hectares; at one point, there were nearly 500 slaves whom toiled at the production of a number of cash crops such as sugar, coffee, indigo, rum, etc. under the supervision of a handful of missionaries. From the remains of the cemetery where approximately 1000 people (Slaves, Amerindian and White land owners) have been interred, our motivation is to draw the fine line between commemoration of memory and glorification of history.

[155] *Geoarchaeology, Paleobiology, and Archaeology of Rockshelters and Caves from Valencia (Spain)*

Cave and rockshelter stratified sites from Mediterranean Spain are the result of the accumulation of time-averaged palimpsests that probably do not represent the normal range of human activities on the landscape. We focus the discussion on understanding the nature of human responses to climate changes, and we argue that different erosive and removal events in several Mediterranean sites had been decisive in our vision of the end of the Paleolithic-Epipaleolithic and the beginning of the Neolithic. Nevertheless, caves and rockshelters have produced geoarchaeological, radiometric, paleobiological, archaeological and ethnographical data that could be used as proxies for systematic recovery of materials needed for eco-dynamics research. The goal of this contribution is to present long-term trends concerning the human populations in Valencia (Spain), a micro-region of Mediterranean Iberia, between the late Upper Paleolithic and the beginning of the Neolithic (ca. 20–6 ky calBP). Data about the use of the caves by shepherds in the twentieth century, which has affected the preservation of archaeological sites, are also included.

[314] *Birds, Monkeys, and Shapes, Oh My! Investigating Intersecting Motifs on Ceramic Vessels, Stamps, and Candeleros*

Ongoing design description and analysis have revealed commonalities in the decoration of diverse ceramic artifact classes. Here we outline the specifics of these design features, focusing on depictions of monkeys and birds, geometric designs such as crosshatching and dots, and how these are used individually and in combinations. The use of similar designs on diverse pottery artifact classes suggests a commonality of accepted design elements, although there are differences between classes in design grammar. Thus, in addition to discussing the motifs themselves, we summarize our work to date on design grammar, with particular attention to the Late and Terminal Classic periods in the Middle Chamelecon area of SE Mesoamerica.

Austin, Anne (Stanford)

[240] *Fragmented Bodies and Splintered Coffins: What Can They Tell Us about Ancient Egyptian Mortuary Practices?*

Intrusions into the burial chamber directly impact the mortuary assemblage, often erasing the purposeful placement of grave goods and destroying the peaceful preservation of the body. So what can these palimpsests of havoc actually tell us about original mortuary practices? In this talk, I answer this question through analysis of Theban Tomb 290, the ancient Egyptian tomb of Iry-Nefer. This tomb, studied in 2013-14 as part of the French Institute mission at Deir el-Medina, contains up to 70 individuals from the 19th through 21st dynasties. Through a qualitative analysis of the state of preservation of the bodies in combination with a quantitative analysis of the minimum number of elements, I determine the primary ways bodies in this Egyptian tomb were fragmented after burial. I then use Egyptological research into post-depositional looting in antiquity and modernity to determine how the reuse of grave goods impacts fragmentation of the body in Egyptian tombs. While post-depositional processes can fracture evidence for ancient Egyptian mortuary practices by damaging key areas such as the head and pelvis, they also offer unusual access to the innermost layers of mummification, allowing insight into daily life practices such as tattooing and preparation of the body during embalming.

Avila, Jairo (CSU, Northridge)**[391]** *Local or Non-local: Reassessing Material Exchange in Southern California*

Previous studies on material exchange have provided valuable insights about the complexity of long-distance networks once established by prehistoric cultures. Fueled by the presence of middlemen throughout the region, these elaborate and intricate networks of interaction and trade allowed easier acquisition and exchange of materials (local and non-local) over the years. Given the extensiveness of materials (i.e. lithics, beads, ochre) repeatedly entering and exiting Southern California by land or sea, how and when do materials no longer become non-local or exotic? When are remote cultures and materials sources no longer remote or unobtainable? Focusing on Southern California, this paper looks at both reassessing the role material exchange played in uniting people and landscapes, and how constant social, political, and economic relations affected material value.

[81] *Symbols of the Spanish Conquest: Early Colonial Period Figurines from the Basin of Mexico and the Michoacán*

The Spanish intrusion in Mexico brought indigenous peoples into contact with a Hispanic cultural system, creating a fusion of multiethnic societies each with its own religious, social, and economic values. Our research considers how material culture is formed and transformed through a variety of processes involving structure and practice in specific contexts, which we glean through archaeological collections and documentary records. We focus on the materiality of ceramic figurines made by the Nahua and Purepecha during the 16th and early 17th centuries, to study modes of manufacture, form, decoration, and particularly continuity and change in imagery. The Spanish conquest and the subsequent Christian indoctrination process resulted in the disappearance of material culture symbols associated with indigenous religion, including idolatrous representations prevalent in precolumbian ceramic figurines. Post-Conquest figurines portrayed different ethnic and social groups, and the sacred became the secular. These hybrid artifacts have a symbolic foundation in ideology and world view, for the construction of political organization and other expressions of structural components of society. Their symbols tended to solidify within the indigenous population the imposed way of life, economic and political order, and social organization.

Awe, Jaime [24] see Peniche May, Nancy

Awe, Jaime**[306]** *The Evolution of Anthropomorphic Imagery at Cahal Pech, Belize and Its Implications for the Rise of Kingship in the Middle Preclassic Maya Lowlands.*

In a series of articles published in the 1980s, and in the subsequent volume "A Forest of Kings", Linda Schele and David Freidel demonstrated that the institution of kingship had been firmly established in the Maya lowlands by the Late Preclassic period. Twenty five years later, ongoing research in Belize and the Peten now suggests that this level of cultural complexity may have actually arisen by the Middle Preclassic period. One line of evidence that strongly supports this argument is the evolutionary change in anthropomorphic imagery. In this paper, I present evidence from the Belize River valley which suggests that the replacement of figurines by other forms of anthropomorphic imagery was closely associated with changes in the socio-political structure of Middle Preclassic Maya society.

Ayres, William [52] see Thompson, Adam

Azéma, Marc (CREAP/TRACES UMR 5608 CNRS TOULOUSE)**[181]** *Graphic Narration and Spatial Organization in the Grotte Chauvet-Pont d'Arc*

The Aurignacian site of Grotte Chauvet-Pont d'Arc (Ardèche, ca. 37,000 calBP) signals the origin of figurative art, with nearly 500 stylistically uniform parietal decorations. Images of animals are composed in a spectacular fashion, especially in the Secteur des Chevaux and the Salle du Fond.

The latter, the end of the cave's passages, is the clearest example of the management of subterranean space by Paleolithic artists in the interest of achieving their ultimate intention: to narrate by image. The animated representations relate to each other in a narrative system whose meaning is lost to us. Multiple levels of graphic themes can be identified, the most evident being the major role of the "lead actor" in the cave: the cave lion. This narrative illustration develops at the level of the simple illustrated panel to that of complex frieze and to the level of the ensemble of the Salle du Fond. The cave itself directs the order in which the visitor perceives the images, thereby structuring the narrative constructed by the representational associations of unknown significance (symbolic? mythological?). Comparison of the Salle with other chambers of the cave confirms the likely extension of this narrative system to the scale of the entire cave

Azevedo, Diana (Utah State University) and David Byers (Utah State University)

[164] *Zooarchaeological Fish Remains and Signals of Resource Depression from Jamaica and Beyond*

This poster presents an analysis of archaeofaunal fish remains from Bluefields Bay, Jamaica and findings of prehistoric marine resource depression from the Caribbean area. The Jamaican collection derives from recent excavations of a shell midden in Belmont, encompassed by the Bluefields Bay marine sanctuary. Preliminary radiocarbon results suggest the site dates to Jamaica's Meillacan Ostionoid (900-1500 A.D.) occupation. The collection contains over 17,000 bones, with 8,961 specimens identified to Actinopterygii (ray-finned fishes) representing 50.45% of the collection. Zooarchaeologists have documented the effects of resource depression by measuring changes in prey choice and prey size. We use a combination of average adult body size and habitat zone to determine rank order of Caribbean fishes. The Jamaican collection suggests a reliance on high-ranked reef fishes as opposed to lower-ranked pelagic fishes. We use published data to identify signals of resource depression on Tobago, St John, and other islands. Based on these data and those we observed in our Jamaican study, we suggest human impacts to fish populations are idiosyncratic, not inevitable, and require particular attention to specific reef ecosystems to understand the impacts of human predation on each.

Babalola, Abidemi (Rice University), Laure Dussubieux (Field Museum, Chicago) and Susan McIntosh (Rice University)

[140] *Glass Beads from Igbo Olokun, Ile-Ife: Chemical Composition, Production, and Regional Interaction*

The site of Igbo Olokun in the city of Ife, in southwestern Nigeria has been identified as a primary glass and glass beads production center dating to the "Classic" period (12th-15th c.), but glass from well-recorded contexts has been rare. Excavations in 2011-2012 produced over twelve thousand drawn glass beads. LA-ICP-MS analysis of 49 glass bead samples revealed two main compositional groups: High Lime, High Alumina (HLHA); and Low Lime, High Alumina (LLHA). While the occurrence of HLHA corresponds with other compositional analysis previously carried out on Ile-Ife glasses, the LLHA represents a new group that had not earlier been reported for Ile-Ife glass beads. This paper contributes to the argument for local manufacture of bead in Ile-Ife. It also examines the regional and trans-regional spread of Ile-Ife glass beads from the 12th through 17th century A.D.

Badillo, Alex (Indiana University)

[120] *Full-Coverage Survey Techniques in the Mountains of the Sierra Sur, Oaxaca, Mexico*

This poster presents full-coverage mountain survey methodologies in light of the development of GPS technologies and GIS software and data during the last decade. Oaxaca, Mexico is a well-known area for settlement pattern research, as various projects have successfully implemented full-coverage regional surveys there. These efforts have produced large continuous datasets of the

spatial distribution of archaeological remains throughout Oaxaca. Improvements in GPS equipment and GIS software give us the ability to adapt full-coverage survey methods to local environments producing rich datasets. With the use of GIS it is possible to combine data layers, local knowledge, and judgmental sample strategies to develop a survey strategy tailored to the local region. High accuracy GPS and its ability to customize the kinds of descriptive and metric data offer the ability to expedite work in the field and shorten time spent post-processing geospatial datasets. The Nejapa Valley region and the Quiechapa frontier region will be used as case studies to illustrate the usefulness of GPS technology and GIS software to setup and execute a regional survey project.

Baer, Sarah (SWCA Environmental Consultants)

[352] *Managing Meaning: Mitigation, Monitoring, and Mentoring at a Rock Art Site in the Uinta Basin, Utah*

In 2014, SWCA, in collaboration with Crescent Point Energy U.S. Corp and Sunrise Engineering, completed detailed analysis, laser 3D scanning, mapping, monitoring, and dust mitigation of a rock art site in the Uinta Basin, Utah. Detailed analysis of the rock art figures—characteristic of the Archaic, Fremont, Ute, and Historic periods—gives us insight into possible movement of peoples between the Tavaputs Plateau and Uinta Basin. Importantly, the interest in the project lies not only with interpretation of the rock art itself, but also on positive collaboration between energy industry professionals, archaeologists, construction personnel, Native American tribal members, and local peoples during mitigation activities and subsequent monitoring of road construction near the site. Engagement in rock art by diverse groups demonstrates that interpreting the past provides an opportunity for open dialogue and provides mentoring on the importance of preserving historic places.

Baer, Alexander

[388] *Monumentality and the Archaic State: Heiau Distribution in Kaupo, Maui*

In the early 18th century, competing archaic states on the islands of Maui and Hawai'i were engaged in a long-standing conflict to establish primacy over the Hawaiian Archipelago. To better oversee preparations for war, Maui's King Kekaulike moved his entire royal court to the fertile, but politically peripheral district of Kaupo. Oral traditions speak of Kekaulike expanding a network of ritual structures throughout the region, resulting today in a landscape covered with some the largest heiau in the archipelago. In this paper I discuss the monumental structures of Kaupo and their distributions both across the region and through time. Combining extensive AMS dating of these, and residential structures, with GIS analyses I demonstrate that virtually all of the heiau in the district were in fact constructed well before the arrival of King Kekaulike. This indicates that despite its position on the fringes of the Maui polity, Kaupo's sociopolitical infrastructure was established without the direct oversight of the central regime. The network of temples therefore represents a local expression of increasing sociopolitical complexity, mimicking, at a smaller scale, the developments ongoing in the larger rise of Hawaiian states.

Bagwell, Elizabeth (Aspen Environmental Group)

[354] *Methods for the Analysis of Structural Wood and Some Examples from NW Mexico – A Paper in Honor of Tomas C. Windes*

The wooden portions of prehistoric and historic architecture are not always well preserved. However, when they are present they provide a wealth of information about construction techniques, labor effort, and other aspects of the lives of the people related to building construction. Some key attributes of analysis include: tree species, when the tree died, felling methods, branch and bark removal methods, and surface treatment. This paper summarizes some of Windes' contributions to this area of study, identifies some of the questions that these data might answer, and presents a case study of Medio Period (1200-1450 A.D.) adobe architecture from the Casas Grandes region of NW Mexico.

[166] *Investigations of a Microfaunal Assemblage: Emergence of Pest-Host Relationships at Aşıklı Höyük, Turkey*

Small vertebrate remains are often ubiquitous in archaeological contexts, with rodent and microvertebrate activity recognized as a common source of disturbance. On the other hand, small vertebrates can have great significance for archaeological interpretation because they provide key evidence, directly or indirectly, on human subsistence and settlement behaviors, such as food storage, sedentism, seasonality, and site abandonment. This poster presents the results of a preliminary analysis of the microfaunal assemblage at Aşıklı Höyük, an early Aceramic Neolithic settlement in the Aksaray province of Turkey. The primary focus of this analysis is on the earliest levels of the site (Layers 4 and 5 in trench 4GH), which contain semi-isolated roundhouse structures, diverse outdoor features, and middens. Considerations of the architectural features of the site are important for understanding the potential factors that attracted small vertebrates to these human-altered environments, such as concentrations of food resources and the presence of safe places for these animals to reproduce or hibernate.

[402] *Plant Niche Construction: From Forager to Planter in the Zagros Mountains, Iran*

In terms of niche construction, the development of agriculture at the end of the Palaeolithic was a realignment and expansion of existing hunter-gatherer plant ecology modifications to a transforming human and natural setting. This paper suggests that people's engagement with their surroundings altered under pressure of changes in the environment and their subsistence, residence and mobility strategies. Increased foraging efficiency and stability were sought. These relied on a suite of actions and responses to ecological conditions, passed down the generations since the emergence of active modification and control of plants, and animals, during our primate evolution. To reduce logistic costs, improve the ability for longer-term storage and increase yields per hour of invested labor, plant niche modifications were developed on earlier Palaeolithic plant exploitation. Between the Upper Palaeolithic and the PPNA, plant niche construction efforts targeted economising on the expended

energy versus yield and broadened the variety of exploited plants and their calorific worth as is most clear with food plants in the Fabaceae and Poaceae families. In sum, people's niche construction activities developed dependent on their local environment and lifestyle and the ecological conditions of the targeted plants.

Baird, Douglas (University of Liverpool) and Andrew Fairbairn (University of Queensland)

[161] *The Ordering of Space at Boncuklu, Central Anatolia (8500-7500 cal B.C.): Household and Community*

This paper explores the degree to which the spatial ordering of Neolithic settlements may be related to the nature of households and their inter-relationships and where symbolic and cosmological factors may have had a role, using evidence from central Anatolia, notably from Boncuklu, where practices antecedent to those at Çatalhöyük are well attested. Still influential is a 'Domestic Mode of Production' model in which it is proposed that increasing household autonomy in the Neolithic reflects the dominance of the household in production and consumption, the Byrd and Banning model. Increasing house size and spatial division is often seen as related to this. In this context the emergence of corporate institutions at the supra-household level can be construed as the counter balance to the increasing economic autonomy of households, performing key integrative functions that allow the development of stable long term communities in the face of the autonomous tendencies of the household. We examine the Boncuklu evidence with reference to these paradigms and suggest alternative ways of envisaging relationships between households and community and consequent spatial ordering of various practices. This also allows us to consider the possible role of cosmologies in spatial arrangements and installations at the site.

[203] *What Once Was... Taphonomical Processes and Their Implications for Understanding Tiwanaku Funerary Practices and Social Identities*

Archaeological investigations into group affiliation and status, gender and other social identities are often based on human burials and their grave goods. Once deposited burials become subject to a series of cultural and natural taphonomic processes that alter the material record. The systematic recovery of over 200 provincial Tiwanaku burials from the Middle Horizon Period (A.D. 500-1000) settlement of Omo M10 in the arid Moquegua valley (southern Peru) presents a compelling case study for observing stages of looting and decomposition. The rich material record of the Omo M10 burials offers insights into the diverse uses of perishable and non-organic materials to express social constructs of status, gender, and group identity. Taking into consideration how distinct taphonomical processes impacted Tiwanaku funerary spaces and offerings both locally and regionally, I demonstrate the utility of a graded taphonomic scale in order to critically evaluate the material basis of the archaeological interpretations. Such an approach precludes the potential fallacy of directly comparing contexts site-wide or regionally that have been exposed to variable taphonomic processes, and arrives at a more cautious - albeit perhaps less wide ranging - view of Tiwanaku social identities and burial practices.

Baker, Brenda (Arizona State University)

[240] *Death on the Middle Nile: Mortuary Traditions and Identity at the Top of the Great Bend*

Our understanding of ancient Nubian mortuary traditions principally derives from monumental elite cemeteries such as Kerma, El-Kurru, and Meroe and the 1960s salvage excavations in Lower Nubia.

More recent work in Upper Nubia, in northern Sudan, however, has revealed substantial regional variation. Assessment of habitation, rock art, and cemetery sites from the Mesolithic through Christian periods in the Bioarchaeology of Nubia Expedition (BONE) project area on the right (north) bank of the Nile River in the region of el-Ginefab illuminates the rich archaeological record of a previously uninvestigated landscape. Mortuary practices in this “hinterland” at the top of the Great Bend show similarities to “core” sites, but local practices suggest that temporal differences in grave architecture and treatment of the dead are not always as distinct over time. Grave goods, however, indicate integration into far-flung exchange networks rather than isolation. Persistence of local traditions, spatial and social organization within and among cemeteries, and distinct identities marked in life (e.g., dental ablation) or death (e.g., burial with archery equipment) from the Kerma period (c. 2500-1500 B.C.) through Christian periods (c. A.D. 550-1400) are discussed to highlight new perspectives on ancient Nubian identity and mortuary behavior.

Baker, Jeffrey

[333] *Population, Climate Change, and Agriculture in the Late First Millennium C.E. Maya Lowlands*

Over the last 20 years, a number of studies have provided evidence for a “drought” in the Maya Lowlands between the 8th and 10th centuries. Researchers have argued that a higher water table in the northern lowlands allowed agricultural practices to continue in the north, while sites in the south suffered from the drought. This paper will examine the relationship between population changes and climatic changes in the Maya Lowlands. The nature of the water table and the agricultural practices of the Prehispanic Maya will be examined in light of how they might have helped or hindered the response to a drought.

[76] *Landscape and the Impact of Late Colonial Industrial Agriculture on Indigenous Communities in the Tehuantepec Region of Mexico*

During the late colonial period, the political economy of the Oaxaca Isthmus of Tehuantepec, like many areas of rural New Spain, witnessed dramatic changes in response to Bourbon political reforms and as a consequence of increased engagement with global capitalism. These changes are particularly apparent in the sheltered piedmont zone of the Rio de los Perros, where Zapotec elites had managed to control productive agricultural lands into the early 18th century. New creole landowners emerge in the documentary record through their multiple petitions to engage in sugar cane production and to establish sugar refineries. In this paper we examine the archaeological footprint of these endeavors and explore changes in the landscape of power and the impact these changes had on indigenous communities.

[73] *You Go First: An Agent-Based Model of Mating-Migration between Early Farming and Foraging Societies*

Following the introduction of agriculture, domestication and permanent settlement in the early Holocene, patrilineal and patrilocal models have become more common than matrilineal and matrilocal ones. While patrilocality is observed at the worldwide level, matrilocality has been associated to specific areas, e.g. sub-Saharan Africa.

Matrilocal and patrilocal residence patterns indicate whether as a rule, a newly formed couple settles

with or near the female's or male's parents respectively. In this context, mating can be seen as a sub-category of the migration process, where one of the two components of the newly formed couple moves into the household/village/city/country of the other. Where patrilocality is widespread greater female mobility is observed. The opposite is true for matrilocality.

Using available ethnological data, our agent-based model (ABM) focuses on mating-migration dynamics between hunter-gatherer populations (HGP) and food-producing populations (FPP). We explore within and between population mating-migration behavior, highlighting possible tendencies for gendered 'marriage' migration among traditional HG and AP societies.

[408] *Arquitectura Preclásica en el Grupo Balam Acrópolis Central de El Mirador, Peten*

La Gran Acrópolis Central es el corazón del sitio arqueológico El Mirador, el cual presenta diferentes grupos de edificaciones de variada complejidad. Uno de ellos es el Grupo Balam con arquitectura del Preclásico Tardío. Se investigó los aspectos físicos, espaciales, funcionales, sociales e ideológicos a través de una secuencia arquitectónica minuciosa. El estudio permitió conocer no solamente los materiales y sistemas constructivos, las remodelaciones arquitectónicas, el arte en estuco adosado, como también los objetos asociados a esos espacios que permitieron acercarnos y explicar la sociedad que los construyó y ocupó.

Balco, William (Northern Illinois University) and Michael Kolb (Northern Illinois University)

[368] *Exploring the Roman Occupation and Abandonment of Salemi, Sicily: The Cistern at Largo Cosenza*

Excavations in Salemi, Sicily, have discovered a large, bell-shaped cistern dating from the 1st century B.C. to the 1st century A.D. This feature appears to be contemporaneous with a large mosaic floor identified nearby in 1893. The Roman cistern contained a wide variety of domestic debris attesting both the economic interconnectivity and independence of this site. This paper discusses the use and abandonment of the cistern, contextualizing the site within the broader, western Sicilian region. Initial results of the materials analysis suggest that Roman Salemi participated in several overlapping networks of pottery exchange while also maintaining material independence through the possible manufacture of glass artifacts. Furthermore, the high frequency of tablewares at this site contrasts with the high frequency of processing wares from other sites located in the nearby valleys, suggesting different occupation strategies employed at contemporary sites in the Sicilian hinterland.

[313] *Proyecto Gran Canal: El patrimonio caribeño nicaraguense (cultural y arqueológico) en peligro*

Este tema estará referido a la preocupación de algunos investigadores, arqueólogos y antropólogos, nacionales y extranjeros, que trabajamos en la región caribeña de Nicaragua por las implicancias que tendrá la construcción del canal interoceánico en el caribe. Siendo que el área geográfica que se verá afectada posee en la actualidad un patrimonio vivo (comunidades originarias y étnicas) asentado en Punta de Aguila, lugar donde se pretende la construcción del principal puerto que dará inicio al canal por el caribe, produciéndose quizás la desaparición de dicho poblado. Se encuentra además, gran variedad de patrimonio arqueológico, evidencia material distribuida en éste y otros poblados cercanos, por ejemplo, en el poblado de Monkey Point, lugar de un asentamiento creole, donde aún se encuentran muchos concheros antiguos y las evidencias mas antiguas sobre el poblamiento en Nicaragua. Los habitantes actuales se encuentran alarmados por la desinformación de los pormenores en cuanto a los procesos que se avecinan. Los pobladores actuales quieren encontrar una salida para mitigar las consecuencias de dicho proyecto, ya que no se oponen al mismo.

[176] *Where Are the Lives? Characterizing Settlements from Small Artifactual Debris*

This paper is inspired by consideration of how charred plant macrofossil assemblages relate to past human lives, as one component of the small artifactual debris on settlements. Cultural decisions regarding activity location, rhythm and 'waste' deposition mean there can be wide variation in the archaeological remains of an otherwise identical plant processing activity; this issue is common in archaeology as many classes of material, including plant assemblages, are understood with models from actualistic studies. Our understanding of the past also pivots on the inherent temporality of all archaeological contexts, which embody many scales of process compared to present-day observed events (a duality much-debated from Schiffer and Binford onwards).

I thus present a strategy to identify patterning in small artifactual debris across excavated settlements by comparing multiple classes of materials from bulk sediment samples; and the implications of the results for understanding associated charred plant assemblages and lifeways. As daily life is the very basis of social meaning and identity, identifying and understanding small artifactual debris is vital since it is imbued with conscious and unconscious cultural decisions regarding the juxtaposition of materials. The case studies are all from rural Roman Britain, however the concepts and methods are widely applicable.

Ballard, Hannah and Elena Reese (Pacific Legacy, Inc.)

[416] *Life on Grove Street: Victorian Households in Hayes Valley, San Francisco*

During the mid to late 19th Century, Hayes Valley was a San Francisco neighborhood transitioning from working to middle class. Residents included European immigrants and transplants from other parts of the US. Many families rented the single and multifamily residences that lined the streets. In 2013, Pacific Legacy, Inc. conducted testing and archaeological monitoring excavations for the construction of a multistory building on Grove Street in the Hayes Valley. These investigations unearthed two privies associated with 19th century residences. The privies, which date from the 1860s-1890s, contained a diverse array of artifacts including those associated with Catholic religious practice, women, and children. The privy contents as well as the documentary record demonstrate the transitional nature of this San Francisco neighborhood, the efforts of families to conform to the middle class Victorian norms, and their various economic strategies.

[300] *The Landscape Archaeology of the Northwestern Plains: Problems and Potential*

The Plains of Northern Montana contain a uniquely preserved record of rock circles (tipi rings), rock piles (cairns), and other rock configurations that communicate resident, transient, and permanent aspects of prehistoric Native American life in the modern Blackfeet Indian Reservation. This paper relies on the long-term recordation of several thousand of such features to articulate a continuous architectural landscape that represents leadership, planning, seasonality, demography, and the passage of time. We seek to explain this record in the context of minimal and monumental human endeavors to conceive a better understanding of the ethnographic and archaeological pasts.

[318] *La materialización de la vida en comunidad entre los cazadores, pescadores y recolectores marinos que habitaron el litoral del Desierto de Atacama durante los 6000-4000 Cal AP (Norte de Chile)*

Los cazadores-recolectores han sido tradicionalmente entendidos como formas sociales caracterizadas por sistemas simples de organización, estructuras políticas levemente jerarquizadas, bajo desarrollo económico y tecnologías primitivas. Esta imagen trazada a partir de generalizaciones desmedidas se encuentra hoy muy lejos de representar la enorme diversidad de soluciones sociales y modos de vida de las poblaciones que han basado su subsistencia en la caza-recolección. Dentro de esta heterogénea categoría los cazadores-recolectores marinos han tomado cierta distancia y unicidad por vivir de un medio ambiente caracterizado por la riqueza de sus ecosistemas naturales, permitiéndoles en algunos casos alcanzar desarrollos complejos en su organización social, política y económica.

En la costa arreica del Desierto de Atacama (Norte de Chile) se asentaron desde los 13000 Cal-AP grupos humanos dedicados a la explotación del medio marino sin abandonar en ningún momento de su historia la caza-recolección, aun cuando en su devenir experimentaron cambios bastante profundos en sus formas de organización social, relaciones de producción y vínculos con otras sociedades. En esta ponencia buscaremos esclarecer estas transformaciones a partir de su arquitectura, la funebria, los medios para explotar el ambiente marino, los restos de los animales que consumieron, las cadenas operativas líticas y su patrón de asentamiento.

[305] *Religious Subjects and Gendered Transformations at the Native American City of Cahokia*

Though processes of subjectification are continuously ongoing, there are moments when powers coalesce in particular persons, places, or objects and bring about pervasive transformations. We explore these moments through gendered divisions of key religious spaces, objects, and practices at the Native American city of Cahokia and other early Mississippian places. Through cosmological oppositions, these spaces, objects and practices both created balance and fomented politico-religious transformation. In particular, we locate subjectification in practices of smoking tobacco with flint-clay pipes, sweating in circular lodges, corn ceremonialism, and the gathering of human and other-than-human persons in the specific ritual contexts of the eleventh and twelfth centuries CE. We recognize a continuum of power relationships and argue that religious subjects (people, spirits, and ancestors) were created through relationships mediated in particular places and can transcend, change or reify gender divisions. Subjectification at Cahokia was contingent upon accessibility and experiences where gendered persons came to embody place and ceremony in particular moments. Through deeply involved relationships with the dead, naturally powerful elements/forces, and divinely inspired designs, certain Cahokians may have been transformed along this shifting continuum of power relationships, from religious subjects to authorities.

[348] *A Chronology of Generations? A Site-Based Study from the 6-5th Mill. Settlement and Cemetery of Alsónyék, South Western Hungary*

The Neolithic site of Alsónyék was found in the course of the construction of a motorway. The earliest occupants were the first farmers arriving from the North Balkans. After a short gap, two later Neolithic occupations were followed by an immense settlement and cemetery of the Lengyel culture: 120 robust houses and in sum 2400 burials were excavated. Geomagnetic surveys revealed the remains of a large site lacking parallels in the Central European Neolithic. Dating has been completed with the help more than 200 radiocarbon samples, evaluated with the Bayesian statistical method. This study allows us to define a series of micro-narratives about the lives of the sixth and fifth millennium occupants, yielding a long-term history of Neolithic at the southern margins of Central Europe.

Banks, William (CNRS) (CNRS)

[40] *Culture-Environment Relationships and Heinrich Stadial 1 in Western Europe: Are Ecological Niche Shifts Implicated?*

A common theme among Upper Paleolithic studies is how hunter-gatherer adaptations may be related to environmental variability, with some focusing on how culture-environment relationships during the Paleolithic are intertwined with ecological niche dynamics. The reason being that when faced with the rapid-scale climatic fluctuations and environmental reorganizations characteristic of MIS 3 and 2, Paleolithic populations could have responded in a variety of ways. Ecological niche modeling methods applied to the archaeological record (Eco-cultural niche modeling: ECNM) have aimed to better understand how specific populations responded to Dansgaard-Oeschger climatic variability and identify those instances for which technological or adaptive shifts correspond to shifts in the ecological niches exploited by archaeological populations. For example, the technological changes between the Proto-Aurignacian and the Early Aurignacian were roughly coincident with Heinrich Stadial 4 and an expansion of the exploited ecological niche. This study shifts focus to the latter Upper Paleolithic and targets the Early and Middle Magdalenian archaeological cultures, the latter corresponding to Heinrich Stadial 1. ECNM is used to evaluate whether adaptive shifts observed between these cultures are associated with a niche shift and results are evaluated against a larger framework of culture-environment interactions that considers pre-LGM and LGM contexts as well.

Banks, Kimball (Metcalf Archaeological Consultants Inc. & Combined Prehistoric Expedition Fdtn)

[136] *Nanu, Nanu: Nabta and New Agers*

Over a span of some 30 years, the Combined Prehistoric Expedition conducted investigations of Neolithic occupations at Nabta Playa in Egypt's Western Desert. The most startling discovery was an elaborate expression of Late and Final Neolithic ceremonialism unprecedented in Africa. The expression included a "sacred mountain", tumuli burials, ceremonial burials, stellae and megaliths, and an astronomical calendar circle. The publication of the results has had unintended

consequences: it attracted the attention of not only the archaeological community but also New Agers. New Agers began to pilgrimage to the site and disturb some of the features, especially the calendar circle. The result was to move the circle along with several other structures to the Nubian Museum in Aswan to prevent their destruction. Others have advanced theories to explain the function of the circle and megaliths, including a "star map" that indicates an astronomical knowledge at least as sophisticated as ours. This knowledge included the distance to the stars to which the megaliths were aligned and an intimate knowledge of the Milky Way, including the relative position, scale, and orientation of our sun, and placements of the spiral arms and the galactic center.

[405] *Local Politics and Site Ownership: Archaeology in the Age of Lawfare*

Heritage management encompasses a tremendous range of activities and concerns, including stewardship of the archaeological record. The ethical responsibilities of conservation and protection require recognition of the competing interests involved in the property ownership. This paper reflects on the implications of the dynamics involved in a recent case in Florida. A location containing a significant early 19th century archaeological record became caught up in legal battles. The dynamic is part of a larger trend that some anthropologists have labeled as lawfare, a double-edged sword used by the traditionally oppressed but also by the powerful.

Barba, Luis (Universidad Nacional Autonoma de Mexico)

[26] *Archaeological Prospection In Coixtlahuaca, Oaxaca*

During field seasons 2008 – 2011 a large set of archaeological prospection techniques were applied in large areas surrounding present town of Coixtlahuaca, Oaxaca in a joint project carried on by University of Georgia and the National University of Mexico. This project attempted to put together the large experience of Kowalewski in archaeological survey in Oaxaca's valleys and the experience of the Archaeological Prospection Laboratory using geophysical techniques in Mexico. These approaches are complementary because the scale of archaeological survey is in the order of 106 m², the archaeological prospection is closer to 104 m², building in this way, a bridge to connect the archaeological excavation that covers areas around 102 m². It was possible to take advantage of the data obtained during the 50 km² survey carried on by Kowalewski's team, selecting some specific areas to perform geophysical studies that at the end of the process allowed archaeologists to select areas for excavation. It was a unique project since there is no other example of such a combination of scales and techniques in an extensive archaeological site like Coixtlahuaca to detect not only the presence of buried structures but more importantly, occupation density in the area.

[410] *The Río Viejo Weaver: Burial Practices, Osteobiography, and the Early Classic Collapse*

The Early Classic (A.D. 250–500) in the lower Río Verde valley was marked by political fragmentation and significant transformations in social, political and economic relations following the collapse of a regional polity centered at Río Viejo. How the region's inhabitants navigated these transformations remains poorly understood, although regional-scale evidence from settlement patterns and excavation indicates the abandonment of many communities and major changes in the way people engaged with uninhabited monumental spaces like the acropolis at Río Viejo. This paper provides a micro-scale consideration of the broader social processes under way during the Early Classic in the lower Verde. Combining osteobiography with a detailed analysis of burial context and grave contents, we examine lived experience from the perspective of a single individual from the post-collapse era. This individual was an adult female who showed signs throughout her skeleton of occupational stress possibly related to weaving. She was also buried in the fill of an abandoned ritual structure with a number of grave offerings including ceramic vessels and a ceramic pendant. The juxtaposition of her physical health, burial location, and grave contents reveal the complex interplay of economic, religious, and political tensions during an era of significant social change.

[187] *Visual Representations and Entanglements: Photography and Native Identity-Making in the Classroom and Museum*

This paper examines politics of representation of Native North American communities, past and present, through the use of photographs in academic and museum settings. We consider how photographs of people and objects have been used to naturalize precepts of colonialism, as well as how they have been used to empower indigenous subjects. The implementation of NAGPRA has provided a framework for museums to determine if they should display certain objects deemed culturally sensitive; however, there are no formal procedures in place for historic photographs and images, whether used in museum exhibitions or education venues such as classroom lectures, publications, and media. We critically examine the roles of photographs in popular and academic imaginations as a means to explore improved methods of teaching anthropology in the 21st century. Through interviews with Native consultants, we aim to explore "best practice" approaches for representing Native identities in the classroom and in museum exhibits, in order to move away from outdated representations and stereotypes.

Bardolph, Dana (University of California Santa Barbara)

[347] *Paleoethnobotany at Cerro la Virgen: Exploring the Lives of People and Plants at a Chimú Town in the Hinterland of Chan Chan*

This paper explores the roles of plant foodways in the social, political, and economic organization of Cerro la Virgen, a Late Chimú site in the Moche Valley of North Coastal Peru. Located in the hinterland of Chan Chan, the capital the Chimú Empire (A.D. 1000-1460), Cerro la Virgen comprised a diverse community of craftspeople, farmers, and fisherfolk. Recent paleoethnobotanical investigations of assemblages from different household contexts afford a closer look at the diverse economic strategies of the inhabitants of different households, which I contextualize within the broader history of *corvée* labor, exchange, and social interaction witnessed during the Chimú empire. I consider issues both methodological and theoretical, including (1) the extraordinary preservation of

organic remains at the site, which allows us to examine the importance of fruits and other resources that do not often preserve in charred macrobotanical assemblages; (2) the role of plants within a broader subsistence economy that may indicate wider relations of interregional interaction and exchange; and (3) a questioning of the assumption that the community of Cerro la Virgen functioned primarily as a state-controlled agricultural enterprise.

[121] *Taphonomy and Negative Results: An Integrated Approach to Residue Analysis*

Residue preservation within the matrices of artifacts is a complex process that can be better understood when multiple types of biomolecules (e.g., protein and fatty acid residues) are evaluated as part of a systematic whole. Commonly, types of residues are evaluated independently, which may relate to different types of biomolecules requiring distinctive methods for extraction and analysis. Thus, the archaeologist either encounters positive results (a hit for a particular residue, such as a protein) or not. If the result is positive, archaeologically meaningful conclusions are drawn. Negative results are dismissed. From a taphonomic perspective, however, and considering complexes of residue types as interacting systems, positive results are more meaningful when negative results can be explained. Consideration of multiple types of biomolecular residues as an interacting system allows better explanation of negative results, thus increasing confidence in conclusions drawn from positive results. We apply an integrative approach to studying organic residues from ceramic artifacts from the Dillard and Switchback Sites in southwestern Colorado using total organic carbon assays and mass spectrometry of proteins and fatty acids. Our protein results are better explained in light of fatty acid and total organic carbon analyses, which generally reflect severe weathering in these artifacts.

Barker, Claire (University of Arizona)

[343] *Communities of Practice and Corrugated Pottery at Chevelon Ruin*

During the A.D. 1200s and 1300s, the Colorado Plateau experienced widespread, large-scale migration and the subsequent aggregation of groups into large Pueblo communities. During this period, people migrated to the Homol'ovi area, aggregating into seven large pueblo settlements. The demographic upheaval resulting from this large-scale population movement brought diverse individual and group identities into contact and, potentially, conflict. Chevelon Ruin, one of the aggregated settlements that comprise the Homol'ovi settlement cluster, was occupied from A.D. 1285-1400. Like the other six settlements in the Homol'ovi area, occupants of Chevelon Ruin produced both decorated Winslow Orange Ware and Homol'ovi Utility Ware. Through analysis of locally produced utilitarian corrugated pottery, this research will investigate the relationship between social identity, artifact style, and communities of practice at the site of Chevelon Ruin. By exploring the presence, extent, and significance of standardization in manufacturing methods within this production area, we will gain a better understanding of community composition and organization at the site of Chevelon Ruin.

Barkwill Love, Lori (University of Texas at San Antonio)

[262] *Early Pithouse Period Ceramics in the Upper Gila: A Look from Winn Canyon*

The Early Pithouse period (A.D. 200 to 550) is characterized by circular pithouse structures often located on isolated knolls, an abundance of undecorated brownware, and a small percentage of red-slipped ceramics generally associated with the end of the time period. Few studies have focused on these Early Pithouse period ceramics. To help fill this gap, a preliminary study was conducted on a sample of the ceramics from Winn Canyon, an Early Pithouse period site in the Cliff Valley in the Upper Gila region. Attribute and petrographic analysis were used to explore the similarities and

differences between the brownware and red-slipped ceramics. This paper will provide the findings of the ceramic analysis and discuss directions for future research on the Early Pithouse period ceramics in the Upper Gila.

[51] *Overview of Two Seasons in the Roman and Neo-Punic settlement of Zita (Zyan), Southern Tunisia*

After Carthage was destroyed by Scipio Africanus Minor (Aemilianus) in 146 B.C.E., the Punic settlements that it controlled were occupied by the Romans. Exporting wine, olive oil, garum (a sauce made of the fermented intestines of small fish), and purple dye (of *Bolinus brandaris* and *Hexaplex trunculus* shell-fish), the eastern Maghreb continued to flourish. Many of the ancient monuments in modern Tunisia date to the centuries following the Roman conquest, until the center of power shifted to the Tripolitanian Region, in modern Libya, during the second half of the second century CE. The city of Zita (Zyan), near Zarzis, may have been founded during the former period or have been built on a more ancient settlement. After its abandonment by the fourth century CE, the surrounding olive orchards encroached on the site and regular plowing has obscured most of the ancient remains. During two excavation campaigns we performed a detailed surface survey and excavated part of the Roman capitol and forum (previously published in 1886), as well as the tophet (a Punic child sacrifice or burial precinct). In August 2014 we also excavated an area where large amounts of debris of industrial metal working were deposited in previously abandoned structures.

[312] *Housepit 54 through an Indigenous Framework: A Holistic Interpretation of an Ancient Traditional Home*

Data collection and analysis at Housepit (HP) 54 Bridge River Site, British Columbia, has provided an opportunity for a range of studies emphasizing (but not limited to) questions of subsistence, inheritance, lithic technological adaptations and spatial organization of the ancient occupations of this household during the BR3 period (ca. 1300-1000 cal. B.P.). This poster draws upon data acquired through the systematic analysis of artifacts and ecofacts and is further enhanced through the use of indigenous theory. It is through this perspective that we can begin to understand HP 54 as an indigenous household and create visibility for the traditional lifeways supported throughout these floors. The goal of this poster is to create a holistic interpretation of HP 54 in the ancient past, one that draws not only from the western theoretical lenses but also from indigenous beliefs and practices that led to the formation of the record we call HP 54. This research is designed to provide a comprehensive framework to gain a deeper understanding of not only the household structure itself, but also the individual lives lived within this indigenous home.

[282] *Asa T. Hill, the WPA, and the Fluorescence of Systematic Archaeology in Nebraska*

The most prominent New Deal work-relief program with regard to archaeology was the Works Progress Administration (renamed in 1939 as the Work Projects Administration; WPA), which existed from 1935 to 1943. Functioning through sponsoring universities, historical societies, and other agencies, the WPA supported major field and laboratory projects. In Nebraska, almost all of the New

Deal archaeological projects were carried out with WPA-funded labor. Between 1936 and 1941, the University of Nebraska or the Nebraska State Historical Society drew on such WPA laborers to excavate numerous sites under the direction of Asa T. Hill. Marvin Kivett deemed Hill the “father of systematic archaeology in Nebraska.” Hill was a self-educated archaeologist. Hill’s archaeological work led, in 1933, to his appointment as Director of the Museum and Field Archaeology for the Nebraska State Historical Society. Between 1933 and 1941, extensive surveys and excavations of sites in Nebraska and Kansas were carried out under his direction, much of which was funded by the WPA. He mentored or worked alongside a number of prominent figures in early Nebraska archaeology, including Paul Cooper, Waldo Wedel, John Champe and Duncan Strong. Hill initiated the excavation methods still used for plains earthlodge villages.

[263] *La Florida/Namaan: a Classic Maya River Port*

The Classic Maya polity Namaan is referred to in inscriptions at several sites in Mexico and Guatemala, attesting to its importance as an ally to many neighbors. Namaan has long been identified as the site of La Florida, located on the San Pedro River in western Peten, Guatemala. This position lies at an intersection of routes connecting the large cities of central Peten to the fertile Tabasco Plain and the Usumacinta River Valley. Although many archaeologists and epigraphers have visited the site since the 1940s, it remains virtually unexcavated and significant portions of the site have never been mapped. We visited La Florida in 2013 and 2014 to assess the condition of the site and its monuments and to explore beyond the known site core. In this paper we present the results of these visits. Two new architectural groups and new monuments were located and new hieroglyphic passages were documented.

[43] *A Community Approach to Data Recovery Investigations at the Dimond Knoll Site, Harris County, Texas*

The Dimond Knoll Screening Project has been one of the most successful Public Outreach efforts undertaken to date by the Texas Department of Transportation’s Archeological Studies Branch. Excavation of this small floodplain mound in northwestern Harris County was completed 2012, revealing a record of regular visitation by mobile foraging groups across nearly ten millennia. Once the upper sediments of the knoll were extensively sampled through meticulous hand excavation, the remaining sandy mantle was stripped away in order to more effectively expose and investigate deeply buried cultural deposits. Rather than simply discarding the stripped soil, TxDOT made arrangements with the Houston Archeological Society to have the sediment moved to an off-site location for screening. Hundreds of artifacts were recovered over the year-long screening project, including chipped stone tools, pottery, and faunal material. The project has been featured in various local media outlets, resulting in an increased awareness of the archaeological heritage present in the Houston area. Artifacts recovered at the screening site will be cataloged, analyzed, curated and reported along with those recovered in the hand-excavated units at the site, rewarding the many community groups who participated in the screening project with a tangible contribution to their regional heritage.

Barretto-Tesoro, Grace (University of the Philippines-Archaeological Studies Program)

[238] *Evidence of Precolonial Cosmology from the Philippines*

Cosmology prior to European contact has been the focus of recent research in the Philippines. The

objective of this paper is to investigate cosmology practices in the Philippines prior to the introduction of Christianity during the Spanish colonial occupation from the 16th century A.D. onwards. This research is significant because it will show that elements of the tripartite cosmology of past populations in the Philippines which can be traced from the Neolithic period persist until the present although their exact meaning may have been lost among contemporary Philippine societies. Using data from ceramics recovered in the Philippines, this paper will explore the archaeological evidence for past cosmology dating to the 10th to the 16th centuries A.D. Analysis shows that specific design elements on earthenware pots and porcelain widely distributed in the Philippines were important to the early local populations. This indicates that in the precolonial porcelain trade, inhabitants in the Philippines were actively choosing certain designs on ceramics because they were important to their belief system.

Barrientos, Gustavo (Facultad de Ciencias Naturales y Museo, Universidad Nacional de La Plata), Juan Belardi (Universidad Nacional de la Patagonia Austral, CONI), Luciana Catella (Universidad Nacional de La Plata), Flavia Carballo (Universidad Nacional de la Patagonia Austral) and Fernando Oliva (Universidad Nacional de Rosario)

[185] *Continuous Spatial Models of Artifact Relative Frequency Data as an Aid for Sourcing Chert Materials: Two Examples from Patagonia and the Pampas of Argentina*

The aim of this presentation is to introduce and discuss an approach to sourcing chert materials based on the use of spatial continuous models of relative frequency data (i.e. percentage representation of stone tool classes in georeferenced artifact assemblages), which is particularly useful in areas where there is scarce information about both the variability of one or many stone tool classes represented in lithic assemblages across the regional space and the localization of their likely or actual sources. Such models are constructed using geostatistical interpolation (kriging) under the assumption that continuous surfaces make more intelligible the spatial information recovered from relatively few, scattered, and unevenly distributed sampling locations. As long as it is expected that, in most situations, the relative frequency of a stone tool will decrease as a function of the distance from the source, the examination and analysis of the modeled continuous surfaces may provide relevant clues about source location, thus helping in planning problem-oriented surveys and implementing more analytical sourcing activities. We will exemplify the approach with two case studies from regions previously inhabited by hunter-gatherers that present remarkable differences in geology, geomorphology, and sampling coverage: southern Patagonia and the eastern Pampas of Argentina.

[242] *Los Recintos Funerarios y la Veneración de los Antepasados en los Espacios Habitacionales del Grupo B de Naachtun, Guatemala*

Durante el período Clásico, el culto a los antepasados en la cultura maya tuvo muchos propósitos, como fundamentar el arraigo a un lugar y la ostentación del poder por parte de un grupo familiar o linaje; esto se lograba haciendo de la figura de los antepasados agentes socialmente activos, rememorados mediante eventos rituales dedicados a su persona. Las evidencias arqueológicas de estas prácticas sugieren un fuerte vínculo entre estos personajes y el espacio, materializado generalmente en los contextos funerarios. El Grupo B de Naachtun, al norte del Petén guatemalteco, es un área residencial de élite organizada en tres conjuntos de "unidades-patio". Las excavaciones en los patios 31, 32 y 22 denotaron huellas de reingreso al espacio sepulcral, actos rituales que involucran la extracción de un segmento óseo, así como la colocación de mobiliario que conmemora éstas prácticas; evidencias interpretadas como manifestaciones de veneración hacia los antepasados. Los resultados del estudio del material y el contexto espacial inmediato, mismos que se mostrarán y argumentarán en esta ponencia, apuntan al culto sistemático de estos personajes ancestrales que son posiblemente los fundadores del linaje, fuentes de todo poder económico y político.

Barrios, Edy (CUDEP-USAC)

[183] *Building a Community: Late Classic and Postclassic Residential Structures at Rio Amarillo, Copan, Honduras*

Rio Amarillo, an ancient town, rests 20 km east of the great Maya city of Copan in Honduras. In the last four years residences from the Late Classic and Postclassic period have been excavated at the site. Investigations of the residential buildings from Río Amarillo have allowed us to better understand the influences and allegiances of the inhabitants of this community resting on the margins of the Maya world. The architecture of the structures reflects ties to both Copan and to areas in the interior of Honduras. Artifacts from the houses nearest to the ritual core echo the dominant ideology of Copan during the Late Classic, including the worship of the great city's first ruler, K'inich Yax K'uk' Mo'. With the fracturing of the Copan polity, Rio Amarillo's population moved their residences to higher ground. The debris around these later homes demonstrates that their inhabitants continued to be involved in long-distance trade networks, but that these goods were rarer, with locally-produced ceramics and lithic artifacts dominating the assemblages.

[316] *Using GIS to Explore the Strategic Location of Ancient Maya Centers Within the Vaca Plateau of Western Belize*

Settlement patterns studies in archaeology have shown that a myriad of environmental, political, social, and ideological factors influenced where ancient people chose to settle on the landscape. In efforts to better understand these complex behaviors, archaeologists have increasingly turned to GIS-based modeling approaches including viewshed and least cost path analyses. This study draws upon these techniques to explore visibility and movement across the north Vaca Plateau of west-central Belize, where a number of ancient Maya polities emerged over the course of the Classic period (A.D. 250-900). A model has previously been developed that suggests the key center of Minanha was strategically located, with a high degree of network connectivity through intervisibility with other centers, and that it is situated in close proximity to major corridors of movement. This paper expands on this model by integrating high-resolution LiDAR data, which includes a number of previously unrecorded sites, to evaluate settlement strategies within the area to the south surrounding the center of Ixchel. Implications for power, politics, territoriality, communication, and defensibility are examined in conjunction with available archaeological and epigraphic data.

[371] *The Culebra and Ronquin Paleosols and Their Vessel Assemblages*

Rim sherds from the Culebra and Ronquin sites along the Orinoco River reflect a broadly- shared range of common vessel shapes. The suite of bowls, jars, platters and other shape categories reflect the existence of a common household repertoire of vessels used in food serving, storage and preparation activities. This presentation reviews the commonalities in the range of vessel shapes recovered from secure, well-dated paleosol contexts in these two sites, suggesting that both were part of a riverine inter-action sphere along the Orinoco in northern Venezuela.

[293] *Kroeber's Omnivore's Dilemma: Regional Perspectives on Late Holocene Human Paleodiets in the San Francisco Bay Area*

The analysis of ancient hunter-gatherer diet in the San Francisco Bay Area has been the subject of enormous research effort over the past century. Hundreds of "shell mounds" that once dotted the landscape around the bayshore provide evidence for significant population growth during the Late Holocene. Resource intensification models link population increase to a shift away from exploitation of low-cost, high-ranked prey toward greater use of high-cost, low-ranked prey at a number of archaeological sites, a consequence of resource depression. However, these shifts in animal exploitation often do not track the relative importance of different food resources to the diet. In this study, we use stable carbon and nitrogen isotopes of bone collagen and stable carbon isotopes of bone apatite as a measure of the relative importance of marine versus terrestrial resources, trophic level, and variation in the non-protein sources of the diet within different microenvironments of the Bay Area. Results indicate that human diets are geographically-patterned, with a greater emphasis on higher trophic-level marine protein (marine fish, sea mammals) in the North Bay and greater emphasis on C3-terrestrial and lower-trophic level resources in the South Bay. Temporal patterns, while noted, are most meaningful when examined separately by microenvironment.

[221] *Opening the Black Box: Enabling Transparency in Scientific Computation*

Reproducibility, enabled by transparency in reporting, is the gold standard for science. It is not systematically repeating scientific research, but the potential to do so that maintains high quality in research practice. Reproducibility also drives scientific advance because it enables new research to build on prior accomplishments. This ethos is especially effective because it emerged from within the scientific community.

Archaeology espouses this reproducibility ethos, made all the more important because archaeological practice can destroy the integrity of its data. But transparency for computational archaeological research has not yet received the consideration afforded to other archaeological practice. This is increasingly important as computational archaeology—spanning mining, synthesis, and visualization of large, complex datasets, to modeling and simulation of social dynamics—become more prevalent.

We describe community initiatives for promoting transparency in computational archaeology. The CoMSES Net Computational Model Library is a framework for publishing computational code, so that it can be used by others and authors can be credited for their work through citations. The MIRACLE project is developing cloud-based environments for reproducible workflows of complex, computational analyses of large, multi-dimensional datasets. These initiative share the goal of encouraging and enabling transparency and reproducibility in scientific computation.

Barton, Loukas (University of Pittsburgh)

[345] *Social Aspects of the Diffusion of Agricultural Products and Practices*

The adoption of agricultural products and practices is a social process. Archaeological patterns reveal more than just the timing and direction of the adoption, they help to reveal the very nature of social interaction over a wide area. In particular, the spatial and temporal patterns of diffusion point to norms and priorities in social learning, which in turn generate new avenues for exploring archaeological data. Evidence for the adoption of wheat (a western domesticate) in East Asia is best understood by models that characterize the diffusion of innovations, and the models point to specific attributes of the archaeological record that help characterize the nature of social relations in

agricultural Asia, ca. 5,000 – 3,000 years ago.

Barton, Huw

[414] *Fallow Management and the Origins of Swidden Agriculture in the Tropics*

This paper considers the idea that the origin of swidden agriculture in the tropics arose from long-term practices of fallow management. In various forms, these ideas have been expressed before (particularly in South America), though swidden systems are normally thought of as being introduced into mainland and island Southeast Asia along with rice and taro 'agriculture' from southern China. This paper suggests instead that certain 'domesticates' may have been integrated into a pre-existing fallow management system, one that may also have contained 'domesticates'. At different times, scholars of tropical agriculture have placed different emphases on the 'fallow' as either a 'pause' between sowing crops or as a functional and productive aspect of the agricultural system itself. This paper looks at evidence of the latter in the tropics of Southeast Asia and South America. When the 'fallow' is thought of as the engine behind a system of human induced disturbance designed to drive biodiversity that is good for humans, patch mosaic management, in places like Australia, can also be seen as part of this same or at least similar, behavioral approach to niche construction.

[40] *Levantine Foragers during the Terminal Pleistocene and Early Holocene*

The Levant is geographically limited by the sea in the Mediterranean in the west, deserts in south and east with the only widened extension of wetter condition in the Euphrates and Tigris basins. Abrupt climatic changes allowed for the demographically growth of Terminal Pleistocene foragers in the Levant and led to increasing territoriality. Pressures were increased with the expansion of hunting-gathering groups from the Nile Valley into Sinai and the Negev. The social and economic impacts resulted in the sedentism of Natufian groups in the southern Levant and the establishment of sedentary complex societies of foragers in the Tigris basin and its northern tributaries.

[368] *Neolithic Voyages to Cyprus: Wind Patterns, Routes and Mechanisms*

Humans first arrived in Cyprus around 12,000 calibrated years BP. Visits to Cyprus resulted in settlement on the island during the Pre-Pottery Neolithic A beginning around 11,000 cal BP. Later occupations of the Cypro Pre Pottery Neolithic B testify to intensive connections with the mainland. We examined the possible routes to sail from the mainland to Cyprus and back by studying: sea level; options of available watercraft; sea conditions and currents; navigation skills; sailing routes; and prevailing seasonal and diurnal wind regimes. It is suggested that the optimal sailing route and season from the mainland to Cyprus by Neolithic navigators was from southern Turkey between April and October. Their return trip was from east or southeast of Cyprus to the Levant coast. This counter-clockwise pattern enabled the permanent human settlement on the island and contacts with the mainland.

Barzilai, Rebecca (Indiana University, Bloomington)

[359] *Negotiating Practices at the Emerald Site (11S1): A Case Study of Two Burned Structures*

Located near Silver Creek in the Illinois uplands of the midcontinent of the United States, the Emerald Site (11S1) in Lebanon, IL is a constructed Mississippian mound center where everyday practices were entangled with the performance of Mississippian religion. Recent excavations at the

Emerald Site by Indiana University and the University of Illinois have unearthed high densities of non-domestic structures dating to the Terminal Late Woodland (TLW) Edelhardt (A.D. 950-1000) and Early Mississippian Lohmann Phases (A.D. 1000-1050), indicating complex social practices interweaving TLW, Mississippian, and diverse migrant peoples from throughout the Midwest. This poster will focus on two burned structures, one characteristic of Edelhardt Phase peoples and the other of Lohmann Phase peoples, illustrating the ways in which religious practices and social representation are introduced, negotiated, and realized at the Emerald Site, and how the Edelhardt-Lohmann moment is impacting how we understand the importance of the site and religious practices in the fluorescence of Cahokia.

Basanti, Dil (Northwestern University)

[23] *In Death Do We Join: Community Building in Ancient Ethiopian Funerary Practices*

Aksum was the capital of northern Ethiopian kingdom that is famous for its numerous pre-Christian funerary stelae dating to the first four centuries A.D. The six largest stelae employ a peculiar “house” symbolism carved into their surfaces. Art historians have also noted that later Christian churches in the Ethiopian highlands, also sites for burial, mimic the layouts of old Aksumite elite houses. Beyond this, there has been little serious interpretation on what the “house” symbolism indicates or its significance to the two traditions. Reviewing Aksumite burial practices, I argue here that the stelae served an integrative purpose for Aksumite corporate groups, and that the “house” symbolism is an extension of these identity-building efforts. I then suggest that the ideology guiding these practices continues into the Christian era and serves a similar integrative role through Christian churches; resulting in a variation of the “house” symbolism. In this way, the syncretism observed with the “house” symbolism arises from common community-building processes among the two traditions.

Basgall, Mark E. [341] see Delacorte, Michael

Basgall, Mark E. (CSU Sacramento) and Bridget Wall (CSU Sacramento)

[341] *High Elevation Archaeology of the Inyo Mountains in Relation to Adjacent Ranges*

In the years since Bettinger's seminal studies in the White Mountains of eastern California, there have been projects completed at high elevations in two adjacent ranges, the Inyo Mountains to the south and the Sierra Nevada to the west of Owens Valley. These efforts have been of limited scope, but seem to show similarities as well as important differences in patterns of land use over time. Some extensive surface collections from the Inyo range have recently become available for examination, materials from 115 locations visited by Rollin and Grace Enfield from 1940-1980. Providing a more robust and expansive portrait of high elevation archaeology in the region, these assemblages are assessed in light of previous data and models.

Basiran, Alper and Cevdet Merih Ereğ (Gazi University)

[8] *Direkli Cave: Aerial Photography of An Epipaleolithic Site*

UAVs (Unmanned Aerial Vehicles), or “drones” as they are commonly referred to, are increasingly common in archaeology. Drones are an emerging technology that can provide low cost tools for aerial photography, regional surveys, site identification, excavation documentation, mapping and 3D photogrammetry. UAVs offer a huge potential for archaeological projects, being able to collect large amounts of high-resolution surface data.

They are often cheaper than other aerial photography systems, operate under a wide variety of conditions, and can be quickly deployed in difficult environments.

During the Direkli Cave Archaeology Project, it will be tested how a budget drone will be able to collect valuable data for creating high-resolution pictures and maps.

Newly initiated research at Direkli cave is helping to define an initial understanding of Epipaleolithic hunter-gatherer traditions in the central Taurus region of southern Turkey. Detailed analysis of the Direkli chipped stone tools and faunal assemblage suggests that the cave functioned as a short-term

logistical camp in the late Epipaleolithic. Especially geometric microlit such as lunates and triangulars was used by occupations of the cave. The cave used to primarily in the late summer and fall.

Bassett, Hayden (Department of Anthropology, College of William & Mary)

[50] *Internally Divided: An Archaeological Investigation of a Jamaican Slave Village, 1766 to 1838*

On the large-scale sugar plantations of the Caribbean, enslaved Africans were forced into dense communities on the scale of small urban townships. In many cases, the "slave village" site was allotted by the plantation owner, though the internal composition was largely left to the choices and dynamics of the enslaved community. This poster summarizes the findings from a recent archaeological survey of the slave village of Good Hope estate, an eighteenth-nineteenth century sugar plantation in northern Jamaica. Home to 400 to 500 enslaved laborers at any one time between 1766 and 1838, the discovery and excavation of the village site provide insights into the internal composition and material lives of a large-scale enslaved community. Data from this shovel-test-pit survey suggests that the conditions of enslavement varied from household to household, as well as the means for manipulating one's position within the hierarchical organization of the enslaved community. Differential access to material goods, relative household location, and the physical modification of the landscape are three ways in which enslaved households negotiated internal socioeconomic divisions, while simultaneously seeking to moderate the conditions of chattel slavery.

[93] *Assessing the Efficacy of Lesson Modules as a Public Education and Outreach Strategy for Archaeology*

Archaeological education and outreach is becoming ever more of a priority in a discipline that struggles to make research accessible and relevant to diverse publics. In recent years, this void has begun to be filled through the creation of grade school lesson modules on various archaeological topics. However, though these modules are readily available, little has been done to assess the efficacy of such an educational outreach strategy. To address this gap, a study conducted in collaboration with the Blackfeet Tribe systematically assesses the overall efficacy of Science and Language Arts lessons covering the 10,000 year significance of bison to native peoples. The modules themselves emphasize a multi-vocal and pragmatist perspective of the past in an attempt to more broadly connect with the diverse public. This study argues that (1) the respectful incorporation of archaeological education in a non-alienating, inclusive fashion allows for the interdisciplinary potential of archaeology to be more fully realized as well as for it to be more effectively implemented and disseminated, and (2) middle school students, as the upcoming generation, are a key demographic to target in order to encourage a more far reaching appreciation of archaeological ethics, goals, and practices into the future.

[108] *The Archaeological Climate: New Materialisms and Ontologies of the Anthropocene*

Archaeologists have long documented how humans have historically responded to climate changes. With broad scholarly debate over the adoption of the "Anthropocene" to describe the current period of Earth history, they are also contributing to evaluations of how land-use practices historically influenced Earth's climate, arguably since at least the mid-Holocene. While archaeological

approaches to past climate changes have much to contribute to the Anthropocene debate, they often uncritically leave intact modernist ontological binaries of nature and society that are foundational to most historiographic framings of the Anthropocene. In one case, society responds to a recalcitrant Nature; in the other, it produces it. In this paper, I explore how new materialisms further push archaeology to reconceptualize human-environment interactions by accounting for the "vitality" (sensu Bennett 2010) of nonhumans in helping to constitute environmental conditions and social collectives. How, for example, do the temporal boundaries of the Anthropocene and notions of historical agency and determinacy change if one shows that nonhuman environmental constituents have always been entangled in human actions and rarely guaranteed to be in full conformity with human desire, design, or intention? I address this and related questions through several archaeological case studies, including mid-Holocene socio-environmental transformations in South India.

Bauer-Clapp, Heidi (University of Massachusetts Amherst)

[72] *A Matter of Balance: Opportunities and Challenges in "Difficult" Heritage*

Tourism centered on archaeological sites or associated material culture can benefit local communities, financially or otherwise. Yet when the site in question involves "difficult" heritage such as violence, communities often must grapple with tensions regarding how to balance memorialization or education with profitability. Such tensions can be heightened when the site involves human remains. This paper presents a case study of St Helena, a small British Overseas Territory in the South Atlantic Ocean. In the mid-1800s the island received nearly 30,000 captive Africans "liberated" from the middle passage of the transatlantic slave trade. Recently, a salvage excavation uncovered the skeletal remains of at least 325 of the estimated 8000 of these individuals who died and were buried on the island, yet this remains a little-known aspect of the island's history. As a result, local efforts to promote this heritage for tourism must negotiate the tensions associated with such difficult heritage as well as what this history means to the local community. Drawing upon fieldwork in the United Kingdom and St Helena, this paper analyzes the opportunities and challenges archaeology creates for "locals" and "tourists" and the often-complex interplay between the interests of these groups.

[405] *Bottom-Up Heritage Management in Ithaca, New York: Community Initiatives and Collaborations with University Archaeologists*

Discovering Enfield Falls is dramatically different from academic managed heritage projects that are top-down projects initiated by archaeologists. In our project, the heritage planning originated with stakeholders who were determined to preserve the history of a community that was demolished in the early twentieth century to create a state park. This 19th century hamlet was both a commercial center for farmers and a regional scenic tourist destination. The stakeholders did not need archaeologists to help them discover their history or value Enfield Falls as a heritage site. They needed archaeologists to collaborate with them in order to reveal the cultural landscape and history buried in the park to a larger community both locally and within the northeast region of the United States and Canada. The collaboration involved students enrolled in Cornell University service-learning courses with a participatory action research focus. From 1998 to the present, archaeologists and community members have collaborated on all stages of the work, from fieldwork to museum exhibits. In our outreach, we have jointly produced permanent indoor and outdoor exhibits, an archaeological walking trail, an extensively illustrated brochure, an orientation film for the park's museum, and two public access television films.

[373] *The Emergence and Distribution of Beans (*Phaseolus vulgaris*) in the Upper Tennessee River Valley*

This is a preliminary study of beans (*Phaseolus vulgaris*) recovered from late prehistoric and historic Native American sites in East Tennessee. Beans are known to be the last domesticated plant that was adopted by late prehistoric cultures in the Eastern Woodlands. In the Southeast, the emergence of beans is not clearly understood because no regional studies have been done and very few samples have been directly dated to establish a chronology. This problem is addressed by analyzing the spatial and chronological distribution of beans recovered within and across sites from the Upper Tennessee River Valley.

Baustian, Kathryn (University of Nevada, Las Vegas)

[131] *The Bioarchaeology of Social Order: Cooperation and Conflict among the Mimbres (A.D. 550-1300)*

A comprehensive bioarchaeological assessment of Mimbres health, activity, and interpersonal violence was completed using data from a sample of 248 human burials from 17 Late Pithouse (A.D. 550-1000) and Pueblo (A.D. 1000-1300) sites in the Mimbres region. The findings presented here demonstrate broader patterns for interpretation of community experiences that have not been as well described in previous case studies from individual site samples. This larger sample of all available adult burials reveals relatively good health, low rates of interpersonal conflict (approximately 10%), and sufficient diets. Although some individuals from all time periods showed indicators of interpersonal violence, Mimbres communities do not appear to have had endemic warfare seen in other regions of the Southwest. Stress was perhaps mitigated then by social mechanisms or forms of social control that promoted cooperation and resolved conflict. The limited use of strategic interpersonal violence may have been one of the ways that social order was maintained. Mortuary data support archaeological indicators of a fairly simple political structure but atypical burials from multiple sites suggest differential status or social significance in the community. These individuals may have served special roles and both skeletal and mortuary findings better inform our interpretation of Mimbres societal structure.

Bautista, Stefanie (Stanford University)

[31] *Towards an understanding of the transition from Paracas to Nasca from a household perspective: Interpreting changes in ceramic consumption at Uchuchuma*

This paper highlights how the study of ancient dwellings and the activities that occurred within them can help archaeologists better understand the dynamic and complex nature of people, their relationships to each other, and the broader society they live in. In the Rio Grande, Nasca Region, Perú, Andean archaeologists assume that the Nasca culture (1–700 A.D.) developed directly from the Paracas (800–100 B.C.) based on the continuity of some pottery traits and settlement. While there has been extensive amount of research in this area, archaeologists still do not know how daily life was affected by this transition from Paracas to Nasca. This study tests whether Paracas household organization and domestic activities changed along with the development of the emerging Nasca society by comparing both Paracas and Nasca ceramics from a residential archaeological site. Uchuchuma, located in the Aja Valley, has both a Paracas and Nasca domestic occupation, making it the ideal locale for investigating this transition. This more in-depth analysis of Paracas and Nasca ceramic-making traditions (e.g. morphology, technological composition, and decoration) and domestic consumption will shed light on how economic relations were organized among Paracas households, and test whether practices changed or persisted during the Nasca occupation.

Baxter, Erin (University of Colorado, Boulder)

[273] *Aztec Ruins, 2.0*

This poster will present a "new" view of Aztec Ruins -- particularly Aztec West -- which refines modern base maps with historic data. This latter includes data drawn from Morris-era excavation photos, as well as additional information from unpublished sketch maps, correspondence, and field

notes. This 'new' map will include unpublished locational data on mounds, burials, floor features, wall features, remodeling, refuse, burning... etc etc. Almost no reading required.

[348] *Approaches for Producing Precise Archaeological Chronologies*

For the fortunate few, dendrochronology allows an annual window into the archaeological record. Over the past 20 years, however, Bayesian chronological modeling has brought chronologies precise to within the scale of past lifetimes and generations within the reach of all archaeologists. Explicit statistical modelling allows radiocarbon dates to be interpreted within the framework of knowledge provided by associated archaeological evidence, providing more precise dating and thus allowing the activities of people in the past to be understood in new ways. Until now the majority of published models are site-based. These models take into account the 'relatedness' of groups of radiocarbon dates from the same site, and can also incorporate powerful prior information about the relative order of dated samples derived from stratigraphy. But archaeologists have a wide range of other types of information about the material remnants of the past at their disposal – location, artifact typologies, the character of sediments, sequences derived from seriation, cultural associations, and others. This paper discusses the kinds of archaeological information that can be the basis of our chronological models by examining their relative strengths and weaknesses and the power of existing approaches to capitalise fully on their potential.

Beach, Jeremy and K. Bryce Lowry (University of Chicago)

[20] *An Archaeological Investigation of Gender on the Late Prehistoric Steppe*

In 1954, Hawkes warned that the intangible aspects of social life are the most difficult for archaeologists to comment on due to distance between object and ideology, the material and the mental world. Certainly, there is an epistemological slippage that can occur when moving between categories of social life that rely on objects to legitimize claims or complete tasks, and those aspects of society which can be veiled within larger, and immaterial, structures or norms—religious beliefs, ideological superstructures, affect. This paper will attempt to problematize discussions of gender often couched solely in terms of power, political economy, and ideology. How can a discussion of gender proceed if data speaking to power and ideology are missing, or are unclear at best? Using archaeological, ethnographic, and historical approaches we will demonstrate that views about gender are of special interest both empirically and theoretically, as they are truly “nested” within the most impenetrable sections of Hawkes’ schema—yet—not entirely out of reach. We will focus on the late prehistory of Mongolia and the wider steppe (ca. 1500-0 B.C.) in order to investigate gender roles and practices, sexual divisions of labor, and (in)equality within the oikos.

Beach, Timothy [176] see Cook, Duncan

Beach, Timothy (University of Texas at Austin)

[350] *Maya Wetland Fields from 2014 and Earlier Coring Evidence*

This paper has two main goals: first to present our latest findings for wetland field formation from a series of 2014 palustrine, floodplain, and lacustrine cores, and second to consider the relative strengths and weaknesses of the different approaches to coring: piston-, soil-, and vibra-coring compared with excavation in these environments. We first present how the new cores from 2014 at Akab Muclil and Laguna Verde compare with previous coring and excavation data toward

understanding ancient Maya wetland field uses and formation. The paper will use extensive, multiple proxies, including AMS dating, stratigraphy, magnetic susceptibility, XRD-XRF, micropaleontology, general chemistry, stable isotopes, elemental analysis, pollen, phytoliths, micromorphology, and charcoal from dated strata. Second, we discuss which coring methods work best in a variety of wetland environments of Mesoamerica for understanding the differences in the timing, use, and crop types of wetlands over the Late Holocene. Maize agriculture appeared in this region by at least 4,000 years ago, wetland fields were a Late Preclassic and dominantly Classic Period phenomenon, and ongoing work is providing a better chronology of when and how wetlands formed and how humans used these environments, which are being destroyed so rapidly in this region today.

[281] *Coastal Dynamics and Site Formation: A look at the Archaeological Deposits of Coastal RI after Hurricane Sandy*

The impact of Hurricane Sandy on the southern New England coast has brought attention to the delicate nature of our coastal landscapes. Just as we are beginning to utilize new insights into climate change for urban (re)development, we must also consider coastal archaeological sites at risk in areas of high erosion. The Public Archaeology Laboratory, Inc. (PAL) surveyed 28.2 km of Rhode Island's coastline to evaluate the effects of Hurricane Sandy on coastal archaeological sites. Using GIS, PAL created a predictive model comparing archaeological site sensitivity with areas of significant storm erosion to identify areas with the highest potential for containing intact archaeological deposits impacted by the hurricane. Field reconnaissance identified a WWI era fortification and thirty-two pre-contact Native American archaeological sites, seven of which were previously documented. The data obtained during the survey contribute to our understanding of Native American resource use and settlement in the coastal zone and coastal alteration as well as site formation processes resulting from coastal dynamics and sea level rise. This poster will present on the Hurricane Sandy archaeological project, consider how natural processes have shaped the coastline and impacted cultural deposits over time, and discuss the implications for the future of these sites.

Beasley, Melanie (University of California, San Diego)

[293] *Men at Work: Economic Complexity and Exploitation of Dietary Marine Protein Sources in the San Francisco Bay Area*

In the San Francisco Bay Area, distinct dietary niches were exploited in prehistory, and these different food economies are most readily distinguished in terms of their primary protein sources. This paper highlights the use of external auditory exostoses (EAE), a pathology linked to the exploitation of marine resources in cold water, to evaluate varying economic complexity in acquisition of marine protein food sources between different sites around the Bay Area. The high occurrence of EAE in males compared to females across the Bay Area suggests that the males were habitually exposed to cold water and/or sea spray at a higher frequency than females. This indicates that males were likely the primary procurers of marine dietary resources, which supports ethnohistoric observations that men were primarily responsible for fishing activities. However, there is variation of occurrence of EAE between sites within the Bay Area suggesting that there was a varying degree of reliance on a marine substance economy across the region, supporting the general trends seen in the isotopic evidence.

Beaudoin, Matthew (Timmins Martelle Heritage Consultants Inc.)

[13] *Who Shot First?: Codified Categories Creating Imaginary Archaeological Pasts*

Archaeologists in Canada are empowered by the Canadian state through licensing and/or permitting systems; as such, archaeological practices are intrinsically entangled with various levels of governance. While it would be convenient to argue for an archaeology either free entirely of state control, or entirely and purposefully guided to fulfill state mandates, the reality is more nuanced. Archaeology is often structured by interpretive conventions that act to replicate the dominant archaeological zeitgeist, which complicates presumptions of unrestricted actors or invisible structuring controls. By exploring how archaeological sites are uncritically categorized and labelled in Brant County, Ontario, Canada, I demonstrate how the conventional taxonomic practices serve to create an imagined colonial past where the nineteenth century Ontario landscape is populated by white European people of English descent and devoid of various 'Others'. This imaginary past is not born from the purposeful guidance of state regulators, but rather reinforced by the state's codification of existing archaeological conventions and the uncritical acceptance of conventional categories by archaeologists.

Beaudry, Mary (Boston University)

[36] *Discourse and Dissonance in the Archaeological Archive*

A process begun afresh for each archaeological site or research project involves constructing the archive through integrating differing lines of evidence. For historical archaeologists the archive includes written records, oral traditions, and material culture; often elements of the archive provide overlapping, conflicting, or entirely different insights into the past, requiring resolution and integration because of differences in scale, completeness, representativeness, temporal resolution, and lack of correspondence. The documentary record of a site can be as remarkably rich in detail and length of coverage as the archaeological record is deficient in the sorts of easily-dated sealed deposits that provide tight chronological control required to link episodes of deposition and particular objects with known inhabitants of the site. Or the reverse can be true; at times there are few if any documents to help one understand who lived at a site at a given time period, and the site is not recent enough for oral history to provide insight into what happened there in the past. This paper considers the intertextuality of sources and analyzes contrasting examples of success and of failure in attempts at establishing a dialogue between above-ground and below-ground evidence.

Beaupré, Andrew (College of William and Mary)

[405] *One Site, Multiple Pasts: Negotiating Identity and Archaeological Heritage along the US/Canadian Border*

Fort Saint-Jean lies in the Richelieu River Valley approximately half-way between the modern American/Canadian border and the City of Montreal. The valley has been a space of contestation between French, British, Canadian and American ideas, identities, and empires. For over three hundred years this contestation has taken numerous forms, ranging from ethnic stereotyping to open warfare. When I began directing the Laval University archaeological field program at Fort Saint-Jean, our research questions were geared toward the role the site played in Canadian military history. At that time, I was unaware of the significance of this specific National Historic Site to the heritage of multiple modern peoples. French-Canadian Nationalists vaunt the Richelieu Valley for its role in the 1837 rebellion, for the Loyalists Fort Saint-Jean is a figurehead of imperial control of North America. For all Canadians, the site can be seen as a shrine to Canadian military heritage. Finally the site is often employed by Americans to commemorate the short lived invasion of British Canada by the Continental Army. This paper discusses the path taken by one graduate student through the complexities of research partner and stakeholder interactions on the topics of ethnic and collective North American heritage.

Beaver, Joseph (University of Minnesota Morris) and Rebecca Dean (University of Minnesota Morris)

[276] *Macroscale Analysis of Faunal Remains in the Hohokam Area of Southern Arizona: Preliminary Results*

Pre-Contact societies in southern Arizona developed large-scale, agriculturally-based communities with essentially no access to domesticated meat. Their hunting opportunities were limited, as well, by the need to live close to water sources for irrigation. The resulting trade-offs between community

needs have important implications for political organization, labor choices, and gender roles. In this poster, we present preliminary results of a GIS analysis of relationships between species representation and environmental characteristics in the Hohokam area. We examine the effects of agricultural labor constraints, species habitat constraints, and diachronic changes in human population on archaeofaunal patterns. Our data set consists of over 100 faunal assemblages ranging from the Early Agricultural Period to the Hohokam Classic Period, covering a wide range of micro-environments in southern Arizona.

Beck, Kelly (University of Utah)

[310] *Ecological Baselines, Long-Term Population Histories, and the Zooarchaeological Record*

The potential for zooarchaeological data to inform modern conservation issues is unquestioned by archaeologists; however, with a few notable exceptions, such an approach has been underutilized. Zooarchaeological data are uniquely positioned to provide a long-term view on the population history and variation in foraging ecology of a species. Such information is paramount to conservation efforts for threatened taxa, particularly in addressing what has been called by conservation ecologists the "Shifting Baselines Syndrome." This poster uses ancient DNA and stable isotope data to investigate the late Holocene population history and feeding ecology of Guadalupe fur seals from San Miguel Island, California. Ancient DNA sequence variation suggests that Guadalupe fur seal populations on San Miguel Island were fairly substantial and remained stable throughout the late Holocene. Stable carbon and nitrogen isotope ratios from these same specimens indicate little variation in fur seal feeding ecology across the same time span. Together, these inferences of late Holocene Guadalupe fur seal population history and feeding ecology provide significant, new baseline information regarding long-term variation in these ecological characteristics important to ongoing conservation and management efforts.

Beck, Colleen (Desert Research Institute), Lauren W. Falvey (Desert Research Institute) and Harold Drollinger (Desert Research Institute)

[311] *Protest Graffiti at the Historic Nevada Peace Camp*

The Peace Camp, near the Nevada National Security Site, is the location where protesters have gathered for several decades to voice their opposition to nuclear testing and environmental issues. This National Register eligible property contains an abundance of archaeological features, such as rock cairns, tent pads, sweat lodges, and geoglyphs. Associated with these features are two concrete highway drainage tunnels that served as a passageway and a place of respite from the desert conditions. In addition to these transient uses, their concrete walls provided a canvas where protesters could express their feelings in a setting much more private and enduring than a group protest activity. The tunnel interiors are covered with colorful graffiti: literary quotes, pictures, abstract designs, and personal sentiments. This remote and concealed locale contrasts with the urban displays where the drawings are created to be seen by and shared with others. A detailed analysis of this artistic legacy has defined hundreds of diverse panels of texts and images with most expressing the activists' goals of peace and saving the Earth by stopping nuclear testing.

Beck, Jess (University of Michigan - Museum of Anthropology)

[332] *Commingled, Communal and Complex: Reconstructing Iberian Copper Age Mortuary Practices*

Fragmentary and commingled human remains recovered from salvage excavations present bioarchaeologists with a number of interpretative challenges, including calculating MNI in the absence of detailed provenience information, untangling post-excavation commingling of remains, and analyzing high volumes of recovered material. Importantly, analytical techniques developed in recent research on forensic and archaeological taphonomy can help overcome some of these difficulties. Here I focus on the case of Marroquíes Bajos, a 113 hectare Copper Age enclosure site in Andalusia that was salvage-excavated in advance of urban expansion of the city of Jaén. Excavations revealed seven discrete mortuary areas, ranging from commingled deposits in wall

trenches to richly accoutred interments in artificial caves. Using the lens of forensic taphonomy to assess the preservational patterning of skeletal and dental remains from three previously unstudied necropolises allows me to identify the types of burial practices likely used at each locale. In addition to unpacking late prehistoric funerary practices, investigating the demographic composition of these three mortuary populations through an analysis of dental development and wear provides insight into how Copper Age communities at such large-scale centers were organized socially, illuminating the ways in which community identity was formed and maintained during the Iberian Chalcolithic.

[384] *Laboring in Tiwanaku's Moquegua Colony: A Bioarchaeological Activity Indicator Comparison Using Population-Based and Life Course Approaches*

Diverse, lower elevation areas were home to producers and procurers of goods not easily grown or obtainable in the South Central Andean heartland of the Tiwanaku state. Various Tiwanaku colonial settlement clusters, near present-day Moquegua, Peru, comprised one such region. Tiwanaku colonists in this area participated in activities that included farming of corn and coca, as well as transportation of goods between the heartland and colony. For example, Omo-style (Omo M16D and Rio Muerto M70 sites) burials included people who may have embraced more of a pastoralist lifeway, while Chen Chen-style (Omo M10, Chen Chen, and Rio Muerto M43 sites) burials comprise people with potentially a more agrarian lifestyle. In addition to site-based burial differences, prior research has shown individual, gender, and subgroup-specific variability in grave good assemblages, isotopic differences reflecting diet and migration patterns, and cranial modification, likely reflecting the multicultural Tiwanaku way of life. This research uses patterns of specific skeletal evidence of activity (i.e. musculoskeletal stress markers and osteoarthritis) to address labor differences, employing both a population-based perspective by burial area and a life course approach by individual burial, in order to understand the Tiwanaku colonial life and workforce in the Moquegua region.

[3] *A Matter of Time – Applications of Portable X-Ray Fluorescence in Establishing Rock Art Chronologies*

The aim in this examination was to examine the potential for portable XRF technology to contribute to chronologies of in situ rock art. In order to do this pXRF data from Chumash rock art panels in the Wind Wolves Preserve in South Central California were compared with one another, and with readings from ochre found in excavated deposits. These ochre deposits are associated with other artifacts which have known dates. The results showed that multiple pigments were used within each rock art panel and within individual elements, indicating that multiple painting events may have taken place over a period of time. The pXRF data can be used to link areas of panels in which the same pigment material was used in order to tie together chronologies based on superimposition. The results also demonstrated the potential for comparison of chemical composition to be used to link ochre from excavated deposits with in situ rock art, thereby providing a probable date for its production.

Bedford, Stuart (Australian National University), Matthew Spriggs (The Australian National University) and Richard Shing (Vanuatu Cultural Center)

[77] *"By all means let us complete the exercise ": the 50 year search for Lapita on Aneityum, southern Vanuatu comes to a conclusion.*

Archaeological research on the island of Aneityum, the southern-most inhabited island of the Vanuatu archipelago (the former New Hebrides) began in 1964 under the direction of Richard and Mary Shutler. It was soon after this that William Dickinson first began analysing pottery sherds from various sites across the archipelago. Since those early beginnings he has studied 100s of samples including 112 samples from the single site of Teouma. Early pottery sites remained elusive on the southern islands for decades and particularly on Aneityum. More recent assessments of its geomorphology, a key aspect regularly emphasised by Dickinson, along with some serendipitous test-pitting led to the discovery of a Lapita site on the island. Dickinson's petrographic expertise was once again called on some 50 years after research first started on the island.

Beekman, Christopher (University of Colorado Denver)

[39] *Western Mexico: Opening Act of the Mesoamerican Epiclassic*

The Epiclassic has been described as a major watershed in Mesoamerican prehistory, but in different or even contradictory ways. The period has been claimed to usher in a shift from prestige to mercantile economies, religious to military political systems, territorial states to city-states, parochial to international art styles, and in the case of western Mexico, from non-Mesoamerican to Mesoamerican society. These metanarratives have privileged formal characteristics, which are in any case found empirically wanting, at the expense of understanding the causes, processes, or complexity of the disruptions characterizing this era. In western Mexico, the Teuchitlán culture was replaced by new settlements of Bajío origin ca. A.D. 500, a century earlier than is typically recognized as Epiclassic. Even so, the processes in motion are the same noted elsewhere in many areas of Mesoamerica – namely climate change, warfare and population dislocation, the disruption of polities dependent upon a relatively sedentary and docile population, new demands on the prestige economy, and major changes in iconography. These were epic processes in the sense proposed by the organizers, and they can only be clarified by moving beyond the simple dichotomies used to define the Epiclassic.

Beisaw, April (Vassar College)

[289] *Mapping Contagious Abandonment and Resilience, North of New York City*

The lands around New York City's rural reservoirs contain ruins of residences, schools, churches, farms, and other businesses, displaced by watershed creation that began in the mid-nineteenth century. But even the forests around them are artifacts of the abandonment. Here, the spaces in between buildings and trash piles are the places where the region's economy flourished before the

reservoir changed everything. Treating each ruin as an individual site would ignore the interconnectedness of rural economies and the contagiousness of abandonment. However, treating these ruins as individual features within larger sites of watershed creation, their interconnectedness is prioritized. Spatial gaps between each ruin come into focus as places where economic and social activities once took place. The secondary growth forest, the dry creek beds, and the quarried cliffs are cultural features in need of interpretation. Standing and occupied structures are also integral features whose documentation allows for assessments of resilience. Together, these multiple feature types provide information on not only where but also when and why abandonment occurred across vast sites. This landscape contains 150-years of data on cultural impacts of environmental engineering that can inform future watershed projects and contribute to research on rural and urban abandonment.

[251] *Hunting Blinds from Plateaus and Hills in Southern Patagonia (Santa Cruz, Argentina): Tactics and Beyond*

The aim of this paper is to present and discuss the distribution patterns of Late Holocene hunting blinds from two distinct environments of southern Patagonia (Argentina): basaltic plateaus and hills. These are mostly semicircular stone structures built for the hunting of guanaco (*Lama guanicoe*), a medium-size wild camelid that was the main staple for the hunter-gatherer populations throughout the Holocene. Despite of the existence of a number of shared traits (e.g. obsidian from the same source, similar rock art motifs) that suggest tight social ties and interactions, both environments show differences in frequency and diversity of hunting blinds as well as in the inferred tactics implemented by the hunters, which can be explained by differences in topography, seasonality, and prey biomass.

Belfer-Cohen, Anna (The Hebrew University of Jerusalem) and Nigel Goring-Morris (The Hebrew University of Jerusalem)

[82] *Reflections on the Origins of the Neolithic "House" in the Near East*

Large-scale durable architecture appears quite suddenly with the emergence of the semi-sedentary Natufian (ca. 15,000 calB.C.) in the Near East. Subsequently, during the course of the Natufian, structure sizes diminish. Construction traditions, including house that were semi-subterranean, constructed with wooden posts, stones and puddled mud continued during the PPNA (ca. 10,000-8,500 calB.C.), albeit with the innovation of mud-brick superstructures. An important distinction between the Natufian and the PPNA is the appearance of public architecture, reflecting the dichotomy between residential housing, 'homes', and communal structures, hardly recognized during the Natufian. This portrays changes in the social dynamics of communities participating in the processes of Neolithisation, culminating in the fully sedentary village societies of the PPNB (ca. 8,500 calB.C. onward).

Changes were quite rapid, involving the shift to rectangular architecture, assumed to indicate modifications in basic social unit behaviors - the rectangular house is supposed to be the domain of a nuclear-com-extended family as the plan enables additions according to need. Through time the sense of ownership grew, most probably together with hygienic demands accompanying increasing

sedentism. Starting with the Early PPNB there is extensive use of plastered floors and the beginnings of systematic house cleaning and garbage disposal.

Belkin, Sara (Boston University) and Jennifer Wildt (Boston University)

[93] *High School Students, Archaeology, and Public Outreach*

Since 2009, an archaeological field program for high school students has conducted excavations at the Mary M.B. Wakefield Estate in Milton Massachusetts. Co-Directed by two graduate students in Boston University's Department of Archaeology, this program has taught professional level excavation methods to dozens of local and non-local students for two two-week sessions each July. These students work alongside graduate volunteers as they learn to excavate small to large units, draw plan views and profiles, and wash and handle all types of artifacts. From excavating a late eighteenth-century summerhouse foundation to an early nineteenth-century cobble-paved yard, these students are also expected to aid the co-directors in interpreting the past by connecting their individual units with what past activities and episodes their stratigraphy and artifacts represent. This poster will present our experience with working with high school students, integrating our program within recent developments in community-archaeology. Our poster will address the particulars of our program but also seek to show the benefits of teaching archaeological skills to high school students beyond the context of archaeology.

[139] *What Were They Thinking? Using Electroencephalogram (EEG) to Map Brain Activations during Stone Tool Manufacture*

While psychologists have been using many different methods to map brain activity during various tasks, archaeologists have yet to fully utilize the potential of these techniques to examine early human cognition. Paleolithic stone tools provide a promising line of evidence in human behavioral and cognitive evolution. Recently, brain imaging modalities such as Functional Magnetic Resonance Imaging (fMRI) and Positron Emission Tomography (PET) have been used to more directly link cognition and stone tools. This paper will review these previous studies and propose a new protocol. In contrast to earlier research, which has used hemodynamic brain activity mapping techniques (fMRI, PET, and fTCD), the research proposed here will be conducted through electromagnetic imaging with electroencephalogram (EEG) to examine the parallels of cognitive development with lithic industry advancements. Through the use of the EEG, a modality with better temporal control, we might isolate where in the lithic reduction process previously noted cognitive differences occur as well as provide a naturalistic knapping environment during the brain imaging.

[354] *Beyond the Dates: Reconstructing the Social Histories of Southeastern Utah Cliff Dwellings with Tom Windes*

For over a dozen years, Tom Windes and his Woodrat crew have been scampering in and out of the canyons of the Cedar Mesa area, mapping hard to reach cliff dwellings and taking tree-ring samples from archaeological wood in intact structures. Beyond just obtaining tree-ring dates during this work, Tom has developed new dendroarchaeological sampling methods, trained a new generation of researchers in these techniques, and pushed the limits of standard tree-ring analysis and interpretative methodologies. More than just dating ancient structures, Tom and his colleagues are developing new ways of reconstructing the social histories of cliff dwellings and ancient communities in Southeastern Utah based on detailed architectural documentation, tree-ring dating of structural timbers, and landscape level analyses. This presentation outlines Tom's various contributions to the dendroarchaeological sciences, his undying support of a new generation of researchers, and some of the new methods Tom helped to inspire that are pushing and challenging interpretive frameworks of Southeastern Utah prehistory.

[86] *Captives, Messengers, Pilgrims, Refugees, Wives: Classic Maya Written Accounts on Travel in the Upper Usumacinta*

This presentation reviews references to travel in Classic Maya inscriptions at the archaeological sites of the Upper Usumacinta region. Although direct accounts of going to, or coming from, specific places are few, many texts and captioned images mention non-local individuals or describe events at other sites. The vast majority of such contexts involve warfare, but there are also references to visiting dignitaries, exiles, artisans, messengers, pilgrims, and, above all, brides from other royal families. The combined data from textual sources paints a picture of substantial mobility at least among the Classic Maya elites who produced and used hieroglyphic texts. In addition to revealing the political and historical fabric of the region, travel accounts shed light on the network of land and riverine routes in the Western Maya lowlands.

Bement, Leland (Oklahoma Archeological Survey, OU)**[148] *Beaver River Complex Contribution to Folsom Archaeology: An Update and Future Directions***

The Beaver River Complex (NW Oklahoma) of early Paleoindian (Clovis and Folsom) large-scale bison kill sites began contributing to our knowledge of Folsom hunting organization two decades ago with the identification, excavation, and analysis of the Cooper site. Since then a total of five Folsom kill components have been identified at three arroyo kill sites within a 700 m reach of the Beaver River. The most recently discovered site, Badger Hole, contains the youngest Folsom kill component of the sample, dating to 10,350 radiocarbon years before present. The results of the 2011 and 2012 excavations and subsequent analyses of this site's lithic materials and dating are combined with that from the other Beaver River complex sites and regional sites to provide an update on the current state of analyses and the direction for future southern Plains Folsom research.

Bender, Shilo (University of Missouri), Lauren Trimble (University of Missouri), Todd VanPool (University of Missouri) and Christine VanPool (University of Missouri)**[6] *Provenance Analysis of Obsidian Artifacts from 76 Draw, New Mexico***

During the 13th and 14th Centuries, southern New Mexico was a borderland where the Medio period Casas Grandes, Salado, and El Paso phase cultures intersected. The complex cultural setting is illustrated by contemporaneous settlements associated with the various cultures in close proximity of each other. Recent research at 76 Draw, a large Medio period settlement near Deming, New Mexico, focused on understanding the nature and degree of interaction among the various cultures. We hope to contribute to this understanding by determining the chemical source of obsidian artifacts recovered from the site. Obsidian artifacts recovered from 76 Draw reflect several different sources, the most common of which are Mule Creek, Sierra Fresnal and Antelope Wells. We find that obsidian was transported from the Sierra Fresnal and Antelope Wells sources in a raw or preform state, but Mule Creek obsidian was likely introduced as finished, bifacial tools.

Bender, Laura (Midwest Archeological Center, NPS)**[359] *The Search for Little Bow's Village, Cedar County Nebraska***

The Corps of Discovery Expedition traveled the stretch of the Missouri River that today divides Nebraska from South Dakota in August of 1804. From their vantage point on the river, Meriwether Lewis and William Clark both note an abandoned Omaha village at the mouth of what is now Bow Creek, Cedar County, Nebraska. The explorers' map identifies the village as having been founded by Omaha leader Little Bow after branching off of the main Omaha tribe. Since the 1940's archaeologists have made attempts to relocate this village as described by Lewis and Clark without success. This poster describes a renewed effort to identify the site.

Benfer, Adam (University of Calgary)**[246] *Navigating Prehispanic Central America: Discerning Aquatic Transportation Routes and Technologies***

In the lowland tropics of southern Central America during the later prehispanic periods, the oceans, lakes, and rivers were interregional highways that linked dispersed societies for purposes of trade and communication. Using ethnohistoric sources, archaeological finds, and ethnographic data, we review the types and varieties of indigenous watercraft that might have been used to navigate these natural transport networks. Along the way, we consider the lifeways of these prehispanic boatmen and boatwomen and the roles that they may have served in the distribution of material culture. Focusing on our research in the San Juan River basin of Nicaragua and Costa Rica, we demonstrate how Geographic Information Systems can be and are being used to map out prehispanic aquatic transportation networks based on archaeological data, indigenous watercraft technologies, and water-body navigability.

[365] *Migration and Cohabitation at Morton Village: Future Research Directions*

New evidence for Oneota/Mississippian cohabitation at Morton Village leads us to develop novel questions and models for understanding the nature of social interaction at the site, while also recontextualizing previous analyses and interpretations within a revised framework of migration, cooperation, and ethnogenesis. In addition to carrying out additional excavations to further test hypotheses about the nature of co-habitation and social stress at the site by examining site structure, foodways, architecture, and other material culture, future research directions include, 1) a consideration of Turner's (1969) concept of *communitas* as a potential interpretive framework; 2) resituating bioarchaeological trauma analyses within the contemporary sociocultural literature on community experiences of violence in migrational contexts; 3) modeling social interaction and raw material distribution patterns through the application of geochemical analysis as a method of clarifying cultural integration; 4) development of a model for comparing regional Oneota and Mississippian mortuary practices that explicitly considers the nature of migration and cohabitation; 5) ceramic use-wear analysis; and 6) ceramic analysis as a means of exploring movements of individuals, ideas, and material culture with a particular emphasis on exchange, mobility, and the social negotiation of identity.

[74] *Human Response to Sea-Level Change in the Early Holocene: Examples from the Continental Shelf*

Human response to sea-level rise is an important aspect within the broader topic of coastal prehistory. Sites found on today's continental shelf directly contribute to the archaeological record and are, in some cases well preserved under water. Recent emphasis on continental shelf archaeology, or submerged prehistory, has encouraged prehistorians to embrace underwater archaeology in order to fully appreciate past lifeways and adaptation to sea-level change in the final Pleistocene and early Holocene. Examples from northern Europe and the Mediterranean basin will be discussed.

Benn, David (Bear Creek Archeology Inc)

[353] *Cosmograms and Archetype Ancestors at the Pierson Creek & Yaremko Sites, Iowa*

Recently discovered geoglyphs at two Late Woodland sites in northwestern Iowa take the form of anthropomorphic turtles, bison, thunderers and a "stickman" similar to the petroglyphs at Pipestone Monument in southern Minnesota. Excavations indicate the geoglyphs functioned as cosmograms where vision quests and other life-renewal rituals probably were conducted. The cosmograms and associated evidence for rituals are compared to ethnographic descriptions of Lakota tribal myths to reveal possible symbolism for the figures. The two sites are hypothesized to have been part of a "sacred" locality where multiple ritual sites were integrated as a structured mythological landscape. In this narrative, archaeological investigation is perceived to be encountering two levels of inquiry: the rationality of place and the dream state of mythology.

[191] *Validating Niche-Construction Theory through Path Analysis*

Under the conventional view of evolution, species over time come to exhibit those characteristics that best enable them to survive and reproduce in their preexisting environments. Niche construction provides a second evolutionary route to establishing the adaptive fit, or match, between organism

and environment, viewing such matches as dynamical products of a two-way process involving organisms both responding to problems posed by environments as well as setting themselves new problems by changing their environments through further niche construction. Path analysis forces researchers to specify how variables relate to one another and encourages development of clear and logical theories concerning the processes that influence a particular outcome. As we show through a case study—the coevolution of cattle husbandry and the tolerance for milk consumption—path analysis can also call attention to potential areas of weakness and ambiguity in data sets and how they are used in constructing archaeological and evolutionary inferences.

[328] *Fighting the Tigers: Chinese Mobility as Resistance During the Exclusion Era*

During the mid-nineteenth century, Chinese and many other immigrants flooded California's shores in pursuit of economic opportunities. Over the next several decades, Chinese labor became threatening to national Euro-American interests and federal and state governments passed a variety of taxes, ordinances, and legislation targeting Chinese communities. The most restrictive of these were the Chinese Exclusion and Geary acts, which barred immigration by Chinese laborers and severely limited their mobility patterns. Through ingenuity and active resistance, however, Chinese settlers frequently traveled between the West and their homeland and found ways to circumvent racist regulations. Employing historical documents, immigration files, and archaeological surveys and excavations, we present a case study of Chinese fishermen who lived in Santa Barbara, California, circa 1880 to 1915, that illustrates how they skirted exclusion laws and successfully carved out economic opportunities at the margins of American society.

[16] *Evidences for Social Structure and Ritual Practices from Körtik Tepe at the Beginning of Settled Life*

Until the end of the 1990s, southeastern Turkey was considered a secondary center of Neolithisation. However, excavations in the context of the Ilisu Dam project have shown that there was a long local tradition of permanent settlement since at least the Epipaleolithic. Evidences from Körtik Tepe indicate strong commitments to the site and to households. Social and emotional relationships were consolidated by intense ritual behavior, including burials beneath house floors, the increasing use of body adornments, and rich symbolism. Some decorated objects and burial rites were highly standardized. Many of the dead were buried in a hocker position with their head pointing to the north/northeast. However, despite the enhanced materialization, and the differentiation and institutionalization of social identities, some behaviors resisted or denied these changes. Many valuable objects were deliberately destroyed to cover the dead bodies or to serve as "offerings" for the dead, though no true ancestor cult can be discerned. It seems that the people of Körtik Tepe were on the threshold of the institutionalization and objectification of social roles and ritual behavior, but basically were still hunter-gatherers and fishermen intimately embedded in their natural environment.

[346] *The Technology of Aztec Featherworking: Glyphic Clues in the Florentine Codex*

Featherworking was among the finest of the luxury industries in the Aztec world. The craft employed complicated techniques and some expensive materials, but a relatively straightforward and inexpensive toolkit. Book 9 of the Florentine Codex features a detailed account of this featherworking technology. Forty-one illustrations accompany the Nahuatl textual account, and 27 phonetic glyphs (as single elements or in structured combinations) are embedded in these illustrations. Renewed

interpretations of these illustrations and new translations of the phonetic glyphs reveal otherwise undocumented or ambiguous details about the types of feathers, the identity of auxiliary materials, the uses of various tools, and the techniques of featherwork construction. These glyphic translations and interpretations are placed in the context of extant Aztec-period feathered objects.

[51] *Modeling the Influx of Agriculture: An Agent-Based Model Exploring Agricultural Spread Scenarios in the Western Mediterranean*

During the sixth millennium B.C. agropastoral subsistence spread rapidly across Mediterranean Europe. The results of the currently available radiocarbon chronology suggest that this transition may have occurred in less than 1,000 years. The swift proliferation of new types of material culture and new modes of subsistence has led researchers to hypothesize that the appearance of agriculture in the west Mediterranean was the result of a migration of farmers, the adoption of agriculture by indigenous groups, or a combination of these processes.

In archaeological research, agent-based models (ABM) are emerging as productive analytical tools for understanding prehistoric complex systems. Given the variety of environmental, economic, demographic and social factors involved in the spread of agropastoralism, ABMs can play a pivotal role in researching the advent of the Neolithic. Four general models have been commonly advanced to explain the spread of agriculture through Europe's western Mediterranean region and this project will evaluate each of them. This submission outlines an ABM under development that can be used to test these alternative hypotheses and the generation of test implications that can be evaluated with empirical data.

[387] *Investigating Variability in Lucayan (Bahamian) Microlith Assemblages*

Chert is an imported non-local raw material that the Lucayans (Bahamas) obtained by way of direct procurement or trade and exchange with the Greater Antilles. The physical composition, morphological characteristics, and measurements of chert microlith assemblages from four Lucayan sites are compared to determine differences and similarities. The observed variability is explained in terms of inter-site differences in tool use and site function, and temporal changes in inter-island socio-political relations. While starch grain and phytolith analyses have determined that some microliths were used to process multiple plants, a few microliths yield evidence for one plant. Based on ethnographic data, the study will examine if these were single tools or components of specialized composite tools.

Bernard, Julianne**[143]** *Introducing the Cache Cave Archaeological Project: Background, Aims, and Methods*

Caching in caves and rockshelters has been documented in many parts of the Chumash region and beyond, but the discovery and excavation of this Cache Cave provides one of the first opportunities to document cached items in context, assess formation processes, and interpret a site of this kind with preservation of perishable artifacts, as well as materials that are potentially associated with their manufacture and maintenance. This paper introduces the Cache Cave site, situates this site among other cache cave sites in California and the Great Basin, provides an overview of the methodological approaches taken in documentation and excavation, and outlines the goals and potentials of continued research at this important site.

[143] *Chair***Bernard, Henri (Université Paris 1 Panthéon Sorbonne)****[172]** *An Ear of Corn of Jade from Arroyo Pesquero, Sacred Offering*

There are many objects in olmec-style with iconography in public and private collections outside of Mexico attributed to the archaeological site of Arroyo Pesquero, a remarkable site known for its beautiful offerings on hard stones (jade, serpentine) especially masks, has been the subject of few campaigns of archaeological research in 1969 a short stay for the Archaeologist Manuel Torres and in recent years by the Arroyo Pesquero Archaeological Project directed by Carl Wendt, in that project, in 2012 exploration season, an extraordinary and unusual archaeological specimen an ear of corn made of mottled brown and white jadeite was discovered, confirming the importance and significance of this site for the olmecs. The objects with origins attributed to this site in American collections have been the subject of several studies in counterpart European collections are often poorly documented and do not receive adequate recognition. This presentation is a compilation of the objects attributed to Arroyo Pesquero organizing the collections on existing types and trying to trace possible links particularly with the piece found in 2012.

Bernardini, Wesley (University of Redlands)**[358]** *Sight Communities in the American Southwest*

Communities can be conceptualized along a number of dimensions – spatial, demographic, economic, ritual, among others. This study proposes that it may also be productive to consider

communities organized around vision. It is well established that people construct mental representations or “cognitive maps” of their surroundings to organize spatial information and experiences and for spatial orientation and navigation. Populations who shared significant portions of their cognitive maps are likely to have shared important details of their cosmologies such as concepts of familiar and foreign, landmark references, and ritually charged places. This study uses GIS to identify the anchor points around which sight communities may have been oriented, and assesses the social consequences of visual landscapes that changed as populations fluctuated and migrated across them.

Bernatchez, Jocelyn and James McGrath

[356] *The Ochre Assemblage from Pinnacle Point 5-6*

In recent years, southern Africa has figured prominently in the modern human origins debate due to increasing evidence for precocious behaviors considered to be unique to our species. These significant findings have included bone tools, shell beads, engraved ostrich eggshell, and heavily ground and engraved ochre fragments. The presence of ochre in Middle Stone Age (MSA, ~250-40kya) archaeological sites in southern Africa is often proposed as indirect evidence for the emergence of symbolic or artistic behavior, a uniquely modern human trait. However, there is no remaining artwork from this period and there is significant debate about what the ochre may have been used for. Compared to other artifact classes, ochre has gone largely unstudied. A solid understanding of the ochre record throughout the MSA is necessary in order to fully assess the role of ochre in the behavioral development of modern humans. This paper presents the ochre record from a long sequence of the MSA at Pinnacle Point 5-6 in Mossel Bay, South Africa.

Bernemann, Amanda

[359] *Oneota Subsistence Practices at the Christenson Site (13PK407)*

The Christenson site (13PK407) is a Moingona phase Oneota site along the Des Moines River, dating to around A.D. 1250. Excavations took place in both 1983 and 2001 in order to salvage the site from erosion by the Des Moines River. Analysis of the 1983 deer remains indicated a mid- to late-winter season of death, suggesting that the Christenson site represented a winter occupation. This season of occupations differs from other Moingona phase Oneota sites, and this reanalysis of the 2001 faunal remains provides an opportunity to study possible seasonal differences in Oneota subsistence. Along with a study of diet breadth, analysis of the spatial distribution, breakage patterns, degree of burning, and other modifications of the assemblage allow for better understanding of the diet and subsistence practices at Christenson. Additionally, further understanding of this site provides more insight into the larger subsistence strategies of the region at this time.

Berquist, Stephen (University of Toronto) and Edward Swenson (University of Toronto)

[142] *Infra-structuration of Imperial Power in Ancient Angkor and the Andes*

A comparison of the agricultural reclamation projects and religious architectural programs of the Chimú, Inka, and Angkorian empires will serve to demonstrate that statecraft was an inherently technological pursuit in ancient societies. Supra-local political regimes were literally built by and through infrastructure that reconfigured different communities of practice. An important objective of the paper is to demonstrate that an analysis of the materials, temporalities, and technologies underlying the production and maintenance of state infrastructures (and counter-state infrastructures) can illuminate cultural variation in the ideological and economic construction of centralized power in archaic complex society.

Berrey, Adam [36] see Drennan, Robert

Berrey, Charles (University of Pittsburgh) and Scott Palumbo (College of Lake County)

[246] *Interregional Exchange and the Rise of Inequality in the Intermediate Area*

Interregional exchange has long played a prominent role in explanations of hierarchical development

among early complex societies in lower Central America and throughout the Intermediate Area. It is argued to have been a primary basis of social power among highly developed chiefdoms of the sixteenth century, and to have played a vital role in the onset of inequality approximately 1000 years earlier. However, while interregional exchange was undoubtedly an important element of early inequality in many parts of the Intermediate Area, its role has often been emphasized at the expense of other activities that were also important, and of the factors that prompted inequalities to develop. Recent archaeological research has revealed that the factors underlying early inequality (including the activities that were used to support it) were highly variable from one region to the next, and that more attention must be paid to local and regional-scale processes in studying the development of inequality in the Intermediate Area.

Berry, Meg (Center for Rock Art Research and Management - University of Western Australia)

[353] *Digging Deeper: The Use of Rock Art in Archaeological Contexts to Understand Past Lifeways on Murujuga, Northwest Australia*

Murujuga comprises one of the most complex rock art provinces in the world. The iron red boulders of this ancient landscape host petroglyphs which communicate a myriad of sociocultural dynamics of groups utilizing changing landscapes over millennia. These petroglyphs are situated within a landscape marked by complex and diverse archaeological signatures including stone arrangements, lithic scatters, quarries, middens and hut structures. Our archaeological understanding of the prehistoric lifeways on Murujuga is dominated by Holocene evidence, with the oldest subsurface material being dated to only 8,500 BP. However, the rock art corpus speaks to use of landscapes for much longer than this and for possibly more than 30,000 years. In this paper I will analyse the rock art motifs that have previously been identified as the earliest phase of petroglyphs across Murujuga. I will contextualize this line of evidence with preliminary archaeological excavations undertaken during 2014 by the Center for Rock Art Research and Management at the University of Western Australia. This paper will illustrate the interplay between subsurface archaeology and analysis of the extensive Murujuga rock art corpus, and it will explore and further our understanding of how cultures utilized and socialized Murujuga landscapes from the Pleistocene onwards.

Bertilsson, Ulf (Director of Swedish Rock Art Research Archives)

[137] *Carved Footprints and Prehistoric Beliefs: Examples of Symbol and Myth, Practice, and Ideology*

Footprints are frequent on prehistoric petroglyphs. The author has studied its design, sprawl, dating and interpretation in archaeological research as a wider investigation of this theme. Case studies of significant rock art sites in Scandinavia, the Mediterranean and the Near East show that the footprint is a general phenomenon, occurring in all these areas during the time period c. 3000 B.C.-500 B.C. The footprints have been interpreted in different ways; as the epitome of an otherwise invisible deity, a sign of reverence or as a symbol of a dead person. Footprints may have more complex meaning manifested in a partly sliding form scale, also related to the time factor. They stand out as symbols of great vitality, length and spread in the prehistoric imagery and world of conceptions. This indicates archetypal characteristics, and representation of a phenomenon that in recent research has been termed core universals. This is further illustrated by the fact that footprints also occur in the Native American rock art e.g. the Central Mississippi River Valley, a fact that opens up avenues for further investigation into this specific symbol.

Bertolazzi, Riccardo (Riccardo Bertolazzi, University of Calgary)

[368] *Statuae Meae Ubique Steterunt: Some Considerations on Julia Domna's Statue Bases from North Africa*

Roman African provinces are characterized by an extraordinary number of epigraphic sources concerning the dynasty of the first African emperor, Septimius Severus. Among these are many statues dedicated to Severus' Syrian wife Julia Domna, whose presence at the side of both her husband and her son Caracalla is recorded by the historical accounts on this period. A survey of the

African inscriptions that commemorated the erection of statues in her honor leads to the conclusion that at least forty-five individual statues were put up during the reigns of both Severus and her son Caracalla. This number, if compared to the few statues erected to previous imperial women, is extremely significant for understanding the high profile role enjoyed by Domna. Her statues were present in many important cities, as well as in the important camp of Lambaesis. Furthermore, the triumphal arches built in the cities of Assuras, Theveste and Cuicul reveals the presence of other statues dedicated to Domna. It is therefore possible to observe that in North Africa she was perceived as a central member of the imperial family, rather than a mere instrument of propaganda used by Severus to promote the dynasty among his subjects.

[155] *A Tale of Two Styles: A Geoarchaeological Investigation into Lima & Ychsma Construction Materials at Cajamarquilla, Peru*

This paper examines construction materials from Cajamarquilla, one of the largest prehistoric urban sites on the Central Coast of Peru. Little work has been published about the architecture at Cajamarquilla, other than to comment on the enormity of the site and its constructions. Rammed earth (tapia, in Spanish) is the main construction style at Cajamarquilla, but with marked observable differences between the Lima Phase (A.D. 500 – 800) and Ychsma Phase (A.D. 1100 – 1450) occupations. Lima walls were built using large, uniform courses of tapia and appear to be tempered with small pebbles and seem homogeneous, whereas Ychsma walls were built with small, uneven courses of tapia and the tempering materials used were much less uniform in size and included organic materials. The level of socio-political complexity is unclear for these cultures, especially the Lima culture, which created massive, well planned construction projects but lacked a regional system of ranked settlements usually seen in a state level society. This study aims to characterize the raw materials and preparation methods using bulk and thin section analyses in order to determine relative labor investment for construction materials to provide additional evidence for different technological and social conditions that prevailed during Lima and Ychsma occupations.

Bettinger, Robert (University of California-Davis)

[1] *Aboriginal Sociopolitical Groups in California and the Great Basin: The Rise of Orderly Anarchy*

Socio-political development in aboriginal California follows a trajectory quite different from that in much of western North America, culminating in very small socio-political units, in some places independent family groups approximating those characteristic of the Great Basin. The key development leading to this family-level organization was in both places the privatization of stored plant food, which incentivized the intensive use of plant foods (pinyon and acorn) that were abundant but costly process. Privatization was the result of a technological breakthrough, the appearance of bow and arrow technology, which permitted the formation of smaller, family-centered social units more inclined to invest in costly resource procurement because the proceeds of that went directly to offspring and close relatives, culminating in a system termed “orderly anarchy.”

The alpine zone (above 10,000 feet) of White Mountains of eastern California is the most extensive, and by far the most intensively occupied by aboriginal groups, in the Great Basin. The earliest consistent use, beginning about 5500 BP, is by hunting parties. Beginning sometime after A.D. 600,

the White Mountains village residential pattern is distinctive, featuring one or more well-built dwellings, well-developed middens, and extensive assemblages of chipped and ground stone. While hunting was clearly important to the village pattern, artifact counts indicate a surprisingly heavy reliance on plants, with milling equipment on average accounting for roughly 30% of all formal tools. The key distinction between the White Mountains pattern and its counterparts in central Nevada (Alta Toquima) and Wyoming (High Rise) is intensity of use. While High Rise houses were never used intensively, and Alta Toquima houses only rarely, all White Mountains houses were used repeatedly and intensively. This occupational intensity peaks after A.D. 1300, probably reflecting developments connected with the Numic spread. Earlier village use between A.D. 600 - 1300 noted here and at Alta Toquima is more likely the result of Basin-wide trajectory of regional intensification.

[205] *The Tooth About Pastoralism: Oral Health, Physiological Stress and Diet in a 19th Century Mobile Pastoralist Population from Mongolia*

To better understand diet, oral health, and physiological stress loads of historic 19th century mobile pastoralists from Central Asia, the frequency of caries, ante-mortem tooth loss (AMTL), and linear enamel hypoplasia (LEH) were assessed macroscopically from a skeletal sample (n=40) of a pastoralist population from Urga (Ulaanbaatar), Mongolia. Results show a low percentage of individuals affected by caries (11.4%) consistent with a diet low in sugars and carbohydrates but high in animal products. Thus, despite potential access to agricultural products within their interaction sphere, such foods did not appear to have played a significant role in this population's diet. However, examination showed high prevalence of AMTL (67.5%), which may lead to underestimation of carious lesion prevalence. While LEH frequency among the Urga population appears high (77%), comparison with a contemporaneous sedentary, agriculture-dependent population from Guangdong province in southern China (n=37) shows a significantly higher percentage of individuals with LEH (100%) and evidence of multiple periods of stress (Urga: 27%, Guangdong: 92%). These results suggest that there are generally lower physiological costs associated with a pastoral rather than agricultural lifestyle and that mobility, population density, and diet have a significant effect on stress loads in these settings.

Betzenhauser, Alleen (Illinois State Archaeological Survey) and Timothy Pauketat (University of Illinois at Urbana-Champaign)

[237] *Elements of Cahokian Neighborhoods*

American Indian neighborhoods were very much under construction during the late-eleventh century at Cahokia. A social order that transcends pre-Mississippian village life may now be defined based on large-scale excavations at East St. Louis and Cahokia proper. Architectural patterns and craft production debris within the greater central complex indicate possible religious if not political or ethnic divisions that did not form organically. The central problems of a Mississippian analysis, however, are distinguishing (1) neighborhoods from other kinds of occupational zones and (2) human neighbors from other-than-human residents. We use new measures of architectural diversity, density, and positioning to identify the elements of Cahokian neighborhoods and how they were created, maintained, and reconfigured. Ultimately, we will demonstrate how these varying neighborhoods were implicated in processes of urbanization, community formation, and the development of social divisions within the central complex and beyond.

[221] *Scripting the Spatial Analysis of Archaeological Datasets*

For some time, interpreted languages such as Python, Matlab and R have made it easy to document and run computational function calls either line-by-line or in a script. While the spatial functionality provided within these environments has long been seen as inferior to GIS packages, it has now reached considerable maturity. The open source, multi-purpose and often 'bleeding edge' nature of these working environments also mean that there are often considerable analytical advantages to using them instead of mainstream GIS. This often means that while visualisation and querying of spatial data in archaeology might still first be explored via earth viewers and traditional GI systems, entire final spatial analytical workflows can now be conducted and shared via scripts in a manner similar to standard statistical and non-spatial methods. This should have considerable implications for how we teach students, make working notes, conduct peer review and archive spatially-explicit archaeological research, and this paper considers these issues via a series of practical examples in R.

Biagetti, Stefano (CaSEs - Univ. Pompeu Fabra (Barcelona, Spain))**[23]** *Resilience and identity: the ethnoarchaeology of the Kel Tadrart Tuareg (SW Libya)*

In the Tadrart Acacus (SW Libya), ethnoarchaeological research carried out between 2003-2011 has shown that its current inhabitants, the Kel Tadrart Tuareg, are a successful example of adaptation to extreme climatic and environmental conditions. Their exceptional resilience, characterized by high degree of variability and opportunism, escapes some of the traditional assumptions often done in ethnography and archaeology regarding the classification and identification of societies, such as mobility, food security, or interaction with neighboring groups. Indeed, this study demonstrates that identity and self-representation play major role in shaping individual and communal choices in the Kel Tadrart society, leaving specific material correlates that might elude our traditional interpretive tools. These data reveal the often underestimated complexity of arid zones pastoral societies of the present, raising issues related to mainstream approaches to Saharan Holocene archaeology, where arid times are generally associated with marked drops in both cultural and social level of communities.

Bicho, Nuno (Universidade do Algarve), Jonathan Haws (University of Louisville), Mussa Raja (Universidade Eduardo Mondlane), Omar Madime (Universidade Eduardo Mondlane) and Célia Gonçalves (Universidade do Algarve)**[174]** *Middle and Late Stone Age of the Niassa Region, Northern Mozambique. Preliminary Results*

Located between modern-day South Africa and Tanzania, both of which have well-known and extensive Stone Age records, Mozambique and its Stone Age sequence remain largely unknown in the broader context of African Pleistocene prehistory. This is in spite of the country's critical position linking southern and eastern Africa, and of its clear potential to inform various models about recent human evolution. Specifically, the geography of Mozambique makes its sea coast a natural area of interest to evaluate recent scenarios about the importance of coastal adaptations to the success and diffusion of *Homo sapiens* outside of southern Africa. Here, we present the results of field survey in the Niassa lake region. Two main contexts were surveyed: river valleys running to the Niassa (Malawi) lake and limestone bedrock exposure where Middle and Late Stone Age sites and deposits were found during 2014, including dozens of surface sites as well as a few in situ localities in rockshelters with both lithic artifacts and well preserved faunal remains.

[297] *The Neolithic House: Ruth Tringham's Interdisciplinary Approaches to (Re)Constructing Prehistoric Village Life in Southeast Europe and Anatolia*

People create themselves through the houses they build. Ruth Tringham's archaeological as well as anthropological inquiry has identified houses as active material culture entangled with both material and immaterial social values and rules. Architecture is the material expression of culture, both enabling and constraining the relationship between people and their actions. In archaeology, we receive the final phase of the use-life of a house, yet abundant evidence exists for its making and constant re-making as living space. This paper will explore the intersection of architecture and archaeology focusing on Ruth Tringham's interdisciplinary approaches to (re)constructing architecture from Neolithic Southeast Europe and Anatolia. The spaces and materialities associated with archaeological investigation – dirt, waste, rubbish, ruins – can be useful as themes for thinking about the Neolithic house, its functions and meanings as well as its construction of mudbrick, daub and wattle, timber or stone. The paper will also try to elucidate and challenge conventional narratives of sedentism to seasonality, and spatial organization to early social complexity. It will also scrutinize the complex processes involved in constructing and re-constructing architecture and the reciprocal relationship between people and the things they built.

[121] *Accuracy and Precision of 3D Modeling in Lithic Analysis*

Studies of stone artifacts increasingly rely upon measurements of 3D models, due to the ability to capture a larger range of volumetric and angular attributes on these models. Despite the enthusiasm for these new techniques, little research has been conducted on the efficacy of digital reconstructions for quantitative lithic analysis. The objective of this project is to quantify the advantages and disadvantages of two methods of 3D data capture (e.g. photogrammetry and laser scanning).

We capture 3D models of experimentally produced stone artifacts (produced on basalt and obsidian) using both multiple image photogrammetry and laser scanning. The accuracy of these methods is tested through comparisons with standard digital caliper measurements. Precision is investigated by recreating each model twice. Results show that technique and raw material can have an impact on model accuracy. Obsidian is slightly more accurately modeled by photogrammetry and basalt flakes are slightly more accurately modeled by laser scanning, although both of these techniques are imperfect. Both techniques exhibit relatively high levels of precision. Results show that only photogrammetric volume is imprecise. Here, we review the strengths of the different methodologies and provide recommendations for future use of 3D modeling in archaeology.

[100] *MayaArch3D: System Architecture, Admin and Security Features, Attributes and Maya Calendar Translation Services*

The MayaArch3D project is developing and investigating a bundle of different services and tools for the integration, analysis and presentation of archaeological data-sets. The architecture of this system is designed in a scaleable, flexible and standardized way. Whenever possible, the system uses well known specifications, like OGC-WMS, OGC-WFS and W3DS. For not yet existing standardized service interfaces, the project investigates new suitable approaches. Such interfaces include for instance a Time Service, an Attribute Service and the Geometry Service for single objects. Each component is designed as an exchangeable artifact. All these services are connected to the different data sources: 2D database, 3D database, attribute database and shapefiles. Everything is brought together in the WebGIS Frontend for 2D and 3D visualization and analysis. To prevent misuse of this collection of spatial referenced datasets (e.g. looting), the project developed a role based security concept, using a Lightweight Directory Access Protocol Service (LDAP) for managing of different rights and security levels. The system uses as many open source components as possible.

[386] *A Biface Cache from Paradise Springs, Central Mojave Desert*

A cache of eight pressure-flaked bifaces, including two Humboldt Basal-Notched knives of Coso obsidian and six chert dart-point preforms, was found at Paradise Springs, south of Fort Irwin in the Central Mojave Desert. Hydration rinds on the two Humboldt bifaces indicate that the cache dates to about 1400 cal BP. The function of the cache within its social context, the special role of the Humboldt Basal-Notched knife, and the persistence of the altatl and dart into bow and arrow times are discussed.

Birch, Jennifer (University of Georgia)

[26] *Making Communities Work: Organizational Diversity in the Eastern Woodlands of North America*

Stephen Kowalewski has advanced a number of conceptual frameworks for the comparative study of organizational complexity. His multiscalar, cross-cultural approach permits the recognition of broad patterns while incorporating meaningful variation. In a 2013 paper, Steve explores the “work” involved in the formation of large, co-residential communities. He suggests that we might productively focus on the labor process, as community members purposefully redirected people’s time, energy, and resources to particular ends. In this paper, the social and physical work of making community is used as a framework to explore the development of organizational complexity and diversity in eastern North America. Archaeological, ethnographic, and historical data are combined to understand relations of production, consumption, power, ideology, and the development of sociopolitical organization in multiple subregions. For some communities, work became more intense, differentiated, and specialized in the absence of clearly defined hierarchies. In others, highly visible leaders emerged, though the relationship between political complexity and labor is far from clear. Thinking about how habituated practices of work structures social relations and articulates with large-scale, long-term societal patterning allows us to transcend normative constructs of eastern North American societies as “chiefdoms” and “confederacies.”

[133] *Tula 2014: Reexamining Ball Court 2 through Cross-Cultural Comparisons with the Yucatan*

The Proyecto de Investigación, Conservación y Mantenimiento para la Zona Arqueológica de Tula 2014, directed by Dr. Robert Cobean focused on the restoration of Ball Court 2. Today, the three major ceremonial centers exposed at Tula are the Palacio Quemado, Pyramid B and Pyramid C; these structures form an L-shape that faces the Adoratorio situated in the center of the plaza. The positioning and architectural dimensions of Ball Court 2 in Tula's main precinct are almost exact with the largest Ball Court at Chichen Itza. Ball Court 2 served as a ritual and political centerpiece at Tula Grande; a second and smaller Ball Court at Tula has numerous associations with the rain god Tlaloc, while the religious components of Ball Court 2 are less understood. This colossal structure contains an I-shaped playing surface surrounded by staggered palatial chambers for the Toltec elite. The summer 2014 excavations reopened the work of Eduardo Matos Moctezuma at this Ball Court forty years prior, after a small team of graduate students from Zacatecas and the United States focused on repairing its eastern façade. The following presentation utilizes the summer 2014 Tula project to illustrate the ritual identity of Ball Court 2 in greater detail.

[296] *A Kangaroo Hunt*

O'Connell is best known for championing an approach to exploring the evolution of human behavior and its attendant archaeological patterns through the distinctive lens of human behavioral ecology. His contributions in developing ways to operationalize theory for generating testable hypotheses about big questions in the human experience have indelibly shifted the trajectory of empirically bent studies of subsistence. However, far less appreciated are his keen ethnographic descriptions of the social contexts in which decision-making unfolds. Here I use an important essay that O'Connell (2000) wrote which describes an emu hunt conducted in Alyawarra country in 1974 as a springboard to discuss the contexts of contemporary hunting practices among Martu in Australia's Western Desert. I argue that insights into both the Alyawarra and Martu situations provide important directions for framing new questions and theoretically driven hypotheses concerned with subsistence transitions.

Birge, Adam (University of Texas at San Antonio) and Cassandra Koontz (Vanderbilt University)

[208] *Trophies of Violence: The Manufacturing and Processing of Human Trophy Heads at Uraca*

Human trophy heads appear in the iconography of prehistoric Andean ceramics, weavings, and statuary as early as the Late Formative (400 B.C. – A.D. 100), and actual trophy heads are not uncommon bioarchaeological finds in south-coastal Peru. Human trophy heads were prepared by cleaving the head from the body, cutting the occipital and parietal bones to remove the brain, drilling holes in the frontal bone, and threading that hole with a carrying cord for display. At the Middle Horizon cemetery of Uraca in the Middle Majes Valley (Arequipa, Peru), eleven trophy heads were recently excavated from two sectors: Sector I, located near the ritual petroglyph field of Toro Muerto, and Sector II, located farther to the north. We examine differences in cutmark type, number, and location between sectors in order to shed light on the changing contexts of violence in the Middle Horizon Majes. We also examine the spatial distribution of trophy head styles from published samples in southern Peru to determine whether Uraca styles are more consistent with Wari, Nazca, or local traditions. Lastly, lithic artifacts from both sectors are examined to explore whether they may have been involved in trophy head manufacture.

[400] *Potsherds, Paving Stones, and Puppets: Possible Paths for an Anarchist Archaeology*

This presentation will explain three possible strains an anarchist archaeology might pursue. While I will briefly explain how my own work in the related field of material culture studies relates to anarchist scholarship, the focus will be on exploring what an anarchist archaeology might look like. In brief one focuses on the far past or perceived "past" and what we may learn from it; the next on more recent resistance and alternative political forms; and the final on the contemporary anarchist milieu.

[22] *The Distribution of Articulated Animal Remains: An Analysis of Household and Community Ritual in Chaco Canyon*

Chaco Canyon is thought to have been a regional center during the Pueblo II period. Its identity as such makes it a particularly interesting locale at which to compare the relationship between public community-based and more exclusive household-based rituals. In this paper, the nature of articulated animal remains and their deposition are examined in order to elucidate social relationships at both the community and household scale, particularly at the largest and most well-studied site, Pueblo Bonito. To do so, we seek to identify the characteristics of ritual activity as outlined by Bell (2009[1992]) to suggest that cases of articulated faunal remains were deliberately deposited as acts of ritual expression. This will include an examination of the characteristics of the faunal remains, associated materials, geologic composition, and the spatial and architectural framework of the associated deposits, as ascertained from excavation records. By considering the differential context and content of structured deposits containing faunal material, we address the flexible relationships, or lack thereof, between community and household rituals across the site, and, more broadly, the region.

[86] *Volcanic Ash in the Ceramics of the Greater Palenque Region and Usumacinta Drainage, Chiapas and Tabasco, Mexico*

Knowledge about the movement of pottery with volcanic constituents throughout the northwestern Maya Lowlands, from Preclassic through Postclassic times is closely tied to sub-regionally specific resources of the Usumacinta Drainage—from its origin in the highland to the Gulf delta. Following pioneering work in the region by Blom, Berlin, Ochoa, and Rands, we focus on sites in the greater Palenque subregion and their links to sites along the Usumacinta and in the Chiapas Sierras. Although Karl Saper, 19th Century explorer and antiquarian, noted the possible presence of volcanic ash near Palenque, no continuously exploited sources, other than those of Usumacinta have been determined. The volcanic pottery, therefore is either imported to Palenque or the tempering materials are imported—or both. In this presentation we present aspects of the compositional and archaeological patterning that we observe in our use of an extensive data base of temper examinations, petrographic analyses and chemical characterizations using neutron activation to investigate subregional sources of raw material procurement, ceramic manufacture, distribution, and changes in technology through time.

[178] *Rising Sea Level and Sea Turtle Nesting on St. Catherines Island, GA; What the Present and Past tell about the Future!"*

Geologists involved in sea turtle conservation have documented deterioration of sea turtle nesting habitat during sea level rise in The Modern Transgression on a "Sentinel Island." Deterioration of habitat has resulted in rapid erosion of backbeach nesting habitat at ~ 3.0 m per year (declining from 25% to 12% adequate habitat in a decade), including fragmentation of three beaches in 1990 into eight beaches in 2013, formation of washover fans and wash-in fans onto backbeach marsh meadows and into maritime forest, formation of nearly continuous tree "boneyards," scarps, and relict marsh mud exposures along most of the beach. All these phenomena contribute to difficult

nesting conditions for loggerhead sea turtles; forcing relocation of “at risk” nests into nurseries. Erosional effects are expected to continue and accelerate as the rise of sea level accelerates leading to an increasing trend of barrier island erosion and deterioration of loggerhead sea turtle nesting habitat on St. Catherines Island, on the southeastern coast of the USA, and around the World.

Collaborative, interdisciplinary research amongst geologists, archaeologists, and other scientists in “Conservation, Research, and Education” has dramatically enhanced our understanding of processes being driven by rising sea level on the Georgia Coast.

[275] *Examining the influence of Middle and Late Holocene shorelines and tidal zones on shell ring locations along the lower Southeastern coasts.*

This study examines the interplay of Holocene sea level change and the locations and timing of construction of Archaic coastal shell rings. Based on 161 radiocarbon dates from 32 shell rings located on the lower Atlantic and Gulf coasts, most shell ring construction took place from 5000—2750 cal BP, with the greatest intensity occurring during a roughly 1,000 year window between 3500 and 4500 cal BP. We use a high-resolution reconstruction of past sea levels (Balsillie and Donoghue 2004) and GIS to model shoreline migration and the average area of intertidal zones near locations of radiocarbon-dated shell rings at 250-year intervals from 6000-2500 cal BP. By roughly 5000 cal BP, sea levels had begun to approach modern elevations. However, moderate fluctuations (e.g., over 2 m between 3900 and 3750 cal BP) continued during that period. Combined with the relatively gentle slope of the continental shelf along much of the lower Atlantic and Gulf coasts, these fluctuations could produce shoreline movement by tens of meters in a decade, and in some cases by 2 km or more in a single 250-year interval, while daily tidal ranges could have produced intertidal zones of as much as 2 km wide.

Bisson, Michael (McGill University)

[64] *Technological, Typological and Forensic Analysis of the Small Finds from the Early Middle Paleolithic Beds at Tabun Cave, Israel*

Tabun Cave, Israel, has provided the reference sequence for the Late Lower and Middle Paleolithic in the Levant. Re-excavation by Jelinek (1968-73) recovered a large sample of lithics including over 23,000 small finds. This paper reports the first detailed typological, technological and forensic analysis of the small lithics from beds 60 to 68, the Early Middle Paleolithic (EMP) “D-Type” Levallois Mousterian. These pieces provide clues to lithic reduction sequences, as well as examples of small retouched tools and tool fragments. High and low power microscopy has found evidence of the use of small lithics as expedient cutting tools. The small lithics closely mirror the technological characteristics of the extensively studied larger specimens at Tabun, and it would have been possible to reconstruct the entire sequence of the site based solely on the small finds.

[256] *An Extraordinary Earth Oven Facility at Kelley Cave*

Feature 4 is a complex, well-preserved feature documented in Kelley Cave, a dry rockshelter in Eagle Nest Canyon that was investigated in 2013-2014 by the Ancient Southwest Texas Project of Texas State University. What we first recorded and still habitually refer to as "a feature" is a stratigraphically complex set of deposits and interfaces that formed near the mouth of the rockshelter over time. We think it represents an earth oven facility reused many times to bake agave lechuguilla, wild onion, and other plant resources. The evidence includes layers of discarded uncharred and charred plant fiber (e.g., cut leaf bases and quids), ash, charcoal, and fire-cracked rocks. The stratification is preserved owing to fortuitous circumstance. A very large roof-fall slab purposefully set upright has sheltered and protected deposits from slumping down the talus. Late in the facility's use life, the 3m+ oven pit was filled with a thick layer of plant debris that was soon capped by a 3-5cm mud drape. The interlocked fiber-mud layers proved resistant to burrowing animals and has protected an exceptional archaeological record. This presentation highlights the field investigations, stratigraphy, and ongoing analyses.

[269] *Queer and Complex: Everyday Life and Politics in Mesoamerican Prehistory*

When we speak of complex societies, archaeologists focus primarily on broad systems of power, socio-political access, and economic control. These discussions, both explicit and implicit, continue to be framed by heteronormative, androcentric and classist assumptions. Elites and men (as conceptual and literal heads of households) remain the primary frame of reference for how states operate and who and what matters in our discussions of complexity. In this paper, I explore how notions of complexity have affected discussions around ancient Mesoamerican everyday life and practice. Using queer and feminist theory, I interrogate the ways in which the normalization and standardization of archaeological evidence ignores social variation and the impact that "queered" identities (whether queered/marginalized by the discipline or by social standards in the past) had in shaping civil society. Interpretations of the ancient Maya state, for example, remain intellectually and materially divided for the most part from discussions of lower status peoples and everyday life. Given the extensive conversations and critiques that have attempted to redress this issue both within and outside of anthropology, why does it persist? And in what ways can queer theory help us unsettle these assumptions?

[396] *ESR Dating Ungulate Tooth Enamel at Pešturina, Serbia: The Lumpiness Factor*

Sitting on a major mammalian migration route from Asia into Europe, Pešturina contains at least four archaeological layers, including Aurignacian, Denticulate and Charentian Mousterian. A series of matrix-supported silty conglomerates holds five recognizable archaeologically and geologically distinct layers. All the layers contain éboulis clasts ranging from silt-sized grains to over 1 m³. Skeletal remains, including teeth, from Late Pleistocene herbivores occur associated with Paleolithic

artifacts in all layers. A roof collapse forms the base of the currently excavated test pits. From the Mousterian layers, 39 enamel subsamples from 11 ungulate teeth were independently dated with standard ESR, using a four-component volumetric dose averaging model. Since the teeth contain almost no U, the dates are independent of the U uptake model selected for the age calculation. Although one tooth was reworked into Layer 4, most appear to be in stratigraphic succession and likely date the layers in which they occurred. Since Layer 3, which contains a Denticulate Mousterian assemblage, dates to 39 ± 3 ka and correlates with MIS 3, Layer 4 with Charentian Mousterian dates to MIS 5. Thus, humans using the Mousterian had arrived near the Sićevo Gorge by MIS 5 and persisted there until at least 39 ka.

[178] *Pluralistic Communities, Coalescence, and Population Aggregation at Mission Santa Catalina de Guale*

Recent ethnohistorical research on the Spanish mission communities of La Florida has done much to document and elucidate complicated patterns of indigenous population relocations. These migrations, aggregations, and dispersals—due to multiple factors such as epidemics, Spanish reducción policies, and flight from antagonistic native groups—resulted in the formation of complex and diverse colonial social networks. At Mission Santa Catalina de Guale (GA), the most pronounced of these was the 1663-1666 aggregation with Mission San Diego de Satuache. Discussing this event, and drawing on recent geophysical and archaeological evidence, this paper discusses the aggregated, pluralistic community that formed on St. Catherine's Island during the latter portion of the late 17th century.

[213] *A Three Dimensional View of Architecture and Building Material Use at Structure B-4 Cahal Pech, Belize C.A.*

Excavation information at Cahal Pech structure B-4 present some of the most complete data on the Maya formative period in the Western Belize River Valley. Structure B-4 contains fourteen floors which represent increasingly complex and chronological construction events. Excavated floor level information contains architectural and construction material elements which can be stored and analyzed in a Geographic Information Systems (GIS) database. Using available excavation and publication data, this paper will discuss the structure B-4 archaeological sequence and demonstrate the utility of excavation analysis in three dimensional (3D) GIS software. Each excavated floor will be discussed along with the building material, architectural style and temporal importance of each successive construction event.

[151] *Izapa's Hinterland: The Use of Lidar Mapping to Examine the Layout and Spatial Orientation of Secondary Centers in the Soconusco region, Chiapas, Mexico*

We analyze the settlement layout patterns and orientations of major buildings at eight Middle and Late Formative period sites that fall within Izapa's hinterland. Our previous examination of Izapa's layout, using high-resolution Lidar maps, confirmed the observations of earlier researchers that the site had a dual orientation: N-S aligned to the volcano Tacaná and E-W to winter solstice sunrise. This dual orientation led to an off-square (97 degrees) layout of the site during the Late Formative period, and perhaps dates even earlier to the Middle Formative. New Lidar mapping of the Izapa's hinterland provide accurate plans of individual mound orientations along with complete layout patterns for eight major sites. These new Lidar maps show that these secondary centers have

layouts that are very similar to Izapa's pattern, but they also reveal significant orientation adjustments to both the volcano Tacaná and to solstice sunrise locations on the distant horizon. These data show the pervasive significance of the duality of sacred mountains and solar movements in the cosmology of the ancient peoples of the Soconusco.

[194] *Frannie Berdan and Economic Anthropology*

We all know of Frannie Berdan's many contributions to historical scholarship, archaeology, art history, and Aztec studies, but my goal in this paper is to assess Frannie's influence on the growth of economic anthropology during a time when the discipline was just beginning to rethink the anti-market theories of Karl Polanyi. The principal institutional context of change was the Society for Economic Anthropology, of which Frannie was a founding member and a founding board member. In the Society's early meetings, her presentations on Aztec economy were well argued and rich in detail, leaving substantivists little option but to modify their positions. While the rethinking of economic theory by anthropologists has had a long and complex history, and still is ongoing, my sense is that, having attended those same critical meetings, Frannie can be considered to have a place in any consideration of the history of ideas.

[140] *The Complex Story of Complex Beads: Elemental Analysis of Some Early Types from the Southeastern US*

Glass beads are one of the most important artifact types on colonial archaeological sites, providing insights into colonial trade networks and helping address critical chronological issues. In this paper, using a sample of 16th to 17th century beads from Mission Santa Catalina de Guale (GA), the Glass Site (GA), and Jamestown (VA), as well as a comparative sample from Venice, we use LA-ICP-MS and XRF analyses to examine elemental variability within and across these assemblages. Primarily focusing on Nueva Cadiz and seven-layer chevrons, this paper is our first attempt at elementally characterizing some of the earliest glass bead types found in the Southeastern United States. With this data we explore the idiosyncratic provisioning strategies of Spanish entradas, address lingering questions surrounding the origins of some early bead types recovered at Jamestown, and consider the complex patterning of beads circulating through international markets and diverse colonial enterprises—including entradas, missions, and settler societies.

[374] *Esnesv Stories: Muskogee Oral Traditions, Trader-Diplomats, and Sacred Landscapes*

It has long been obvious to archaeologists that Mississippian and Woodland mound centers in Southeastern and Midwestern United States were parts of large-scale regional exchange networks. However, modeling how goods moved from point A to point B remains more troublesome. Do these goods represent direct or down the line exchange? Do they represent a shared ceremonial complex or loose connections between very different complexes? Oral traditions maintained by a descendant Muskogee (Creek) tribal town provide an explanation. These stories describe the deeds of esnesv, persons of a special social status that combines the roles of trader, traveler, diplomat, and holy worker. Esnesv travelled great distances across the Southeast, often across "enemy" territories, and facilitated exchange relationships. They also carried information about peoples throughout the region and could mediate conflict between groups. Rituals surrounding esnesv suggest that this role was considered sacred. Framed within contemporary Muskogee theories of embodiment, esnesv can be understood to carry animate objects laden with cosmological Power and entangled with human lives, enfolding places and communities into each other as they physically moved fragments of landscapes across the region.

[410] *Living on the Dead in the Mixteca Alta, Oaxaca*

In exploring the bioarchaeology of ancient Oaxaca, an important component is the social context of human burials. This paper explores the placement of four burials, containing seven individuals, associated with the same Yucuita phase (500-300 B.C.E.) household at Etlatongo, Oaxaca. This household appears to have been located in the same space for several generations, shifting slightly both horizontally and vertically through time. These burials are associated with the first occupation of this household, and they represent a variety of burial positions, including extended and seated, as well as placements, from features dug below the house to those placed directly on the house floor. Exploring the placements of these burials, it is possible to reconstruct the sequence in which they were interred. I argue that the parallel burials placed on the house floor belonged to the founders of this household. Upon their death and interment, the house was terminated and occupation shifted. Prior to this space being filled in, however, a shaft was built that provided access, both physical and spiritual, to one of the burials. Successive generations lived on their ancestors, who played an important foundational role in establishing this household.

[171] *Prehistoric Foragers in the Central Alaska Range*

Upland landscapes in the central Alaska Range play an important role in understanding prehistoric hunter-gatherer settlement organization, subsistence activities, and lithic assemblage variability in interior Alaska. Previous research hypothesizes that late Pleistocene and early Holocene seasonal upland hunting conditioned lithic assemblages in the interior, and that seasonally available upland resources grew in importance through the middle and late Holocene, as interior foragers shifted to a logistically organized settlement system. To further evaluate these hypotheses, we conducted fieldwork in the upland upper Susitna River basin, central Alaska Range, to add to our knowledge of prehistoric forager activity in the understudied uplands of interior Alaska. This study utilizes paleoecological and geoarchaeological data from the Susitna study area to provide the ecological

context for prehistoric upland landscape use. This study also incorporates site structure, faunal and lithic assemblage data from the study area to evaluate settlement organization and lithic assemblage variability in interior Alaska. This paper presents the results of these analyses, focusing on understanding how foragers utilized upland landscapes from earliest colonization through the late Holocene, and the influence that ecological change and volcanism had on landscape use in the uplands of the central Alaska Range.

[265] *A Closer Look at Immigrant Life Expectancies from German Cemeteries in Southeastern Wisconsin*

This study describes statistics of life expectancies among the immigrant population and its sub-sets throughout the mid-nineteenth to early twentieth centuries in southeastern Wisconsin. At this time, German populations were becoming established as a major cultural and ethnic force in Milwaukee and the surrounding counties. Data from individuals disinterred from two unmarked cemeteries in Ozaukee county were analyzed to assess cultural and physical disparities in the mortuary record among these immigrant populations. This analysis is supplemented with other data local to the region.

[374] *Oral History and Archaeology: A Case from Crow Country*

Arrow Rock, located in the Pryor Mountains of southern Montana, is a place for travelers to offer gifts in return for their safe passage through the Pryor Gap. These gifts are mostly left by members of the Crow community and meant for the Awa-Kulay, or Little People, living in the mountains. The Little People are described as dwarves that are both human and supernatural beings that can act as spiritual guides for the Crow Tribe. Throughout Crow history stories are told of the Little People being seen across Crow Country, visiting individuals during vision quests, and at larger social events. Arrow Rock is an important location for the relationship between the Crow and the Little People because it is said to be where they met for the first time. Arrow Rock is also unique for archaeologists due to two archaeological collections of gifts left for the Little People. The first was excavated in 1939 by Oscar T. Lewis and the second by Nels Nelson in 1946. This paper presents the initial findings of a reanalysis of those collections in conjunction with Crow Oral Histories.

[167] *Toward Effective Cyber-Infrastructure Support of Socio-Environmental Research*

Understanding coupled human and natural systems is a major research focus for the social and natural sciences. Scholars interested in historic environmental conditions (including those of deep prehistory) cannot simply extrapolate the past from the present. Instead, they need environmental knowledge specific to their spatial-temporal problem contexts. However, in accounting for environmental change they are likely to find that state-of-the-art data on past environments are difficult to discover and even more difficult to integrate, process, and interpret. Here we introduce our ongoing effort to design and prototype SKOPE—Synthesized Knowledge Of Past Environments—a cybertool that, for a given location and temporal interval, integrates contemporary, historical, and paleoenvironmental data from federated data sources on the Web and returns a synthesis of key

environmental parameters relevant to humans. The proffered environmental data are documented with record of their provenance and, to the extent possible, assessments of their accuracy and spatial and temporal resolution. While the tool is designed to be extensible, our initial efforts address the US Southwest over the last two millennia.

[230] *Sourcing Quartzite Projectile Points from 39FA65, The Ray Long Site, Fall River County, South Dakota*

The purpose of this research was to determine if the tool stone used for two quartzite Angostura projectile points from the Ray Long site (39FA65), Fall River County, South Dakota, could be linked to a specific quarry or geologic formation. The Ray Long site is the type-site for the Paleoindian period Angostura complex which has a regional distribution of Utah, Colorado, southeastern Idaho, Wyoming, southwestern South Dakota, and western Nebraska. The seven quarries selected for the study are located in the Black Hills Uplift in South Dakota and the Hartville Uplift in Wyoming. The study applied macroscopic and microscopic examination to lithologically describe and XRF testing to define initial XRF signatures for the quarries and the two projectile points. Results suggest that the tool stone material used to produce the projectile points likely originated in the Spanish Diggings quarry complex in the Cloverly Formation of the Hartville Uplift.

Boger, Rebecca (Brooklyn College, CUNY)

[290] *Building Resilience and Sustainability through Collaboration and Community Research*

The island of Barbuda, West Indies has a relatively unique history, land tenure and geography. Despite its arid climate and thin soils, the enslaved and eventually free people of Barbuda developed a complex herding ecology and built historic wells that are strategically located around the island to support their sustainably resilient agricultural practices. Now, these wells are largely abandoned and people are increasingly dependent on external food and water. An interdisciplinary team of archaeologists, anthropologists, and geoscientists are working closely with US undergraduate and graduate students, along with Barbudan experts and high school students to document these historic wells and assess the state of food and water resources on the island. Our research approach integrates traditional ecological knowledge (TEK) with western science to take a long-term perspective and assessment of the present situation. The methods used for data collection are varied and include kite and unmanned flight air photography, GPS mapping, water and soil testing, surveys and focus group discussions. Together, this collaboration is building a robust dataset while enhancing the capacity of people to address the challenges being brought about by climate change.

Bogle, Johnny (GSU)

[246] *Seeking Isla Palenques's Deeper Meaning*

Although Isla Palenque is an important Panamanian archaeological site that has been investigated several times from the 1960s through the 80s, there remain important questions associated with the human occupation of the settlement. Current changes in Panama's tourism growth make this emergent study important, because while this site has remained relatively "unchanged" for decades, current construction projects are beginning to limit study of the island that has been notoriously difficult to investigate due to ecological, political, and historical factors. Original studies established culture chronologies and regional comparisons related to "adaptive radiations" of early settlers, but the broad focus and older methodology invite an update to help advance theory aided with newer technological methods. Initial interpretations labeling the island an important "ceremonial center" highlight its significance, but shed little light on deeper explanations of the function of the island over

time, or reasons for its initial occupation. My current investigation looks to expand outside the original centralized excavations by broadening the study area to a community settlement survey of the entire island. Current data that elucidates the social organization of the island enabling a deeper understanding of relations associated with trade and exchange in southern Central America will be presented.

Bohorquez Gerardy, Stefan (Cerro Hojas-Jaboncillo Project)

[367] *Las Voces del Barro y el Paisaje Manteño en Hojas-Jaboncillo, Manabí Central (Ecuador)*

El gobierno ecuatoriano ha apoyado desde el 2009 al proyecto arqueológico “Cerro Hojas-Jaboncillo” y al estudio de la sociedad Manteña, en la provincia de Manabí (Ecuador). Actualmente la investigación está dirigida a los procesos constructivos de las estructuras y las modificaciones del paisaje, innovaciones en tecnología, estilos e iconografía cerámica, y en la dispersión y conectividad de los asentamientos manteños. El paisaje cultural manteño no solamente pudo ser apreciado en las áreas en las que este grupo social imprimió su huella con su forma particular de transformación y construcción de estructuras, sino también en su iconografía cerámica, donde la reunión de elementos del diseño decorativo nos tiene preparado un discurso acerca de su propia concepción de su ocupación y control. El barro de las paredes de las estructuras también expresa su existencia. En un medio adverso para la conservación, este barro cuidadosamente preparado sigue allí y se lo puede observar con un ojo entrenado incrustado en el paisaje manteño de Cerro de Hojas-Jaboncillo.

[235] *In Progress: Updating and Redesigning the SAA's Archaeology for the Public Webpages*

There is no doubt that public archaeology is delving into the digital realm. While the web provides a number of new and exciting avenues for the public to interact with archaeology, its complexity also introduces new challenges for individuals and organizations who want to use websites as an engagement tool. This paper discusses recent efforts to redesign a major online resource for public archaeology: the SAA's Archaeology For the Public website. The authors first provide a brief history of the development of the site, which was designed to serve as a “web-based interface between the field of archaeology and its many diverse publics”. They briefly discuss what the site has accomplished and the challenges it has faced. In particular, they highlight the difficulties inherent in creating and maintaining a dynamic web-based resource that is meant to serve multiple audiences. The authors then discuss the overall philosophy that has guided efforts to gather audience feedback and evaluate the website for a redesign. Finally, the paper concludes by considering on a broader level how organizations like SAA can create meaningful digital resources that effectively serve multiple audiences who are interested in archaeology.

Bolunia, Mary Jane Louise (National Museum of the Philippines), Rey Santiago (Retired archaeologist) and Alfredo Orogo (National Museum of the Philippines)

[238] *Early Maritime Involvement of Butuan with Other Southeast Asian Polities and China*

The significance and importance of Butuan as a trading center as early as the 10th century C.E. can be based on the thousands of artifacts excavated from 1976 to 2014 ranging from Chinese ceramics belonging mostly to the Song Period (ca. 10th-13th centuries), Southeast Asian and locally produced

earthenware pots and stoves. Another very important artifact encountered were plank-built edge-pegged boats that measures approximately 15 meters long and 3 meters wide. In 2012, a larger boat was excavated projected to reach 25-30 meters long. Questions regarding Butuan's position as a trading center can be answered further by the results of the geomorphological studies conducted in 1986 and 2001. Major geologic events drastically changed Butuan's landscape as a group of islands prior to the 15th century and to its present form as part of Mindanao Island today. To further determine the use and capability of the boats in the open seas, replicas were built and actual sailing were undertaken in the South China Sea reaching the waters of South Vietnam and returning to the Philippines.

[181] *The Aurignacian Open-Air Campsite of Régismont-le-Haut (Hérault, France)*

Régismont-le-Haut (Hérault, France) counts among the rare open-air Aurignacian campsites in southwestern France having both spatially conserved activity areas and explicit traces of a constructed living space. This minimally disturbed single habitation occupies two perpendicular paleochannels, whose geometry separates the site into two main zones.

Throughout its excavation numerous combustion structures (27), all being surrounded by differentially diffuse archaeological material, have been discovered within the two paleochannels. The density and nature of archaeological materials, the character and location of the hearths, and their association with features indicating a possibly structured living space (in particular possible post-holes and associated wedging stones), have allowed us to characterize the two zones. The first contains several polyvalent units, which we interpret as a domestic zone. The second contains several structures having seemingly specialized purposes, including a probable bison primary butchery area and several ochre processing and use areas, which we thusly interpret as a multi-function workshop zone. The fact that all of the material is encased in a single occupation surface, along with the seeming coherence and complementarity between the various structures and zones, pleads in favor of a single episode of occupation, likely in the form of a relatively large seasonal residential campsite.

[235] *MicroPasts and Research-Led Public Archaeology*

A core aim of public archaeology is to study and strengthen the public value of archaeological research. In pursuing this goal, the MicroPasts project sees archaeological research, public engagement with archaeology and the study of the cultural, social and economic implications of citizen participation as overlapping and mutually reinforcing areas, that can generate high quality new resources (data, enhanced interpretations, skills, funding, etc.) and processes (e.g. methodological innovations, learning, etc.). Digital technologies can act to super-charge these opportunities for effective community and crowd-fueled research. MicroPasts supports both online and offline collaborations between academics and other members of the public in order to: produce open research data together via crowd-sourcing; discuss how this data can be used for future research projects; and crowd-fund community archaeology agendas. This paper will introduce the MicroPasts project and consider the strengths and weaknesses of the public archaeology model behind it. Thereafter, it will discuss the value of digital participation in the project for both academics and communities. It will present: (a) the results of the analysis of socio-demographic, attitudinal and behavioral data relating to volunteer participation; and (b) a summary of the archaeological analysis allowed by the open data created via crowd-sourcing.

[394] *Resistance, Refuge, and Retaliation: The Use of Caves during the Spanish Civil War in Asturias*

During the 2014 field season of the Archaeology of Violence in Asturias Project, a survey of caves in the Spanish province of Asturias was undertaken with the aim to document the usage of these subterranean shelters during the Spanish Civil War (1936-39) and their continued importance as vital landscape features in the guerrilla resistance movement (1939-65). These caves-- as well as other features such as roads, valleys, industrial buildings, and villages-- have long been ignored in anthropological and archaeological projects in Spain in favor of military archaeology-based approaches that focus on more formalized, "official" war sites: trenches, battlefields, and military prisons. This paper argues for a more macroscopic view of the Civil War, moving beyond site-based analysis to inter-site landscape interpretation. The diversity of use-types discovered through the survey of the caves as well as the caves' articulation with other kinds of features demonstrates the materially totalizing nature of the conflict, forcing a broader archaeological interpretation of the Spanish Civil War that moves beyond isolated sites towards more complex understandings of a dynamic network of violence, power, and politics that shaped and was shaped by the particular landscape of Asturias.

[169] *The Treatment of the Dead in the Mid-Chincha Valley, Peru*

This paper investigates post-mortem human body manipulation associated with above-ground and semi-subterranean tombs known as chullpas, which date from the Late Intermediate Period (A.D. 1000-1476) to the Late Horizon (A.D. 1400-1532) in the mid-Chincha Valley, Peru. Mortuary rituals are cross-cultural social processes that comprise a range of practices. One such practice is the treatment of deceased bodies which varies across time, space, and social organization. A 2013 survey of the mid-Chincha Valley discovered a large number of chullpas that exhibit evidence of post-mortem human body manipulation including bones with red pigment, reed posts put through vertebrae, and worked bones. The intensive analysis of human remains and grave goods recovered from a single chullpa in 2014 found the above evidence in addition to cut marks on different human bones and numerous textile bundles containing human remains. Associated ceramic and textile data suggest members of the Chincha Kingdom (ca. A.D. 1100-1450) engaged in these practices. Here, we present these data and characterize the post-mortem human body manipulation performed in the mid-Chincha Valley. We argue that this funerary practice played a significant role in group identity building and the construction of space and place in this coastal valley.

[40] *Intensification of Aquatic Resource Exploitation at the Terminal Pleistocene/Early Holocene Boundary?*

Intensive and specialized exploitation of marine resources has traditionally been attributed to the Early Holocene in Europe, from c. 11,500 cal BP (e.g. Clark 1965, 1975; von Brandt 1984) as a response to changing climate, reduction in large mammal biomass, and consequent broadening of the resource base. However, the technical sophistication of fishing gear recovered from Early Holocene archaeological contexts is suggestive of a long history of development. This paper presents a synthesis of the evidence for marine exploitation in the Upper Palaeolithic of Europe. Widespread and diverse evidence for fishing in the Upper Palaeolithic suggests there was little change in the fishing activities practiced on either side of the Terminal Pleistocene/Early Holocene Boundary.

[228] *Signaling Entitlement: the Behavioral Ecology of Conspicuous Consumption*

Everyone agrees that conspicuous consumption is some kind of social display, but what kind of display is it? I argue that conspicuous consumption is (or is like) a territorial display in social space, wherein social space is defined as a kind of virtual territory in which resources produced by collective action with a social group are allocated and defended. There is general agreement that conspicuous consumption involves the expenditure of surplus production, but there is continuing debate over the precise functional context of surplus production: is it optional (as in a community ritual fund) or is it a critical part of a long term survival strategy? This presentation will attempt to clarify two critical issues associated with conspicuous consumption: 1) the role of surplus and its disposition in middle-range communities and 2) the role of prestige (rather than dominance) hierarchies in the allocation of resources produced collaboratively by such communities.

Boone, Cristie (Ichthyofaunal Analysis)

[406] *Big Reasons to Eat Small Fishes: Nutritional Composition and Subsistence Decisions along California's Central Coast*

While behavioral ecology approaches to human subsistence in archaeology often focus on calories, nutritional content is another aspect that can influence a resource's desirability. In particular, fats are an important dietary source of easily digestible calories for hunter-gatherers. Proximate composition (fat, protein, moisture, and ash) is presented here for several fish species commonly found in archaeological sites along the central California coast, and combined with data drawn from the literature for some species that are also commercially important today. Results portray a wide range of fat content among fishes, indicating that in fat-limited environments, Clupeiformes (sardine, herring, and anchovy) might be more highly valued. Proportions of these small schooling species in Monterey Bay Area archaeological assemblages are discussed in relation to culture history, subsistence, and paleoclimate.

[400] *Hidden Revolutions: Re-examining Transitions in the American Southwest from an Anarchist and Network Perspective*

Globally, archaeologists often talk about cultural change as a dynamic, directional process that leads toward either failure (collapse, reorganization, abandonment, and "stability") or state level societies. This evokes a unilinear evolutionary framework that most admit is flawed. But what if state level societies were not the "pinnacle" of human civilization? What if states represent societal failure instead? From this position, often glossed over historic periods may stand out as lynchpins vibrating dangerously on the rickety cart of human history. This paper, using both social network and anarchist

theory, will re-examine one of these potential lynchpins: the widespread transition from dispersed pithouse communities into aggregated aboveground settlements that occurred throughout the American Southwest. I will argue that this was not merely a transition, but a Pithouse to Pueblo Revolution. This reevaluation can lead to many insights as to the “failure” of Southwestern indigenous groups to create state level societies and instead highlights their successes in maintaining incredibly complex egalitarian forms of social organization. This paper will finish by using macroregional data to examine how the above examination helps explain why local groups resisted the spread of a religious ideology (Salado) introduced by northern migrants into the southern Southwest.

[400] *Chair*

Boremanse, Didier

[242] *Religious Rites of the Lacandon*

According to Lacandon worldview till the last century, the ruined buildings of Classic Maya culture, and the funerary caves found near small archaeological sites on the shores of lakes in the forest, were respectively the “houses” of celestial and terrestrial deities (who once lived on earth). From these shrines the ancestors of the Lacandon collected stone relics which they deposited at the bottom of their incense burners. A Lacandon censer is a clay pot with an anthropomorphic head modeled on its rim, to which offerings of food and drink were made. Each censer represented a specific deity, with whom the celebrant could communicate because the sacredness and healing power of the censer derived from the relics it contained. Some gods were irascible and vengeful. For the slightest offense they sent an illness or another misfortune to the wrongdoer, or to a member of his family. Through divination a man could learn which gods were upset, what fault had been committed, which deities consented to mediate and what payments they requested. In subsequent rituals the celebrant entreated the mediators to help curing the ailing person, and to bring his/her share of offerings to the angry gods in order to appease them.

Borenstein, Gabrielle [212] see Gill, Lucy

Borenstein, Gabrielle (Columbia University)

[401] *Emergent Spirituality: The Anthropomorphic and Zoomorphic Ossuaries of Peqi'in (Upper Galilee, Israel)*

The creative and diverse mortuary practices of the Chalcolithic period in the Southern Levant demonstrated a profound departure from the single-person, intramural interments of the earlier Neolithic periods. During the Chalcolithic, formalized structures and subterranean chambers were constructed for corpse depositions that were more complex in nature. Of particular interest, many of these structures exhibit innovative tendencies that allude to portraiture. Iconographic motifs are not exclusive to the Chalcolithic period, but the artifacts from the site Peqi'in mark a significant shift from the preceding Neolithic. Accordingly, this paper examines these anthropomorphic and zoomorphic ossuaries as a lens to symbolic expression – figurative representations – in mortuary contexts. Specifically, I consider the associated meaning of exaggerated facial features – the uniquely modeled eyes, ears, mouths, and snouts – as well as the accompanying head accouterments as a means to interpret what appears to be an increased concern for realism. Using new criteria for classification and comparative examples from contemporaneous sites such as Shiqumim, Giv'atayim, and Azor, it endeavors to deconstruct this assemblage in the broader context of secondary cave burials and examine what these mortuary changes represent in terms of death and belief on a site-specific and regional level.

Borrero, Mario (University of California, San Diego)

[27] *Forgotten Finds: Updating Existing Collections for Modern Research*

The existing collections of our nation's institutions hold great potential for future research and should

be subject to modern scientific inquiry. If these collections are not catalogued or sorted properly, they can lie forgotten and virtually inaccessible to scholarly research. The example presented here is of a legacy collection, comprised of artifacts from the Tulare Lake area in Kings County, California. This selection is primarily of lithic tools, which represent ancient California life-ways, with rough dates from 9000 B.C.E. to 1000 C.E. The majority of this collection was "gifted" to the museum, as such the material itself had lost most of its provenance by the time it entered museum collections. This did not diminish the quality of the collection as the stone-tools represent a wide variety of both material and morphological types. Beyond its academic potential this assemblage also maintains cultural significance for the Yokut community. The priority was to offer the most complete classification of the material possible and to generate a rich understanding of the overall collection. These efforts have already produced novel results and stand to highlight the potential benefit for updating existing collections for their use in modern study.

[92] *Lithic Raw Material Procurement at the Multicomponent Prehistoric Wansack Site (36ME61), Mercer County, Pennsylvania: Evidence for Mobility and Trade Patterns through XRF Data*

The Wansack Site (36ME61) is a multicomponent, prehistoric site located in western Pennsylvania (Mercer County). Four seasons of excavation (1974-1977) yielded ample evidence of occupation spanning the Archaic, Woodland, and Late Prehistoric. The present study analyzes the patterns of raw material procurement, seen through the lithic artifacts collected from the site. The primary method utilized to do this is X-ray fluorescence spectrometry. Samples of chert from Flint Ridge, Upper Mercer, and Sky Hill outcrops provide a baseline for source types that occupants of the Wansack Site may have used. The elemental composition of source specimens is compared to that of 198 artifacts recovered from the Wansack Site to determine the point of origin of the latter. Flakes from all stratigraphic levels of occupation are tested, as well as across the site from each period. This study focuses on what the patterns of raw material procurement at the Wansack Site show about the changing dynamics of mobility and trading relationships from the Archaic through the Late Prehistoric periods in the upper Ohio River drainage. The data show a trend of residential mobility gradually being replaced by logistic mobility, as well as small-scale, local trading relationships increasing in importance and complexity.

[282] *Desert Digs: New Deal Archaeology in Southern Arizona, 1934-1941*

The Sonoran Desert of Southern Arizona is well known for its wealth of archaeological sites left behind by PaleoIndian, Archaic, and Formative period cultures. During the Great Depression, archaeological surveys and excavation projects provided employment opportunities for hundreds of young men and women seeking jobs. Bryon Cummings and Emil Haury at the University of Arizona

in Tucson and Odd Halseth at Pueblo Grande Museum in Phoenix took advantage of a variety of New Deal work programs to undertake these archaeological investigations at a scale previously unheard of. This presentation summarizes these important projects and discusses how their results significantly advanced our knowledge of the prehistoric cultures of Southern Arizona through published and unpublished reports, master's theses, and museum exhibits. This New Deal archaeology was undertaken between 1934 and 1941 through the Public Works Administration (PWA), Civilian Conservation Corps (CCC), and Works Project Administration (WPA) at Ventana Cave, Pueblo Grande, Besh-Ba-Gowah, University Indian Ruin, Valshni Village, Jackrabbit Ruin, and other sites.

Boswell, Alicia (UCSD)

[404] *Reassessing the Late Andean Period in the Moche Valley: the View from Cerro Huancha*
In this paper I review the history of thinking about the Late Andean Period in the Moche Valley and present recent research from the site of Cerro Huancha, a large center located in a tributary of the Moche River in the chaupiyunga ecological niche. Encompassing the duration of the Inca and Chimú Empires, A.D. 1000 – 1532, the Late Andean Period was a time of change in political power and Cerro Huancha provides insight to how these two empires administered and interacted with populations in the Moche Valley.

Bouchard-Perron, Julie-Anne (University of Nottingham)

[154] *Colonialism, Nationalism and the Appropriation of new landscapes: Consuming Old and New Worlds in Historical Quebec City (Canada)*

Since the Age of Discovery, Quebec City and its broader area have seen their lot of colonists and travellers, some of whom chose to establish themselves in the region. Their relationship with this initially new, landscape was transformed through time, following wider political events and social convictions. The nature of the settlers' attitudes and perceptions to the territory impacted their foodways by calling upon particular social networks. In doing so they reflected colonialist and nationalist discourses, reproducing their inherent inequalities and their particular grip over territory. This paper is based on a reconstruction of Quebec City region's foodways, from its exploration (1541) to its intensive industrialization (1900s), through the analysis of plant remains from five archaeological sites and critical revisiting of historical documentation. Within this framework, plant ecological preferences are used as a proxy of their geographical provenance; their consumption is seen as a form of territorial political and social incorporation, which can be diachronically and synchronically tracked.

[375] *Distribution Patterns and Production Technology of Ancient Maya Ceramics in the Three Rivers Region*

Since 2009, investigative research for the Dos Hombres to Gran Cacao (DH2GC) project has focused on an unsurveyed area in the immediate northeastern periphery of Dos Hombres and has expanded to include an area located two kilometers southeast from the La Milpa site core. The incorporation of a broad multiregional comparative dataset will facilitate a greater understanding of the sociopolitical dynamicity on multiple social and economic levels within the Three Rivers Region in Northwestern Belize. This paper will specifically focus ceramic data that has come from the DH2GC project, La Milpa periphery, and other areas of the Programme for Belize property. Topics such as ceramic distribution patterns and part-time ceramic provisioning within a larger regional context will be discussed. Also, an observed (probable) intermittent ceramic production area found in the outskirts of the La Milpa site-core will be presented.

Boulanger, Matthew (University of Missouri) and Michael Glascock (University of Missouri)

[123] *The Afterlife of Archaeometry: The Lawrence Berkeley National Laboratory Database Project*

What happens to artifact-sourcing data after a laboratory closes? We provide an update on the ongoing effort to preserve archaeometric data produced between 1968 and 1990 at the Lawrence Berkeley National Laboratory. Over the past decade, we have located and digitized chemical and contextual data for over 10,000 archaeological specimens analyzed by the laboratory. Our efforts are now turning toward analysis and application of these data, many of which have never been published let alone studied. Aside from representing one of the single largest databases of neutron activation data for archaeological research, the Berkeley database project demonstrates the fundamental need for explicit data-storage protocols, data-management plans, and an infrastructure for the long-term preservation and sharing of archaeometric data. Determining how best to preserve and retain the utility of these data is increasingly pertinent given the widespread and decentralized nature of archaeometry in the twenty-first century.

Bourgeon, Lauriane (Université de Montréal)

[357] *Humans and Carnivores at the Bluefish Cave II (Northern Yukon): Interpretation of the Faunal Remains*

While research is still ongoing, the earliest date for the first modern humans in America is well accepted at 14,000 cal BP. Some archaeological sites propose a date prior to the end of the Last Glacial Maximum, however. This is the case of the Bluefish Caves which proposes a human presence in northern Yukon as early as 25,000 uncal BP. Here, approximately 18,000 bone specimens recovered from Cave II have been determined and examined under stereomicroscope. This zooarchaeological and taphonomic study reveals significant additional details about the broad faunal spectrum in the cave, the main agents responsible for the accumulation and modification of the bone assemblage, as well as the cultural activities performed at the site. The ungulate fauna is dominated by horse, bison, caribou and Dall sheep, mixed with some carnivores such as lion, wolf and smaller canids. The highly fragmented material is consistent with patterns of breakage and marrow extraction processed by humans. However, carnivore action is significant and indicates that carnivores played a major role in the modification of the assemblage. Overall, only a few traces can be attributed to human activities. The time, duration and ultimate role of human activity at the site is evaluated here.

Boutin, Alexis (Sonoma State University)

[299] *Narrativizing a Bioarchaeology of Care: A Case Study from Ancient Dilmun*

Since 2008, the Dilmun Bioarchaeology Project has been studying and publishing the materials from Peter B. Cornwall's 1940-41 expedition to Bahrain and eastern Saudi Arabia, which now reside in the Hearst Museum of Anthropology at UC Berkeley. By analyzing these skeletal and artifactual remains, our multi-disciplinary team is adding to anthropologists' understanding of how life was experienced and death commemorated in Dilmun. One of the most exceptional skeletons belongs to a young woman who lived and died during the Early Dilmun period (ca. 2050-1800 B.C.E). Humerus varus deformity, femoral anteversion, and unusually short stature would have differentiated her visibly from the surrounding population and somewhat modified her mobility. Yet she was buried with more elaborate grave goods than her contemporaries, raising the possibility that her loss was especially profound. With guidance from the Index of Care, I will present a fictive osteobiographical narrative that explores the care that this young woman may have required at certain stages of her life course. This type of writing prompts a critical examination of the ways that bioarchaeologists interpret and disseminate their findings. It also provides a more humanizing view of past personhoods that communicates effectively and accessibly with broad public audiences.

[264] *How to Use DNA Analysis to Assess Health in the Past. Applications for New World Soft-*

Tissues

Human remains can offer many insights into our past culture, especially about our attitudes to death. However, how we lived is a much larger question. Whilst paleopathology can give us some understanding of the diseases that affected our ancestors, DNA evidence can give us so much more. Mummification, either artificial or natural, of human remains is highly variable, for example frozen ice-mummies such as the Tyrolean Iceman have a very different thermal history to heat desiccated mummies such as found in pre-dynastic Egypt. This can affect DNA preservation and amplification. In the same way, soft tissues from the Arctic and southern Peru can not be considered as similar test samples in terms of treatment. However, non-skeletal material is a valuable resource as many pathogens are concentrated in organs rather than in bone, and thus, if DNA preservation and extraction issues and amplification inhibition can be overcome, we can expand an exciting field of archaeological research. Here we shall present what needs to be undertaken to ensure that any DNA preserved in tissues can be studied, and what these studies can reveal about our past health.

[168] *Taphonomic and Taxonomic Comparisons of Bird and Mammal Remains from Tse-whit-zen*
Birds are often relatively scarce in Northwest Coast shell middens in comparison to fish, mammal and shellfish. However, large numbers of bird bones have been recovered from Tse-whit-zen. In fact, bird bones are both more numerous and more identifiable than mammal bones at the site. In the largest house structure, 47% of the bird bones greater than 1/4" in size were identified to taxon (79% of those were identified to element). In contrast, the mammal identifiability rate ranged from 7% to 16%. The differences are driven primarily by fragmentation rates, with mammal bones experiencing a high level of pre-depositional crushing, presumably for grease extraction. Despite the major differences in fragmentation, the percent of burned bones is broadly similar between birds and mammals (32-33%). The interpretation of the burning patterns, however, is different for birds versus mammals. Mammal bones appear to have been burned as part of the grease extraction process, whereas the bird bones often reflect the effects of roasting whole birds over open flames. Murre, duck and deer dominate the Structure 1 assemblages during both chronozones 3 (1450-1000 BP) and 4 (700-350 BP), with an apparent pulse in Pinniped and pelagic bird taxa around 700 BP.

[202] *Bioarchaeological Evidence for Matrilineal Descent in a 13th Century Native American Village*

The 13th Century Late Woodland Shannon site (44MY8), located near Blacksburg in Montgomery County, Virginia, was excavated in the 1960s. Excavations identified palisade lines, several circular structures, refuse-filled pits, and over 130 burials. Most burials were single, primary interments located around structures or between structures and palisade lines. Researchers have assumed that individuals buried close to one another around structures were genetically related, or at least shared clan affiliations. Recent mitochondrial DNA analysis of 11 adults from the site (7 males and 4 females) illustrates burial practices generally reflective of a matrilineal descent system. Two sets of male and female maternally-related individuals were buried in close proximity with similarities in grave goods. This possibly reflects the avuncular support relationship between a woman, her children, and her brother. In contrast, three other maternally-related adult males are buried in clusters of burials separate from one another. This may reflect matrilineal postmarital residence. However, rigid spatial segregation of interred individuals by age or with distinctive grave goods is not evident. This suggests that the Shannon site and other comparable Late Woodland villages in Southwest Virginia represent decentralized, sociopolitically autonomous matrilineal communities.

Boza Cuadros, Maria Fernanda (Syracuse University)

[31] *Building Control: Architecture and the Regimentation of Daily Life in Eighteenth Century Santa Cruz de Lancha, Peru*

Social control, central to Spanish colonial rule, was exercised through the regimentation of everyday life, the design and construction of space, and the imposition of practices such as sleeping on beds and mode of dress. In this paper I examine the built space at Santa Cruz de Lancha, an eighteenth century Jesuit hacienda in the Pisco valley, and elucidate on the ways in which the site architecture structured everyday life at the estate. Further, I pose and evaluate questions for future research that will bring to light the ways in which the African laborers at the hacienda contended with their enslavement, particularly in the configuration of their domestic spaces. Given the remarkable preservation of the site, Santa Cruz de Lancha is an ideal place to examine the daily operations and lives of a colonial hacienda's inhabitants.

[181] *The Gravettian Open Air Site of la Vigne Brun (Loire Valley, France). Shedding New Light on a Famous Unknown Site*

Excavated especially in the late 70s and early 80s, the site of la Vigne Brun provided numerous dwelling structures unique in Western Europe. Each structure is a circular excavation of 6 m in diameter, is coated with ochre, and has a central hearth. This site is generally interpreted as the result of a single occupation and all the dwelling structures of are considered contemporary. New research by a multidisciplinary team shows that site formation processes are much more complicated and allows us to propose the hypothesis of an aggregation site that is not only related to social practices, but also the hunting of horses.

Bracken, Justin (CUNY Graduate Center)

[219] *Muralla de Leon: Exploring the Fortifications*

The summer of 2014 saw the return of archaeological investigation after a 30-plus year hiatus to Muralla de Leon, located on the shores of Lake Macanché in the Petén of Guatemala. Ringed by a partially-collapsed wall of varying height, the site appears to have been a locus of contestation at various eras of Maya history. A Postclassic temple assemblage within indicates occupation by the Kowoj, who were subsequently driven from the area by the rival Itzá. However, preliminary evidence dates the initial construction of the wall to an earlier time, perhaps making the Kowoj only one of many groups to take refuge within the fortifications. This past summer's work invoked a dual-pronged approach that sought to generate a digital map of the site while also obtaining general site chronology and architectural insight via targeted excavation. In the course of the mapping effort, a number of previously undocumented structures were located throughout the general vicinity. The ongoing exploration of these settlements will serve to describe in detail the occupational history of the region around Lake Macanché, while at the same time providing context for the construction and function of the wall through comparison of what lies inside with what lies beyond.

[355] *Landscape Archaeology in Northern Belize: The Need for a Critical Reassessment*

Michael Smith and Katharina Schreiber note that, "For the Classic Maya, studies of sacred landscapes are dominated by research on caves." Unfortunately, northern Belize lacks large caves that have attracted archaeological interest and no large cave survey has been conducted in the region. Lacking such studies, archaeologists appear to be at a loss on how to engage sacred landscapes. An underappreciated aspect of the Petexbatun Regional Cave Project was its articulation of an explicit model of the general principles on which ancient Maya landscape was conceptualized. The California State University, Los Angeles Archaeological Field Program has applied this model to three studies in northern Belize at Maax Na, Chawak But'o'ob and La Milpa.

This presentation discusses the nature of sacred landmarks in the region which abound in the karstic landscape and provide surface archaeologists with abundant opportunities for empirically documenting the sacred landscape within their site boundaries.

[32] *Defining Marginality Under Shifting Baselines: Historical Transformations of California's Channel Island Ecosystems*

Spanish arrival to California's Channel Islands in A.D. 1542 marked the beginning of widespread ecological changes for island land and seascapes. Over the next several centuries, the Chumash and Tongva were removed to mainland towns and missions, sea otters were extirpated from local waters, commercial fisheries and ranching operations developed, and a variety of new domesticated plants and animals were introduced. The ecological fallout was both swift and extensive, resulting in new terrestrial floral and faunal communities, transformed hydrological systems, and exceptionally productive shellfisheries. While archaeologists have long recognized the pervasive effects of these historical transformations, it has only been in the last several years, after decades of restoration biology, that we have come to appreciate how dramatically baselines shifted after Spanish arrival. Island terrestrial ecosystems may still be considered marginal to their mainland counterparts, but the degree of this marginality and its influence on the evolution of Chumash socio-political systems bares reevaluation.

[165] *Zooarchaeology and Historical Archaeology: A Case Study of the Leland Stanford Mansion*

Investigating the socioeconomic status of occupants in 19th century historical sites has long been a goal of archaeological investigations; more recently, analyses of the animal bones preserved in these sites (zooarchaeology) have been used to compliment conclusions drawn from other lines of evidence. Following in this tradition, we will use faunal remains to examine changes in socioeconomic status of the inhabitants of the Stanford Mansion in Sacramento, California. The Stanford Mansion was the epitome of luxury when it served as the Governor's mansion in the late 1800s. However, after the house was graciously donated by Jane Stanford to the Catholic Diocese of Sacramento, it became an orphanage and subsequently a home for dependent high school girls. We hypothesize that the conversion of the Stanford Mansion from the Governor's mansion to an orphanage and girls home will be evident in the animal bones, which will reflect meat cuts, excavated at the site. We expect to see a decrease in the quality of butchered meat from older to younger archaeological layers, reflecting the transition of social strata that occurred at the mansion.

Brandt, Steven (University of Florida)

[412] *Not Always Shiny and Pretty: The Darker Side of Obsidian in Symbolizing Power, Ethnicity and Inequality in Contemporary Ethiopia*

This paper builds upon previous research among craftspeople of Southwestern Ethiopia who still procure obsidian on a regular basis to manufacture scrapers for the production of leather products. Previous ethnoarchaeological studies of these male and female hide workers of multiple ethnicities have provided a wealth of information on the role of lithics in past and present societies, and have been especially important in helping to debunk the idea that men were largely, if not exclusively responsible for the manufacture of flaked stone artifacts in Stone Age societies. More recent analyses of the crafters' scrapers using pXRF instruments have also revealed a strong correlation

between specific obsidian sources, social boundaries and ethnicity. However, there is also a darker side to the hide workers' contemporary use of volcanic glass: it brands them as prominent members of scorned caste groups whose economic, social and political roles in Ethiopian society have been severely marginalized. The paper concludes with a consideration of how studies of obsidian materiality can potentially provide archaeologists with novel ways of interpreting changes in lithic raw materials within ancient societies.

Brannan, Stefan (University of Georgia) and Jennifer Birch (University of Georgia)

[177] *Palisaded Enclosures and Political Complexity in the Eastern Woodlands of North America*
Earthworks and enclosures have a long history of construction and use in the eastern Woodlands of North America. However, the development of palisaded enclosures around permanent settlements occurs concomitantly with the transition to maize horticulture, the transition to settled village life, and an increasing concern with boundary maintenance. In this paper, we employ data from Northeastern and Southeastern North America to examine how processes of enclosure transformed the relationships between people living within walled communities and those in the outside world. We argue that enclosed settlements developed initially as defensive communities. Subsequently, these groups developed more complex forms of social, political, and economic organization to meet the challenges of living together in circumscribed groups. These organizational structures differed in the Northeast and Southeast. Dynamic processes including climatic change, aggregation and dispersal, migration, alliance formation, and the emergence of regional polities and confederacies shaped the historically contingent biographies of enclosed places.

Brant, Erika

[378] *Rejection or Reinvention: Rethinking Social Hierarchy in the Post-Collapse Colla Polity (A.D. 1000-1450) of Southern Peru*

The collapse of the highland state of Tiwanaku, around A.D. 1000, was accompanied by a dramatic uprising against the ruling elite. Elite ancestor effigies placed in large open plazas were iconoclastically disfigured, while the Putuni Palace, home to Tiwanaku's ruling dynasty, was leveled. In the post-collapse period, Titicaca basin peoples abandoned the symbols of Tiwanaku's authority. A 1500-year tradition of ritual architecture and craft goods disappeared, and ritual practice turned to the worship of ancestors placed in modest burial towers, or chulpas. Does such a transition in ritual architecture and the rejection of state-affiliated material culture signal a reinvention or, conversely, a rejection of hierarchy in the post-collapse period? Excavations conducted at the post-collapse Colla necropolis and pilgrimage center of Sillustani revealed a series of kin-focused ritual compounds as well as a previously understudied domestic sector characterized by multiple elite houses. Such findings suggest a more segmented, and possibly situational, role of leadership during the Late Intermediate Period (A.D. 1000-1450).

[294] *Long and Continuous Record of Climate and Environmental Change from Speleothems of the Cape Floral Region of Southern South Africa*

South African climate is determined by the alternating influence of subtropical trade-winds bringing rainfall to the east coast during summer and temperate westerlies causing rainfall in the south-west during winter. High growth season temperatures favor C4 grasses in the summer rainfall region whereas C3 grasses dominate the winter rainfall region. Pinnacle Point on the central south coast

has mixed summer-winter rainfall and C3-C4 vegetation. Millennial and longer time-scale changes in rainfall regime and vegetation are recorded in the $\delta^{18}\text{O}$ and $\delta^{13}\text{C}$ of speleothems. The $\delta^{18}\text{O}$ and $\delta^{13}\text{C}$ records of Pinnacle Point speleothems cover the interval between 330 and 41 ka (Bar-Matthews et al. 2010, and this study). Higher $\delta^{18}\text{O}$ and $\delta^{13}\text{C}$ values indicate high summer rain and abundance of C4 grasses in MIS 7 (~240 ka and ~230 – 205 ka) at the MIS 6/5 transition and in MIS 4 and frequently coincide with phases of southward shift of the Intertropical Convergence Zone and increased rainfall amounts in the summer rainfall region (Wang et al. 2008, Ziegler et al. 2013). The speleothem $\delta^{18}\text{O}$ and $\delta^{13}\text{C}$ variability deviates from the glacial-interglacial pattern depicted by the Antarctic Dome C record (Jouzel et al. 2007) probably reflecting the influence of the Agulhas Current.

[241] *Beyond Provenance: Using the Chemical Composition of Copper-Alloys to Explore Technology and Metal Flow*

The vast chemical datasets for copper-alloy objects are a tremendous, but underused, opportunity. These data were often considered objective fixed points that represented chronological sequences and geographical provenance. Recent work has demonstrated that, though the object composition is fixed, it is only a final characterization. Bringing together material science, archaeological, and conceptual approaches, we discuss the life histories of units of metal. Before being cast into the final object a unit of metal may have gone through chains of melting, mixing, deposition and recovery, alloying, and smithing. Luckily there are predictable chemical changes that accompany these technological effects. Our analysis approach emphasises a pragmatic way of interpreting data, which teases apart the palimpsest of factors that contributes to the analyzed values. Using this new method, this paper will discuss case studies exploring how technological changes occurred within early metallurgy. The first is 'horizontal' using the chemical dataset for Bronze Age Europe. From individual objects, through workshops, regions, and onto a continental scale, we will discuss the nature of the flow of metal and ideas. A second case study is 'vertical' and compares the characteristics of technology and exchange for Britain from the start of metallurgy to the Industrial Revolution.

[303] *Archaeology, Identity and Art: The Caranqui Murals of Ibarra, Ecuador*

The incorporation of signs and symbols derived from an ancient, indigenous past has a long and venerable history in the tradition of New World muralism. As an important form of public art, murals merit a more sustained consideration of content, context, and communicative intent. The use of specific, realistic archaeological content in contemporary works is an interesting phenomenon that underscores the relation between the politics of identity (re-)construction and historical "veracity"/materiality, as well as the different of ways in which archaeology figures in society today. This paper explores the intersection of public art, community identity, and local archaeology in the context of a recently painted set of murals created by a group of local activist artists in the vicinity of Ibarra, Ecuador.

Bremer, J (Santa Fe National Forest) and Anne Baldwin (Española Ranger District, Santa Fe

National Forest)**[34] *Evolving Histories and Changing Archaeologies on the Santa Fe National Forest***

The management of cultural resources on the Santa Fe National Forest includes interpreting the evolving histories of communities and coordinating those histories with the present state of archaeological practice. At the time of its designation in 1915, the Forest had active excavations and ethnographic research being conducted on it with continuous research since that time. This research has consistently involved using local community members as participants or interpreters. Frequently these community members were descendants of those responsible for cultural remains on the landscape. We explore the unique relationship between cultural resources on the Forest and local indigenous communities (both Pueblo and Hispanic). We also discuss how that relationship has influenced history making and how contemporary archaeological practice has affected that relationship.

[95] *Best Practices and Community Engagement for Reinternment of CA-LAn-270 (Los Altos Village) Cultural Materials on a National Registry Listed Site*

Within the core of NAGPRA is a spirit of collaboration and consultation between institutions, investigators and native communities. At CSULB, we have partnered with Tongva/San Gabrielino community members and university administration to reinter cultural remains from CA-LAn-270 (Los Altos Village Site), a site excavated in the 1950s. Community interests have centered on placing the re-interment place on university campus property and at a location of CA-LAn-234, a National Register listed location. With a overlap of archaeological and community interests and with cooperation from university administration, we have establish a program that seeks to find common ground across interests while also mitigating impacts to the archaeological record. Here, we make use of geophysical studies and remote sensing to guide the project to minimize impact during the preparation of the area for reburials. Impacts to LAN-234 are mitigated through a field school component that brings together the community, archaeologists and students, as well as seeks to learn more about this significant deposit. Our approach reflects community involvement and university administration approval while also using best practices for conducting archaeological field work on a nationally registered historic site in addition to meeting the needs of the local community and preserving the archaeological record.

[35] *Controlling for Carnivores and Shaft Fragmentation in Skeletal Element Analysis: Some Insights from Southern Idaho Cave Deposits*

Although caves are often excellent for organic preservation, they also attract carnivores and introduce the potential for rock fall. Carnivores systematically remove spongy long bone ends from assemblages, while experimental studies have shown that rock fall can fragment dense long bone shafts. As a result, these processes may bias faunal assemblages in opposing directions. This has implications for the interpretation of correlations between bone density and skeletal element frequencies in caves. We explore this problem with two bison dominated late Holocene paleofaunas from southern Idaho. The first fauna was recovered from Baker Cave, an archaeological site contained in a lava blister with abundant evidence for both carnivore scavenging and bone fragmentation. The second fauna contains bison remains recovered from a fissure in a lava flow north of Grace, Idaho. This fauna contains evidence for carnivore scavenging but not for human activity. Bone counts in each assemblage are significantly different depending on whether shafts or

ends are counted. We use a taphonomic simulation to show how carnivores and rockfall might differentially bias long bone representation, and we suggest that zooarchaeologists should consider both processes in the interpretation of correlations between bone density and skeletal element representation in caves.

Breternitz, Cory (PaleoWest Archaeology)

[354] *Tom Windes: Celebrating 40 Years of Innovative Research on the Colorado Plateau*

Tom Windes has been a leader of innovative research on the Colorado Plateau for over four decades. His early work as the archaeologist on the Manti-LaSalle National Forest in southern Utah lead to one of the first pot hunting prosecutions under ARPA. His Forest Service career was followed by work with the Zuni Tribe and then nearly three decades of association with the National Park Service's Chaco Center. Tom has become synonymous with all things Chaco, serving as Project Director for the Chaco Center's work in Marcia's Rincon and the excavations at Pueblo Alto. Tom continued his association with Chaco Canyon with surveys of the Eastern Community, Navajo sites, and has maintained rain gauges throughout the San Juan Basin. He is an expert on Chuska ceramics and the larger Chacoan world in the San Juan Basin and beyond. For the past 15 years he and a dedicated of volunteers, the Wood Rats, have been mapping and collecting dendrochronological samples from prehistoric sites in SE Utah, Mesa Verde, Chaco Canyon, and historic site in New Mexico. Above all, Tom is an excellent teacher and mentor enriching the lives of his colleagues, dedicated group of volunteers, and students.

[351] *Long-term Seabird Exploitation in the Faroe Islands*

Fowling traditionally played an important role in the subsistence economy of the Faroe Islands. The large-scale, sustainable exploitation of wild seabirds in the Faroes is noted in written sources at least as far back as the 16th century. Though the practice of fowling in these islands no doubt far precedes the earliest written documentation, archaeological evidence for the activity has until recently been limited. However, recent archaeofaunal data are beginning to provide a more complete picture of the important role played by wild resources such as seabirds in the settlement-period palaeoeconomy of the Faroes. The evidence suggests that seabirds, particularly puffin (*Fratercula arctica*) and guillemot (*Uria aalge*), were harvested in significant numbers from initial settlement onward.

Brezine, Carrie (Michigan Society of Fellows)

[241] *Bodies of Technology: Dress in Colonial Peru*

The textiles of Magdalena de Cao Viejo provide an opportunity to study technological changes in one coastal Andean settlement between the late 16th and the early 18th century. As a colonial reducción, Magdalena was home to people of both Andean and Spanish descent. Among the more than 3,000 textile artifacts are examples of cloth woven with precolumbian methods and indigenous fibers, fabrics created on European-style floor looms, and examples which combine Andean and European techniques and materials. The size of the collection makes it possible to ask questions such as how widely new technologies were adapted and whether there was any relationship between gender and the use of new techniques. The variety of textiles illustrates how technologies can be accepted, changed, combined, or rejected by individuals. Because many of the fabrics were once part of garments the textiles of Magdalena illuminate ways that technologies are both intimate and public. Technological choices are not only decisions about methods of production but statements of identity which persist long after the process of creation is complete.

Bria, Rebecca (Vanderbilt University)

[142] *The Infrastructure of Community: Agricultural Intensification and the Development of Corporate Groups at Hualcayán, Peru*

This paper examines how the construction of agricultural infrastructure was essential to the constitution of a new kind of community in the highland Andes after the collapse of the regional Chavín religion (500/200 B.C.). It presents recent excavation data from Hualcayán—a long occupied ceremonial center in Ancash, Peru—to discuss how local people reorganized their community when they abandoned a central Chavín mound and built segregated structures for agricultural production, such as terraces, canals, and ritual enclosures. The new infrastructure changed the ways that people cooperated and interacted: canals required water allocation and cleaning; terraces required clearing and structural maintenance; and fields required coordinated planting and harvesting, ritual propitiation, and pastoralism for fertilizer. Enclosures in the fields indicate that distinct groups oversaw ritual practices. In building this infrastructure, local people rejected the universalizing styles and rituals that characterized Chavín to establish a community focused on the coordinated activities of local corporate groups. The paper argues that infrastructure is not a mere reflection of broader political or social ideas, such as community. Rather, a community of human and non-human actors is created in the social interactions and practices through which people build, maintain, and care for essential and enduring material structures.

[291] *Reevaluating Vijayanagara Imperial Collapse*

This paper reexamines notions of imperial collapse by looking at recent archaeological work at the eponymous capital of the Vijayanagara Empire and at settlements of one of its subordinate regional polities. The Vijayanagara Empire is well-known archaeologically through work at its primary capital at modern day Hampi, Karnataka, India, which is today recognized as a UNESCO World Heritage Site. The former primary capital city was intensively occupied until just after the empire suffered a serious military defeat in 1565 CE, following which the imperial court left to reestablish itself at two subsequent capitals quite distant from the original. This process has often been termed as the “collapse and abandonment” of Vijayanagara, though in reality, both the central government and its regional subsidiaries persisted and even flourished. The Keladi-Ikkeri Nayakas were established as regional leaders under the Vijayanagara Empire and later ruled as an independent state based in modern Shimoga District, Karnataka. The historical record and archaeological evidence from Nayaka sites is reviewed against the record of the imperial capital to argue that flexibility in imperial political strategies facilitated socio-political continuity, rather than collapse, on the periphery.

Briggs, Rachel (University of Alabama)

[173] *Characterization of the Mississippian Standard Jar*

The Mississippian standard jar is a specific kind of vessel form that, in tandem with maize agriculture and shell-tempering, was disseminated throughout the Eastern Woodlands during the late prehistory. As previous researchers have noted, the jar appears to be specifically adapted for slow, long-term boiling, especially when compared to earlier Woodland Period jars that are generally better suited for short-term cooking. Following the proposition that pots are tools, I characterize the Mississippian standard jar as expressed during the Moundville I phase (A.D. 1120-1260) at the Mississippian civic-ceremonial center of Moundville in west-central Alabama. I argue that the particular culinary advantages offered by this form made it a specialized, nextamazing tool, and was intimately tied to an ancestral hominy foodway.

[83] *Dealing with Reality: Managing Education at the National Park Service-Midwest Archeological Center*

The National Park Service takes pride in high caliber interpretation of natural and cultural resources, and is known as the major supplier of informal education in the United States. With the centennial of the NPS approaching in 2016, the Service is directing all parks and programs to intensify education efforts. In addition, the NPS Call to Action of 2012 establishes the increasing of NPS relevancy to young people as a priority. Maximizing educational products and impacts is of particular concern for archaeologists, as enhancing understanding and stewardship is critical for long-term preservation of these non-renewable resources. However, ever-increasing workloads for NPS archaeologists are pulling staff time and funding from such efforts. The challenge to increase the relevancy of NPS archaeology to young people and other audiences requires creative partnerships and focused priorities, which leverage the resources spent on research and management. The Midwest Archeological Center works to maximize outreach through partnerships with educational organizations and NPS units across the Midwest Region, and strives to increase our impact through expanded content and delivery channels.

[293] *Reconstructing Mobility in the San Francisco Bay Area: Strontium and Oxygen Isotope Analysis at two California Late Period sites, CA-CCO-297 and CA-SCL-919*

Stable isotope analysis can reconstruct individual mobility of prehistoric California on a scale that can distinguish movement between different parts of the San Francisco Bay Area. This study uses strontium and oxygen isotope analysis to compare individual mobility patterns of two Late Period sites, CA-CCO-297 and CA-SCL-919. Three life stages are used for comparison, including early childhood from first molars, early adolescence from third molars, and adulthood/time of death from bone. Isotopic ratios from bone resulted in consistent and site-specific signatures for both sites, while enamel ratios were much more variable, suggesting higher mobility during childhood and adolescence than during adulthood. CA-SCL-919 is composed mainly of non-local individuals born in a wide variety of locations, while many individuals interred at CA-CCO-297 were born locally. Both sites revealed mobility shifts from childhood to adolescence, possibly due to post- or pre-marital residence changes. The data also suggest sexual differences in movement patterns, which may inform on post-marital residence patterns. This work gives insight into ancient kinship organization in the San Francisco Bay Area, differentiates site-specific mobility patterns from life-history mobility signatures, and provides testable hypotheses on the structure of post-marital residence patterns during the Late Period of the San Francisco Bay Area.

[291] *Ingenuity from the Periphery: Contributions to Old World Transformations from the Aral Sea Deltas*

The deltas of the Aral Sea lie within an internal drainage basin where critical water resources are prone to unpredictable change. The nature of this resource landscape discourages the emergence of enduring centralized states and was a key factor that led to the peripheral status of the deltas in world history. Nevertheless, complex social institutions did develop there in the early 1st millennium B.C. – late 1st millennium A.D., and these were based on especially diverse and flexible economic strategies. After the Arab conquests in the 8th century A.D., when the deltas of the Aral Sea became linked with core areas of the Old World, the ingenuity embedded in these local systems became an important source of new innovations that drove cultural transformations in both core and periphery

regions.

Britt, Kelly (FEMA)

[34] *Mandating Community Archaeology: Using Law to Bridge the Gap Between Public Outreach and Community Engagement*

The task of decolonizing the practice of archaeology for a collaborative community project in the public sector is one that is at times easier said than done. While many archaeologists working in federal, state and local agencies may subscribe to a postcolonial approach to research and dissemination of data, political bureaucracy, budget cuts, limited staff and time, among other issues, all make this endeavor challenging to say the least. However, for federal agencies, a variety of laws and ordinances requiring public outreach provide opportunities to pursue a community centered practice. Compared to many academic community archaeology projects, a federal approach appears to be more top-down 'outreach' rather than dialogic 'engagement' with the community. Consequently, this paper will discuss ways in which 'outreach' can be a stepping stone to a community-based approach to these projects. It will highlight several successes and hardships in conducting community-engaged archaeology in the Federal Emergency Management Agency (FEMA). Given this agency's mission to support citizens and first responders in all stages of disasters from preparation to recovery, it is not the first agency one thinks of when imagining public sector archaeology, yet it provides a unique setting in which to conduct community archaeology.

[284] *Predictive Modeling of Archaeological Sites in Death Valley National Park*

Archaeologists have long worked to develop predictive modeling tools, techniques, and methods, as it is well known that human habitation locations are patterned and often align with environmental constraints. The National Center for Preservation Technology and Training (NCPTT) and the National Park Service (NPS) have developed methods to move a database with over 2,000 archaeological sites into a statistical prototype based on Maximum Entropy niche modeling. Layers of DEM, LiDAR, GIS, environmental data, and information from state site files combine to produce statistical and graphical readouts of a grid-based model of archaeological sites. The resulting models determine the probability of the occurrence of cultural resources in the park by displaying potential spatial and temporal locations of cultural resource sites in Death Valley National Park as well as to create quantitative readouts of the veracity and percent contribution of each environmental variable. This paper will discuss methods undertaken to identify and eliminate bias within raw datasets, then examine how these changes influenced our interpretation of the model accuracy and directions for future development.

[343] *The Multi-Kiva Site: A New Perspective on the Pueblo III Period Occupation of the Middle Little Colorado River Valley*

Previous research in the middle Little Colorado River valley of Northern Arizona has characterized the Pueblo III period (1125-1275 C.E.) as dominated by dispersed pithouse villages which were later replaced by the aggregated cluster of masonry pueblos at Homol'ovi. Recent survey and excavation in this region shed new light on the occupation and land use of the middle Little Colorado River valley prior to Pueblo IV. The landscape is dotted with mid-sized pueblos that may have acted as centralized locations which facilitated the integration of dispersed settlements. This paper will present data from testing and excavation of one such pueblo, the Multi-Kiva Site (AZ P:3:112[ASM]), in 2012 to 2014. Additionally, this paper seeks to draw comparisons between Multi-Kiva and other contemporaneous and analogous pueblos in the region through architectural and ceramic analysis to refine our understanding of the Pueblo III period in the middle Little Colorado River valley and

beyond.

Britton, Emma

[245] *Results of Petrographic Analysis of Polychromes across the Casas Grandes World*

This research, part of my dissertation, focuses on the mineralogical variability of Casas Grandes polychromes. Whereas past studies have suggested that some Casas Grandes polychrome types are more common in some geographic areas than others (see Brand 1935; De Atley 1980; Findlow and DeAtley 1982; Kelley et al. 1999; Larkin et al. 2004 for more complete discussions), these studies have been challenged as they assume polychromes recovered at sites are made locally, rather than imported (Douglas 1995; Minnis 1984, 1989). Recent studies refocus on polychrome production, as a result (Carpenter 2002, Sphren 2003, Woosley and Olinger's 1993). In my presentation, I will discuss the results of petrographic analysis of polychrome sherds from Sayle's 1936 surface collections, which is geographically extensive. Sayle's (1936) collection will be utilized to determine the extent, strength, and directionality of human relationships across the Casas Grandes region. These sherds are used to examine three interrelated aspects of ceramics: similarities and differences in production sequences, centers of production and distribution, and shared knowledge as determined through paste recipes. Characterization studies, like petrographic analysis, aid in my understanding of variability or standardization of paste-temper across the region, helping to determine past communities of practice and networks of knowledge.

[337] *Stable Isotope Analysis of Permafrost-Preserved Human Hair and Faunal Remains from Nunalleq, Alaska: Dietary Variation, Climate Change and the Pre-Contact Arctic Food-Web*

The reconstruction of diet and subsistence strategies is integral to understanding past societies and human-environment interactions. Here we present stable carbon, nitrogen and sulphur isotope data from non-mortuary human hair and faunal remains from the site of Nunalleq, Alaska. Spanning the Little Ice Age (c. 1350 to 1650 A.D.), this large, complex and well-preserved site offers a near-unique opportunity to reconstruct the pre-contact Arctic food-web and to explore temporal and site-spatial variations in human diet and subsistence. Overall data suggest a mixed diet (including marine and terrestrial protein), but inter-individual isotopic variations suggest intra-group differences in the consumption of higher trophic level foods. The analysis of longer strands of hair, permitting the reconstruction of time-series dietary information, indicates both seasonal dietary homogeneity and heterogeneity amongst different individuals. The implications for our understanding of geographical, temporal and socio-cultural complexity in pre-contact Arctic subsistence will be explored.

[272] *Pueblo I/Pueblo II Subsistence Strategy in Klethla Valley: A View from a Resource Processing/Storage Site along Begashibito Wash*

The Arizona Department of Transportation conducted a highway widening project on US 160 between Cow Springs and Tonalea which required archaeological excavations at site AZ-J-33-35 (NN) as mitigation. The site is along Begashibito Wash in the western reaches of the Klethla Valley in northern Arizona. The excavations at AZ-J-33-35 (NN) uncovered an architecturally unique resource processing/storage site where locally available plants and corn were harvested, processed, and stored. Evidence for use of the site ranges from the late Basketmaker III through Pueblo III periods; however, radiocarbon dates and diagnostic ceramics indicate the primary occupation and most intensive use of the site took place intermittently during the Pueblo I and Pueblo II periods, ca.

A.D. 800 to 1150. While maize was represented at the site, primary reliance on native resources was indicated by several lines of evidence. This exhibit presents the results of the excavations with emphasis on the site's function within the settlement-subsistence networks of prehistoric Klethla Valley.

Brodie, Neil (University of Glasgow)

[279] *Syria: Cultural Property Protection Policy Failure?*

International 'cultural property protection' policy is structured around two UNESCO Conventions: the 1970 Convention on the Means of Prohibiting and Preventing the Illicit Import, Export and Transfer of Ownership of Cultural Property and the 1972 Convention Concerning the Protection of the World Cultural and Natural Heritage. Together, these conventions encourage a policy which aims at cultural site protection at source and the recovery and restitution of stolen or otherwise illicitly-traded cultural objects. The widespread looting of archaeological sites that broke out in Syria in 2011, nearly thirty years into this UNESCO-inspired policy regime, suggests that as regards looting and trafficking of cultural objects, the policy is not working. It has failed. In this paper, I discuss possible reasons for this failure.

[293] *Late Holocene Resource Depression in San Francisco Bay: Recent Research with Tule Elk, Sturgeon, and Waterfowl*

Prehistoric resource depression has been widely documented in many late Holocene contexts characterized by expanding human population densities and some of the most detailed records of this phenomenon have been derived from the San Francisco Bay area of California. I summarize here recent analyses focusing on tule elk, waterfowl, and sturgeon from multiple regional sites using traditional zooarchaeological measures of resource depression but also those drawing on allometric size relationships, stable isotopes, and ancient DNA. These analyses suggest the late prehistoric faunal landscape of the region was fundamentally anthropogenic and have implications for a wide range of other significant changes in human behavior and biology as well as the modern management of California vertebrate faunas.

Brouwer Burg, Marieka, Eleanor Harrison-Buck (University of New Hampshire) and Astrid Runggaldier (University of Texas at Austin)

[244] *Preclassic Roots of Well-Trodden Routes in the Central Maya Lowlands of Belize*

Traditional approaches to ancient Maya territories focus on site hierarchies, which are defined by a capital with monumental architecture and an elite body that controls a hinterland population. In the central lowlands, E-Groups are among the earliest monumental architecture found and are almost always associated with sites that later develop into large Classic Maya capitals, such as Tikal and Naranjo. Thus, scholars suggest that E-Groups are in some way connected to early forms of Maya political authority and territorial control. Current scholarship emphasizes the desire to create distance between monumental centers with E-Groups as a means of demarcating territorial claims and resources. We cross-examine these politico-economic explanations and suggest an alternative model that emphasizes inclusion whereby such monumental constructions facilitated connections between communities through regular social gatherings, such as ceremonies involving agriculture, marriage, and feasting. We examine shared traditions in early monumental architecture in the mid-to-upper Belize Valley and the concomitant exchange of goods, namely high densities of groundstone, which point to female involvement and large-scale feasting activities associated with these

complexes. Examining both archaeological and geospatial data (least-cost and viewshed analyses), we explore the roots and routes of these connections among settlements in this area from Preclassic times onward.

Brown, Sarah (University of California, Davis), Christyann Darwent (University of California, Davis) and Ben Sacks (University of California, Davis)

[28] *Next-Generation Sequencing Unravels the Relationship of Paleoeskimo and Thule Dogs from the North American Arctic*

The peopling of the North American Arctic, occurred in two waves. First, the Paleoeskimo people migrated from Siberia roughly 4,000 BP, followed by the Thule people ca. 1,000 BP. The Thule people are known for their innovation and rapid colonization of the North American Arctic, compared to small population sizes of the Paleoeskimo. A distinguishing characteristic of Thule culture relative to previous Arctic cultures was increased use of dogs, particularly for dogsled traction. Use of dogs by the Thule is reflected in the archaeological record by a dramatic increase in dog remains in zooarchaeological assemblages. Here, we present results from an Arctic wide survey of over ~500 ancient dog samples and analysis of the temporal and spatial distribution of dog remains and their genetic characteristics. We compare diversity of both whole mitochondrial genomes and the D-loop region in Thule and Paleoeskimo dogs from Siberia, Alaska (interior as well as coastal), Canada, Greenland to assess origins, interchange, and changes through time. We show that, similar to their human companions, domestic dogs colonized the North American Arctic in two waves.

[80] *Exploring Settlement and Mobility Pattern Changes Using Radiocarbon Databases*

Using data from a newly constructed regional ¹⁴C database for the Early and Middle-Holocene on the northern Northwest Coast of North America, a combination of Bayesian models, summed probability distributions and spatial analyses are used to evaluate hypotheses regarding the nature and timing for the development of collector strategies on the northern coast. Research and taphonomic biases are accounted for by binning the radiocarbon data, and by applying a general linear model to the data set. I then address the problems and limitations of these methods as they relate to understanding changing mobility patterns on the North Coast.

Brown, Alyson (McMaster University), Eduard Reinhardt (McMaster University) and Aubrey Cannon (McMaster University)

[112] *Sedimentary Evidence of Increasing River Discharge from Namu Lake, B.C. during a Period of Fluctuation in the Staple Pink Salmon Fishery*

Pacific salmon has been a vital resource to the people of British Columbia as far back as 9,700 years before present (BP). Sediment cores collected from Namu Lake, British Columbia provide evidence for paleoenvironmental conditions that may have led to the decline of the pink salmon population ~3400 cal years BP. Archaeological evidence obtained from the Namu shell midden reveal fluctuating pink salmon populations at this time. Particle size analysis of the lake sediment cores indicate fluctuations in river discharge as well as changes in erosional intensity. Particle size coupled with radiocarbon dating revealed low variability and high minimum grain size values during this interval. An increase in alkali earth elements; Mg, Na, and K during this time also indicate that erosional mechanisms had intensified throughout the interval 3400-2300 cal years BP, likely due to consistently wetter conditions along the coast. Increased discharge from the Namu River would have resulted in increased sediment entering Namu Lake and eventually the outflowing river; the spawning ground for the pink salmon. The results of this study help us to understand the sensitivity of salmon to fluctuating hydrological conditions and how future populations might respond to changes in climate.

Brown, James (Central Washington University), James Chatters (Applied Paleoscience), Patrick McCutcheon (Central Washington University), Jon Adler (DirectAMS) and James

Feathers (University of Washington)**[121] *Comparison of Radiometric Dating Techniques: Pacific Northwest***

Radiometric dating is problematic in non-midden sites of the Pacific Northwest. Charcoal is ubiquitous in the forest soils and unburned bone readily dissolves. This fact impedes development of a regional chronologies and understanding of the process of resource intensification that was so important to development of Northwest cultures. To alleviate this deficiency, DirectAMS and Central Washington University undertook research to demonstrate the validity of alternatives to traditional radiocarbon dating of charcoal and bone, by using radiocarbon dating of calcined bone and luminescence dating. Calcined bone (bone burned in excess of 600 °C) survives well in archaeological sites with acidic soils that are common to archaeological contexts along the Northwest Coast and has been found in the Old World to provide accurate radiocarbon dating. Luminescence dating can be applied to fire-cracked rock, which is common, particularly in food processing features. We developed a protocol for comparing calcined bone and luminescence dates with charcoal dates, taking all from the same features contexts. Results were compared for seven sites, demonstrating the validity of this approach to solving the region's dating dilemma.

Brown, Gloria (California State University, Sacramento), Daniel Reeves (Retired, United States Forest Service) and David Robinson (University of Central Lancashire)**[143] *Serrated Scapular Tools from Cache Cave***

Due to taphonomic processes at most open sites, bone tools are underrepresented in relation to stone tools. Tools made from modified artiodactyl scapulae are best known from protected sites (caves and rockshelters) in the Great Basin, such as Humboldt Cave and Lovelock Cave. These scapular tools vary in form and presumably function. Some are pointed and described as awls, but a second type is a serrated form, which we will discuss here. Many serrated forms are described as scapular saws, suited for cutting soft plant material, such as tules, but other forms are described as shaped for other uses, such as stripping seeds or as fleshers. In California, scapular tools have been recovered from the greater San Francisco Bay region as well as other areas. Here we will discuss serrated scapular tools recovered from the recent excavations of a cave at the Wind Wolves Preserve in Kern County, California. This site is located in the territory occupied ethnographically by the Emigdiano Chumash, a group for which little information existed until recently. The presence of these serrated scapular tools at this site provides insights about the lifeways of the people at this location.

Brown, Nicholas (Stanford University)**[250] *Material Perspectives on Canal Ceremonialism at Chavín de Huántar***

This work presents an interpretive revaluation of canal ceremonialism at the Andean Formative civic-ceremonial center of Chavín de Huántar. Focusing on a set of spaces within the subterranean stone-lined waterway "Canal 2," excavated in 2012 in an "Esplanade" area flanking the site's monumental core, this study explores the excavation hypothesis that canals acted as stages for the ritual-sacrificial deposition of artifacts. Through an analysis of stratigraphic and material patterning within these spaces, six distinct zones of canal deposition were identified. With the characterization of and comparison between each zone, prehistoric depositional activity was assessed and tested against theories of sacrificial deposition. Although contexts identified by excavators as "ritual" proved materially distinct from those occurring outside of canal contexts, it is concluded that there is insufficient evidence to substantiate claims of sacrificial deposition occurring prehistorically within Canal 2. The classification of depositional zones as "ritual" in the context of Canal 2 is suggested to be ineffective for such a structure that appears to have possessed spatially and temporally diverse functionality as reflected in its architectural and depositional history.

Brown, Leslie (University of Wyoming)**[264] *Isotopic examination of human remains associated with the Korell-Bordeaux site (48GO54), Goshen County, Wyoming: $\delta^{13}C$ and $\delta^{18}O$ from bone and enamel apatite***

Bone and enamel apatite from human remains (N=17) recovered at the Korell-Bordeaux (48GO54) site in Goshen County, Wyoming during the 1980 and 2009 field seasons was analyzed using stable

carbon and oxygen isotope methods. Patterns related to the geographic mobility and overall sustenance sourcing of the members of the population during their first and final decades of life are detailed. Remains stained with degraded copper alloys were examined through the same procedural methods and differences in data are explored. Avenues for additional research at this site and similar sites will be presented.

[272] *Modeling Soil Moisture of Farmland near Mesa Verde Villages at Goodman Point, Southwestern Colorado*

The abandonment of the Mesa Verde region at the end of the Pueblo III (PIII) period (A.D. 1150 to 1300) represents a complex synergy of causal processes, such as inter-village conflict, drought induced water and food resource stress, and high population density. Decisions to abandon a place, however, occurred at the village level of human interaction. This study examines the location and properties of farm plots near villages, which would have been important in those decisions. Aggregation into large villages in defensive locations where water sources were easily accessed and more easily protected as well as regional and local data on animal exploitation indicate that food resource use became concentrated near villages during PIII. Farm plots near villages would have made a major contribution to subsistence. In this study, we pilot a hydrological model to evaluate the spatial distribution of the soil moisture in relation to the archaeological sites of the Goodman Point area in southwestern Colorado in order to determine the locations and agricultural potential of farm plots near villages. This local-scale study of farm plot potential provides the opportunity to examine an important aspect of subsistence near and within villages at Goodman Point.

Brown, M. Kathryn (The University of Texas at San Antonio)

[306] *The Coming of Kings in the Belize River Valley*

Twenty five years have passed since Linda Schele and David Friedel presented their thoughts on the origins and establishment of the institution of kingship in their book "A Forest of Kings." Their historical reconstruction of Cerros illustrates the steps taken by early rulers to establish and institutionalize a hierarchical social system. Through the empirical data from Cerros, they artfully illuminate how the construction and display of symbols of royal power on monumental buildings coupled with elaborate ritual displays, allowed emergent kings to solidify their newly defined role within the community. In this paper, we present data from the Belize River valley pertaining to the "Coming of Kings." We assess how emerging kings established and legitimized their authority through the construction of monumental architecture, public art, ritual deposits, elaborate burials, and symbolically charged portable objects. We then compare these data to the Cerros trajectory laid out in "A Forest of Kings."

[306] *Chair*

Brown, Kyle (University of Cape Town)

[356] *Discovering the Trick to Flaking Middle Stone Age Tools on Quartzite*

South African Middle Stone Age tool makers were skilled at the production of fine, symmetric points and blades on quartzite, a material that is known for its toughness and durability but not for its ease of flaking. The accurate replication of MSA tools on quartzite proved to be almost impossible during a replication and experimentation program that spanned over ten years. Heat treatment was the 'trick' that unlocked the potential of silcrete and it became clear that there must also be a trick with the South Coast quartzites for consistent and predictable success. Information gained from the systematic collection and preparation of raw material samples for the SACP4 Palaeoscope Project eventually provided clues that lead to the discovery of two key requirements for quartzite replication. The morphology of beach cobbles selected for flaking is the first critical step. Successful flaking of quartzite then requires an understanding of the internal structure of the stone and perhaps even rudimentary geometry. Identification of tricks or critical path steps in the stone tool production process provide insight into early modern human behavioral complexity and identifies definable raw material traits that lead to regional variation in the Middle Stone Age technology.

Brown, Ashley (Department of Anthropology, The University of Tulsa) and Miriam Belmaker (Department of Anthropology, The University of Tulsa)

[368] *Evidence for Climate Change During the 3rd – 5th Century CE: The Microvertebrate Evidence from Tel Huqoq, Israel*

The 3rd-5th century CE Levant is known as a time period in which climatic conditions of the southern part of region were wetter than today. The climatic system of the northern Levant differs from the south, which raises the question of whether or not there was climate change in the north. At present there is no paleoecological data from the northern Galilee. Thus, obtaining paleoecological data is vital for understanding how climate may have affected the local social and economic sphere. The archaeological site, Tel Huqoq (Northern Galilee), a 3rd-5th century CE village and synagogue, serves as a case study. Microvertebrates, derived from barn owl pellets, were used as a proxy for climate change. Preliminary results suggest the local area surrounding Tel Huqoq experienced higher levels of moisture than that of today; indicated by the presence of the species: *Crociodura leucodon* (Bicolored White-toothed shrew), *Crociodura russula* (Lesser White-toothed shrew), *Apodemus sylvaticus* (Common Field Mouse), and *Apodemus mystacinus* (Broad-toothed Field Mouse). These results support data obtained from the Dead Sea lake levels, which indicate a rise in moist conditions around the 4th-5th century CE; suggesting occurrence of climate change was widespread within the Levant at this time.

Brown, Gary (National Park Service)

[406] *What's in the Oven? Specialized Processing, or Mixed Food Preparation in the Chumash Kitchen*

The distinction between generalized hunter-gatherers and economic specialists has long interested archaeologists reliant on faunal and botanical remains. Resource-processing features provide another line of evidence to address the topic, though specialized facilities do not necessarily imply patterns of specialized subsistence. Chumash inhabitants of the Santa Monica Mountains provide a case in point. Earth ovens interpreted as specialized resource-processing facilities are commonly excavated, yet a mixed economy based on diverse marine and terrestrial wild plant and animal resources enabled a remarkably complex, sedentary non-agricultural society. Data from earth ovens and middens are employed to show how specialized technologies for resource processing can be coordinated within a broad subsistence base capable of supporting social systems that resemble agricultural societies in many respects.

Brughmans, Tom [84] see Graham, Shawn

Brughmans, Tom (Department of Computer and Information Science)

[200] *Off the Beaten Track: Exploring What Lies Outside Paths of Most Frequently Cited Publications in Citation Networks*

Most citation network analysis techniques are designed to identify the main paths of the 'flow of academic influence' through a citation network, or result in a ranking of publications with the highest scores for certain network measures. Although such results are interesting, they are not always particularly surprising. A recent application of citation network techniques to a network of archaeological literature concluded that a literature review will allow one to identify key works and the main paths of influence more rapidly, although intuitively (Brughmans 2013). Citation network techniques were considered particularly useful for their ability to identify communities of scientific practice in very large datasets.

This paper aims to evaluate the ability of citation network analysis techniques applied to large datasets to make non-trivial contributions to a close reading of a corpus of archaeological literature, without the common focus on a handful of well-known authors and publications. It will therefore explore the use of citation network analysis techniques for archaeological publications further, by reviewing methods that highlight features of publications in citation networks other than high citation counts, and evaluating how community detection methods can replace the focus from most-cited papers to the communities within which they emerge.

Bruhns, Tanachy**[85]** *An Examination of Spatial Relationships using GIS data from the Basketmaker Communities Project*

The Basketmaker Communities Project (B.C.P) is a multiyear investigation by Crow Canyon Archaeological Center in Cortez, Colorado of one of the largest Basketmaker III communities known in the central Mesa Verde region. This paper examines a combination of artifact, architectural, and spatial information from 97 sites collected by Woods Canyon Archaeological Consultants and Crow Canyon Archaeological Research Center. By using ESRI's GIS software to analyze (B.C.P) data this study applies exploratory data analysis, statistical spatial analysis, and network analysis to track the demographic and subsistence transformations of the community over the course of the seventh century.

Brunclikova, Lenka [321] see Sosna, Daniel

Bruner, Emiliano (CENIEH (Spain))**[33]** *Visuospatial Integration: Perspective in Cognitive Archaeology*

Cognitive archaeology is based on the assumption that behaviors can reveal cognitive capacities, and that archaeology can provide inferences on behaviors. Additional information comes from the fossil record (paleoneurology) and from methods in neuroscience (neuroarchaeology). Visuospatial functions can be investigated from all these perspectives. In archaeology, visuospatial capacity can be investigated in terms of space and geometry according to information on tools, tool use, and space organization. In paleoneurology, changes at the parietal areas have been described in Neandertals and modern humans. In terms of functions, parietal areas have been associated with tool use, eye-hand coordination, simulation, and body-environment integration. Neandertals have been hypothesized to display a mismatch between their neurosomatic organization and their complex culture. The evolution of the modern human brain involved changes probably associated with the precuneus, a medial element integrating visual and body stimuli with memory, largely connected with the prefrontal areas and with the intra-parietal sulcus, which is decisive to coordinate the eye-hand system. Visuospatial functions represent a major interface between brain and environment, and hence are particularly interesting for theories in extended mind. Archaeology supplies different possibilities to investigate visuospatial behaviors, which makes these hypotheses partially testable.

Bruner, Kale [302] see Hatfield, Virginia

Bruner, Kale and Hannah Owens (University of Kansas, Biodiversity Institute)**[302]** *Where's the Cod? Toward a Predictive Model of Prehistoric Land-use and Migration in the Aleutian Islands*

This study explores human/environment interactions in the Aleutian archipelago by pairing eco-niche modeling of cod (*Gadus* sp.), a primary subsistence species, with prehistoric archaeological site distribution using a GIS platform. The distributions of site locations and cod habitat simulated using GARP software at multiple time slices through the Holocene show strong spatial and temporal correlation. Both site location and cod distribution are time transgressive with a pattern of westward expansion across the island chain through the Holocene. These data suggest that ecological resilience was an adaptive strategy practiced throughout the Holocene by hunter-gatherers in the Aleutian Islands. This study highlights the analytical potential of using eco-niches of subsistence species in conjunction with the geographic distribution of resources critical to survival such as fresh water and lithic material in developing predictive models of land-use and for formulating and testing hypotheses about the adaptive strategies of coastal hunter-gatherers.

[350] *On the Origins of Raised-Field Farming in the Lake Titicaca Basin of the Andes*

One of the most dynamic debates in the archaeology of the Lake Titicaca Basin of the Andes surrounds the appearance and disappearance of raised-field farming. There is now a general consensus that raised-fields were a Formative period indigenous technology that was expanded upon by the Tiwanaku state and that fell out of use, except in small pockets, when the state declined. In this paper, I use ethnographic and archaeological data from the Taraco Peninsula, Bolivia to tackle the rather nebulous issue of how this technology first emerged in the Formative period. I do so by considering the practices associated with raised-field farming in the broader context of Formative period agropastoral taskscape and climatic fluctuations that resulted in frequent lake level changes. A clearer understanding of Formative period raised-field farming will shed new light on the subsequent history of their expansion and abandonment.

[366] *Residue Analysis of Ceramic Vessels from the Copan Sub-Stelae Cache Offerings*

Developing new ways to study collections of archaeological materials housed in storage facilities and museums is a key challenge for the future of archaeological research. Following the contextual re-identification of ceramic objects housed in Copan's Centro Regional de Investigaciones Arqueológicas in 2013-2014, our team performed residue analysis on several objects that were excavated from sub-stela and altar caches at Copan during the 1930s. With their contexts re-established, these vessels hold great potential for understanding the types of offerings made during stela dedicatory rituals. We present preliminary results from a residue analysis project to determine the types of offerings contained within the vessels. Our results provide insight into the various types of ancient Maya ritual drinks and liquids used in ceremonial contexts.

[300] *Multidisciplinary Reconstruction of Interactive Change in Holocene Treeline, Paleoclimate, and High Altitude Hunting Systems in Rocky Mountain National Park, Colorado*

More than eighty high altitude game drives are known along north central Colorado's continental divide, but until recently there has been limited understanding of the interactive effect of cyclical climate and ecosystem change on Holocene alpine tundra hunting systems. University of Northern Colorado researchers, after fifteen years of high altitude archaeological and paleoclimate research, have produced an early phase reconstruction of game drive use and elevation-specific environmental zone shifts from ca. 10,500-600 BP. The reconstruction is based on multidisciplinary data from a continental-divide centered research area of ~47 km² in Rocky Mountain National Park. The area has 70%+ archaeological surface survey coverage, paleoclimate and paleoecology evidence from multiple sediment-cored alpine and subalpine fens, and a tundra ice patch site with 4,300 BP radiocarbon-dated tree remains, the latter showing a 70+ m increase from modern-day treeline.

The new evaluation of the skeletal remains and the archaeological documentation from the Saint Benedict cemetery in Prague is a unique opportunity for a bioarchaeological analysis of past mortality crises. The rescue archaeological excavation (held in 1971) and the first osteological analysis (Hanakova et al., 1988) showed in the Baroque phase V (1635-1786) the presence of several multiple graves (approximately 30 with 190 individuals) and also many other simultaneous individual burials concerning all age classes (N= 272). The initial hypothesis of multiple graves connected to the plague epidemic in 1680 A.D., when the cemetery and the buildings belonged to the Premonstratensian order, has been refuted. This presentation discusses results of a multidisciplinary study of the identity of the people buried in multiple individual graves after 1635 A.D. More specifically, the investigation of historical events, the osteobiographic indicators from the skeletons, the stable isotope analysis and the direct radiocarbon dating are used to elucidate the origin of the buried individuals. The study highlights the pitfall of considering all buried individuals as one unit for further anthropological analysis as well as bioarchaeological interpretation. This contribution was supported by the project Barrande – Mobility, 7AMB13FR012.

Bryan, Adrienne (University of California, Los Angeles) and Lisl Schoepflin (University of California, Los Angeles)**[247]** *The Study of an Inca Huaca in a Modern Context*

What happens when two imperial ideologies collide? How and why do indigenous objects of worship continue to be sacred 500 years after that collision? After defeating the Inca, the Spaniards during the late sixteenth and seventeenth century attempted to eradicate Inca religion and its influences from the indigenous memory during the famous extirpation of idolatry. While conversion to Christianity was largely successful, it also initiated a process of fusion as Andean elements subtly integrated with Western religious art and ceremonies. Our paper aims to refine and understand the nature of Spanish and Andean syncretism by considering an unnamed huaca, or an Inca sacred object that is still worshipped inside Cuzco's cathedral in Peru as a case study. Through data from the Chronicles and other documents, we reconstruct the history of this Inca sacred stone and the dynamic process of Andean syncretism since the Spanish invasion. Overall, this poster will sharpen the idea of what a huaca is, how this definition changed over time, and shed necessary light on an important process of transition in Andean culture. As such, it will allow us to identify the emergence of a new heteroglossic identity in Spanish and modern Peru.

Bryson, Robert (National Park Service)**[29]** *Discussant***Brzezinski, Jeffrey (University of Colorado at Boulder), Arthur Joyce (University of Colorado at Boulder) and Sarah Barber (University of Central Florida)****[249]** *Embedded Rituals: Examining Caching Practices in Public Buildings at Cerro de la Virgen, Oaxaca, Mexico*

Examining the construction and use of public spaces in precolumbian Mesoamerica has been productive in revealing the ways in which people constituted local communities. As settings for activities such as feasting, cemetery burial, and caching ceremonies, public buildings brought together living people, ancestors, divinities and religious objects through practices that reproduced local histories and identities. Recent research on the Pacific coast of Oaxaca, Mexico has focused on the public, ceremonial precincts of several sites in the lower Río Verde Valley, where a complex polity emerged during the Terminal Formative period (150 B.C. – A.D. 250). In this paper, we examine variation in caching practices between two adjacent public building complexes at Cerro de la Virgen, a secondary political center in the region's hinterland. Excavations in a restricted public building exposed a bundled cache of elaborately carved stone objects as well as 75 ceramic vessels interred in successive layers of construction fill. In an adjacent, more accessible complex, people placed 260 ceramic vessels in stone slab compartments beneath the surface of a patio. We argue

that the contrast between the ritual assemblages indexes the social negotiations that occurred between people of varying status positions at the end of the Formative period.

[191] *Investigating Drivers of Technological Richness among Contact-Period Western North American Farmers*

Building on several previous studies we investigate the factors that influence technological richness in nonindustrial farming groups. A number of studies have shown that the factors that influence technological richness and complexity in hunter-gatherer groups differ from the factors that influence farming populations. Specifically, environmental risk is the primary driver in hunter-gatherer technological richness and complexity, whereas population size seems to be the main driver for farmers. Here, we focus on variation in technological richness (total number of material items and techniques) among 37 contact-period nonindustrial farming groups from western North America and test two hypotheses: (1) technological richness is affected by environmental risk (proxies include species richness, annual average precipitation, and average January temperature) and (2) population size is the primary determinant of technological richness. We found technological richness to be negatively correlated with population size and species richness. Additional analyses controlling for shared history confirm these results. Thus, in contrast to previous empirical findings, the primary driver of technological richness of farming groups in western North America is consistent with the environmental risk hypothesis and not consistent with the population size hypothesis.

Buchanan, Meghan (Indiana University)

[289] *Absences and Abandonments in the Mississippian Midwest*

Archaeological studies of hypothesized regional abandonments often perform what Tim Ingold (2008) refers to as "a logic of inversion;" by drawing lines around sites, regions, and spaces we create boundaries in which life is lived, and by extension, create spaces where life is not lived. In examples of abandonments, the absence of evidence related to human living spaces is taken as the absence of (human) life. In other words, when we demarcate "abandoned" or "unoccupied spaces" (noted as such by a lack of material culture), do we unnecessarily exclude spaces where life was lived? Drawing on Mississippian Period archaeological data (and lack of data) from portions of the Mississippi River valley, I discuss how identifying certain spaces as abandoned/vacant and others as occupied have an impact on our interpretations of regional interactions and the big histories of the midcontinental US.

[8] *Sub-Pixel Detection of Obsidian at Glass Mountain Site Using NASA Satellite and Aircraft Data*

We examine the detectability of sub-pixel artifacts (i.e. site midden, obsidian artifacts, and pottery sherds) using airborne and spaceborne image data. This poster focuses on research conducted to date at the Glass Mountain Site in northern California. This large obsidian quarry area has been investigated winter 2014 and again during the height of vegetation growth 2014. Visible, SWIR, and TIR spectral characteristics of targets and background were measured in the field. A spectral library has been constructed from ~100 target and background samples. The average density of obsidian per m² has been calculated for ~10 8 x 8 m squares. Image data include: NASA's MODIS/ASTER airborne simulator (MASTER) imaging system, the Airborne Visible/Infrared Imaging Spectrometer (AVIRIS), and the Advanced Spaceborne Thermal Emission and Reflection Radiometer (ASTER). Our objectives are to: 1) test the detection limits of obsidian artifacts at the sub-pixel scale; 2) examine the influence of background, seasonal vegetation change and other on-site changes have for the detectability of obsidian, 3) establish the instrumentation, spatial scale, and spectral bands needed to improve the detectability, and 4) test predictions of new locations for obsidian artifacts at specific (spatial) densities in other image scenes and ground truth these predictions.

[415] *An Extant Example of Warm-Climate Forager Gastrophagy and Its Implications for Extinct Hominin Diets*

Accounts of gastrophagy (consumption of prey stomach material) are widespread in ethnography. The practice is recorded from different latitudes, subsistence strategies and with a wide variety of prey; however, many such reports are anecdotal. Conversely, where recent authors mention gastrophagy it is typically marginal to their main research. Little is therefore known about the frequency, seasonality, demographic factors, species composition, and relative dietary contribution of gastrophagy and the true importance of the behavior remains uncertain. Here we discuss the parameters of gastrophagy in a group of contemporary foragers (the Hadza of Tanzania) in order to put it into context. We then consider the implications of gastrophagy in hominin evolution. Given its obvious benefits to cold-adapted recent *H. sapiens*, gastrophagy may explain evidence of 'non-nutritional' plants found in Neanderthals calculus. As gastrophagy also occurs in warm climate foragers, such as the Hadza, we consider its practice in earlier hominins inhabiting tropical climates. If gastrophagy occurred at a significant level, plant remains from their (hunted or scavenged) prey could potentially confound hominin dietary interpretations based on tooth wear, calculus, lithic residues, and isotope analyses. A case in point could be the seemingly surprising evidence for bark consumption in *A. sediba*.

[136] *Noah's Ark: The Temptation of Media*

Genesis tells us a story about a man cast out by God to build an ark during a great storm sent to cleanse the earth of all that was corrupt. "Noah's Ark" is a biblical narrative that has captured the attention of people, both religious and agnostic, for hundreds of years. Hollywood producers, recognizing an enduring tale of destruction and rebirth, have spent decades recreating this story, most recently in the 2014 blockbuster "Noah" starring Russell Crowe. Additionally, renewed interest among the news media was cultivated in recent years concerning the findings of a deep-sea expedition led by archaeologist Robert Ballard. Here, Ballard recovered an ancient shoreline in the Black Sea along the coastline of Turkey, close to Mount Ararat where Noah's Ark is believed to have rested after the great flood. Focusing on Ballard's approach to the media attention derived from his research, alongside an analysis of several published works on the same topic, this article examines the ways in which the media has interpreted the work of archaeologists over several decades. Further, this article investigates the relationship between archaeologists and the media and comments on the reluctance that some professionals may feel towards the world of journalism.

[144] *Prehispanic Sculpture from Matacanela*

This presentation offers a historiographic review of investigations that have documented and interpreted the stone monuments from the archaeological site of Matacanela, located in the Tuxtlas Mountains of southern Veracruz, Mexico. This study is designed to reconstruct the possible spatial location of these sculptures in an effort to improve our understanding of their original on-site contexts. In addition, the Matacanela sculptural corpus will be compared with the monuments and stylistic traditions documented at other regional sites along the Mexican Gulf lowlands in order to understand better the site's temporal and cultural contexts. Ultimately, this paper seeks to generate additional lines of evidence that will complement other recent studies undertaken at the site.

Bueno, Lucas (Universidade Federal de Santa Catarina) and Myrtle Shock (Universidade Federal do oeste do Pará)

[157] *Technology, Subsistence and Territoriality: Changing Patterns in the Middle to Late Holocene on the Central Brazilian Plateau*

During the middle to late Holocene a series of archaeological sites in central-north Minas Gerais state, located in the southwest of the Central Brazilian Plateau, show contexts marked by the presence of an expedient lithic technology, no pottery, human burials and structures made of botanical remains. These structures contained domesticated plants, such as maize, manioc, cotton, bottle gourd, squash, peanut and native plants, such as palm nuts, passion fruit, jatobá, umbu and pequi. In this presentation we argue that this context is intimately related to a process of changing territoriality that took place in Central Brazil during the mid-Holocene, which is closely related to paleoenvironmental changes that marked the archaeological record during this period.

[355] *Some Methodological Problems with the Study of Non-Urban Caves in Northern Belize*

Cave archaeology in northern Belize is poorly developed because the soft dolomitic limestone does not permit the formation of large and impressive caves. Several studies of small caves associated with public architecture have been conducted within the Rio Bravo Conservation Management Area, Orange Walk District, Belize. These studies suggest that caves played much the same role in the sacred geography that has been documented elsewhere in the Maya area. Nevertheless, there are no systematic surveys analogous to those conducted in central Belize and the Peten. The California State University, Los Angeles Cave Research Project initiated a survey of several caves located considerable distance from site cores to fill the informational void on such features. The initial survey highlights a number of methodological problems in dealing with such caves and suggests how these problems might be addressed.

[313] *Bayesian Probability Weaning Age Estimates of Sub-Adults from Canimar Abajo, Cuba*

Bone collagen from thirty-two sub-adults (between 0 and 5 years old) and eighteen adult females, excavated from two cemeteries at Canimar Abajo, Cuba (occupied between 1130±110 B.C.E. and 580±120 CE) were analyzed for carbon and nitrogen isotopic compositions and then used in two open source Bayesian probability mixing models (Stable Isotope analysis in R, SIAR; Weaning Age Reconstruction with Nitrogen isotopes, WARN) to estimate weaning ages. The weaning age estimates are complimentary between the two models averaging approximately 2 years of age. This estimate is consistent with other pre-historic weaning age estimates in and around the Caribbean.

[384] *Paleopathology and the History of Tuberculosis: New Results from Ancient South America*

This paper will first examine skeletal evidence for disseminated TB in the Americas prior to the Era of Exploration. We then consider this American tuberculosis in the context of traditional models and more recent molecular evolutionary models based on contemporary Mycobacterium tuberculosis complex strain variation. The most parsimonious current global history for TB places its origin in Africa, then spreading to South and Southeast Asia. Subsequent dispersal to Europe and increased virulence characterized the pathogen carried around the globe in the 15th century, which continues to plague 21st century global health. Both the older and more recent models for the history and co-evolution of our species and Mycobacterium tuberculosis have, however, largely ignored the

American expression. In this comprehensive study of the Western Hemisphere examples of skeletal TB2, we screened 68 pre- and post-contact individuals for five genes. Three of the 68 samples, all from the Chiribaya culture of southern Perú, show convincing molecular evidence of TB. Surprisingly, these South American forms are most closely related to those affecting seals and sea lions. Still to be assessed is ancient North American TB, which may have originated in eastern Asia or South America or from an animal vector.

[250] *Inferring the Functionality of Three Prehistoric Structures in Rio Blanco Ecuador*

The Manteño culture is associated with the integration period, which is the latest precolumbian phase in coastal Ecuador. Much of what is known about the Manteño is the U shaped seats that were used by the elites in ceremonies; however, there is a paucity of information on the function of Manteño structures. With the support of Florida Atlantic University I conducted a survey of sixteen structures in Rio Blanco, Ecuador. Of the sixteen sites I performed shovel tests on three of the sites that have been previously registered by Angelo Constantine, an Ecuadorian archaeologist. All of the structures had a rectangular design. After I tested the three structures, I analyzed the ceramics hoping to delineate the form and function of the vessels. The majority of my data was based on the ceramics that were recovered from the inside and the outside of the structures. Using a methodology established by Mester (1990), preliminary results indicate that the smaller structures contained considerably more ceramics than the larger structures, which may imply different uses for the different structures. With this data, we can shed more light on the functions of these structures and learn more about the political structure of the Manteño.

Bulger, Teresa (WSA Archaeological Consultants)

[416] *Poverty, Motherhood, and Childhood in 19th-Century San Francisco*

Popular images of the maritime industry in places like San Francisco's Yerba Buena Cove often focus on men — whether working on docks or ships, or on land at iron works and carpenter's shops. Less visible in the historical record of these spaces are the women and children also living, and often working, along the waterfront. Historical research on the neighborhood that bordered Yerba Buena Cove in the late-19th-century suggests that most residences were occupied by families, rather than by single men. This paper will examine the experiences of mothers and children within households along the 19th-century shoreline of Yerba Buena Cove where poverty, hard work, and poor living conditions were the reality of everyday life. Domestic assemblages from William Self Associates' 2013 excavations at Block 6 and 201 Folsom Street will be used to address these questions.

[359] *Relatedness and Social Organization at the Ray Site (11BR104): Biological Distance Analysis of a Middle Woodland Ridge Top Cemetery*

A considerable number of biodistance studies have been conducted on archaeological populations from the Lower Illinois Valley. Many of these have included groups of remains dating to the Middle Woodland Period (50B.C.E. to 400CE), a period which has in the past gained attention for the elaboration of burial mound complexes, intensification of horticulture, as well as proliferation of "exotic" and intricately crafted artifacts. In the Lower Illinois Valley, this period is also characterized by the expansion of populations into previously uninhabited valleys. Questions of population

expansion and genetic diversity have been explored at many sites in this region and time period, most focusing on non-metric trait analyses. In this study, a cemetery population from the Ray Site is reanalyzed with regards to biological distance in order to explore how it compares to other sites in the region in terms of intra-site levels of genetic diversity, male vs. female genetic diversity, and diversity between spatial burial clusters. Our results suggest a distinct genetic identity for this population compared to other Lower Illinois Valley sites. By combining biological distance analyses with spatial and material analyses, we also explore questions of social organization and residency patterns.

[342] *Residues of Ancient Food Preparation in Sheltered Bedrock Features*

Recent analysis of bedrock features located in several dry rock shelters across the arid western U.S. indicate that such settings provide favorable contexts for organic residue preservation. Residues extracted from these contexts can provide a unique window into past functions and resource use. Gas chromatography / mass spectrometry (GC/MS) was used to identify and quantify very small amounts of lipids absorbed and preserved in the various bedrock features. Though organic residue studies are increasingly used to identify the use and processing of various plant and animal products in prehistory, investigations of lipid preservation in ground stone artifacts remain scarce. One reason for this situation is the expectation of poor preservation in ground stone artifacts. Dry rock shelters in the arid western U.S. are known to provide exceptional preservation for a range of organic artifacts and ecofacts and offer likely settings to encounter lipid residues from ancient food processing. Bedrock features in these contexts may provide additional benefits by retaining products typically leached away in open sites. The interpretive potential of absorbed organic residues from these contexts will be discussed and methods for sampling these types of features in the field will be described.

Burant, Eric

[301] *What's in a Grave?: A Preliminary Analysis of Material Culture from the Milwaukee County Institution Grounds Cemetery*

The Milwaukee County Institution Grounds (MCIG) Cemetery is located in Wauwatosa, Wisconsin. This historic cemetery was in use from 1878 to 1974 and interred Milwaukee County's indigent. The individuals represented consist mostly of poor European immigrants, subsequent generations, institutionalized residents, and the unclaimed deceased. The material culture associated with the 2013 MCIG cemetery excavations recovered from 685 individual graves, was stabilized, inventoried and accessioned. Conservation techniques were implemented for various material and artifact types, including the use of electrolysis on metal objects. A general chronology based on artifact variation firmly anchors the population within the social and historical context of the cemetery. Moreover, material culture associated with the spatial interpretation represented by individual burials and variation within burial treatment when supplemented with historical documentation can provide temporally sensitive data that can be used to identify individual burials.

Burham, Melissa (University of Arizona)**[266]** *Out With The Old and In With The New: The Termination and Reoccupation of Outlying Temples at Ceibal, Guatemala*

Recent research in outlying residential groups at Ceibal, Guatemala has contributed to our understanding of ritual practices carried out by different segments of society. More specifically, the termination of minor temples located in the peripheries of Ceibal reveals information about ritual destruction and reutilization of ceremonial buildings in the Maya area. At the end of the Protoclassic period (ca. A.D. 1-225), many temples in outlying residential groups were completely buried and the nearby domestic buildings were deserted. Following this apparent abandonment of the peripheries, the occupation of Ceibal was limited to the site core, and the city was abandoned at the end of the Early Classic (ca. A.D. 225-450). This practice of terminating the outlying temples appears to have been important to the process of abandonment of the site between A.D. 450 and A.D. 600. During the Late Classic (ca. A.D. 600-830) and Terminal Classic (ca. A.D. 830-950), many residential groups were reoccupied and the local temples were reused in a different manner, but often not rebuilt. More broadly, this research provides pertinent information about termination rites, the relationships between the cores and peripheries of lowland Maya centers, and settlement patterns in the Petexbatun region.

[79] *Crafting Choices: Neolithic – Early Helladic II Ceramic Production and Distribution, Midea, Mainland Greece*

Forming part of a broader program of macroscopic, petrographic, SEM, and NAA analysis of ceramics from Mainland Greece, this paper focuses on the Late Neolithic to Early Bronze II sequence at the site of Midea in the Argolid. Through investigating the technological variability present at Midea, our results suggest significant differences, and continuity, in technological choices over time. Most notable is the decline of grog temper between the Final Neolithic and Early Bronze Age periods. This is accompanied by the increased dominance of a sandstone-low grade metamorphic fabric believed to originate in the area around Asine but which appears to have been widely distributed throughout the NE Peloponnese. These results indicate a fundamental shift in the way potters approached their craft between the end of the Neolithic and the early stages of the Bronze Age. Significant changes not only in specific technological choices but also in the scale of production and exchange, suggest the emergence of particular production areas and increased interaction between communities over time.

Burke, Chrissina (Northern Arizona University)

[87] *Bison Killsites and Carnivore Utilization: A Discussion of Prehistoric Human Impacts to Scavenging Carnivores and the Implications for Conservation Management*

Zooarchaeologists have commonly employed analyses concerning only site formation processes when studying carnivore modification and utilization to North American faunal assemblages. Yet, such processes are rarely discussed beyond descriptions of the presence of tooth marks or overall percentages of elements with modifications. Additionally, limited discussion has occurred with regards to the implications of these data on how humans and carnivores interacted in the past. In this paper, I address this deficit with the results of a study in which I analyzed eight bison bonebeds from Wyoming and Colorado for degree of carnivore utilization and identification of the carnivores responsible for utilization. These data are discussed in the context of human-carnivore relationships to explore how understanding the degree of carnivore utilization in zooarchaeological assemblages can assist with creating a holistic perspective on the connections between humans and the environment for future applications to conservation management.

[185] *Determining the Provenance of Suwannee Chert: A PXRF and Microscopic Analyses Case Study from Northwest Florida*

This work presents results on the use of microscopic and PXRF analyses for determining Suwannee chert provenance. Traditionally, analysis of the diagnostic microfossils, fabric, and inclusions in Florida cherts has allowed for successful sourcing of lithic raw materials to a distinct quarry cluster within a specific limestone formation. Instrument analysis has not been pursued due to its prohibitive cost, and trace-elemental analysis has been discouraged because of the inherent difficulty associated with recognizing geochemical signatures across formations as a whole. Recent research has suggested that instrument analysis in combination with microscopic analysis may allow for more discrete provenance determinations for Florida cherts. A new multi-technique approach is proposed for Florida provenance studies, and new standards for microscopic analysis attributes, adequate sample size and harvesting strategies, and statistical and graphical analyses are presented. A PXRF and microscopic analysis of chert from the Wacissa quarry cluster in northwest Florida serves as a case study for developing and testing the benefits and drawbacks of a new methodology. The potential for narrowing the source ascriptions of Florida cherts is high, and by reevaluating the techniques equipped in current provenance studies, sourcing cherts to smaller geographic areas within the established quarry clusters may be possible.

[392] *Legacies of Movement and Land Use in the Mojave Desert: An Intensive Study of Two Multi-Component Sites at Fort Irwin, San Bernardino County, California*

Fort Irwin is a United States Army installation located approximately 37 miles northeast of Barstow in San Bernardino County, California. Covering an area of 1,193 square miles, Fort Irwin is roughly the size of Rhode Island. This large installation has a wide variety of archaeological resources, including two large, multi-component sites that were re-recorded by the Fort Irwin Cultural Resources Program in 2014. Bitter Spring (CA-SBR-2659/H) is a National Register of Historic Places (NRHP) listed site in the southeastern corner of Fort Irwin, and Drinkwater Spring (CA-SBR-3831/H) is an NRHP eligible site in the north-central portion of Fort Irwin. These sites have yielded evidence of extensive periods of use, yet they contain different archaeological resources, particularly in their historic components. Diverse uses of desert resources across the Mojave were influenced by several factors such as traditional Native American interaction networks, European migration routes, and mining activities. This paper will explore Bitter Spring and Drinkwater Spring as important stopping points for regional networks and will discuss variations between the assemblages as they relate to the different ways people moved across the landscape in these areas of Fort Irwin.

[54] *Middle Bronze Age Animal Economies: Transitions at Pecica Santul Mare (Romania)*

The Bronze Age is a period of fundamental social and technological changes in Europe, including the emergence of more complex political and economic systems. Pecica "Șanțul Mare," a large tell located in the Carpathian Basin (Romania), provides an ideal case study of economic reorganization throughout the course of the Middle Bronze Age (MBA), when it came to rise as a regional center. The Middle Bronze Age was an era of more centralized control over animal production and specialized horse breeding. This new study seeks to understand the period prior to its regional dominance. I analyze the faunal assemblage of the earliest settlement layers of the MBA occupation (1900-1850 B.C.E.). The animal economy from this transitional period forms the foundation for the suite of changes occurring the site's apex. The patterns that we see at Pecica can be used as a model for emerging economies in the greater Carpathian region.

Burns, Gregory (University of California, Davis) and Jelmer Eerkens (University of California, Davis)**[114]** *Stable Isotope Sourcing of Olivella Shell Beads from Central California*

Although a temporally diagnostic type artifact, the pre-contact cultural role of Olivella beads is poorly understood for Central California and the San Francisco Bay Area. While important as an item of trade and burial wealth, the nature of Olivella bead origin and conveyance is uncertain. Stable isotope sourcing, using oxygen and carbon from serial sampling shell carbonate, provides a potential to locate where shell was collected for bead production. We document developments in a technique for interpreting seasonal marine isotope signatures along the California coast, and compare sourcing results for beads from possible manufacture, domestic, and funerary assemblages from several Middle and Late Period sites.

Burrillo, Ralph (University of Utah), Michael Lewis (University of Utah) and Joan Coltrain (University of Utah)**[276]** *Oxygen Isotope Variability in Water Sources on the Colorado Plateau: Preliminaries to Stable Isotope Models of Prehistoric Irrigation*

For aboriginal agriculturalists, subsistence strategies are tightly constrained by ecological conditions. The primary carbohydrate staple of prehistoric communities in the American Southwest (*Zea mays*) derives from low-altitude, subtropical conditions in Mesoamerica and is at its environmental limit on the cooler, more arid Colorado Plateau. In areas like Cedar Mesa in southeastern Utah, environmental limitations were addressed by either of two strategies. Dry farming with summer monsoonal precipitation was possible in certain periods, but was subject to variation on a yearly to centennial timescale. Irrigation using local surface water (derived mostly from snowmelt) was also used in limited areas, but required investing in construction and maintenance of irrigation features. Recent experimental work suggests that oxygen isotopes in plant cellulose can be used to distinguish irrigated from dry-farmed cultivars when compared against the isotopic variability of rain- and groundwater in a given region. The purpose of this pilot study was to measure the oxygen isotope values of water sources on Cedar Mesa, and determine whether variability is significant enough that the analysis of cellulose from archaeological maize samples could reasonably identify them as having been irrigated or dry-farmed.

Burtenshaw, Paul (Sustainable Preservation Initiative)**[188]** *State, Local and Individual Perceptions of Archaeology as an Economic Asset*

The perception of archaeological resources as an economic asset is a large factor in the interaction of archaeologists with the public. This perception can pre-exist in the location and stakeholders that archaeologists work with, or alternatively archaeologists may seek to create this perception, seeking new value for cultural heritage in people who might otherwise be disengaged. There are certainly challenges to such perceptions, including the matching of hoped-for economic benefits with the realities and practicalities of the tourism industry, and the difficulties in communicating the 'economic

value' of archaeology. However opportunities also exist including increasing action and funding for preservation, engaging new audiences and bringing sustainable benefits to local communities. Drawing from research on community perceptions in Jordan, the history of 'value' debates in the United Kingdom, and the experiences of the Sustainable Preservation Initiative, this presentation will explore ideas of archaeology as an economic asset in the individual, community and state and how they interact with each other.

Burtenshaw, Julia, Diana Magaloni and Johannes Neurath

[379] *Researching LACMA's Colombian Ceramics*

The study of objects that are without context or provenience, as we most often find in museum collections, is challenging. Focusing on LACMA's collection of Colombian ceramics, this paper will present the results of research carried out by the Program for the Art of the Ancient Americas at LACMA, and examine procedures and outcomes of integrating historical, ethnographic, and archaeological data for interpreting museum objects. Colonial text sources convey a sense of the impression that 16th century Colombia and its inhabitants made on the conquistadors, and in many cases the objects appear to illustrate the same world that the Spaniards described. However the cultural gap was too great for them to appreciate more than a minimal element of indigenous culture, and many let their imaginations run away with them. On the other hand, ethnographic data can illustrate practices and allow us to interpret and consider the symbolic aspects of objects. Studying the collection using a multi-disciplinary approach reveals a story of diversity and time-depth that is not always apparent in each of these strands alone.

[310] *Ceramic Distribution, Migration, and Social Interaction at Mine Wash, a Late Prehistoric (1300-200 BP) Seasonal Habitation Site in San Diego County, California*

We selected 40 pottery samples from different levels within three separate excavation units at the site of Mine Wash (CA-SDI-813, 1100-310 BP) in central Anza-Borrego Desert State Park. The composition of these small, undecorated sherds was characterized by a combination of thin section petrography and INAA. This was compared to a now extensive petrographic and geochemical database of ceramics and raw materials from the San Diego region. Our analysis reveals a compositionally diverse assemblage that contains material from several non-local sources in the Colorado Desert to the east and the nearby Peninsular Range mountains to the west. The movement of pottery to Mine Wash is likely to reflect seasonal migration of social groups between different landscape zones along ethnographically-known trails. We consider the correspondence of macroscopic, petrographic, and geochemical classification methods. Additionally, we propose possible explanations for intra-site compositional variation of ceramics across the three excavation units.

[361] *Mountain Shoshone Landscape Occupation of Caldwell Basin, Fremont County, Wyoming*

Interpreting the use of mountainous regions by prehistoric and historic hunter-gatherers has been hampered through the years by difficult access, excessive ground vegetation, and wilderness restrictions. Archaeologists have benefited, however, from the regular occurrence of forest fires that burn thousands of acres and expose hundreds of archaeological sites every summer, as our knowledge of campsite structure and landscape use has dramatically improved. We now know that remote campsites often contain tens of thousands of artifacts that represent a greater commitment to mountain resources and places than previously considered. New recording methodologies are now being employed to properly document these sites. In this paper, we describe a second field season's efforts to investigate the Caldwell Creek sites, which were exposed by the Norton Point fire in 2011. In addition to an overwhelming number of lithics, the fire also revealed numerous diagnostic

Mountain Shoshone artifacts, including ceramics, side-notched and un-notched projectile points, and a wide variety of Shoshone knives and bifaces. We discuss increased data sets as well as the results of specialized analyses of ceramic and obsidian sourcing that contribute to the growing knowledge of landscape use in high-altitude environments.

Bush, Dominic and Mark Schurr (University of Notre Dame)

[165] *Faunal Remains at Collier Lodge and Their Implications for Our Understanding of the Lodger Diet*

Since the Collier Lodge Project commenced in 2003, excavations from the Porter County, Indiana site have yielded substantial amounts of faunal remains. The goal of my research is to examine particular collections of remains, which date to the nineteenth century, and construct a clearer picture of life at Collier Lodge. The remains being analyzed offer a unique look at diet and the interaction between fauna and residents of the lodge. Specifically, I am comparing the amount of domesticated faunal remains found against the amount of wild faunal remains found. This comparison will hopefully shed light on how much of each category of fauna constituted the average lodger's diet. I aim to accomplish this through close examination of remains, for such things as cut marks and exposure to fire, as well as comparing remains to previously identified ones in order to decipher species. The wide array of remains from feature contexts will shed light on everyday aspects of life at the lodge and give us a better understanding of this relatively recent addition to the National Register of Historic Places.

Bush, Mark (Florida Institute of Technology)

[186] *Shifting Baselines: Tales of the Unexpected*

A shifted baseline is the intergenerational acceptance of the progressive degradation of a system as reflecting its natural state. Paleoecological analyses have revealed the long-term usage by humans of sites previously thought to be 'pristine'. Analysis of lake sediments in remote areas of Panama and Ecuador revealed unexpected histories of land usage. In Ecuador, Lake Ayauch provided a record of maize agriculture from 6000 years B.P. At Lake Wodehouse, in Panama, a 3300-year long record from an apparently mature forest setting yielded a long history of maize agriculture. In both cases the expectations of little human influence on the environment were falsified. Finding the pre-human baseline may require looking as far back as the early Holocene in the Andes, whereas it may be as recent as 1920 in the Galapagos Islands. Lake Junco, on the Galapagos Island of San Cristobal, was impacted by human activity in the late 1920s, and changes associated with the introduction of grazing animals were evident in the pollen record. What was unexpected in this study was the composition of the flora prior to that disturbance. Fossil pollen evidence pointed to a different natural baseline than was generally described for the highlands of the Galapagos Islands.

Bustard, Wendy and Dabney Ford (Chaco Culture National Historical Park)

[354] *Windes Was Here*

Documenting field work has been standard archaeological practice for over a century. Long-term preservation and continuing use of those records has been less standard. Tom Windes' documentary record of his work in Chaco Canyon is an example of what best practices can achieve. In particular, Windes developed a style of mapping archaeological sites that has proved invaluable in relocating, monitoring, and maintaining Chaco's World Heritage resources. Standards for archaeological site documentation have changed in the past 45 years, but Windes' keen sense of the cultural landscape and his ability to interpret surface remains has kept his records relevant. Working in a pre-digital era of hand-written and typed field notes, hand-drawn maps, and (mostly) black and

white photography, Windes' legacy is impressive. At least 50 linear feet of his records have been cataloged into the Chaco Museum Collection. Although paper records pose preservation and access challenges, one of their advantages is the personal touch. Handwritten annotations, comments, and artwork can provide information, insight, and sometimes humor. This personal touch can indelibly link archaeologists with their projects in a way that electronic files cannot.

Büster, Lindsey (University of Bradford, UK)

[177] *Broxmouth Biographies: Roundhouses as Mnemonic Devices in Iron Age Scotland*

Broxmouth hillfort in SE Scotland saw continued occupation for almost 800 years (c. cal. 600 B.C.-A.D. 200), during which around 30 generations of inhabitants shaped the settlement and its surroundings. Activity at Broxmouth can be broadly split into six (both enclosed and unenclosed) phases, the last of which (c. cal. 200 B.C.-A.D. 200) is characterized by re-enclosure, and well-preserved roundhouses of timber and stone. The form, fabric and development of the roundhouses over time suggest that these last inhabitants were well aware of the long biography of the site, and made conscious efforts to draw upon and engage with it. This paper will demonstrate how biographical and materiality approaches, coupled with Bayesian modelling of radiocarbon dates, have allowed for the biographies of the roundhouses to be more closely intertwined with those of their inhabitants. This has revealed the central role of roundhouses, and their associated deposits, in the negotiation of past and present at Broxmouth, and in the communication of both household and communal identities.

[166] *Environmental Reconstruction at La Quemada, Zacateca, Mexico Through Stable Isotope Analysis of Leporid Bones*

Reconstructing the interactions between past environments and the expansion and secession of complex societies plays an important role in our understanding of their social development. Stable isotope analysis of faunal bone is a useful tool in reconstructing past environments and can give insight into the social-environmental dynamics of past civilizations. In this poster we present results from the stable isotope analysis of leporid bones (N=79) excavated from stratified midden deposits in the archaeological site of La Quemada, Zacatecas, Mexico. The results of $\delta^{13}\text{C}$ and $\delta^{18}\text{O}$ in bone apatite and $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ in collagen were used to create a profile of the local environment and to explore possible temporal changes. Our results suggest significant environmental changes taking place throughout the Epiclassic Period (600-900 A.D.). These results improve our understanding of the cultural history of La Quemada and increase our knowledge of social-environmental dynamics across the northern frontier of Mesoamerica.

[168] *Use of Integrated Faunal Records from 10-Liter Bucket Samples to Explore Complex Human Ecodynamics at Tse-whit-zen*

On the northern Pacific Coast of North America, animals play an extremely important role in conceptual models related to hunter-gatherer evolution and social dynamics of household production and resource control. Our ability to rigorously apply faunal remains to these models is limited by substantial data requirements including well-documented contexts, high-resolution chronology, control over complex site formation processes and taphonomy, as well as large sample sizes. Unique circumstances led to the 2004 excavation and careful geoarchaeological documentation of the large Native American village of Tse-whit-zen, coastal Washington, USA, occupied from 2000 BP until the early 20th century. Faunal samples were obtained from micro-stratigraphic contexts, providing an opportunity to study fine-grained patterns in animal use in the context of complex environmental and social change. Research thus far has generated over 200,000 identified

specimens obtained from ~5 distinct chronological units and at least three households. The presentation highlights some of the findings thus far.

[319] *Frozen Ground*

Remnants of perennially frozen ground can serve as indicators of past climate changes. Evidence of ground ice like pseudomorphs, or solifluction lobes, for example, has helped us identify cooling events such as the last glacial maximum or the Younger Dryas. Cryogenic activity can also have wide ranging affects on the behavioral context of archaeological sites displacing material from its original location a few millimeters to many meters. Here I illustrate some common types of cryogenic features and provide examples from archaeological sites in southern Siberia and Alaska.

[403] *Ritual and Mobility: $\delta^{18}O$ and $\delta^{13}C$ Analyses of Bronze Age Khirigsuur Horses from Khanuuy Valley, Mongolia*

Khirigsuurs are large stone burial and ritual monuments that served as stages for group activities and social negotiation during the Late Bronze Age (c.1300-700 B.C.) in Mongolia. Animal remains were routinely interred in satellite mounds associated with primary burial features, in particular the heads and extremities of horses, and often in great numbers. The question remains, however, whether horses selected for interment in khirigsuur satellites were from local or distant herds. Here, we examine the carbon and oxygen isotopes of incrementally sampled mandibular molars from horse heads ritually deposited in khirigsuur complexes located in Khanuuy Valley. Such isotopic data provide first insights into the complexity of social and political networks involved with khirigsuur construction and maintenance.

[202] *Bone Carbonate Derived Stable Isotope Data and Aleut Diet Change*

In this poster, we build on an earlier study by using stable isotope data extracted from bone carbonate to evaluate the hypothesis that two behaviorally distinct groups of people, Paleo- and Neo-Aleut, occupied the eastern Aleutians after 1000 BP. This study focuses on directly dated burial assemblages from Chaluka midden, Ship Rock Island and Kagamil Island. We use the SISUS linear mixing model informed by isotopic data from Aleut faunal assemblages to address temporal and spatial variation in Aleut diet. The patterning we report illustrates a transition in both at ca. 1000 BP. Our results suggests that the Chaluka diet, dominated by Paleo-Aleut inhumations, differed in both trophic level and foraging location from the other two sites for much of the past 4000 years. Trends in our data also suggest that individuals from Ship Rock and Kagamil burial caves, primarily Neo-Aleuts, had enough access to higher trophic level foods to differentiate their bone chemistries from

those buried in Chaluka midden. These trends in diet, recently reported genetic differences, as well as the introduction of novel mortuary practices at ca. 1000 BP, suggest that Neo-Aleuts do represent a population new to the eastern Aleutians.

Byers, Patricia

[272] *Using the Anasazi Origins Project Faunal Remains to Determine Archaic Subsistence Patterns*

The purpose of this study is to prevent the loss of important archaeological information by examining a collection of faunal remains from the Anasazi Origins Project (AOP) that have been virtually untouched since their excavation. Re-evaluation of these collections will allow us to identify their research potential, as well as possible cultural significance that was not identified during initial investigations. The collection being examined for this study is the Anasazi Origins Project. Excavated in the 1970s by Cynthia Irwin-Williams, this collection comes from a series of sites in northern New Mexico dating from the Archaic to the Ancestral Pueblo Periods. Only the faunal remains will be analyzed for this study. Once collected, all the faunal data will be gathered and analyzed according to time period. The Archaic faunal data collected from the AOP collection will be analyzed in comparison with other faunal data gathered from the area to identify Archaic Period subsistence patterns. Lastly, all the information gathered during the study will be added to tDar so that it may be used for future research.

Byrd, Brian (Far Western)

[82] *The Neolithic Houses of California – An Ethnohistoric Comparative Perspective on Household and Community Organization among Complex Hunter-Gatherers*

The talk addresses the built environment of complex hunter-gatherer villages of the contact period in California. Although not agriculturalists, they constitute one of the most diverse and well-documented amalgam of complex hunter-gatherers in the world. The study explores the interrelationship between vernacular architecture, households, community organization, and their socio-economic underpinnings. In doing so, highlighted case studies will include the Chumash of coastal southern California, the Patwin of central California, and the Wintu of northern California. Finally, consideration is given to the potential for ethnohistoric vernacular architecture of California hunter-gatherers to provide insight into fundamental variables in the development of Neolithic households worldwide.

[273] *Illuminating Identity with Mortuary Features at Slade Ruin (AZ Q:15:1 [ASM]), a Pueblo III Site in East-Central Arizona*

Aggregation characteristic of prehistoric east-central Arizona archaeological sites influenced residential and regional identities during the Pueblo III (1100-1300 A.D.) period. Some aspects of these identities can be explored by focusing on mortuary feature and osteological data. In 1991, a total of 101 burial features were mapped and excavated at Slade Ruin (AZ Q:15:1 [ASM]) located on private land in Eager, Arizona to avoid contamination from a nearby hydrocarbon spill. This cemetery sample provided representative data to test the hypothesis that mortuary behavior and health at Slade Ruin indicates multiple complex identities of adults and fewer identities of infants and children. A preliminary mortuary analysis was conducted by collecting feature variables including burial position, orientation, and artifact association as determined from feature records in addition to osteological variables including age, sex, pathology, and indications of trauma. Results from Spearman correlation and chi-square analyses reveal significant patterns related to the processes of constructing multi-faceted and fluctuating identities in the broader Mogollon region of the Southwest. Abundant ceramic associations, variable body positions and orientations, extensive spinal osteophytosis, and severe dental pathologies indicate developing and changing social and biological identities throughout the life course.

[129] *Trends in Late Holocene Climate Change in Central Mexico*

Lakes in central Mexico are ideal sites for the study of late Holocene climatic trends. These lakes have high sedimentation rates and their sediments are rich in pollen, diatoms and other biological remains that allow reconstructions of past environmental, ecological and climatic changes. In these lakes, precipitation, concentrated during the summer months, is frequently more important than temperature as a long-term environmental control; however, both variables are connected by climatic mechanisms. We present a review of late Holocene lake records from central Mexico that show climatic variability, its impact on tropical ecosystems and document human impact in this culturally rich region. In these records the main climatic trends that can be identified are: 1) a trend to dry conditions during the Classic, particularly the late Classic (A.D. 600 to 900), 2) Relatively moist conditions during the late Post-Classic (Ad 1200-1400) and 3) colder Little Ice Age, with two dry phases that follow the Spörer and Mounder solar minima (1400 - 1560 and 1650 - 1750).

[417] *Settlement Strategies and Environmental Features in the Sardinian Bronze Age: a Remote Sensing Approach*

In this paper, we provide a remote sensing approach for the analysis of the settlement patterns of the Nuragic civilization, using data from Landsat 7 ETM+ in a sample area of Sardinia (Gallura). By evaluating archaeological and geological data through remote sensing imagery, we outline a territorial characterization to identify patterns in the settlement choices of the Bronze Age communities, through the use of Geographic Information Systems and Spatial Statistical Analysis. This method reveals new aspects in the settlement strategies and shows how, and to what extent, an integrated approach can shed new light on different facets of the Nuragic civilization, a long-lasting culture that existed in Sardinia (Italy) from the Middle Bronze Age (ca. 1600 B.C) to the early Iron age (ca. 800 B.C.). With the use of the Earth Observation (EO) methodologies and the GIS platform, we reconstruct, with a high level of precision, the geomorphology of the examined area and analyze the spatial statistical relationship between Nuragic settlements and environmental features. As a result we identify a different settlement strategy for the Nuragic civilization in Gallura, in spite of the

otherwise similar traits of this civilization throughout Sardinia.

Cadena, Bibiana and Meggan Bullock (Escuela Nacional de Antropología e Historia)

[393] *Indigenous Testimony to the Conquest of Mexico: An Osteological Analysis of Violence in Contact-period San Gregorio Atlapulco, Xochimilco*

While ethnohistoric documents offer insights into the physical and structural violence that accompanied the Spanish conquest of Mexico, these accounts are typically written from the perspective of the conquerors. Few native testimonies exist that provide an indigenous perspective of this period of social, economic, and political upheaval; however, human skeletal remains offer a means of directly evaluating the violence of the Conquest and its impact on the native population. The archaeological site of El Japón in San Gregorio Atlapulco, Xochimilco was the subject of an archaeological salvage project in the 1990s in which 389 burials were excavated. Archaeological data clearly date these skeletons to the decades following the Conquest. An osteological study of violence in the skeletal sample, which incorporated archaeological, paleodemographic, and paleopathological data, as well as detailed analyses of perimortem trauma, indicates that a large number of individuals of both sexes and all ages died in a massacre of the population. Cranial trauma and defensive wounds are frequent in the sample as is evidence of decapitation, dismemberment, and defleshing. The appearance and patterning of these traumatic lesions suggest that both Europeans and indigenous individuals participated in the violence against the inhabitants of San Gregorio Atlapulco.

[338] *Feeding the Gods, Calling the Rains: Archaeobotanical Remains from a Monumental Fire Shrine at El Perú-Waka', Guatemala*

The discovery of a fire shrine atop the adosada of Structure M13-1 at El Perú-Waka' supports the archaeological and epigraphic records which have at various places in the Maya region (including Waka') made reference to the arrival in A.D. 378 of Siyaj K'ak'. This event resulted in the introduction of the fire shrine cult, glossed as Wite Naah in Mayan, from Teotihuacan to the Maya Lowlands. M13-1's cal A.D. 7th century fire shrine is the final phase of the main temple's fronting platform. Careful collection of soil samples and the subsequent archaeobotanical analysis makes this context unique as no other such fire shrines have been fully sampled for plant remains. These new data provide additional avenues for exploring rituals carried out at these fire shrines. The plant remains, understood as offerings to the gods, include wood, diverse types of seeds, flowers, and incense, and reflect a special concern with themes of fertility, water, and agricultural abundance. This unique deposit provides new insights into the ritual use of plants among the ancient Maya; activities that continue today.

Cai, Yan (University of Pittsburgh)

[52] *Socioeconomic Change in Tikopia Household under the Perspective of Ecological Change*

My analysis provides a picture how socioeconomic organization change in terms of changing ecology. Differences in aggregated artifact assemblages between households and sites in the KS phase have been taken to indicate participation in mutually exclusive economic activities (eg. Wood working, fishing, and animal processing), the products of which were then exchanged for those of other units. In contrast, a weak difference in the proportional composition of economic artifact assemblages between sites indicates that sites were not emphasizing different economic activities. Instead, the significant difference reflected on the social artifact assemblages (eg. Ceramic, ornaments and religious ornaments). This pattern indicates the economic exchange did not appear across the sites, but a growing social differentiation appeared on the island. The pattern of socioeconomic organization is related to the abundance and diversity of resources in the landscape. A declining aggregated artifacts between households and sites in the Tuakamali phase indicates that individual households were considered the central economic decision making, showing a high degree of autonomy among households and sites. The pattern of economic organization resulted in

a decreasing social differentiation. This process was associated with the ecology shift, from diversity of wild resources to concentration of domestic resources.

[218] *Heritage Preservation, Community Development and Sustainability: Tihosuco, Mexico and the Caste War of the Yucatan*

International tourism is a powerful economic force in Mexico today, but usually provides little help to indigenous communities except through a long process of economic trickle-down. In addition, many ancient sites which are the focus of this tourism, are controlled by the nation-state with indigenous peoples often having little say about development or use of the economic benefits. Our recent project in Tihosuco, Quintana Roo is a collaboration between the town of Tihosuco, the Tihosuco Ejido, the local Museo de la Guerra de Castas, and the Penn Cultural Heritage Center. This project focuses upon the local heritage of the rebellion of the mid-19th century called the Caste War of the Yucatan – one of the most successful indigenous rebellions in the Americas. This project is focused upon the following: 1) the local identification of a Maya heritage and identity – tied to the Caste War; 2) the documentation and preservation of this heritage both in the jungle surrounding Tihosuco and in the town itself; 3) the identification and preservation of a series of additional important features including language, historical photographs, oral histories, and other things; 4) the gradual development of a sustainable tourism program, run by the local community.

Caine, Alyson (Durham University)

[380] *The Skeletal Findings from Excavations in the Batinah, Oman*

Background. The presence of limited settlements has limited the understanding of prehistoric occupation in the Arabian Peninsula (Potts 1990). Interest and research of Arabia during the Bronze (3200-1200 B.C.) and Iron Age (1200-400 B.C.) has increased producing a greater understanding of the people from the region and their culture.

Methods. A total of sixty-four tombs were excavated with twenty-seven yielding human remains. These twenty-seven tombs originated from various periods of the Bronze and Iron Age. Each tomb was analyzed independently for demographic information (age and sex) as well as pathological prevalence.

Results. Eight individuals were assessed for age, two non-adults and six adults. Twelve individuals were assessed for sex; six females, four males, and two ambiguous sex. Pathological conditions were identified in fourteen individuals with varying prevalence; dental diseases 9%, new bone formation 14%, osteophyte formation 21%, and metabolic disease 7%.

Discussion. Research on the health and demography of prehistoric Arabian populations can further illuminate the past stories of these regions that are not well understood. Any additional information on the peoples of the past will help with the understanding of health today as well as further elucidate our health history.

Cajigas, Rachel (University of Arizona) and James Watson (Arizona State Museum and the University of Arizona)

[155] *Determining Construction Materials and Soil Formation Processes at a Burial Mound in Northwest Mexico Using Soil Micromorphology*

El Cementerio [SON P:10:8] is a late Ceramic period (cal. A.D. 943-1481) burial mound in Central Sonora, Mexico. The mound was constructed within the floodplain about 300 meters from the eastern bank of the Rio Yaqui. We conducted micromorphology analysis (the microscopic analysis of undisturbed soils and sediments) in order to characterize the nature of the soils and sediments used

to construct the mound. Samples were collected in situ from excavation units across the mound, with their orientation preserved. Thin sections were made and then analyzed with a petrographic microscope. Twenty-one samples were collected from various soil horizons and contacts to determine the construction practices and whether natural soil forming processes have been occurring in the mound. Preliminary assessments suggest that the visible mound stratigraphy is a result of a combination of naturally occurring soil forming processes following the construction of the mound, and an artifact from the soils used to construct the mound. This is significant because certain soils and sediments may have been intentionally selected for construction of the mound.

Calaon, Diego (Marie Curie Fellow, Stanford, US - Ca' Forscari Venezia, I)

[116] *Gis, Heritage and Industrial Archaeology at Aapravasi Ghat*

Between 2010 and 2013 an archaeological excavation was carried out in the warehouse where the Beekrumsing Ramlallah Interpretation Center on Indenture Labour (BRIC) has been set up. In the 19th century, the warehouse was located in the proximity of the "Hospital Block" and nearby the "Immigrants' sheds" of the Immigration Depot. The excavation represented an exceptional opportunity to investigate the topography and the industrial development of a key area of Port Louis. The ceramic, glass and metal assemblages offer a fascinating picture of the material culture of the tropical colonial city between 18th and 20th century. The site was connected with the landing place of the indenture immigrants (as shown in the maps dated 1857) and with the Aapravasi Ghat as a former Immigration Depot. The excavation investigated one of the key area in the Indian Ocean World. The depot's role in social history was also recognized by UNESCO in 2006. The archaeological reconstruction proved that Trou Fanfaron, the area where the building complex is located, was also the landing point for the French East India Company: in the same area slaves were imported and traded from Africa and India.

[22] *Investigating the Development of Social Inequality through Preclassic-Period Maya Household Ritual*

In this paper we will discuss how ritual activities in both emergent elite and commoner Maya households contributed to the development of social complexity and hierarchy during the Preclassic period at the site of Holtun, Guatemala. Our working hypothesis at the site is that while certain households successfully manipulated traditional ritual practices and symbols related to political and religious authority, all households would have contributed to the cultural milieu in which the dominant households were able to develop in the Middle and Late Preclassic periods. Through time, non-dominant households may have been excluded from using primary symbols of power, or may have actively sought out new symbols to counteract emergent power. We identify this process through comparison of contexts of ritual activity, and artifacts found within them, in households identified by sub-surface and tunneling excavations. We hope to show that ritual contexts indicate household innovation, support, and active engagement with emergent symbols of power during the Middle Preclassic period. However, ritual activity may diverge during the Late Preclassic, indicating avoidance/independence or possibly even resistance in a movement from solidarity to autonomy among households at the site.

Callow, Christopher (University of Birmingham)

[18] *Diasporas and Identities in the Viking Age*

This paper briefly sets out and analyses recent terminological discussions among archaeologists and

other scholars working on regions influenced and settled by 'vikings' in the Viking Age, c.800-c.1050 CE. 'Diaspora' has, perhaps belatedly, been a term applied to the pattern of social and economic relationships linking some communities across Europe and the North Atlantic. The applicability of the term 'diaspora' or of seeing a series of diasporic communities will be considered alongside the more detailed papers in this session.

Cameron, Catherine (University of Colorado) and Lindsay Johansson (University of Colorado)

[182] *The Biggest Losers: Gambling and Enslavement in Native North America*

This paper explores an apparently common outcome of gambling among the indigenous inhabitants of North America – the enslavement of individuals who wagered themselves (or their family members) and lost. Archaeologists are becoming increasingly aware that slavery was not a post-contact phenomenon, but existed prehistorically in societies operating at a variety of socio-political scales from bands to states (Cameron 2008, 2011, in prep., Kohler and Turner 2006, Koziol 2012). Most captives were taken during raids or warfare, but the ethnographic, ethnohistoric, and historic data we present suggests that gambling could also be a source of slaves. We present accounts of men gambling away children, wives, and eventually themselves, sometimes limb by limb. In some cases these unfortunate people became slaves for life. In others, they could be redeemed by their relatives who paid their debt or through their own efforts at repayment. Sometimes the winning gambler sold his newly acquired slave to another, often distant, group so he would not have to suffer disapproval for enslaving a fellow group member. We argue that these accounts provide evidence that enslavement through gambling also occurred prehistorically and then use oral histories to support our argument.

[403] *Herding Strategies during the Xiongnu Period of Mongolia: A Comparison in the Diet of Domestic Fauna from the Egiin Gol Valley and Baga Gazaryn Chuluu*

During the Xiongnu Period (300 B.C.-A.D. 100), mobile agro-pastoralism constituted the primary form of subsistence. While this is supported by domesticated animal remains uncovered in mortuary and domestic contexts and historical and micro-botanical evidence for the use of agricultural products, a dearth of research exists concerning the variation of mobile agro-pastoralism among the Xiongnu. As such, this paper centers on regional differences in herding patterns and specifically does so through the use of $\delta^{13}\text{C}/\delta^{15}\text{N}$ bulk sampling of mandibular and maxillary teeth of domestic herd animals. The samples tested in this study were recovered from mortuary sites in two distinct ecotones of Mongolia: the Egiin Gol Valley in the north (EG) and Baga Gazaryn Chuluu (BGC), an area located within the desert steppe of the north Gobi. By comparing the $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values of samples from EG and BGC, this study reveals intra-species and inter-regional trends in C3/C4 plant and water consumption during the Xiongnu Period. In addition, the $\delta^{13}\text{C}/\delta^{15}\text{N}$ data generated in this study is compared against existing $\delta^{13}\text{C}/\delta^{15}\text{N}$ data from Bronze Age and Xiongnu Period human remains recovered from EG as well as modern $\delta^{13}\text{C}/\delta^{15}\text{N}$ data generated from *Ovis* sp. and *Capra* sp. remains collected in BGC.

Camp, Anna (University of Nevada, Reno)

[87] *A Twist on Taphonomy: Catlow Twine Basketry in Archaeological Contexts*

This presentation is a first attempt to trace the taphonomic trajectory of specimens of Catlow Twine, an important kind of basketry technology. Catlow Twine basketry spans over ~9,000 cal B.P. years in the archaeological record of the Great Basin. The longevity of this artifact class and its appearance throughout the Northern and Western Great Basin allows for a thorough investigation of how it has been used. Catlow Twine is simple close twine technology; one of the oldest techniques in the Great

Basin. It was used to make mats, large trays, small bowls, hats, and burden baskets. The manufacturing techniques and materials of this type are extremely strong and flexible, allowing for the creation of versatile and long lasting objects in the archaeological record. Compiling data about this technology has revealed how the original form and use of some Catlow Twine baskets changed through time, indicating completely new final purpose and destination.

Camp, Stacey (University of Idaho)

[305] *The Archaeology of First Generation Japanese American Men at an Idaho WWII Internment Camp*

Amidst wartime xenophobia, the United States government unjustly imprisoned over 120,100 individuals of Japanese heritage during World War II. Despite being housed in dreary, tar-papered military barracks at sites that ranged from former racetracks to prisons, Japanese internees transformed their inhospitable living conditions into places that embodied some semblance of home and Japanese culture. These transformations were material in nature; internees creatively modified and consumed American-made goods, designed, built, and grew elaborate and ornate gardens, and composed expressive art work utilizing local materials gathered from the desolate camp landscapes and trash middens. As scholars are now recognizing, such activities expressed not only internee resistance to unjust imprisonment, but also communicated differences and transformations taking place within the Japanese American community itself. This paper examines how one group of first generation Japanese (also known as "Issei") men incarcerated in the remote wilderness of North Idaho coped with incarceration based upon two archaeological field seasons at the camp in which they were imprisoned.

[103] *A Predictive Model of Archaeological Site Location in the Hodh ech Chargui Region, Mauritania*

This paper presents a model to determine potential archaeological site locations in far southeastern Mauritania (known as the Hodh ech Chargui). Although sustained archaeological research has been carried out throughout West Africa since the 1940s, the 81,000 km² Hodh ech Chargui region has been poorly examined, with two regional surveys constituting the majority of the archaeological record for the area. It has been proposed that the Hodh ech Chargui served as a place of passage between the two Early to Late Iron Age population centers in the Hodh Depression and the Middle Niger Delta, rather than a place of settlement itself (MacDonald 2009: 45). The preliminary results of this model provide a foundation for testing this hypothesis, and more broadly illustrate the potential for GIS and remote-sensing based approaches to plan research in areas of interest throughout the ancient world.

Campbell, John (Memorial University of Newfoundland)

[110] *Transitional Archaic – "Mu Awsami Saqiwe'k" in the Maritime Provinces, Canada.*

The Transitional Archaic (4,100 -2,700 BP) is an often overlooked and underrepresented period in the Northeast; especially in the Maritime Provinces. To explain the origins of these "broadpoint using" cultures, archaeologists over the past few decades have embraced either a cultural diffusion or migration model. In this paper, I reopen the debate by examining existing collections from Maine and the Maritime Provinces, including the newly discovered Transitional Archaic component at the Boswell Site (BfDf-08) in Nova Scotia. In particular, this research aims to re-evaluate the migration theory through the study of lithic usage and subsistence strategies over this broad area.

[168] *The Whale beneath the Barnacle: Rare Taxa in the Analysis of Marine Invertebrates from the Tse-Whitzen Village Site*

In faunal analysis, rare taxa can potentially provide valuable biogeographic or socioeconomic information, but are inherently difficult to interpret and to integrate with quantitative measures. Working with extremely large assemblages highlights these issues. Among the half million specimens of shell identified from the Tse-Whitzen village site are more than 20 taxa represented by less than 30 specimens. There is no single explanation for the presence of taxa in very low numbers, and the interpretive significance of their presence varies as well. In this assemblage, some taxa are present only as modified artifacts, i.e., ornaments (jingle shell, abalone, scallop), and others are non-food taxa which are likely to have been brought in by non-cultural processes (small chitons, gastropods). On the other hand, two taxa that have potentially large economic significance may be rare because of preservation and processing factors (*Coronula diadema*, an obligate whale barnacle, and geoduck). To what extent can these taxa be brought into discussions of past behavior otherwise dominated by measures of relative abundance?

Campbell, Rachel (Missouri Department of Transportation) and Michael Meyer (Missouri Department of Transportation)

[394] *Excavating St. Louis: French Colonial and Urban Archaeology*

The history of the city of St Louis, Missouri begins with the arrival of the French and spans over 250 years of development into the large urban center of today. The original settlement was thought to have been destroyed by the expansion of the city; however, recent excavations by the Missouri Department of Transportation at the Madame Haycraft Site (23SL2334) have discovered intact French colonial occupations in the heart of downtown. Work here has uncovered a large poteaux-en-terre French style structure built by Louis Dumot in 1795. Found within this structure was a relatively dense scatter of colonial-period French and English ceramics and an associated cellar feature containing significant quantity of food bone, a fragmented wine bottle, musket balls, and faience sherds. Continuing research plans to uncover more information about early settlement in St Louis as well as change the outlook of historic archaeology in large urban centers.

[91] *Long-Term Perspectives from Obsidian Sourcing in the Southern Levant*

This poster details the elemental characterization of obsidian artifacts from three prehistoric sites in Israel: Beisamoun, Nahal Lavan 109 and Tel Tsaf. Raw material sourcing was achieved using the non-destructive technique of EDXRF spectroscopy, matching the chemical fingerprint of the artifacts' materials with those from known obsidian sources. With the assemblages spanning the Pre-Pottery Neolithic B to Chalcolithic (9th – 6th millennia B.C.), our aim was to generate a long durée view of supra regional connectivity. When integrated with techno-typological data, our results provide us with a deep-time perspective on not only raw material choice, but also cultural-technical traditions. Preliminary results suggest an initial conservative focus on Cappadocian (Göllü Dağ) obsidian, a habit that is radically reconfigured by the 6th millennium B.C. with evidence for the use of a wide array of raw materials from sources in Central, Eastern and North-Eastern Anatolia. These results are then located within a broader discussion of socio-economic changes in the southern Levant during these periods.

Campetti, Casey (Indiana University of Pennsylvania)

[269] *Out in the Field? Queer Archaeologists, Queer Archaeology, and CRM*

A perennial critique of cultural resources management (CRM) has been its perceived overemphasis on field methods and its dissociation from advancements in archaeological theory, particularly the integration of gendered archaeologies and feminist perspectives. Over the past two decades CRM has made considerable gains toward inclusivity of theory - however, the climate for queer practitioners in CRM working as field technicians, managers, and principal investigators does not

readily reflect these gains. In addition to very real issues in seeking employment and receiving fair promotions, the work environments (particularly the field) for CRM archaeologists can be willfully ignorant of LGBTQ issues or outwardly hostile. These considerations make the queer CRM community relatively invisible in comparison to queer academic archaeologists. What does a queer-safe CRM work environment look like, and why should this matter? This paper discusses the challenges, opportunities, and benefits involved in the creation of safe workspaces for queer CRM archaeologists through an examination of the invisibility of queer field practitioners, issues surrounding legislative and corporate discrimination, and the connections between queer archaeologists and the larger conversation of queer archaeology.

[6] *Preliminary Results of Geophysical Surveys Along the Middle Fork Salmon River, Idaho*
The Frank Church – River of No Return Wilderness is the largest designated wilderness in the lower 48 states encompassing over two million acres and two wild and scenic rivers (Salmon River and Middle Fork Salmon River) in central Idaho. Cultural resources were identified as one of the main tenets of the establishing legislation, and the Central Idaho Wilderness Act of 1980 mandates “the protection of archaeological sites and interpretation of such sites for the public benefit and knowledge.” Over 10,000 visitors float the Middle Fork Salmon River every year and many of their recreation campsites coincide with prehistoric pithouse villages occupied over the last 3,000-4,000 years. At least 16 sites have been identified as being at-risk from recreational activity. This poster presents preliminary magnetometer results at four of the sites during the 2014 field season. Non-ground disturbing geophysical surveys were conducted to explore the potential for intact near-surface and subsurface cultural deposits. The magnetometer results suggest that subsurface deposits still exist and this information will help us focus our future fieldwork with the ultimate goal of protecting the resource while allowing the recreation to continue.

[366] *Aplicación de la topometría digital en conservación e investigación de los monumentos mayas*

La documentación de los monumentos prehispánicos, ha sido uno de los objetivos principales de los investigadores de la cultura maya por la información que sus imágenes e inscripciones proveen sobre la historia, organización social y cosmovisión de los habitantes de las antiguas ciudades de Guatemala, México, Belice y Honduras. La documentación topométrica digital de alta resolución también conocida como escaneo en tres dimensiones (3D) representa una nueva fase en la investigación y conservación del patrimonio cultural. Esta ponencia se enfocará en el programa de escaneo en tres dimensiones de “Corpus de Inscripciones Jeroglíficas Mayas” y el componente de entrenamiento local del “Programa Santander” durante los últimos seis años. Presentaremos algunos resultados del programa, especialmente con respecto a los monumentos y edificios en el sitio arqueológico de Copán. También hablaremos de la experiencia del uso de los datos 3D en la conservación, reproducción, e investigación epigráfica y visual de los textos e imágenes mayas mencionando los logros y las dificultades en la aplicación de la tecnología.

Cannon, Mike (SWCA Environmental Consultants) and David Meltzer (Southern Methodist University)

[135] *Forager Mobility, Landscape Learning, and the Colonization of the Americas*

Among the many important contributions that Robert Kelly has made to the archaeological and anthropological literature are 1) an elegant theoretical model of forager residential movement, presented in his book *The Foraging Spectrum*, 2) a very influential argument about the Paleoindian

colonization of the Americas, which he developed along with Lawrence Todd, and 3) insightful discussions of landscape learning by hunter-gatherers. Here, we explore these issues further by expanding Kelly's residential movement model to incorporate aspects of landscape learning. This provides a framework for addressing the question of when it is more economical for foragers in a new landscape to learn how to acquire novel resources rather than move in pursuit of resources with which they are already familiar, a question that is central to many discussions of the colonization of new regions. Implications of the model for the North American archaeological record are also considered.

[361] *Developing A Minimally Invasive Protocol For Assessing Site Eligibility on the North Training Area, Camp Guernsey, Wyoming*

The North Training Area of Camp Guernsey is located within the Hartville Uplift of eastern Wyoming, an area rich in archaeological resources particularly extensive formations of toolstone quality raw materials. Because of the potential for live training exercises to impact cultural resources, the Wyoming National Guard proposed the development of an experimental testing protocol of selected sites using minimally invasive methodologies that included geophysics and small diameter auger probes. Minimally invasive testing was proposed for sample areas within a range of site types from a variety of landforms to assess the National Register of Historic Places significance of these areas within a landscape framework. Results of the project assess the utility of nested geophysical survey methodologies and flighted, hollow stem and hand-bucket auger techniques to test linkages between geomorphic setting and archaeologically preserved materials in order to answer questions about past human behavior in this dynamic landscape.

Canter, Ronald (Maya Rivers)

[86] *The Upper Usumacinta Travel Corridor, A Game of Chutes and Ladders*

Like other major rivers the Usumacinta had parallel land routes. Unlike most rivers the Usumacinta lies bound within whitewater canyons below Yaxchilan, cut off from its flanking trails except at gaps dictated by the geography. In the Classic Period, the river and its trails formed a ladder-like grid offering great mobility, but requiring tradeoffs between speed and safety. For both the ancient Maya and modern boatmen the Usumacinta was a fast, efficient, and dangerous route to the lowlands. Two rapids, Chicozapote and El Porvenir were especially challenging. A long portage below El Porvenir avoided even worse downriver. Travel upriver was tedious but still efficient for bulk cargoes. The lightly loaded or faint-of-heart would have favored the trails. Documented use, geography, and ancient remains confirm river use and major trails. Rope grooves identify past harbors. On land, Yaxchilan fortified gaps in a cross ridge, restricting travel to only a few gated passes. Piedras Negras sat astride both river and trail where rugged hills pinched them together in a narrow pass. The cities fought over control of the Usumacinta corridor.

Canuto, Marcello (M.A.R.I./Tulane University)

[306] *From "Star Wars" to Attack of the Kaan*

Over the past 25 years, epigraphic research on the Classic Maya has demonstrated that political alliances and warfare were not only widespread but also structured in such a manner to suggest a greater degree of political centralization than originally contemplated. Texts carved on ancient monuments suggest that lowland Maya society of the Classic period (A.D. 250-850) was characterized by a rivalry between two major capital cities, Calakmul and Tikal, who sought to dominate the Maya lowlands. This paper will focus on recent research at lowland Maya sites like La Corona, Uxul, and El Perú-Waka'. These projects are beginning to show how warfare, alliances, and marriages were some of the tools used by the kings of Calakmul in the 7th century to undermine

Tikal. In that process they developed a large regional kingdom extending as far south as Cancun. Consequently, the "star wars" of the 7th century are better understood as a concerted multi-generational strategy - "the attack of Kaan" - to dominate the southern Maya lowlands.

[399] *From Quarry to Household: The Economics of Limestone Bifaces among the Classic Maya of Buenavista del Cayo, Belize*

Limestone is one of the most abundant stone resources over much of the Maya lowlands and scholarly research has been focused on its use as a construction material. Limestone was also used to create a variety of portable items, such as manos, metates, bark beaters, and bifaces. In this paper we examine the evidence for production, exchange, and consumption of limestone general utility bifaces in the Buenavista del Cayo zone, Belize during the Classic period. Although chert bifaces are more abundant within the Buenavista zone, based on limestone biface breakage patterns we propose that limestone was chosen as a knappable material because of its durability and suggest these tools would have been well suited for agricultural activities. Based on the natural distribution of limestone in the Buenavista zone, the consumption rates of limestone bifaces in households within a 1 km radius of the site core, and evidence for limestone biface production in the Buenavista East Plaza we suggest that these items were distributed through a marketplace exchange network.

[232] *The Inca occupation at Pampa de Flores: Continuity, changes and abandonment of public architecture in the Lurin Valley during the Late Horizon*

The Inca conquest of the Peruvian central coast brought a series of changes to the political and social landscape of the Lurin valley. At Pachacamac, the main religious center of this area, radical changes included, not only the resurgence of this sanctuary and expansion of its cult, but also a series of transformations in its architectural setting. In other settlements of the valley associated to the Ychsma polity, changes were less obvious, probably due to the different strategies followed by the conquerors. The continuity, change and abandonment of certain public architectural structures in sites such as Pampa de Flores, Panquilma and Huaycán de Cienenguilla, seem to be a reflection of these different control strategies. They would also imply variations in the socio-political landscape, where some populations gain importance and prestige, while others were partially abandoned. This presentation discusses the nature of the Inca occupation at the prehispanic site of Pampa de Flores, one of the main administrative centers of the valley, and what would have been the impact of this new occupation.

[404] *Irrigation Systems as a Chronological Proxy? Continuous Occupation at the Valley Edge, Chicama Valley, Peru.*

The extension of irrigation systems from valley centers into the desert margins has been used by archaeologists in the Virú, Moche and Chicama valleys both as a form of relative dating and as a measure of societal complexity. Chronological periods in these valleys have become tied into uniform evolutionary sequences: the expansion of irrigation systems is correlated with population growth, technological advancement, and social hierarchy in the form of increased levels of bureaucracy and the emergence of a managerial elite. However, recent research in the agricultural landscape of the Pampa de Mocán in the Chicama Valley suggests that marginal landscapes were irrigated and occupied continuously from Preceramic periods through the Late Horizon. In order to

understand the nature of the occupation of landscapes at the distal ends of irrigation systems, this project carried out a full coverage survey of the area. In view of the results, I argue that the distance of irrigation systems from the river is not a reliable proxy for time or complexity. Instead, I suggest that its occupation was not due to any one prime-mover pushing populations into open areas at the valley edges, but rather the result of the long-term formation of landscape capital.

[124] *Three-Dimensional Scanning and Printing in Undergraduate Archaeology Education*

Three-dimensional imaging is a quickly growing part of archaeological documentation, investigation, education, and public outreach. Cost and expertise barriers to using 3D software and equipment continue to drop. Nonetheless, many efforts in 3D archaeology are driven by graduate students or focused undergraduates who become part of dedicated 3D laboratories or projects. Since 2013, we have been working with a different approach of incorporating three-dimensional imaging and printing at the general undergraduate level. Students in an Introduction to Archaeology course are utilizing 3D scanning and printing as a routine part of term papers, while students in a course on archaeology and art cooperated to document artifacts for planned online exhibits. Unsurprisingly, these efforts have generated interest in archaeology, though not uniformly. Faculty time to guide novice students through the use of the equipment and software is a drawback at this scale, though in many cases this leads to greater student engagement with their project and the course. The growing use of 3D technology in archaeology suggests that it must eventually become a part of undergraduate education, with the nature of that education becoming an important question.

[157] *The Environmental Context of Prôto-Je culture at Pinhal da Serra, RS, Brazil – Insights from Paleoecology*

Understanding the purposes and associations of burial monuments and sacred built landscapes in the Formative period of the Americas is an important research goal among archaeologists. A key step that can help us to better understand the social and spatial organization of these cultures is determining the ecological and environmental characteristics of the landscapes within which these cultures lived and developed.

Created by the Je group in south-eastern Brazil, and with more than 30 pit houses and mortuary/ceremonial architectural structures discovered so far, Pinhal da Serra (PDS) has been key in helping to understand Formative cultures and the rise and dynamics of complex societies. Nevertheless, little is known about the relationship of this culture with its surrounding landscape.

We present paleoecological data from a peat bog core close to archaeological excavations at Pinhal da Serra. We use fossil pollen and charcoal data to reconstruct vegetation history, land use and past agricultural practices. The results of our analyses will improve understanding of the relationship between prôto-Je cultures and the surrounding vegetation over at least the last c. 2,000 years, and in turn provide new insights into the social patterns and organization of prôto-Je culture within the highly structured landscape of PDS.

Cardinal, J. Scott (New York State Museum) and Jennifer Loughmiller-Cardinal (University at Albany, SUNY)

[4] *Negative Results, Positive Contributions: Selection Biases and the Necessities of Looking to the Spaces Between...*

A recent study illuminated the bias toward publishing significantly positive results by researchers in the social sciences, raising substantive questions regarding the treatment and dissemination of null or statistically non-significant data. In archaeology, we also tend towards emphasizing the latest discovery, the big site, or the conclusive analysis. While it is satisfying to be able to present the latest and greatest in one's field, what then becomes of the rest of the data? Typically, these are relegated to summary tables, supplementary technical reports, or cursory discussions of miscellany that note how the rest of the data support or relate to the "big find". The preferential bias towards positive significance, however, generates both analytical and interpretive self-selection biases in our archaeological understandings. Null data sets play an absolutely critical role in the inferential methods of spatial, quantitative, and archaeometric analyses. In addition, null or negative results can provide epistemic boundaries on the evaluation of interpretation and theory.

Cardona, Augusto (Proyecto Arqueologico Misti), María Cecilia Lozada and Hans Barnard

[184] *Tiwanaku in Arequipa*

Although Tiwanaku expansion outside the Titicaca Basin has been documented extensively in southern Peru, specifically in Moquegua, the influence and/or presence of this highland state in the Arequipa region is not well known. In this paper, we evaluate work in Arequipa over the past 15 years regarding Tiwanaku in light of our work in the Vitor valley about 40 km from the city of Arequipa as part of the Vitor Archaeological Project. In Arequipa, we have identified relatively small Tiwanaku settlements characterized by a local ceramic tradition, which contrasts to the more direct and extensive contact seen in Moquegua. Furthermore, in the Vitor valley we have detected Tiwanaku fragments in Millo, an extensive administrative Wari node dated to 850 A.D. Although it would be tempting to suggest the co-existence of both Wari and Tiwanaku affiliated groups in Vitor, we propose that imported Tiwanaku ceramics reflect an horizontal axis linking the Millo complex to Moquegua, and not necessarily to Tiwanaku groups that inhabited in Arequipa after the collapse of Tiwanaku in the Titicaca basin.

[11] *Integrated Geophysical Surveys at Archaic and Formative Archaeological Sites in Tumbes, Peru*

In this poster, we interpret data collected through nondestructive geophysical methods at the prehistoric sites of Santa Rosa and El Porvenir in the northern region of Tumbes, Peru. In late May and early June 2014, a program of integrated geophysical survey incorporating magnetometer and ground penetrating radar sought to identify subsurface archaeological features at the two sites. Previous excavations at these sites provided material data dating from 4750 B.C. and revealed architectural shifts and changes in settlement patterns in the Archaic and Formative periods. Geophysical mapping at Santa Rosa displays subsurface geological features and possibly, previously unknown anthropogenic features such as a circular structure similar to one found during excavations in 2007. El Porvenir, excavated in 2006, revealed an elliptical structure with a clay floor and hearth. Integrated survey at this site attempts to define features such as shell deposits, hearths, and floors. This integrated geophysical survey will aid future excavations at these prehistoric sites, furthering understanding of regional cultural variations during the Archaic and Formative periods in far northern Peru.

[131] *Rainfall and Conflict among the Lowland Classic Maya*

Determining the causes of conflict in the Maya region during the Classic Period is an important undertaking. Conflict was a prominent feature of relationships among Classic Maya polities and has been implicated in the collapse of Classic Maya society. Recently, Kennett et al. (2012) have argued that reduced rainfall led to increased conflict in the Lowland Maya region between ca. 300 and 900 CE. They arrived at this conclusion after comparing epigraphic records of conflict and variation in $\delta^{18}O$, which they use as a proxy of past rainfall. While Kennett and colleagues' hypothesis is interesting, their study suffers from several shortcomings. Most importantly, they employed a subjective approach to finding correlations, namely visual comparison of curves. Here we report an attempt to rigorously evaluate Kennett et al.'s hypothesis. We collated epigraphic data on warfare intensity and then compared them to Kennett et al.'s rainfall proxy data with the aid of formal methods for assessing the strength of the association between time series. The results we obtained are not consistent with the predictions of Kennett et al.'s hypothesis. Thus, if rainfall impacted conflict intensity among the Classic Maya, it did not do so in the manner suggested by Kennett and colleagues.

Carlson, Justin (University of Kentucky) and George Crothers (University of Kentucky)

[35] *Anthropogenic Fire Management and Changing Land-Use Strategies in the Mammoth Cave Plateau and Sinkhole Plain, Central Kentucky, USA*

In the Mammoth Cave Plateau and the Sinkhole Plain of Central Kentucky, caves and rockshelters are the primary site type. The Plateau contains little arable bottom land, but cliff overhangs, caves, and perennial streams and springs are abundant. The Sinkhole Plain has abundant arable land, but surface water is quickly diverted to underground streams and permanent water sources are limited to caves and karst windows. We compare the archaeology of two important cave sites—Salts Cave in the Plateau and Crumps Cave in the Sinkhole Plain—with regard to their chronology of occupation, range of prehistoric activities, and evidence of anthropogenic forest impacts, especially by fire. In Central Kentucky, the Late Archaic-Early Woodland transition (ca. 3500-2500 BP) is a critical period for changes in land use, adoption of new subsistence technologies, and socio-economic reorganization. We hypothesize that human groups occupying the forested uplands and Sinkhole Plain asserted new forms of property relations that required greater socio-economic control and incentivized investment in landesque capital. Throughout this transition, caves and rockshelters remained the primary site type.

Carlson, Justin N. [144] see Crothers, George

Carlson, Kristen (University of Oklahoma)

[148] *Folsom Adaptations to Bison Hunting: A Comparison of Northern and Southern Plains Arroyo Trap Kills*

The purpose of this research is to compare and contrast Paleoindian arroyo trap bison kills on the Southern plains to analogous sites on the Northern plains to investigate the transition from opportunistic hunting to organized hunting under different environmental regimes. Analyses to address this problem include: Stable isotopes of bison bone to aid in environmental reconstruction; radiocarbon dates to determine the antiquity of the sites being compared; and the seasonality of the kill event to relate hunting organization to bison behavior and trace element analysis to reconstruct bison mobility patterns. This research provides new perspective on the transition from passive, opportunistic hunting of large game to active, organized hunting of bison herds that developed during the early Paleoindian period in North America.

Carlson, Jenna (College of William and Mary)**[165]** *Oxen at Oxon Hill Manor: Identifying Draught Cattle from the Archaeological Record of Colonial Maryland*

The methodologies for identifying and analyzing draught cattle from the archaeological record have been developed and refined over the past twenty years. However, little research has been done which applies these methodologies to faunal assemblages from the New World. This research identifies possible draught cattle from an eighteenth-century well and a possible smokehouse at Oxon Hill Manor in Prince George's County, Maryland, using pathological and osteometric analyses. Analysis of pathologies on metapodials and phalanges identifies which specimens most likely came from individuals used for draught labor. Osteometrics delineate the sex ratios of cattle in the archaeological record, thus providing a means for assessing the husbandry strategies in regions where draught cattle were used. As Oxon Hill Manor was home to an elite upper class planting family, the site provides a unique opportunity to explore the changing roles of draught oxen with the shift from tobacco to diversified agriculture in the last half of the eighteenth century. Additionally, the documentary record from Oxon Hill Manor provides a means to test the reliability of these methods for identifying draught cattle from British North American faunal assemblages.

Carlson, Eric (Historical Research Associates)**[312]** *Continuity and Change between Late Prehistoric and Early Historic Periods: Visually Reconstructing Two Successive Occupations of Housepit 54 at the Bridge River Village Site, Mid-Fraser Region, British Columbia, Canada*

The use of reconstruction illustrations, or artist's renderings of the past, offers a unique and informed method of communicating continuity and change between two successive occupations of Housepit 54 at the Bridge River Village site, located in the Mid-Fraser Region of British Columbia, Canada. Based on archaeological data and analysis from recent excavations of the large, multifamily housepit, visual representations can effectively integrate a variety of information and interpretation simultaneously. Spatial analysis, social dynamics, and other aspects of household archaeology can be expressed visually in the illustrations. Most importantly, the illustrative process fosters dialogue between the various archaeologists and members of the Xwisten Band of the St'at'imc Nation who, together, have a vested interest in the accurate portrayal and preservation of the past.

Carlson, Risa (University of Cambridge/US Forest Service) and James Baichtal (US Forest Service)**[320]** *Updates and New Discoveries of Early Holocene Predictive Model Sites in the Southern Alexander Archipelago of Southeast Alaska*

New Early Holocene sites were discovered during the 2014 field season using a predictive model based on the age and elevation of *Saxidomus giganteus* shells in relic raised marine deposits in the Alexander Archipelago of Southeast Alaska. Additionally, three new higher elevation sites were found inadvertently during road construction activities which fit the criteria of the predictive model. This paper presents the preliminary findings of latest discoveries and updates on the first Early Holocene predictive model sites under study, which were found beginning in 2009.

Carlson, David (University of Washington)**[381]** *The Intersection of Identity, Labor, and Racism in Washington State Company Towns*

This paper will propose research to address the intersection of identity, racism/racialization, and labor as manifested in the material and documentary remains of workers and administrators in Washington State company towns. From the mid-1800s to the Great Depression, logging and mining towns formed a critical part of state and regional economies. The archaeology of labor-related sites in this state and period has been historically under-researched, and the relationship between labor, racism, class consciousness, and the material culture of workers in industrial settings is a topic of interest to historical archaeology. Furthermore, as settlements whose existence is owed largely to market needs, they serve as an avenue for understanding how workers and other local inhabitants responded to the expansion of capitalism. Thus, investigating late 19th to early 20th century labor in Washington's peripheral settlements will improve our understanding of local history, the social

context of work, and the formation and maintenance of identity in the context of capitalism. Here I will review prior work on labor in Washington State, and then propose future avenues of research that will draw on multiple lines of data (geographic, remote sensing, archaeological, documentary) to address its social context and materiality in the region.

[102] *Neolithic Northern China in the Context of Early Eurasian Interactions*

With a focus on painted pottery assemblages known as Yangshao, Majiayao, Banshan, and Machang from Neolithic Northern China, the present study explores early Eurasian interactions and exchanges indicated by ceramic assemblages and other kinds of archaeological records dated before 4000 years ago. Since the 1920s, scholars have noticed parallels between China's painted pottery and other collections in Central Asia and further west, prompting the "western origins" theory on painted pottery found in China. However, findings of the last several decades demonstrate that painted pottery followed a general east-to-west expansion from central China to modern-day Xinjiang from approximately 8000 to 2000 years ago. This trend leads to the emphasis on the local origins and independent development of China's painted pottery. While both hypotheses have their merits, many recent studies suggest intensified cross-regional connections between East Asia and other regions of the Eurasian Continent by 4000 years ago. Whether any external influence can be determined in the development of Neolithic Northern China's painted pottery remains an open question and demands further studies.

[73] *Cooperative Practices in Hunter-Fisher-Gatherers from Tierra Del Fuego: A Study on Resource Visibility and Social Sharing*

Cooperation studies have become an essential area of knowledge across different disciplines. Within the humanities and the social sciences, it has been used to explain human behavior as well as the maintenance of the social tissue itself. It has also given clues to explain the variability and the plasticity of human social organization at different levels.

In this presentation we focus on Yamana society a nomadic hunter-fisherer-gatherer group that inhabited the southernmost region of South America and who maintained this socio-economic organization approximately till the 30s of the last century. This society developed a range of cooperative practices (through production, distribution and consumption activities) that took place mostly during aggregation events caused by a great accumulation of resources. Through Agent Based Modelling we pretend to explore the role played by different variables that may influence the development of these cooperation practices.

The aim of this paper is to present some theoretical and methodological results of this study.

Caron-Laviolette, Elisa (Université de Paris 1/UMR 7041 ArScan)

[181] *From Palethnography to Paleohistory: Following a Magdalenian group through Three Successive Occupations at Etiolles*

Since the 1980s, spatially oriented techno-economical lithic studies of a few key open-air sites in the Paris basin have been essential to our comprehension of Upper Palaeolithic behavioral patterns. While these analyses have largely been synchronic in focus, and many others evaluate diachrony on the long-term, we hope to now bridge these two approaches through a study of the mid-term.

One of the only Palaeolithic contexts that allow for such an approach is the three-level sequence that constitutes the D71 domestic units at the Magdalenian site of Etiolles. Not only are these levels spatially well preserved, but they document three consecutive installations, within a few decades at most, in the exact same location. Through lithic refits and their spatial analysis we are able to reason on three different time-scales: each single short-term occupation, the greater long-term changes during the terminal Magdalenian (14 000 cal B.P.), and the rarely accessible historical time-scale, what we deem the intermediate, or mid-term. Here we present preliminary results of our comparative and palethnological analysis of these three successive installations, which will allow us to evaluate the stability or mutability of technical traditions from a "paleohistorical" perspective, and thus nuance our understanding of long-term cultural evolution.

[257] *The Proyecto Arqueológico Río Sahuaripa: Interaction, Integration, and Cultural Dynamics in the Sonoran Serranía*

The characterization and descriptions of the Rio Sonora and Serrana (formerly known as the southern or Alamos branch of Rio Sonora) archaeological traditions exemplify Richard Pailles' contributions to the archaeology of Sonora (and northeastern Sinaloa as well) and our current understanding of the serranía region. The Proyecto Arqueológico Río Sahuaripa (PARS) represents the first systematic archaeological investigation of the Sahuaripa River basin, located in eastern Sonora. The primary objectives of this research are to 1) reconstruct the cultural-historical occupation of this region; 2) identify and define the cultural transitions manifest between the Río Sonora and Serrana archaeological traditions; 3) define the southwestern limits of the Casas Grandes interaction sphere; 4) examine the role this region played in regional and long distance exchange systems; 5) investigate the timing and nature of Opata-Pima interaction and/or intrusions; 6) document late prehispanic socio-political organization; and 7) confirm the possible routes of the earliest Spaniards to traverse northwestern Mexico. Many of these themes were pioneered by Richard Pailles, and to whom this research is indebted.

Carr, Erin (University of Nebraska - Lincoln)

[8] *Prospects for Detection of Ephemeral Historic Sod Structures Using Geophysical Techniques*

Sod houses represent one form of ephemeral historic structure that became common to portions of the Great Plains as a result of the Homestead Act of 1862. Since their construction in the late 1800s and early 1900s, sod house and out buildings have either been preserved, allowed to "melt," deliberately removed and put under cultivation. This poster examines the documentation of these structures under various post-occupation conditions through the use of surface level, non-destructive, geophysical techniques. I will report on the 2014 geophysical survey of these structure locations from Custer County, Nebraska.

[3] *Portable X-Ray Fluorescence Studies of Black-Gloss Pottery from Monte Pallano (Italy)*

This is an examination of a collection of 200 sherds of black-gloss pottery (a type of fineware that was used for dining and wine consumption from the 5th century B.C.E.-1st century B.C.E.) excavated from the Monte Pallano ridge in the Abruzzo region of eastern Italy. Customarily, pXRF has been used to identify and characterize clay sources for ancient pottery production. In this paper,

the elemental composition of the ceramics—measured with a Bruker Tracer III SD pXRF—is analyzed: 1) to characterize the composition of the sherds, 2) to describe the homogeneity/heterogeneity of individual sherds, 3) to compare sherds excavated from two nearby areas on Monte Pallano (a settlement and a sanctuary precinct), 4) to contrast local pottery to that made elsewhere, and 5) to relate these data to fabric groupings made using traditional ceramological techniques.

[83] *25 Years of NAGPRA in the National Park Service*

The Native American Graves Protection and Repatriation Act (NAGPRA) became law on November 16, 1990, requiring Federal agencies and museums to repatriate Native American human remains, funerary objects, sacred objects, and objects of cultural patrimony to lineal descendants and culturally affiliated Indian tribes or Native Hawaiian organizations. During the 25 years since its enactment, the National Park Service (NPS) has been responsible for both implementation of the Act and compliance with the Act. This paper will focus on NPS's servicewide compliance with NAGPRA over the last 25 years, discussing the evolution of how we respond to NAGPRA issues, and looking at where we go from here. Opportunities arising from, and challenges to, NAGPRA compliance will be addressed and specific projects, activities, and accomplishments will be highlighted.

[243] *Geoarchaeological Approaches: Assessing the Formation and Preservation of a Late Pleistocene Drowned Terrestrial Site on the Pacific Coast of South America (Chile)*

GNL Quintero 1 (GNLQ1) is a Late Pleistocene paleontological submerged site located in Quintero Bay (32°46'S), ~50 km north of Valparaíso, on the Pacific coast of Central Chile. We describe the geoarchaeological approach applied by combining geomorphological, bathymetrical, sedimentological and paleontological data with a digital simulation model. The resulting evidence indicates that the unit containing the extinct bone assemblage (Unit 2) was deposited in a low-energy fluvial sedimentary environment, possibly a shallow floodplain where wetlands were formed in a semiarid climate. This Unit is interbedded between two coastal units related to a marine regression-transgression cycle. The underlying marine layer is much older than GNLQ1 site, while the overlaying layer corresponds to a postglacial transgressive unit. Digital simulation modelling considering regional uplift rates information suggests that a significant part of Quintero Bay was exposed and GNLQ1 site would have been located a few kilometers inland from the paleo-shoreline. The characteristics of the depositional environment and the geomorphological context favored the formation and survival of an extremely well preserved faunal assemblage. GNLQ1 provides the first unambiguous evidence for the Pacific coast of South America that this record can survive in situ and be located through underwater investigation.

[99] *Archaeological Ceramics for Beginners: A Hands-On Activity for Introductory Classes*

This activity is designed for students who have little or no experience with archaeology and, in many ways, is a classic; archaeological ceramics activities or labs are offered at many institutions. So, why offer it up? For two reasons: first, as a well-proven option that new instructors can use in their classrooms that is explicitly connected to the Principles for Curricular Reform and, second, as a starter for conversations with experienced instructors. The activity engages students with a hands-on, experiential understanding of the properties of clay and temper, the identification and categorization of archaeological ceramics and the interpretation of geospatial ceramic data. Data analysis includes both how materials and artifacts were employed in the past, as well as, the effect of modern peoples on ancient sites. Because it is for beginners, this activity focuses upon Fundamental Archaeological Skills principle of the Principles for Curricular Reform, but also addresses Stewardship, Ethics and Values, and Real-World Problem Solving as well as touching upon the other principles.

[260] *Neanderthals on Naxos? New Work at the Early Prehistoric Chert Source of Stélida*

A two-year geo-archaeological survey of the Stélida chert source on the island of Naxos (Cyclades) has documented Middle Palaeolithic activity across the site, both near the best quality chert outcrops and in front of two small rockshelters. The material is dominated by products from a discoidal core technology, followed by Levallois flake and blade industries. The assemblage part-relates to the Denticulate Mousterian, which in Greece – along with Levallois technologies – are exclusively related with Neanderthal populations. Stélida arguably provides the first evidence for Neanderthals in the Cyclades. A key research question is whether this material was the product of intense moments of exploitation or quarrying and knapping activity over the long-term, but precisely dating the material is difficult, with comparanda spanning 250–40 ka. Thus we currently do not know if early hominin visits to the source involved crossing glacial lowstands, or ‘modest seagoing’ from the mainland to the

'Cycladean' island mass. With recent Pleistocene sea-level reconstructions suggesting that a landbridge existed between Anatolia and the southern Greek mainland, the Stélida data is also helping us to reconfigure our view of Greece from being a Pleistocene cul-de-sac, or refugium, to potentially a major route in early hominin dispersal.

Carter, Alison (University of Wisconsin-Madison)

[349] *Angkorian Residential Patterns: A View from the Trenches*

One of the defining features of the great temples of Angkor is the pattern of enclosed space that surrounds many major monuments. The outer limits of these enclosures are frequently bounded by masonry walls and moats. Although more than a century of research has been devoted to understanding the temples that lie at the center of these enclosures, the structure and function of the vast rectilinear spaces that surround them remains very poorly understood. This paper draws on recent fieldwork by the Greater Angkor Project (GAP) at the walled temple enclosure sites of Angkor Wat and Ta Prohm in order to understand residential patterning within these enclosures. GAP excavations (2010-2014) suggest that the areas for habitation were constructed at the same time as planning and construction of the temples within the enclosures. However, a comparison of material evidence from Angkor Wat and Ta Prohm suggest that the nature and length of habitation within both these enclosures differed. Although preliminary, data from these excavations provide valuable insight into the nature and variability of Angkorian habitation, elucidate the transition into the post-Angkor period, and highlight the continuity and discontinuity in the use of space within these large enclosures.

[118] *The Taphonomic Study of Small Fauna Gruta da Nova Columbeira (Portugal)*

This poster presents the results of a taphonomic study of Gruta Nova da Columbeira, a cave site containing at least six separate Middle Paleolithic occupation levels in Vale do Roto, Portugal. The valley contains at least five other caves that have been occupied at different times. Gruta da Nova Columbeira, excavated in 1963, has well-preserved faunal remains rendering it a good site for studying Neanderthal subsistence behaviors. The excavation yielded larger fauna such as red deer, ibex, auroch, horse, rhinoceros and roe deer. Carnivores such as hyena, lynx, wild cat, bear and wolf compromise a significant portion of these remains. The site also yielded a large amount of smaller fauna that were not analyzed making it a good subject for this taphonomic analysis. This poster presents the taphonomic study of the small animal assemblage. Analyses include calculation of NISP and MNE for each taxon, as well as the recording of surface modifications, such as tooth scoring, tooth punctures, fractures patterns, cut marks, fracture patterns and skeletal element patterns. The results are then compared to published data from actualistic studies to help determine the agents responsible for the formation of the assemblage.

[409] *Archaeological Aerial Thermography in Theory and Practice*

Archaeologists have recognized since the 1970s that thermal images captured at an optimal time in the diurnal cycle have the potential to reveal surface artifacts, subtle topography, and even subsurface architectural remains. However, it is only with the recent development of reliable and stable unmanned aerial vehicles, small, uncooled, high-resolution thermal cameras, and powerful photogrammetric image processing software that archaeological aerial thermography has become practical. This paper discusses our recent efforts to deploy this emerging technology on a range of archaeological sites, with examples including an ancestral Puebloan community in New Mexico, a Mississippian mound center in Arkansas, a Late Bronze Age city in Cyprus, and an Iron Age metal production center in Dubai. Results provide a methodological blueprint for drone-based collection

and processing of thermal imagery, and illustrate some of the factors that affect the visibility of archaeological features under different environmental conditions. We also discuss a number of experimental approaches to processing thermal data that help highlight archaeological features even further, pointing to some of the many still unexplored possibilities for drone-based aerial thermography to aid in archaeological research.

[252] *A Study of Domestic Ceramics from Hualcayán, Ancash, Peru*

In the Peruvian Andes, archaeological analysis of prehistoric ceramics disproportionately focuses on materials recovered from ritual spaces compared to domestic areas. This bias limits our understanding of the role of ceramics in domestic contexts. To address the imbalance, this poster focuses on characteristics of ceramics recovered from survey and excavations at a residential sector of the Hualcayán site. This sector, called Panchocuchu, contains most of the site's domestic architecture that includes residential structures, open spaces, terraces and perimeter walls occupied between C.E. 200 to 950. The ceramics included in this analysis from excavation were recovered from the exterior and interior of a living space, and an adjacent patio speculated to function in cooking and as a cuyero (cuy or guinea pig pen based on coprolite and faunal remains). The ceramic analysis from this sector provides substantive information about the function and morphology of the ceramics based on their recovery context. The results of the study presented in this poster provide the basis for comparing the manufacture and use of ceramics between ritual and domestic contexts.

[389] *Lithic Technological Organization and Social Networks during the LGM in Southwestern Iberia*

Clusters of sites in particular regions of Southwestern Europe seem to reveal that the Last Glacial Maximum (LGM) settlement patterns form a scenario of relatively isolated refugia that may have contracted and expanded their cultural influence as climate fluctuated. Similarities between each of these niches have been long argued, based on the distribution of specific types of lithic weaponry. This paper will focus on a study of lithic technological organization during the LGM in Southwestern Iberia, using statistical procedures to demonstrate that similarity between regions is mainly visible in the size and type of the lithic blanks produced and, very rarely, in the specific technological attributes of their production. From a paleoanthropological standpoint, the results indicate that the human adaptive system to the LGM in this area worked at two different, but complementary, scales. One that is essentially local, formed by several eco-cultural niches where communities have shared techno-economic schemes that are best adapted to the particularities of each ecological context. The other, supraregional, related mainly with broad geographical social ties, maintained, most probably, as an extra factor of the adaptive response to the impact of climate and landscape modifications, functioning through sharing behaviors of stylistic concepts and typological elements.

[277] *Plain and Interesting: An Evaluation and Redefining of Non-Decorated Pottery from Nuvakwewtaqa, Chavez Pass, Central Arizona*

Long ago, Southwestern archaeologists realized the value of non-decorated pottery as a source of cultural information. The fundamental work of Colton and others (e.g., Pilles and Wood) have established the examination of non-decorated pottery as a key aspect for understanding the Sinagua Culture of central Arizona. This poster represents a continuation of the work began by Henderson

(1978, 1990) and later refined by Heness (1990) on the non-decorated pottery excavated from Chavez Pass Ruin (13th to 15th century A.D.). My work differs from these previous studies in that my goal is not to refine the chronology of Chavez Pass Ruin, but rather, to refine current typological definitions of non-decorated pottery from the site based on temper composition. I show that although some non-decorated pottery from Chavez Pass Ruin fall into the types Colton established for the Sinagua, many of the non-decorated pieces fail to securely fall within this typology. Using temper groups, instead of typology, intriguing patterns became apparent within Chavez Pass Ruin.

Casias, Kellii (University of Montana) and Kelly Dixon (University of Montana)

[311] *Informal Economic Strategies during Alcohol Prohibition In Anaconda, Montana Alcohol Prohibition*

One of the many unintended consequences of the Prohibition Era was an unorganized but collective social resistance movement across the nation. Research in the town of Anaconda, Montana, focused on the years of 1923 through 1926, granted a unique opportunity to capture a snapshot of collective social resistance in a company town, and allowed a new, feminine narrative to emerge. The Prohibition years in Anaconda were put into historical, and sociocultural context by compiling lists of male and female liquor law offenders' experiences through the use of primary sources such as newspaper accounts, court records, and oral histories. Comparison of fines, jail terms, and property seizures of male and female home brewers and business owners indicated a systematic leniency towards women offenders when all crimes were equal. Socioeconomic status's revealed that overwhelmingly widowed women used the sale and production of illegal alcohol as an economic strategy to support their families. Unequal applications of the law on the part of city officials indicates a tolerance of illegal activity for the pragmatic financial exploitation of residents. The findings although general in nature can be used as a starting point for a more realistic discourse on how people collectively circumvented Federal Prohibition laws.

[342] *Methods for Examining and Creating a Typology of Bedrock Features in the Lower Pecos Canyonlands*

Bedrock features are a common archaeological occurrence in the Lower Pecos Canyonlands of southwest Texas. These occur in a wide range of forms, from polished "slicks", cupules, and small grinding facets to large, deep, well-developed mortar holes. Even though relatively common, bedrock features, and ground stone in general, have received very little directed research in the region. This paper discusses ongoing research which uses a multi-faceted approach to examine bedrock feature attributes at several sites across the region. Structure from Motion photogrammetry was employed to document and create accurate feature maps. On-site morphological attributes and macroscopic wear patterns targeting manufacture and use were recorded for each individual work station. These data create a large dataset that allows for statistical analyses to help identify the range of variation of Lower Pecos bedrock features. Results from on-site observations will be compared with residue samples from various features to determine if these varied lines of evidence provide complementary data. This project provides a baseline dataset for future studies, creates a preliminary bedrock feature typology, establishes viable methodological protocols, and contributes to our overall understanding of the roles that bedrock features played in Lower Pecos lifeways.

[286] *Archaeobotany in Southeast Asia: What Have We Learned So Far?*

Archaeobotany as a specialisation in Southeast Asia began in the late 1960s. Archaeobotanical methods (e.g. flotation, phytolith and pollen sampling) are still not routinely used in archaeological fieldwork in SEA, although in the past ten years, archaeobotany has gained momentum. For example, several sites in Thailand (Ban Non Wat, Khao Sam Kaeo, Khao Sek, Non Ban Jak, Phu Khao Thong), Vietnam (Lo Gach, Loch Giang, Rach Nui) and Cambodia (Ta Phrom) have included archaeobotanical analyses as part of the excavation agenda. This paper will present some of the latest research derived from macroremains analysis from sites in mainland SEA, with an emphasis on how the inhabitants made use of their habitats in their subsistence regime. Settled peoples have exploited their surroundings and adopted suitable crops for cultivation, but have also found limiting factors that constrained agriculture and cultivation practices. Discussions revolve around the crops and weeds found in the archaeobotanical assemblages, which help define diets, farming systems and habitats.

[312] *Linking Geochemistry and Geology in Interpreting Anthropogenic Sediments at Bridge River, British Columbia*

Previous research utilizing energy dispersive x-ray fluorescence (EDXRF) spectroscopy and isotope ratio mass spectroscopy (IRMS) identified geochemical patterns in Housepit 54 sediments that might be attributable to human occupation. In this study we conduct additional geological analysis of Housepit 54 sediments in order to more fully understand the observed geochemical variation. In addition to grain size analysis, detailed mineralogical analysis of fourteen sediment samples from a single occupation level was conducted using polarized light microscopy, scanning electron microscopy with energy dispersive x-ray spectroscopy (SEM / EDS), and x-ray diffraction (XRD). Our data indicate that the observed geochemical variation in Housepit 54 sediments is the result of the complex interaction of both natural geological and human processes.

Catacora, Andrea and Jo McDonald (University of Western Australia)

[138] *Digital Data Collection, D-Stretch And Databases: New Approaches to Recording Rock Art*

In Lincoln County

A BLM-funded rock art recordation project recently undertaken in Lincoln County, Southern Nevada has focused on three Areas of Environmental Concern: Mount Irish, Shooting Gallery and Pahroc. The overall Project was designed to be a comprehensive heritage inventory of all archaeological evidence in these Areas, and based on a systematic sample there are close to 700 recorded sites in these areas, of which around 200 contain rock art. Building on earlier work by the Nevada Rock Art Foundation and others, one of the BLM's project goals was to provide a comprehensive contemporary record of the Areas' heritage resources. Research goals included the characterization of rock art in its archaeological context and to better understand how the rock art in these three areas is related. Digital innovation has been achieved using hand held recording devices, detailed GPS, digital enhancement and photogrammetric software, and a GIS-based database to meet our goals. We are beginning a detailed stylistic analysis of the data recorded from over 1,200 panels and many thousands of recorded motifs to better understand the nature and extent of rock art production in this part of the Great Basin.

[35] *Rethinking Deodoro Roca Rockshelter (Ongamira, Córdoba, Argentina). Seventy Years of Archaeological Ideas*

The hunter-gatherer archaeology of the Ongamira Valley has been a landmark in the archaeology of Argentina's Central Region. The cultural sequence built in the 1950s is still used by many archaeologists to interpret regional peopling, subsistence, land use and mobility. However we believe it is time to review the use of rockshelter-generated data under a new approach that embraces landscape archaeology. Stable isotope-based paleo-environmental reconstructions create a baseline and permit insights into the role of rockshelters through time. Surveys looking for new sites, outcrops and lithic quarries, in addition to the study of the intervisibility between them are integrated into rockshelter data to improve understanding of the social use of space, peopling and mobility. The interconnection of data constructed through the analysis of technology and the acquisition and use of faunal and botanical resources leads to new ideas about social strategies and networks. We discuss how these theoretical changes were made and relate them to Argentinian archaeology.

Cattin, Marie-Isabelle

[181] *Nomadism in the Magdalenian Groups of Monruz and Champréveyres (Switzerland)*

Located in a region where flint is of mediocre quality, the Magdalenian sites of Monruz and Champréveyres (Neuchâtel, Switzerland) show the introduction of a high proportion of good quality flint from sometimes very distant (up to 200 km) regions. For this reason we can argue that flint was not a constraining factor on the selection of camp location. It is certain that favorable hunting grounds, as well as the proximity to water sources and combustible materials, were more important. The Magdalenian groups of Monruz and Champréveyres likely anticipated their needs and collected raw materials from regions they visited, or obtained them through exchange, when travelling to regions poor in lithic raw materials. Distant materials arrived at the sites in different forms, from tested nodules, to tools, to unworked blanks. The analysis of discarded cores and the different stages of the chaîne opératoire represented permit us to define the first activities realized on the campsite, as well as the "passage" (arrival, working and use, and departure) of tools and cores through the site. Here we present some examples that will illustrate situations (arrivals and departures) in the campsite linked to nomadism and group territories.

Catto, Lisa (Portland State University) and Virginia Butler (Portland State University)

[168] *Developing a "Good" Website for the Tse-whit-zen Project*

Websites have become a relatively common way to share findings from archaeological research with the public. They are easily adaptable, can reach a wide audience (e.g. location, age, education levels), and can supplement other outreach programs. What makes a "good" one? Answering this requires that one has established goals; and that one has developed ways to assess whether the goals have been met. In our background research, explicit goal-setting and assessment of archaeological-based websites has scarcely been attempted. We are currently creating a website for the Tse-whit-zen project to address these concerns. Working with project investigators and local stakeholders, we are defining the core themes and content we want visitors to "take away" from a website visit. Working within budgetary, skill and time constraints, we are defining the website scale and selecting software (e.g., Wordpress, Dreamweaver, Weebly). Drawing on previous social media and education research, we are developing instruments to assess whether our goals are met (e.g., visitor tracking, focus groups, and online surveys).

Caulk, Grady (Corps of Engineers), Daniel Hughes (Corps of Engineers) and Wendy Weaver (Corps of Engineers)

[243] *Locating and Identifying Submerged Prehistoric Sites as Part of CRM*

Section 106 of the National Historic Preservation Act requires Federal agencies like the US Army Corps of Engineers to make a reasonable good faith effort to consider the effects of their undertakings on historic properties. The Jacksonville District of the Corps of Engineers has been conducting underwater cultural resource surveys since the 1970's. While the potential for prehistoric sites has always been considered, technological advances have allowed us to improve our ability to evaluate the potential for underwater projects to impact prehistoric sites. This paper will discuss the methods that the Jacksonville District uses in searching for and identifying prehistoric sites. This will include discussions of the use of contractors, including contracting requirements and review. The interpretation of data, as well as using geotechnical cores to sample deeply buried surfaces.

[294] *Marine Geophysics Reveals the Character of the Now Submerged Paleo-Agulhas Plain*

This work was undertaken to understand the evolution of the terrestrial landscape now submerged by high sea levels offshore of Mossel Bay. Two marine geophysical surveys and scuba diving were used to examine evidence of past sea-level fluctuations and interpret seafloor geological deposits. Eight seismic sequences characterize the shelf, extending from the Mid-Cretaceous to the Holocene time. Geological mapping dating by Optically Stimulated Luminescence (OSL) revealed that the most prominent Quaternary units are associated with the MIS 6 glacial to MIS 5 interglacial periods and include incised lowstand river channels and regressive aeolianites. MIS 5 transgressive beachrock and regressive beach and dune deposits on the shelf are associated with the subsequent fall in sea level. MIS 4 lowstand incised river channels were infilled with sediment truncated during rapid landward shoreface migration at the MIS 4 termination. Back-barrier MIS 4/3 sediments are preserved as a result of overstepping associated with meltwater pulses of the MIS 2 termination. Accommodation space for coastal deposits on the South Coast continental shelf is controlled by antecedent drainage pathways and shelf gradient. The geological deposits on the emergent shelf indicate an expanded glacial coastal plain dominated by low-gradient meandering rivers and wetland lakes.

Cawthra, Hayley [294] see Copeland, Sandi

Cecil, Leslie (Stephen F. Austin State University)**[248]** *Postclassic Peten Podophilia*

In 1996, Fredy Baldizon (a CUDEP student) brought a box of 87 Postclassic tripod plate supports that he collected from a single location on the Tayasal peninsula to the Proyecto Maya Colonial's laboratory. It was not until 2014 that I discovered that another large set (n=66) of tripod supports was associated with a single structure (2034) at Ixlú. Statistical analyses (based on height, form, and paste characteristics) indicate statistically-significant differences between the supports at the two sites. These two collections of tripod supports may represent fragment enchainments or hoards. In either case, the sets reflect social practice and interactions of the cultures that made and transported the pottery fragments as they do not represent pottery smashed in place. As such, the Postclassic Maya from Tayasal and Ixlú may have emphasized their social and/or political interactions, perhaps feasting events, with the deliberate collection and deposition of these tripod supports.

Cerezo-Román, Jessica (Harvard University)**[202]** *Deconstructing Multiple Intersecting Identities and Cremation Ritual among the Preclassic Hohokam of the Tucson Basin*

Hohokam cremation funerary customs are unraveled to acquire a deeper understanding of intersecting identity differences among seven Preclassic Period archaeological sites (A.D. 475-1150) of the Tucson Basin. This is done by analyzing the mortuary treatment of 477 individual remains using two primary datasets: (1) biological profile of the skeletal remains; and, (2) posthumous treatment of the body inferred from the analysis of the remains and archaeological contexts. Results indicate the existence of social differences in funerary practices related to age at death and sex identity intersections. However, there also were differences between sites in how individuals were treated related to different community social networks of interaction. The results provide a glimpse of the potential social variation and multiple social groups within Tucson Basin Preclassic Period Hohokam sites.

Cervantes Perez, Jose (Centro INAH-Oaxaca), Tito Mijangos (Centro INAH Oaxaca) and Agustin Andrade Cuautle (Centro INAH Oaxaca)**[410]** *Representación Bioarqueológica de la colectividad funeraria en San Sebastián Etla, Oaxaca.*

El estudio de los entierros colectivos es una de las vertientes que presentan las prácticas funerarias, y mediante el registro minucioso en campo y el análisis de los materiales arqueológicos en el laboratorio, es posible estudiar de manera integral y multidisciplinaria, un trabajo en conjunto entre la antropología física y la arqueología de dichas expresiones culturales. La investigación que será presentada se enfoca en la distribución y depósito de una serie de esqueletos humanos excavados en la comunidad de San Sebastián Etla, Oaxaca derivados de los rescates arqueológicos realizados por la sección de arqueología del Centro INAH Oaxaca. Este contexto funerario colectivo, por su forma, depósito y el número mínimo de individuos encontrados, muestra que se trata de un posible cementerio del periodo formativo temprano mesoamericano. Como resultado del análisis de los restos óseos en su contexto arqueológico, se presentará el número de eventos funerarios, a fin de contribuir al conocimiento de la práctica funeraria colectiva de las antiguas sociedades de mesoamericanas y en específico, los valles de Oaxaca durante el mencionado periodo.

Cesaretti, Rudolf (Arizona State University)**[167]** *Hydraulic Empire Revisited: Exploring the Sociopolitical Vulnerabilities of the Riverine Socio-Ecological System of Pharaonic Egypt*

Ever since the falsification of Wittfogel's thesis on the role of centralized irrigation construction and administration in ancient Near Eastern states, most scholars of Pharaonic Egypt have found it taboo to theorize a relationship between irrigation-based productive systems and the Pharaonic political economy. A wealth of geoarchaeological and paleoclimatological proxy data has enabled the reconstruction of long term trends in Nile flood levels, highlighting not only the considerable inter-annual variability of inundation, but also dramatic fluctuations at millennial scales. While it is now

rightly acknowledged that Egyptian artificial irrigation systems were normally constructed and administered at the household and local level – enabling a high level of robustness in a socio-ecological system dependent on the maximization of floodwater for arable land – the sociopolitical trade-offs of such a system remain undertheorized. Using a stylized demographic-structural model to study the impact of fluctuations in carrying capacity on the Pharaonic political economy, this poster explores how: (a) long-term flood trends were mechanisms for both state expansion and collapse, (b) regional geomorphological differences in the Nile River stimulated divergent socio-ecological systems, and (c) decentralized regional institutional (nomarch, temple) power over local irrigation networks produced a decentralized sociopolitical structure prone to devolutionary tipping points.

Challis, Sam (Rock Art Research Institute, South Africa)

[149] *Medicine Dog; Medicine Baboon: Images of Horses Perceived by Contact Cultures in Rock Art*

Horses traveled when Europeans expanded across the globe and thereafter swiftly spread among indigenous groups on those continents colonized. The way they are portrayed in rock art can potentially tell us much about the nature of the entanglements of contact and the groups both bringing and adopting this hugely influential domestic animal. This paper draws on rock art evidence from South Africa, Australia, North and South America. Indigenous portrayals of the horse are sometimes conflated with other animals and, far from being the product of bewilderment or misunderstanding, it transpires that often the artists well understood the horse, but in terms that were familiar to them.

Chamblee, John (University of Georgia)

[26] *Long-Term Data versus Contemporary Crisis: Anthropological Archaeology in the U.S. / Mexico Borderlands*

Steve Kowalewski's work demonstrates the importance of long-term data and provides methods for synthesizing archaeological and other social science data to address problems of contemporary concern. This paper takes cues from that research and combines it with the social conscience for which Steve is known and respected. Instead of treating the deaths of undocumented border crossers in isolation, this phenomenon is contextualized by the long-term history of the U.S. Mexico Borderlands as a crossroads. In this light, current border control mechanisms fit into a cycle of intensifying effort to control the flow of goods and people through the region.

Chan, Benjamin (Faculty of Archaeology, Leiden University)

[211] *The Faces behind the Façade: Monuments and Their Associated Practices in Neolithic Britain*

Over the last 40 years the analysis of monuments has lain at the center of our understanding of Neolithic societies. Interpretative approaches toward monuments range in scale from the overarching view of Renfrew's emerging chiefdoms to embodied perspectives focusing on their materiality. Regardless of analytical scale, most accounts treat monuments as complete architectural forms and fail to grasp the significance of the wider activities that surrounded their construction and use. This paper will show how recent excavations at Durrington Walls, Wessex, and the Ness of Brodgar, Orkney, have revealed the milieu of activities that surrounded these sites. These involved both routine daily subsistence practices and also episodes of feasting and mass consumption. The manner in which eating, drinking, sleeping, stone working, wood working and other technical activities were interwoven in the use of ceremonial monuments questions the persistent notion of a dualism of ritual and domestic life. Moreover, it suggests that the wider practices surrounding the construction and use of monument complexes provided an arena for social reproduction, the transmission of skills and the negotiation of social identities and were one of the driving forces behind the spread of ideas and technological practices over large geographic areas.

[43] *Public Outreach and Pipeline Archaeology in the Western United States*

Cultural resource companies are increasingly tasked with disseminating the results of their archaeological research to the public. Because the nature of the archaeological record differs for each compliance project and because there are many different "publics" who can be identified, archaeologists have taken several different approaches to public outreach. In the last decade, Alpine Archaeological Consultants, Inc. has created a variety of public outreach products that describe what was learned during the archaeological research for several interstate pipeline projects in the Intermountain West. Among the items created for public consumption were several types of publications, including books for school-age children, books for adults, brochures, and videos; the development of museum displays; the installation of interpretive signs in the field; and presentations to avocational archaeology groups. The challenges encountered in the process of creating and distributing the different types of public outreach products will be described. An attempt will be made to assess the effectiveness of these various approaches from the perspectives of historic preservation professionals, educators, and, insofar as is possible, members of the general public.

[407] *Archaeometallurgy, Environment, and Landscape in Upland Laos: Its Impact on 'World-Views' during the Transition from the Bronze Age to Early States in SE Asia*

Recent excavations have shown that mining for copper ore in upland Savannakhet Province, south-central Laos, began at least 2500 years ago. We suspect that it may have begun even earlier. This paper considers who might have been living in this area prior to the introduction of mining and smelting technology and how the relationship between these prior occupants and their environment might have changed with this new technology. The scale and nature of the impact would have differed, depending on whether already present populations borrowed and adapted the technology from other, larger and more structured, societies - or if the technology was brought into the area in a conscious exploration and colonisation process by those same larger societies. Finally, this paper considers if the introduction of metallurgy was a key factor in reorienting views of the landscape in the past; drawing the uplands into the consciousness of lowland floodplain-based agricultural societies? The archaeological work that this discussion is based on has been carried out over several years under an MOU between MMG-LXML (transnational mining company), the Department of National Heritage of Laos and James Cook University, Australia.

[121] *Faux for Fact: An Experimental Ceramic Restoration Process*

This poster focuses on research conducted on experimental restoration processes on ceramic materials. The focus of this research is in determining a potentially ideal adhesive for use on ceramic cultural remains within the restoration process. The restoration process can be very invasive and destructive. Thus, to perform experiments with various chemicals on faux artifacts will ultimately help the archaeologist further understand the proper techniques that need to be carried out in order to preserve the actual fragile and irreplaceable artifacts for later studies. My process involved breaking ceramic plates with an objective of restoring these faux ceramic artifacts with different adhesives so I can better understand what is the most practical and ethical methods within the art of ceramic restoration.

[301] *Expanding Juvenile Dental Age Assessments Using 2013 Recovered MCIG Subadult Dental Data*

Outstanding preservation of the juvenile dentition of individuals recovered during the 2013 Milwaukee County Institution Grounds (MCIG) Poor Farm Cemetery project allowed for the application of four separate dental age assessments. We present the results of a pilot study that attempts to broaden the utility of the Moorrees et al. (1963a, b) tooth formation stages through their application to maxillary dentition and mandibular incisors from a sample of sub-adults from the MCIG cemetery. Tooth formation stages are correlated with other dental and osteometric assessments of age to provide a preliminary, population-specific expansion of methods.

Charles, Douglas (Wesleyan University)

[372] *Burial Mound as Palimpsest*

Time perspectivism has been defined as “the belief that differing timescales bring into focus different features of behavior” or “or different sorts of processes.” These different behaviors and processes require different concepts and explanatory principles. Criticism of time perspectivism has ranged from seeing it as advocating environmental determinism to it simply being a version of Annales history. Research under the umbrella of time perspectivism has generally focused on processes involving long timescales and on viewing archaeological assemblages as palimpsests. One notable exception is a study of the Hochdorf “princely” grave assemblage, usually considered a closed find, but treated as a palimpsest. Woodland period burial mounds in the American Midwest and Southeast can also be viewed as palimpsests. This paper will evaluate the utility of a time perspectivist approach, refining the manner in which it is applied to closed finds, or more accurately, the assemblage of closed finds which comprises a Woodland burial mound and mound group. The Elizabeth site from the lower Illinois River valley serves as a case study.

Charlton, Michael (University College London)

[89] *Immanence, Configuration and the Bloomery Ironmaking Process: Identifying Behavioral Opportunities from Physical Constraints*

All metallurgical systems conform to the scientific laws defined for chemical, physical and thermodynamic interactions. These laws place clear limitations on the range of technological

possibility, but, more importantly, create technological opportunity. Some metallurgical opportunities will be better suited to particular socioeconomic and natural environments than others. Models derived jointly from materials science and geology on one hand and evolutionary sciences on the other can offer insights for identifying the exploitation of metallurgical opportunities in the archaeological record, predicting the kinds of environments in which particular forms of exploitation are likely to occur and hypothesizing the trajectories of metallurgical traditions.

Ternary phase diagrams have a long history of use in archaeometallurgy for inferring parameters of smelting processes from the primary chemical components of slag—a residuum of non-reduced compounds from the furnace charge. The structure of ternary phase diagrams also serve as simple models of technological possibility that, when combined with insights from evolutionary theory, become fitness landscape models. Application of one such model to slag from an Iron Age and Medieval bloomeries in northwest Wales reveals how the histories of ironmaking processes are shaped through the interplay between scientific law, culture and the environment.

[183] *Residential Architecture at Caracol, Belize: Conjoined Buildings and Distributed Space*

During the Classic Period (A.D. 550-900), the ancient Maya inhabitants of Caracol resided in formally constructed residential groups comprised of a series of buildings. These residential groups are believed to have been occupied by extended families. Some of the structures constituted formal residences, but other structures served a variety of functions, ranging from cooking to storage. Additionally, over two-thirds of Caracol's residential groups had at least one eastern building that was utilized as a ritual locus associated with a cyclical deposition caches and burials. Residential groups were distributed over an anthropogenic landscape that had been modified for intensive terrace agriculture; each group appears to have had control of enough land to have been agriculturally self-sufficient. Most households at Caracol also produced one or more crafts that permitted the inhabitants of residential groups to obtain necessary items at the site's markets. The level of social well-being in the site's residential groups has been interpreted as a conscious management strategy called symbolic egalitarianism. Archaeological information exists for 134 residential groups at Caracol and three dozen of these groups have been intensively investigated. These data are useful for framing variable social practices that existed in the Classic Maya area.

Chase, Diane (University of Central Florida) and Arlen Chase (University of Central Florida)

[295] *Iconographic Portraiture and Political Implications: Peter Harrison's Contribution to Mayanists' Understanding of Site Q*

As a dirt archaeologist, Peter D. Harrison was both intrigued by and skeptical of hieroglyphic

interpretations about the ancient Maya, especially relating to Tikal, Guatemala and its political context. However, at the same time he was particularly interested in site emblem glyphs and their significance, centering first on Tikal and next on Tikal's political enemies. One of his published contributions to the field was a well-documented paper in which he critiqued the way in which epigraphers had lumped a number of different animal heads together as representative of a single polity. Harrison argued that a variety of animal representations were conflated within what was then called the Site Q emblem glyph and that what was being attributed to a single entity was actually the products of several polities. This paper revisits Peter's earlier contribution and, through doing this, also examines the role of what has been referred to as Site Q within broader Maya political history.

Chase, Arlen (University of Central Florida) and Diane Chase (University of Central Florida)

[344] *Seventh Century Star Wars: Reassessing the Role of Warfare in Shaping Classic Period Maya Society in the Southern Lowlands*

At the time that *Forest of Kings* was written, Mayanists were unsure of how impactful Maya warfare actually was. Did it serve symbolic and ritual purposes like the Aztec flower-wars? Or, was Maya warfare actually waged for territorial gain? *Forest of Kings* was one of the first books to situate Maya conflict as warfare for territorial control. But, the depth and nature of this control as well as the way in which warfare articulated with and affected broader Maya society could not be answered in the hieroglyphic record. While hieroglyphs were used to frame the situational dynamics of Maya politics in *Forest of Kings*, at the time of the book's publication only limited archaeological data existed that could be used to complement the epigraphy. Twenty-five years later, this situation has changed. This paper examines Maya warfare and political history from the perspective of Caracol, Belize, using archaeological and newer hieroglyphic data to supplement the history of the ancient Classic Period Maya so admirably documented by Schele and Freidel in 1990.

[385] *Applications of Cultural Heritage and Digital Preservation in Science, Technology, Engineering, and Mathematics (STEM) Education*

This paper discusses the application of innovative 3D heritage documentation methods to augment science, technology, engineering, and mathematics (STEM) education. A California-based nonprofit dedicated to the digital documentation and preservation of cultural heritage sites worldwide, CyArk is a leader in digital heritage preservation, archival, and technological advancement. CyArk practices a range of techniques, including 3D laser scanning, high definition photography, and photogrammetry, channeling the resulting data towards future site conservation, interpretation, and development of educational materials.

CyArk will present a case study analyzing the digital preservation of the 18th century Spanish missions along California's coast, which represent historic El Camino Real. Studied by 450,000 California 4th graders each year, the Missions serve as model classrooms to teach the importance of our shared history. Through interactive lesson plans, students participate in active learning while visiting a mission site, while also engaging in technology and math subjects. In this discussion of El Camino Real digital preservation collection, CyArk strives to demonstrate the interconnectivity between history, heritage, and digital technology. CyArk believes emphasis on archaeology, cultural heritage preservation, and documentation in the classroom is a strong asset to STEM education, and will support the next generation of cultural heritage and technology advocates.

Chatters, James [121] see Brown, James

Chatters, James (Applied Paleoscience)

[370] *An Overview of the Hoyo Negro Project and Its Findings*

Hoyo Negro is an immense, underwater collapse chamber deep within the Sac Aktun Cave system, Quintana Roo, Mexico. On its floor lie data-rich calcite raft deposits, bat guano piles, scatters of

wood and charcoal, skeletons of large animals, and the remains of one teen-age human female. These sediments and fossils lie in total darkness, >40 meters below sea level, creating major technical challenges for their study and recovery. Investigations by a team of divers and scientists from Mexico, the US, and Canada, which began in 2011 using in situ study and minimal sampling, have begun to unlock this trove of potential information about the terminal Pleistocene paleoecology and human occupation of the Yucatan Peninsula. Thus far we have mapped the site in detail, identified as many as five extinct species of megafauna (two perhaps new to science), conducted geochemical studies of the calcite raft deposits to elucidate patterns of climatic change, determined the age range of the site, and begun studies of the human remains. Overall, the site dates from ca 8000 to >40,000 BP. Naia, as the girl has been named, is as much as 12,900 years old and her mitochondrial DNA places her origin firmly in Beringia.

[158] *Fire, Transformation, and Bone Relics: Elite Funerals at the Great Temple of Tenochtitlan*

As described in historical sources, the Great Temple of Tenochtitlan was the final resting place for some elite individuals: their bodies were exposed to fire and cremated bones were deposited in funerary urns. However, archaeological findings suggest that funerary rituals were more complex, depending on the identity, social status and cause of death of the deceased, as well as body symbolism. Seven urns containing cremated bones from five individuals along with numerous burial goods were found in this building, proving the existence of an important diversity in funerary rituals. In this paper I will present the different types of cremation rituals, the symbolism of fire as a transforming element, as well as the symbolism of cremated remains and their possible use as bone relics for consecrating ritual spaces.

[190] *The Earlier Stone Age Occupation of Wonderwerk Cave: Combining the Archaeology and Geology*

The archaeology and geology of the Earlier Stone Age of Wonderwerk Cave (Northern Cape Province, South Africa) present a paradoxical picture. On the one hand there is a record of hominin occupation spanning a period of at least one million year that includes multiple proxies indicating the use of fire. However, the micromorphological study of the sediment shows almost no anthropogenic signal and the density of artifacts is extraordinarily low. This paper presents an overview of the current state of research including the new excavations at the site that began in 2013 in collaboration with Liora Kolska Horwitz and Francesco Berna. Although many questions remain about site formation processes in the early phases of hominin occupation at Wonderwerk the evidence suggests that the nature of occupation during this early period was different from the cave occupations familiar from the Middle Stone Age and Middle Paleolithic. The research at Wonderwerk provides an example of the critical role that micromorphology plays in the archaeology of early hominins.

Chazin, Hannah (University of Chicago)

[258] *Crossing the Line (Part I): Making Taphonomy Work for Social Practices in Prehistory*

This paper is the first part of a two-part exploration of the use of taphonomy as an archaeological technique across prehistoric archaeology and the archaeology of the contemporary. Parts I and II are a dialogue, through which both authors have re-approached their own work on taphonomy as an

archaeological method and analytic. Part I is an exploration of how approaching taphonomy as history opens up the possibility of exploring the political ramifications of pastoral practices. The zooarchaeological analysis of faunal remains from pastoralist societies in the Late Bronze Age South Caucasus serves as a case study. This work suggests how treating taphonomy as history and analyzing pastoralism as acts of assembling can productively address the simultaneously economic and political stakes of the organization of pastoralist life. The paper suggests that the political stakes of pastoralist assemblings are two-fold: 1) they produce the background of everyday, unremarkable practices of production, consumption and exchange and 2) assembling is also key to producing prescriptive material, semiotic narratives (discourses of power). In doing so, the paper will address how dialogue with the use of taphonomy in the archaeology of the contemporary has productively influenced this approach to taphonomy in a prehistoric context.

Chen, Pochan (National Taiwan University)

[49] *Exploring the Social Structure of Kunming Yangfutou Cemetery, Yunnan, Southwestern China*

Dian is the most important polity from Warring States to Western Han period in the Dian Lake area of Yunnan, southwestern China. Except for sparse records in Shiji, Hanshu and Huayangguozhi, our understanding of Dian all comes from archaeological discoveries, especially those large and complex cemeteries. Since 1950', archaeologists excavated many important Dian cemeteries including Jinning Shizhaishan, Jiangchuan Lijiashan, Chenggong Tianzimiao, Qujing Batatai, Chengjiang Jinlianshan and Kunming Yangfutou. These cemeteries usually have several hundred burials with abundant burial goods; however, the complexities in burial goods also confuse researchers. Some scholars applied several statistic methods in the analyses of these Dian cemeteries for understanding their social structures, social hierarchies and gender relations but none of them pay attention on spatial relations among burials. This paper applies spatial autocorrelation techniques in GIS to explore the spatial distribution of burial goods and their relations with the social structure at Yangfutou cemetery. With Moran's I and Local G* autocorrelation analyses, I argue that the Yangfutou cemetery can divided into six groups possibly according to descent relations. The southern group might be an elite group compared to others. The other groups might be equal in social status but different in terms of economic situation.

Chen, Peiyu

[113] *Dwellings and Corporate Groups in Montegrande, Jequetepeque Valley, Peru: A Household Study of Social Differentiation*

This research takes two kinds of analytical unit, dwelling and hypothetical corporate group, to analyze and compare spatial relationship between the east and west sectors in Montegrande, a Early Formative site locates in Jequetepeque Valley, Peru.

The map-based analysis reveals different changing pattern during the two phases of occupation. The primary result shows that east sector went through a significant transition from phase 1 to phase 2 in

the configuration of corporate group and in the location of largest dwelling. On the other hand, the nature of west sector didn't change significantly, while the dispersed dwellings in phase 1 became better connected through patios in phase 2 occupation. The comparison of dwelling size shows that there was no significant difference between the two sectors in phase 1 and there is a tendency that east sector had larger dwelling area than west sector in the latter occupation.

The result of comparison not only depicts a possible social differentiation, but implies various social strategies taken by different households: the rich households tried to isolate themselves from others and regular households tended to incorporate themselves into a larger corporate group in the settlement.

Chen, Hong, Xiaoling Zhang (Key laboratory of Vertebrate Evolution and Human O) and Chen Shen (Royal Ontario Museum)

[179] *An Experimental Study of Lithic Use-wear Multi-stage Formation*

Use-wear analysis has become an essential method for the functional study of lithic artifacts from archaeological assemblages. However, research concerning multi-stage use-wear formation is poorly developed. In this paper, we report the results of an experimental study focusing on flake scar patterns, rounding and polish formation in multiple stages. For comparative data and interpretation, nine cases of single working tasks were undertaken on scraping bone with Onondaga chert from Ontario Lake. The resulting flake scars and abrasive wear were observed separately in each stage and photomicrograph were taken and compared to compare the changing trajectory of use-wear formation. This experiment clearly demonstrates that flake scar formation does not correspond to the rate of usage over time and we propose that the formation of scar patterns and rounding become diagnostic attributes for use-wear observation. Flake scar fractures occur most frequently in the early stages. During later stages, flake scars stopped developing while rounding and polish became more apparent. The study also examines the changing trajectory and rate of scar invasiveness and length of use. The results are informative as it is suggested that scar invasiveness grew as the use time increased at a given working angle.

Chenoweth, John (University of Michigan-Dearborn)

[258] *Power and Nature: A Contemporary Archaeology of Yosemite National Park*

Parks are the creation of established power structures, and are themselves statements about power over nature. Visitors to these parks, however, negotiate these structures in their own ways. Often, historical archaeological analysis focuses on power struggles: domination and resistance between classes, races, and genders, for example. This paper analyzes how some of the tools of these more traditional archaeological analyses apply to the present. A contemporary archaeology of litter in Yosemite has explored the concepts of "nature" and "culture," carefully critiqued by anthropologists over the last few decades, but still at the forefront of the public debate over the environment. Visitors' actions make statements of power over nature but in ways that can defy our usual categories of domination and resistance.

[48] *Testing a Locally-Adaptive Model of Archaeological Potential (LAMAP) to Assess Ancient Maya Settlement Location and Density in Belize's North Vaca Plateau.*

In 2012, a settlement survey was conducted on the North Vaca Plateau in west-central Belize as part of the Social Archaeology Research Program (SARP). The survey was intended to test the predictions of a new archaeological potential assessment method called the Locally-Adaptive Model of Archaeological Potential (LAMAP). A LAMAP assessment was produced for Minanha, a Classic Maya civic-ceremonial center, which served as the first case study for the new method. When conducting the survey to test the LAMAP predictions, however, the survey team found that modern

forest cover made it impossible to complete a survey with sufficient coverage to adequately validate the model in a reasonable amount of time. Thus, a LiDAR survey was commissioned to supplement the field results. The LiDAR imagery proved useful for identifying cultural features beneath the canopy with much greater efficiency than could be accomplished using traditional methods. In this paper we report a comprehensive test of the LAMAP assessment using a combined LiDAR and traditional survey dataset. We find that our understandings of Maya settlement patterns, and our ability to assess locational models like LAMAP, are significantly improved with the use of the combined dataset.

[315] *"Made to Grow Old": Dressers, Delph, and Island Homes in Western Ireland*

Archaeologists have described and discussed households for decades, yet only recently have they made the theoretical leap from residential structures and coresidential units to peoples' homes. Homes are built, embodied and enlivened by peoples' actions, thoughts, relationships, experiences and aspirations. This poster presents the results of an ethnoarchaeological analysis of homemaking on the islands of Inishbofin and Inishark (co. Galway) as well as Inishturk (co. Mayo) in western Ireland. Through the ethnographic lens of dressers and delph on Inishbofin and Inishturk, we investigate how people employed the material goods of everyday life to build and preserve a sense of home. In turn, we compare these ethnographic delph and dressers to the archaeological material remains of 19th century homes on Inishark. By holding delph and other objects, dressers protect and embrace memories of loved ones lost to death and emigration as well as mementoes of important life milestones like pilgrimages, births, deaths, and marriages. We argue that dressers and their contents transformed houses into home, working in tandem with the main hearth to anchor the home in a family, a community and island heritage.

[309] *From foragers to Producers: Desert Gardening at the Archaic Peruvian Site of Quebrada de Burros*

Research at the Peruvian site of Quebrada de Burros (Dep. of Tacna, Peru) evidenced a very early settlement of fishermen and shell-gatherers on the desert Pacific littoral. The campsite has been occupied during the Early and Middle Holocene, between 10,000 and 6,000 B.P. The analysis of organic remains indicate that since the beginning, the different groups not only relied on ocean resources but also exploited the surrounding vegetation. In particular, phytolith analyses show that the settlers drastically changed their direct environment over the time. This is the first time that such a direct human impact on vegetation could be identified at a very local scale for the Central Andes. We could also put in evidence that these inhabitants already used some domesticated food plants whose respective presence are among the earliest for the Andes.

[370] *Histomorphology and Metabolic History of a Submerged Pleistocene Skeleton from the Cenote of Hoyo Negro, Tulum, Quintana Roo, Mexico*

This paper explores the histological preservation, metabolic history and living conditions in rib sections of a submerged female youngster, macroscopically determined to have died during her mid teens. This partially preserved skeleton counts among the most ancient individuals securely dated in the Americas. For the purposes of the study, we studied an undecalcified mid-shaft section of the

twelfth rib and quantified osteo density (OPD), formation processed, cortical and total bone area and histological growth arrest, serializing analogous rib sections of a female control cohort from the Yucatecan peninsula. This study was financed by Subdirección de Arqueología Subacuática of the Instituto Nacional de Antropología e Historia, and conducted at the Universidad Autónoma de Yucatán, Mérida, financed by CONACYT Project no. 152105 (2012-2015).

Chi Kei, Lo (The Chinese University of Hong Kong)

[349] *Preliminary Study on Western Han Dynasty Settlements in the Lingnan Region*

Recent archaeological excavations in eastern and northern Guangdong and eastern Guangxi discovered palaces and administrative offices in the period of Nanyue Kingdom. Also, the characteristics of the palaces and the offices were Han-style and other facilities were installed defensive function as a military post. Based on the excavations, this paper studies how the elements of Han culture were integrated into Yue culture as reflected their settlement structures, architectures, and other material expressions in the Lingnan region, covering Guangdong and Guangxi on Western Han dynasty settlements. Firstly the paper examines the development of politics and economics from the early Western Han to the later Western Han. Second, it studies how Zhao Tuo, King of Nanyue, maintained Han culture but also combined with Yue culture to re-construct the new "kingdom" that presented architectural forms. Third, it discusses how Yue people under the control of Han authorities adapted external impacts on their culture in Lingnan region.

Chiang, Chihhua (Department of Anthropology, National Taiwan University)

[49] *Use-wear Analysis of the Stone Tools at the Wansan Site, a Neolithic Site in Taiwan*

This is a multi-stage project whose goals are to understand the possible uses of various stone tools excavated from the Neolithic Wansan site in Northern Taiwan. In this poster, I will demonstrate the preliminary results of this project that identify possible patterns of stone tool use-wear. There are abundant finely ground lithic tools recently excavated from the Wansan site. Previous research has categorized these tools based on their morphology, and classified these tools as projectile points, adzes, axes, hoes, knives. The terminology implies the functions of these tools based on ethnological analogy. However, no systematic analysis of the use-wear or residue has yet been conducted on this collection. I will employ both high and low power methods to observe the use-wear of these tools in order to examine possible patterns among different types of tools. Based on the results, I can further plan the next stage of research to conduct experimental archaeology and residue analysis on these tools.

Chiarulli, Beverly (Indiana University of Pennsylvania)

[185] *Patterns of Lithic Raw Material Exploitation and Use in Western Pennsylvania*

During the Late Prehistoric period, at least four major lithic raw material types were used for the manufacture of a limited variety of tool types. The major tool forms were small triangular projectile points and flake tools. The major raw material types used in this region include Onondaga, Loyalhanna, and Shriver cherts and Vanport Siliceous Shale. Workshops and quarries have been identified have been identified and are found on the north, south, east and west sides of this region. An analysis of the lithic assemblages from several villages has found that all of these raw materials were used throughout the area. Analysis of the raw material types used in the villages suggests that although the percentage of a raw material type used in any particular village generally reflects the distance to sources, there are some materials that are present in much greater than expected quantities. In some cases, the most commonly used material is from quarries that are twice as far from a site as closer quarries. Analysis of the assemblages suggests that the use of raw materials reflects not only proximity to source areas, but also either perceived qualitative differences in the materials or access to different cultural networks.

[405] *The Role of Intangible Heritage Values in the Management of Places and Things*

One of the stated goals of decolonizing archaeological theory and practice is to redistribute power and authority in the creation and communication of cultural heritage, a laudable goal. However, achieving such a goal is only possible if archaeologists and historians relinquish their role as historiographical experts—as the ultimate authority on historical truths and significance. While in recent years there has been a trend towards increasing public outreach and engagement, in some cases such collaborations have actually strengthened the colonial power relationships in which archaeologists have participated. One way forward is to turn to a definition of materiality that acknowledges that tangible and intangible heritage are inextricable, and that meanings and values are continuously created and recreated in the present by a variety of memory communities (see, for example, the 2003 UNESCO Convention on the Safeguarding of the Intangible Cultural Heritage). In this paper I examine several case studies—including the Northeast U.S. and the Bahamas—as a means to demonstrate that collaborative praxis must foreground the intangible.

Chinchilla, Oswaldo (Yale University)

[39] *Epiclassic in Southern Mesoamerica? Tradition, Innovation, and Reaction in Pacific Guatemala*

The Early Classic ascendancy of Teotihuacan was felt strongly on the Pacific Coast of Guatemala, particularly at Montana and related sites on the coastal plain of Escuintla. The Teotihuacan downfall roughly coincided with the demise of those sites, and the rise of a new dominant center Cotzumalhuapa, around A.D. 650. The process seems to parallel the emergence of Epiclassic centers in highland Mexico, and differs in many respects from the Maya Highlands and Lowlands, where there are fewer indications of major changes in the political landscape in the wake of Teotihuacan's collapse. This paper examines two questions: How did Pacific coastal peoples respond to the demise of the highland Mexican metropolis? And how did local developments in Escuintla relate with broader Mesoamerican patterns? The archaeological record and the sculptural corpus of Cotzumalhuapa suggest adjustments that combined the maintenance and reinvigoration of coastal traditions, the adoption of innovations stimulated by Teotihuacan influence, and reactions against the former ascendancy of Teotihuacan culture in the region.

[347] *To Screen or to Float?: Methodological Considerations for Archaeobotanists in Coastal Peru*

In recent years, coastal Peru has seen an encouraging upwards trend in the number of archaeologists trained in the field of paleoethnobotany or archaeobotany. With growing numbers of practitioners in the field, it is crucial to remain vigilant of methodological concerns that are relevant not only to archaeobotanists as a whole, but particularly to those working in the unique environment of coastal Peru. In the interest of maximizing interpretative potential while maintaining the capability to run comparisons across multiple datasets, archaeobotanists need to be constantly mindful of ways

to improve the methods and techniques we utilize when conducting our research. Issues of concern include sampling protocols, processing techniques, identification and counting procedures, and quantification. Archaeobotanists working in the dry, coastal region of Peru, for example, employ a variety of techniques in the processing of sediment samples for botanical remains that fall under the general categories of screening/sieving and flotation. The choice of a certain processing method alone can have a profound effect on the quantity and quality of botanical remains as well as an effect on the actual taxa recovered. This paper will present recent research on these issues using data collected from the North and South Coast of Peru.

[349] *Toward a Reconstruction of Early Settlements in Metal Age Yunnan*

Although research works on the Bronze Age burials in Yunnan in the past fifty years have expanded our knowledge on various aspects of ancient Yunnan societies, many questions pertaining to the earliest stages of human existence in Yunnan have remained to be answered for short of a well-defined chronological sequence from settlement archaeology. Recent findings of early habitation sites in the environs of the Lake Er are beginning to shed new lights on the exiting issues, including questions regarding the onset of metallurgy in Yunnan. Studied in conjunction with a newly established ceramic sequence, the typological, stratigraphic, metallographic, and phytolith analyses of materials taken from these sites can now be used to assist in characterizing the regional features of early Yunnan cultures, as well as in interpreting interactions occurring in and around western Yunnan during the 2nd millennium B.C.E. These studies appear to have dovetailed with the result from analyzing metal particles in sediment cores from Lake Er--a chronological table suggesting the transition between the Neolithic and Bronze Ages of Yunnan.

[77] *Connection and Competition: Some Early Insights Gained from Petrographic Studies of New Caledonian Lapita Pottery*

In this paper we will present the newest results gained from both petrographic and chemical compositional analyses of New Caledonian Lapita pottery samples in order to address issues concerning long-distance connections among several Lapita communities, as well as competition that might have happened between Northern and Southern Lapita communities. We have been able to develop an effective way of identifying pottery production areas within New Caledonia and our results suggest that there were possible social boundaries between two sides of the Grande Terre.

Chiykowski, Tanya (SUNY Binghamton)

[391] *Trade, Migration, and Movement at Cerro de Trincheras, Sonora, Mexico*

Archaeologists study the movement of potters, materials and techniques to understand migration and exchange on both a local and regional scale. Modern international divisions, such as the Mexican - US border, interrupt these research questions in the Greater Southwest culture area. In Sonora, archaeologists have clear evidence of population upheaval after A.D. 1300; Southern Arizona Hohokam groups migrated into the Altar Valley, bringing with them new ceramic technologies and displacing a resident Trincheras population to the Middle Magdalena valley. Whereas the presence of large amounts of Hohokam Sells Plain ceramics at Cerro de Trincheras in the Middle Magdalena valley suggests that Trincheras and Hohokam populations interacted, neither how the process occurred, nor the impact of those linkages are understood. What processes resulted in such a large percentage of 'foreign' plainware ceramics at Cerro de Trincheras? My paper

will use ceramic petrography and GIS analysis to address the likelihood of trade, community migration, and the movement of women as part of a wider question of population interaction and innovation in the late prehistoric Greater Southwest.

[80] *On the Precision and Accuracy of Radiocarbon Dating*

Radiocarbon dating in the modern age is a precise experiment requiring an understanding of nuclear physics using accelerators. It requires measurements on the order of parts per trillion of carbon 14 nuclei in samples. Although most of the procedures of radiocarbon dating are standardized these days, the final results of the measurements have limitations on precision and accuracy that require careful verification before final acceptance. Recently, our group has carried out radiocarbon dating on samples of which the actual dates are approximately known. These samples were sent out for radiocarbon dating several times for a consistency check to confirm consistency of results. These experiments were performed over different accelerators in order to check for consistency. Based on reports for each radiocarbon date, we have worked to reconstruct the data collected during the measurements and applied standard nuclear physics analysis to the data. The preliminary results from this study will be presented with suggestions on how to refine the precision for radiocarbon dating.

[232] *Panquilma: Socio-politics in Household Archaeology*

An analysis and discussion contributing to previous research of the socio-political organization found at the Yschma site of Panquilma, located on the Lurin Valley, central Peruvian coast. Panquilma is a 13th–15th century site on the borders of one of the most important and influential religious centers in the Central Andean Coast – Pachacamac. The site of Panquilma is comprised of three sectors; Sector 1 is characterized as the public zone and includes monumental architecture in the form of pyramids with ramps, Sector 2 consists of multi-room domestic compounds, and Sector 3 encompasses a series of shallow, rounded tombs containing substantial amounts of human remains. This discourse will focus on the domestic confines of the site, highlighting any socio-political discrepancies found between the two existing groups of the domestic sector -- the peripheral and central household compounds. Ceramic analysis, as well as the complementary use of a pre-existing ceramic typology for Panquilma will be used to classify variation in ceramic types. In doing so, domestic activities that may have developed in the household compounds can be easily recognized. Subsequently, we will distinguish the differences in accessibility and identify the existence of any contrast in status between these two differing household compounds.

Christensen, Kim (University of California Berkeley)

[327] *'Authenticity, Repurposed': Mason Jars, Archaeology, and Contemporary Narratives*

From the satirical website The Onion to the venerable New York Times newspaper, mason jars are receiving attention due to their current resurgence in popularity for food preparation, décor, and do-it-yourself projects. These contemporary examinations of the mason jar's popularity tend to contrast the frivolity of today's use with a singular utilitarian historical view. In this paper, I examine the varied discourses that they have been placed within historically and by archaeologists in order to complicate the static view promoted by contemporary discussions. I argue that while their use for food preservation may have indeed been a matter of survival in many cases, the promotion of mason jars by the late 19th/early 20th century domestic science movement and issues of gender, race, class, and rural/urban location add important texture to this seemingly bland and ubiquitous food container. In complicating their history by drawing attention to issues of inequality implicated in their

historical use, I critique the notions of authenticity and nostalgia attached to mason jars in the present moment as continuing to overlook the same, ongoing issues of inequality.

[46] *Inka Border Negotiations in the North: The Canari Case in the Province of Azuay, Ecuador*
This paper will reassess relationships between the Inka and the Canari in the northern frontier zones of the Inka empire through local archaeological data. So far, scholarly knowledge about the Canari has been based upon ethnographic descriptions provided in various Spanish sources. The Canari have been characterized as a strong-willed independent people who offered fierce resistance to Inka domination. They were entrenched in the civil war between Waskhar and Atawallpa and eventually their resistance was broken by means of the mitmaq policy. Inka presence in Ecuador is commonly evaluated through archaeological information obtained from Tomebamba and Ingapirca. Tomebamba functioned as Wayna Qhapaq's capital and Ingapirca was a tambo outpost about 40 kilometers to the north.

I will discuss Canari material from Ingapirca and from the nearby sites of Coyoctor recently excavated by Ecuadorian archaeologists and Cojitambo. All three evidence original Canari settlements with Inka overlays. The paper analyzes Canari-Inka relations from the perspectives of origin narratives, stone ideology, and landscape construction. Coyoctor emerges as a complex case study of all three. The results show a new nuanced understanding of Canari-Inka dynamics which carry over into the present by reinterpretation of local toponyms and associated ritual practices.

[101] *Got Swag? Investigating Beads and Bead Trade in Scotland during the First Millennium A.D.*
The most prevalent theory concerning intercultural interaction demands a dominant-subordinate relationship in which the subordinate group passively accepts the culture imposed on them by the dominant population. This argument is often applied to Scotland in the first millennium A.D., where the transferred cultures are the Irish, Anglo-Saxons, Romans, Norse, and others from continental Europe. Studies of beads in Scotland are particularly affected by these theories: very few beads are seen as uniquely Scottish objects, and very little agency is accorded to local, Scottish groups for this period. Yet, until now, there has been no systematic study of Scottish beads during the first millennium A.D. from which to draw such conclusions. This study records and analyses the distribution of beads found in Scottish contexts dating to the first millennium A.D., and argues instead that the distribution patterns of these beads demonstrate clear agency on the part of local populations. Thus, rather than blindly accepting imported cultural practices, local groups in Scotland are actively selecting the beads they wish to use/import and are re-appropriating the materials they have to fit their own needs.

[134] *Archaeological Data vs Historical Accounts. The Inca Occupation of Incahuasi, the New Cusco, Cañete, Peru*

This paper presents the results of recent research at the archaeological Inca site of Incahuasi located at the Cañete valley, Peru. Although Incahuasi is frequently mentioned in the archaeological literature and by Spanish chronicles (it is considered a New Cusco) little research has been done at the site. New data from archaeological excavations allows us to compare historical accounts about the nature of Inca's occupation of the site, showing significant differences and challenging the picture that the historical accounts present us about Incahuasi.

Chuipka, Jason (PaleoWest Archaeology)

[229] *Absent or Overlooked: Addressing the Early Athapaskan Presence in the San Juan Basin of Northwest New Mexico*

The San Juan Basin of New Mexico is one of the most archaeologically rich areas of the American Southwest. Three years in, the Navajo-Gallup Water Supply Project is the latest in a long history of infrastructure projects that provides the opportunity to conduct archaeological research and expand our understanding of the past. One question being addressed is when the Southern Athapaskans moved into the upper San Juan Basin and how long they occupied it before Navajo culture emerged. At the present time, archaeological evidence for the earliest emergence of Navajo culture (forked stick hogans, sweat lodges, characteristic ceramic and lithic technologies, maize agriculture) points to the A.D. 1500s. Archaeological evidence for an earlier Athapaskan presence has proven elusive, and interpretation of data has been prejudiced by hypotheses regarding the timing of migrations. Further complicating this issue is that most aceramic artifact scatters and camp sites encountered on large data recovery projects that may shed light on this issue have not been selected for investigation as they are considered to have minimum research potential. The current project seeks to devote more attention to defining and dating sites that may contribute to understanding the early Athapaskan occupation of the region.

[78] *Where Was Chachapoyas? A View from the South*

To answer the query "what was Chachapoyas?" we must think in terms of time, space and identity. Chachapoyas scholars have encountered documentary and/or archaeological evidence of a mosaic of social identities, all undergoing transformations during successive pre-Inca, Inca, and Colonial times within a truly vast Andean region. In this paper, I consider notions of Chachapoyas internal and external boundaries as they have been conceived in the southern area where I conduct my research. Chachapoyas scholars usually make reference to ethnohistorian Waldemar Espinoza's 1967 map of "Grupos Étnicos" and/or the map drawn by Langlois ca. 1940. Neither scholar provides detailed justifications for border placements. Scholars concur that differences in material patterning indicate the existence of a poorly understood boundary that once separated Chachapoyas into northern and southern sub-regions, and perhaps justified the Inca's creation of northern and southern Inca administrative units (or hunos). The meanings underlying these differences require explanation, as these "halves" do share material attributes. My research suggests that wholesale inclusion of the southern area under the "Chachapoyas" label inhibits understanding of cultural developments at important sites like Gran Pajatén. Here I examine when, where, and perhaps why some boundaries may, or may not have functioned in southern Chachapoyas.

Church, Michael (HDR)

[228] *Renaissance Florentine Palaces, Costly Signaling, and Lineage Survival*

The elites of Florence, Italy built a huge number of palaces during the city state's period of republican government between 1282 and 1532. Intuitively, these palaces seem like a perfect fit with the predictions of costly signaling theory: they were expensive, highly visible, and vast, and the families that commissioned their construction viewed them as ways of reflecting and producing status. But were these structures costly signals, or did elites spend money on lavish houses simply because they could afford to do so? This research uses the material record of 174 extant palaces built between 1282 and 1532 and demographic and political data extracted from the city's republic-era election records to evaluate whether palaces are consistent with the predictions of costly signaling theory. My findings indicate that palace owners had more offspring and more political

success than their non-palace owning peers, but they obtained these advantages before they commissioned their palaces, not after. In addition, palaces' fit with the predictions of costly signaling varies over time. My results indicate that costly signaling can operate in complex ways, offer new insight into Florentine elites' consumer choices, and reveal parallels with modern American decision-making regarding residential real estate and other spending.

[377] *Implementing Politogenesis by Canonical Cycling in an Agent-Based Model with Circumscribed Environment*

"Politogenesis" is a fundamental social process for understanding how and why early societies increased or decreased their social and political complexity. Agent-based models (ABM) of archaeologically recorded processes of early polity formation and regional dynamics are beginning to show promising results for advancing theory and research on politogenesis, especially when ABM results can be compared with empirical patterns, such as cycling. This study investigates politogenesis in a geographically circumscribed region by implementing an ABM. The model uses a decision-making process enabling agents with bounded-rational adaptive capacity for managing significant changes in subsistence or living conditions. Qualitative analyses of simulation results demonstrate how the model generates regional polities with detailed narratives of politogenesis with face validity. Significantly, model outputs are validated by "peaks and valleys" of political and social complexity similar to those proposed by earlier models of polity cycling, such as the Dynamic Model of J. Marcus and related theory and research. Interestingly, the model identifies a period of time in regional politogenesis that exhibits a phase transition from polities with low complexity to polities with higher complexity. Increased population densities that enabled production beyond subsistence, with regional territorial limits imposed by circumscription, can account for this shift.

[132] *Geometric Morphometric Assessment of Cranial Shape Change in Trigonocephaly*

Investigating the only known prehistoric example of trigonocephaly, a condition thought to result from premature sutura frontalis fusion, we address cranial shape changes in this condition that have been previously limited in scope and based on living individuals. The individual derives from a prehistoric context on Santa Rosa Island (CA-SRI-24), dates to 1500-1650 A.D., and is housed at the PHMA, UC Berkeley. Ninety-three 3D landmarks were collected from normal skulls for comparison (n=43, range from 6.0-8.0 years) with a Microscribe 3D digitizer and from a CT scan of the trigonocephalic (8.0 years \pm 24 months) using Amira 5.5. Skull shape was explored using Principle Components Analysis (PCA) on Procrustes-aligned shape variables. Principle components of the face and vault separated provide more of an insight into the overall shape change and potential cause. The PCA reveals major shape change in the face and anterior cranial base. These changes are coupled with cranial shortening and supramastoid-level broadening. Maximum cranial breadth is displaced anteroinferiorly. The degree of shape change occurring in virtually all regions of the skull in this malformation is well beyond that currently documented and has potential implications for understanding suture closure, skull growth, brain development, and modern surgical intervention practices.

Civitello, Jamie (Valles Caldera Trust)

[93] *Earthwatch at the Valles Caldera National Preserve: Building a Successful Volunteer Research Partnership with Obsidian, Quarries, Soil, and More!*

Since 2012, the Valles Caldera National Preserve has partnered with Earthwatch Institute to bring volunteer-scientists into the field to participate in archaeological research. Volunteers stay overnight on the Preserve for 11 days and work side-by-side with Preserve archaeologists to excavate a large obsidian quarry in the heart of the caldera. The volunteers gain skills in applying archaeological methods, while living and working in one of the most spectacular landscapes of northern New Mexico. Each person feels personally invested in the research that will help Preserve managers interpret and protect a poorly understood resource. Outcomes from excavations so far include insight into site formation processes and ongoing research and analysis aims to explore quarry site use over time as compared to a nearby habitation site. Beyond the research aspects of our partnership, connecting our constituency (the American people) to the archaeological resources under our stewardship is the transcendent goal of the partnership between the Preserve and Earthwatch.

Claesson, Stefan (SEARCH, Inc.)

[192] *Pleistocene Megafauna Finds from the Merrimack River Delta*

In 2013, two Pleistocene mega-faunal remains, a single mammoth tooth and a partial juvenile mastodon mandible with teeth, from two separate locations, were recovered by a scallop-fisherman in the Merrimack River embayment off the coast of New Hampshire and Massachusetts. These well-preserved finds follow on previous finds by fishermen in the same locale over the last two decades, as well as numerous other offshore finds that have occurred in the Gulf of Maine for more than 50 years. This presentation will broadly discuss the provenience and scientific sampling potential of previously recovered mammoth and mastodon specimens in the Gulf of Maine, the seafloor and sub-seafloor characteristics at the approximate locations of the 2013 recovery sites, and the potential coexistence of late Pleistocene – early Holocene mega-fauna with the initial Paleoindian occupation in the region.

Clardy, Kelsey (The University of Tulsa)

[66] *The Muscogee (Creek) Nation Council House: A Continuation of Architectural Traditions*

Public architecture is reflective of society. Council houses were an important example of public architecture during both prehistoric and pre-removal times and were prevalent across the Southeast. The original purpose of these council houses was to provide a place for the people to conduct official meetings in the winter months. The purpose of this research is to demonstrate that the Muscogee (Creek) Nation Council House in Okmulgee, OK is an example of post-removal public architecture that was a continuation of past architectural traditions, as well as a cultural adaptation to a new situation. This council house was constructed as a meeting place for a nation attempting to retain sovereignty in the wake of removal and war. Life was significantly altered by removal. The construction of the council house in Okmulgee, although not identical to pre-removal council houses, was a way to maintain a connection to the pre-removal world and demonstrates cultural continuity in its use as an important meeting place for the nation in Indian Territory.

[16] *Establishing Identities in the Protoneolithic: History Making at Göbekli Tepe in the Late Tenth Millennium cal B.C.*

Processes of early sedentism are associated with the agglomeration of complex hunter-gatherer populations within the 'confines' of spatially limited permanent settlement systems, possibly with 'fixed' territorial claims, and with an economy based on stored harvests of wild cereals and pulses, and broad-spectrum hunting. Against this background, the emergence of social hierarchies and identities has long been an area of discussion among archaeologists. Be this as it may, we still find it extremely challenging to describe the different paths which social evolution may have taken in the Early Neolithic, let alone backing up any assumptions with empirical or physical evidence. In this

paper, we turn our attention to the PPNA ritual enclosures at Göbekli Tepe. We will discuss the role of these structures in the genesis of Early Neolithic group identities. In doing so, we posit that the monumental architecture at this site was used as a means to express and substantiate long-term (historical) social relationships in the Early Holocene.

Clark, Jamie [7] see Phillips, Cassidy

Clark, Bonnie (University of Denver)

[34] *The Good, the Bad, and the Awkward: The Archaeology Open House as Heritage Process*

The open house has long been a tool employed by archaeologists who wish to engage or at least inform the public about their field work. Projects that have a strong community mandate would seem tailor-made for this type of activity. Yet if these events are to meet their promise, they need to move from mere "show and tell" to more thoughtful and theoretical interventions. That is particularly true for sites with difficult or contested histories. This presentation draws on four seasons of open houses held by the University of Denver Amache field school at the site of Colorado's WWII-era Japanese American internment camp. Ranging from 400 person tours, to museum exhibits, to one-on-one tours, activities at these open houses have often, but not always, been successful. Framed by critical heritage studies, especially Laurajane Smith's contention that heritage is a process, this presentation will highlight some ways archaeologists can enable or hinder engagement through the open house. Voices of visitors, community volunteers, and students are woven through this reflection.

Clark, Brian (Rice University)

[47] *Problems of Archaeological Site Preservation and Identification in the Highland Mountains of Ethiopia*

This paper will discuss how historical, environmental, and social changes have effected archaeological site preservation in the mountains of the central Ethiopian Highlands, with implications for improving archaeological research in the region. Over the past decade, archaeological and historical research in the central highlands of Ethiopia has seen a growing interest to move beyond prominent Aksumite and Pre-Aksumite monumental sites to more ephemeral sites like medieval settlements and royal camps. The mountainous terrain of the highlands and its settlement history, however, has posed a number of challenges to good site preservation and effective reconnaissance. Based on fieldwork conducted around the mountains of Lasta, Amhara Region, this paper will review some of the human and environmental impacts on archaeological site preservation. These include conditions such as deforestation, the erosion patterns of intensively cultivated vertisol soils and the unintended consequences of locally organized environmental remediation efforts. The results of this research can help to better assess the archaeological potential of an area in the Highlands prior to invasive fieldwork and devise research strategies appropriate to the expected conditions. They may also contribute to better land-management practices that protect both the environment and its tangible cultural heritage.

[82] *The Transition to Home Living in Middle America*

In Middle America the transition from the Archaic to Early Formative period (ca. 2000-1400 B.C.) was marked by the first use of pottery and the construction of durable dwellings clustered in small hamlets or villages. These markers of year-round dwelling in one place represent a major transition in Early Formative times to neolithic lifeways and presumably lifeworlds. I review the evidence of the earliest houses known from highland and lowland regions of Middle America, with an emphasis on the Pacific coastal lowlands of Chiapas, Mexico. The evidence of Late Archaic dwellings is extremely sparse for all of Middle America, so the full nature of the transition in domestic architecture and structures cannot be reconstructed. One is left mostly to conjecture based on the earliest structures

built in the Early Formative period. I review the evidence of early domestic structures known for proto-Mesoamerica here and speculate on how the transition from living in caves or ephemeral shelters to durable houses may have been experienced. At a minimum, the transition must have involved a shift from living in sheltered areas to dwelling in one's own home.

[164] *Precolumbian Vertebrate Remains from the Coconut Walk Site, Nevis, West Indies*

Archaeological investigation of the Precolumbian site of Coconut Walk on the island of Nevis (northern Lesser Antilles) revealed midden deposits dating between ca. A.D. 850-1440. While the site had been previously excavated by the British Time Team television show in 1998, only cursory examination of faunal remains was conducted (NISP=451). We report on the complete analysis of more than 18,000 recovered vertebrate remains from a 5x5m trench in the core midden area, providing enhanced understanding of the relative importance of various taxa and methodological issues associated with site recovery techniques. Analysis indicates that the assemblage consists largely of herbivorous reef parrotfish species along with several species of pelagic fish, birds, lizards, and rodents such as the indigenous rice rat (*Oryzomyini*) and the introduced agouti (*Dasyprocta* sp.). When coupled with the invertebrate assemblage, the vertebrates constitute a complementary and extensive dataset to help examine human diet and site use on Nevis that provides a framework for understanding numerous issues related to Caribbean island adaptations during the Late Ceramic Age .

[188] *The Pros and Cons of "Public Archaeology Days"*

The Florida Public Archaeology Network is tasked with educating Florida's public about the state's rich archaeological heritage. One method that has been used to do so is what we call "Public Archaeology Days". These days mainly consist of identifying artifacts that the public has legally collected on private land, usually their own backyards or farms. There has been much debate surrounding this method of public outreach and much discussion on how to properly host these events. Often we partner with other educational venues to host these events. We strive to make them educational for the public and attempt to provide them with not only information about the artifacts they bring us, but also teach them about the laws, the importance of archaeological site context, the Florida Master Site File and also the ethics involved with collecting. Of course, this must be done in such a way as to not deter the public from approaching archaeologists with their finds or information about potential sites. Through trial and error, we are constantly working to enhance this program and ensure that it meets our goal of public education while remaining a positive experience for both the archaeologists and the public.

[230] *Boots on the Ground and Planes in the Air: Assessing Damage to Archaeological Sites Caused by the 2011 Missouri River Floods*

In the spring of 2011, the Missouri River Mainstem received unprecedented combination of snow melt and rain causing widespread flooding unseen since the construction of the Missouri River Dams. One of the consequences of the flooding was damage to archaeological sites located on the lands surrounding the reservoirs. As a result, South Dakota State Historical Society (SDSHS) partnered with the University of Arkansas Center for Advanced Spatial Technologies (CAST) to assess potential damages related to the flooding for the US Army Corps of Engineers (USACE). The SDSHS/CAST team developed a program that combined on-site erosion monitoring with the collection and orthorectification of historic aerial imagery, ground based geophysics, low level aerial photography, and high altitude remote sensing. This integrated approach incorporates a time-series of GPS data and aerial imagery with recently collected geophysical data providing a surface and

near subsurface view of many sites damaged by the recent floods, providing assistance to the USACE in the management of these finite resources.

[278] *Twenty Years of Studying the Salado*

Archaeology Southwest (formerly the Center for Desert Archaeology) has been heavily engaged in studying the Salado Phenomenon through the lens of migration for nearly twenty years. Our research has been both intensive and extensive in scope: gathering new data from sites on public and private lands, reanalyzing existing collections, and scrutinizing published and unpublished reports from nearly every valley and basin in southern Arizona and southwestern New Mexico. Here we summarize this research and the salient empirical facts that any model of Salado must accommodate. We then present our conception of Salado, consistent with these facts, as an inclusive ideology that was developed by a spatially dispersed, but culturally connected, immigrant minority from northeastern Arizona. This ideology was ultimately adopted by many local groups in an attempt to ease tensions in the wake of migration and integrate multi-cultural coalescent communities. Many of these communities failed prior to the arrival of Europeans for reasons that remain obscure.

Clark, Amy (University of Arizona)

[289] *Analyzing Activity Areas When Only One Material Remains: The Interpretation of Low Density, "Empty" Spaces in Open-Air Middle Paleolithic Sites*

It is common for open air sites dating to the Pleistocene to lack organic preservation, including bone. Many of these sites also do not contain features such as hearths. Therefore, the dominant signal that remains is the result of lithic reduction. Because knapping is a reductive process, it creates a large amount of waste material and this debris dominates the artifact count numerically and volumetrically. Lithic pieces associated with other types of activities, such as wood working or butchering, can easily be overlooked when dealing with such a quantitative bias. Furthermore, most archaeologists would be hesitant to identify an "activity area" based on the presence of only one artifact, even if that artifact has been associated with a particular activity through use wear analysis. The lack of organic debris makes such a conclusion unwarranted. This presentation will focus on a method that highlights these so-called "empty" areas and places them on equal footing with the high density concentrations of material. It is argued that these low density/blank zones are as important to the site's structure as the dense clusters of debris, particularly for sites with limited preservation.

Clark, Dylan (New Mexico State University)

[307] *Believing Is Seeing*

Humans use an array of senses to experience the world, vision being how we primarily characterize most experiences. Color, contrast, and brilliance are all factors that are both consciously and unconsciously considered when visually interacting with the material world. These are not passive factors that are simply filed away by the brain, but active communicators that trigger responses in the mind of the viewer. This influence on human behavior has a direct impact on material culture. Since archaeological study seeks to make cultural inferences from material objects, consideration of these elements' agency on a viewer makes it desirable to understand how visual attributes guide behavior. The area I will focus on is the American Southwest, which has a long history of ethnographic and archaeological study, allowing examination of the importance of color in Pueblo ritual behavior and material culture, both present and past. I will use artifact and architectural examples from the Mogollon and Anasazi regions as well as existing anthropological research to identify and analyze elements of visual perception and their relationship to past cultures and the archaeological record. Though this study focuses on the Southwest, the aim is to explore a workable methodology applicable to general archaeological research.

Clarke, Mary (Boston University)**[193]** *The Role of the Sweatbath in Classic Maya Ritual Performance*

This paper reviews the scholarship regarding Mesoamerican sweatbaths and their role in performance, specifically choreographing locations for transformation and sympathetic transition in supernatural space. The recently discovered sweatbath at the site of Xultun in Guatemala, known as Los Sapos, will be inserted into this dialogue in conjunction with that regarding plazas and Maya theatricality more broadly. After both contextualizing Los Sapos and presenting interpretations regarding its site-specific function, this paper will propose conclusions that will add to the knowledge of these unique structures within the known corpus of Mesoamerican architecture.

Clauter, Jody (Office of the Wyoming State Archaeologist)**[201]** *The Results of Using Associated Records to Facilitate New Research: Recent Excavations at the Elk Mountain Site (48CR301)*

The Elk Mountain site (48CR301), also known as the Garrett Allen site, is located in south-central Wyoming in the Carbon Basin along Halleck Ridge. The site was excavated every year from 1969 until 1978, and a University of Wyoming field school was held at the site in 1979 and 1980. The excavations were highly productive and recovered artifacts included ceramics, manos and metates, large amounts of lithic debris, tools, and faunal remains. Despite its productivity, a site report, site map showing the extent of all excavations, and artifact analyses were never completed. In 2014, personnel from the Office of the Wyoming State Archaeologist began field investigations at 48CR301 in order to relocate the previous excavations, generate a topographic site map, determine the feasibility of future research at the location, and explore a collections-based approach to excavation through information housed in the associated records on file at the University of Wyoming Archaeological Repository. Along with detailing the results of the 2014 excavations, this presentation discusses how useful and important associated records like catalog cards, candid photographs taken by crew members, and field notes are for facilitating new excavations at previously investigated sites.

[201] *Chair***Clayton Martinez, Lucia (University of Western Australia)****[137]** *Patterns Through Space: A Spatial Analysis of Murujuga Rock Art, Northwest Australia*

Spatial analysis is a methodology that has been widely used for researching rock art. It has had a wide-ranging focus, varying from informed methods (using ethnographic information), to formal, and experiential methods. Rock art perceived as communication is a structured form of transmitting information to a specific audience. This allows us to look for conventions of representation, grammatical rules that determine the form that rock art should take according to its location within the site. Spatial analyses undertaken on Murujuga, the Burrup Peninsula in northwest Australia, have primarily focused on establishing chronologies, the clustering of rock art motifs at a broad landscape scale, and the relationship with resource foci. My research has focused on formal methods, using spatial information to identify patterns in the rock art assemblage at the Happy Valley site, an engraved site complex in southern Murujuga. I have sampled the rock art assemblage at Happy Valley to look for these conventions and identify the cultural choices made by the artists in the production of rock art. In this paper I will identify patterns in the rock art that provide an insight into the nature of the site's occupation and how the occupants perceived the landscape.

Cleghorn, Naomi (University of Texas Arlington)**[356]** *The Blind Spot: An Early Later Stone Age perspective on the Agulhas Bank from Knysna Eastern Heads Cave 1, South Africa*

The exposure of the wide continental shelf of the Agulhas Bank during the gradual regression of the shoreline from 45,000 years ago, culminating in the Last Glacial Maximum (LGM), opened up a vast new area for foragers. Humans with well-established coastal resource exploitation strategies would have naturally shifted their foraging range to the south, following the regressing shoreline. During this

period, the South African technological record underwent a critical transition from the prepared core and flake-based technologies of the Late Middle Stone Age (MSA) to the bladelet-rich Later Stone Age (LSA). Unfortunately both the nature of the Agulhas Bank habitat and this transition from MSA to LSA are not well documented in the southern South African archaeological or paleoecological record. Here, we examine new data from KEH-1 at Knysna - the only site with dates throughout this period to face out onto the now drowned Agulhas Bank. We consider the potential relationship between KEH-1 and the overlapping sequences of Nelson Bay Cave and Boomplaas, and discuss the importance of current coastal sites for understanding human population movement and strategies during the Last Glacial.

[309] *Phytolith Processing Methods and the Effects upon Results*

Biological microremains such as pollen, diatoms, starches, and phytoliths are invaluable data sources for reconstructing paleoenvironments and subsistence practices among human populations during times of technological transition. A primary goal of archaeological research is to use these remains to reconstruct the relationship between environment and technology. Phytoliths in particular allow us to reconstruct the specific flora that comprises the biome in a particular place and time. Currently, no standardized method of phytolith extraction exists. Researchers operating in a variety of geographical and chronological locales employ individual methods to achieve the same basic processes in sediment samples: the removal of clays, carbonates, and organics in order to isolate phytoliths for analysis. The effect that these differences in methodology may have upon the results when comparing samples has not yet been studied. The goal of this paper is to quantify the variance in results between three different processing methods. Thirty sediment samples from three diverse geographic regions and time periods were processed (Olduvai Gorge Plio-Pleistocene/Oldowan; Kapthurin Formation Pleistocene/MSA; northern Tunisia, Iron Age; Goytepe, Neolithic. Additional testing is necessary for an accurate understanding of these methodologies and their effects upon results in phytolith analysis.

[132] *St Bees Man: A Cold Case Review*

St Bees Man was discovered in 1981 during an archaeological excavation of the south chancel aisle of St Bees Priory in Cumbria, England. His body was extremely well-preserved with pink tissue, blood present, and intact organs all observed during a forensic autopsy. This 'cold case' review shows the importance of balancing both archaeological and forensic techniques. In forensic archaeology, the handling of potential evidence, overall sampling strategy, and opportunity for further analysis are significant factors in the re-examination of archaeological cold cases. After providing background information on this case and analyzing previous research involving St Bees Man, new evidence is given for the mechanism of preservation in the burial environment using analytical techniques including XRF/EDS, textile analysis, and soil analysis. While efforts were made to preserve St Bees Man at the time of his death, many other factors influenced the remains, most significantly the inter-relationship of the lead, resin, shroud, soil, geology, and moisture in the burial environment. This presentation will consider the burial environment, preservation methods, adipocere formation, issues with exhumation, and the opportunity for interviews and further forensic analysis in an archaeological cold case along with the burden of proof for establishing an identity for St Bees Man.

Clinnick, David and James Walker (Durham University)

[396] *The Forgotten King*

One hundred and fifty years ago, a letter of correspondence was read aloud at a meeting of scientists in Newcastle, UK, boldly claiming for the first time that humans had not always been alone

in their genus. William King, the Anglo-Irish geologist, was the first person to recognize Neanderthals as a separate species of *Homo*, and one of the first people to substantiate claims regarding the antiquity of man. He did not live long enough to see his proposition or name (*Homo neanderthalensis*) become accepted, and even now, with his foresight on the matter widely recognized, he is rarely afforded much more than a cursory description as a footnote in the history of Neanderthal research. This presentation provides a timely celebration of King and his contribution to Neanderthal studies.

[355] *A Wind from the Depths of the Earth*

Among the hundreds of caves I have observed in the Maya area a number stand out in possessing relatively large tunnel systems with restrictions near the entrances. When air is driven from the caves due to atmospheric pressure, the restrictions create a fast moving flow of air that is quite noticeable around the entrance to the cave. Ethnographic evidence suggests that modern Maya are quite aware of such air movements. Because rain was closely associated with caves among the ancient Maya and wind was closely associated with rain, there can be little doubt that the presence of cave wind held significance prehistorically. Iconographically, the IK or wind sign can also indicate a cave. On Chenes monster-mask façades, the mouth, which is recognized as a cave symbol, takes the form of the IK sign. This paper argues that recording the presence of air currents should be considered an indispensable part of recording any cave.

[413] *Chichén Itzá and Its Maritime Ports during the Terminal Classic Period*

The ancient city of Chichén Itzá reached its apogee as a regional capital in the tenth century. Part of this apogee included the territorial hegemony that Chichén Itzá exerted over a vast area of the maritime coasts of the Yucatán peninsula and Belize. By controlling the coasts, Chichén Itzá maintained strict authority over the different objects and merchandise that were distributed and exchanged throughout the Maya lowlands in the Terminal Classic period. In order to control the distribution and exchange of objects and merchandise, Chichén Itzá developed a complex and efficient seaport infrastructure, which resulted in the establishment of at least two contemporary types of seaports along the Gulf of México and the Caribbean seas. The morphological differences between seaports founded in those two areas suggest that Chichén Itzá faced distinctive economic as well as political challenges. However, the ancient city successfully acquired objects and merchandise from other regions of the Maya area and beyond.

[77] *Petrographic and Geochemical Evidence Reveals the Local Focus of Interaction throughout Samoa's Prehistory*

Bill Dickinson's extensive and unequaled ceramic petrographic research has identified spatial patterns of artifact production and population interaction across the Pacific Islands. In Samoa, his work on ceramic collections suggests a largely local focus of production and distribution. We combine Dickinson's ceramic petrography with all available geochemical analyses of ceramics, basalt and obsidian artifacts, and demonstrate local-scale production and movement for all of these artifact classes. Additionally, local artifact production and distribution is the dominant pattern for Samoa's prehistory. We argue these patterns are explained by Samoa's demographic history and environment.

[296] *Martu Ethnoarchaeology: Foraging, Site Structure and the Scales of Constraint on Human Behavior*

In his watershed 1995 publication, O'Connell outlined the utility of approaching ethnoarchaeology through a general theory of behavior by noting the disparity between studies examining faunal remains and those attempting to explain site structure. While the former was finding great success by drawing on models from behavioral ecology, the later was stagnant and lacking a general theory of behavior. Drawing on ethnoarchaeological data collected with Martu Aboriginal foragers, we highlight a possible explanation for this pattern. At large spatial extents, human behavior is constrained by patterned environmental variability, as such, a general theory of behavior is likely to characterize key aspects of human decisions. At small spatial extents, human behavior is not constrained by patterned environmental variability, as such, any general theory is unlikely to explain human decisions that produce site structure. While studies of site structure will likely remain descriptive, ethnoarchaeological analyses examining variability at larger scalar extents can provide archaeologists with key insights into the interpretation of prehistoric human behavior.

[85] *The Changing Scale of Integrative Pueblo Communities in the Northern San Juan Region: Basketmaker III through Pueblo III*

Most studies of ancestral Pueblo communities in the northern San Juan region of southwestern Colorado use clusters of roughly contemporary habitations, often associated with public architecture, to define the spatial extent of residential communities. The term "community" has also been used to define important social groupings at both larger and smaller spatial scales depending on the focus of study and the type of social connection suggested. This study uses the locations of great kivas, one of the most persistent forms of Pueblo civic architecture, to analyze the spatial extent of integrative communities in the central Mesa Verde region from A.D. 500 to A.D. 1280. Analyses of data using

different GIS techniques suggests that changing spatial relationships between great kivas, as architectural symbols coordinated community effort, reflect accompanying changes in the scale and composition of the associated integrative communities. This study uses data developed by the Village Ecodynamics Project and provides an empirical means of delineating approximate community boundaries while also discussing accompanying changes in social structure over time. Finally, this study addresses how the definition of integrative communities can complement previous community studies spanning a range of scales.

Cohen, Rachel (University of Pennsylvania)

[7] *Sites and Sight Lines: An Investigation of Intervisibility Among Hilltop Sites in Azerbaijan*
Most archaeology takes as its primary unit of focus the archaeological site. Yet sites did not exist in isolation: interactions between sites, and between people and the surrounding landscape, were also an important component of ancient societies. These interactions were social, political, military, and/or ritual, and investigating the use of landscape provides archaeologists with a means to understand larger-scale processes such as growth and expansion of urban centers. One way of looking at interactions between sites involves an examination of intervisibility. In open regions such as the Near East, sites were often located on natural or man-made hills with a commanding view of the landscape and of other sites. This high visibility could be used for defense against approaching enemies, to facilitate communication, and to create social unity. This project examines a group of eight Early Iron Age hilltop sites in the Naxçivan region of Azerbaijan. Using GIS analysis, I demonstrate the role that visibility played in the location of these sites and in their interaction with the surrounding landscape. This information, in turn, can be combined with survey and excavation data to provide a better understanding of urban development in this region.

[253] *Toward a Comparative Approach: Postclassic (A.D. 900-1521) Ceramics from the Pátzcuaro and Zacapu Basins, Michoacán, Mexico*

Research on the Purépecha Empire (A.D. 1350-1521) in western Mexico has traditionally focused on elite activities after imperial formation. Consequently, there is limited information about the mechanisms for imperial development and changes in internal social, political, and economic structures that must have occurred in pre-imperial contexts. Study of artifact production is particularly important for understanding political reorganization strategies because producers and consumers may have been susceptible to state directives. This presentation compares recently excavated ceramic material from Angamuco in the Pátzcuaro Basin and the Malpaís Prieto in the Zacapu Basin, Michoacán dating to the Middle to Late Postclassic periods (A.D. 1200-1521). Comparison of changes in pottery form and style highlight similarities and differences in manufacturing, decoration, and consumption practices at these two important urban centers before and during the formation of the Purépecha Empire. Ultimately we seek to establish a comparative approach for studying ceramics in the Pátzcuaro and Zacapu Basins, two regions with a long history of occupation in western Mexico.

[152] *The Fisherfolk of the Two Late Archaic Shell Rings on St. Catherines Island: Similarities and Differences in Contemporaneous Coastal Economies*

Late Archaic (2250-1800 cal B.C.) shell rings, found along the Atlantic coast of the southeastern United States, are large, ring-like structures composed of shell. Sometimes shell rings are complexes with two or more rings in close proximity, while others are singular rings. Rarely are two rings found on an island system without the rings forming a complex. Two shell rings on St. Catherines Island, GA, have been documented and excavated on opposite sides of the island and do not form a complex. Large, systemically analyzed archaeofaunal collections from these rings provide the opportunity to make inferences about Late Archaic coastal economies. In this paper, collections

from these roughly contemporaneous shell rings located on opposite sides of the same island are compared. Overall, fishes comprise the vast majority of individuals in these collections. Assemblages from each ring, however, reflect the different localities of the two rings. Further differences are noted in the densities of vertebrate remains from these two sites. Vertebrate remains, particularly fish remains, are far denser in the McQueen Shell Ring compared to the St. Catherine's Shell Ring. This preference for fishes can be interpreted as control and access to resources.

Cole, Matthew (California State University, Long Beach), Matt Becker (California State University, Long Beach) and Carl Lipo (California State University, Long Beach)

[52] *Coastal Groundwater Seeps on Rapa Nui*

Rapa Nui (Easter Island, Chile) is a remarkably resource-poor volcanic island. Significantly, it lacks surface streams found on more tropical Polynesian islands, other than several remote access volcanic crater lakes. Due to the island's highly permeable, volcanic subsurface, rainwater infiltrates rapidly and becomes groundwater. Only along the coast does the water table intersect the topography to form seeps or springs. We hypothesize these seeps and springs were a primary source of fresh water for the prehistoric inhabitants of the island. In this study, we measured salinity and temperature just below the ocean surface in transects along the coast. Our findings show a marked decrease in salinity and temperature, indicating the proximity to freshwater seeps. Significant groundwater discharge was detected in the areas of La Perouse, Anakena, and Vaihu. These findings provide a foundation of spatial constraints to test hypotheses about settlement patterns and prehistoric land use.

[101] *Curating Ancient Glass in the 21st Century Museum: The Case of the Yale University Art Gallery*

The Yale University Art Gallery's ancient glass collection has never been the subject of a dedicated exhibition, despite being one of the most extensive of its kind in the United States. As a YUAG Graduate Curatorial Intern (2012-2014), I curated a future exhibition of this collection. Numerous pieces will be available for public view for the first time, drawing together examples covering a timespan of over 2,000 years and a geographical range from the Levant to the western Roman provinces. The objects illustrate the evolution of an industry and the artistic and social factors that impacted the aesthetics and functional use of glass in antiquity. This project allowed me to examine the role of the museum in collecting, conserving, and displaying ancient glass. For instance, I explored ways to use glass from Yale's archaeological excavations to contextualize unprovenanced objects. I also curated plans to integrate more of the YUAG's ancient glass collection into the permanent gallery, so as to make this resource more widely accessible. This talk employs the YUAG's forthcoming exhibition as a case study to investigate how museums can best utilize their ancient glass collections to the benefit of specialized scholars, students, and the general public.

[174] *Dating the Early Stone Age Site of Isimila, Tanzania*

The Early Stone Age (ESA) site of Isimila is located on the Iringa plateau, Tanzania, close to the East African Rift Valley. Due to the abundance of handaxes present at the site in both primary and secondary contexts, Isimila has long been recognized as a key site of international importance for understanding the behavioral complexity of our hominin ancestors often compared to major East African sites (e.g. Kalambo Falls, Olduvai Gorge and Olorgesailie). Despite the international significance of Isimila, the chronology, taphonomy and geomorphology of the site remain poorly understood, and are in urgent need of re-examination using modern analytical techniques and theoretical perspectives. Previous dating efforts (a single U-series date from a bone sample) gave an age estimate of 260 kya for the site (Howell et al. 1972). However, this date is problematic due to methodological inadequacies and therefore it is timely to undertake a re-characterization of Isimila. The subject of this paper is to therefore give details of a new OSL dating programme undertaken at Isimila in 2014 that allows, for the first time, a chronological contextualization of this unique and

important ESA site within the broader setting of the East African Palaeolithic.

[373] *Late Holocene Dietary Variation along the Central California Coast: Isotopic Evidence for Marine Dependence*

Reconstructing dietary variation among earlier human populations remains a major goal of archaeological research. Along the central California coast, archaeological reconstructions of hunter-gatherer subsistence have primarily focused on data gleaned from archaeofaunal remains and lithic assemblages. In this study, we examine paleodiets in Late Holocene (ca. 3430-660 B.P.) humans and animals from the Monterey Bay area of the California coast. Using stable carbon and nitrogen isotopes of collagen and stable carbon isotopes of bioapatite, we track the relative importance of marine versus terrestrial resources in the diet. Our sample includes radiocarbon dated human burials from 13 coastal archaeological sites, excavated over the past three decades through cultural resource management efforts. In addition, stable isotope data from Monterey Bay hunter-gatherers are compared with previously published data on coastal groups from the Santa Barbara Channel to the south and Drakes Bay and Tomales Bay to the north. Variation in human paleodiets is examined in light of latitudinal differences in terrestrial versus marine resource productivity and time period. This data contributes to the sparse isotopic literature on human foragers from the California coast.

[296] *A Cross-Cultural Analysis of the Impact of Diet Breadth on Subsistence Toolkit Richness and Complexity*

Identifying the causes of spatiotemporal variation in technological richness and complexity is an important task for archaeology. James O'Connell has proposed that diet breadth can be expected to affect investment in subsistence technology and therefore the number and intricacy of subsistence tools. Narrower diets, he suggests, will be associated with lower investment and therefore fewer and/or less complex tools, while broader diets will be associated with higher investment and therefore more tools and/or tools of greater complexity. This relationship can be expected to exist, according to O'Connell, because technology affects the time devoted to capture and processing, and investment in reducing capture and processing time should be low when diet is narrow and only increase if return rates fall and diet becomes broader. Here, I report the first empirical test of O'Connell's diet-breadth hypothesis. I used data for a large sample of historically-documented nonindustrial populations to examine the relationship between diet breadth and food-getting toolkit richness and complexity. I did so while controlling for several factors that have been found to affect toolkit structure in previous studies. The results I obtained indicate that we need to be cautious when invoking the hypothesis to explain patterns in the archaeological record.

[6] *Application of End-Member Mixing Analysis (EMMA) of Grain-Size Distributions to Characterize Site Formation Processes of Rimrock Draw Rockshelter (35HA3855), Harney Basin, Eastern Oregon*

Sedimentological investigations were conducted on Unit 2 of Rimrock Draw Rockshelter (35HA3855), a deeply stratified, multi-component Paleoindian site located in the Harney Basin, eastern Oregon. Field descriptions and end-member mixing analysis (EMMA) of grain-size distributions of 13 sediment samples identified six stages of site formation: three stratigraphic units (SU), two unconformities, and a Bt soil horizon. EMMA resulted in the characterization of three end-members (EM) that correlate with field descriptions. EM's 1 and 2 represent 88.4% of the total variance among samples and are present within SU1 and SU3. EM 1 correlates well with the bottom stratigraphic unit, SU1, a well-sorted fluvial deposit. EM 2 correlates well with the upper stratigraphic unit, SU3, a poorly sorted aeolian deposit punctuated by colluvium derived from a nearby colluvial wedge and the brow of the rockshelter. EM 3 correlates well with the poorly developed Bt horizon that overprints an eolian deposit within the middle stratigraphic unit, SU2. These results demonstrate the applicability of EMMA to distinguish between depositional units within an archaeological context and provide geologically meaningful interpretations of paleoenvironments for the development of hypotheses related to human-environment interactions.

[83] *Progressive Partnerships for Heritage Preservation: 3D Immersive Learning, Documentation and Research Tools in our Nation's Park System*

Today, much of the world's cultural heritage is at risk from natural and human-induced causes. New technologies such as terrestrial laser scanning, advances in imaging and photography, 3D printing, and other spatial and visualization techniques are greatly advancing capabilities for heritage preservation and research. These technologies are democratizing data access, and improving the ability to share and interpret archaeological information globally. The ability to rapidly and accurately document the world around us is revolutionizing fields of archaeology and museum sciences, and is creating new areas of research integration. Using case study examples from collaborative work in our nation's National Park Service (NPS) System, we will demonstrate the latest in research involving heritage and archaeological documentation and to emphasize effective workflows and approaches for the heritage management. These projects are bringing National Parks to the classroom and are enhancing and improving the way we teach, learn and interact with our past, offering educators and the NPS immersive and interactive methods for interpretation and instructional experiences.

Collins, Shawn, Sarah Payne (Crow Canyon Archaeological Center) and Erica Olsen (Crow Canyon Archaeological Center)

[188] *There's No App for This: The Value of Archaeology and Experiential Education in a Digital Universe*

The Crow Canyon Archaeological Center, a not-for-profit organization located in southwestern Colorado, has used archaeological research to teach multiple audiences about the human experience for more than 30 years. Changing educational standards and transportation needs have affected Crow Canyon's student program attendance, and an aging demographic increasingly limits our adult program attendance, with ramifications felt in our membership and donor support. We face the challenge of communicating the relevance of archaeology in the modern world to our varied audiences, and help them appreciate the value of experiential programs though abundant digital media are accessible from afar.

Collins, Ryan (Brandeis University)

[263] *At Yaxuna X Marks the Spot: Centering across in a Middle Formative Maya Landscape*

From the placement of objects in household offerings, to monumental works of art and architecture, it is well known that the ancient Maya commemorated their cosmological center in a variety of ways. Even at the settlement level, quadripartite divisions of space are observed branching out from a central core giving modern researchers insight into the way ancient Maya peoples may have

understood their world. At the Maya site of Yaxuná, Yucatan, Mexico investigations have made it apparent that traditions of marking the center were taking place as early as the Middle Formative. Yet, evidence from recent excavations in the E-group plaza reveal that the center was not marked in the same way, or even in the same space, over time. This paper has two purposes. The first purpose of this paper is not only to explore the implications of change evident in practice, performances, and political displays once held within the central plaza of the ancient site but how such changes were reflected within the greater settlement. The second is to explore how the data from Yaxuná suggest the exchange of ideas with contemporaneous sites in the central lowland Petén, and how such an exchange likely changed over time.

[370] *Reconstructing Water Levels and Access to Hoyo Negro*

"Hoyo Negro" was discovered in the Sac Actun Cave system in the Yucatan Peninsula; Mexico which contained abundant fossil remains of Pleistocene animals including the remains of a young PaleoIndian woman. There are several cenotes of varying size and age which may have been used by Paleoamericans to access Hoyo Negro. The two closest cenotes are "Ich Balam" and "Oasis". To determine if these cenotes provided access to Hoyo Negro during occupation of the area, the paleoenvironmental evolution of Ich Balam and Cenote Oasis were investigated. Measurements of cave conduit morphology were taken from Cenote Oasis to Hoyo Negro. Additionally, 9 sediment cores were acquired directly in, and around the cenotes. Radiocarbon dating, identification and abundances of foraminifera, thecamoebians and ostracods were determined for each core to reconstruct the flooding history of the pit and cave passages. Microfossil assemblages, along with sedimentary markers, indicated that Ich Balam was open by at least 8170 Cal BP and the Hoyo Negro Pit was isolated from the surface around 8000 Cal BP due to the flooded cave passage. These results provide constraints on the access and use of Hoyo Negro, and provide important information for interpreting the taphonomic history of the skeletal material.

Colman, Arlene (New World Archaeological Foundation)

[242] *La Venta's Offering 4: Representation of Olmec Ritual Practices*

Offering 4 at La Venta consists of one brownstone and 15 greenstone human figurines arranged in front of six jade celts set on end. This unique offering was placed north of the pyramid in the Ceremonial Court of Complex A as part of a ritual activity that dedicated a new building phase in the court around 600 B.C. It was associated with a massive serpentine pavement and a cruciform axe offering. About a century later, Offering 4 was reopened and checked. Offering 4 at La Venta conveys a story in media res. The vertical celts, apparently representing stelae, appear to reference the six stelae, which were positioned on the south base of the pyramid that flanked the stairway. The scene created in Offering 4 commemorated an event performed against the backdrop of the pyramid and the stelae. I explore this inference and possible roles and meanings that these stone stelae once played at La Venta.

[310] *Identifying Ground Stone Production at Bolsa Chica through Hammerstone Analysis*

Debris attributed to the manufacture of groundstone implements are not always identified or collected. This can make groundstone production difficult to quantify through debitage analysis. Therefore, the identification of groundstone production often rests on the analysis of hammerstones. Recently Scientific Resource Surveys, Inc., conducted an intensive technological analysis on the lithic assemblage from a well-known Millingstone Horizon site, located on the Bolsa Chica mesa, in Orange County, California. During the analysis, SRSinc identified hundreds of beveled shaped hammerstones thought to have been instrumental in the manufacture and maintenance of utilitarian and ceremonial groundstone artifacts. Previous studies have shown that beveled hammerstones are

used for the initial shaping, modification and rejuvenation of ground stone implements. Similar methods of manufacture would also be attributed to ambiguous artifacts like coggled stones and charmstones. This poster discusses the manufacture of utilitarian and ceremonial ground stone artifacts at Bolsa Chica and how the analysis of hammerstones has aided in the interpretation of this industry.

Colombo, Leah (University of Miami)

[192] *Finding the Needle in the Haystack: Submerged Prehistoric Archaeological Sites in Everglades National Park*

Many attempts have been made to consistently locate submerged and inundated prehistoric archaeological sites offshore the state of Florida. In many instances these attempts have not been successful in some respects but beneficial in others. This paper will identify the issues of studying such sites and the results of past and recent studies. However, the main topic of the paper will focus on a recent study exercised within the Florida Bay region of Everglades National Park. Working in conjunction with RSMAS, a project was developed by the National Park Service to identify the parameters necessary to build a predictive model for prehistoric site locations in Florida Bay. While focusing on the model, the potential effects of climate change and sea level rise on Florida Bay since the initial flooding will also be discussed.

Colón, Justin, Jimmy Daniels, Lana Ruck and Clifford T. Brown

[246] *Obsidian Exchange Patterns among the Coastal Plains of Northwest Nicaragua*

We performed morphotechnical and trace element analysis of 2871 obsidian artifacts recovered during survey and excavation from 12 archaeological sites in the Department of Chinandega, northwest Nicaragua. The elemental analysis was conducted using the Bruker Tracer III-V portable X-Ray Fluorescence (pXRF) spectrometer. The pXRF spectra and elemental concentrations of artifacts were compared with those of known source provenience. The results show 98 percent of the specimens match the geochemistry of the Güinope obsidian source in Honduras. The remaining specimens are sourced to La Esperanza in Honduras and the Ixtepeque source in Guatemala with one specimen from El Chayal in Guatemala. Most specimens arise from a core-flake industry consistent with the small size of the obsidian nodules at Güinope. Some prismatic blades and flakes were made of Güinope obsidian. We show that there were small but significant differences in the rate of consumption of prismatic blades among the sites. The overall regional pattern appears to be that sites in the Pacific coastal plains were engaged in more robust trade with the more distant sources of La Esperanza and Ixtepeque, while inland sites used Güinope obsidian almost exclusively.

[85] *Radiocarbon and the Stable Isotope Chemistry of Grand Gulch Basketmaker II Burials: Age-Based Dietary Patterning and Geolocation.*

The stable isotope chemistry of 149 directly dated Basketmaker II burials from the Four Corners region of the American Southwest indicates relatively heavy reliance on maize and low animal protein intake. Sex and age patterning reveals differences in adult male versus female diets and distinguishes adolescent diets from those of adult males. Hydroxyapatite oxygen isotope values effectively sort individuals relative to the latitude and elevation of burial sites and are further used to clarify the origins of a subset of poorly provenienced remains, thought to be from Chaco Canyon. Grand Gulch Basketmaker II burials date to a two sigma range of 415 B.C.-A.D. 322, contemporary with Black Mesa Lolomai Phase occupations and post-dating the March Pass, AZ, White Dog Phase.

Colvin, Matthew**[177]** *Emergence of Place: The Great Circle of Fort Center, Glades County, Florida*

In South Florida, earthen enclosures represent some of the earliest and largest communal monuments. At around 300 meters in diameter, Fort Center in Glades County, Florida contains one of the largest enclosures in the entire Southeast. As the earliest recorded earthwork at Fort Center, I argue the construction of the Great Circle acts as a trigger and anchor for coalescence and the establishment of place. Since this event occurs during a period of long term fisher-hunter-gatherer practices, examining the life cycle of this monumental enclosure offers insight into emergent institutions within these communities. Although contemporaneous and comparable earth moving occurred among northern Woodland Period communities, the Great Circle of Fort Center may have persisted as the creation of communal memory rather than developing as a result.

Colwell, Chip (Denver Museum of Nature & Science)**[116]** *Makak: Between History and Heritage*

This paper examines a “mythic” settlement named Makak, located at the edge of Le Morne Cultural Landscape, a World Heritage Site, in Mauritius. A recent ethnohistoric study, conducted in collaboration with Mauritian colleagues used an array of oral, written, and material evidence to show that Makak is an informal place name for an area first settled by French colonists in the 1700s, then by several prominent “Free Colored” families in the 1800s, and finally depopulated as residents were forcibly removed in the 1940s. The investigation suggests that Makak is a serial settlement, which apparently long thrived as a multicultural community, tapped into global trade networks. As a key historical site adjacent to Le Morne Cultural Landscape, a World Heritage Site, Makak also plays a vital role in the Mauritian sense of identity and belonging. This presentation will thus also explore how Makak lives on not just as history, but as a place of heritage in Mauritian collective memory.

[160] *Discussant***Comer, Douglas (Cultural Site Research and Management (CSRM))****[199]** *Searching for Evidence of Early Human Occupation of the New World with Aerial and Satellite Imagery*

The pluvial lakes in the Mojave Desert, which are today simply expanses of sand in nine years out of ten, were once large bodies of water, many of them linked together by streams and large rivers. Several were fed by the Mojave River, which introduced aquatic life. Fresh water clams were common along the beaches on lakes fed by the Mojave River, which were also places frequented by human groups that were attracted to the resources to be found there, among which were now extinct mega-fauna. Both Clovis and Western Stemmed tools have been found in the area that we are investigating, which includes the playas known as Coyote Lake and Silver Lake. We are using synthetic aperture radar imagery produced from data collected from the NASA UAVSAR platform, Lidar, and multispectral and hyperspectral imagery to search for the shorelines of the pluvial lakes as they existed 13,000 to 20,000 years ago, with the objective of finding material altered by human activity on association with fresh water clam shells or other datable materials.

Commendador, Amy (Idaho Museum of Natural History), John Dudgeon (Idaho State University) and Bruce Finney (Idaho State University)**[233]** *Prehistoric Diet on Rapa Nui via Stable Isotope Analyses of Bone Collagen and Carbonate*

Previous analyses of carbon and nitrogen stable isotopes in dentin collagen from prehistoric individuals on Rapa Nui suggested a predominately terrestrial diet in the early phase of occupation,

followed by a slight expansion into marine-based subsistence post-A.D. 1650. This was unexpected as the documented pattern across Polynesia is a marine-dominated strategy in the early phases of occupation with terrestrial resources incorporated later, as agricultural systems supplant foraging behaviors. To examine this further, we conducted carbonate analyses (for C and O stable isotopes) on 28 of the same individual tooth samples used in the collagen study. These combined analyses provide a more accurate understanding of prehistoric diet, as collagen represents primarily the protein portion of the diet while carbonates have been shown to record whole diet (including non- or low-protein sources). Our results are similar to those of the collagen analysis, providing additional support for a primarily terrestrial-based subsistence system throughout the prehistory of the island.

[95] *Taking Tech on the Road: Mobile Makerspaces and Archaeological Engagement*

This poster introduces a London, Ontario-based initiative called the Digital Humanities MakerBus, a school bus converted into an innovative classroom, laboratory, and creative play space. The purpose of the project is to provide access to digital technologies and other hands-on resources to community groups wherever they may be located. Although the project has been wildly interdisciplinary since its inception and was not conceived of with any specific disciplinary purpose in mind, our team believes that there is enormous potential for mobile makerspaces to democratize access to technologies and inspire new forms of archaeological engagement. The MakerBus provides a means for individuals and groups to develop community-driven projects in their own meaningful spaces. Potential projects include archaeological, historical, and heritage based projects, which, heretofore, have not been a common focus of other established "maker" projects. Along with an introduction to the "maker movement," this poster will present a short outline of several maker technologies and demonstrate how they have already been utilized toward the aims of archaeological and heritage engagement by our project. Ultimately this poster aims to inspire dialogue about the implications of democratizing technologies and about what it means to change the locus for archaeological exploration and engagement.

[382] *Ornaments, Pigments, and Household Production: Spatial Patterning and Residue Analysis of Ground Stone Artifacts from Pueblo Bonito, Chaco Canyon, New Mexico (A.D. 800-1200)*

Previous investigations of craft industries at Chacoan great houses have focused largely on finished objects (e.g., ceramics, turquoise, and shell). This study explores an often overlooked but ubiquitous and highly diverse class of artifacts – ground stone abraders – in an effort to better understand the organization of production at Pueblo Bonito great house. Analysis of variation in form of these versatile implements provides insight into the range of craft items manufactured. Drawing on the

recent results of a comprehensive radiocarbon dating project, GIS and pXRF analysis reveals the spatial patterning of and temporal trends in craft production, pigment processing, and subsistence activity. Discrete clusters of heavily-used lapidary and mealing tools confirm that both craft manufacture and food processing occurred at Pueblo Bonito and that, over the long-term, these activities were spatially associated with specific areas of the pueblo. We further contend that these spatial clusters reflect individual households or working groups of craft laborers in Pueblo Bonito.

Conlee, Christina (Texas State University)

[31] *Early Maize on the South Coast?*

Presently evidence for the earliest domesticated maize in the Central Andes comes from the north coast of Peru. Dating to the Middle Preceramic this early maize consists of Proto-Confite Morocho and Confite Chavinense, which were primitive types of popcorn. In contrast, little is known about the early use of maize on the south coast. A cob of Confite Chavinense was found in a Preceramic context at the site of La Tiza in southern Nasca. Surrounding contexts, including a hearth, date the context to ca. 3640-3365 B.C. in the Middle Preceramic. However, the uncharred corn cob was radiocarbon dated to the Late Intermediate Period, a time long after Confite Chavinense is known to have been cultivated. Researchers at the north coast sites also had dating problems with uncharred corn cobs that produced dates that were far too young and propose that they were contaminated. It is possible that the La Tiza cob may have been similarly contaminated and that it too dates to the Middle Preceramic. Conversely, the cob may have been intrusive from a Late Intermediate Period occupation and reveal a long history of the use of ancient types of maize on the south coast.

[299] *A Post-Mortem Evaluation of the Degree of Mobility in an Individual with Severe Kyphoscoliosis Using Direct Digital Radiography (DR) and Multi-Detector Computed Tomography (MDCT)*

Since 2010, the Bioanthropology Research Institute at Quinnipiac University, in collaboration with the Inforce Foundation, Cranfield Forensic Institute at Cranfield University and the Center for Human Bioarchaeology, Museum of London, has established a temporary field radiographic facility under St. Bride's Church, Fleet Street, London in order to conduct a radiographic survey of the skeletal remains of 227 individuals from the 18th and 19th centuries interred in the crypt and retained in the church. The collection constitutes a unique assemblage of skeletal remains covering a date range of 1676–1852/3, with biographical data and detailed parish records. One of the skeletons demonstrated not only severe kyphoscoliosis, but also an uncharacteristic robustness of the femora and humeri for such a severe spinal deformity. Based on initial radiographs, it was determined the remains were

stable enough to be transported to St Bartholomew's Hospital for additional examination using multi-detector computed tomography to better visualize the internal structure of the skeleton. The presentation considers the different diagnoses derived from the radiographic studies and the analysis in attempting to establish the individual's degree of mobility and impairment, placed in conjunction with the social conditions for the parish at this time.

[365] *Introduction to the DMM-MSU Morton Village Project*

Morton Village and Norris Farms #36 cemetery, located in the central Illinois River valley in Fulton County, Illinois, offer a rare opportunity to investigate migration and conflict with multiple data sets. The cemetery was excavated in the 1980s for highway improvements. Archaeologists from the Dickson Mounds Museum branch of the Illinois State Museum recovered 264 apparent Oneota burials dating to ca. A.D. 1300, and the cemetery is well known for the high level of violence evidenced. The Morton Village site is about 400 m from the cemetery on the same valley-edge ridge complex. Limited excavations in the 1980s provided evidence of both Oneota and Mississippian use of the site. In 2007 DMM and Michigan State University began a long-term effort to more fully understand the village, its relationship to the cemetery, and the nature of Mississippian and Oneota interactions at the site and in the region. Data from excavations, remote sensing, and radiocarbon assays suggest co-habitation by Oneota and Mississippian people at the village in the 1300s, engendered preliminary interpretations of site organization, and fostered questions about the role of ritual and stress in this multicultural population.

[40] *Early Holocene Aridity and the First Farmers of Europe*

The spread of agriculture into Europe from its Near Eastern heartland was an important cultural event, the causes of which have been debated for many decades. DNA analyses are increasingly providing insights into the genetic inheritance of Europe's first farmers, yet the triggers for their initial migration remain elusive. The earliest agricultural sites in Europe appear to be those situated in coastal Greece, while more fertile inland areas, such as the Thracian Plain, were settled centuries to millennia later. In this presentation we interrogate the paleoenvironmental record from Thrace to elucidate the environmental factors that may have affected the timing and distribution of the earliest European agricultural settlements.

[407] *Forager Efficiency, Demographic Shift and Environmental Change: Re-evaluating the Broad Spectrum Revolution in Mainland Southeast Asia*

On the Thai-Malay Peninsula the Pleistocene to Holocene transition was accompanied by significant post-glacial sea level rise, new environmental conditions, and increased human population densities. How did foragers adapt to these changes? In this region, the BSR has been the primary framework for understanding forager response to these conditions since Gorman's analysis of the fauna from Spirit Cave (1971). Gorman suggested, following Flannery's in the Near East, that at the Pleistocene-Holocene transition a broadening of the diet occurred to include resources previously ignored by Southeast Asian hunter-gatherer groups because of the environmental change and human demographic shifts that occurred. This paper reexamines the BSR in this region by quantifying zooarchaeological data from a series of Pleistocene-Holocene sites in Thailand and Malaysia, guided by the theoretical predictions of the prey-choice model in foraging theory. Results suggest that a 'true' BSR did not occur during the Pleistocene-Holocene transition; instead forager efficiency remained high during periods of environmental change and human demographic increase.

[287] *Reflections on Digital Data Acquisition and Analysis at Chavín de Huántar, Peru*

The monumental center of Chavín de Huántar in the Peruvian Central Andes has been the subject of mapping efforts for more than a century, and of digital mapping efforts since the mid-1990s. Spatial technology has been fundamental to significant revision of the site's construction sequence, definition and extent, and ultimately interpretation. This results from the site's complex, three-dimensional, and often-observed architecture, mapping which has only become practical – and perhaps even possible – with digital tools. The array of technologies brought to bear over the last 15+ years includes total station, high-precision GPS, satellite imagery, laser scanning, photogrammetry, near-surface geophysics, and kite aerial photography; data have been managed with both CA.D. and GIS. That rare duality resulted from the need to simultaneously manage complex, three-dimensional data and extensive, attribute-rich data, as well as distinct sets of research questions. This paper reflects on the respective contributions of these two strategies to the analysis of complex architecture, teasing apart the relative contributions of different strategies of digital data acquisition and considering what analyses they have enabled, before contemplating the risks of digital representation becoming an end unto itself.

[315] *Dynamic Households on the Irish Frontier: An Archaeology of the 18th -19th Century West Coast*

This research explores colonial transformation of households and communities on the fringes of empire - the frontier. Often overlooked, these fluid spaces have revelatory potential regarding deeply situated cultural change and social dynamics in the face of catastrophic adjustment. This project focuses on the local processes as embodied by these individual households and rural communities on the coast of western Ireland in order to understand larger regional and national social and cultural transformations. Contextual variability and social change are examined through the lens of material activity and change in the 18th and 19th centuries. The material remains from Inishark and Inishbofin, two islands off the coast of Co. Galway, demonstrate the presence and connection to broader global networks of economic trade and access. This evidence counters the pre-existing academic narrative of colonialism by framing these areas as frontier zones in order to better understand the degrees of complexity and nuances of change. Through examination of ceramic material and architectural remains from excavations of several different households on these islands, the data reveals dynamic and complex economic interactions between communities off the coast, on the mainland and abroad.

[92] *Spatial and Temporal Analyses of Redeposited Projectile Points from McFaddin Beach, Texas*

McFaddin Beach (41JF50), in Jefferson County, Texas is a 32 kilometer-long beach, stretching from High Island in the west to Sea Rim State Park (next to the mouth of the Sabine River) in the east. Since the 1950s, artifacts from almost all periods of Texas prehistory have been recovered on this beach. The projectile points found on McFaddin Beach are redeposited material from an offshore, submerged location. Results indicate that projectile point distribution is significantly correlated to longshore drift and hurricane activity in the Gulf of Mexico. These redeposited artifacts inform us about the mobility patterns of Paleoindians who lived on the Texas continental shelf. Further, typological variability in projectile points throughout the Holocene transgression inform us about mobility patterns and resource allocation of later groups on the Texas continental shelf.

[176] *Mercury Pollution and the Ancient Maya: Where, Why and How*

Multi-element inorganic geochemical studies across the Maya lowlands have revealed elevated levels of mercury (Hg) in soils and sediments that date mainly from the Classic period (c. 250-900 A.D.). Mercury pollution has now been recorded at a range of archaeological sites despite the absence of metallurgy until the Postclassic Period (after 1000 A.D.), or any other industry capable of significant heavy metal pollution of the environment. This paper presents the first detailed analysis of the extent and magnitude of anthropogenic Hg in the natural environment of the ancient Maya. Given the scarcity of mercury sources in the Maya world, and the importance of liquid (native) and solid forms of mercury (cinnabar) to the Maya, we examine the possible sources and idea of mercury as a prestige commodity, and the implications of this for our understanding of the trade of high-value natural resources in antiquity.

Cook, Jessica (University of Georgia) and Ervan Garrison (University of Georgia)

[192] *These Are the Pearls that Were His Eyes: Interpretive Frameworks for Submerged Middle Archaic Sites in the Big Bend of Florida and the Georgia Bight, U.S.A.*

Sedentary occupations and monumental architecture first appear during the Middle Archaic (8,000 BP to 5,000 BP) in Florida at sites where marine, estuarine, and riverine resources were exploited, spreading to the coast of Georgia by the Late Archaic, around 4,500 BP. However, the coastline did not reach its modern position until around 5,000 BP, leaving many sites submerged. Fieldwork was

initiated in June of 2014 in order to relocate, excavate, and interpret Middle Archaic sites submerged in Apalachee Bay, Florida, that were initially documented during the 1980s and 1990s. Concurrent synthesis of extant datasets gathered off the Georgia coast is also ongoing. Our results highlight issues commonly encountered when working with submerged prehistoric sites: the difficulty in locating/relocating them in an open water context; the need to implement appropriate protocols for recognizing sites as such when encountered; and the need to develop a useful interpretive framework for understanding highly reworked deposits. None of these issues are insurmountable and even disturbed marine sites have potential to elucidate the behaviors of sedentary foragers of the coastal southeastern U.S., and earlier groups. These sites also add to the body of knowledge around site formation processes, a critical need as sea levels rise today.

[33] *Higher Cognitive Sequelae of the Recently Expanded Parietal Lobes in Homo sapiens*
Bruner and his colleagues (Bruner et al. 2013) have demonstrated that the parietal lobes in *Homo sapiens* are expanded in comparison to Neandertals and *Homo heidelbergensis*. The traditional parietal lobe function of the brain, somatosensory integration, is thought to be among the phylogenetically oldest functions of the brain. However, recent research has shown that the parietal lobes may be critical to many of the higher cognitive functions of modern *Homo sapiens*. There are two regions appear to be the epicenter of parietal expansion: the intraparietal sulcus (IPS) and the precuneus. The IPS has been well documented by fMRI research to have topographically dedicated neurons for the appreciation of numbers, known as numerosity. Numerosity has been shown to have two core functions: subitization, which is the ability to distinguish between one, two, and three things, an ability present in human infants and monkeys. The second is the ability to distinguish between small sets from large sets of things, known as fuzzy set comparison or analog comparison. The precuneus has been shown to be critical to autobiographical memory and future simulations. The present paper will discuss the implications of these functions as a feral basis for abstraction and modern symbolic thinking.

Cooney, Gabriel (UCD School of Archaeology)

[30] *Encountering the Sacred in the Everyday: From Prehistory to the Present*

A notable feature of the Irish prehistory is the recurrence of activity over long periods of time in specific areas. These persistent places or landscapes are also a feature of the wider world of prehistoric Atlantic Europe. This pattern of human activity has been long debated. Depending on the point of view of the researcher it can be explained for example as indicating foci of long-term settlement, as the repeated but unrelated use of areas improved by human modification in the context of technological constraints on land use or as special places, sacred landscapes. Not only does the understanding of such landscapes require explanation in terms of how they articulated with everyday life in the past, but they also pose problems of recognition and sustainability in today's world. Globally significant cultural landscapes, for example as indicated by World Heritage status, are recognized as requiring specific protection, but there are problems relating to the wider recognition of prehistoric landscapes. The protective focus tends to be placed on visible monuments; dots on a map. In the context of modern development pressures, competing land uses and social

change can we retain an ability to recognize and retain what was sacred in prehistory?

[394] *Remote Sensing at the Buffalo Lake Métis Wintering Site (FdPe-1): Preliminary Results*

The Buffalo Lake Métis Wintering Site (FdPe-1), located in central Alberta, Canada, presents one of the most extensively studied examples of overwintering practices amongst the Fur Trade-era Métis. With historical records accounting for approximately four hundred cabins being present at the site in 1876, this site has the potential to have been the largest settlement west of the Red River at the time of its occupation. However, surficial evidence of these cabins is now scarce as a result of modern agricultural practices. Geophysical surveys were conducted at the site during the 2014 field season, with a focus upon magnetometry, conductivity and resistivity. The preliminary results of these surveys are presented, with the goal of determining more accurately any spatial patterning amongst the cabins and the total extent of the site.

[288] *Small Island Water Security: considering how the past can help secure a safer future*

Water security is the capacity of a population to safeguard sustainable access to adequate quantities of acceptable quality water for sustaining livelihoods. Small islands can often face particularly problematic issues surrounding water security with the impacts of precipitation variability and relative sea level change keenly felt on islands with limited rain catchment and fast draining hydrological systems. This paper explores some archaeological case studies on small islands from the Caribbean and the Pacific that have studied long-term human-water relationships to consider how findings can inform current debates surrounding improved water management systems, sustainable island population capacities, early warning systems for water insecurity and the management of island abandonment.

[294] *Testing the Paleo-Agulhas Plain Migration Ecosystem Hypothesis with Serial Isotope Analysis of Fossil Fauna*

In contrast to Holocene sites, late Pleistocene sites along the South African south coast are dominated by large and medium-sized ungulates, many of which are typical of open-habitat grasslands and migration ecosystems. During much of the late Pleistocene, sea levels were substantially lower, exposing the Paleo-Agulhas Plain up to 100 km south of the modern coastline. The Migration Ecosystem hypothesis proposes that the Paleo-Agulhas Plain supported a migration ecosystem driven by summer rainfall producing fresh green grass during summer in the east, and winter rainfall producing fresh green grass during winter in the west. We tested the migration hypothesis with serial samples of strontium, carbon, and oxygen isotopes in fossil fauna enamel from Pinnacle Point sites PP13B and PP30. We also created a bioavailable strontium isoscape for the region. Results indicate that bioavailable strontium is strongly influenced by marine sources, as well as bedrock geology. Strontium isotopes of the fauna vary by less than 0.0005 within each individual, and suggest that most animals spent their time on or near the Paleo-Agulhas plain, not further inland. Carbon and oxygen isotopes of potentially migratory individuals are consistent with east-west movements, showing evidence for consumption of C3 and C4 grasses in varying proportions.

[336] *Federal Agency and Alaska Native Co-Management of the Sqilantnu Archaeological District, Alaska*

One of the more unusual provisions of the 1971 Alaska Native Claims Settlement Act allowed the 12 newly formed Alaska Regional Native Corporations to select significant historic and cemetery sites as part of their settlement. Cook Inlet Region, Inc. (CIRI), selected three sites at the confluence of the Russian River with the Kenai River. The two federal agencies managing the area protested the claims. Among many complications was the fact that the area is one of the most popular sport fisheries in Alaska. Twenty-seven years after the claims were filed, facing drawn out legal action, the major parties sat down and negotiated a co-management agreement that was signed into law as the Russian River Lands Act in October 2002. The result is a unique partnership for managing archaeological and cultural resources and public use. The fundamental agreement could be a strong positive template for co-management of other significant heritage resources.

Corcione, Maria

[107] *Health Conditions Between the Muisca-Tibanica Society: Bioarchaeological Analysis of Phenomena in Porous Skull*

The doctoral research I drive seeks to understand whether there is relationship between nutrition and the appearance of porosity in the skull within the Late Muisca society Tibanica located in the Soacha Colombia. From the macroscopic, histological and radiological analysis is to perform a differential diagnosis to understand the true involvement anemic trait. According to the etiology presented for porous phenomena, its causes is the high consumption of maize, which inhibits the absorption of iron, resulting in iron deficiency anemia; if true, a high maize consumption among the non elite group of Tibanica, reveal high frequencies of porotic hyperostosis and cribra orbitalia. The designed to answer questions about the relationship feeding disease bioarchaeological analyzes have not been carried out to the country with a large sample of Late Muisca period, which is an opportunity to conduct research that attempts to approach the phenomena porous in the skull from a not only paleopathologica but biocultural perspective.

Corcoran-Tadd, Noa (Harvard University)

[108] *Slow Thinking: Beyond the Entangled List*

Several theorists under the broad umbrella of a new materialism have argued that our accounts of the social-natural world proceed too quickly, skating over rich complexities and contradictions in favor of simple ontological impressions. In response, they suggest, we need to slow down our analytical movements in order to track the complex articulations of a world that becomes difficult to resolve at higher speeds. Here I argue that this issue is particularly relevant for archaeologists for whom issues like temporal compression and interpretive gaps are often highly explicit. I seek to use archaeological materials to both slow down historical accounts of the silver economy in the colonial Andes and to move beyond the descriptive list stage of analysis often encountered in . Faced with a list that might include llamas, mules, alfalfa, altitude, hemoglobin, capital, and adobe walls, I deploy this heterogeneous assemblage to trace specific questions of animal labor, bioplasticity, and precarity in the colonial Andes.

Cordell, Ann (Florida Museum of Natural History), Neill Wallis (Florida Museum of Natural History) and Thomas Pluckhahn (University of South Florida)

[79] *Ceramic Petrography and Woodland Period Social Interactions in Florida and the Southeastern United States*

Swift Creek Complicated Stamped pottery found throughout much of the lower Southeastern U.S. is arguably the premier material for the systematic study of Woodland interactions. The unique

impressions of individual carved wooden paddles are often found on pottery at multiple sites, lending an unparalleled level of detail and spatial resolution to social connections. Furthermore, the distribution of vessels potentially reflects a broad range of interactive practices among a large proportion of past populations rather than only the occasional practices of a few individuals. Petrographic analysis of Swift Creek pottery has been undertaken as part of an ongoing research program that uses integrated materials analyses of pottery, including Neutron Activation Analysis, digital imaging of paddle stamp designs, technological analysis, and absolute dating, to identify patterns of social interaction. This paper focuses on petrographic data obtained thus far. Several hundred samples have been taken from more than two dozen sites distributed across Florida and Georgia and dating between A.D. 200 and 800. Preliminary integrative results indicate that interactions were geographically extensive, but clearly most intensive along particular corridors.

[367] *Settlement Patterns Study in the Lake San Pablo Area, Northern Highland Ecuador: Preliminary Results*

The project "Cultural and Technological Principles Associated with Occupation Modalities during the Integration Period: Value and Use in Present Day Ecuador", carried out by the INPC (National Institute of Cultural Heritage of Ecuador) and funded by SENESCYT (Ecuador's Department of Science and Technology) has researched five areas of the country, including in the Otavalo Canton. This paper presents the preliminary results of a survey, conducted with the collaboration of community members, from three parishes next to Lake San Pablo. We report on earthen mounds, raised fields, and areas of dispersion of cultural materials in a 30 square kilometer area. Mounds close to the raised fields in the low-lying areas near the lake may represent chiefly control of these agricultural works, while habitation sites of the regular population seem to have been mostly located on the slopes around the lake. Complementing information from the archaeological survey will be data gathered by historians, geographers, and cultural anthropologists (among other professionals) in this multidisciplinary project.

Cordova, Guillermo (Guillermo Cordova)

[231] *The River Suchil Valley project, Zacatecas and Durango 10 years of its inception*

This project aims to understand social complexity in prehispanic Mexico by studying the strategies of landscape use and resource management throughout the first millennium A.D. in a territory occupied today by the municipalities of Sombrerete and Chalchihuites in the state of Zacatecas, as well as Suchil in the state of Durango. In our presentation, we will evaluate and present the results of multiple lines of research, such as bioarchaeology of the ancient inhabitants, hierarchy and complexity of settlements, mining, the importance of the lapidary industry, funerary patterns over time, etc. The information generated so far allows us to consider the dynamic social developments of the Chalchihuites culture. For example, the establishment of settlements with public areas for the performance of agricultural and funeral rituals required the importation of turquoise from the American Southwest for the production of jewelry, which was also used by elites as grave goods and perhaps exported to western and central Mexico as well.

Corl, Kristin (New Mexico State University)

[110] *Faunal Evidence for Subsistence Strategies at Cottonwood Spring Pueblo*

The zooarchaeological assemblage from Cottonwood Spring Pueblo (LA 175), an El Paso Phase (A.D. 1275-1450) horticultural village in southern New Mexico, is dominated by small game. What explains this pattern? The high relative percentage of rabbit to deer follows a general trend

associated with aggregated populations, growing agriculture dependence, and less seasonal mobility. Additional variables possibly contributing to this trend include shifts to small game in response to droughts, over exploitation of larger game, niche creation by human modification, and preferential hunting strategies, all of which influence the faunal ratios regardless of dependence on agriculture. My hypothesis is that hunting of small game is a direct result of the intensification of farming. The expansion of cultivated fields creates a niche that attracts rabbits that would otherwise live in grassland environments, which are then targeted for hunting. To assess this hypothesis I examine archaeological evidence of field expansion, environmental evidence of precipitation and temperature, and faunal data including game species (lagomorphs, deer, antelope) as well as proxy species of microenvironments (e.g. rodents). I also examine stable carbon and nitrogen isotope patterning in a sample of lagomorphs to assess whether they were consuming grassland plants (C4) or domesticated plants (C3).

Cormier, Aviva (Boston University)

[206] *A Combined Bioarchaeological and Isotopic Approach to Understanding the Regional Diversity and Population Mobility within the Holmul Region, Guatemala*

The northeastern Petén of Guatemala is an ideal area for applying stable isotope analysis to reconstruct past population histories and to explore the interplay of migration and social complexity throughout the rise of the Maya. The strontium and oxygen isotope analysis of dental enamel is a productive alternative when bone collagen is not available or is severely altered by taphonomic processes or conditions of preservation. These isotopic analyses of dental enamel can be combined with biological profiles of interred individuals in order to address questions of regional identity, differing mobility, and changing complexity of the Maya in the Holmul Region. This poster presents the preliminary osteological analysis and biological profiles of individuals excavated from Homul, La Sufricaya, Cival, and Hamontun, emphasizing burial treatment, estimated age, biological sex, perimortem trauma, cultural modification, pathology, and/or dental health. Further, this poster presents the methodology of a combined bioarchaeological and isotopic approach to understanding regional diversity and population mobility. An application of this method would encourage the use of these bioarchaeological and isotopic analyses at sites in the greater Maya region and throughout the world, especially where the difficulties of excavating and the poor preservation of human remains may have previously dissuaded scholars.

Cornwell, Kelsey (University College London)

[120] *Theoretical and Practical Advances in Underwater Regional Survey*

To contend with expensive and invasive 'big dig' excavations, archaeologists have trended towards using regional surveys to examine and interpret distribution patterns across a given area. Regional surveys offer an effective and efficient way of analyzing the long-term use and wide scale development of variably occupied spaces. With the introduction of Geographic Information Systems and other new technologies, archaeologists have been able to capitalize on the insights gained from statistical analyses, such as regression and predictive models, to further our understanding of pre-modern societies.

Underwater archaeology, however, has not enjoyed the range of theoretical and methodological developments that terrestrial archaeology has over the past 50 years. Until recently, conducting regional surveys underwater was too costly in both time and finances. In the past twenty years, though, archaeologists have begun to utilize oceanographic tools to inspect large expanses in both shallow and deep water, revealing a great deal of submerged cultural material. This project examines if, where, and how theories established to investigate land sites and regions could be applied to underwater environments, with particular focus on the Mediterranean, and offers a case study from Eratosthenes Seamount as a practical application.

Coronado, Anabella (The University of Texas at Austin) and Adriana Linares (The University

of Texas at Austin)**[261]** *Arqueología Comunitaria en la Región Ixil de Guatemala*

Esta ponencia detalla la reciente investigación participativa en las comunidades de Santa María Nebaj, San Juan Cotzal y San Gaspar Chajul, localizadas en el Departamento de El Quiché, Guatemala. La investigación socialmente comprometida comienza con la elaboración de un atlas regional que reconozca y actualice el listado "oficial" de sitios arqueológicos para su protección. Entre las herramientas metodológicas más valiosas destacan los datos provenientes de historias orales que sobreviven varias generaciones de migraciones, exilios, destierros y repoblaciones en la región, así como la participación activa de autoridades indígenas, arqueólogos, etnohistoriadores, antropólogos, y conservadores expertos en patrimonio. Inclusivamente, se propone realizar el cambio de los nombres ya institucionalizados de los sitios arqueológicos para que sean más acordes a las realidades locales. Se presenta también, la parte correspondiente a la excavación que se ha discutido con las autoridades y localidades para la elaboración de mapas culturales. El alcance final del proyecto es que dichos mapas abarquen y proyecten las distintas etapas históricas y la sobrevivencia autónoma de éstas comunidades.

Corpuz, Monica**[27]** *Unearthing the Mysteries of the Frank Palmer Archaeology Collections*

The Frank Palmer collections were the founding collections of the first museum in Los Angeles, the Southwest Museum, opened in 1914, and also for the Southwest Society's exhibit in the Pacific Electric Building in downtown Los Angeles of 1907. Their profound importance to the individual founders of the museum, the Southwest Society and to the general populace of Los Angeles is well documented in meeting minutes, newspaper clippings and articles in magazines. The artifacts assembled by Frank Palmer came from all over southern California from sites such as Redondo Beach and the southern Channel Islands. However, the origins of the collections are murky as are many of their current locations. Additionally, very little research has been conducted on the collections and so they are poorly understood. Collections such as the Frank Palmer collections represent an important resource for research into early collecting practices and the aims of early museums and archaeologists. I plan on discussing my research on the Frank Palmer collections that I have conducted at the Autry National Center of the American West on the Southwest Museum Collection.

Corrales-Ulloa, Francisco (Museo Nacional de Costa Rica) and Adrián Badilla-Cambronero (Museo Nacional de Costa Rica)**[170]** *Exchange, production and consumption of exotic and exclusive goods in the delta of Diquís, Costa Rica.*

Exchange and consumption of various goods in late prehistoric period chiefdom societies of the Diquís Delta, southern Costa Rica is discussed. Because of its geographical position and socio-economic development the Diquís region had a major role in exchange and regional relations, in Greater Chiriquí (southeastern Costa Rica and western Panama), and at the extra regional level (southern Central America). Various goods (metal objects, statuary, polychrome and biscuit pottery, polished axes, stone spheres, etc.) had different areas of distribution and consumption within Greater Chiriquí that have been related to manufacturing sites and centers of power. At the same time, in major sites like Finca 6 and Caño Island, fragments and whole pottery vessels from Guanacaste (NW Costa Rica) have been found, suggesting trade routes along the Pacific coast. This pottery has been found in contexts along with other polychrome types and anthropo- and zoomorphic statuary with a restricted area in the Diquís delta, suggesting the acquisition of exotic goods and production of exclusive goods by the delta's chiefdom societies.

[316] *Geospatial Analysis of Material Procurement and Distribution in the Hinterlands of Northwestern Belize*

The ancient Maya employed a wide variety of lithic raw materials for tool manufacture, such as strategies that combined local production of flaked stone tools with the import of some finished tools from distant sources. Over time, variable stone tool acquisition, manufacture, and use are reflected in the comparative differences in the formal versus expedient technologies and raw material types from a variety of contexts, including ceremonial, non-domestic, and domestic. The authors will present an overview of the dataset from excavations in northwestern Belize and the lithic raw materials available from sources within and adjacent to the research area. Geospatial analysis of raw material procurement and distribution during the Late and Terminal Classic periods will be examined through the use of a Geographic Information System. The spatial distribution of materials will provide insights into the regional and localized circulation of goods. Indicators of greater diversification and intensification are expected to appear in productive households to confirm that the local economy was focusing on supplying and procuring materials for commodity and non-commodity production to support administrative structures and guarantee integration in the local and regional economy.

Cossin, Zev**[394]** *Indigenous Labor and the Hacienda System: Examining Everyday Micropolitics and Global Capitalism at the Historic Hacienda Guachalá, Ecuador*

Scholarship in a variety of disciplines pertaining to global flows of people, goods and ideas have begun to emphasize the mediating effects of local communities and cultural logics on and against broader transformations and structural conditions. This topic is of particular importance to an anthropological understanding of both contemporary capitalist processes globally as well as their historical precedents. Recent theoretical approaches to contemporary capitalism, specifically, approach capitalism as performative, as highly adaptive yet premised on stable repetition, and as a relational series of networks that compose an ongoing project rather than a fixed total system. More than an economic system, it is a medium for intercultural entanglements that consist of dynamic social formations, networks of production and circulations. In this paper I synthesize archaeological and documentary evidence pertaining to the colonial and post-independence occupations of the historic Hacienda Guachalá in the highlands of Ecuador. In so doing, I reflect on the ways that this literature usefully intersects with archaeological work and the capacity of material analysis to contribute to such discussions.

Coster, Adelle [186] see Kealhofer, Lisa

Costin, Cathy (California State University, Northridge)**[398]** *Crafting Identity and Wealth on the North Coast of Peru*

The "organization of production" is not a monolithic, homogeneous entity in complex empires, and the production of different types of goods will be organized commensurate with the role they play in sociopolitical processes. In this paper, I investigate the ways in which craft production was reorganized after the Inka conquest of the Chimú polity of Peru to control the creation and deployment of wealth and to manipulate the construction of social identity in the changing sociopolitical landscape. Some ceramic production became more centralized under the auspices of the state than it had been under the prior regime, because heretofore most ceramics had not been

politically charged. In the case of textiles, authority over production was decentralized. The greater centralization and establishment of attached ceramic production served to consolidate control over symbolic content and the distribution of objects used in political feasting and ritual. In contrast, the decentralization of textile production both precluded provincial administrators from monopolistic control over the production of wealth items and supported state ideological ends. Overall, by assuming control over elite textile production and instituting state-sponsored ceramic production, the Inka co-opted the production and display of social identity and established control over the visual discourses of power.

[347] *Social Implications of a Maize-Free Botanical Assemblage in Early Middle Horizon Contexts at the Huaracane Site of Yahuay Alta, Middle Moquegua Valley, Peru*

Analysis of the micro and macrobotanical remains from the Huaracane settlement of Yahuay Alta's early Middle Horizon (A.D. 550 – 800) contexts revealed no recorded signature of maize use at this site, but the presence of a variety of other agricultural remains. We know that the Tiwanaku and Wari states established colonial settlements in the Moquegua Valley in this period, and that the Tiwanaku colonial project in the middle valley focused on its excellent potential for maize agriculture.

Regardless of Yahuay Alta's close proximity to Tiwanaku maize fields, the site's maize signature was silent. Importantly, sampling on living surface and midden contexts recovered no indicators of other Andean crops, typical of the Middle Horizon, e.g., potatoes, quinoa, or aji peppers. Instead, the remains of weedy greens and the root crop arracacha (*Arracacia xanthorrhiza*, Ban. APIACEAE) dominated the botanical assemblages from domestic contexts. We consider the presence of the evidence together with the rest of the material culture remains to discuss Yahuay Alta's early Middle Horizon agricultural and political economy. We argue that this apparently maize-free diet was at the root of a complex Huaracane strategy that avoided cultivating and/or consuming maize to remain inconspicuous in a potentially contentious political landscape.

Costosa, Jen-I (Graduate School and University Center CUNY)

[290] *Digging the Past- Creating New Pathways for the Future: Graduate Student Perspective from the Field*

As local communities are trying to adapt to the challenges of the anthropocene they are being faced not just with the loss of archaeological sites but also their livelihoods, identity and home. When living in a small island developing state (SIDS), the partnership of cultural heritage investigations with citizen science, transcends theory and provides the local participants with the tools to conserve and preserve the stories of the past while making empowered solutions towards challenges of the future. Teamwork and collaboration has always been key in archaeological fieldwork but it was mostly driven from the outside in. This new bottom up approach assists junior researchers in building cultural sensitivity and awareness while generating the colleagues of tomorrow from the very communities they have the privilege of working in. An archaeological understanding that values and is inclusive of local stakeholders is necessary to foster heritage and pride to combat paralysis in the face of climate change and create resilience for the future. Citizen science is not only life changing for the local citizens but a new way of training the scientists of tomorrow.

Côté-Landry, Maude [121] see Gardner, Chelsea

Coudart, Anick (Arizona State University)

[82] *European Neolithic Houses & New-Guinean Contemporary Houses: Toward a Material Culture Theory*

The archaeological and ethnographical study of domestic dwellings gives us the opportunity to grasp the logical structure that underlies the transformation of any architectural tradition, then the process of reproduction-transformation of a cultural group, and ultimately the evaluation of its sustainability. A comparative architectural approach between Bandkeramik Neolithic and New-Guinean Anga groups allows us to extract the structure inherent in architectural traditions; i.e. the articulation between cultural rules, variations between households or settlements, and contingent differentiations. Since

there is a structural correspondence between the dwelling and the collective representations that underpin each culture, it becomes possible (through domestic architecture) to measure the relative importance of the terms that describe this structuration. As each of these terms relates to a greater or lesser degree of stability, this allows us to measure, at the level of the cultural 'system', the relationship between the factors contributing to stability (cultural norms) and those relating to instability (individual expressions and contingent adaptations). In other words, this allows us to investigate the relationship between sustainability and resilience, and presents us with one avenue to evaluate the logic that is responsible for the reproduction of a cultural system, as well as the potential life-span of its identity.

[315] *Illuminating Invisible Houses: Using Ground-penetrating Radar and Three-Dimensional Geospatial Modeling to Reconstruct 19th-Century Irish Homes, Inishark, Co. Galway, Ireland*

This poster examines the use of ground-penetrating radar in combination with three-dimensional modeling to identify, examine, and virtually reconstruct the subsurface material remains of nineteenth century homes on the islands of Inishark and Inishbofin, Co. Galway, Ireland. In this research we employ a multi-stage research program starting with a ground-penetrating radar survey of multiple house sites and a digital scanning of the ground surface to develop a high-resolution topographical map, followed by the archaeological excavation of houses. This allows for a more nuanced understanding of the interconnections between different data sets and the changing nature of architectural remains on the island. The spatial arrangement and layout of sod and stone buildings, as well as the extent of their preservation, can provide valuable insight into the daily lives and shifting residential practices and social customs of the nineteenth and early twentieth century villagers of Inishark and Inishbofin.

Couplin, Shawna [391] see Delaney, Colleen

Coutu, Ashley (University of Cape Town/University of York)

[391] *ON THE TRAIL OF IVORY: MAPPING TRA.D.E IN IRON AGE SOUTHERN AFRICA*

Our current knowledge of the pre-colonial ivory trade in southern Africa consists of evidence from a number of archaeological sites dating from the 7-11th centuries A.D., such as Schroda, K2, Ndondonwane, and KwaGandaGanda. These sites have yielded large caches of ivory debris, suggesting that these places were centers for ivory carving/production. However, it is unknown whether raw ivory was obtained locally or brought from further afield, whether there was a standardised mode of production, and which markets drove the demand for its manufacture.

In order to investigate these questions, a combination of bioarchaeological techniques has been utilized to determine the species of the ivory (Zooarchaeology by Mass Spectrometry), as well as isotope analysis to determine possible source regions. This paper will present the ZooMS and isotope data ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$, $\delta^{18}\text{O}$ and $87\text{Sr}/86\text{Sr}$) from the analysis of ivory artifacts and working waste from Iron Age sites in southern Africa. Isotope measurements from the ivory have been mapped onto environmental variables to reconstruct the catchment areas. Ultimately, this data will be combined with evidence for other trade goods (cattle, metal, glass beads) to better understand the movement of commodities across southern Africa from the first millennium A.D. onwards.

[278] *True Facts About the Dinwiddie Site: Surprising Results from Limited Testing in a Disturbed Site*

Archaeology Southwest and the University of Arizona's 2014 Upper Gila Preservation Archaeology (UGPA) field school excavations at the Dinwiddie Site (LA106003) produced interesting and somewhat unexpected results. Dinwiddie is a Cliff Phase (A.D. 1300 – 1450) Salado site located along Duck Creek, a tributary of the Gila River, in southwestern New Mexico. It was partially excavated by avocational archaeologists in the 1960s and the remaining deposits have faced

multiple sources of disturbance. Despite this history, test excavations in small areas of intact deposits at risk for future disturbance revealed unanticipated variability in architecture and ceramics between roomblocks. Spatial variation in pottery types represented in different parts of the site may be linked to temporal differences or to variability in social connections. Evidence of intensive remodeling and rebuilding in some rooms indicates a longer period of occupation than has commonly been attributed to Cliff Phase sites.

Coward, Fiona (Bournemouth University)

[210] *Using Networks to Investigate Material Identities in the Epipaleolithic and Early Neolithic of the Near East*

This paper will illustrate the potential of methods derived from network science and especially social network analysis can be used to investigate the social interactions and relationships within and between the earliest village sites in the Near East across the shift from a mobile hunting-and-gathering way of life to a more sedentary, village-based and ultimately agricultural lifestyles. This approach provides a new perspective on the question of social change at the time as it views social groupings as dynamic, emergent networks of relations, rather than as discrete, static and homogeneous entities. The fundamental significance of material culture to personal and group identity is used as the basis for social network analyses of a database of material culture from more than 500 sites across the region; This paper thus challenges accepted 'cultural' and temporal groupings but also points to some potentially significant temporal trends in the data over the course of this period, and goes on to consider ways in which the use of SNA might be developed and enhanced to address these issues in more sophisticated ways in future.

[97] *To Retest or Not To Retest: A Case Study at Wide Ruins*

To conduct an archaeological data recovery project using another's testing results as your guide can be problematic, especially when those results are over a decade old. In 2014 Northland Research, Inc. undertook a large data recovery project at two sites located at the Wide Ruins Community on the Navajo Nation. Both of these sites had been previously tested by a company other than Northland. One of these sites AZ P-37-42(NN) was an obvious habitation with the remnants of a room block and an associated great kiva located just outside of the right-of-way. For this reason a less than robust testing strategy was utilized on this site. As a result of testing, a total of 80 cultural features were projected to be within the right-of-way. In reality Northland located well over 350 archaeological features within this site. This poster presents the results of the archaeological testing and subsequent data recovery at AZ P-37-42(NN) and examines if an alteration of testing methodology would have made a significant difference in the archaeological feature projections. Additionally this poster seeks to provide some insight on the lessons learned from the Wide Ruins excavations.

[310] *The UseWear Analysis of the Blue Lake Museum Lithic Collection*

This paper examines the usewear related modifications on an assemblage of North American lithic artifacts that is held by the Blue lake Museum. The collection consists of a variety of material and tool types. There are a number of flaked projectile points and scrapers, as well as groundstone tools. All pieces were acquired by the Blue Lake museum through donation by private individuals and not all of the pieces have a known context. There has not been any intensive analysis carried out on this collection. Usewear analysis will be used to determine whether or not a given artifact was utilized and, if possible, to determine the work action the tool was engaged in as well as what material the tool was used on. Microscopic analysis will be used to examine usewear and coupled with ethnoarchaeological research to determine origins of the pieces. This paper will provide the Blue Lake Museum with a greater understanding of their lithic assemblage as well as guidelines for doing usewear analysis on museum lithics collections with no archaeological context.

Crabtree, Pam (New York University)

[28] *Beyond Bones: Non-Faunal Evidence for the Role of Dogs in Anglo-Saxon Society*

Zooarchaeological data have provided much new information on Anglo-Saxon dogs including information on animal sizes, ages at death, paleopathology, and evidence for the treatment/mistreatment of dogs. However, many aspects of the relationship between humans and dogs in the Anglo-Saxon period cannot be understood on the basis of animal bones alone. This paper will explore the non-archaeozoological evidence for human-dog relationships in the Anglo-Saxon period drawing on evidence from literature and art history. The paper will focus specifically on the role of dogs in hunting and falconry.

Crabtree, Stefani (Washington State University)

[84] *Alliances, Coalitions, Hierarchies and Conflict in the Ancestral Pueblo World*

Using the experimental testbed of the Village Ecodynamics Project's agent-based simulation "Village," we examine how population growth and resource depletion in the Central Mesa Verde landscape between A.D. 600 and A.D. 1280 set the stage for territorial conflict, and how lineage and clan membership likely affected the structure of coalitions. We take a three-pronged approach, combining models for the evolution of leadership, models for the formation of coalitions and alliances, and models for conflict. In our model, groups may choose to fight offending groups or offer a merger with those groups when territories are contested. As time goes on, conflict may arise over productive agricultural land and a structure of hierarchical relations between groups may develop, forming what we call "complex groups." These hierarchies may be more or less stable due to many internal dynamics, including the productivity of the environment, the ability of dominant groups to retain dominance, and the ability of subordinate groups to leave hierarchies. This paper thus directly examines how networks of relationships among groups emerge through time, and how those networks (in the form of coalitions or alliances) ameliorate conflict or help groups win in conflict.

[398] *Going Where the Job Takes You: Itinerant Producers in the Eastern Roman Empire*

Architectural relationships between the eastern Roman imperial capital at Constantinople and its provinces have traditionally been understood as derivative. In the province of Isauria on the southern coast of Anatolia, however, distinctive remains have led to the conceptualization of a group of native stonemasons known as 'Isaurian builders,' who traveled through provinces across Anatolia and northern Syria, leaving in their wake an identifiably Isaurian style of early Christian churches. At the same time, brick masons from the capital were exported to the provincial capital at Seleukeia, whose workshop in turn exported its product even further afield. This paper addresses the movement of craftpersons to, from and within Isauria, questioning traditional understandings of innovations and developments in construction materials and techniques between a province and its capital, as well as relationships between provinces within the same empire. This has ramifications for understanding

these workmen as itinerant specialists, matching the quality of the regional limestone in the caliber of its stonemasons, or as seasonal workmen, driven by economic circumstances to ply their skills and labor outside their native province. More broadly, it illuminates our understanding of the inter-provincial movement of productive knowledge and technologies, facilitated by the very fabric of empire.

[304] *From La Villa to Pueblo Grande: Corporate Descent Groups and Property Rights Along Canal System 2*

Most studies of the organization of Canal System 2 have taken a “top-down” approach and focused on the degree to which a centralized management structure was required to operate and maintain the canal system. In this paper, we take a “bottom-up” approach and focus on the interests and concerns of the irrigators themselves. Architectural data from several pre-Classic sites along the canal system are examined in an attempt to reconstruct the organizational strategies of multi-household, corporate descent groups. We argue that corporate descent groups often contained a core set of high-ranking households and affiliated households of lesser rank. It is further suggested that high-ranking households were able to maintain a position at or near the top of the social hierarchy for several generations, similar to “house” societies in many parts of world. The implications of the emergence of house-like social formations in early Hohokam society are discussed. The implications for our understanding of the pre-Classic to Classic period transition are also considered.

Craig, Lorena (University of Montana)

[312] *Lithic Raw Materials Procurement and Exchange at Housepit 54, Bridge River Site, British Columbia: What a Diachronic Perspective Reveals*

While the Bridge River settlement in the Middle Fraser Canyon of British Columbia is located in one of the richest salmon producing areas on the Fraser River, occupants of the site had limited direct access to many sources of raw material critical for production of chipped stone tools. Current excavations by Dr. Anna Prentiss at Bridge River Housepit 54 focus on an estimated 15 housepit occupation floors dating in the range of 1000 to 1500 cal. B.P. This allows for a unique study of intergenerational adaptations. This poster presents results of analysis of lithic raw materials acquired from known sources with a focus on defining relationships between the organization of lithic raw material acquisition and use and variation in subsistence pursuits. More specifically, this study seeks to test hypotheses linking patterns of land use to strategies of lithic procurement. For example, it can be hypothesized that periods of subsistence diversification and “search” oriented foraging strategies led to more frequent use of distant lithic raw material sources. However, access to toolstone through trade also remains an important alternative hypothesis for lithic raw material procurement, especially in light of Bridge River’s highly productive fisheries and proximity to trade routes.

[78] *The Development of ‘Peripheral Communities’ in the Eastern Andes*

The Chachapoya have come to be seen as a peripheral cultural entity in relation to the broader Precolumbian Andes, yet little work has addressed how these ‘peripheral’ communities developed in relation to each other. While it is clear that the material culture that is manifestly associated with the Chachapoya developed prior to A.D. 1000, it is unclear how uniform this process was on a regional level. In the Precolumbian Andes the development of centralized and partitioned monumental architecture has been commonly used as evidence for social and political transformations. This paper utilizes a scalar perspective to position the social and political changes of the Chachapoya on a regional level. Further, in order to better understand the development of Chachapoya communities,

this paper addresses the significance of centrality for one such community, Purumllaca de Soloco, and the role that the construction of its monumental architecture and the accretional changes of the surrounding settlement played in the social and political development of its community.

[311] *Trends in Catawba Architecture, ca. 1750-1820*

Recent archaeological investigations have documented a series of sites associated with the historic Catawba Nation in South Carolina dating from 1750-1820. During this period Catawba communities underwent dramatic and abrupt changes associated with population loss from epidemic disease, settlement relocation, and the development of new economic strategies. Among the most striking of these, were changes in domestic architecture. In this poster, we define various types of Catawba structures present on late eighteenth-century sites and identify chronological shifts that demonstrate a transition from the construction of post-in-ground houses to log cabin architecture. Finally, we address what these changes in architectural modes tell us about shifts in community organization through time.

[342] *Shiny Grooved Surfaces: The Case Study of the Skiles Rockshelter, Lower Pecos, Texas*

Shiny grooved surfaces are common in rock shelters and cave sites in the Lower Pecos region, Texas. They are found on horizontal as well as vertical exposures, usually in close association with mortars and/or rock art. The shiny appearance has been interpreted as the result of human traffic, hand touching, animal sacrifice, etc. In many cases these surfaces are densely grooved and incised by a variety of shallow and deep marks which are not found outside the shiny surface. Such phenomena have scarcely been analyzed in detail, in spite of their central location within many sites and their assumed social/ceremonial importance. The aim of this paper is to present a new analytical protocol based on Structure from Motion photogrammetry, high-resolution 3D models and spatial analysis. We use one case study from the Lower Pecos (Texas) and focus on the location, context and characteristics of the shiny surface, background noise, associated features (mortars), microscopic residues, and especially the grooves and incisions. These are characterized in terms of dimensions, cross-section, location, orientation, production and use signs. Their spatial clustering and super-imposition are studied in detail. The results provide new insights into the utilization history of the surface and suggest possible interpretations.

[333] *Thule Response to Climate Change at Cape Espenberg, Alaska, CE 1500-1700*

Food plant remains and wood charcoal provide insight into how prehistoric Arctic peoples may have adapted to climate change. This study addresses Thule plant and fuel use at Cape Espenberg, Alaska from CE 1500-1700. Plant macrofossil and charcoal remains were sampled from occupation layers of three Thule semi-subterranean houses. Macrofossil and charcoal counts were analyzed using ANOVA, T-test, and Tukey Post-Hoc tests. Results indicate that plant foods contributed vitamins and fiber to Thule's primarily meat diet. Wood was an important fuel, but was supplemented by bone and blubber. Conservation of woody fuel may reflect a decline in local driftwood availability due to climate change. These results underscore the importance of plants as food and fuel to prehistoric Arctic peoples, and demonstrate how these variables can be interpreted as proxies for climate change. Furthermore, these data suggest how modern Inupiat subsistence strategies may change in a warming Arctic.

Crawford, Gary (University of Toronto)**[414]** *Niche Construction and Early Agriculture in Northeastern North America*

Agriculture in the Northeast is a secondary development with research focusing on migration as a result of population growth in agricultural centers and the introduction of maize, bean, squash, sunflower and tobacco and the subsequent consequences of their introduction. Unlike pristine/primary origins whose explanations are couched in complex ecological considerations, be they interactive (ecological engineering, niche construction) or based in HBE (human behavioral ecology), ecological considerations are rarely considered in secondary origins. This paper explores varying modes of human-environment (particularly plant) interaction before and after the onset of maize production in Ontario. Human decisions and activities in Ontario before and after the introduction of maize appear to have played a significant role in agricultural development in the region, including the evolution of crops and the local landscape.

[345] *Discussant***Creager, Brooke (University of Minnesota)****[332]** *Problematizing Religious Transformation: Burial Evidence for the Transition to Christianity*

The identification of religion through the examination of burials faces many problems, mainly the different avenues of interpretation. This paper will examine the conflicting evidence for religious belief used to identify religious practice in burials. The use of a few key features, or lack of features, to designate a burial of one religion or another does not take into account variation or coincidental practices, which only resemble a particular religion. Mixed burials present another problem of interpretation, as they are often described as transitional, marking the period between a traditional polytheistic and Christian society or as a hybrid religion attributed to the catchall of polytheism. Religious theory allows for multiple interpretations of any one burial assemblage. My thesis developed using a case study of conversion in early medieval Britain will be considered at such sites as Spong Hill and Sutton Hoo.

Crebbin, Kyle (Southern Oregon University), Chelsea Rose (Southern Oregon University) and Shana Sador (Southern Oregon University)**[12]** *The Jim Rock Historic Can Collection Online Database at Southern Oregon University, Ashland*

Jim Rock was an historical archaeologist known for his passion for the humble 'Tin Can.' Prior to his death in 2010, Rock spend much of his lengthy career with the Forest Service focusing on education and outreach. Rock amassed a large comparative collection of bottles and cans, which he housed in suitcases and carted around teaching both the public and the professional archaeological community about the importance of often overlooked and undervalued artifacts, particularly cans. Rock's 1987 volume "A Brief Commentary on Cans" remains instrumental in historical archaeology in the American West. Upon his death, the collection was given to the Southern Oregon University Laboratory of Anthropology (SOULA), who continues to use it as a teaching aid. In the interest of honoring Rock's legacy and sharing his collection with a wider audience, SOULA collaborated with the Southern Oregon University Hannon Library in the digitization of the collection within a searchable database available to the public.

Creger, Cliff (Nevada Department of Transportation) and Beth P. Smith (Nevada Department of Transportation)**[6]** *Spatial and Small-scale Geoarchaeological Analysis of a Middle Archaic Antelope Trap in Northeastern Nevada, U.S.A.*

Great Basin Antelope Traps are ideal laboratories due to their feature system level focus on one set of subsistence behaviors (antelope hunting). By combining data collected using LiDAR, GPS and GIS, our analysis in the Liza Jane Trap focused on the spatial patterning of lithic artifacts and the location of small-scale landforms.

The geoarchaeological analysis indicates relatively stable landforms modified by cultural-transforms.

Analysis to locate small-scale landforms was performed to locate remnant landforms that might bely the location of the trap wall.

The spatial analysis of the site lithics indicates that the breakage pattern and distribution of the projectile points is concentrated along specific trajectories. Both dart and arrow points are present at the site. The spatial analysis of the projectile point accumulations show trajectories that stem from one location and repetitively use the same trajectories based on the range of points, although distances covered by each technical projectile system are different.

The results of the geoarchaeology and the lithic spatial analysis indicate that the harvest zone is spatially patterned and stable even though the technology shifted from dart points to arrow points over time.

[84] *Empirical Validation and Model Selection in Archaeological Simulation*

Empirical validation is a key stage of any model development process and should provide an objective and quantitative account of the model performance. Yet, too often this stage plays a marginal role in the inferential exercise, with many discussions almost exclusively dedicated on the model building process. This paper discusses this neglected aspect of archaeological simulation, distinguishing two approaches drawn from epistemological parallels with statistical modelling. The first utilizes simulations as some sort of null templates; observed summary statistics are compared against simulation generated data, and significant deviations often becomes the basis for the development of more complex models. The second approach, which is the main focus of this paper, is centered on the theoretical framework of multi-model inference. Multiple competing models are formalized as computer simulations and compared against each other on the basis of their complexity, knowledge of the parameters, and goodness-of-fit to the observed data. The result is a probabilistic evaluation of whether one model is “better” than another, a solution that can overcome the problem of equifinality through its quantification. Examples from Neolithic and Bronze Age Europe will showcase the pros and the cons of this latter approach.

Crock, John (University of Vermont)

[43] *Levels of Public Engagement in Vermont Archaeology and Striving to Match Outreach with Outcomes*

A review of the last 15 years of the University of Vermont Consulting Archaeology Program's public outreach activities suggests that projects with experiential learning components and strong community partnerships have had the greatest impact. Efforts that combine visits by school groups to the field, excavations open to the public and field work opportunities for volunteers generate the greatest participation and public interest and yield the most positive feedback. Handbook style publications in print and online also have been well-received by both general readers and teachers tied to a standards-based curriculum. Due to common issues such as project size and accessibility, however, it is difficult to regularly replicate the grand successes and often challenging to link specific project areas and results to specific outreach efforts. It is even more difficult to measure the long-term, lasting impacts of any efforts, especially for desired outcomes such as engaging an all-inclusive public, promoting archaeological awareness and stewardship, and maintaining support for compliance-related legislation.

[12] *Shared Ritual Ideologies: Long Spouted Vessels on the Iranian Plateau in the Third and Second Millennium B.C.E.*

Interactions between Mesopotamia, Iran, and Central Asia during the third and second millennium B.C.E. are well documented with much written on this topic. I will expand on this scholarship by tracing long spouted Iranian vessels across these regions to investigate possible shared ideologies. These vessels are often associated with Iron Age context in northern Iran, but this characteristic trough spout has been present on vessels on the plateau since at least the 4th millennium B.C.E. This unique design forces the user to confront the vessel's shape making it an ideal object for transmission of cultural ideas. Depictions in cylinder seals and figural art suggest a possible ritualistic function and grave analysis suggest their inclusion in a ritual set. For this poster, I combine these data with spatial and network analysis to illustrate how these vessels may represent a shared ritual ideology that persisted across the Iranian plateau and Central Asia during the third and second millennium B.C.E.

Crombé, Philippe (Ghent University, Department of Archaeology) and Erick Robinson (Ghent University)

[40] *The Impact of the 9.3 Cooling Event on the Human Environment in the Southern North Sea Basin*

In a recent paper Robinson et al. (2013) could synchronize major changes in Mesolithic armatures and the development of the Rhine-Meuse-Scheldt Culture with the abrupt cooling event of 9.3 cal BP. It is suggested that this climatic event led to environmental stress which triggered the development of inter-regional social networks, e.g. by expanding long-distance raw material exchange and creating particular socially symbolic artifact types. Yet, the impact of the 9.3 cooling event on the landscape, in particular the vegetation, still remain poorly understood due to a lack of sedimentary deposits. Today, new evidence has become available which points to a marked increase of forest fires at the onset of this particular cooling event. In this contribution we will investigate whether there is a causal relationship between both and which impact these forest fires may have had on contemporaneous hunter-gatherers. One possible explanation is that the colder and drier conditions connected to the 9.3 event induced the burning of large stands of trees. Alternatively the increase in forest fires may reflect a response of hunter-gatherers to abrupt cooling. Controlled burning of the forest may have been applied in view of stimulating particular plant species (e.g. hazel) and/or optimizing the hunting.

Cronin, Joseph (PIARA) and Rebecca E. Bria (Vanderbilt University and PIARA)

[252] *Not Incised, but Well-Burnished: A Typology of Undecorated Early Horizon Feasting Wares from Hualcayán, Highland Ancash, Peru*

Feasting has long been recognized as one of the most widespread and significant political and ritual activities in the prehispanic Andes. In spite of this deep significance, the undecorated ceramics that undoubtedly played important roles in these ritual events are often overlooked for analysis in favor of their more elaborate, decorated counterparts. Here, we present a quantitatively constructed typology for undecorated ceramic vessels recovered from an Early Horizon ceremonial mound at the site of Hualcayán in the highlands of Ancash, Peru. Examining functional characteristics like vessel form alongside a suite of technological variables including firing, temper selection, and surface finish technique, we explore evidence for multiple production processes and consider their implications for reconstructing the social organization of feasting events in the Ancash highlands. More broadly, we examine Hualcayán's parallels with and departures from other models of feasting organization during the Early Horizon, taking into consideration the reported ceramic assemblages from contemporary sites on the north-central coast as well as those throughout the neighboring highlands.

Cross, John (Bowdoin College)

[281] *Lives as Lived in the Archaic: A Human Agency Perspective*

Archaeological fieldwork in the Northeast over the last 20 years has resulted in a significant increase in the number of known pre-Contact sites with radiocarbon-dated components; we no longer speculate on whether or not people occupied the region during the Early and Middle Archaic periods. However, the emphasis has largely been on fitting new data into an existing framework of anthropological and evolutionary generality, rather than on exploring the historical specificity of the archaeological record. In an effort to re-cast the discussion, I draw on insights from human agency to frame research questions that are appropriate for the social, spatial, and temporal scales at which people lived their lives in the past. Excavations at the multicomponent Simpson-Stewart site in Maine illustrate several promising avenues for research and also examples of the challenges and biases introduced by preservation, field methods, and in the ways in which variation in the archaeological record has been aggregated into broad-scale units of time, space, and culture. Future syntheses of the Archaic Period in the Northeast will necessarily involve a critical re-examination of the assumptions that underlie the culture history that we think we know, and a recognition of the historically-contingent nature of the archaeological record.

Cross, Michelle (Cardno)

[416] *A Freeway Through the Past: The Replacement of Doyle Drive through the Presidio of San Francisco National Historic Landmark*

The historic south access road to the iconic Golden Gate Bridge, was known as Doyle Drive. It was identified as structurally and seismically deficient in the early 2000's and construction on its replacement began in 2009 by the California Department of Transportation (Caltrans). The Doyle Drive Project was unique in that it spanned the Presidio of San Francisco, a National Historical Landmark District, and that it involved several agency landholdings and stakeholders including the Presidio Trust, National Park Service, San Francisco County Transportation Authority, Federal Highway Administration, and Caltrans. This presentation will address the archaeological and mitigative approaches undertaken for this multi-year project, unexpected archaeological finds, and review the unique history that the "freeway" crossed through. The presentation will present the results of archaeological and historical research associated with the Doyle Drive Project through 2012 and how these finds shed light on the history and development of the Presidio of San Francisco, as well as the growth and development of the City of San Francisco at large.

[144] *Electromagnetic Induction Survey at Matacanela to Detect Off-Mound Structures and Landscape Features*

Approximately 2.28 ha of Matacanela were surveyed using an electromagnetic induction meter to measure near-surface variations in magnetic susceptibility and/or conductivity. Eight distinct areas were selected for survey deemed most likely to reveal Late Classic or Postclassic occupation or landscape features based on topographical features, LiDAR imagery, and surface finds. The primary areas of interest were off-mound and plaza areas containing domestic or non-elite contexts. The largest contiguous survey block, measuring 1.1 ha, encompasses two U-shaped plazas with intervening low mounds. Despite some limitations in data collection due to field crops, survey results indicate several subsurface anomalies that can be tested in the second field season or further explored with more detailed or alternate prospection techniques, including ground penetrating radar.

Crowell, Aron (Smithsonian Institution)

[374] *The Intensification of Indigenous Sealing in Southeast Alaska: A 19th Century Camp Complex at Yakutat Bay*

Late 19th century harbor seal hunting among the glacial ice floes at the head of Yakutat Bay attracted hundreds of Tlingit, Eyak, and Tsimshian participants who harvested thousands of seals, an annual congregation of indigenous peoples that exceeded any other in southeast Alaska. The extraordinary scale of this communal, clan-mediated enterprise by the 1870s derived in part from the abundance of seals at Yakutat and subsistence demand (especially for seal oil) but appears to have been increased by the availability of guns and a new commercial market for seal products. Extensive archaeological data from the Smithsonian Institution's NSF-funded Yakutat Seal Camps Project (2011-2014) are joined with Yakutat oral narratives, indigenous knowledge of seal ecology, archival sources, and camp photographs from the 1899 Harriman Alaska Expedition to reconstruct this post-contact trade and hunting pattern.

Crown, Patricia (University of New Mexico)

[276] *Possible Images of Theobroma cacao in the Prehispanic American Southwest*

The discovery of cacao residues in southwestern pottery raises questions about how much southwestern populations knew about Theobroma cacao. A number of possible images of cacao trees and pods suggest that some southwestern people were either familiar with the tree and the fruit that held cacao beans. Comparisons of Mesoamerican and southwestern imagery offer possible parallels in depiction of trees and fruit, and the southwestern material provides potential iconographic models that may be sought in other media.

[59] *The Impact of Low-Cost, Low-Tech DIY Approaches at the Pompeii Quadriporticus Project*

Born a paperless research project, the Pompeii Quadriporticus Project (PQP) employed multiple digital approaches to archaeology in its first three field seasons (2010-2012), including 3D modeling, ground penetrating radar, and a host of iPad applications. By the PQP's final season (2013), the availability of a number of low-tech, user-accessible digital techniques tempted us to consider if these DIY approaches could produce data sets of commensurate quality to those recorded using expensive and/or complicated equipment. Therefore, in our final season, the PQP evaluated several low-cost, low-tech DIY approaches to supplement our extant collection procedures and data sets. This paper focuses on the impact of three of these approaches: 1. DIY spectrometry, 2. in-field archival documentation, and 3. DIY aerial photography. In terms of results, some techniques proved more useful than others, but the process of implementation for each - including failures - offers insight for crafting successful future DIY approaches. Therefore, this paper also considers larger issues concerning DIY approaches to archaeology through the lens of the PQP's experience. These include the role of specialists in the implementation of DIY techniques, collaboration with a variety of fields outside of archaeology, and the combination of low-tech, DIY with high-tech, specialist

approaches.

[340] *Whose Ancestors, les Gaulois?*

Four decades ago this summer, newly arrived in a country where we barely spoke the language, our field crew began excavation of an Iron Age hill fort. First encounters quickly taught us that local identity was grounded in the tradition of the Iron Age Celts, not the later arriving Romans, Franks, or the region's powerful medieval dukes. My intention was to see how indigenous peoples had fared before and after the Roman conquest; I planned a colonization framework. But the site was a surprise, yielding evidence for repetitive utilization over three millennia as a sacred precinct, a place of feasting and the exercise of power, and a fortification against marauders. No familiar narrative could cover the site's complex history. We constructed a "meta-narrative" that could fit the site into a more encompassing framework. Landscape archaeology was in its infancy and did not yet include a regional perspective. Using a comprehensive understanding of archaeological "best practice," we assembled a new toolkit for interpretation. Our project was among the first to integrate ethnography, remote sensing, and regional- and continental-scale paleo-environmental and documentary evidence. Burgundy's complex and well-preserved history of settlement and environmental change taught us historical ecology.

[95] *Archaeology Not Only for Archaeologists: Examples of Integration of Archaeology and Rural Communities in Perú*

Many people in our society misunderstand the nature of archaeological fieldwork. The misunderstanding often results from a lack of open access with the public by professionals in our discipline. An aggressive shift to providing the public with information and education about archaeological research and the value of cultural heritage will address this concern.

In the highlands of Ancash, Perú, a central objective of PIARA (Proyecto de Investigación Arqueológico Regional Ancash) promotes co-created projects with members of rural communities to explore their prehistory. PIARA designs programs in which the host community discovers the value of their heritage and cultural identity, and archaeologists realize the value of the modern host community.

This poster focuses on PIARA's 2014 projects including the creation of a small museum in the Hualcayán community, an oral history project on the early history of the community, and fine arts projects that allow students to use the prehistoric material culture to link their past and present. PIARA's co-creative approach successfully meets both community needs and those of the professional archaeological community

[410] *Oaxaca and its Eastern Neighbors in Prehispanic Times: Population Movements from the Perspective of Dental Morphological Traits*

The dynamic interaction among human groups in Prehispanic Mesoamerica led to population exchange and migrations that have begun to be untangled from a bioarchaeological perspective. Still, little is known about the demic biological exchange between Southern Sierra Madre populations and their coeval Eastern neighbors along the isthmus and Maya corridors. The present paper focuses on dental morphology and affinities among Prehispanic settlers that inhabited the present state of Oaxaca (Mexico) during the Classic and Postclassic periods, and their relationships with coeval groups from the East. Three dental collections dated to the Classic (Monte Alban) and the Postclassic periods (Zaachila and Cerro Guacamaya) are compared with coeval collections from the Eastern territories. When the three samples are compared to Postclassic Maya ones, they cluster together, showing expected differences with the Maya coastal sites. However, when the Classic period samples are included, the collections from Oaxaca are distributed in different clusters witnessing heterogeneity within the Oaxaca region, indicating some level of morphological affinities with an isthmus sample and with Southern Lowland Maya groups, triggering broader questions regarding affinity-by-distance and population movement in Prehispanic Mesoamerica. The study has been funded by CONACyT grants CB-2010-154750 and I0010-2014-02-232831.

[144] *Mapping Matacanela - the complementary work of topographical survey and LiDAR.*

This talk compares methods used for the topographical mapping of the archaeological site of Matacanela. Specifically, we compare the results of the GIS processing of LiDAR data collected and distributed for no charge by the Instituto Nacional de Estadística y Geografía with the results of traditional topographical mapping, undertaken using a Sokkia total station. For the purposes of project planning, the LiDAR data was processed, and maps were generated using GIS. These LiDAR-based data enabled the first topographical map of Matacanela and its environs to be generated, the project area to be defined, and for cost and time assessments to be estimated for the purposes of budget preparation. Because of the uncertainty of the quality and resolution of the LiDAR data, topographical mapping of the site area was considered an important step to “ground-truth” the LiDAR, and to collect more fine-grained measurements from small-scale architectural features, artifact concentrations, and other cultural and natural features that may have been missed during the fly-overs. Here, we consider the two approaches and the type and quality of data achieved by each, as well as the benefits and drawbacks of using either approach alone.

[179] *Use-wear Analysis of Ground Stone Tools from the Jiahu Site*

Jiahu is one of the most important settlement sites of the Chinese Middle Neolithic Age (ca. 7000-5500 B.C.) and is located in the upper Huai River Valley, China. During excavations, a number of ground stone tools were uncovered. Use-wear analysis and replication experiments were conducted in order to understand the functionality, usage and contact materials of these tools. Our experiments

involved stone shovels, axes, adzes, gouges and other common stone tools from Jiahu site. Experimental results indicate that shovels at the Jiahu site were the primary digging tools. Axes and adzes were used to process wood, animal bones and fur. In addition, we found that gouges were used to process wood, meat and animal furs. Based on these findings, we propose that quite a few ground stone stools at the Jiahu site were multifunctional composite tools and there is no direct corresponding relationship between the tool morphology and function.

[260] *"Where the Mountains Meet the Plains": Plains-Pueblo Connections on the Park and Chaquaqua Plateaus During the Diversification Period, A.D. 1050-1450*

The Park and Chaquaqua Plateaus—politically bisected by the Colorado-New Mexico state line—are distinctive geographical features that demarcate the transition from the Rocky Mountains to the Llano Estacado and High Plains. Regional archaeology has emphasized interpretation of sites as part of a cultural demarcator between the Northern Rio Grande Pueblos and residents of the Southern and Central Plains. Yet there has been limited work to examine local, between-household interactions and the effects of increasing trade, conflict, and movement in those regions during the Late Pre-Colombian Period. Utilizing decades of archaeological undertakings in southeastern Colorado and northeastern New Mexico, this paper will focus on Sopris, Apishapa, and Cimarron sites of the Diversification Period (A.D. 1050-1450) and their material record as a case study for questions surrounding the concept of a "cultural frontier."

Culley, Elisabeth (Arizona State University)

[377] *Operationalizing Semiotic Theory as an Archaeological Research Method: A Levantine Case Study*

Archaeology has long flirted with Peircean semiotics as an heuristic for interpreting prehistoric behaviors and the cognitive processes that support them. Yet beyond the widespread adoption of Peircean terminology (icon, index, symbol), the discipline has been unable to operationalize the approach as a viable research method. This paper introduces Peircean Semiotics as a means of re-classifying non-utilitarian artifacts in terms of their target audiences and concomitant social consequences. Preliminary results from an analysis of Levantine deposits dating from 200ky to the Pleistocene/Holocene boundary reveal different symboling behaviors across the region and with implications for the evolution of 'modern' human cognition. As a case study, this research highlights the potential for identifying the shared cognitive substrate and social implications of seemingly diverse artifact types and for articulating multiple theoretical perspectives for more holistic analyses in a range of research contexts.

Cunnar, Geoffrey (WCRM)

[179] *Interpretation of Burial M33 at the Longshan Site of Liangchengzhen*

A relatively rich burial, M33, was excavated in 2000 at the late prehistoric, Longshan period center of Liangchengzhen by a collaborative team from Shandong University, The Field Museum, and Yale University. The most unusual grave good was a turquoise artifact located on the left arm of the interred. This presentation provides a description of contextual, use-wear, comparative and replication analyses in order to better understand the nature of the turquoise artifact and the burial ritual for the deceased.

[245] *Power before Paquimé? Hypotheses on Political Economies in Casas Grandes.*

In this paper, I outline alternative hypotheses on the nature of the late-Viejo and early-Medio Period

political economies in the Casas Grandes Regional System from what is now Chihuahua, Mexico. Recent research has described in impressive detail the productive base and the ideology that may have emerged at Paquimé during its late-Medio Period (A.D. 1350-1450) florescence. However, little is known about power in the Casas Grandes region either prior to Paquimé's brief 14th Century expansion into a primate center or outside of its immediate hinterland. Drawing on recent research from the Santa Clara Valley, I offer some alternative hypotheses for the political economies of the late-Viejo and early-Medio Periods. I emphasize the role that ritual performance may have had in local modes of production and consider its implications for the emergence of inequality in the Casas Grandes Regional System.

Cunningham-Bryant, Alicia (Temple University)

[240] *Living on the Edge: Syncretism, Acculturation, and the Meroitic Kingdom*

Although Greco-Roman Egypt has received more scholarly attention, the contemporaneous Meroitic civilization of Nubia deserves recognition as an important culture in the history of North Africa and the Eastern Mediterranean world. Examination of the archaeological evidence from the Meroitic civilization of Sudan (ca. 400 B.C.E. to ca. 400 C.E.) presents the opportunity to further current understandings of evolving cultural interaction on the fringes of several distinct world powers (namely Egypt, the Hellenistic World, and Rome).

While previous discussions of Meroitic funerary religion have attempted to address the nature of Meroitic cultural and religious integration, the small data sets, geographic specificity, and narrow scope of the attempts has meant that the entirety of Meroitic funerary religion as currently understood, is in essence based on limited archaeological evidence. This has led to skewed and incomplete presentation of the culture as a monolithic unit. Through the inclusion and analysis of significantly more archaeological evidence, taking the form of Meroitic offering tables, a more nuanced and dynamic view of the Meroitic kingdom emerged, one which demonstrates a diversity of cultural processes due to varying levels of interaction and exchange, and which presents an entirely new view of the structure of the Meroitic kingdom.

Cunningham-Smith, Petra (University of Florida) and Elizabeth Graham (Institute of Archaeology, University College London)

[248] *Invertebrate Zooarchaeology of Marco Gonzalez, Belize as One Aspect of an Investigation of Trade and Environment*

The zooarchaeological remains associated with ancient coastal communities are an important source of information on how past societies used their natural resources. They reflect people's interaction with their environment and can yield information on how these interactions affected culture, economy and—not least—the ecology of such areas. The research presented here is an analysis of large invertebrate remains, primarily conch but also other large mollusks found at the ancient Maya site of Marco Gonzalez on the island of Ambergris Caye, Belize. Large invertebrates have been hypothesized as an important commodity, traded to inland Maya sites as complete shells, as raw material “blanks,” and as finished artifacts. Shell artifacts are ubiquitous in elite and ritual deposits at inland sites, although the distances from these sites to the coast is often great. This study explores the possible uses of large invertebrates as construction material, food, and raw material for artifact production and trade, and considers the impact of mollusk exploitation on the local environment.

Curet, L. (National Museum of the American Indian, Smithsonian Institution)

[387] *Exchange and Interaction in the Caribbean: The View from Two Collections of the Smithsonian*

Recent research in the Caribbean has produced strong evidence of long distance interaction throughout the Circum-Caribbean region, including possible direct exchange between Central America and the Greater Antilles across the Caribbean Sea. A recent casual survey of the Caribbean

collections in the Smithsonian's National Museum of the American Indian and the National Museum of Natural History has identified two objects that may add information on this topic. The first one is a three-pointer found near the Lake Valencia region of Venezuela and the second a "condor" amulet from the early Ceramic Age found in Trinidad. This paper discusses the artifacts, the collection information, background on the collectors, and how these objects fit within the models suggested for long-distance interactions in the Caribbean.

[218] *Çatalhöyük and Localized Universality: The Challenge of Sustaining Heritage Post-UNESCO*

UNESCO has long set the example for heritage practice, with site practitioners worldwide motivated to achieve the nearly universally desired World Heritage Site (WHS) status to help preserve and sustain their sites. However, the idealized goals espoused by UNESCO, a global organization, are inherently universalizing, which can render them incompatible with the particularities of each local setting. One illustrative example is Çatalhöyük, Turkey. Since being granted UNESCO WHS status in 2012, more constrictive government regulations have been enacted, in what seems to be a proactive measure by local bureaucracy to ensure it maintains WHS status. Though sustainability has become a priority in UNESCO policy recently, these increasingly strict local regulations have actively hindered archaeologists from trying to institute sustainability measures locally--such as making changes on the site that would benefit the nearby community--as every modification to the site is now being strictly monitored. It is important, therefore, to consider this cautionary tale of the inherent dichotomy between global UNESCO and each unique local situation. Despite how it is widely conceived, UNESCO designation is not always the ideal answer for sustainable preservation.

Cuthrell, Rob (UC Berkeley)

[41] *Archaeobotanical Evidence and Diachronic Changes in Foodways of Indigenous Groups in the Central Coast and San Francisco Bay Regions, California*

The Central Coast and San Francisco Bay regions of California are areas of high climatic, ecological, and indigenous cultural heterogeneity. During the last two decades, archaeobotanical research in these regions has begun to document the contributions of botanical resources in indigenous foodways systems through time. In the San Francisco Bay Area, a large number of anthropogenic shell mounds were population aggregation sites used for thousands of years, and, for the period after ca. 1050 CE, archaeological evidence indicates increased sedentism and sociopolitical complexity among Bay Area groups. Elsewhere on the Central Coast, these attributes are not as apparent. By the onset of Spanish colonization in the late 18th century, indigenous peoples in both of these regions employed fire-based landscape management practices that transformed vegetation structure over large areas. This paper presents an overview of the current state of archaeobotanical research in the two regions, describes how archaeobotanical data contributes to research on changing foodways and sociopolitical systems, and considers how archaeobotanical data may make greater contributions to these topics through future research.

Cutrone, Daniel (California State University Los Angeles)

[355] *The Montezuma Canyon Citadel Complex: A Major Prehistoric Religious Shrine*

Spirit Bird Cave created a new model to evaluate Southwestern caves and earth openings in relation to prehistoric Native American beliefs about religion and sacred landscape. This model suggests that such concepts were major considerations in the choosing of settlement locations and foremost in the

ideology of the prehistoric peoples. Site 42SA2120 in Montezuma Canyon, which fits this new paradigm, has not been formally described to this point. A survey of the site found evidence that the site was a place of prime importance and perhaps served as a major religious location for the surrounding area through at least the Pueblo II period. A rock art panel associated with the complex documents an origin extending back to at least the Basketmaker III Period. It was given the name "Montezuma Canyon Citadel" during the 2013 Pecos Conference.

Cutts, Russell (University of Georgia) and Sarah Hlubik (Rutgers University)

[174] *Thermal Curve Fracture (TCF) as a Diagnostic Tool for the Identification of Anthropogenic Fire*

Recognizing fire evidence in the record can be challenging and contentious. Aside from baked earth features – hearths, daub, etc. – a widely reported associated artifact is fire-cracked rock (FCR). Unlike flaked stone assemblages, FCR lacks a standardized description, criteria, test or model; archaeologists often learn identification 'in the field.' Recent actualistic studies have demonstrated that a previously undescribed type of FCR has likely been unknowingly lumped with other 'angular fragments'—another widely reported, but not usually fire associated, artifact class. Termed thermal-curve fracture (TCF), these pieces tend to be proportionally uniform in thickness and width with a curve angle between 173° and 176°. This report details experiments testing three hypotheses: that thermal curve fractures are 1) a distinct angular fragment type, describable and clearly associated with fire; 2) produced in fires that are anthropogenic, as suggested by temperature and duration; and 3) produced primarily when knapped materials are exposed to fire. A cursory survey of 1.5 Ma collections from FxJ20, Koobi Fora, Kenya, revealed a number of potential TCF classed as 'angular fragments', suggesting the possibility that fire evidence is present on ESA sites.

Cyr, Howard (University of Tennessee), Scott Meeks (Tennessee Valley Archaeological Research), Rocco de Gregory (Tennessee Valley Archaeological Research) and Hunter Johnson (Tennessee Valley Archaeological Research)

[173] *Location, Location, Location: Multi-scalar Investigations into the Unexpected Timing and Length of Occupation of a Late Woodland and Early Mississippian Site in the Lower Mississippi Valley*

Site 22HO626 is a multicomponent site located along an abandoned meander loop of the Yazoo River, Holmes County, Mississippi. Due to the presence of surface collected exotic lithic materials and a close proximity to the Poverty Point center of Jaketown, 22HO626 was expected to represent a Late Archaic settlement within the lower Mississippi Valley. However, work by the University of Tennessee's Archaeological Research Laboratory and Tennessee Valley Archaeological Research indicates a more recent period of occupation for this riverside location, beginning during the Late Woodland period and continuing only into the Early Mississippian. This multidisciplinary study, which incorporates site-level artifact, feature, and stratigraphic analyses with a landscape-scale remote sensing investigation, provides an explanation for the unexpectedly late period of occupation and for its relatively short duration. This case study illustrates the importance of multi-scalar approaches in examinations of cultural resources and settlement strategies within dynamic environments such as those found within the complex fluvial landscape of the Mississippi Alluvial Plain.

Czerniak, Lech

[211] *Is Length Significant? LBK Longhouses and Their Social Context in Central-Eastern Europe*

In studies of LBK societies, one of the categories of feature which are potentially indicative of differences in social status are longhouses that are notable for their substantial length (e.g. over 33 m). The author examines this issue based on examples of LBK longhouses in Poland. Rescue excavations carried out during the past decade along the routes of planned motorways have led to the discovery of over 100 new longhouses together with their broader settlement contexts. This has

provided a fresh insight into the social significance of very long longhouses based on analysis of their construction details and interior layout, evidence of extensions and repairs, the composition and distribution of refuse, as well as spatial relationships with other houses and changes over time. The author believes that the longest of longhouses was not the seat of an individual of exceptional status, but rather home to the most numerous (and most important?) household.

Daehnke, Jon (University of California, Santa Cruz)

[146] *Turning Privilege into "Common-Sense": Truth-Claims and Control of Cultural Heritage*

Over the course of the last few decades Indigenous and descendant communities have increasingly made calls for control of their own heritage, both in terms of material objects and historical narratives. While these efforts have resulted in at least some measure of success, these communities continue to occasionally face challenges from researchers, scholars, and other agents who are in positions of power that allow them to control and define what heritage consist of. In my paper I interrogate the ways that those in positions of power use language and other mechanisms to normalize and universalize what are actually very culturally dependent views on the ownership, forms, and purposes of heritage. In effect, their position of privilege gets transformed into "common sense," and culturally contingent truth claims become reasonable and shared, while the views of others are denigrated as outside of the norm, irrational, and therefore subject to skepticism. I explore this topic by looking at ongoing debates over the issue of cultural continuity, especially as it applies to repatriations, as well as recent calls for the celebration of a "shared" heritage.

Dahlstedt, Allisen (Arizona State University)

[203] *Infectious Diseases within the Tiwanaku Periphery*

Today, infectious diseases, such as tuberculosis, devastate millions of lives annually. The prehistoric prevalence and distribution of such infectious diseases provide context for their modern (re-)emergence, spread, and associated social perceptions, as well as inform the experiences of individuals in the past. Here I examine the expression and distribution of pathological lesions on the skeletal remains of 143 individuals from Omo M10, a Tiwanaku migrant community in Moquegua, Peru. The Middle Horizon (500-1000A.D.) was a time of population growth and early state expansion in the south-central Andes. During this period, individuals moved between the Tiwanaku capital in Bolivia and peripheral sites in southern Peru, likely to gain access to fertile agricultural land. Infectious diseases often appear and spread with such population growth and increased human interaction, among other environmental and behavioral factors. Differential diagnoses reveal several probable cases of infectious diseases, including human treponematoses and tuberculosis. The presence of Pott's disease supports the relatively early presence of tuberculosis in southern Peru. These results encourage future research examining social perceptions of these illnesses expressed in mortuary contexts. The integration of future isotopic analyses can additionally inform the potential spread of these diseases through the residential mobility of infected individuals.

Dai, Xiangming

[283] *Backgrounds of Emergence of the Early States in Central and Northern China*

Traditionally Erlitou was considered the capital city of the first kingdom—the Xia dynasty, in Chinese history. However, an increasing amount of archaeological data in the past decades has suggested that Taosi was the first state-level society earlier than Erlitou emerging in central China. With the amazing discoveries of the Shimao walled site in north Shaanxi province in the past several years, I offered that Shimao was another early state appearing in northern China, which was approximately simultaneous with late Taosi and early Erlitou. In this paper I will demonstrate some common circumstances of the emergence of these three early states, including the similar economic activities, control and monopoly of prestige goods by elite, competition and warfare among different regional social groups, and so on. I will also attempt to demonstrate some differences for the causal

factors resulting in the rise of the three states, and further discuss the similar and different dynamics of the formation of these early states.

Dal Martello, Rita (Peking University, School of Archaeology and Museology)

[37] *Rethinking Burial Practice in Qijia Culture*

Mortuary data is one of the few now available tools we have to understand Chinese late neolithic culture of Qijia. With the exception of Lajia site, the most famous and best investigated sites are cemeteries, scattered throughout the regions of Gansu, Qinghai and Ningxia in Northwest China. The data they revealed has been a long time source for Chinese archaeologists in the attempt of reconstructing the social organization of the time, often putting too much emphasis on only certain type of burial (e.g., the so-called "suttee" burials) and neglecting the wide range of possibilities present within the same cemetery. New insight on this data can help us review the theories and assumptions made in the past. In this paper I attempt to evaluate the rate and pattern of change over time of some aspects of mortuary practice, such as presence and quantity of prestigious and ritual goods, tomb architecture, arrangement of burials within one cemetery and so on. Although a secure chronology has yet to be established for Qijia Culture, its significance on the overall context of pre-imperial China is increasingly recognized by scholars, and therefore its studying is of primary importance to get a better understanding of the time.

Dalan, Rinita [220] see Greenlee, Diana

Dalan, Rinita (Minnesota State Univ-Moorhead)

[284] *Development of Magnetic Susceptibility Instrumentation and Applications*

A 1997 NCPTT grant to develop a prototype down-hole magnetic susceptibility instrument arose out of frustration with existing technology and a desire to expand archaeological field studies of magnetic susceptibility. This instrument allowed high-resolution vertical investigations of susceptibility within a small diameter (ca. 2.5 cm) hole made with a push-tube corer. An NSF grant supported improvement of the prototype via robust laboratory and field testing, resulting in a final engineered product (the MS2H) in partnership with Bartington Instruments, and also established an archaeological soil magnetic laboratory to improve research and training. A second NSF grant extended equipment and software, allowing increased integration of field and laboratory geophysical studies. Two additional NCPTT grants addressed the last crucial step in the advancement of down-hole susceptibility technology, namely application within archaeological practice. The first advanced the instrument's use in the detection of buried archaeological sites, and the second focused on the identification of unmarked graves. Due to its broad applicability, use of magnetic susceptibility technology has steadily grown. Integrating down-hole and laboratory techniques with surface geophysical surveys has produced a more mature magnetic susceptibility method that is much more widely employed than it was in 1997.

Dale, Emily (University of Nevada-Reno)

[128] *Give Me a Y-Beam: Architecture and Agency at Rural Chinese Woodchopping Camps, Mineral County, Nevada*

For the turn-of-the-century rural Chinese woodchoppers of Mineral County, Nevada, the construction of cabins, dugouts, corrals, and fences served myriad functions. Yet, architecture, even in its simplest forms, consistently goes beyond the functional. The orientation of and relationships between structures, material preferences, and diverse construction techniques demonstrate the choices made by the Chinese as they strove to make a living supplying firewood to nearby mining boomtowns. This paper will discuss the ways the Chinese adapted their construction methods to the rural environment, their various needs, and lack of traditional architectural materials and how the architecture informs on the builders' ethnicity, masculinity, and sense of community.

[309] *Micro Analyses of 17th Century Adobe Bricks from the "New" Church at Pecos, New Mexico*

The clash of Pueblo farmers and Spanish missionaries in central New Mexico marks the transition from prehistoric maize farming to the modern era along the Rio Grande River. The interaction between Native Americans and Spanish was not totally either peaceful or confrontational. The first church, built in the 1620s, was later burned during the Pueblo Revolt when Spanish were forced to leave, then rebuilt when relations improved. Four bricks from the new church (Mission de Nuestra Senora de los Angeles) were examined for microscopic, chemical, elemental, and structural information. Combining pollen, phytoliths, starch, macrofloral remains, charcoal, XRF and XRD signatures with petrographic analysis yields a record of both native (maize) and introduced (Old World cereal) crops. Sporormiella dung fungal spores indicate presence of grazing draft animals and possibly use of dung making adobe. Evidence for treating stems used to make the adobe was sought in the phytolith record and thin sections. Quantities of charcoal varied between the lower bricks (more charcoal) and the upper bricks. This study examines evidence for porosity, mineral composition, and other factors that affect structure, as well as economic and behavioral evidence of life at Pecos, New Mexico during this period of alternating strife and peace.

Dalton, Jordan and Colin Quinn (University of Michigan)

[54] *Agropastoralism in Bronze Age Transylvania: An Analysis of Faunal Assemblages from the Geoagiu and Mureş Valleys*

The Bronze Age was a period of dynamic social transformations in Transylvania. Unfortunately, there have been no systematic archaeological studies of the subsistence economy that funded, and was affected by, the social transformations of emergent inequality. In this poster, I present the first analysis of faunal assemblages from Bronze Age contexts in Transylvania. The faunal assemblages, collected during the 2012-2014 surveys of the Geoagiu and Mureş Valleys, provide the first opportunity to understand the diet and ecology of the communities living in southwest Transylvania. By monitoring similarities and differences in the use of animals across space and through time, and situating these practices within the broader regional context of the Carpathians, it is possible to shed new light onto the role of agropastoral economies in the dynamic social transformations of the Transylvanian Bronze Age.

Dalton-Carriger, Jessica and Elliot Blair (University of California, Berkeley)

[140] *Answering Chronological and Regional Interaction Questions via pXRF and LA-ICP-MS Analyses in the Interior Southeast*

Native American inhabitants in the interior Southeast did not experience direct and prolonged European contact until the late 1600s, however European trade goods still managed to filter their way into the area. While trade goods are present, site chronology has not been clearly defined in many areas. Both pXRF and LA-ICP-MS testing on glass trade beads from East Tennessee and surrounding states has revealed trends in their chemical composition which can be correlated to date ranges. This method of analysis allows us to answer questions about Native American habitation in East Tennessee and regional interaction with Europeans in the interior.

Daly, Niamh (University College Cork)

[332] *Till Death Do Us Part: A Bioarchaeological Investigation of Female Kinship Ties in Early Medieval Ireland*

The introduction of Christianity in the 5th century A.D. had far reaching effects in Ireland. The first few centuries of the early medieval period (c. 400-1200 A.D.) is considered a time of dramatic cultural transformation. The documentary record that emerged in the wake of this process was created by male clergy in a rural, hierarchical, patrilineal society where the position of women was complex. This research uses archaeologically-recovered human remains from the immediate post-conversion period to assess the changing culture of female kinship ties and post-marital residence patterns. An essential strategy for this research is the application of biogeochemical techniques, namely stable isotopic analysis, to assess if the chemical analysis of the human skeletal remains negates or validates historically-derived narratives regarding female kinship ties. The results of this research increase the visibility of the lives of the female cohort in early historic Irish society.

Damick, Alison (Columbia University) and Severin Fowles (Barnard College)

[342] *Ground Stone Landscapes of the Ancestral Pueblo World*

The lives of precolumbian communities in New Mexico were anchored and shaped by stone features in the landscape. Stones were pecked, ground, and piled into cairns or circles; ethnographic evidence from descendant communities suggest certain stones received offerings of corn pollen, antlers, or prayer sticks; in other cases, parts of stones were removed as potent medicine, either as stone powder or flakes; elsewhere, it was the abrasive contact between fixed bedrock and tools that appears to have been significant. To call such features “shrines” is to focus on how they were bound up in indigenous understandings of the points of access to worldly powers. Here, we examine the logics of ground stone shrines (slicks and cupules) associated with ancestral Pueblo sites of the northern Rio Grande, paying special attention to their mode of construction, spatial distribution, and relationship to natural features of the landscape.

[4] *Using 3D Laser and 3D Sonar as Tools for Mapping, Analyzing Site Formation Processes, and Long Term Monitoring of Shipwrecks*

3D imaging creates a permanent digital record that allows scientists to study minute site details and also serves an important outreach role by allowing the public to virtually explore archaeological resources. While 3D imaging of archaeological sites using laser and lidar is a growing trend in terrestrial archaeology, its application in marine archaeology has only recently emerged. Marine archaeologists are now beginning to use 3D laser- and sonar-derived models as new tools for interpreting shipwreck sites and analyzing site formation processes in the marine environment. Using the sub-centimeter accurate 3D laser/sonar data collected repeatedly at the same site over time in conjunction with traditional diver collected or remotely sensed data, archaeologists can better quantitatively analyze the changes occurring on a site. Collectively, these datasets can provide important information to archaeologists and submerged cultural resource managers about site stability versus continual degradation as well as changes in sediment deposition. As an example, discussions of the results of a Bureau of Ocean Energy Management-funded study employing 3D imaging of deepwater shipwrecks in the Gulf of Mexico to study anthropogenic impacts will demonstrate how this technology can assist with long term monitoring efforts.

[20] *The Queen of Heaven in Iron Age Greece: Analyzing Religious Ideology and Symbolism on Multiple Scales*

In this paper, I approach religion and ideology in the archaeological record through an analysis of iconographic symbols, one that centers on the dialectic between longstanding meanings of symbols

as they are transmitted across space and time and the local social, political, and intellectual contexts in which they appear. I situate my analysis within recent models from cultural evolutionary psychology, which see religion, along with its attendant rituals and symbolisms, as an adaptive mechanism for human groups that both reflects and enables growing social complexity in human societies. My paper will move forward on two levels: I will first analyze the meanings behind the broadly shared mythical, literary, and iconographic motif of the Queen of Heaven as she was transmitted between the Near Eastern and Mediterranean worlds across the Bronze and Iron Ages, particularly in terms of her socio-political connotations. I will then consider the appearance of her symbolism within several sites on mainland Greece in the Iron Age. In particular, I will interpret the meanings behind these symbols against the longstanding tradition of the Queen of Heaven as a deity connected to divine kingship as well as the novel socio-political and intellectual contexts developing in the Iron Age.

Daniels, James (University of California, San Diego and ASM Affiliates, Inc.) and Paul Goldstein (University of California, San Diego)

[184] *Establishing Chemical Signatures for Cabuza Style Pottery and the Tiwanaku Tradition Using Portable X-Ray Fluorescence (pXRF)*

Portable X-ray Fluorescence (pXRF) was used to analyze the chemical composition of 60 Tiwanaku and derived style ceramic sherds from different locations in the south central Andes. The results indicate that there are four distinct geochemical groups and that the local Cabuza style pottery from survey collections in the Azapa Valley in Chile has a distinct chemical composition from all other Tiwanaku tradition ceramics. The results also indicate that pXRF is a viable technique for distinguishing between local and imported ceramics and, when considered in tandem with contextual and stylistic data, can provide important information on Tiwanaku ceramic sourcing, technology and exchange.

Daniels, Jimmy [246] see Colón, Justin

Daniels, Brian (University of Pennsylvania)

[254] *Community Archaeology and Emergency Responses to Heritage in Crisis*

How are we to respond to the current intentional destruction of heritage occurring in Syria and Iraq? The international regime of heritage protection rests upon the consensus of actors within the modern system of nation-states. But in the present crisis, one actor, the Islamic State of Iraq and the Levant, rejects that system. Furthermore, in the case of Syria, UNESCO and other international preservation organizations find themselves locked into a structural situation where they are obliged to interact with the Assad government, which has been responsible for so much of the damage to historic sites. What alternatives might exist? Using the work of the Safeguarding the Heritage of Syria and Iraq Project as an example, this paper articulates an alternative model of intervention. While there may yet be hope under customary international law to address ultimate criminal culpability, in terms of practical interventions, focusing efforts on community activists and other heritage professionals outside of formal government structures may prove to be one of the few viable strategies available for effective emergency actions in ethnonationalist and sectarian conflict.

[153] *Zelia Nuttall and the Vexed Question: Between the Devil and the Deep Blue Sea*

It's been almost two score and four hundred years since Francis Drake and his company in two ships, the Golden Hinde and a small ship only known as Tello's Bark, landed somewhere on the west coast of American. This interlude was during what became known as 'The Famous Voyage' (1577-1580). Seventy to eighty men-- and a pregnant black woman named Maria—disembarked, built a rough fort, and remained for five or six weeks. The geographical location of this landing has been the subject of much archaeological investigation and debate in California, but no evidence of the landing has ever been found. In 1908 Archaeologist Zelia Nuttall found a trove of contemporary documents relating to the voyage. The Hakluyt Society published her 'New Light on Drake' in 1914 to great acclaim. She promised a subsequent publication addressing the location of the landing, which she theorized was on the Northwest Coast. Editors rejected that manuscript: to take Drake out of California would be like uprooting the redwoods. I discuss the evidence that lead her to the Northwest Coast, and I will introduce ethnographic, cartographic and new linguistic information that support her theory.

[225] *Place, Place Name and Property in the Identification of O'odham and Pee Posh TCPs*

Ethnogeography considers the ways in which human beings invest places, spaces, or points on the land with names and information that render them culturally meaningful. Many places in a culture's ethnogeography are also Traditional Cultural Properties or TCPs. TCPs are eligible for the National Register of Historic Places and by definition are significant to the perpetuation of traditional worldview and living indigenous cultures. This presentation reports on recent advances in O'odham and Pee Posh TCP investigation and documentation. O'odham and Pee Posh ethnogeography and place names are examined in relation to archaeological data and site location in order to underscore the importance of indigenous systems of geographic knowledge for recognizing TCPs. It also explores the inherent difficulties encountered in the translation of traditional, multi-dimensional concepts of place into western concepts of property based largely on two-dimensional locational systems for mapping and visualization.

[92] *A Place to Pause: Investigations at the St. Mary Bridge Site (24GL203), Glacier County, Montana*

Two field seasons of archaeological excavations along the banks of the St. Mary River in Glacier National Park, Montana have resulted in the recovery of artifacts ranging in age from late Paleoindian to historic times. In partnership with the National Park Service, archaeologists from the University of Arizona and tribal students, preliminarily interpret this site as an area for temporary winter encampments as well as a staging area for residentially mobile groups in the past. Staging areas are transitional places on the landscape where people evaluate the resource potential of their

surrounding environment as they move, leaving behind a variety of tools and materials. The significance of staging area sites across a vast and altitudinally rugged landscape is evidenced in the consistent return of groups to these areas, even into the ethnographic present. A continuous record of archaeological activity is now documented at the St. Mary Bridge Site. What remains to be explicated is the nature of activities at the site specifically. Drawing from our analyses of artifacts, namely a number of projectile points, and site formation processes, we build a site chronology and document those behaviors associated with the transient populations that occupied the St. Mary Bridge Site.

[199] *Terrain Modeling at Orheiul Vechi, Moldova*

The Moldovan site of Orheiul Vechi has been continuously occupied since the Late Paleolithic due in part to its commanding position over the local landscape and its strategic situation on the nexus of Eurasian cultural flows and population movements. From the Iron Age onward, the inhabitants of Orheiul Vechi took advantage of natural fortifications, tributary access to the Dniester River, and nearby chernozem soils to consolidate a long-term power base. Using data from ongoing archaeological studies and newly acquired Lidar and geophysical datasets, we present terrain models of the features that contributed to the diachronic significance of Orheiul Vechi in the local and regional landscape.

[30] *The Landscape of Klamath Basin Rock Art*

For the past three decades, efforts to interpret Klamath Basin rock art symbols using ethnographic literature and concepts of sacred landscapes have advanced our understanding of the art. This approach, however, is limited by the assumption that the rock art symbols meant the same thing in every social and land use context. From my research of the past decade I have inferred that rock art designs are not distributed randomly across the landscape. Instead, rock art displays appear to vary predicatively across three archaeologically-defined contexts that I have identified as settlement sites, frequently used areas and special use areas. In the research presented here, I use this apparent pattern to propose a context model for the rock art of the Klamath Basin and suggest that Klamath Basin shamans situated their varied repertoire of sacred symbols within these distinctive contexts in order to structure the way people encountered and experienced them. Understanding how rock art is patterned on the landscape has led to refined interpretations in an area where relatively little rock art research has been done.

Davies, Benjamin (The University of Auckland)

[84] *Simulating Late Holocene Landscape Use and the Distribution of Stone Artifacts in Arid Western New South Wales, Australia*

The archaeological landscapes of arid environments often feature surface scatters of stone artifacts, which are used to infer past human activity and organization. For hunter-gatherer groups this typically involves some interpretation of mobility; however, the scales of activity inferred from these assemblages usually extend beyond the boundaries of study areas. Understanding what these assemblages mean in terms of human mobility requires assessment of how samples fit within a wider landscape distribution. This study uses computer simulation to evaluate interpretations of mobility and place use from the ratio of cortical to non-cortical stone in surface assemblages from arid western New South Wales, Australia. First, the cortex ratio concept is investigated using an agent-based model coupled with an experimental dataset. These initial model outcomes are found to be consistent with expectations from the distribution of cortex, and the influence of core reduction intensity and selection intensity on assemblage variation is demonstrated. Second, a measure called

the cumulative cortex ratio is proposed for evaluating the dispersal of cortex over a continuous surface. Finally, the differential distribution of cortex within the Rutherford's Creek study area is assessed by simulating different scenarios of place use and computing the cumulative cortex ratio on simulated data.

[47] *Landscape-Scale Survey at the Brú na Bóinne World Heritage Site, Ireland*

The Brú na Bóinne World Heritage Site in Ireland is one of Europe's most significant Neolithic landscapes, and has been the focus of significant effort as regards remote sensing for the last 20 years. Until recently this focused on relatively low-resolution lidar survey and small-scale geophysical prospection, often 'monument-centric' in approach. In 2014 much higher resolution lidar data were obtained for part of the WHS alongside the first landscape-scale geomagnetic surveys within the area, covering in excess of 60 hectares. These surveys have redefined our understanding of the landscape of Brú na Bóinne, and have led to the identification of a number of new monuments within the wider Boyne complex. This presentation firstly outlines these new discoveries and their place within the archaeology of Brú na Bóinne, and secondly discusses their significance more broadly within the context of Neolithic Ireland and Great Britain.

[92] *The Effects of Sampling by Size Class on the Organization of Technology at the Sunrise Ridge Borrow Pit Site (45PI408), Mt. Rainier National Park, Washington*

Prior lithic paradigmatic classification at the Sunrise Ridge Borrow Pit site (45PI408) has shown significant intra-site variation in chipped-stone technology and function. Recent fieldwork recovered an additional sample of artifacts bringing the total chipped stone assemblage to a sample size of $n = 13036$. Size grading, or mass analysis, was done for all lithic artifacts before cataloging. Recent attribute analysis of all lithic artifacts > 0.635 cm mesh size ($n = 3681$) demonstrates that significant technological variation is present, but the results of an analysis of lithic artifacts < 0.635 cm mesh size ($n = 3543$) reveals meaningful frequency changes across multiple dimensions suggesting that some of the intra-site variation resides in the < 0.635 cm mesh size lithics. Dimensions affected significantly, both diachronically and synchronically, include fragment type, cortex, wear, raw material type, platform type, thermal alteration, and reduction class. Analysis of the < 0.635 cm mesh size lithics revealed a 13 percent increase in obsidian raw material type and a 14 percent increase in the pressure flake platform type. Although the sampling of lithic assemblages by size class is performed for a variety of reasons, the significance should be carefully assessed before interpretations of the organization of technology.

[112] *Aleutian Microtechnology in Anangula Times (9000 - 4000 BP)*

Since its discovery more than 50 years ago, the Anangula phase has been recognized as the first known occupation in the eastern Aleutian Islands. The initial discovery of the Anangula Blade Site near Umnak Island, and the more recent find of Hog Island in the Unalaska District revealed assemblages in many ways characteristic of highly mobile terrestrial hunter-gatherers with only minimal evidence of a maritime economy. This seeming paradox of island dwellers heavily invested in terrestrial resources may be explained by seasonal land fast ice which provided a route for caribou access onto the archipelago. Microblades, most likely hafted to arrow shafts, are abundant during Anangula times. Bows are best used for terrestrial, not maritime, game. The Anangula sites are extensive but shallow, without middens, have ephemeral structural remains, and have a limited repertoire of tools. Individual tool types including microblades, blades, burins and scrapers, however, are numerous. This pattern suggests specialized extractive activity. Anangula most likely represents

an off shoot of the interior Paleoarctic tradition, and it developed toward the end of the phase into a populous and sedentary adaptation to the rich marine environment.

[118] *Quantifying the Effects of Erosional Processes on Stone Artifact Concentrations: Implications for Site Formation at Open-Air Paleolithic Sites*

An essential part of archaeological site management and interpretation is determining how recent landscape modifications affect artifact distributions. Stone artifact scatters can be an initial indicator of subsurface concentrations, yet little scholarship has focused on quantifying the nature and rate of the erosional processes that affect them. The archaeological record of northern Malawi demonstrates that despite abundant surface scatters, subsurface distributions may vary considerably in density and integrity. This study uses GIS to examine the processes by which a large concentration of stone artifacts has eroded over multiple monsoonal cycles, and how artifact attributes vary and potentially contribute to site erosion and/or preservation. In 2012, total station data and complete collection of surface finds at the "Bruce" site in Karonga, Malawi, yielded an assemblage of over 3000 artifacts. In 2014, over 2300 newly exposed artifacts were plotted and collected from the same area, resulting in high-resolution provenience data and two complementary lithic assemblages. Artifact attributes such as size class and weathering stage are combined with the spatial data to quantify how the surfaces of archaeological sites can change over even brief periods of time. This highlights the need for modern analogues in assessing the depositional histories of open-air Paleolithic sites.

Davis, Kaitlyn (University of Colorado, Boulder) and Scott Ortman (University of Colorado, Boulder)

[229] *Transformation in Daily Activity at Tsama Pueblo, New Mexico*

This paper analyzes the artifact assemblage from Tsama, an ancestral Tewa community along the Rio Chama in north-central New Mexico. This site was excavated by Florence Hawley-Ellis during a field school in 1970, but basic analyses of the resulting collections were only completed recently by the laboratory at the Crow Canyon Archaeological Center as part of a project investigating Tewa origins. We present the results of these analyses and compare the artifact assemblage from Tsama with that of Sand Canyon Pueblo, a 13th century site in southwest Colorado, to examine the continuities and changes in daily practice that accompanied migration from the Four Corners region to the northern Rio Grande. We also examine the degree to which differences in artifact assemblages reflect changes in social organization, as expressed in the differing community plans of these two sites.

Davis, Mary (UW-Madison)

[292] *Urban Lithics -- The Role of Stone Tools in the Indus and at Harappa*

Lithics are one of the most common artifact classes encountered at nearly every site of the urbanized landscape of the Indus Civilization of Pakistan and Northwest India. This paper examines the lithic assemblage at the urban center of Harappa (3300-1900 B.C.E.), one of the type-sites of the Indus, focusing on the chipped stone assemblage collected by the HARP excavations from 1986-2001. This assemblage is contextualized within the specialized production and the complex inter-regional distribution system of chert prismatic blades in the Indus. This assemblage illuminates that the lithic use at Harappa was not limited to agricultural or domestic tasks but was integral to many specialized craft productions. Intra-site analysis of these tools was used to address fundamental questions of the political, economic and social organization at the urban center. This paper highlights the utility of lithic analysis, moving beyond inferences about subsistence, mobility, and the limited role that lithics often play in archaeology of complex societies.

[411] *Revealing the Common Ground: Technological Practice, Intrusive Shapes and Hybrid Pastes in the Kampos Group Pottery of Crete*

The dawn of the Early Bronze Age in the Aegean is of undoubted importance. Whether we emphasise the crafting and consumption of copper or the appearance of whole assemblages of pottery outside of their stylistic "homeland" in the Central Cyclades, Early Bronze I (c. 3100-2600 B.C.E.) has always been characterized as a time of change, featuring the movement of people, goods and ideas. In our haste to categorise, label and seek identities, we have perhaps lost some of the complexity and creativity involved in this web of contacts and transactions, of acceptance, resistance and the emergence of new practices.

The distinctive material culture set which we label the Kampos Group has caused interest by its appearance in specific settlements and contexts, mainly on the north coast Crete. Aided by an integrated programme of ceramic analysis, involving minero-petrographic, chemical and microstructural studies the apparently intrusive pottery is characterized, contextualising its operational sequence within Cretan ceramic practice. Through raw material choice, tempering practice, surface modification and firing, we consider aspects of itinerancy, hybridity of technological practice and identity in a ceramic world which is totally transformed by the time of Renfrew's phase of 'International Spirit' in Early Bronze II.

[361] *Sourcing Interactions: X-Ray Diffraction of Central Plains Tradition Ceramics during the Medieval Climatic Anomaly*

Recent research by Roper (1995 and 2007) questions the long-held perspective that the various phases of the Central Plains tradition (CPt) consisted of small village dwelling populations with distinct borders. New evidence suggests a more fluid distribution of autonomous farmsteads following major stream systems throughout the Central Plains (USA). This debate has led to various questions surrounding the interaction amongst communities and individuals in the CPt populations with an emphasis on the scale, degree and nature of the interaction. To begin examining this issue of interaction, our research has focused on developing procedures using X-Ray Diffraction (XRD) to obtain detailed compositional data on CPt ceramic deposits and thereby determine the source of these deposits in the Nebraska Sand Hills during the Medieval Climatic Anomaly. We compare these compositional data sets with those reported by Roper (2007) for CPt deposits elsewhere. By comparing the composition of CPt ceramics with clay from surrounding sources, this research aims to understand more about the movement and spatial distribution of the pottery and, in addition to, the people within the broader CPt system during this time period.

[298] *Graphic Documentation of the Mural Painting in the Sacred Precinct of Tenochtitlan*

From historical sources we know that the religious buildings of Tenochtitlan (1325–1521 CE) were richly polychromed. Architectural remains of the sacred precinct corroborate this information, as they still contain important remnants of the mural painting on their façades and interiors. Unfortunately, their state of conservation is quite poor, owing, on the one hand, to the particular pictorial materials and techniques utilized by the Mexica during the fourteenth, fifteenth, and sixteenth centuries, and, on the other, to the aggressive deteriorating agents that currently characterize the archaeological

contexts of the Historic Center of Mexico City. In this paper, we propose a methodology of digital graphic documentation specifically developed to recover and store the most information possible about the Great Temple archaeological zone's mural paintings, whose long-term conservation is seriously threatened. This methodology is based on the combined application of topographic surveying with total station and GPS, the imaging and digitization of the mural paintings, computer-generated chromatic reconstruction, digital photography, vector modeling, and virtual reality. The result is the generation of three-dimensional reconstructive models of the most important religious buildings of Tenochtitlan and an exhaustive catalogue of their mural paintings.

[407] *Stone Artifacts from Southeast Sulawesi: Technology beyond the Toalean*

We report on the stone artifact assemblages and geoarchaeological contexts from two recently excavated rockshelters in southeast Sulawesi, Indonesia. Human occupation starts at 19,000 BP. We find low density occupation during the Pleistocene, followed by a major increase in discard and change in local environmental conditions in the early Holocene. Striking changes in artifact discard rates occur during the middle Holocene, and distinctive retouched forms appear. We discuss the implications for human colonization of large islands such as Sulawesi and the interpretation of spatially discrete technologies such as the Toalean in south Sulawesi.

De Carteret, Alyce (Brown University)

[22] *A Good, Old-Fashioned Patio-Group Raising: Domestic Architecture as Ritual among the Classic-Period Maya*

As anthropological and archaeological scholarship attests, household ritual has a potent role in forging and maintaining sociopolitical relationships both within the household as well as with the communities, cities, and states of which it forms a part. Archaeological research in the Classic Maya area has revealed evidence of feasts, ancestor veneration, dedication and termination caches, and other ritual practices taking part within the limits of the house. The most substantial remnant of Classic Maya domestic ritual, however, may be the patio group itself, whose construction and renovation--much like the barn raisings of nineteenth-century North America--united households and communities in ritual activity. This paper will consider domestic architecture as ritual among the ancient Maya, and how the ritualized aspects of homebuilding may have changed over the course of the Classic period (ca. 200 - 900 CE). As its driving question, this paper asks, "How did the Classic Maya build their homes, and how did homebuilding build the Maya?" Evidence will be drawn from both archaeological excavation, consisting primarily of non-elite residences in the Central Peten, as well as ethnographic data from modern Maya communities.

El hallazgo en el año 2010 de puntas de proyectil del tipo foliáceo manufacturadas casi en su totalidad en cantos rodados de riolita, así como la gran cantidad de desecho de talla asociado a ellas, en el sitio La Flor del Océano en Sinaloa; cuyas excavaciones continúan hasta el día de hoy, ha propiciado una serie de debates académicos acerca de su antigüedad y tecnología aplicada a ellas. En la presente ponencia, expondremos los resultados de las últimas temporadas de campo del Proyecto Arqueológico Las Labradas y las propuestas entorno a la aparición de dicha industria lítica en un contexto precerámico.

De Leon, Jason (University of Michigan)

[146] *The Edge of Humanity: Why Commonsensical Notions about Nature Impede our Understandings of Structural Violence in the Arizona Desert*

Since the 1990's Border Patrol has employed a strategy known as "Prevention Through Deterrence." This policy emphasizes heightened security around urban ports of entry so that undocumented migrants will attempt to cross the border in more remote areas that are difficult to traverse but easy for law enforcement to patrol. Rather than deterring migration, hundreds of thousands of people each year now spend days in the desert attempting to walk across one of the most extreme environments in North America. Moreover, hundreds die annually during this process. In 2012 and 2013, the Undocumented Migration Project conducted a series of experiments in the desert that used pig carcasses as proxies for the human body. The goals were to understand how unburied bodies decomposed and the political implications of this form of death. Drawing on these data and a historical review of burial treatment, I argue that humans have long employed nature to construct forms of post-mortem violence that I term "necroviolence." I posit that anthropologists working in all time periods can gain new insight by rethinking long-held notions about the nature/culture divide in taphonomic studies and that "natural" post-mortem treatment can be productively added to current anthropological frameworks of violence.

De Leon, Sandy (University of Illinois at Chicago/National Museum of the Philippines)

[238] *Investigating Social Practices, Community and Interaction in the Philippine Islands during the Metal Age*

Investigations of social interaction and notions of community among island societies of Southeast Asia during the Metal Age (500 B.C.-A.D. 800) are very limited, especially in the Philippines. This general lack of well-documented settlement, household and burial data, and underdeveloped theoretical frameworks interpreting the archaeological remains, impede our understanding of social organization in the period and fail to contextualize the appearance socially stratified and politically centralized island societies during the late prehistoric and early historic period. This paper presents a proposed multi-scalar research plan to utilize mortuary remains and examine similarities and variation in mortuary styles, pottery composition, trade goods and mortuary landscape features to investigate how Metal Age societies may have maintained ideas of community and group identity, as well as how they may have structured social relations. It presents preliminary findings of micro-regional analysis of jar burial remains from the Bacong Region of the central Philippines that will be expanded to include jar burial sites from the greater Philippine macro-region, and discusses some of the challenges of settlement archaeology. The research findings query the notion that late prehistoric island societies were necessarily simplified hierarchical and politically centralizing antecedents to the more complex societies of the Early Historic period.

[8] *Near-Surface Geophysical Investigations at the Multicomponent Magnolia Valley Site (40RD314) in Rutherford County, Tennessee*

In May 2014 we collected magnetic gradiometry, frequency-domain electromagnetic-induction (EMI),

and ground-penetrating radar (GPR) data at the Magnolia Valley site (40RD314) in Rutherford County, Tennessee with the Middle Tennessee State University 2014 Field School, a component of the MTSU Rutherford County Archaeology Research Project (RCARP). We collected data using Geometrics G-858 cesium vapor magnetometer, GSSI's Profiler EMP-400 multifrequency electromagnetic conductivity meter, and Sensor's & Software's pulseEKKO PRO GPR with 500 MHz antennas at a line spacing of 0.5 m and station spacing of 0.1, 0.25, and 0.025 m, respectively. The use of multiple methods was necessary to characterize feature type. Negative apparent conductivity paired with strong dipolar magnetic responses were indicative of historic metal artifacts. High magnetic susceptibility and strong magnetic gradient contrasts indicated probable Archaic pit and habitation features. A historic two track wagon road was identified approximately 25 cm below the surface with both GPR and magnetometry. Ground-truthing the results proved the efficacy of this multi-method survey strategy and resulted in the identification of a rock-lined earth oven, several large (over 1 m in diameter and 1 m in depth) pits, and a possible Archaic structure/living space footprint along with the historic two-track road and metal artifacts.

[294] *Foraging for Shellfish in a Predictable and Productive Inter-Tidal Environment, the South Coast of South Africa*

The south coast of South Africa has the oldest and best studied evidence for early use of coastal resources, and various researchers have argued that coastal resource use was significant for cognition, social complexity, and the maintenance of population refugia. To date there has been little consensus on the foraging returns and sustainability for inter-tidal resources in this coastal environment. Here we present the first net return and regeneration rate estimates for inter-tidal foraging in the varied south coast of South Africa. Foraging experiments were conducted with Khoesan descendants in the area and hourly caloric net return rates were recorded over 35 low tides and through the seasons. Net return rates varied as a function of gender, tidal range, marine habitat types and weather conditions. The mean net return rate (kcal/hour) in some instances equals or exceeds that recorded for hunting of large mammals, and shows that under the right conditions the south coast provides an extraordinarily rich protein resource. Our results show that strategic coastal foraging along the south coast could have been a highly predictable and productive foraging strategy for emerging modern humans. We relate these results to recent analyses and discussions of Middle Stone Age coastal foraging.

[178] *Spanish Mission Archaeology in the Southeast. 1974-2014 A.D. (After Dave)*

The archaeological study of Spanish missions among the American Indians has been underway in the Southeastern and Western regions of the United States for more than 70 years. This paper considers the directions and contributions of that body of work in the Southeast, with particular attention to the interdisciplinary impacts of the Santa Catalina Mission program, carried out by Dave Thomas between 1974 and today on St. Catherine's Island, Georgia.

Deal, Michael (Memorial University of Newfoundland)

[268] *Site Formation and Paleoenvironmental Reconstruction at a Terminal Archaic/Woodland Period Site in Central Nova Scotia, Canada.*

Despite being the area of earliest European occupation in Canada, with ample Contact period ethnohistorical evidence, very little is known about Pre-Contact occupation along the Annapolis River drainage system, in central Nova Scotia. At present there are less than 50 recorded Pre-Contact sites and virtually no private collections. This has long puzzled local archaeologists, as the Annapolis

River is an obvious travel route to the interior, and a large (2130 km²) watershed rich in plant and animal resources. The recently discovered Boswell site has revealed a complex history of site development. Continual vertical accretion of river sediments at the site during the Terminal Archaic and Woodland periods has created a deeply stratified deposit. Current research at the site suggests new strategies for the survey and excavation of sites along the Annapolis river system. The authors will also present the results from ongoing paleoethnobotanical and paleoenvironmental analyses and discuss their significance for interpreting aboriginal lifeways at the Boswell site over the last 4000 years.

[354] *Tom Windes and Southwestern Dendroarchaeology*

Tom Windes is virtually unique among archaeologists for his appreciation of the range of dendrochronology's contribution to archaeology and of the preservation crisis that afflicts the integrity of wooden elements in Southwestern archaeological sites of all ages. Tom's interest in dendrochronology as more than dating led him to develop sampling tools, techniques, and protocols that maximize the behavioral and chronological information in dendroarchaeological wood. His recognition of the accelerated rate of deterioration of archaeological wood, due to both natural and human causes, persuaded him that as many as possible wooden elements should be recorded and sampled before their scientific potential was irreversibly compromised. Beginning his decades-long effort to sample archaeological wood with National Park Service sites, Tom scoured the Southwest, from the Rio Pecos to the Grand Canyon, for suitable material. Adhering to LTRR's dictum to collect one sample from every wooden element and to his conviction that valuable chronological and behavioral information is in peril, Tom and his volunteers collected and documented thousands of samples that otherwise would have gone unstudied. The scale of this contribution is exemplified by the numbers of samples available before and after his activities and by numerous sophisticated analyses of these dendroarchaeological data.

Dean, Emily (Southern Utah University) and Amelia Perez Trujillo (Ministerio de Cultura, Cusco, Peru)

[393] *The Archaeology of Rebellion and Resistance: Archaeological Investigations of the Neo-Inca State of Vilcabamba, Peru*

In 1536 Manco Inca, the 'puppet' ruler installed by Pizarro, threw off the shackles of colonial rule and led a rebellion against the Spanish. After failing to retake the former imperial capital of Cusco, Manco Inca and his followers established a Neo-Inca state in Vilcabamba, the remote region east of Cusco. Vilcabamba functioned as the seat of Inca resistance against the Spanish from A.D. 1536 to 1572. While the historic record from the 1600s and 1700s is rich, few records exist for the period of 'first contact.' Those accounts that do exist are mostly slanted towards the Spanish point of view. The daily lives of the Inca who defiantly rejected Spanish rule during this time of intense culture contact remain obscure. This paper draws upon original survey and excavation data from Vitcos and the surrounding Vilcabamba region collected from 2008-2011 to investigate the lives of the Inca during this time of upheaval. More specifically, we address the degree to which these 'rebel' Incas adopted and/or rejected Spanish material culture in their architecture, ceramic technology, religious life, and food-ways. We hope that our analyses will illuminate the material forms of resistance taken by the inhabitants of this 16th c. Neo-Inca state.

Dean, Randall (City and County of San Francisco Planning Department)

[416] *Use of Archaeological Districts in San Francisco*

It is very probably the case that more archaeology is done in San Francisco than in any other major city in the U.S. Yet this archaeological work is done without the benefit of any archaeological ordinance or adopted archaeological guidance but rather through the City's implementation of State environmental laws. To overcome the vagueness and generality of these regulations, the City Planning Department has initiated an Archaeological District Project (A.D.P), with the aim

of creating codified theme-based archaeological districts. The archaeological districts are to be designed so as to enhance potential archaeological site identification, provide theme/period-specific historic contexts, identify significant related property types and research issues, and will actuate archaeological investigation and treatment procedures and protocols for archaeological consultants for resources related to the specific district theme. This paper will discuss the problem-basis, design, mechanics, and anticipated operational nature of the codified theme-based archaeological districts in San Francisco, and the development of its first archaeological district, thus far, for the Hispanic Period.

[166] *Between Party Lines: A Bipartisan Reevaluation of the Early Paleoindian Zooarchaeological Record*

The debate regarding early Paleoindians as megafaunal specialists or subsistence generalists has had a long and contentious history in Americanist archaeology. A quantitative reanalysis of the early Paleoindian zooarchaeological record in the continental United States is presented. Previous analyses of the faunal record focused only on taxonomic richness and have not utilized other measurements of taxonomic diversity. My analyses of the faunal record include measurements of taxonomic richness, evenness and heterogeneity. Evenness and heterogeneity indices of fauna are also based on body size class. Indices are calculated based on two different methodologies used by previous authors. The first is a conservative method that includes only fauna with strong evidence of subsistence use while the other is a liberal method that includes all fauna found on an early Paleoindian sites. Analyses produce results that are opposite of what the original authors concluded with the conservative method indicating that the early Paleoindians were megafaunal specialists while the liberal method indicates the early Paleoindians were subsistence generalists. This poses more questions regarding early Paleoindian subsistence patterns and poses implications of what faunal remains can tell archaeologists about prehistoric human diets.

DeAntoni, GeorgeAnn (University of California, Berkeley), Peter Nelson (University of California, Berkeley) and Rob Cuthrell (University of California, Berkeley)

[268] *Charcoal Identification as Means of Central California Landscape Reconstruction*

The purpose of my paper is to present a paleoethnobotanical study of a late prehistoric Central California site (located in Sonoma County) that reconstructs the pre-contact landscape via the identification of wood charcoal remains. The analysis of charcoal and the low-impact paleoethnobotanical methodologies utilized in this study provide the basis for generating hypotheses about how Native peoples interacted with the local environment while also considering how the landscape may have changed over time through anthropogenic management. By identifying the representative tree taxa of the site through wood charcoal analysis and identification, this study will provide critical information for future environmental restoration projects initiated by local tribes and resource managers. With the completion of this project, a better understanding of human interactions with the pre-Contact Bay Area landscape may be reached and plans for the restoration of native plants can be initiated.

Deats, Jennifer (University of Colorado)

[230] *Occupation Lengths in Middle Missouri Sites*

Collections and reports from Middle Missouri salvage archaeology, conducted primarily in the 1950s, hold a wealth of information about Plains Village farming communities, much of which is still being studied. In this paper, I provide a basis for the assessment of occupation lengths in the Middle Missouri utilizing data culled from site reports on several Middle Missouri sites, spanning time and space. This study utilizes evidence of repair of housing structures, overlapping storage pits, and artifact counts to build a statistical model for the examination of occupation length. A unique aspect of this study is the incorporation of potsherd counts for each site. Due to the general approach of

Plains Archaeologists to the study of ceramics, the potential for ceramic potsherds and vessels in a study of this kind is largely overlooked. Though they are usually resigned to taxonomic purposes, I attempt to incorporate sherd counts into an analysis of site occupation lengths, utilizing accumulations research that has been conducted in other areas of North America.

[188] *Learning heritage while teaching archaeology at Tahcabo, Yucatán: archaeologists' perspectives on the opportunities and risks of local community engagement*

While a great deal of archaeological research in the Maya area has been conducted with the interests of the academic community and tourism industry in mind, there are fewer examples of archaeology conducted with the needs of local "publics" foregrounded. We propose greater dialogue between archaeologists and the people who live near (and within) places where archaeologists conduct research, and consider the dissemination of archaeological information to communities involved in archaeological projects to be an important principle of best practices within the discipline. Drawing from ongoing community-engaged archaeology at Tahcabo, Yucatán, we explore the opportunities and risks inherent in intensified dialogue and dissemination. In particular, we consider the challenges of balancing epistemologies within a co-learning project in which community members share their perceptions of archaeology and knowledge of cultural heritage and we propose archaeological techniques as beneficial ways to learn about local pasts and present-day issues. Reaching a rapprochement requires commitment to collaboration on both sides. Co-learning projects to be considered in this light include a field trip for middle school students and their parents to a nearby archaeological site, a youth photography project that addressed strengths and problems within the community, and a heritage day at the primary school.

Deffebach, Nancy

[303] *Beyond Surrealism: The Anthropological Sources of Leonora Carrington's "El mundo mágico de los mayas" (1964)*

In 1963 Leonora Carrington was invited to create a mural-sized painting for the highland Maya ethnography room at the Museo Nacional de Antropología in Mexico City. *El mundo mágico de los mayas* (1964) portrays the humans, gods, and spirits that inhabit the sacred space of the modern Maya. Carrington's debt to surrealism is immediately apparent. Her greater debt to anthropology is less obvious.

Carrington made several research trips to Chiapas and read extensively about the Maya before she designed the painting. She always acknowledged the profound influence of the "Popol Vuh" but was intentionally vague about her other written sources.

I interpret Carrington's imagery in relation to publications about modern Maya ethnography and the ancient Maya that were available in the early 1960s. Carrington made numerous preparatory sketches that contain brief notations. The notes and imagery of the drawings indicate that she drew heavily on Calixta Guiteras-Holmes's "Perils of the Soul" and Sylvanus Morley's "The Ancient Maya." I discuss the significance of Carrington's notations and the major shift in subject matter that took place between the creation of the drawings and the completion of the monumental painting.

Dega, Michael (Naga Research Group) and Kyle Latinis (Director of Social Science

Directorate, HTS)**[407]** *The Social and Ecological Characteristics of Prehistoric Cambodian Earthworks*

This paper moves discussion of prehistoric earthworks in Cambodia from normative archaeology into an ecological landscape structure, based on archaeological datasets. Discussions provide a synthesis of archaeological and newly borne out ecological explanations for original site construction, occupation, landscape use, sustainability of occupation for the earthwork culture over a c. 2000 year period, and terminal use of the sites. The paper moves discussion of the earthworks in the direction of landscape archaeology cum historical ecology to add more elements to explain this unique social system.

DeGayner, Jacob (National Park Service)**[358]** *Advanced Spatial Documentation of Cultural Resources at Southern Arizona National Parks*

This poster presents the experiences to date associated with the execution and development of an advanced spatial documentation program at the National Park Service Southern Arizona Office, including sample products, case studies, success metrics and challenges associated with development and implementation. In late 2013, resource managers and support staff of the NPS Southern Arizona group decided to invest in the capacity to complete 3D digital documentation projects in-house. The goals of this effort were to reduce project management overhead expenses associated with the contract process, control costs, standardize products, foster a workflow where the NPS retained control of products and data, and ultimately expand the scope of spatial resource documentation at park units. This effort has been assisted by recent advances in spatial documentation technology such as close-range photogrammetry and the enhanced speed and portability of phase-based terrestrial laser scanners. These advances allow the efficient documentation of backcountry archaeological sites that would previously have required significant time and expense. Additionally, rapid data capture capabilities facilitate the spatial documentation of multiple preservation project phases, increasing the temporal as well as spatial resolution of documentation products.

DeGeorgey, Alex (Alta Archaeological Consulting)**[293]** *Use of Faunal Resources as Trade Commodities During the Late Period - Evidence from a Stege Mound (CA-CCO-297)*

Site CA-CCO-297 (a Stege Mound) is a prehistoric shell mound located on the northeastern margin of the San Francisco Bay. Recent archaeological investigations at CA-CCO-297 suggest that fish, waterfowl and sea otters were exploited as commodities for exchange rather than purely subsistence items. Emphasized production of locally available resources for participation in inter-regional exchange systems appears linked to demographic pressures and reduced foraging efficiency. This paper explores the dynamics of economic behaviors and commodification of natural resources in Central California as manifested in the Late Period archaeology of a Stege Mound.

Del Cid Castillo, David Ricardo (David Del Cid)**[193]** *The Pyramid 12H3 Xultun Archaeological Site, Peten: Transition from the Preclassic to Classic*

The pyramid 12H3 is located on the east of the B group and is the largest pyramid at the site of Xultun, measuring 50.0 x 20.0 m, and approximately 26.0 m tall, with a north-south axis orientation. The pyramid has at least five construction phases. The early work on the structure and documentation consisted of cleaning looter's tunnels with the intention of understanding the phases of construction and obtaining relevant data on the early occupation of Xultun. Research conducted within Sub-1 revealed the first settlement of Xultun, dating to the Middle Preclassic period characterized by the presence of the ceramic type Savana Youth Red Orange Red Rejolla.

[314] *Is It Hot Enough Yet? Reconstructing Firing Temperatures for Prehistoric Honduran Ceramics through Re-Firing Experiments*

Investigations conducted in the Naco valley and its environs within NW Honduras from 1975-2008 have revealed multiple facilities in which ceramic containers were fired. The vast majority of these date to the Late (A.D. 600-800) and Terminal Classic periods (A.D. 800-1000). Their diverse forms and dimensions hint at variations in aspects of production including the temperatures at which the vessels were heated and the degree of control artisans exercised over the manufacturing process. One line of evidence that we have pursued in trying to describe this variability involves re-firing a sample of over 200 pottery sherds that span a wide range of domestic and decorated Late and Terminal Classic taxa derived from settlements that fashioned, and those that consumed, ceramic containers. The results of these tests are used to reconstruct the varied ways craftworkers who fabricated different classes of vessels in diverse facilities at sundry locations might have participated in the area's political economy and to infer how their roles in those relations changed over time.

[341] *More than a Bivouac, Less than a Village: Middle Archaic Use of Great Basin Alpine and Other Uplands*

The role of Great Basin alpine/upland habitats within broader land-use strategies has long been debated. We explore upland and lowland data from either side of the White Mountain highlands to reconstruct late Middle Archaic (~1350-2500 B.P.) use of regional landscapes. This information suggests that regionally wide-ranging, logistically organized patrilineal groups made seasonal use of alpine and other uplands for late summer/fall hunting and gathering prior to winter encampment in valley lowlands on either side of the mountain range.

DeLance, Lisa (University of California, Riverside)

[133] *From Rags to Riches: The Class, Status, and Power of Clothing Among Ancient Maya Women*

Analysis of Maya female imagery has generally centered on the role of women as depicted on monumental architecture. While we understand these depictions to be tools of propaganda, they are often used to make assertions about the lived experience of ancient Maya women. In contrast to the analysis of highly politicized and highly public imagery depicted on monumental architecture, this paper examines depictions of feminine performance on a personalized medium: Maya painted vases. More specifically, this paper will focus on the juxtaposition of clothing design and performativity, including gesture, pose and activity, among Maya women.

An examination of vessel imagery through the comparative lens of performance and clothing challenges the idea of Maya social organization as a dichotomized system in which individuals are classed as either elite or commoners, but not both, never somewhere in-between. Although primarily an analysis of vessel imagery, these inferences can be extended to other forms of representation including ceramic figurines and mural paintings to form a more complete, and more complicated, picture of ancient Maya social relations. When clothing design and performative action are analyzed in tandem, the elite/commoner dichotomy collapses, revealing the highly meaningful intersection of ancient Maya social, political, and economic identity.

[391] *They Sent Sandstone Across the Sea? A Preliminary Petrographic Study of Stone Bowls and Mortars*

The Spanish chroniclers of the 18th century document extensive and intensive long distance regional trade networks among indigenous peoples throughout southern California (and beyond).

Archaeologists are currently reevaluating these long held interpretations of Chumash regional exchange networks in the southern California region during the late prehistoric period. We report a pilot study focused the determination of the lithology/mineralogy of stone bowls/mortars collected from various sites in the Channel islands on the mainland using thin-section petrographic techniques. Our project documents the range of lithologies for a sample set of groundstone bowls and mortars, and compares them to the range of lithologies of potential natural outcrop sources of these groundstone tool types on the various northern Channel Islands of California, and the adjacent mainland. The rock types include sandstone, volcanoclastics, and volcanic rocks. Our study has implications for interpretations of archaeological materials specifically from the southern California Bight region, as well as broader studies focused on regional trade and exchange.

[416] *Archaeology of the Gold Rush Waterfront*

Archaeological research conducted in the former, now land-filled Gold Rush waterfront of San Francisco has defined a rapidly developed port infrastructure and substantial remains of discarded material culture that comprises a several block wide and deep macro-site. Buried ships, collapsed buildings, pilings from wharves and piers, and discarded cargoes buried by urban expansion and the filling of the area have emerged periodically due to redevelopment since 1907 and discoveries continue well into the early 21st century. These discoveries should not be looked at as single sites but rather as part of a more extensive buried maritime cultural landscape. As well, the material culture and features of this massive site define an "instant port" in an "instant city" reliant not only on intense capitalization by entrepreneurial maritime interests, but also reliant on global maritime trade diverted in response to the Gold Rush.

[122] *Performativity and Pedagogy: the Effect of Verbal and Nonverbal Instruction on Experimental Acheulian Handaxe Symmetry*

The Acheulian techno-complex is comprised mostly of bifacial handaxes, which became increasingly symmetrical through time, especially after 400kya. Symmetry has recently been considered a highly significant aspect of the Acheulian toolkit. It has many potential opportunities for a better understanding of the evolution of cognition in early Homo; however, little is known about how this complex skill was transmitted. Could the increasing symmetry of handaxes in the archaeological record be evidence for the introduction of language instruction? We conducted an experiment with novice flintknappers to investigate whether spoken language instruction has any effect on symmetry. Using the Flip Test, we acquired the index of asymmetry for 172 bifaces made by 28 individuals. These individuals learned the skill either through verbal instruction or nonverbal observation. Overall, we found no significant difference in symmetry scores between the verbal and nonverbal groups; however, only the bifaces produced by the nonverbal group became significantly more symmetrical over time. These results indicate that not only is language instruction unnecessary for the transmission of this complex skill, but language may actually be a hindrance. Thus, the introduction of linguistic instruction was probably not the variable responsible for the increased symmetry of handaxes in the archaeological record.

[413] *Transformations in Political Economy and Routes of Exchange on the Eve of the Classic Maya Collapse: New Evidence from the Port Kingdom of Cancun and the Classic Maya Frontier*

The Classic period archaeology and history of the Pasión River “highway” and its connecting land routes demonstrate the vital role of riverine exchange systems and also register major changes in routes, agents, and economies. The riverine port city of Cancun held a critical position at the intersection of both river and land routes that connected the southwest Classic Maya cities to other Peten centers, to southern highland trading partners, and to the more distant realms of Tabasco and Veracruz. Recent evidence from excavations at Cancun and in the Verapaz highlands, as well as from compositional analyses, demonstrate that in the late eighth century there were dramatic shifts in both river and land routes of exchange connecting the southern lowlands with other areas of Mesoamerica. These shifts also involved changes in political economy, port control, commodities and market exchange, and the agents involved – as well as the impact of specific historical events. Taken together this interregional pattern reveals a change in both economic modes and routes as part of a general transformation (at times violent) in the political economy of eastern Mesoamerica near the end of the Classic period.

[307] *The Materiality of Emotion: Steps toward Understanding Affective Experience in the South Andes*

Anthropologists routinely acknowledge the affective significance of things. Display and use of objects (in rituals and performances) can evoke strong emotions. Elaborate objects may be used to forge consensus, to evoke memory, or to foster solidarity and express shared interests. Alternatively, displays may divide opinion, generating a diverse response. Understanding the role of emotions in the past is crucial, both for creating rich and nuanced pictures of past societies, as well as for explaining their trajectories of change. In this paper, I set out initial steps for thinking about past emotions using archaeological evidence. First, I consider the visibility, scale, and permanence of different categories of objects, suggesting how their varied materialities afforded distinct potentials for materializing affective experience. I discuss how specific objects may have sustained particular types of affective experience, taking audiences and scale into account. Through a case study from the Andes of northwest Argentina, I show how objects were used in creative and idiosyncratic ways (1) to evoke a sense of place and locale, (2) to sustain memory of events in the life of a household, and (3) to forge personal networks within the wider South Andean region.

[280] *A Proto-Historic Site in the Western Great Lakes*

The discovery of several early iconographic/Jesuit rings in 1996 in Marquette County, Michigan led to the subsequent discovery of a proto-historic locus within a larger multi-component site. Professional archaeologists and volunteers spent two summers excavating 34 square meters near this discovery, and eventually identified the area as Location A at the Goose Lake Outlet #3 site. The excavated area is a single component occupation located in an ecologically diverse region that has been used from the Late Paleo Indian period to present. This region is immediately adjacent to the Lake Superior basin, but is located on Goose Lake Outlet which is part of the Lake Michigan drainage system. Preliminary evidence including numerous glass trade beads suggest the area was

a winter encampment dating between A.D. 1630-1640. The recovery of abundant large animal remains will aid insights to subsistence and seasonality, and botanical analysis will help establish the habitat and potential plant resources. This locus represents a unique opportunity to investigate the Proto-Historic, a poorly defined occupation in the Western Great Lakes.

Demoule, Jean-Paul (Université de Paris I - Sorbonne)

[82] *The Neolithic House, from Anatolia to Central Europe*

It is accepted with good reason that the appearance of the Neolithic in Europe results from a phenomenon of diffusion, notably demic, from the Near East and more particularly Anatolia. At first sight, there are considerable differences between the Near Eastern houses, which are often small and stone-built with white plaster floors, and the large wood and earth houses of Central Europe. In fact a more detailed analysis of the situation in intermediate regions, especially the north-west Anatolian forest and the south-east Balkans (Kovacevo excavations), shows a gradual development, also linked to available building materials. Thus wood and earth construction is well attested in Anatolia (Ilipinar), while stone is used in Greece (Sesklo). This paper will thus examine the respective contribution of environmental constraints and cultural choices, including the social organization that can be deduced from architecture. Comparisons will be made with other regions of Eurasia at the same period (Russia, Japan, etc).

[125] *The Modern United States of Historical Archaeology Site Reporting: A Multi-State Analysis of Reported Historical Archaeological Sites Archived in the Digital Index of North American Archaeology*

It is recognized that certain biases exist in the archaeological recording of historic sites and contexts in comparison to those from prehistory. Typically, these studies deal only with one state or a discrete region of interest due to the legacy limitations of archaeological record keeping in research and cultural resource management settings. This study demonstrates a first step toward providing historical archaeologists with greater insights into the larger effects of the many discrete choices made during historic site reporting. The advent of the Digital Index of North American Archaeology (DINAA) affords historical archaeologists an important opportunity to categorically and quantitatively assess how site recording is accomplished at a massive level. DINAA is a growing, open access system that provides research definitions for archaeological sites and can make interoperable multiple archaeological databases (currently covering 15 states and over 500,000 sites), through a linked open data strategy that correlates site descriptive ontologies to more standardized vocabularies. This poster provides an assessment of archaeological site definitions and other recording trends through multiple queries of the publicly available DINAA structure, and highlights potential patterns that emerge from disciplinary interests in reporting of cultural components, activity types, or material culture types.

[414] *Early Cultivation Practices and Plant Domestication in New Guinea and Island Southeast Asia*

Early cultivation practices and plant domestication in the New Guinea and Island Southeast Asian regions were largely based on the vegetative propagation of a range of plant types – including root crops, shrubs, grasses and herbs – as well as the transplantation of palms, pandans and trees. The character of early agricultural practices within these regions, as well as in tropical rainforest environments elsewhere, requires different conceptual and methodological approaches than have been adopted or proposed elsewhere. This stance does not represent a descent into conceptual relativism, rather it seeks to understand the emergence of agriculture for each region of the world on its own terms.

Dennehy, Timothy

[153] *Free or Despotic? The Distribution of Hunter-Gatherer Ethnolinguistic Groups in California*

How do hunter-gatherers divide their landscape into territories? In this paper, I will delve into results from a prior study showing a significant difference in territory size between coastal and inland groups in California (Dennehy et al. 2014). I will first simulate territory sizes and locations using an Agent-Based Model (ABM) of hunter-gatherer bands. The model will draw on human behavioral ecology to simulate distribution of foraging groups under three different conditions of social organization: an Ideal Free Distribution (IFD), Ideal Despotic Distribution (IDD), and a hybrid where both forms are possible. "Ideal" here refers to agents that have perfect knowledge of the suitability of different patches in their environment. Such agents are "free" when they can come and go from any patch as they please; they are "despotic" in cases where social hierarchies exist that allow a patch's current inhabitants to successfully defend it from newcomers. I expect each condition to produce a different distribution of forager groups, visualized as maps of simulated territories. I will then compare these maps to that created by Alfred Kroeber (1922) to test which condition more accurately matches the known distribution of California foragers.

[391] *Porcelain, Kilns, and Chiefs: LA-ICP-MS Analysis of Sherds in the Pre-Colonial Philippines and Southern China*

This research examines issues of production and distribution of Chinese porcelain in the Song, Yuan, and Ming dynasties by comparing chemical signatures of porcelain sherds and clay collected from sites in Fujian, China both to each other and to sites of dispersal within Philippine chiefdoms in Tanjay, Cebu, and Manila. This research examines how patterns of long distance trade were negotiated within the Philippines at one end of the network and the variations in production

strategies, distribution, and sources within Fujian kiln sites at the other. Chemical signatures, through the use of Laser Ablation Inductively Coupled Plasma Mass Spectrometry (LA-ICP-MS) are used to distinguish patterns, examine ceramic homogeneity across the sites and regions, and begin to suggest porcelains kiln sites as sources of production within the network. This focus across various scales, and at both ends of this trade connection, allows for the examination of not just centers but also interior or 'periphery' groups which were likewise connected and interlinked into this porcelain exchange network.

[13] *In(di)visible Fulcra: Perception and Balance in Canadian Archaeological Governance*

The history of provincial heritage legislation and policy in the Canadian context has been infrequently studied and rarely theorized. Contemporary critical heritage and applied archaeological research are beginning to reverse this trend and the past that is coming to light has significant implications to future archaeological governance. Drawing from research conducted in British Columbia and Ontario, this paper highlights two important facets of archaeological governance: perception and balance. Perception revolves around the fluctuating identities and performances within the provincial regulatory apparatus during the transition from academically to commercially driven archaeology. Perceived shifts in the roles of state-affiliated archaeologists and the negotiated perceptions of stakeholders segue into a discussion of balance within the archaeological bureaucracy. The history of archaeological governance is one of an orchestrated balance between seemingly competing interests and identities. Both internal and external equilibria are consciously and unconsciously maintained as provincial archaeologists realize their roles within a wider bureaucracy and the role of cultural resource management within wider economic and cultural sectors.

[32] *The Assumption of Insular Marginality: The Curious Case of Isla Cedros, Baja California*

What about islands inspires us to think of them as places on 'the edge?' The idea of an island is often more remote than the reality. The word itself conjures up notions of loneliness and isolation. Some islands are inextricably linked, to other islands and/or the adjacent mainland, while the nonpareil isolation of Rapa Nui is legendary. Lying off the Pacific Coast of Baja California, Isla Cedros presents a strange combination of these factors. The island supported a large resident population before European Contact due to ample fresh water, surrounding seas teeming with marine resources, and a robust terrestrial ecosystem. The islanders were tied into the social networks of the adjacent peninsula as evidenced by Jesuit documents and an abundance of obsidian brought from the mainland. This island was the largest population center for hundreds of kilometers in every direction. Isla Cedros was not a marginal place, but one of the most important centers, one of the most ecologically rich locations, and home to one of the most dynamic social environments in the region. Its remoteness from other major centers provides archaeologists an opportunity to examine the essential qualities of an island and the impacts of such on human behavior.

[174] *Explaining Intraregional Assemblage Variability in Southern Africa during MIS 2: Different Strokes or Different Folks?*

In southern Africa Marine Isotope Stage 2 was a period of intense cold, and palaeoenvironment and geoarchaeological data indicate inverse moisture availability in the different rainfall zones. Sea levels fell rapidly, exposing the continental shelf while the number of archaeological sites across the subcontinent decreased, likely a result of populations concentrating along the now-submerged coastline. There were, however, pockets of inland 'refugia'. People contracted into centers of occupation in the northwestern escarpment, the Western Cape, the southern Cape Fold Mountains and the Maloti-Drakensberg Mountains when the rest of the country seems largely abandoned. Similar artifacts (bladelets) suggest that these distant groups were socially enchainned. In two of these regions, the northwestern escarpment and Maloti-Drakensberg, some sites dated 24-23 cal kBP conform to the popular culture: Spitzkloof A and Sehonghong, but there are also contemporaneous intraregional differences, with other sites lacking not only bladelets but also grindstones (Apollo 11 and Melikane). Two hypotheses are being tested. First, there were multiple groups on these landscapes, with some participating in attenuated social networks and others not. A second hypothesis is that the different signatures reflect differences in the use of individual sites, whether seasonally or because of variable catchment potential.

DeWitte, Sharon (University of South Carolina)

[207] *Developmental Stress and Disease Susceptibility: The Association between Skeletal Indicators of Leprosy and Other Physiological Stressors*

Leprosy has long interested bioarchaeologists because of its antiquity and because it can cause skeletal lesions. These lesions are primarily associated with lepromatous leprosy resulting from a minimal cellular immune response. This study tests the hypothesis that early-life developmental stress increases the risk of developing lepromatous leprosy by examining the association between skeletal signs of leprosy and other skeletal stress markers. A combined sample of 126 adults from two Danish cemeteries (c. 12th-13th centuries CE) was assessed for the presence of skeletal indicators of leprosy and other, non-specific stress markers. Based on the results of chi-square tests, there are no significant associations between any indicators of childhood stress and having two or more signs of leprosy. There is, however, a significant association between tibial periosteal lesions and having two or more signs of leprosy. These results suggest that childhood stress is not predictive of developing lepromatous leprosy (or skeletal manifestations thereof) but that stress that can occur later in life might be. However, several of the leprosy-lesions have low specificity and thus the co-occurrence of periosteal lesions and signs of leprosy might reflect other conditions rather than indicating that previous physiological stress increases the risk of lepromatous leprosy lesions.

Dexter Kennedy, Jaime (University of Oregon) and Geoffrey M. Smith (University of Nevada, Reno)

[415] *Paleoethnobotany at LSP-1 Rockshelter, Lake County, OR: Assessing the Dietary Diversity of Plant Foods in Holocene Diet*

Over the past five field seasons, collaborative research at the LSP-1 rockshelter in Oregon's Warner Valley conducted by the University of Nevada, Reno archaeological field school and Bureau of Land Management has revealed a record of human occupation spanning the Holocene. While faunal remains are prominent in the deposits, nutritional information can also be derived from pollen and seed data at LSP-1. This paper presents the results of paleoethnobotanical analysis with respect to diet breadth and foraging of locally available plant taxa during the Early (~11,000-7,600 BP), Middle (~7,600-3,000), and Late Holocene (~3,000-contact). These data contribute to a growing body of

research identifying plant resources targeted by people living in the Warner Valley. Additionally, data generated by this study also have the potential to provide insight into the nutrient intake associated with preferred plant foods and to facilitate our understanding of hunter-gatherer dietary diversity over the course of several millennia in the northern Great Basin.

Di Giuseppantonio Di Franco, Paola (University of Cambridge)

[188] *Experiencing the Past through "Digifacts"*

This paper presents DIGIFACT, a project aiming at improving our understanding of how people perceive artifacts through different media. This project will clarify the role of 3D technologies in the perception of archaeological artifacts, which are critical to our world heritage, and help us understand how people experience artifacts in a museum and how 3D replicas can improve visitor experience of authenticity and understanding. For this research, I will collect data on how visitors experience the archaeological record in the Museum of Anthropology and Archaeology in Cambridge, developing a research program to feed into the redevelopment of the World Archaeology Gallery. In order to explore how people perceive museum artifacts through different media, I will videotape volunteer participants at the MAA while they interact with selected artifacts through different forms of media. Speech and gestures will be analyzed with methods borrowed from Cognitive and Information Science, to see how the medium (e.g. tactile experience vs interaction with 3D virtual copies) influences the way people describe and understand objects.

Diaz, Diana (Graduate Student in Anthropology, California State University, Northridge) and Danielle Kurin (Assistant Professor of Anthropology, University of)

[111] *Discerning Site Distribution and Settlement Patterns in Andahuaylas (Apurimac), Peru*

In the Andahuaylas region located in the southern central highlands of Peru, archaeologists have documented the presence of three critical cultural occupations: Wari, Chanka, and Inka (ca. A.D. 700-1400). Previous investigations claim that environmental change may have influenced collapse and played a decisive role in resettlement patterns. Using spatial data from 86 surveyed sites, this study investigates how state collapse, reorganization, and environmental transformations influenced settlement patterns in the region. Nearest neighbor analysis and other GIS applications are marshaled to evaluate how regional site density, settlement location, agglutination, and length of occupation varied over time. These data are then used to address the nature of site abandonment as well as motivations for population aggregation. This research emphasizes the role social agency as our results suggest that human settlement on the landscape may be more strongly predicated by the social milieu than macro climactic conditions.

Díaz Rocha, Ana María (Boston University)

[12] *Lacquer Arts of Viceregal Latin America: A Study of Transculturation*

The establishment of a trade route between Asia, the New World, and Europe during the sixteenth century allowed admiration, exchange, and adaptation of different motifs, materials, and artistic techniques. The study of lacquer arts offers unique evidence of the transculturation that defines the arts of Spanish America during the viceregal period. This poster explores the use of unique American lacquer traditions that combine indigenous techniques and European forms with designs borrowed from Europe, Asia, and prehispanic America. I look specifically at two separate lacquer art traditions that developed in the sixteenth and seventeenth centuries and are still in use today: Maque Lacquer and Barniz de Pasto. Both techniques developed from precolumbian Lacquer techniques that used organic materials prevalent in the regions of production. While trying to understand cultural and artistic modifications and new outcomes during the colonial period, I also focus on the subject's implications for our understanding of material and iconographic studies in archaeology.

Diaz Vazquez, Juan Carlos [111] see Rios, Jorge

Díaz-Díaz, Miguel (Para la Naturaleza)**[290]** *La erosión costera como agente de cambio geomorfológico y pérdida de contexto arqueológico*

La erosión costera es el proceso por el cual la acción hidráulica del mar transporta los sedimentos de un lugar de la costa a otro. Esta situación es particularmente importante en islas, donde gran parte de la población ha vivido y continúa viviendo en zonas costeras. Dentro del contexto de ciencia ciudadana, en esta charla presento el desarrollo de mi investigación multidisciplinaria que combina geomorfología y arqueología para evaluar cómo la erosión puede amenazar un sitio arqueológico costero. El proyecto evalúa el transporte de sedimentos en la boca del Río Grande de Manatí y su relación con el sitio arqueológico Tierras Nuevas dentro de la reserva natural Hacienda Esperanza en Manatí, Puerto Rico. El sitio comprende seis bateyes pre-colombinos y colinda con playa Machuca la cual le sirve como protección contra erosión. El estudio analiza datos sedimentológicos y geomorfológicos para entender el dinamismo de la playa y si la erosión presenta una amenaza para el recurso. Esta información nos podrá ayudar a identificar el potencial de riesgo para la preservación del sitio arqueológico, para la estabilidad de las comunidades aledañas ante el cambio costero futuro, y para la preservación de las áreas naturales que componen la Reserva Natural de Esperanza.

Dibble, Loretta (Rutgers University)**[174]** *Worked Bone Harpoon Technological Persistence and Variation Through Time and Geography (Turkana/Omo Basin, Kenya/Ethiopia)*

This paper reports results from a detailed study of the variation in Holocene worked bone harpoons from the Lake Turkana/Omo Basin (Northern Kenya/Southwest Ethiopia). Bone harpoon sites in this basin span more than 6,000 years (approximately 9,000/10,000 bp through 3,000 bp). A review of the dates associated with these archaeological assemblages and the dating of sedimentary features correlated with the changing lake levels in the basin is presented along with new dates and new material from recent excavations (FxJj108) and survey in Koobi Fora, Kenya. Throughout the basin considerable spatial and temporal variation exists in features such as harpoon length, haft, barb design, and attachment styles. Post-tool production variables such as harpoon usage breakage patterns and taphonomic variation also vary from site to site. A theoretical framework of harpoon functional variation is presented to encompass environmental differences, differences in prey species, and patterns of tool use. The goal is to use the archaeological record to test the hypothesis derived from this theoretical model and to identify patterns of harpoon production and usage. How this research can connect to larger issues related to movement of peoples and the persistence and function of bone technology will be considered.

Dibble, Harold (University of Pennsylvania), Alain Turq (Musée National de Préhistoire), Laurent Chiotti (Muséum National d'Histoire Naturelle), Marie Soressi (Leiden University) and Laurent Bruxelles (INRAP)**[190]** *A Brief Review of the Work of Paul Goldberg in SW France*

There are few researchers who have achieved the breadth of experience of Paul Goldberg, whose work spans almost every continent on the planet, and from the early Pleistocene to the Holocene. There are some regions, however, that have greatly benefited from his expertise, including SW France. In this paper we will review some of his work here, beginning with his dissertation work at the site of Pech de l'Azé II, and over the past 14 years at the sites of Pech de l'Azé I and IV, Roc de Marsal, and La Ferrassie.

DiBenedetto, Katelyn (University of Nevada Las Vegas) and Levi Keach (University of Nevada Las Vegas)**[7]** *Playing with Fire at 'Ais Giorkis: A Geospatial Analysis of Prehistoric Fire Residue*

Kritou Marottou 'Ais Giorkis is an Early Neolithic (9.5 kya) site located, uniquely, in the western foothills of Cyprus' Troodos Mountains. It is one of five near contemporary sites and has produced

the largest chipped stone and faunal assemblages recovered thus far. There are also several preserved circular, cobbled platforms, whose function has yet to be determined. In fact, little is currently understood about the lifeways practiced at the site. This includes the intensity and duration of its occupation, making interpretation of the site and its past human experience difficult. To better engage with this issue, this study will employ geospatial analysis, while taking a landscape approach. It specifically examines the residue of fire activity, including the spatial distribution of both burnt chipped stone and faunal remains as well as observed ash lenses. Preliminary examination of the burnt chipped stone has revealed spatially distinct clustering at the site indicative of anthropogenic fire. The other data will be incorporated within the geodatabase to determine what differences and similarities exist between patterns. This will then be compared within the spatial location of the platforms within the local landscape to produce a more robust understanding of both 'Ais Giorkis and its inhabitants.

[168] *Database Development and GIS Analysis at Tse-whit-zen*

Digital databases promote consistency and data quality, facilitate analysis of patterning at multiple temporal and spatial scales and promote accessibility to a wide range of potential users. The value of digital databases is especially clear with large complex projects that involve collaborators working in separate research settings with different collections, but where data integration is essential to meeting project goals, such as with the Tse-whit-zen project. This presentation reviews approaches used to create and maintain the Tse-whit-zen database-- that includes faunal, chronological, and geo-spatial records of excavated deposits. Hand-drawn excavation unit-level maps were digitized and stored in a geodatabase. Spatial and temporal analytic units of various scales were defined. Through a unique identifier, the analytic units (e.g. Chronozones) were linked to the faunal and other records stored in an Access database and used as the basis for analysis calculations and visualizations. Records were visualized both in 2D in ArcMap and 3D using ArcScene.

[186] *From Frontier to Forefront: Microbotanical Evidence of Early Holocene Horticulture in the Middle Cauca Valley, Colombia*

Archaeological research in the Middle Cauca region of Colombia has identified significant human presence during the early to middle Holocene (10,600-3600 uncal BP), associated with lithic technology focused on plant processing (e.g., handstones, milling stone bases, and "hoes"). Starch residue analysis on these tools has documented the early availability and use of several domesticates; both exogenous, such as maize (*Zea mays*) and manioc (*Manihot esculenta*), and possibly indigenous, such as achira (*Canna edulis*) and cocoyam (*Xanthosoma* sp.). The Middle Cauca valley was a conduit for the dispersal of cultigens in and out of South America by early forager-horticulturalists, who were also potentially experimenting with the domestication of local plants. These results reinforce Piperno's pioneering work demonstrating that the humid Neotropics were an early and independent cradle of plant domestication and agricultural origins in the New World.

[214] *Reinterpreting the Rise of the State in Mesopotamia as a Self-Organizing Process Engendered by the Interaction of Interpersonal Behavior and Religious Eschatology*

Anthropologists have long used “integration theory” to explain the rise of the state in Mesopotamia. This perspective, derived from functionalism, structural-functionalism, general systems, or cultural ecology, sees state emergence as a response to problems of population growth, ecological distress, competition, warfare, or the need to organize long distance trade. Integration theory is thus “top down.” That is, it posits that state governance is imposed upon a population as a social solution to one, or a series of, adaptive challenges. Largely ignored in integration theory is human agency. We propose a “bottom up” perspective that gives primacy to interpersonal interaction and religious ideology. Specifically, we posit that (a) the interpersonal behavior characteristic of irrigation agriculture in interaction with (b) the “judgmental” form of religious eschatology that is invariably present where such agriculture is practiced, engendered self-organizing or multi-agent processes that led inexorably to the rise of the state in Mesopotamia.

[85] *Architectural Specialization in Basketmaker III Proto-Villages*

The foundations of Ancestral Pueblo community organization were codified in aggregated communities during the Basketmaker III Period (A.D. 500-725). This study compares morphological differences in public architecture and habitation pit structures at several aggregated sites in the Northern San Juan Region to reveal functional specialization of space associated with both long-term habitation and periodic communal gathering behavior. This specialization may reflect the primary social institutions at the household, settlement, and community levels during Basketmaker III. These patterns are then compared with specialization of structures identified at aggregated Basketmaker III sites in other regions in order to identify the origins of the Northern San Juan Basketmaker III population.

Diehl, Michael

[55] *Farmaging and the Limitations of Storage during the Early Agricultural Period at Las Capas*

The charred macroplant assemblage from Las Capas yielded one domesticate (*Zea mays*), and forty-six wild plant taxa endemic to the greater Tucson Basin of southern Arizona. These 47 taxa, their ubiquities, and their natural ranges of occurrence, indicate that the San Pedro phase and Early Cienega phase occupants of Las Capas were primarily dependent upon wild foods. Agriculture was used to mitigate the risks of food shortfalls associated with the alternative strategy of foraging for wild food plant taxa. Limitations on the utility of agriculture for producing sufficient food supplies were a consequence of the use of a very low yield variety of popcorn maize, and the absence of storage facilities capable of protecting stored food from moisture intrusion and subsequent degradation. The resulting subsistence system was likely a semisedentary one that saw multiple abandonments and reoccupations of the site each season. The particular combination of irrigation supported maize cultivation, extensive foraging, and seasonal residential mobility has no clear analog in the southwestern US ethnographic record. The term “Farmaging” is introduced to describe the Las Capas subsistence and settlement system.

[175] *“A Mourning Dirge was Sung”: Community and Remembrance at Mission San Gabriel*

Recent research at Mission San Gabriel (CA-LAN-184H), conducted in collaboration with descendant communities, has identified two major types of Mission-period features related to communal mourning. In addition to the known practice of interring and memorializing the deceased in the Mission’s cemetery, archaeological data recovery excavation has identified a series of artifact-filled pits that have much in common with prehistoric and historic Native American mourning features that have been documented throughout the greater Los Angeles area. While the cemetery reflects burial practices and mortuary rites under the purview of the mission’s Catholic priests, the possible mourning feature suggests a concurrent ceremonial practice that may have derived from indigenous

ritual traditions with a long history throughout the region. Taken together, these practices allow for consideration of the complicated power dynamic within the mission setting and the ways that group identity and community may have been formed and transformed on multiple levels. When paired with documentary evidence, particularly the mission's burial journal and ethnohistoric descriptions of traditional Gabrielino burial and mourning practices, these data can provide invaluable insight into the interplay between Native American and Catholic traditions as practiced within the mission community.

[186] *Long-Distance Adoption of Exotic Cultigens in Northwest Peru: Problems and Processes*

By 7,000-6,000 BP on the coast and in the western highlands of northern Peru, several long-distance food crops, whether domesticated or not, were adopted by local communities. Most of the crops are derived from Neo-Tropical environments far to the north, perhaps in the Ecuadorian and Colombian lowlands, or from the eastern side of the Andes. The technological, demographic, and economic mechanisms and processes by which this adoption process took place are considered for several archaeological localities dating between 10,000 and 6,000 years ago. The wider social and economic implications of this process are considered theoretically and historically.

[412] *Evocative Stones: Variable Obsidian Source Use in Northern California*

Northern California contains multiple, geochemically distinct, high-quality obsidian sources that were quarried in prehistory. However, not all were exploited equally. Instead, selection patterns suggest that some obsidian sources were reserved for manufacture of specific types of objects, while others could be used for more routine tools. The geologic and cultural context of the obsidian source may offer explanations for why differential quarrying and use occurred. Glass Mountain in Siskiyou County, California, provides a case study for selective use of obsidian for special objects. Just as obsidian objects fulfilled utilitarian or symbolic functions, obsidian sources retained special roles within prehistoric contexts.

[233] *Despotism, Cooperation, and the Evolution of Social Hierarchy in Prehistoric Hawai'i*

Ancient Hawaiian society is often emphasized as a locus for the evolution of complex hierarchical polities. At the time of European contact, Hawaiian society was divided into a large class of commoners and a smaller class of hereditary chiefs and land-managers, the latter controlling a vastly disproportionate share of land and resources. This despotism by Hawaiian elites is regularly emphasized in discussions of the 'development of the state;' however, the high level of cooperation inherent in this social organization is not. This paper is an attempt to complement previous research by exploring the evolution of social hierarchy in Hawai'i using a suite of models derived from evolutionary ecology and evolutionary game theory, specifically, the Ideal-Free and Ideal-Despotic Distribution models, economic defendability, and models of cooperation. In particular, problems associated with large-scale cooperation in despotic social groups are emphasized as a powerful force leading to hierarchy. The predictions of these theoretical models are evaluated using the archaeological record of the Leeward Kohala region on the Island of Hawai'i.

[7] *Exploring Land Usage at Tannehill State Park: Giving Artifacts a Context through Watershed Mapping*

Tannehill Historical State Park encompasses a resource rich environment that has supported human settlement for thousands of years. Dozens of possible sites have been identified across the park's landscape, but few are thoroughly investigated, leaving a gap in current understanding of settlement patterns and land usage in prehistoric times. Josselyn Site 2G, a large surface collection, is one site where little is known. It holds projectile points indicative of the Middle Archaic, Late Archaic, Early Woodland, and Middle Woodland Periods, indicating regular site usage of the area over of thousands of years. Little was found under the surface at this site, indicating disturbance of the artifacts from their original location, likely caused by erosion or water runoff. This project uses existing site information in conjunction with remote sensing to help expand knowledge of land use and site locations at Tannehill State Park. Digital elevation models are used to map watershed in the region, with the goal of locating the possible original context of the artifacts collected at Josselyn 2G, as well as identifying other possible site locations. It holds the potential to greatly enhance our understanding of long term landscape usage as well as human adaption within the landscape.

[22] *House Ritual in Chaco Canyon: Scale, Context, Emergent Differentiation and Inequality*

At Chaco Canyon, clear indications of social differentiation in the Pueblo world first appeared during the 9th-11th centuries. One materialization of this is the contrast between two contemporaneous architectural forms: great houses, interpreted as populous communities or largely empty centers of seasonal ritual pilgrimage, and small houses, explained as multi-family households. Since ritual artifacts have been excavated from both house categories, analyzing inter- and intra-site variation in ritual assemblages is a fruitful way to investigate the structure of Chaco society. Approaching from the intersection of materiality theory, Pueblo ethnography, and collections-based research, I explore how the differing scales and contexts of ritual in Chacoan houses, particularly cosmological scale, structured sociopolitical relations and emergent inequality. At Pueblo Bonito, objects in ritual caches index a greater breadth and diversity of cosmological phenomena than those indexed in ritual contexts from small houses. This suggests that emerging leaders used their greater control over significant materials and linked cosmological phenomena to connect themselves to potent and distinct forces within a socially valued cosmic order. By doing so in varying public and private contexts, they materialized social differences both among themselves and from small house residents and negotiated their way to greater power in Chaco society.

[75] *Sacbe Construction, Agricultural Production, and Community Organization in the Classic Maya Community of Cerén, El Salvador*

The exceptional preservation of the Classic Maya community of Cerén, El Salvador has afforded the opportunity to examine how one group of people constructed their built environment. The remarkably well- preserved site (public and domestic structures, earthen sacbe (road), agricultural fields, plant casts, and artifacts) greatly aids in our understanding of small-scale socio-political organization. This paper draws on data collected during the 2013 field season as well as earlier research. The presence of an earthen sacbe at the site raises significant questions about labor organization, power distribution, and the relationship of Cerén to other communities in the Zapotitán Valley. Additional understanding of cooperation and autonomy is gleaned from stylistic features of the agricultural fields, the synchronized harvesting, and the physical manifestation of other decisions that farmers made. Examining these multiple features helps to illuminate small-scale socio-political organization within one ancient Maya community.

[192] *Survey for Submerged Archaeological Sites on the Continental Shelf of SE Alaska: Proof of Concept*

Four seasons (2010-14) of underwater archaeological survey (NSF OPP -#0703980 and 1108367) on the continental shelf of SE Alaska demonstrates that survey for evidence of human habitation when sea level was lower is feasible. Real time ROV monitoring and video, hydrologic excavation, airlift sampling, and graduated screening can be reliably employed for sea floor sampling following multibeam, side-scan sonar, and sub-bottom profile surveys. Limiting dates for submerged landscape features and archaeological sites can be established based on their depth in relation to regional sea level curves in combination with 14C AMS dating. This research demonstrates proof of concept for survey and testing for sites on the continental shelf pre-dating post-Pleistocene sea level rise.

[299] *What Moral and Ethical Considerations Should Inform Bioarchaeology of Care Analysis?*

The aim of this presentation is to submit for discussion a proposition of an 'orientation map in ethics' which may be useful for scholars engaged in bioarchaeology of care. To this end, I present as a first step the main objections that have been raised in the literature to any attempt of inferring care toward disabled persons in prehistory. I suggest that most of these objections come from two different ethical backgrounds: a number of them are motivated by the defense of a set of values which are required by the epistemology and methodology of any scientific research, while others relate to the interpretations of the moral signification of the contents and outcomes of a bioarchaeology of care analysis. Such objections rely on another normative field, that of both scholar's philosophical and moral valuations. In relation to this short classification, I state then, on the one hand, that a bioarchaeology of care methodology is an adequate answer to any objector who fears that ethics of scientific research may not be honored in the field. On the other hand, I explain why a moral position which differs from ethical relativism in the anthropological literature can contribute to progress in the field.

[244] *Incorporation and Independence in the Preclassic Western Maya Lowlands: Integrating Local and Regional Traditions at Rancho Búfalo, Chiapas, Mexico*

In this paper, I explore tensions between territorial integration and local resilience at Rancho Búfalo, Chiapas, a five hectare Preclassic center that was geographically intermediate to the cultural territories of the Olmec, Lowland Maya, and Pacific Coast. This site's residents employed a localized approach to extra-local architectural packages, ceramic spheres, and burial traditions that complicates traditional narratives of ethnic and political incorporation in Preclassic Southern Mesoamerica. Their continuing access to imported goods such as marine shell and chemically fingerprinted obsidian indicates that this independence did not curtail their productive interaction with broader networks of Preclassic exchange. I contextualize their ability to balance local independence and broader territorial integration by drawing upon studies of the Classic Period and modern Usumacinta River Valley, and the unique geography that has led to its multi-millennia history as a contested space. By demonstrating heterogeneity in political and cultural territories that are traditionally construed as "well integrated," I interrogate the epistemological and geographic boundaries that have been imposed by researchers on the Maya area, and Mesoamerica more broadly.

[53] *Lithic Analysis of Late Mousterian Assemblages at Riparo Bombrini*

We present a preliminary analysis of the Late Mousterian lithic assemblages from Riparo Bombrini, in Northwestern Italy. Riparo Bombrini is an important site because it contains some of the most recent Neanderthal occupations for that region. Our analysis includes both retouched pieces and unretouched debitage, focusing especially on piece dimensions; the presence, kind, and intensity of retouch; platform and termination types; as well as raw material procurement. These multiple dimensions combine to provide a fine-grained view of, among other behaviors, Neanderthal mobility in the various Late Mousterian levels at Bombrini, and thus shed light on the adaptations and behavioral strategies of Neanderthals immediately prior to the arrival of modern humans in NW Italy.

[153] *Oh What a Tangled Web: The Symbolic Use of Road Trash to Advertise Drug Sales*

This paper summarizes eight years of ethnoarchaeological research into the material consequences of drug-trafficking behavior. Tens of thousands of mundane trash items have been retrieved from roadway margins in a suburban setting, then sorted and analyzed. More than 175 artifact categories and pavement features are identified that carry subtle meaning for both buyer and seller. Artifactual, behavioral, and linguistic evidence has been assembled that links individual drug types to everyday objects on the street. Sales of marijuana, crystal meth, and crack cocaine dominate the sample. Several alternative substances are also represented. Recent interview of recovering drug users has provided a crucial chance to test the soundness of ideas generated by the fieldwork. The hidden undercurrent of drug dealing in contemporary society creates a fascinating but illusory archaeological record, one that interweaves systemic and archaeological contexts in an intricate structure of crypsis and mimicry.

[376] *Hun Tun: Household Context and Social Complexity in Northwestern Belize*

The ancient Maya site, Hun Tun is located in northwestern Belize and serves as a platform of inquiry into social complexity at the household level. This paper addresses ancient Maya commoners in household contexts while discussing data that are pertinent to ideas of household identity, social formation, and household production by re-evaluating the value of domestic space. The analysis of everyday objects in domestic contexts contributes to these data. Major archaeological features at Hun Tun will be discussed as they pertain to household archaeology and its contribution to greater Maya social complexity. Particular features challenge existing ideas about the function of hinterland domestic space. In tandem with features, material culture is also discussed as it also contributes to knowledge about the function of domestic activity areas. Such examples include ceramic analysis, various lithic material assemblages, and eccentric artifacts. The data suggests a larger scale of access and exchange for domestic household artifacts and features.

Doelle, William (Archaeology Southwest), Karen Schollmeyer (Archaeology Southwest) and Jeffery Clark (Archaeology Southwest)

[262] *Salado in the Upper Gila*

Salado archaeology in New Mexico was largely defined in the Upper Gila, where the regional name "Cliff phase" originated. Early work by Kidder and the Cosgroves in the 1920s and several professional and avocational projects in the 1960s-70s included important Salado sites. Despite this early promise many projects were underreported, and there has been comparatively little research with modern methods. Recent research by Archaeology Southwest addresses this gap. A strong base of survey and excavation in the Lower San Pedro Valley coupled with a growing understanding of the spread of Salado pottery and other markers allows us to trace Salado influence into the Upper Gila. The regional scale of Salado as the complex outcome of the Kayenta migration from the northern to the southern Southwest in the second half of the 13th century has become increasingly clear. This paper reviews the story of Salado on the scale of the Southwest and then focuses on current Preservation Archaeology efforts in the Upper Gila. Planning is ongoing to define a long-term research program that will improve our understanding of Salado's place in the larger cultural and temporal framework of the Upper Gila.

[83] *Digital Preservation and 3D Technology Strategies for the Management, Protection, and Interpretation of the Only Existing American Revolutionary War Tunnel: Developments from the 3D Documentation Project at Ninety Six National Historic Site, South Carolina*

New strategies for archaeological preservation and interpretation are emerging from collaborative research occurring within our nation's National Park Service (NPS) System. This paper shares results from a dangerous and challenging underground confined space archaeological project documenting a Revolutionary War Era tunnel system as part of cooperative work between the University of South Florida and the NPS Southeast Archeological Center (SEAC). Using digital imaging, terrestrial laser scanning, and aerial LiDAR combined with remote sensing and GPS survey, researchers documented, prepared conditional analysis, and developed public interpretation methods that extend management, preservation, and engagement potentials that yield insight into important historical events in our Nation's history. Three-dimensional survey allows critical assessment of tunnel construction and conditions, and data are being used to create virtual models and replicas for display and educational purposes. Augmented Reality (AR), 3D Printing, and Virtual Reality (VR) models are also allowing for new and engaging teaching methods that bring our Nation's Parks to life in the classroom and beyond.

Doering, Briana (University of Michigan)

[163] *The Earliest Catch: The Origins of Salmon Fishing in the Alaskan Interior*

Ethnographic records indicate that salmon fishing was a primary activity for Athabaskan people living in Alaska's interior. Evidence of fish use in antiquity is difficult to assess due to the highly degradable nature of delicate fish bones. Fishing in the archaeological record is identified by fishing tools in addition to faunal remains. This poster will discuss the antiquity of salmon fishing in Alaska's interior through a GIS-based comparison of anadromous fish streams and evidence of fishing in registered archaeological sites in Alaska's interior. This pilot project will serve as a basis for future archaeological investigations.

[389] *Late Mousterian Industrial Variability in Southwestern France: A Case of Abri Peyrony*

Variability of late Neandertal technological behavior has been a long debated question in which sites from southwestern France figure prominently. As suggested by some, rich datasets from this region show a pattern of chronological sequencing of late Mousterian technocomplexes. According to this model that assumes technocomplexes reflect different cultural groups among Neandertals, Quina Mousterian is always followed by Mousterian of Acheulean Tradition (MTA) and discoidal-denticulate is proposed as the latest expression of Mousterian in this region. This contradicts previous views where MTA is the latest manifestation of Neandertals and represents an origin of the Châtelperronian. Re-opened in 2009, Abri Peyrony, known as an MTA location since early 1900s, yielded a rich dataset that includes numerous lithic and faunal remains, bone tools and worked manganese oxide. Aside from a known MTA level, an older level has been discovered. In terms of lithic assemblage, it shows no bifacial elements characteristic of MTA and it features predominance of discoidal system and denticulate tools. Here we will present recent analysis of lithic industries from this site and discuss its contribution to the questions of the reality of the Mousterian technocomplexes and the validity of the chronostratigraphic sequencing of the late Mousterian in southwest France.

[311] *Good Fare and Tribal Affairs: The George and Saleeche Colbert Site*

The George and Saleeche (Shillich'i) Colbert site in northeastern Mississippi is an early 19th century Chickasaw occupation that has yielded extensive evidence of a well-travelled site, with a wide and prolific scatter of period artifacts, including pearlware, flintlock gun parts, wagon and harness hardware, Chickasaw pottery, trade beads, and in situ architectural foundation features. Historic documentation indicates that Colbert's home served as the Chickasaw council house, where the treaty of 1816 was concluded with Andrew Jackson. This poster compares the rich oral history of the site with the historic record, and reviews recent research along with the latest archaeological findings.

Dolan, Patrick (Washington State University) and Colin Grier (Washington State University)

[80] *Reconstructing Settlement Histories Using Simulations and Calibration of Radiocarbon Dates: An Example from a Plankhouse Village in Southwestern British Columbia, Canada*

Documenting the formation, growth, and decline of individual settlements is critical to explaining the development of settled village life. Radiocarbon dating is often the best, and in our case only, chronometric tool for establishing these temporal dynamics. Here, we explore several approaches to reconstructing the temporality of settlement at the Dionisio Point site, a precontact plankhouse village in southwestern British Columbia. Two decades of research at this 1,500 year-old hunter-gatherer-fisher village has generated more than 30 radiocarbon dates, presenting a rare opportunity to investigate the timing, duration, and, most importantly, shape of the village occupation. We employ Monte-Carlo simulation of uncalibrated dates to evaluate which of several alternative probability distributions of datable events best fits the empirical data set. We compare the results of this procedure with the summed probability distribution of calibrated dates, and consider our results in light of more recent Bayesian approaches to chronology-building. Our results suggest that using multiple methodologies offers useful insights into the complex settlement histories we seek to understand.

Dolan, Sean (University of Oklahoma)

[91] *Black Rocks Beyond the Border: Obsidian in the Casas Grandes World*

Archaeologists in the North American Southwest have documented the source provenance of obsidian artifacts throughout the Ancestral Pueblo, Hohokam, and Mimbres Mogollon regions. These results have impacted how we portray obsidian lithic technology, procurement, and social interaction at both macro and micro regional and temporal scales. Despite the methodological and theoretical advances in southwestern archaeological obsidian studies over the years, obsidian from the Casas

Grandes region in northern Chihuahua, Mexico has not been examined. Casas Grandes is the largest and most socially complex regional system in northern Mexico and the North American Southwest from A.D. 1200-1450 based on the large quantities of exotic objects, ceremonial activity, and architecture. This poster presents XRF analysis of 117 obsidian chipped stone artifacts from four Medio period Casas Grandes sites. Preliminary results suggest differences in obsidian procurement and source use at the Casas Grandes sites compared to contemporary sites further north in southwestern New Mexico with the occurrence of both local and non-local sources. This is the largest sourcing project in northern Chihuahua and these data show the importance of studying social interaction, economy, and lithic procurement using sourced obsidian artifacts to address the scale of Casas Grandes influence to the north.

Dombrosky, Jonathan [121] see Barker, Andrew

[122] *Characterizing Weathered Protein Residues from an Intra-Annual Cooking Experiment: A Mass Spectrometry Approach*

The identification of archaeological protein residues from cooking pottery using non-targeted mass spectrometry based approaches is a promising avenue of research. A major strength of mass spectrometry in archaeological protein residue analysis is that it allows for the reliability of protein identifications to be probabilistically quantified. Though it is clear that proteins can preserve in ceramics under favorable circumstances, little is known about diagenetic processes that affect preservation and identifiability in less than ideal contexts. Thus, archaeologists have few expectations about what residues can be found in archaeological samples, indicating that method development using mass spectrometry in archaeological protein analysis is needed. One pressing question is: Using mass spectrometry, how rapidly do protein residues weather in clay matrices? Here, we employ experimental archaeology to address this question by burying food and protein-spiked pottery in one depositional context (Denton, TX), while extracting the pottery samples at intervals over the course of a year. We use TOC and LC-MS/MS approaches to explore how the identifiability of protein residues changes over the course of a year. Results allow us to evaluate protein identifiability, exogenous contamination, and the utility of non-targeted mass spectrometry approaches.

Domeischel, Jenna (The University of Oklahoma), Leland Bement (The University of Oklahoma) and Scott Hammerstedt (The University of Oklahoma)

[229] *Geophysical Explorations at a Reservoir Site in Southwestern Oklahoma*

The erosion and subsequent looting of archaeological materials from reservoir sites has long been a cause for concern. The damming of rivers results in the inundation of prehistoric camp and burial sites. Human remains and associated burial goods are a favorite of looters, and are frequently exposed by the rise and fall of reservoir waters. This project employs geospatial analysis of the Lake Altus-Lugert reservoir in southwestern Oklahoma to locate high-risk sites before they are exposed to looters. In addition to point plotting, surface collection, and metal detection, three geophysical methods are used, gradiometry, electrical resistivity, and ground-penetrating radar. Primarily through the use of gradiometry and ground-penetrating radar, 28 areas were pinpointed for testing. The results of this testing will assist in determining a future protocol for dealing with reservoir sites and burial recovery in this region.

Donahue, Randolph (University of Bradford)

[17] *Trollesgave: Hunter-Gatherer Social Organization during the Late Glacial in Northwest Europe*

Microwear analysis in combination with refitting and lithic reduction is applied to reconstruct the function and social organization at the Late Glacial site of Trollesgave, Denmark. Analyses of the flint knapping and the spatial distribution of its products reveal the traces of at least three individuals: expert, medium competent, and inexperienced. Based on the quality of craftsmanship and the

aberrant habits of disposing their products of the latter, there is evidence for one and possibly two children. As with Bromme Culture sites in general, the assemblage consists of primarily three types of tools. There is a strong association between these types and their use: end scrapers for dry hide scraping; burins for working hard material, primarily bone; and tanged points primarily for projectile tips. Nearly all divergence from this pattern can be referred to the activities of the children. The site appears to be occupied by a single family hunting (and fishing) unit and provides hypotheses about the social organization of other kinds of Bromme Culture sites in northern Europe.

[37] *Cereal Cultivation Shift during Qijia Culture Period in Gansu and Qinghai Province, NW China: Archaeobotanic Evidence*

Qijia period (4400- 3500 cal yr BP) is the key period for the introduction of wheat and barley originated from West Asia into Gansu and Qinghai Province, northwest China. Based on archaeobotanic and radiocarbon data from Caomaidian, Lajia, Jinchankou and Lijiaping Qijia sites, we discuss change of cereal cultivation through that period. Our results suggest only foxtail millet and common millet were cultivated in Caomaidian and Lajia sites dated to 4300-3900 cal yr BP, which account for 97.19% of crop remains in Jinchankou site (4200-3700 cal yr BP), while barley and wheat weight 2.67% and 0.15% in that site respectively, which were firstly introduced around 4000 cal yr BP. Charred seeds of foxtail millet, common millet, barley and wheat weight 69.94%, 28.21%, 14.38% and 0.40% of crop remains in Lijiaping site dated to 3700-3500 cal yr BP. Though millet crops were the most important cultivated cereal crops throughout Qijia period, new crops including barley and wheat were utilized during late Qijia period, and significance of which in subsistence strategy increased after their emergence in the area.

[284] *Native Americans and Archaeology Training Workshop: A Twenty Year Retrospective*

The Arizona Archaeological Council received funding from the NCPTT during its inaugural granting cycle to conduct a two day training workshop between Native Americans and archaeologists. The goal of the workshop was to promote a productive dialogue between Native Americans, Federal agency archaeologists, academic archaeologists, and archaeologists from the contracting community. Three issues were the focus of that workshop: consultation, oral tradition and archaeological interpretation, and Native Americans' role in archaeology. This presentation reviews the proceedings and the products of that workshop followed by an evaluation of the current condition of the relationship between Native Americans and archaeologists and what progress, if any, has been made in the twenty years since that workshop.

Donner, Natalia (Leiden University)

[246] *Asking New Questions to Central Nicaraguan Pottery*

Prehispanic Central Nicaraguan pottery has often been addressed as "poorly studied", or "problematic". Therefore, a lot of questions remain regarding the region's ceramic development and especially its interactions with other areas. Even though a ceramic sequence was established at the end of the 1980s (Gorin 1990, Espinoza and Rigat 1994), analyses have traditionally focused on type-variety and modal traits, concentrating primarily on decoration techniques and motifs. As a result, we lack vital technological information that will help us determine pottery production. The Leiden University project "Late Prehistoric settlement of Aguas Buenas, Nicaragua, A.D. 500-1522", directed by Dr. Alexander Geurds, is surveying several prehispanic sites in Chontales to design a series of excavations aimed to obtain ceramic samples that will be analyzed using the premises defined by the Chaîne Opératoire (Grace 1997). In this paper, we will present a general research

plan, the methodological strategies we intend to pursue, and the challenges we expect to encounter.

[230] *Buried Middle Archaic Period Occupations on the James River at 39BE122*

Evaluative test excavations were conducted at 39BE122 for the Bureau of Reclamation. One test unit and eight backhoe trenches were excavated. Six paleosols were documented in the upper 3 m of alluvium, four of which yielded evidence for cultural components. Four to five components were found from 140 to 290 cm below surface. Radiocarbon dates of 3690 \pm 30 B.P. from Component 2 and 5140 \pm 30 B.P. from Component 4 demonstrate a Plains Middle Archaic age for the site. The size, artifact densities, and features suggest a series of residential camps.

Donop, Mark (University of Florida)

[12] *Beings from the Third Dimension: Imaging Weeden Island Effigies*

The use of 3-D imaging enhances the ability of archaeologists to record and analyze artifacts for both public and academic purposes. This study used 3-D imaging to scan a sample of ceramic artifacts collected by Decatur Pittman in the 1880s from the Palmetto Mound (8LV2) mortuary facility on the Florida Gulf Coast housed at the Florida Museum of Natural History (FLMNH). This collection consists primarily of Woodland Period (A.D. 200-1000) Weeden Island ceramics that include large portions of eccentric and elaborately decorated sherds and vessels with zoomorphic and anthropomorphic effigies. Over 400 vessels have been analyzed using standard methods that include caliper measurements, hand-drawn profiles, photography, and brief descriptions of decorative motifs. The 3-D scanner at the FLMNH was used to create digital images from a sample of 10 modeled effigies and 20 incised and punctated effigy vessels in an effort to assess the advantages of 3-D imaging before destructive analyses were employed. The study provides a digital record that can be readily accessed and an additional tool to more accurately study artifacts, in this case ceramic effigies.

Donta, Christopher (Gray & Pape, Inc.)

[281] *Small Stemmed in the Northeast: Technology and Cultural Continuity in the Late Archaic*

Small Stemmed projectile points were made and utilized across a wide area of eastern North America, and are one of the most frequent point types found in Archaic contexts in New England. Recent excavations have shed new light on associations with features, dated contexts, and other artifact types. This paper looks at radiocarbon dating of Small Stemmed features across southern New England to document the connections between this point type and others during this complex time period. These documented associations refine our understanding of the origins, time depth, and likely functions of this tool. The distribution of Small Stemmed points and the manufacturing technology both indicate origins in Middle Archaic contexts, and long-term continuity of settlement across the Late Archaic and into the Woodland period. These data address questions as to the origins of Algonquians in New England and their relationships to the greater Northeast during the Archaic.

Doolittle, William (University of Texas)

[257] *In the Spirit of Sauer and Brand: Geographic Reflections on the RSV Project*

The Rio Sonora Valley Project directed by Richard A. Pailes in the late 1970s was pivotal in contributing to our understanding of northwest Mexico. It was the first systematic archaeological research conducted in eastern Sonora since Carl Sauer and Donald Brand in the 1930s, and it precipitated later research by John Douglas, Emiliano Gallaga, Elizabeth Bagwell, and most recently Matthew Pailes. The project was not without problems, and critics. As a member of the RSV Project, and one who continued to work in the area nearly annually for the next 30 years, I share my personal insights on the long-term positive aspects that remain unappreciated. The project was not only important in terms of archaeology, but it contributed to the intellectual development of scholars who

specialize in other topics. It also raised some intriguing questions that beg to be addressed, hopefully in the near future. A few of these are reiterated in this paper.

Dorland, Steven (University of Toronto)

[114] *Learning Landscapes within an Ancestral Wendat Village*

This paper concerns my proposed doctoral research that focuses on learning environments within Ancestral Wendat potting communities, more specifically, the 15th Century A.D. Keffer village. My theoretical perspective is grounded in a framework of apprenticeship, and experiential philosophy that emphasizes the experience and interaction of an individual within the material world, interwoven with both social and body memory. My methodological approach consists of micro-variation analysis to identify the material traces of learning and skill acquisition, and distribution analyses to identify spatial patterns pertaining to learning frameworks. Traditional approaches to pottery in Ontario isolate "juvenile" vessels from "adult" vessels, however, this prevents learning biographies from being identified, and thus, limiting understanding of the learned experience. I focus on identifying the stages of learning required to build the skills and knowledge needed to both form and decorate pottery vessels, as ethnographic examples demonstrate that learning trajectories involve both an understanding of decoration, as well as forming techniques (see Crown 1999; 2001; Wallaert-Petre 2001; Wallaert 2012). I hope to demonstrate that my theoretical and methodological approaches will allow me to explore how knowledge, both practical and abstract, was transmitted, learned, and mastered.

[287] *Clear Views from the Ground: 3D Modeling of Architecture and Rock Art from Chaco to Anguilla*

Airborne LiDAR and orthophotography are increasingly ubiquitous in modern archaeological research, particularly at the regional scale. For detailed intrasite analyses of architectural sites, rockshelters, and caves, however, these airborne technologies offer limited utility. This paper highlights the significant research potential and conservation value of very high-resolution terrestrial LiDAR and gigapan HDR photogrammetry for architectural and "built" cultural dwelling places. Drawing on two unique case studies from the American Southwest and the northeastern Caribbean, we explore the benefits of very high-resolution 3D modeling, visualization and analysis afforded by these increasingly affordable, relatively user-friendly "terrestrial" technologies. The first case study focuses on 3D laser scanning and spherical panoramic HDR photography within Room 28 in Pueblo Bonito at Chaco Canyon. Room 28 is notable for the discovery of hundreds of ceramics vessels in the burned room, including the majority of Chacoan cylinder jars. The second case study entails laser scanning at two Amerindian ceremonial cave sites in Anguilla in the Lesser Antilles, one of which (Fountain Cavern), was previously nominated as a UNESCO World Heritage Site. Analysis-based discoveries and extremely accurate digital reconstructions derived from these studies show significant potential for understanding, documenting and protecting rare, inaccessible and unique sites such as these.

[415] *Analysis of Food Remains in Human Coprolites from Furna do Estrago Prehistoric Site, Pernambuco State, Brazil*

The identification of human food remains from archaeological sites contributes to paleonutrition and paleoepidemiology studies, shedding light on key aspects of human biological evolution and cultural changes. In the present study, macroscopic and microscopic food remains were recovered from human coprolites from Furna do Estrago, Pernambuco State, Brazil. The remains are dated between 1,860 +/- 50 and 1,610 +/- 70 years BP. The region may have been subjected to harsh

environmental conditions periodically in the past. During these times, human groups may have been subject to food shortages and consequently drew on alternative food sources. The study seeks to understand diet alternatives and strategies used by this group during such periods. Based on analysis of microscopic remains, plants were widely used as food sources by the group that buried their dead at the rock shelter, both by the predominance of such items in the analyzed samples, and by the identification of plant resources in the site vicinity. It is necessary to understand the relationship between the natural and social environments, that is, the possibility of selection and distribution of resources beyond the natural supply and their potential use.

[281] *Evaluating Archaic Period Settlement and Subsistence Patterns in Relation to Ecosystem Dynamics in New England*

This paper summarizes preliminary data and interpretations of Archaic Period land use patterns in relation to environmental dynamics within Massachusetts. This analysis is a component of a larger NSF-funded research project intended to analyze the drivers of and responses to ecosystem dynamics in the New England region. This project aims to better understand the dialectical relationship among human activity (fire, land clearance, horticulture), vegetational dynamics, and climate. The following are the specific alternative hypotheses examined in this three-year project: (1) changes in vegetation were the result of cultural development or "evolution"; (2) people passively responded to environmental change, contributing minimal ecological impact themselves; and (3) vegetational histories demonstrate the clear influence of human agency, with different drivers and responses in different cultural contexts. We present comprehensive archaeological and ecological data for the state of Massachusetts as a whole, and our more intensive analysis of three sub-regions within the state: Martha's Vineyard, the Taunton River Drainage Basin, and the Deerfield Valley—representing three distinct ecological zones.

[205] *To Snatch the Baby from Its Mother's Lap: Infant Mortality and Maternal Health at Tell el-Kerkh, Syria*

The injurious effects of the agricultural transition on health have been well documented. However, contributions from the Near East are relatively uncommon. Excavations at the Pottery Neolithic cemetery at Tell el-Kerkh in northwest Syria provide an opportunity to study into the effects of the agricultural transition in this less examined region. The cemetery sample consists of 258 individuals. The mortality profile reveals high infant mortality, with 40% of the sample dying before the first post-natal year. Thirty-six individuals were observed with enamel defects. Most developmental disruptions are estimated to have occurred between 3.5-5 years. Both cribra orbitalia or porotic hyperostosis were observed among 22 individuals, and were associated with early mortality. At Tell el-Kerkh, the increased reliance on agricultural resources, and the population changes that followed, did not come without deleterious consequences to health, particularly for the youngest of the community. The observed juvenile mortality and morbidity may be linked to heterogeneous resistance to acute and chronic disease, parasite loads, and malnutrition. The high frequency of early infant death observed at Tell el-Kerkh, while perhaps expected, further suggest the presence of multiple stressors of maternal health, such as limited dietary resources and culturally embedded expectations of high fertility.

[175] *Community Formation and Integration in Colonial Alta California*

Community formation and integration in colonial settings has traditionally been viewed from the binary perspective of colonists and native people. This session views the concept of community in colonial Alta California (1769-1834) from more holistic and alternative viewpoints. To set the stage for this discussion, this introductory paper offers an overview of the sociopolitical landscape in colonial Alta California and presents a broad discussion of the concept of "community" as it may pertain to the region. How were communities formulated and integrated in colonial settings such as Alta California? Communities are not natural creations, as there are inherent tensions and conflicts within groups, whether by age, gender, ethnicity, or other constructs. What were the geographic and social scales of community seen in colonial settings? Were there "imagined" communities and, if so, in what settings and situations did they emerge? In what ways did multiethnic communities emerge within traditional colonial settings such as pueblos? Drawing primarily on ethnohistoric resources, a case study of the Pueblo of Los Angeles, serves to demonstrate the multi-faceted concept of community and the nature of multiethnic interactions and community formation colonial Alta California.

[175] *Chair*

Douglass, Kristina (Yale University)**[339]** *Early Human-Environment Dynamics on the Southwest Coast of Madagascar*

This paper discusses early occupations of the southwest coast of Madagascar and the impact that human subsistence practices may have had on the highly endemic spiny forest biome. A major transformation of Madagascar's environment post-human arrival is the extinction of a suite of mega fauna species. Ongoing work on the spread of domesticates throughout the western Indian Ocean will certainly improve our understanding of Madagascar's settlement history, but little is known to-date about the earliest arrival of invasive species on the island and the role invasives may have played in contributing to mega fauna declines. Though not as early as forager occupations recently uncovered on the north coast of Madagascar, the sites discussed in this paper also appear to be seasonal forager camps with low artifact densities. Thus far, excavations have yielded little, if any, evidence for the presence of invasive plants and animals. Instead these sites reveal a heavy reliance on endemic wild taxa. Evidence for the exploitation of the now-extinct ratites of Madagascar indicates that foraging for ratite eggs may have contributed to population declines, but the introduction of domesticates like chicken and cattle to the area appears to be a recent phenomenon.

Dowdall, Katherine, Otis Parrish (Kashaya Pomo Tribe), Margaret Purser (Sonoma State University) and John Wingard (Sonoma State University)**[392]** *The Kashaya Pomo Cultural Landscape Project: A Community-Based Approach*

In order to more effectively co-steward Kashaya Pomo cultural resources, the California Department of Transportation and the Kashaya Pomo Tribe conducted a multi-year community-based cultural landscape study. This study documents that for some as yet immeasurable time back into antiquity, the lives of Kashaya ancestors were structured by a landscape that included burn-managed ecosystem components, clearings for villages and other Kashaya places, trails, and boundaries. Their accumulated bank of multigenerational landscape labor and knowledge structured the lives of, and benefited, each subsequent generation up to the present. This study also documents the enduring relationship that modern Kashaya tribal members have with their ancestral homeland, regardless of their proximity to it, and the importance of it to their cultural identity and well-being. Links between Kashaya tribal members and their places, between the past and the present, and between tangible and intangible heritage, have broadened our view of what is to be stewarded and how. We now see a vital part of stewardship to include protecting the linkages between the Kashaya community and their heritage in ways that support their identity in the present.

[404] *Anchoring the Absolute to the Relative: Recent Chronological Research in the Virú Valley, Peru*

For decades north coast specialists worked within a paradigm that viewed the Moche as an expansionist state. Moche fineware was regarded as a reliable indicator for dating this polity's imperialism over its neighbors, an idea that traces its roots to the Virú Valley Project of the 1940s. Extensive recent field research has led many to question this colonial model, however, and to propose other, more fragmented, geopolitical scenarios. This shift has both undermined the universal usefulness of using finewares like Moche for building chronologies and constructing political histories, and also underscored the need for refined chronologies in each valley. This shift led us to question the accuracy of the original Virú Valley seriation and to develop a program of radiocarbon dating in Virú. In this paper we present results from this program that shed light on the political histories and foreign policies of the Virú and Moche polities during the Early Intermediate Period.

Doyel, David (Estrella Cultural Research)

[229] *The Earliest Known Occupations of the Globe Highlands in Central Arizona*

Excavations along Pinal Creek north of the Town of Miami in the Globe Highlands of central Arizona have identified a lengthy settlement history extending several thousand years from the Archaic period to the historical Apache occupation. The focus of this paper is on the earliest known periods of occupation identified by excavation. A preceramic component consisted of a structure fragment and a pit from which maize was recovered that produced a date of 790-415 B.C. E. (calibrated two-sigma), which could be the earliest dated structure in the area. Several temporally associated dart points, including a Cienega-type, were also present. This Late Archaic manifestation could be attributed to the Cienega phase of the of the Early Agricultural period within recent chronological schemes. A nearby Early Ceramic component included two structures, several partial ceramic vessels including a seed jar, and other artifacts. Three associated inhumation burials may represent the earliest-known mortuary features in the Globe Highlands. This component appears to date to the late seventh-to eighth century. These early cultural and technological complexes will be placed within the context of the human settlement history of the region.

Doyle, Sean (McMaster University), Tristan Carter (McMaster University) and Daniel Contreras (Kiel University)

[215] *Archaeological Visibility at Stélida, Naxos: Identifying Activity Hubs at a Palaeolithic Chert Quarry in the Cyclades*

This paper details the methodology used by the Stélida Naxos Archaeological Project (SNAP) to distinguish primary activity areas within a Palaeolithic chert quarry. This work is undertaken in a challenging artifact-rich landscape that has undergone significant post-depositional modification through various environmental factors and anthropogenic disturbance. The two-year non-invasive survey involved walking numerous transect lines to produce a broad-stroke impression of artifact density, which were followed by intensive grid collections in recognized 'hot-spots'. This strategy was supplemented by grab samples of key diagnostic pieces discovered outside of the standardized collection units. Chert outcrops were mapped and sampled to gauge variability in the raw materials. Degree of slope and vegetation cover were recorded throughout, together with noting 'artifact trap' locations such as historic terrace walls and donkey paths, along with all instances of human disturbance including bulldozed tracks, clay pits, and buildings. These systematically documented data are then interrogated using GIS weighted overlay tools and other spatial analysis techniques in an attempt to analyse post-depositional effects and map areas of Lower and Middle Palaeolithic activity (quarrying, tool production). The paper offers some preliminary conclusions, and charts

alternative and supplementary techniques that will be employed in the future.

Doyle, James (The Metropolitan Museum of Art)

[244] *Preclassic Maya Territories and Boundaries*

Many Classic period (ca. A.D. 250–900) polities owe the location of their royal courts to decisions made by settlers in the Preclassic period (ca. 1000 B.C.–A.D. 250). This presentation evaluates the basic question of whether there is evidence of territories or political boundaries in the Preclassic Maya Lowlands. In the past, I have argued that Middle Preclassic residents constructed monumental E-Group architecture at specific places on the landscape as a conscious creation of distance between themselves and their neighbors. I based my conclusion on viewshed analysis that showed that early communities had complementary visible access to the landscape, in other words, non-overlapping views when measured from the E-Group. Here I interrogate the meaning of the perceived distance or implied boundaries between these monumental centers.

I include the latest evidence from ceramic production. The Mamom sphere ceramics, produced for several hundred years across the Maya Lowlands, complicate the question, as we lack any long-range studies of regional or polity-scale differences in the raw materials, production technology, or surface decoration of these vessels. I also reexamine the original data set of similar plazas and pyramidal architecture in the Middle Preclassic given new discoveries in recent years.

[173] *The Study of Temper and its Wider Implications at the Cahokian Lunsford-Pulcher Site*

Lunsford-Pulcher (11-S-40) is a Mississippian mound center located in the American Bottom, near modern day Dupo, Illinois. To date there has been limited excavation and analysis conducted at this important ceremonial village. For this study, 181 rim sherds from a surface collection by Timothy R. Pauketat and Bobby Pauketat were analyzed and then compared to other nearby Mississippian sites (the Washausen, Peiper, and Morrison sites), with a focus on the differences in temper usage. This paper will provide insight into whether people at Lunsford-Pulcher were less inclined to participate in particular Mississippian technological and aesthetic changes in comparison to surrounding sites through our examination of the stylistic and morphological ceramic differences. We investigate how Lunsford-Pulcher people may have used temper to express the fluid ontologies of their diverse population. Researching sites like the Lunsford-Pulcher is a necessary endeavor if we wish to further comprehend the assembling practices and ideologies that were present before and during the rise of Mississippian prominence.

[36] *Elite Ambitions, Public Works, and Political Consolidation: A Comparative View*

We are accustomed to temples, platforms, plazas, tombs, statues, fortifications, raised fields, or other large-scale constructions as archaeologically conspicuous signs of the successes of early complex societies. Archaeologists often assign major roles to such public works in creating social cohesion and extending elite power. This may be a consequence of material benefits, such as increased agricultural production or protection from attack, or it may represent the materialization of politically useful ideology so as to strengthen or extend it. A broadly comparative empirical view makes it clear, however, that larger, more elaborate, and more costly public works do not necessarily

correspond to larger-scale and more successful political consolidation. Some especially impressive examples may instead indicate highly precarious political circumstances. There is a delicate balance of forces between ambition, power, resources, and resistance. Successful elite strategies can contain the seeds of their own destruction if they eventually upset this balance. The balance can also be altered, either to the benefit or the detriment of elites, by forces impinging from outside.

[301] *Who, What, Where, When and How: A Comprehensive Archival Investigation of the Milwaukee County Institution Grounds Cemeteries, 1882-1925*

Since its discovery during the original 1990s excavations, the Register of Burials at the Milwaukee County Poor Farm Cemetery has been the foundation for most historical and archaeological research involving the Milwaukee County Poor Farm Cemetery. Until recently the register was considered a complete listing of most, if not all, burials on the Milwaukee County Grounds between 1882 and the final burial in 1974. However, new excavations during the summer of 2013 as well as comprehensive archival investigations of Milwaukee County death certificates and coroner's inquests have shown that the burial activities on the county grounds were far more complex than the register suggests. This paper provides a summary of the archival findings including a detailed demographic profile of the burial population. A comparison of this data with that generated solely from the register will highlight the potential pitfalls of relying on a single documentary source. In addition, a brief discussion of how this comprehensive archival research will allow this author to identify individuals from this unmarked pauper's cemetery will be provided.

[185] *The Irish Lithic Landscapes Project: Current Chert Provenancing Research in Prehistoric Ireland*

The Irish Lithic Landscapes project is investigating the places where prehistoric communities obtained the raw materials for their flaked stone tools during the Irish Mesolithic, Neolithic, and Early Bronze Age, which dates to c. 8,000–2,000 B.C. While Ireland has a very rich archaeological heritage, there is a significant gap in the island's raw material sourcing research. This project will begin to fill this gap, and therefore deepen our understanding of the prehistoric communities there. The 2014 geoarchaeological prospection for the project centered on the northwest of Ireland, which includes case study assemblages from domestic sites and ritual sites such as megalithic tomb complexes. During 2014 we collected 350 geological samples from over 400 survey points, which included examining c. 250 outcrop groups. The present analysis is using non-destructive energy dispersive X-ray fluorescence (ED-XRF) as a first-order technique to determine chert whole-rock geochemistry, which will be followed by petrographic analysis on a sub-sample of the collection. A significant part of this project is the creation of a lithoteque reference collection of Irish cherts; this will be physically housed at the UCD School of Archaeology, Ireland and accompanied by a web-based, spatial database, open for use by other researchers.

Druc, Isabelle (University of Wisconsin-Madison)

[79] *Rojo Grafitado Is Not Graphite. A Slow-Science Interpretation of the Production of an Andean Ceramic Style*

Building upon the slow-science movement, and the work of Olivier Gosselain and others, this presentation examines how our understanding of ancient ceramic production depends upon the path a research may take. It argues for a re-articulation and re-evaluation of qualitative observation, small number of samples and quantitative data. The Rojo Grafitado case presented arose from research hazards, curiosity, and a regional perspective on ceramic production. During the first millennium B.C. in the northern Peruvian Andes, finely decorated Rojo Grafitado wares appeared in small numbers in different ceremonial centers. The paste and surface of a few of these wares have been recently analyzed and the petrographic results point to a non-local provenance, while the technology and paste recipe appear to be similar in the cases observed. In addition, an SEM-EDXRF analysis suggests that the black pigment used for surface decoration is not graphite, but manganese. Triangulating macropaste analysis, petrography and SEM analysis, with geological, stylistic and ethnographic data allows us to postulate the existence of specialists, operating from a particular region, and producing a specific type of ware for a particular clientele. Such a production scheme has not been identified yet for this early time period in the Andes.

[149] *Exchanges in Stone: Tracing the Influence of Amazonian Peoples on Andean Ones as Expressed in the Rock Art of Huánuco, Peru*

Recent fieldwork documenting hundreds of rock art panels in the region of Huánuco, Peru has allowed the author to begin to establish a more finely tuned chronology than has previously been possible. The process of revealing this chronology involves stylistic seriation using such features as color, line thickness, superpositions, and preference for particular design features during certain periods and in certain groups. One of the surprising revelations of this work has been the widespread penetration of Amazonian ideas expressed in iconography into seemingly remote parts of the Andes. This paper will begin with a discussion of the chronology, including the methodology involved. I will go on to explore the timing and nature of Amazonian influence in the Andes as expressed in rock art. The present research has revealed a strong similarity between the style of paintings on large boulders beside rivers in the highland Andes and those carved onto similarly located boulders in the Amazon. The presence of Amazonian iconography has also been detected at multiple highland locations. I will conclude by exploring some of the implications these revelations have for Andean archaeology and anthropological archaeology in general.

[233] Further Evidence for a Terrestrial-Focused Protein Diet in Prehistoric Rapa Nui

Previous analyses of subsistence activities on Rapa Nui generated new classes of data to explain human persistence on this remote, subtropical and ecologically-marginal island. Even compared to other small to medium-sized islands in Eastern Polynesia, Rapa Nui appears anomalous for several reasons: 1) an apparent shift away from marine protein sources, determined from stable isotope analysis of bone collagen, and 2) a far greater reliance on a single terrestrial carbohydrate (*Ipomoea batatas*), determined from microfossil phytolith and starch evidence. Here we report our efforts to extend this interpretive framework using next-generation sequenced amplicons from commensal species recovered from dental calculus. These data are compared with existing zooarchaeological sequence data from two Rapa Nui commensals (*Rattus exulans*, *Gallus gallus*) and modern marine taxa to further evaluate the terrestrial-focused subsistence hypothesis.

Dueppen, Stephen (University of Oregon)**[23] Opening the House: Transforming Identities at Kirikongo over the 1st and 2nd Millenniums CE (Burkina Faso, West Africa)**

Located at the intersection between Voltaic and Mande historical traditions, contemporary western Burkina Faso (West Africa) is a complex cultural mosaic in which local identities transcend linguistic boundaries and cultural practices, exemplifying the difficulties of employing bounded social categorizations in anthropological archaeology. The site of Kirikongo, located in this region and occupied continuously between 100 and 1700 CE provides an important case study to explore the changing nature of identities in a village community. Over time, inhabitants negotiated individual, house, village and regional identities in the context of growing and in-migrating populations at the level of the village and the greater region. This paper examines multiple dimensions of this dynamic and on-going process of identity formation in the past of Kirikongo with particular attention to durable and changing concepts of space and time. Through the analysis of multiple classes of material culture, it explores the complexity of social categories in the ancient community, as the membership of some social groups became more bounded (e.g., hereditary occupation groups) or open (e.g., houses) within the context of a general trajectory of increasingly permeable community and ethnic identities.

Duffy, Lisa (University of Florida) and Timothy Garrett (University of Florida)**[248] Investigating Ancient Beverages from Cerro Maya, Belize through Chemical Residue Analysis**

Ceremonial vessels used by the ancient Maya are common archaeological findings, and are thought to have contained beverages made from cacao, maize and other plants of ritual and economic importance. Increasingly, methods of chemical analysis able to detect trace levels of organic compounds are being applied to the investigation of these artifacts. Two whole pottery vessels from the site of Cerro Maya, Belize were selected from the collection at the Florida Museum of Natural History at the University of Florida to undergo mass spectrometry. Goals of this testing were to determine if any chemical traces were recoverable and identifiable that would help reveal what ingredients may have been included. Both vessels were from well protected burial contexts and were in good preservational condition. One had undergone field washing and curation, while the other was unwashed. Both vessels underwent ultra-high performance liquid chromatography-high resolution mass spectrometry at the University of Florida. Results from both items were positive for multiple

chemical biomarkers associated with cacao and other ingredients. Among the implications of these results are that washed pottery artifacts in museum collections may be a valuable source of such information.

[351] *Landscape Stability, Environmental Resilience and Anthropocene Transformations in Iceland*

Before the Norse settlement, Iceland was characterized by substantial areas of birch woodland in sheltered valleys, highland willow tundra and birch-willow scrub extending into more exposed areas of upland, coast, and marginal wetlands. Terrestrial mammals had been eradicated by Quaternary glaciations. Aeolian sediment accumulation rates were low and correlated over kilometer-scales. Rapid colonisation by the Norse and their introduction of domesticated animals triggered a rapid change in some environmental processes. In the first four centuries after settlement woodlands were cleared, grassland expanded, soil erosion developed, aeolian sediment accumulation rates increased and spatial variability of Earth surface processes intensified. These changes may have enhanced pastoral productivity and societal resilience in the face of climate change. Tephrochronology enables us to understand these transformations in detail, track change across the landscape and correlate episodes of landscape change with putative drivers of subsistence strategy, economic practice and climate. This helps us to understand when humans became dominant drivers of change, and the implications of this development in the interplay of resilience, sustainability, climate and society.

[53] *New Data from Old Stones: A Technological Pilot Study of Lithics from Kokiselei 6 (1.8 mya) in West Turkana, Kenya*

Behavioral variability is a cornerstone characteristic of *Homo sapiens* that evolved among earlier hominins. Archaeological lithic evidence records changes in hominin behavior and knowledge systems over time. Major changes are evident among lithic assemblages ~1.76 mya in Africa, with the emergence of large, bifacial, core tools (e.g., handaxes). This technology shows marked change from earlier assemblages, conforming to different reduction strategies. The behavioral and cognitive implications of these changes have been topics of debate for several decades. To test hypotheses about the origins and long persistence of this technology, we need comparable technological data for the periods preceding and concurrent with these assemblages. The Kokiselei complex in West Turkana preserves sites amenable to studies of Early Pleistocene (EP) lithic technological variability. Kokiselei 6 (KS6) is one of the largest, densest and best spatially preserved EP (1.8 mya) sites in Africa, with two distinct stratigraphic layers. This paper presents pilot data on lithic technology from KS6, penecontemporaneous with Kokiselei 4, a site with the oldest-dated evidence for bifacial technology (1.76 mya). Forthcoming technological analyses of lithics from Kokiselei sites will facilitate the measurement of technological variability and change during a key phase in hominin behavioral evolution.

Duke, Daron (Far Western Anthropological Research Group)

[87] *Haskett Spear Points and the Plausibility of Megafaunal Hunting in the Great Basin*

Recent Haskett projectile point finds from western Utah's Great Salt Lake Desert provide a compelling case for megafaunal hunting in the Great Basin, a region that stands out in North America for its lack of direct evidence. The Haskett style is likely the oldest representative of the Western Stemmed series of projectile points, and radiocarbon age estimates on black mat organics at the locality suggest a date range between ca. 12,000 and 13,000 cal BP. In this paper, an argument for megafaunal hunting is constructed for critical examination against alternatives. Images and technological attributes for the collection are presented, including one 22.6-cm specimen that is the longest Haskett point documented archaeologically and another that tested positive to

proboscidean antiserum via protein residue analysis.

Duke, Riley (University of Arizona) and Stacy Ryan (Desert Archaeology, Inc)

[278] *Black and White and Shades of Gray: Projectile Points and Bifaces from the Dinwiddie Site, Southwestern New Mexico*

During Archaeology Southwest and University of Arizona's 2013 and 2014 field school seasons, close to a hundred bifaces were recovered from the Dinwiddie site, a Cliff phase (A.D. 1300-1450) Salado site in southwestern New Mexico. These artifacts include Archaic and late Pueblo period projectile point styles and several bifaces interpreted as having been discarded during the manufacturing process. This poster presents the biface and projectile point analyses results, expanding on a study initially conducted for the 2014 Upper Gila Preservation Archaeology field school public outreach project. The discussion focuses on the temporal and cultural associations of the recovered projectile point types and identifiable evidence for on-site point production. Differences and similarities among the three loci excavated at Dinwiddie are examined, and comparisons are made with previously excavated Cliff phase sites in the Upper Gila region. Located only 30 km from the Mule Creek obsidian source, obsidian bifaces are most common at Dinwiddie, followed closely by locally available chalcedony. Procurement strategies and possible social contacts are discussed using the results of obsidian XRF analysis.

[347] *Putting Archaeobotany Under the Microscope: A Case Study for Increased Use of Starch-Grain and Residue Analyses on the North Coast of Peru*

Due to the arid environment and subsequent excellent preservation on the north coast of Peru, evidence obtained from macrobotanical remains has been the primary source of information on plant use. However, despite the richness of the macrobotanical record, the combination of arid conditions and the nature of many plants, such as potatoes and beans – which are consumed in their entirety – macrobotanical remains can only tell us so much. In this paper, we discuss some methodological issues in north coast Peruvian archaeobotany, specifically the over-reliance on macrobotanical analyses and the relative under-use of starch grain and residue analyses. We discuss starch grain evidence from Wasi Huachuma, a Late Moche site in the Jequetepeque Valley, including traces of potato from a grinding stone and a cooking pot. Prior to this, no physical evidence of potato had been recovered from Moche contexts despite Moche iconography featuring potatoes. This indicates that macrobotanical analyses alone are insufficient for uncovering the spectrum of foodstuffs utilized by the Moche. We argue for a more rigorous and consistent application of starch grain and residue analyses, in order to obtain as much information as possible about past plant utilization, rather than relying on macrobotanical remains alone.

[331] *A Hunter's Paradise: A Zooarchaeological Analysis of Hunting Practices in the Kankakee Marsh*

From about 16,000 B.C.E. to the early 20th century, the Kankakee Marsh was a vast wetland covering about a million acres in northern Indiana and Illinois. Today the marsh covers about one percent of its original area. After Removal Period, the marsh was famous among hunters for its abundant populations of fur bearing mammals and waterfowl. A regional analysis of the Kankakee Marsh is conducted to analyze the intersite variability of the faunal remains recovered. These sites date from the Archaic to the protohistoric. The data are then compared with primary historical sources in order to assess the ways that faunal populations changed over time. This research contributes to a broader understanding of past foodways, as well as to the discourse on the impact human societies have on animal populations.

Dumas, Ashley (University of West Alabama)

[109] *Eighteenth-Century Choctaw Pottery from Fort Tombecbe*

The French established Fort Tombecbe in 1736, in part, to secure their relationship with the eastern Choctaw. Over the following twenty-seven years, thousands of Choctaws visited the fort to trade, and, by 1763, a large town was located nearby. Choctaw pottery recently excavated from French components at the fort adds to a regional and offers insights into the relationship between the Choctaw and French during the middle of the eighteenth century at a remote frontier fort.

[158] *Fire and Smoke in Postclassic Petén: Human Remains, Deity Effigies, and Codices*

Fire and smoke were fundamental ritual forces in the Mesoamerican religious worldview. Found in varied contexts (funerary processing, animation ceremonies, and desecratory rituals), fire and smoke were applied to multiple media (human bodies, architecture, and ceramics). In the Postclassic (A.D. 950–1524) Maya lowlands, burning both processed honored ancestors' remains and violated enemies' remains. Ceramic incense burners with deity effigies were used to burn resins to communicate with supernaturals. Here we consider whether fire and smoke were applied in similar fashion to human bodies and censer effigies in the Petén lakes region of northern Guatemala during the Postclassic period. Specifically we document and compare (1) archaeological contexts in which human remains were burned (or have associations with burning), (2) archaeological contexts of ritual use of effigy censers, and (3) descriptions of ritual contexts involving the use of fire and smoke from codices and ethnohistoric and ethnographic accounts. Comparing human remains to representations of bodies suggests that both were subjected to similar ritual processes but that the former were particularly necessary under some political, and religious and calendrical circumstances.

Duncan, Neil (Stanford University)

[226] *The Nature and Status of Paleoethnobotany*

How does one honor the greatest generation of paleoethnobotany? It should not be difficult. What they have accomplished is no less than establishing paleoethnobotany as fundamental archaeology. Their cutting edge approaches succeeded in keeping scientific methodology in archaeology throughout the discipline's theoretical paroxysms, all the while keeping the "ethno" in paleoethnobotany. The next generation of paleoethnobotanists is already building on their mentors' successes by further advancing scientific approaches to phytolith, starch grain, and plant remain studies, working toward greater integration of these approaches, and acting as essential researchers in multidisciplinary archaeological investigations. This paleoethnobotany that the greatest generation established is set to keep advancing, although hurdles stand in the way. In this presentation, I will explain what I believe to be some of the issues facing the next generation of paleoethnobotanists, significantly, the loss of major laboratories and academic attrition, and what I hope the future nature and status of paleoethnobotany will be.

Duncan, Lindsay (University College London) and Elizabeth Graham (University College London)

[350] *Waste Not, Want Not: A Multi-Proxy Perspective on Soil Formation at Marco Gonzalez, Ambergris Caye, Belize*

Set in a coastal wetland environment, Marco Gonzalez—to paraphrase the session abstract—is a repository of sediments, fauna, artifacts and plant remains, pertinent to an understanding of human-environment interactions. Marco Gonzalez is also an area of naturally occurring coral sand, grasses and sedges that has been transformed over time into cultivable land. Our preliminary results indicate, however, an inadvertent, rather than planned, transformation. Nonetheless, the site can be characterized by a distinctive interaction of nature and culture that could be classed as anthropogenic.

This presentation examines the contribution of different proxies to an understanding of soil formation at the site by identifying the nature of occupation and characterising the fabric of cultural detritus. These proxies include archaeobotany to detail the important black carbon component, compositional analysis of artifacts and quantification of cultural materials. These data create a profile of available 'parent' materials which can be compared to known soil chemical and physical characteristics for potential delineation of cultural input. In this way, our current research aims to elucidate factors that contributed to soil formation processes in a setting in which transformation of a marginal area is connected directly to human modification and intensive, long-term habitation and exploitative activity.

Dungan, Katherine (University of Arizona)

[262] *Venturing into the Borderland: Revisiting the 13th-Century Occupation of the Upper Gila*

Between the end of the Mimbres Classic period in the 12th century C.E. and the beginning of the 14th-century C.E. Cliff Phase, most of the Upper Gila region of New Mexico is thought to have been only sparsely populated if not entirely unoccupied. Recent excavation in Mule Creek has demonstrated a strong 13th-century presence in this area, however. Like the Gila Cliff Dwellings on the West Fork of the Gila, the settlements in Mule Creek show clear connections to contemporary sites in the Mogollon Highlands to the north and west. A comparison of ceramic collections from previously excavated sites in the Upper Gila with assemblages from Mule Creek and the Gila Cliff Dwellings provides a window into the variable use of the region during the 1200's. I argue that the 13th-century Upper Gila served as a cultural borderland between Tularosa Phase traditions in the Mogollon Highlands and Black Mountain phase traditions to the south and east. The diverse social connections of the people who occupied or made use of this borderland contributed to the diversity and flexibility visible among 13th-century sites and ultimately at the Cliff Phase Salado sites that flourished in the Upper Gila during the 14th century.

[280] *Hunter-Gatherer Mobility Strategies: A Late Woodland Example from the Upper Peninsula of Michigan*

The Late Woodland (LW) period in the upper Great Lakes region has been linked to the development of the Inland Shores Fishery and especially to the advent of deep water fall fishing. A recent study of LW settlement and subsistence patterns in the eastern Upper Peninsula of Michigan has revealed a shift in the mobility strategies used by LW peoples of that region. Using site locational data and an assemblage diversity index trends were identified that directly inform on LW settlement and mobility patterns that have spatial, temporal, and environmental components. In brief, Early LW people were more residentially mobile and that Late LW people were more logistically mobile. Likewise, Late LW people were making greater use of the interior. This paper will explore the transition in LW mobility patterns and discuss this trend in the context of our understanding of LW dynamics in the region.

Dunning, Nicholas (University of Cincinnati), Vernon Scarborough and David Lentz

[295] *Tikal in Environmental Context: Peter Harrison and Ancient Maya Water Management and Subsistence*

Through the lens of Tikal, Peter Harrison developed an interest in how the ancient Maya thrived in the seasonally arid central Maya Lowlands. Initially this interest stemmed from his investigations of Tikal's Central Palace and its adjacent reservoir. However, soon his interest spread beyond the elite center to questions of basic subsistence and the potential use of wetlands (bajos) for intensive agriculture. Our work at Tikal, the Bajo de Santa Fe, and smaller bajos benefitted from some of Peter's work and ideas, though even his imaginative mind was ultimately impressed by the complexity of water management and agriculture being revealed today.

[9] *A Geomorphic and Elemental Analysis of the Johnston Site (36IN002)*

The Johnston site (36IN002), in Blairsville, Pa, is the type site for the Johnston Phase of the Monongahela Tradition. This site was first discovered by Ralph Solecki during the River Basin Surveys carried out in preparation for flooding of the Conemaugh River Lake. Following its discovery the site was partially excavated in the 1950's by Don Dragoo for the Carnegie Museum. The Johnston site has been revisited by archaeologists from Indiana University of Pennsylvania; however, little geomorphological work or chemical analysis have been completed by either group of investigators. Elemental chemical analyses were conducted with a portable XRF to differentiate areas with a higher probability of yielding archaeological data upon subsurface investigation. Soil samples from the base of the plowzone and the horizon immediately below the plowzone were collected from a 90 square meter block and from a single transect spanning the site and analyzed for elemental content to ascertain preferred locations for subsurface investigation. Particle size analyses of column samples taken from three locations were used to correlate horizons across the site, and to propose a rational history of the development of the landform.

[16] *Radical Neolithic?*

Continuity Phenomenon that lasted for thousands of years in Central Anatolia could be one of the reasons of a distinctive or local process of neolithization in Central Anatolia when compared to the Core Area or the PPN world. The rapid changes, the fast innovations in PPNB, defining discontinuity, have brought a development momentum to the region, however all these PPN began to loose power in their most glorious period. Aşıklı never became part of this system, the people found solutions within themselves, they lived collectively, they were not interested in the attractive but authoritarian life going on in the PPN world. Continuity phenomenon was the basis for the radical Neolithic in Central Anatolia clearly visible at Aşıklı, then transmitted to Çatalhöyük and that lasted more than two thousand years. In this presentation, conditions of the continuity phenomenon of Aşıklı will be discussed.

Dussubieux, Laure (Field Museum of Natural History)

[140] *Elemental Composition of Iron Age Glass Beads from Myanmar*

Glass appears in Southeast Asia at the début of the Iron Age, around the middle of the 1st millennium B.C. Variations in Southeast Asian glass type distributions were found to be excellent markers of changes in cultural and economic interactions but are based heavily on material from Thailand, Cambodia and Vietnam. Other regions, in particular Myanmar's pivotal position with India, have remained largely unexplored, making it difficult to draw a global picture for Southeast Asia during this transitional period. The Mission Archéologique Française au Myanmar has conducted excavations of Iron Age cemeteries located in Upper Myanmar since 2001, throwing new light on social interaction networks around the Bay of Bengal. The cemeteries yielded grave goods including glass, mostly in the forms of beads. An in depth study of this material including typology and elemental composition (using laser ablation – inductively coupled plasma – mass spectrometry) has recently started. Results are giving us insight into the chronology of the sites. Also, they are revealing that if the compositions of the glass do not support the possibility of a local glass production, the singularity of some bead types would suggest that glass beads were maybe

manufactured in the area.

Duwe, Samuel (University of Oklahoma)

[342] *Groundstone Shrines of the Pueblo Southwest*

The Pueblos of the American Southwest define their sacred geographies by using ground boulders and bedrock shrines (cupules, slicks, grooves, and channels) to establish land tenure, reflect cosmologies and religious organization, and to record history. Based on ethnography and Pueblo collaboration we know that these places mark the remains of the deceased, act as communication nodes with the spiritual world, and delineate social boundaries. Because these landscapes (and their associated shrines) vary between different Pueblo peoples and also change through time, archaeologists are excited to record these landscapes to understand the historical development of each modern Pueblo's religion and identity. However, similar types of features are found globally throughout history, including diverse Pueblo villages and their neighbors. How can a widespread (and seemingly common) practice of bedrock and stone grinding be used to address historical and cultural questions on a local scale? Using examples from one Pueblo people, the Tewa of northern New Mexico, I argue that archaeologists must go beyond identifying the presence/absence of certain shrine types and adopt a landscape focus that incorporates shrine morphology and the patterns, context, and association of shrine placement.

Earle, David and John R. Johnson (Santa Barbara Museum of Natural History)

[143] *Ethnohistoric Insights Pertaining to the Emigdiano Chumash and Other Southern San Joaquin Valley Indigenous Groups*

The native groups who inhabited the San Emigdio Mountains on the southwestern edge of the San Joaquin Valley are believed to have been speakers of an interior dialect of one of the Chumashan languages, although which one has been open to debate. Certainly the Emigdiano Chumash occupied an important position in the economic exchange system that linked indigenous Kitanemuk

and Yokuts groups of the San Joaquin Valley with coastal Chumash peoples. Ethnohistorical study of records kept by Franciscan missionaries shed light on the histories of the native groups who inhabited this region and provide important information regarding social interactions as reflected in reconstructed kinship and marriage patterns. These ethnohistoric data provide important contextual information to aid archaeological interpretation and supplement ethnographic and oral historical information collected by early twentieth century anthropologists, including C. Hart Merriam, Alfred L. Kroeber, and John P. Harrington.

Earley, Caitlin (University of Texas at Austin)

[266] *Art and the Ancestors: Sculpture from the Cave Complex at Quen Santo, Guatemala*

At the site of Quen Santo, Guatemala, a hilltop center overlies an elaborate cave complex. First documented by Eduard Seler, the caves at Quen Santo have also been explored by modern-day archaeologists. Missing from modern analyses of Quen Santo, however, is a consideration of sculpture from the site: Seler recovered almost thirty stone monuments, most related to themes of death, ritual, and the ancestors. In this paper I explore the sculptural corpus of Quen Santo for the first time, arguing that Quen Santo was a center for mortuary ritual. Using a combination of art historical and archaeological information, I explore how the sculpture, ceramics, and architecture of Quen Santo point to its unique regional role, and what the site can tell us about ancestor veneration and ritual cave use on the Western Maya frontier.

Early, Ann (Arkansas Archeological Survey)

[188] *Learn by Doing: Sharpening Understanding of Archaeologists and Sites Among Diverse Publics with Hands On Activities in Arkansas*

Most people have unformed ideas about what archaeologists really do; collector of stuff, oddball academic, dinosaur hunter, rock expert, 'save the planet' enthusiast, expert about dead people and dead societies. Poor understanding breeds scatter shot ideas about the 'values' of archaeological sites for science, history, or heritage. In Arkansas, hands-on collaboration showing how archaeologists learn things, and how ancient people made a living, tried out with replicas of archaeological specimens, attract diverse publics in relaxed settings. 'Hands On' clarifies what archaeologists really do and what archaeological sites tell us. We hope this leads to broader interest in preservation, and in the rescue of important stories about real people before developments erase the archaeological landscape.

[112] *New Dates and a Proposed Chronology for the Little John Site (KdVo-6), a Multi-Component Site in Eastern Beringia, Yukon Territory, Canada*

New AMS radio-carbon dates derived from culturally modified bone and charred material in association with artifacts has expanded our appreciation of the antiquity and continuity of occupation at the Little John site, from the early Bolling-Allerod in the Late Pleistocene post-glacial period through the Early and Later Holocene. These new dates, combined with dates from other local sites on the Yukon – Alaska borderlands, allow us to identify a number of discrete chrono-zones at Little John that can be related to, and increase our understanding of, regional vegetation and climate history, major Climate Events, and cultural complexes identified elsewhere in Eastern Beringia. In this paper we present a brief overview of the Little John site and the most recent developed chronology that currently guides our continued excavations and analyses.

Easton, Norman [112] see Hutchinson, Vance

Ebbert, Steven [339] see West, Catherine

Eberl, Markus (Vanderbilt University)**[158]** *Highland Mexican Souls as Essences and Symbols*

The ancient Aztecs believed in multiple souls, including Tonalli, Ihiyotl, Yolia, and Nahualli. These souls overlap and extend beyond animated bodies. For example, the Tonalli is not only the heat of life and centered in the head but also an essence shared by animals and humans, similar to the Nahualli. Yolia refers to the physical heart and animates living beings. At death, it takes the form of a bird and flies away. These examples mix description and symbol: Is Tonalli literally heat or comparable to heat? Does the Yolia of a dying person become a bird or is it like a bird? I argue that neither an essentializing nor a constructive approach can resolve the quandary. Instead, I develop a dialectical model. I pay particular attention to ephemeral substances like fire that are both essences and representations of souls.

[248] *Late to Terminal Classic Period Obsidian Exchange and Regional Interaction in the Belize Valley*

The ancient Maya employed a diverse set of economic strategies to access raw materials and finished products. In the Belize Valley, long-distance exchange of obsidian integrated sites into larger local and regional economic systems during the Classic period. We present the results of geochemical sourcing of obsidian artifacts using portable X-ray fluorescence (pXRF) from Late Classic to Terminal Classic period (ca. A.D. 600-900/1000) contexts at the sites of Cahal Pech, Baking Pot, and Lower Dover in the Belize Valley to understand mechanisms of exchange within and between communities in the region. Results indicate that the Belize Valley was economically linked to the highlands of Guatemala through obsidian exchange, with some weaker ties to the Basin of Mexico. Comparisons with sourced materials from other Classic and Terminal Classic period assemblages in the Belize Valley and elsewhere in the Maya lowlands may indicate the presence of shifting exchange networks, perhaps with an increasing reliance on riverine or coastal routes. The changing nature of exchange networks may have been a factor contributing to the transition to the Terminal Classic and the subsequent Classic period collapse ca. A.D. 780-900/1000 in the Maya lowlands.

Echavarri, Mikhail and Stephen Acabado (UCLA)**[238]** *Ending the Antiquity Debates: The "Short History" Model of the Ifugao Rice Terraces, Philippines*

Local wisdom and nationalist sentiments would have us uphold the long-held belief in the antiquity of the Ifugao Rice Terraces, espoused by pioneer anthropologists of the Philippines, Roy F. Barton and Henry Otley Beyer. Recent findings by the Ifugao Archaeological Project (IAP), however, have provided new information which has driven us to rethink this proposed date, primarily because of the dearth of archaeological data to support the "long-history" model. Evidence is now pointing to a relatively more recent history of Cordillera rice terracing traditions – a "short-history" model grounded on ethnographic, ethnohistoric, archaeological, and paleoenvironmental datasets. Our paper presents findings of the 2012, 2013, and 2014 field seasons of the IAP and their significance in finally resolving the antiquity of the Ifugao rice terraces.

Echenique, Ester (The University of Arizona)**[252]** *Technological Styles and Production Practices in the Río Grande de San Juan Basin (Argentinean-Bolivian Border) during the Late Intermediate Period*

The lack of direct ceramic production evidence, coupled with the lack of technical studies, hinder the understanding of ceramic production practices and its organization across the south central Andes. Yavi-Chicha ceramics associated with a diversity of sites in the Río Grande de San Juan Basin (straddling the border of Bolivia and Argentina) provide a unique entry point to explore socio-political

dynamics during the Late Intermediate (A.D. 1000-1450) and Inka (A.D. 1450-1540) periods. Framed within a larger project that examines the mechanisms through which state ideologies were materialized by the Inka, in this case specifically through the use and manipulation of local ceramic styles, this poster presents preliminary results on the technological styles and production practices employed during the Late Intermediate Period, using indirect evidence (macroscopic and archaeometric data including petrography, Raman spectroscopy, and SEM). Drawing from my analysis of materials from two discrete sites in two subregions of the Río Grande de San Juan Basin, Chipiwayco and Finispatria, located in the core and the periphery of the region, I discuss the relevance of technological variability for understanding craft production practices and socio-political organization at the intraregional level.

Echeverria, Jose

[367] *Patrimonio, Políticas de Estado y Arqueólogos. La Experiencia del Ecuador en los Últimos Cuarenta y Cinco Años*

Para un pueblo, conocer, valorar y usufructuar debidamente su patrimonio natural y cultural es parte esencial de su existencia. Para esto es necesario un trabajo colectivo permanente, una práctica social diaria enmarcada en una legislación adecuada y en una dinámica integradora conducida por líderes que cumplan y hagan cumplir las leyes. A los 185 años de vida republicana, el gobierno reconoce la función del Patrimonio como sustento del desarrollo social y económico del país. En consecuencia, fortalece el Marco Legal, las Instituciones, invierte un significativo presupuesto en inventariar y dar seguridad a los bienes patrimoniales a nivel nacional y restaura determinados bienes inmuebles. La preparación académica de los futuros arqueólogos es estimulada a través de becas y exige a las universidades del país un alto nivel académico y aplicación de una nueva racionalidad. En la formación de los nuevos profesionales, las universidades deben superar "la vieja racionalidad que educa e instruye para la repetición y obediencia, y forma solo especialistas o hiper-especialistas que saben hacer una o dos cosas, pero que carecen de una visión global de los hechos y de los acontecimientos. En el campo investigativo, la universidad debe crear equipos transdisciplinarios, para avanzar hacia una ambiciosísima teoría omniabarcadora

[25] *Integrating Petrographic and INAA Compositional Data: Chupadero Black-on-white Ceramic Production and Distribution in the Salinas and Sierra Blanca Regions of New Mexico*

Ceramic research in the American Southwest is increasingly relying on both mineralogical and chemical compositional data to answer questions regarding pottery production and exchange. Due to differences in the structure and nature of these datasets, integrative studies that attempt to incorporate information on both types of compositional data often produce confusing and sometimes seemingly contradictory results. This paper explores the recently developed 'mixed-mode' method of data analysis, whereby both chemical and mineralogical data are incorporated into a single dataset. To evaluate the applicability of this methodological approach in Southwestern ceramic analyses, a case study was conducted using petrographic and INAA data on Chupadero Black-on-white, a widespread pottery type produced between A.D. 1150 and 1550 in central and southern New Mexico. Results of this study indicate that use of a 'mixed mode' approach may provide a richer interpretation of patterns of prehistoric ceramic production and exchange.

[346] *Origins of the Templo Mayor Skull Masks*

The offerings of human remains made at the Templo Mayor of Tenochtitlán include decapitated skulls, some of them reused as masks or headdresses. It is generally accepted that the sacrificial offerings of the Templo Mayor were obtained through warfare. To test this, we used bioarchaeological analyses to determine where the skull masks came from geographically, and whether the skull masks meet the biological profile of elite warriors. We recorded sex, age, and indicators of disease and nutritional deficiency among skull masks (n=6) corresponding to the reign of Axacayatl (A.D. 1469-1481). We then compared the dentitions of the skull masks with those from groups documented in the Codex Mendoza as the major military campaigns of Axayacatl. We used non-metric multidimensional scaling of dental morphological observations to determine whether individuals in the offering samples were similar to any comparison groups (n=127). Results indicate the skull masks fit the biological pattern expected of elite males, and probably originated from the populations in contact with the Aztecs through military campaigns. These results show that hypotheses derived from ethnohistoric records can be tested using dental morphological data, and that political processes such as warfare influenced the treatment of sacrificial victims at the Templo Mayor.

Edinburgh, Kevan (University College London)**[80] *Modelling Village Development in the Prince Rupert Harbour***

The initial results of a radiocarbon local marine reservoir correction study are presented for Prince Rupert Harbor in northern British Columbia, Canada. These preliminary results are integrated into a series of Bayesian age-depth models that illustrate how shell-midden accumulation rates can dramatically vary. Village development in the harbor is discussed in the light of these new findings.

Edinburgh, Kevan [80] see Ames, Kenneth

Edmonds, Jason (University of California, Davis)**[341] *Obsidian Sourcing and the Origin of the Occupants of the White Mountains High Altitude Villages***

The behaviors discussed in ethnographic accounts of the western Great Basin valleys vary widely and unexpectedly. Although both Owens Valley and Fish Lake Valley were inhabited by Eastern Mono speaking groups in historic times, their population density, settlement, subsistence, and sociopolitical organization were markedly different. Archaeological debate centers on whether these differences result from historic contact or if they have some meaningful time depth into prehistory. Situated between the two valleys, the high altitude sites of the White Mountains can help resolve some aspects of this debate and further explain the use and occupation of this extreme environment. If the ethnographic model is correct, only Owens Valley occupants are expected to have favored occupation of high altitude locations. However, if the ethnographic model has no time depth then occupants are predicted to have originated from throughout the region. Obsidian debitage samples from both pre-village and village contexts were sourced via x-ray fluorescence (XRF). The results of this analysis indicate that prior to the emergence of the village pattern, obsidian was sourced from a broad area. After the emergence of the village pattern, however, sources in Owens Valley overwhelmingly dominate.

Edwald, Ágústa [288] see Hicks, Megan

Edwards, Matt (HDR and UCSB)**[31] *Ni la costa ni la sierra: The Archaeology of the Upper Nasca River Basin***

The human and cultural geography of Andean South America has been seen as fundamentally divided between the coast and the highlands since the early days of Spanish colonization; a conceptual bifurcation that is assumed to have great antiquity and has subsequently shaped archaeological research in the region. Better settlement data from the foothills of the southern Nasca valley have demonstrated that the indigenous cultures of the Nasca valley extended much higher

into the Andean uplands than previously thought. Surveys and excavations in the headwater valleys of the Nasca's southern tributaries undertaken over the last decade have demonstrated that this pattern extends high into the sierra of southwestern Ayacucho. Rather than forming a border for indigenous south coastal development that was only broken by the expansion of highland empires during the Middle and Late Horizons, the upper Nasca Basin is better seen as a shifting zone of interaction throughout prehistory.

[311] *Twentieth-Century Geoglyphs - Military Training Targets of World War II*

For archaeologists, the term geoglyph typically conjures up images of enormous carved landscapes such as the Nazca Lines in Peru or the Blythe Intaglios in California's Mojave Desert. But the creation of earth drawings is not restricted to people of the distant past. Modern populations have also been known to produce their own geoglyphs. Like their prehistoric predecessors, many contemporary geoglyphs have spiritual or ceremonial significance, but others were generated for purely functional purposes.

During WWII thousands of U.S. airmen trained stateside before being sent to the various theaters of the global war. Evidence of the military exercises has survived embodied in the large target configurations on the former precision bombing ranges attached to Army Air Corps training fields. These altered landscapes share many characteristics in common with the gigantic glyphs attributed to prehistoric groups. An informal study of online aerial imagery revealed "military geoglyphs" located in Idaho, Utah, Oregon, Nevada, New Mexico and other western states. The authors present examples of both aerial imagery and ground-level photographs for various target types examined during field projects in Nevada.

[415] *Shellfish and Nutrition in San Francisco Bay: Clues from Seasonality Studies*

Shells are especially visible in the archaeological record of Central California. They comprise much of the midden in the large shellmounds that once lined San Francisco Bay. However, shells are also present in many inland sites, though they were collected from the Bay and hauled many kilometers inland. Seasonality reconstructions using oxygen stable isotopes show that shells on the Bay were typically harvested in two seasons, winter and summer, but inland sites contain shells from just winter. This pattern reveals important clues about seasonal foraging and the nutritional role of shellfish in Central California.

Built upon a fine white volcanic tephra from the eruption of the Ilopango caldera and buried under tephra from an eruption of Loma Caldera, the Maya village of Ceren affords a unique opportunity to explore geostratigraphy, volcanology, and chronology in relation to vulnerability and resilience. The sheer volume and scale of the eruption of Ilopango caldera, known as Tierra Blanca Joven (TBJ), would have had decimated not only the Zapotitán valley in which Ceren is located, but also all of El Salvador and parts of the greater Maya area. However, the dates of both the TBJ eruption and the later eruption of Loma Caldera remain debated. Initial studies found that the TBJ event occurred sometime in the 3rd century, supporting the foundation and occupation of Ceren as having occurred in the late 6th century. However, new radiocarbon dates have reappraised the TBJ eruption, moving it into the 6th century. Likewise, additional radiocarbon dates suggest a date in the later 7th century for the Loma Caldera eruption. This paper aims to explore the implications of the revised dating of the Ilopango and Loma Caldera eruptions for both the cultural trajectory of El Salvador and Maya village of Ceren.

Egeland, Charles (UNC-Greensboro, Department of Anthropology), Alexa Uberseder (UNC-Greensboro, Department of Anthropology) and Cynthia Fadem (Earlham College, Department of Geology)**[53] *Recent Paleoanthropological Work at DK East, Olduvai Gorge, Tanzania***

Olduvai Gorge, Tanzania, remains one of the richest sources of information on human bio-behavioral evolution between 1-2 million years ago. While much research has justifiably focused on the gorge's junction area and its rich collection of sites, including FLK 22 (The Zinjanthropus Floor), the older fossiliferous deposits to the west have received much less attention in recent years. The DK area, which lies along the north edge of the main gorge, is particularly intriguing and was made famous by Mary Leakey's excavation in 1962 and 1963 of thousands of fossils and lithics and, perhaps most famously, a stone circle originally thought to represent the remains of a windbreak. In October of 1968, a nearly complete cranium (OH 24), since attributed to *Homo habilis*, was discovered on the surface a few hundred meters east of the main DK excavations. It is in this area (DK East) that new excavations below Tuff IB (dated to ~1.85 million years ago) were undertaken in 2012, 2013, and 2014. Here, we summarize the work to date, which includes the taphonomic analysis of recently recovered faunal material and additional geological research.

Ehrich, Richard (UCLA Cotsen Institute of Archaeology)**[349] *Sichuan Life Styles – Traditions and Adaptations in Prehistoric Architecture and Settlement Structure***

Neolithic Sichuan formed a crossroad for influences from the north associated with millet agriculture and from the east associated with the growing of rice. But how did the different traditions of

habitation of the Upper Yellow River in the north and the Middle Yangzi River as well as the Three Gorges in the east affect the situation in Sichuan and what role did adaptation to the local environment play? This is a survey of prehistoric architecture and settlement structure in Sichuan and an interregional comparison of the Upper Yangzi River region in Sichuan with the Upper Yellow River region in Shaanxi and Gansu, the Middle Yangzi River region in Hubei, and the Three Gorges region in Chongqing. It is also a discussion of the concepts of “function”, “style”, “tradition”, and “adaptation” as pertaining to choices of habitation.

[15] *Queering “American”: Archaeological Investigations of a 19th-Century Military Fort in West Texas*

This paper investigates how racial identity impacted the creation and maintenance of an American frontier and border community using an assemblage from a 19th century American Army encampment from Fort Davis, Texas as a case study. By engaging a queer theoretical framework, this research focuses on how Black, Mexican, and immigrant bodies challenged ideals of normative White citizenship during a period of great social upheaval and racial tension. With thousands of European immigrants and newly emancipated African-Americans enlisting in the army during the period of reconstruction, the demographics of the new postbellum U.S. Army challenged the very notion of a unified American perspective. Moreover, this research investigates what strategies were employed by members of these frontier/border communities that lead to a collective nationalized identity despite a racially and ethnically mixed population. This paper demonstrated that by queering our understanding of nineteenth century American identity, a more holistic and nuanced understanding of racial interaction can challenge traditional interpretations of the American Westward Expansion.

[312] *The Groundstone Artifacts of Housepit 54, Bridge River Site, British Columbia*

The people of the Middle Fraser Canyon traditionally used groundstone to accomplish a wide range of tasks spanning food processing to weaponry and ornamentation. Excavations of Housepit (HP) 54 at the Bridge River Site, British Columbia, in 2014 revealed an unexpectedly large sample of groundstone tools. Many items were apparently used, broken, and recycled as cooking rocks on select floors. This study draws from multiple data sources to define variability in the nature of groundstone tools and tool functions. More specifically, groundstone are examined for variation in raw material, manufacture technology, use-wear, and residues. Conclusions are drawn regarding differentiation in morpho-function and use-history. Then, implications are developed for exploring differences in household activities between occupation floors. Groundstone thus may offer unique insight into shifts in household economies and sociality. This poster provides an overview of the research on groundstone with a focus on grinding slab tools.

[276] *10,000 Years of Stone Tool Use by Hunter-Gatherers in Central Texas*

We report on stone tool patterns derived from several recent archaeological excavation projects in Central Texas that provide a record of lithic use spanning most of the prehistoric sequence in the region. The projects, located within a few kilometers of one another, effectively sample debitage and tools reflecting Late Paleoindian, Early and Middle Archaic, Late Archaic, and the Terminal Late Prehistoric periods. Supported by several radiocarbon dates, these assemblages span roughly 10,000 years, from 10,300 CAL BP to A.D. 1600. High quality, large-sized stone tool material was available as primary sources roughly 15 to 20 km north of the projects along the Balcones Escarpment, a limestone dominated fault zone with multiple chert exposures. We reviewed over

11,000 pieces of debitage, chipped stone tools, and cores from these projects. Focusing on chipped stone tools and debitage subsamples, we monitor changes in raw material use over this 10,000-year period. Material groups are defined primarily by chert color, inclusions, and patterns in ultraviolet light fluorescence, with groups further assessed by geochemical (e.g., pXRF) methods. Comparisons of shifts in material groups over time likely reflect changes in access, mobility, or subsistence patterns.

[409] *Groundtruthing from the Air: Reconstructing Tribal Agricultural and Landscape Systems in the Lower Chama Valley, New Mexico Using Low Elevation UAV Technology.*

Uninhabited Aerial Vehicles (UAVs) are changing the way that archaeologists conduct fieldwork with Native American Tribes. We present an application of UAV mapping and visualization technology in a combined boots-on-the-ground and satellite reconnaissance of Classic period (A.D. 1350-1600) ancestral Pueblo sites and agricultural systems. This approach reduced field time and enhanced efficiency in the identification and recordation of regionally extensive prehistoric features at a level of resolution not available to the human eye or with currently accessible high elevation imagery. When combined with software applications that enable three-dimensional visualizations of archaeological features, new insights emerge that were previously unavailable to the most discerning or intensive survey techniques. Adoption of this non-invasive (remote) technology by Tribes allows for time efficient compilation of information for applications in land and water rights cases and culturally sensitive land-use planning.

Ek, Jerald (Western Washington University)

[244] *Not That Stable, Not That Durable, but Very Dynamic: Political Geography and Geopolitical Dynamics in the Río Champotón Drainage, Campeche, Mexico*

The nature, plasticity, and durability of states as geographical and territorial entities has been a topic of longstanding debate in the study of Classic Maya political geography. One of the central tenets of Joyce Marcus's highly influential "Dynamic Model" is a view of states as comprised of relatively durable small-scale polities that were sometimes incorporated into more volatile larger scale hegemonic states. However, recent research in Central Campeche suggests that local and regional political geography was far from stable, with changes in broader political networks having important impacts in local territorial organization. Archaeological and epigraphic data instead reflect a much more dynamic political landscape, with shifting allegiances and external influences playing a major role in local dynamics. This paper examines the changing territorial organization of the Río Champotón drainage between the Classic and Postclassic Periods, focusing on the local impacts of larger-scale dynamics driven by external interactions, including the neighboring polity Edzná, the expansionist Kanu'l State of Calakmul, and more distant pan-Mesoamerican linkages via the Gulf Coast maritime trade route. The results of this research have implications for both our understanding of the internal organization of prehispanic Maya city-states and the relationships between these units that defined geopolitical landscapes.

[64] *The Use of Geochemical Analysis and Visual Methods for Understanding Raw Material Acquisition around Amud Cave, Israel*

Amud Cave (eastern Upper Galilee, Israel) is known for its Middle Paleolithic deposits, containing thousands of animal bones and lithic artifacts from 3 anthropogenic stratigraphic units, dated to 68-55 ka. Excavations revealed hominin remains, including Neanderthal burials. Technological characteristics of the lithic assemblage show that the knapping sequence started off-site. However, related mobility patterns remained poorly understood. In order to understand the organizational

decisions made by the Neanderthal hunter-gatherers occupying the site, we initiated a multi-disciplinary study involving a detailed geological survey of the Galilee and adjacent regions, visual characterization (color and texture) and geochemical fingerprinting (using ICP-MS and ICP-AES) of both geological flint exposures and of archaeological artifacts, and a detailed technological analysis of the earliest and latest assemblages. The combined results show that Amud cave inhabitants used flint from the local Eocene formation around the cave but not from its immediate (several meters away) surroundings. Flints from distant source areas (>60 km) were used in both occupation phases. The technological analysis revealed different organizational strategies involving their exploitation. The results of this study enable discussion of diachronic changes in land use behaviors at Amud Cave, which may be linked to ecological shifts in the site's environment.

Elder, James and Shane Sparks (ICF International)

[7] *Exploring the Relationship between Coastal Geomorphic Processes and Archaeological Site Distributions in Central Puget Sound of Washington State*

Although the uneven distribution of precontact archaeological sites along the Puget Sound shoreline is widely recognized, limited research has been undertaken to systematically consider how this pattern may relate to local anthropogenic and geomorphic factors. In this study, we consider archaeological site distributions through the lens of shoreline geomorphology and discuss possible reasons for any observed relationships. Using publically available drift cell data, we categorized the shoreline in our study area into three geomorphic types; depositional, erosional, and neutral. Following this, we grouped all documented precontact archaeological sites located adjacent to the shoreline in by geomorphic shoreline type. This analysis revealed that the distribution of nearshore precontact archaeological sites is strongly related to geomorphic shoreline type. We then tested these findings by categorizing the shoreline of a second study area by geomorphic type; and generated an archaeological predictive model by assigning each type a level of archaeological sensitivity. We evaluated this model by comparing it to the distribution of documented archaeological sites along the shoreline in the second study area. Our analysis reveals that precontact archaeological site distributions along the Puget Sound coast are strongly related to – and influenced by – geomorphic shoreline type.

[302] *Under Threat of Erosion: Late Prehistoric to Historic Contact Houses near the Native Village of Shaktoolik, Alaska*

Historical documents note that the Shaktoolik Peninsula, located in Norton Sound, Alaska, was a nexus of interaction among local Yup'ik, Inupiat from the north, Athabaskans from the east, and Russian and American traders in the 1800s. Yup'ik populations were displaced from the area and replaced by Inupiaq groups during this time; however, limited archival, ethnographic and oral history accounts make it difficult to disentangle the local history. The archaeological record may be able to fill in the story. We report on our investigations, in collaboration with the Native Village of Shaktoolik, at the Shaktoolik Airport site (NOB-072) in 2014. Although noted in earlier archaeological surveys it had never been adequately documented, and unfortunately time is of the essence as the site is threatened by increased seasonal flooding and coastal erosion. The site proved to be considerably larger than anticipated; mapping revealed over 200 house depressions, including a large qasigi or men's house, and multiple complexes of houses with interconnected tunnels. Limited test excavation yielded well-preserved pre- and post-contact organic architecture and artifacts, and a faunal record of both maritime and terrestrial game. We have just scratched the surface of a rich archaeological record of the past 600 years.

[418] *Challenges in Integrating Archaeology into Late-Period Preservation Projects: An Example from Menorca, Spain*

The island of Menorca, Spain, belonged successively in the 18th century to Spain, England, France, again England, and finally Spain. During this period, the British constructed their first purpose-built naval hospital on Isla del Rey, a small island in Mahon Harbor. To date, heritage-related efforts on Isla del Rey have focused on the architectural restoration of the hospital buildings, as well as on the development of exhibit spaces. In 2013, Boston University started a collaboration with the Foundation "Amics de la Illa del Hospital," to develop an integrated program of archaeological research and heritage management for the Island. However, archaeology is still not a priority for many restoration projects of post-medieval sites in Menorca, as in much of the Mediterranean area. Likely factors for this include the relatively late date of the historical remains compared to more ancient cultures, the availability of written records, and most of all, the presence of well-preserved architecture. In this paper, we present preliminary results of our work at the Naval Hospital and describe some of the challenges we experienced as we attempted to incorporate historical archaeology and archaeological heritage management into an architectural restoration project.

[298] *Animal Captivity in Tenochtitlan's Sacred Precinct: Specialized Diet and Paleopathological Analysis of Golden Eagles Found in Offering 125*

After the discovery of the Tlaltecuhltli (earth goddess) monolith, the Templo Mayor Project explored an area known as the Mayorazgo de Nava Chávez, located at the foot of the Great Temple. Offering 125 was discovered west of the monolith and was deposited during the reign of Ahuitzotl (1486–1502 CE). Along with thousands of ritual items, two golden eagle skeletons were buried in this deposit. Commingled bones corresponding to at least three quail were found inside the keel of one of the eagles. Considering patterns of perimortem fractures and spatial distribution, we propose that these remains were not deposited intentionally as part of the ritual. By analyzing archaeological materials, sixteenth-century historical sources, and contemporary reference collections, we conclude that the quail bones correspond to a specialized diet provided to both eagles. In addition, paleopathological analysis of antemortem fractures support the hypothesis that both eagles were captives, confirming the existence of complex management strategies described in the historical sources. With this analysis we will address animal-human relationships, captivity strategies, and the ritual importance of animals.

[336] *Collaborative Archaeologies in Transformation: Preliminary Results from a Social Network Analysis of Archaeological Practice*

Collaborative or community-based archaeology can involve a range of activities, from modifying dissemination practices to shifting to writing research designs with a coalition including non-archaeologists. These approaches were built as responses to specific concerns by crafting research methods to the modern context of archaeology. Out of these myriad approaches has developed a social network of scholars whose professional interactions are consequential for understanding contemporary archaeological practice. This presentation will outline preliminary results of a social network analysis of collaborative archaeology using a database of publications, conference presentations, and other products of these projects.

Elliott, Michelle (Université Paris 1, Panthéon-Sorbonne)

[21] *Ritual Fires and Sacred Hearths: The Management of Wood Resources in Postclassic Tarascan Society of the Zacapu Basin, Michoacán*

According to ethnohistoric sources, fire played a central role in the ritual practices of Postclassic Tarascan society. To venerate Curicaueri, the fire god and the most senior-ranking deity in the Tarascan pantheon, sacred hearths were kept perpetually burning outside temples, and the cazonci (king) was personally responsible for obtaining the impressive quantities of wood necessary for this feat. Fuel acquisition for these fires was often embedded in other ceremonial activities, such as hunts carried out by the Tarascan nobility. Nevertheless, the sacred aspects of fire were not restricted to elite and public contexts. Commoners supplied the majority of the fuel for the temple hearths. Furthermore, domestic hearth rituals were a significant part of the day-to-day affairs of households of all social ranks. However, despite the central role of fire and fuelwood among the Tarascans, little archaeological study of these practices and their associated material culture has been undertaken. This paper presents new work focused on charcoal remains and combustion structures in a variety of contexts at the site of Malpais Prieto, in the Zacapu Basin of northern Michoacán, to elucidate how fire-related practices varied among social strata, in public vs. private contexts, and how wood resources were obtained and managed.

[383] *At the Continent's Edge: A View of Flaked-Stone Crescents from Sonoma County, California*

One of the most unique, enigmatic, and intriguing artifacts of the Western United States is the flaked-stone crescent. Crescents are tools that have been bifacially reduced into a crescent shape, although in some, referred to as "eccentrics," this form is extensively modified with multiple notches or extensions to their inner and outer margins. These lithics capture the imagination of both professionals and the public, reflected in the 1991 designation of a "bear-shaped" eccentric crescent as the California State Artifact. While these artifacts are most common in southern California and the Great Basin, they are also present in the northwest portion of the state, including 14 specimens found in Sonoma County. This paper analyzes these specimens and shows that the patterns demonstrated for crescents in the Great Basin and Southern California appear to be evident in Sonoma County as well. Additionally, evidence gathered using obsidian hydration to assess the age of these artifacts and protein analysis to gain insights into their use, although not completely conclusive, contributes to a wider understanding of Early Holocene occupation of the Southern North Coast Ranges in California.

[85] *Lagomorph Exploitation and Garden Hunting in the Northern San Juan Region*

The northern San Juan (NSJ) region of the United States contains a high density of archaeological sites. Ancestral Puebloan people lived in small hamlets (ca. A.D. 1000) prior to aggregating into large pueblo villages (ca. A.D. 1150). Periods of drought occurred prior to the abandonment of this sub-region (ca. A.D. 1300), influencing the availability of animal resources. Zooarchaeological studies of subsistence in the NSJ region have focused on a decline in availability of large game concurrent with increasing reliance on small wild and domesticated resources. This can be attributed to a combination of factors including resource depression and habitat change as human populations grew prior to the depopulation of the region. Faunal assemblages from later occupation periods are dominated by lagomorphs, specifically cottontails. Shifts in lagomorph abundance are thought to indicate habitat alteration; however it is possible that relatively K-selected jackrabbits (*Lepus* sp.) were overexploited leading to an increased reliance upon more r-selected cottontails (*Sylvilagus* sp.) through garden hunting practices. Zooarchaeological studies of resource depression use the test implication that under substantial harvest pressure, mortality profiles exhibit steepened survivorship (increased representation of juvenile animals). This possibility is explored through analysis of zooarchaeological mortality data from sites in the NSJ region.

Elston, Robert (University of Nevada, Reno - Dept. of Anthropology)

[296] *James F. O'Connell and Great Basin Archaeology*

Jim O'Connell began his professional career in anthropology as a Berkeley graduate student under Robert Heizer, conducting his dissertation (1971) research on the prehistory of Surprise Valley in NE California. A teaching position at UC Riverside (1970-72) was soon supplanted by a research fellowship (1973-78) in Prehistory at Australian National University during which he pursued ethnoarchaeological research among the Alyawara. In 1978, he joined the Anthropology Department at the University of Utah, where he soon began the long collaboration with Kristin Hawkes in human behavioral ecology (HBE) that continues to the present. Although working with Hawkes and others mostly in Africa among the Hadza, and no longer a practicing field archaeologist, O'Connell has continued to publish archaeological work based on his dissertation, as well as critiques, insights and applications to Great Basin archaeology derived from his ethnoarchaeological and HBE research. O'Connell and his graduate students have played a key role in the wide adoption of HBE theory and application of HBE models (diet breadth, patch choice, central based foraging) in Great Basin archaeological research.

Ely, Nancy (Bay Farm School, Alameda, CA) and Alyssa Scott (U.C. Berkeley)

[236] *Archaeology and the Common Core: Bay Farm School and UC Berkeley*

Archaeology provides an amazing vehicle for teaching the Common Core and engaging students in

lessons across the curricula, while emphasizing teaching for deep understanding of big ideas or broad concepts. Social sciences, history, and science easily find avenues for collaboration, while students use language arts and math skills to analyze and apply data, as well as to write reports. Archaeological inquiry may be used to understand the human past, employing such tools as observation, inference, context, evidence and chronology, as well as to inform us about contemporary problems. Especially significant is the opportunity to teach cultural sensitivity and to learn about the former inhabitants of one's own region: how these people met basic human needs, such as food and shelter. Seventh grade students at Bay Farm School learned the basics of archaeological inquiry through Project Archaeology and got some first-hand experience at local archaeological sites which have been excavated by UC Berkeley; this paper presents the results of their investigations.

[357] *Paleoindian Occupation in the North Dakota National Grasslands: A Geoarchaeological Analysis of Site Preservation and Land Use*

A GIS model was utilized to help understand Paleoindian land-use, site formation processes and major landform changes in the North Dakota National Grasslands since the terminal Pleistocene. This landscape has changed dramatically over the last 12,000 years and geoarchaeological methods can help understand what the landscape and environment may have looked like during the Paleoindian period. Further, a recent survey has shown that soil erosion in the North Dakota National Grasslands is occurring rapidly which is impacting site preservation and visibility. Geoarchaeological analyses have been able to detect where and how quickly erosion has occurred. This GIS model is also used to predict probable and potential locations of Paleoindian sites to determine where these sites may be preserved, may be destroyed, and where they are yet to be discovered. These analyses thus, help inform on Paleoindian behavior and modern site formation processes and provide a useful management tool to the North Dakota National Grasslands.

Emerson, Patricia (Minnesota Historical Society)

[30] *Defining Sacred*

In American archaeology, as practiced in the context of cultural resource management, recognition and protection of sacred places requires application of bureaucratic standards that may not co-exist peacefully with the cultural norms of those most concerned about such protection. Definitions of the sacred exist in an awkward balance between the regulatory need for a precise, legally defensible definition and the reality that sacredness is a culturally-based concept that resists easy understanding. This paper will review the definitions of "sacred" that currently exist in law, regulation, and Executive Order, and will examine the assumptions that seem to underlie those definitions. It will contrast existing regulatory definitions with cultural understandings of sacredness, particularly those of American Indian tribes, communities and individuals. Comparison to the concept of significance as it is used in National Register evaluation of other property types may illuminate how legal protections for sacred places could function. Case studies will provide examples of the problems and potentials that can be found within the current system.

[205] *Skeletal Trauma in an Ancient High Altitude Himalayan Community of Mustang, Nepal*

High altitude regions in the Himalayas provided a challenging environment for the early human populations who migrated there. In addition to the risks of hypoxia and cold stress, people had to

deal with difficult terrain and limited resources. Yet populations persisted and established complex polities, including those in the Mustang region of Nepal. Surface recovery and excavations of shaft tombs located near the village of Samdzong in Upper Mustang have yielded human remains and artifacts dating to approximately A.D. 200-700. Bioarchaeological analysis was performed on all remains recovered, a minimum number of 105 individuals (38 subadults, 67 adults). Results indicate that while fractures from accidents are uncommon, there is evidence of interpersonal violence within the adult sample, which is not limited to male victims. Injuries include cranial fractures in four males and three females, three of those wounds perimortem, as well as an embedded projectile in the ankle bone of a male. We examine these signs of trauma for insight into interpersonal relationships at Samdzong, a major node along the ancient salt trade route, as the injuries may reflect tension within the community, or they may indicate intercommunity disputes.

[259] *Formative Period Interregional Interaction and the Emergence of Mesoamerican Scripts*

Interregional interaction often serves as a catalyst for cultural innovation. This paper explores the effects of interaction on the development of Mesoamerican scripts during the Formative period. Current models suggest that the transition from iconography to phonetic writing involved the recontextualization of visual symbols: motifs were excised from the pictorial frameworks in which they were usually contextualized and enclosed within the emergent textual-linguistic conventions and organizational schemes of writing. The dynamics of this developmental process, however, remain obscure. We propose that interregional interaction facilitated the re-situation of iconographic elements and their incorporation into the nascent structure of writing. Sustained interaction between distinct groups employing an integrated, mutually-intelligible iconographic system potentially allows certain users to extract signs from that system to serve in more specific contexts. Scribes may thus juxtapose new values on visual elements, infusing icons with new meaning, and allowing them to function within the context of writing. Effectively, fixing variable meanings to icons in the context of interregional interaction detached them from previous interpretations and facilitated their new use as written signs. This paper examines several potentially illustrative examples of this process.

[35] *Rockshelters and Farming Villages: Complementary Seasonal Occupations at Woodpecker Cave*

The Late Woodland Period in the Midwest of North America shows a marked shift in diet from mixed hunting, gathering and farming a few indigenous crops to a predominance of maize in the diet, indicated by radical changes in stable isotope ratios. The sumptuary displays of elite trade goods of the Adena and Hopewell Interaction Sphere in the Early and Middle Woodland were replaced by more egalitarian burial practices. Farming villages in the major river valleys underwent a major reorganization in spatial structure, also indicating increased egalitarianism. This economic and social transformation was accompanied, however, by increased occupation of rockshelters in upland areas during the Late Woodland. Analysis of the spatial structure of various artifact classes at Woodpecker Cave rockshelter in southeastern Iowa is employed to increase understanding of complementary seasonal exploitation of upland wild resources during a time of radical changes in the intensity of agriculture at farming villages.

[375] *The Evolution of Classic Maya Ceramic Shape-Classes through Time: New Evidence from El Peru-Waka, Guatemala*

This paper presents new work from the analysis of recovered ceramic vessels from the Classic Maya site of El Peru-Waka'. The research focuses on the development and evolution of four shape-classes from A.D. 300 to A.D. 1000. These include presentation platters, cacao vessels, small drinking cups, and bowls. These were serving vessels, designed not only to hold foodstuffs, but as social and political currency in their own right. They were to be present at Classic feasting events to display the wealth and largesse of the hosts. This research argues that changing styles of feasting become evident in the analysis of these ceramics. Such feasting styles may have been regional in scope, illuminating one aspect of an integrated elite subculture of the Classic Maya in the Western Peten.

[301] *Neonatal Line Assessment among Milwaukee County Institution Grounds (MCIG) Perinates to Determine Viability*

A sample of perinatal individuals recovered from MCIG Cemetery (ca. 1890-1920) included broken teeth. We evaluate these teeth for the presence of the neonatal line to differentiate stillborn individuals from those that died as postnatal individuals. Our research is nondestructive. We compare the results of the dental analysis to the distribution of stillborns and live births documented in the MCIG burial record and City of Milwaukee vital records.

Erb-Satullo, Nathaniel (Harvard University)

[241] *Applying Innovation Diffusion Theory to Archaeology: a Case Study on the Rise of Iron Technology in Western Asia*

For a variety of historical reasons, the interdisciplinary field of innovation diffusion research has been underutilized by archaeologists examining technological change. Yet there is much to be gained by engaging with the predictive models produced by hundreds of investigations of technology adoption. Using the case of iron adoption in Western Asia, I demonstrate how an approach utilizing these concepts, with some modifications, provide a more complete perspective on technological change.

Innovation-diffusion theory identifies both structural factors (e.g. the nature of interaction networks and the presence of so-called "opinion leaders") and innovation-specific features (e.g. an innovation's observability and compatibility) that influence the pace and pattern of adoption. Using these concepts, I examine patterns of metal usage and the economic structure of metal production on the southeastern Black Sea coast in the late 2nd and early 1st millennia B.C. Archaeological evidence demonstrates that iron, when it appears, was made with great skill and used in large quantities in ways that were probably highly socially visible. I argue that concepts from innovation-diffusion theory explain these patterns more effectively than approaches which attempt solely to identify relative advantages of iron over copper alloys in terms of efficiency or mechanical

effectiveness.

[393] *Fighting Back at Yellow Jack*

Since the beginning of the twentieth century, burial status has been a subject of archaeological investigation. Tainter (1978), Saxe (1970), Hertz (1907), and Pearson (1999) have contributed to our understanding of what status means in various cultural contexts and how it may be interpreted from archaeological contexts. This paper is an application of the burial status theme applied to burials recorded in late-colonial Peru. In 1868 burial records note the advent of yellow fever. Monthly mortality counts escalated to 7400% that of pre-fever months. Burial status is indicated as entierro mayor or entierro menor, translated to mean "high" or "low" burial, and following Ramos (2010), designated a range of mortuary details. Beyond the cost of high burial compared to low, there were also differences in the number and rank of persons in the funeral, the size and prominence of the cross, length of mass, and burial locale. This paper investigates the demographics of the deaths and the predicted change in burial status due to greater strain on families and community. The concept of status adds a new specificity to the prevailing question of mortuary performance: who merited "high" burial and how would escalated mortality rates influence this performance feature?

[364] *Lithic Landscapes and Basketmaker Villages: An Update of the 2014 Petrified Forest Boundary Expansion Survey*

In 2004 Congress authorized Petrified Forest National Park to more than double in size, in part to protect unique cultural resources. This poster introduces the preliminary results of the first and second seasons of pedestrian survey in these new lands. So far this research has recorded archaeological sites dating from the Early Archaic through the Late Pueblo periods. Sites range from lithic landscapes covering hundreds of acres to multi-room masonry or jacal structures. Mapping in semi-stabilized dunes has focused on large Basketmaker village sites and detailed ceramic analysis has documented phenomenal diversity of ceramic types and sources. This survey and documentation project is being conducted in order to better understand prehistoric land use and change through time in this prehistorically significant area of the southwest. In addition to cultural resource management goals this project also functions as a teaching laboratory with the Petrified Forest National Park internship program. To date, this program has incorporate nine college student interns for in-depth field training and independent research.

[90] *Creative Mitigation: Archaeological Site Monitoring on Military Lands in Central Alaska*

The creation of a large live-fire training range in the Donnelly Training Area (DTA) of United States

Army Garrison, Fort Wainwright (USAG FWA), required Army archaeologists to integrate standard mitigation techniques with a creative new approach. Extensive survey of the entire Battle Area Complex (BAX) target area and the surface danger zone (SDZ) downrange of targets uncovered over 150 archaeology sites. Twenty-nine sites in the target area were excavated and USAG FWA and the Alaska State Historic Preservation Officer developed a creative plan to monitor the condition of sites in the SDZ to maintain a status of “no adverse effects” for the use of the range. Colorado State University’s Center for Environmental Management of Military Lands was contracted to conduct site condition assessments of the 124 sites within the BAX SDZ. Sites are monitored on an annual or more frequent schedule depending on their proximity to target areas and the amount of use the range receives. This paper serves as an update on the successes and challenges of this approach, as well as an example of how training and cultural resource protection can coincide on military lands.

[32] *Toolstone Sources off the Pacific Coast of Alta California: Implications for Evaluating the Marginality of Islands through Space and Time*

Except for major sources of chalcedonic chert on eastern Santa Cruz and soapstone on Santa Catalina, the islands off the Pacific Coast of Alta California were long thought to be impoverished in high-quality materials for making stone tools. As a result, cherts and other toolstones could have been a major source of trade between islanders and mainlanders. We summarize the distribution of known lithic resources on the islands, documenting numerous chert types on the Northern Channel Islands and quartzites, metavolcanics, rhyodacites, and sandstones on the Southern Channel Islands. For islands occupied since the Terminal Pleistocene, the abundance and distributions of such resources may also have changed significantly through time due to sea level rise and coastal erosion. This spatial and temporal variability has implications for understanding a variety of issues, including the antiquity of initial colonization and permanent settlement of California’s islands, the distribution of Paleocoastal lithic technologies, the development of exchange and alternative technologies, and the broader issue of the ‘marginality’ of island environments. Given the discovery of new lithic sources over the last twenty years, further geoarchaeological surveys are required to better understand the diversity, abundance, and distribution of toolstone resources on California’s islands.

[8] *Ground-penetrating Radar at edh-Deir, Petra, Jordan*

Petra is famous for the many tomb façades and complex water management systems carved in its surrounding mountains. The ancient city has been studied by traditional archaeological survey and excavation techniques for more than 100 years. Ground-penetrating radar (GPR) has been previously used in several locations with excellent results, including in front of the al-Khazneh (“the Treasury”), near the Temple of the Winged Lions, on the “Upper Market” and the Garden and Pool Complex (the “Lower Market”), as well as on several agricultural systems in the hinterland. This poster presents results from the 2013 GPR survey conducted in front of edh-Deir (also known as the Monastery), which is located on a high plateau above the city center. A 400 MHz antenna was used to explore the ca. 2,500 square meters immediately in front of the façade, revealing an architectural arrangement oriented at a 45 degree angle from the monument. The nature of the orientation and architectural pattern, combined with insights gained from a related terrestrial scanning project, lead to a new understanding of how edh-Deir may have been used in the broader Petra landscape.

[409] *Archaeological Topography: Comparing Digital Photogrammetry Taken with Unmanned Aerial Vehicles (UAVs) versus Standard Surveys with Total Stations*

This paper addresses how Unmanned Aerial Vehicles (UAVs) are used as a platform to produce accurate topographic maps with a considerable reduction in time and costs associated with fieldwork when compared with a total station. For this study, data was collected in the controlled environment of a mapping course to compare the procedures and time required to train archaeology students in the operation of a total station versus the operation of a small UAV equipped with digital cameras. An artificial mound of 3 ha was mapped with both a total station and the UAV. On average the UAV platform captured topographic data 27 times faster than the total station.

[103] *Mapping the Homelands: A Collaborative Effort of Auburn University, the National Park Service, and Native American Tribes*

Native American land ownership underwent significant geographic changes following European settlement. This intensified after the American Revolution due to demographic changes, tribal migration, and aggressive Euro-American expansion. This paper presents the results of a collaboration between Auburn University, the National Park Service, and federally recognized tribes to plot land loss from ca. 1790 through the 1850s, with particular emphasis on the impact of the War of 1812 on native landholding. The historical and cartographic work combined ethnohistorical data collection with GIS methodology, and resulted in a series of maps showing the locations of federally recognized tribal groups through time. This project is unique in including consultation with Native American tribes. The final result is a dynamic, interactive, and user-friendly online database of tribal land tracts that is accessible to the public on the NPS.gov website. This paper will examine the process and challenges of creating a digital database of land loss for fifty-four tribes across four distinct time periods.

Eschbach, Krista (Arizona State University)

[76] *Consequences of Warfare, Reforms, and Capitalism in Late Colonial Port of Veracruz, Mexico*

At the beginning of the 18th century, Spain and its American colonies were still steeped in mercantilism with the Spanish Crown and elite merchants struggling to maintain a monopoly over trans-Atlantic trade. Over the next hundred years, this economic system was transformed as a result of political and economic events in Europe and the Spanish colonies. By the end of the 18th century, the Port of Veracruz, once one of the few legal ports in Spain's American colonies, was now one of many ports open to rapidly growing trade with Europe. Wealthy merchants who benefited from the mercantile policies of previous centuries were replaced by a new generation of local and foreign entrepreneurs. In this paper, I investigate the social and economic consequences of global developments within the Port of Veracruz by examining periodic shifts in the consumption of local and imported ceramics that coincided with European wars, economic reforms, and developing capitalism. I consider how these shifts varied between two lower status neighborhoods within the port in order to evaluate different consumption strategies and the impact of global changes on economically vulnerable people.

Escobar, Luisa (CIRMA) and Guido Pezzarossi (Syracuse University)

[76] *Booms, Busts, and Changing (Anti)Market Engagement in Pacific Piedmont Guatemala*

Located in the cacao-rich Pacific piedmont region of Guatemala, the colonial period Kaqchikel Maya

community of San Pedro Aguacatepeque produced cacao for the Iximche Kaqchikel polity prior to colonization. With the 16th century global cacao boom that followed Spanish colonization, cacao producing communities in the region became critical sources of this increasingly desired regional and global exchange good. The bust of the global cacao market in the latter part of the century, coupled with increasing depopulation and the impact of colonial antimarket effects (i.e. unequal, exploitative exchanges underwritten by power disparities) led to the decline of cacao production, the abandonment of formerly thriving communities, and the emergence of new opportunities and modalities of market engagement and economic mobility for individuals and communities in the region. This paper focuses on how Aguacatepeque navigated these booms and busts through a transformation of production away from cacao and towards the market-oriented production of sugar cane, and sugar-based products, both legal and illegal/illicit. This transformation in production brought with it a shift in consumption as market dependence for craft goods intensified, redirecting the majority of Aguacatepeque's time, labor, and land use toward globally connected regional Spanish colonial (anti)markets and their broader economic networks.

[21] *The Archaeological Site of Presa de la Luz: New Insights on the Relationship between the Altos of Jalisco, the Bajío and the Mexico Basin*

During the years of 2012 and 2013 draft surface survey was conducted to record more than 600 petroglyphs of the archaeological site known as Presa de la Luz in southern highlands of Jalisco, Mexico. This site drew attention from the beginning due to the high number of pecked cross or solar markers, we recorded nine of these, could be the site with the largest number in any Western Mexico. Solar markers are very similar to those recorded in first instance in Teotihuacan and Mexico Basin. Also, the relationship with the Bajío you can see this in the architecture of sunken patios (patios hundidos) of at least two nearby petroglyphs archaeological sites, as well as a constant debitage obsidian, from which a collection was analyzed through XRF technique. In addition, the surface ceramics collected points to an occupation during the Epiclasic between 700-900 A.D. and perhaps some earlier. In this paper the results and inferences will be tabled and discussed this influence of distant regions.

Espenshade, Christopher

[188] *The Public Swinging Detectors: Interaction With Professional Archaeologists*

Avocational detectorists are one segment of the public that offers great opportunities and challenges for public outreach. It has become increasingly clear that not all laypersons with a metal detector are the same, and that past and ongoing vilification of "relic hunters" is not always appropriate. The class, Archaeological Partnership Program, is introduced. This class teaches avocational detectorists how they can contribute to professional archaeological research, and hopes to help bridge the gap between these two communities.

Espinosa, Ma Alejandra (UA.D.Y)

[24] *Las primeras sociedades agrícolas sedentarias en el Valle de Oaxaca: producciones líticas y surgimiento de nuevas necesidades*

Los vestigios de las primeras aldeas agrícolas muestran una sociedad que se caracteriza por la fabricación de un tipo de cerámica elaborada, la presencia de productos de intercambio y un modo de vida sedentario. De manera general, se ha considerado que la diferenciación de estatus social de estos grupos domésticos es poco perceptible o incluso inexistente. Sin embargo, el inicio del Preclásico se caracteriza por el surgimiento de innovaciones de importancia fundamental y el establecimiento de las primeras aldeas agrícolas tuvo sin duda implicaciones de gran importancia tanto en el patrón de asentamiento como en la economía, conduciendo así a nuevas necesidades.

En esta ponencia se presenta el análisis del material lítico tallado de los primeros grupos sedentarios de los Valles centrales de Oaxaca. La industria lítica de los primeros grupos agrícolas demuestra una regresión cualitativa de la producción lítica local, la cual ha sido generalmente considerada como desprovista de valor social o simbólico y con poco significado en cuanto a la organización de los grupos. No obstante, esta tendencia a la simplificación se explica como una respuesta de eficacia ante las necesidades cotidianas dentro de un nuevo contexto doméstico.

[343] *Ceramics and Social Identity at RAR-2: A Pueblo III Period Site near Winslow, Arizona*

RAR-2 is a small Pueblo III period site located on private land outside Winslow, Arizona. Excavations in 2011-12 by the University of Illinois at Chicago and the University of Arizona Field School at Rock Art Ranch have revealed the production of local utility ware, Rock Art Ranch utility ware, in addition to a variety of imported, non-local utility wares, including Tusayan Gray ware, Mogollon Brown ware, and Puerco Valley utility ware. This study analyses the technological style of the locally produced corrugated utility ware to explore the diversity of social identity within the local community. The technological style of imported corrugated utility wares will also be analyzed; correlation between the locally produced pottery may indicate the origins of extraregional trade connections of the inhabitants of RAR-2. This study will provide insight into larger demographic and migratory patterns within the broader cultural landscape.

Estrada-Belli, Francisco (Tulane University/Boston University/AMNH)

[306] *The Rise and Fall of Maya Kingdoms in the Holmul Region*

Research in the Holmul region of northeastern Peten has focused on Cival as its major political center during the Middle and Late Preclassic period since its rediscovery in 2001. The goals of this research continue to be inspired by several ideas expressed in *Forest of Kings* in 1990. Mainly, the rise of kingship in the Late Preclassic period, the interpretation of giant 'mask' sculptures on the facade of pyramids as backdrop for royal rituals as well as the interpretation of ritual caches. Centers like Cival, El Mirador and Cerros were simultaneously abandoned and replaced by new political capitals in the Early Classic period, such as Holmul, Tikal and Santa Rita Corozal. Newly acquired imagery and texts as well as environmental data allow us today to build upon the influential ideas expressed in the 1990 volume and reveal new untold stories on the nature of Maya kingdoms.

[109] *Salt Production and Economic Specialization at Drake's Salt Works*

The Drake's Salt Works Site Complex in northwestern Louisiana was one of the most intensively-utilized salt production sites in the south-central United States during the seventeenth and eighteenth centuries. According to the historic record, the Caddo salt makers at this saline were capable of producing hundreds of pounds of salt each year to sell to nearby European and American Indian groups. Given the limited availability of salt away from coastal areas, participating in the production and exchange of salt at inland salt springs, such as Drake's Salt Works, would have been a profitable economic venture. Using recent archaeological data from a stratified midden of salt production debris and two habitation zones, this paper examines the intensity of Caddo salt production at Drake's Salt Works. An analysis of salt production vessel rim diameter and thickness from the stratified midden indicates that vessel standardization remained relatively consistent

through time. Additionally, the data from the two habitation zones suggest that the salt makers worked at this site on a seasonal or opportunistic basis. Thus, it would appear that the Caddo were able to meet and profit from the local demands for salt without the need for full-time economic specialization.

Eusebio, Michelle (University of Florida)

[349] *Between Manufacturing and Disposal: The Lives of the Pots in the Neolithic and Metal Age Settlements of Southern Vietnam*

Studies on pottery from archaeological sites in Southeast Asia are largely orientated towards aspects of manufacturing and typology. Emphasis is on the identification of transregional similarities and differences of form, decoration, and composition to establish patterns of human migration, contact, and identity. Less emphasis has been directed towards understanding what happens to different pottery vessels between their manufacturing and disposal, as well as their actual functional use. For example, was a particular pot used to prepare, serve, or store food? To address this question, pottery vessels from the settlement sites of Rạch Núi, An Sơn (Neolithic), Lò Gạch, and Gò Ô Chùa (Metal Age) in southern Vietnam were analyzed for technofunctional attributes and organic residues to determine their usage and food contents. Specifically, organic residues were analyzed for fatty acid profiles with gas chromatography-mass spectrometry, carbon isotopic signatures ($\delta^{13}\text{C}$) of palmitic (C16) and stearic (C18) fatty acids with compound specific isotopic analysis, and carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) with bulk isotopic analysis to elucidate former food contents on pottery. This paper then explores the “lives of the pots” as they were utilized in foodway practices by the inhabitants of Neolithic and early Metal Age sites in southern Vietnam.

Evans, Adrian (University of Bradford)

[17] *Representative Samples and Method Calibration for Lithic Microwear Interpretation Frameworks*

This paper builds on discussion of combined blind-test datasets for lithic microwear analysis method previously presented by the author (Evans 2014). A large randomly sampled assemblage, from the Mesolithic site of West Stainton in England, was analyzed using traditional microwear analysis. The size of the assemblage may allow an investigation of variation of tool function within different classes. However predicted error rates from the combined blind-test dataset were used in monte carlo and bootstrapping algorithms that were run on the primary results from analysis. This paper discusses this experiment and impact of such probabilistic modelling on microwear data when blind-test results are considered and presents this as a possible means of using blind-test data in a positive way to strengthen basic microwear data prior to interpretation.

Evans, Susan (Penn State University)

[182] *It's Alive: Gambling, Animatism, and Divination among the Aztecs*

Gambling and divination both pit the hopes of the petitioner against an uncertain future outcome. Popular for millennia, they seem to inhabit distinct spheres of interest, secular and spiritual, but overlap as the individual tries to assess the odds and garner available forces of knowledge, luck, or patronage of the spirits. In Aztec culture, this overlap linked the spiritual realm of divination and the base entertainment presented by gambling (which they regarded as dissolute, though common). The Aztecs lived in a rich, nuanced environment which they perceived as alive, its vitality evidenced by its animated aspects. The Aztecs responded with patterns learned since childhood: the rites and fates of the calendars of nature and culture, the good and bad omens, and the appropriate chants, adages, or exorcisms to restore a balance if chaos should threaten. One could seek advice from “wise ones” (as Aztecs referred to those with specialized knowledge) to interpret phenomena and their bearing on the future. Similarly, the movement of a few beans and a little time in a game of patolli might radically alter one’s fortune. Gambling and divination depended on animated

phenomena, and Aztec practices reveal their methods of communicating with this living world.

Evans, Amanda (Tesla Offshore)

[192] *Right Place, Right Time: Paleoindian Landscapes on the Gulf of Mexico, Outer Continental Shelf*

Archaeologists have been conducting prehistoric archaeological research on the world's continental shelves for the last 40 years, with a general consensus that remote sensing combined with physical sampling is the best method for identifying sites. Following the conclusion of a US federally-funded (BOEM) study in the Northwestern Gulf of Mexico, two promising Paleoindian landscapes have been verified 20 and 30 miles offshore, at depths of between 16 and 32 m BSL. Remote sensing and physical sampling revealed evidence of highly favorable conditions for supporting human populations, however the survey areas are classified as archaeological landscapes and not "sites". This paper will summarize the results of environmental reconstruction, highlighting the unique differences between identifying archaeological landscapes versus sites. It will also address challenges facing cultural resource managers charged with protecting submerged landscapes and sites offshore.

Evans, Caitlin (James Cook University)

[286] *Sites, Survey, and Ceramics: A GIS-Based Approach to Modeling Early Prehistoric Settlement Patterns in the Upper Mun River Valley, Northeast Thailand*

Recently, a series of intensive pedestrian surveys were conducted in the Upper Mun River Valley, northeast Thailand to examine prehistoric and historic settlement patterns at an intermediate scale. This paper will focus on the early prehistoric (1650 – 420 B.C.) finds, in particular evidence of Neolithic (1650 – 1050 B.C.) occupation. Our results indicate that during the early prehistoric period, site density was unexpectedly high, but settlement integration was weak; site sizes varied greatly and distances between them were uneven. Early prehistoric sites primarily followed a linear pattern, stretching alongside the fossil river network within an elevation range of 141-166 MAMSL. Neolithic sites were located within an even narrower elevation range (151 – 156 MAMSL) and situated on large natural ridges jutting from the low terraces into the alluvial floodplains. How these newly-identified intermediate-scale settlement patterns complement existing excavation and regional aerial surveys within northeast Thailand, will be explored further in this paper.

Evans, Sally (Evans & De Shazo, LLC)

[293] *Auditory Exostosis: A Marker of Occupational Stress in Pre-Contact Populations from the San Francisco Bay Region of California*

The formation of auditory exostosis in prehistoric populations living along the shoreline of San Francisco Bay is due to participation in cold water subsistence behavior. Rates of auditory exostosis in populations from previously excavated archaeological sites located along the Bay Shore were compared with those located in the interior East Bay. A sample population of 1,291 individuals dating from the Early Period (3500 – 200 B.C.) to the Late Period (A.D. 1050 – 1769) was employed to address inter-regional and sex-based differences, and diachronic trends in the frequencies of auditory exostosis. Corresponding with environmental conditions that are conducive to its formation are higher rates of auditory exostosis in populations living along the Bay Shore compared to those occupying an inland setting. Diachronic trends in frequencies of auditory exostosis in the Bay Shore sample also correlates with changes in the use of marine resources, and it is suggested that diving was a strategy employed regularly during the Middle Period (200 B.C. – A.D. 1050) to access shellfish. The sex-based analysis shows this activity was primarily performed by males and reveals different inter-regional diachronic trends in the sexual division of labor as it relates to cold water foraging behavior.

[310] *Ground-Penetrating Radar and Terrestrial Laser Scanning Reconstruction of the Prison and*

Civil War Era Historic Fortifications on Alcatraz Island

Between 2012 and 2013 we conducted a cultural resources assessment and historic preservation project with the National Park Service on Alcatraz Island using terrestrial laser scanning and ground-penetrating radar. Alcatraz is most (in)famous for its brief period as a Federal Penitentiary (1934-1963); however, for the vast majority of its history it was a military fortification – Fortress Alcatraz - under the U.S. Army. As the need for harbor defense diminished, the island was converted into a military prison during the 1860's. The conversion of the island to a prison greatly reduced the surface record of this historic period. An analysis of georectified historic maps showed that historic masonry and earthen work fortification structures once stood in the Parade Ground and Recreation Area of the island. Ground-penetrating radar with 200 and 500 MHz antennas was used to detect the presence, integrity, and extent of these significant historic remains below the island's current prison facade. Laser scanning was undertaken to obtain a current 3D reproduction of the island. The integration of GPR and laser scanning data was used to create a 3D reconstruction, which allowed for a greater understanding of the process of change over time on the island.

[114] *The Thermal and Transpirative Properties of Arctic Clothing Construction: A Women's Adaptive Technology*

The technical ability of women to engineer clothes as adaptation to the harsh arctic environment in Indigenous North America has not been extensively investigated. My research focuses on the analysis of the thermal and transpiration properties of Arctic clothing. The materials chosen for clothing have certain inherent properties that include species of animal selected, different tanning processes, patterning of the garments, seam construction, and tailoring. All these properties play into the thermal and transpirative properties of a finished piece. Through the examination of garments in the collections of the Smithsonian National Museum of Natural History I determined the patterning and seam construction employed by Western Alaskan women; here I focus on a parka, a pair of leggings, and a pair of mittens. Such patterning, seam construction, and tailoring techniques make possible year round habitation of the Arctic.

Ewonus, Paul (University of British Columbia / Kwantlen Polytechnic University)

[154] *A Geography of Foodways in the Salish Sea, Pacific Northwest Coast*

This paper examines past foodways within the southern Strait of Georgia, Pacific Northwest Coast at a number of geographic scales. It also addresses the extent and nature of temporal shifts in the social landscape of the region. Seasonal use of the landscape is revealed through an understanding of place in the Salish Sea. Zooarchaeological analysis of a regional sample of 30 sites suggests that while extensive variation was characteristic of southern Strait of Georgia settlement from 3200 B.C. to the arrival of Europeans, late winter and early spring site use was prominent on southeastern Vancouver Island. The southern Gulf and San Juan Islands appear more generally to have been a focus of spring and summer inhabitation. This pattern is most evident during an important period of village aggregation in the southern Strait of Georgia between 650 B.C. and A.D. 650, although it is expressed to a lesser extent both before and after this interval. People may have established a larger number of villages after 650 B.C. in order to not only increase their use of food resources available in seasonal concentrations, such as herring and salmon, but also to engage in more elaborate ritual activity.

[272] *Farming the Great Sage Plain: Mesa Verde Loess, Soils, and Agriculture*

The Pueblo Farming Project (PFP) seeks to preserve traditional farming knowledge and educate the public concerning traditional farming practices and the place of corn cultivation in Pueblo cultures. Soil profiles inside and adjacent to project gardens reveal the impact of farming on soils over relatively small temporal and spatial scales.

The Basketmaker Communities Project (B.C.P) focuses on better understanding the Basketmaker III Period, as well as the development of Early Pueblo communities. B.C.P geoarchaeological investigations at Basketmaker III (1250-1500 BP) sites focus on the soils' development and tilth. Soil profiles on- and off-site demonstrate differences between farmed and un-farmed soils over larger temporal and spatial scales.

Examination of modern non-irrigation farming practices suggests intimate connections between fertility, soil identity, and management. Both PFP and B.C.P soils exhibit soil hardening and pan development to varying degrees. As pan accumulation limits productivity, its rate of formation is an important factor with implications for Ancient Puebloan site choice and occupation span. Understanding the interplay of climate, cultural practice, and pedogenesis is, therefore, key to deciphering this geocultural record.

[253] *Examining Elite Domestic Practices in Postclassic Xaltocan, Mexico*

The Postclassic site of Xaltocan has been the focus of archaeological investigation for nearly 30 years. Over this period a solid ceramic chronology for the site has been established thanks in large part to the pioneering efforts of Elizabeth Brumfiel and her students. While the vast majority of archaeological research at Xaltocan has focused predominately on commoner contexts, recent archaeological excavations of elite domestic spaces at Xaltocan inform and expand upon the current ceramic chronology. Using these new findings as a jumping off point, this poster presents comparisons between ceramics found in commoner and elite domestic settings at Xaltocan, enabling a greater understanding of local class relations. Additionally, ceramic data sets collected from elite domestic spaces at Xaltocan are also compared with those from other Postclassic elite residences in

the Basin of Mexico. Such comparisons contribute to a greater understanding of how regional elite identity was created and sustained through a shared symbol system and trade relations.

Farahani, Alan (University of California, Los Angeles)

- [162]** *Morphometric Analyses of Cereal Grains from Central Jordan Improve the Resolution of Identifying Shifts in Crop Cultivation and Processing Strategies over 2000 Years (ca. 800 B.C.E. - 1300 CE)*

The measurement of carbonized domesticated cereal caryopses through a number of established morphometric parameters has the potential to provide information on past cultivation conditions, crop processing practices, and taphonomic processes. This poster presents the results of morphometric analyses using a microscope-mounted camera on carbonized cereal caryopses of wheat (*Triticum aestivum/durum* and *Triticum dicoccum*) and barley (*Hordeum vulgare*) collected from the archaeological site of Dhiban, Jordan. The settlement of Dhiban was occupied by agricultural societies for over 2,500 years, although it is located in a semi-arid bioclimate with rainfall too low and variable for reliable rain-fed agriculture. Computer-imaging based morphometric analyses of these grains illustrates that barley caryopses are significantly thicker in the Byzantine period (ca. 500 CE) than in the later Middle Islamic (ca. 1300) period, although wheat grain sizes are not significantly different between these periods. The decreased size yet increased variance of barley caryopsis size in Middle Islamic period samples indicates a shift in agricultural production towards targeted expediency as well as increased crop processing on the site itself. The morphometric analysis of cereal caryopses thus enhances the resolution of the identification of long-term shifts in agricultural practice at the level of changes in individual cultigens.

Farella, Joshua, Thomas Swetnam (University of Arizona Laboratory of Tree Ring Rese) and Mathew Liebmann (Harvard University)

- [239]** *Forests, Fires and People: Reconstructing Human-Natural Interactions on the Jemez Plateau, New Mexico with Tree Rings*

The Jemez Plateau of northern New Mexico contains a rich archaeological and tree-ring record characterizing interactions between humans, forests, climate and fire over the past 500 years. Ponderosa pine and pinyon-juniper woodlands on the Plateau were occupied by roughly 6,000 people within an area of about 30,000 hectares during the early 1600's. Using dendrochronology we reconstructed detailed fire and forest histories directly on and surrounding several large, ancestral Jemez village sites (i.e determining tree establishment dates and fire events). Comparisons with site provenance from ceramic assemblages and structural tree-ring dates enabled us to assess human, forest, and fire interactions. We found (1) reduced or no fires occurring immediately around villages during occupations prior to 1680 CE, (2) trees re-established around and on village sites within approximately 30 years of site de-population, and (3) subsequently, spreading, low severity surface fires began burning at intervals of about 5 to 20 years, until about 1880-1900 CE when fire occurrence generally ceased due to intense livestock grazing. This study demonstrates novel applications of terminus ante quem tree-ring dating of site occupation and utilization, fire and forest dynamics. These methods have potential for application elsewhere, and may complement other chronological methods and archaeological interpretations.

Fargher, Lane (CINVESTAV del IPN), Marc N. Levine (University of Oklahoma) and Flor Arcega-Cabrera (Universidad Nacional Autónoma de México, UMDI-Sisa)

- [25]** *Using Natural Breaks to Work Together: Compositional Analysis of Archaeological Ceramics Using Petrography and NAA*

Historically, the application of petrographic techniques and NAA to the compositional analysis of archaeological ceramics in the New World emerged from two very distinct intellectual foundations. Initially, petrographers focused on studying temper to characterize the types of materials used, their geological sources, and their coarseness in an effort to reconstruct the cultural development of potting traditions and interaction among cultures. NAA, on the other hand, was originally used to measure trace elements to distinguish geological clay sources. Thus, at base, each technique

focused on very different things for very different ends. Accordingly, they have traditionally produced divergent and, sometimes, contradictory results. Therefore, in order to build a bridge between these methods, we present a new method that uses mineral chemistry, continuous variables, and insights from Central Limit Theorem to bring Petrography and NAA together in such a way that they can effectively provide complementary information on temper (or natural occurring aplastics) and clay. In order to do this, we move away from the classic analytical techniques in each area (e.g., ternary data in petrography and log transformations in NAA analysis) and incorporate statistical methods not traditionally used in compositional analysis by archaeologists.

[37] *Early Bronze Age Animal Use at Lajia, a Qijia Culture Site in Qinghai Province, China.*

The faunal remains from Lajia, a late Neolithic and early Bronze Age site in northwestern China, reveal that sheep, a newly introduced domesticate during this time period, are the central source of meat for the site's residents. This represents a shift from earlier modes of subsistence in the region, which were focused on pig husbandry. Sheep were the most common domesticate in the Lajia assemblage, followed by pigs and cattle. An examination of age profiles reveals that mature adult sheep individuals were rare in the assemblage, which suggests that sheep were being exploited for meat. This finding is not consistent with evidence from contemporaneous northern Chinese sites, where sheep are interpreted as being a source of secondary products such as milk and wool. An analysis of bone breakage aimed at determining whether remains were processed for grease and marrow was inconclusive, revealing that the main source of fragmentation in the assemblage was related to butchery, with no significant correlation between increased levels of fragmentation and high-utility skeletal elements. This study provides preliminary but important information regarding food production and animal husbandry during a period in which larger centers of power were emerging and new domesticates were being exploited.

[187] *Evolving Identities in Early Andean Art: Figurative Ceramics from Ancient Ecuador*

For nearly 5000 years, between c. 4,000 B.C.E. and 500 CE, a continuous tradition of figurative ceramics evolved in ancient present-day Ecuador. Though known only through now-anonymous archaeological remains, this tradition represents some of the earliest dated sculptural and ceramic art forms in all of ancient America. At least five distinct, chronologically sequential styles have long been recognized in this tradition, beginning with the earliest Valdivia style and continuing with subsequent Machalilla, Chorrera, Jamacoaque and La Tolita variations. Within each style, noticeably different approaches to establishing identity were employed, including body posture and gesture, basic clothing and skin adornment (cosmetic or tattoo), elaborate jewelry and costuming, display of status paraphernalia (sacred, utilitarian or ceremonial), or highly naturalistic anatomical renderings (individual portraiture?). This paper considers the evolutionary sequence of these differing identity strategies and the implications for interpreting changes in social organization, fashion and emerging cultural ideologies, such as (though not limited to) increased social stratification and specialization, elite power brokering, and long-distance trade..

Farnsworth, Paul (Temple University) and Nydia I. Pontón (Dept. of Anthropology, Temple University)

[394] *Archaeological Excavations at Hacienda La Esperanza, Manatí, Puerto Rico*

Hacienda La Esperanza, a sugar plantation on the north coast of Puerto Rico, was established in the

1830's by Captain Fernando Fernández, a wealthy merchant and slave trader. Hacienda La Esperanza thrived until the abolition of slavery in 1873. At its height, La Esperanza was the most technologically advanced sugar factory in Puerto Rico and one of the most successful plantations at the semi-mechanized level in the Antilles. It also housed one of the largest enslaved populations in Puerto Rico as documented by the slave census of 1870, which registered 152 enslaved people. The research at Hacienda La Esperanza focuses on the examination of class relations and how these shaped the enslaved people's experience at the plantation. This paper will report on the results and on-going analysis from three field seasons conducted at the site between 2012 and 2014. The first season evaluated the current condition of the site using ground penetrating radar and documented previous excavations. The second and third seasons tested the results of the GPR survey and excavated in and around structures where the enslaved people of the hacienda lived and worked. Plans for future research at the hacienda will also be presented.

[337] *The Moose Hill Site: The Dynamic Interplay of Climate Change, Marine Productivity, Volcanism, and Cultural Transitions on the Kvichak River, Bristol Bay, Alaska*

The Moose Hill Site is a multi-component settlement along the Kvichak River in Bristol Bay Alaska. The site consists of ~40 semi-subterranean structures with archaeological assemblages representative of the Arctic Small Tool, Norton, Thule, and Koniag traditions. This research focuses on a late Norton tradition occupation at 840 +/- 30 BP and presents a refinement of the complex transition between the regional Norton and the Thule traditions. The timing and method of culture change during this period is marked by extreme fluctuations in population size, the adoption of new subsistence strategies, migrations, and increased competition for resources. These changes may have been in part due to a regional decline in marine productivity associated with the Medieval Warm Period (MWP), ca. 1100 BP to ca. 650 BP, and a decrease in availability of terrestrial resources resulting from a Katmai area eruption.

Farris, Glenn (Farris, West & Schulz)

[175] *Looking at the Cosmopolitan Community of the Pueblo of San Diego in the Mexican Period in California: 1821-1846*

Following the successful conclusion of the Mexican Revolution, many soldiers from the old Spanish Presidio of San Diego moved down the hill to found a civil pueblo. The soldiers themselves represented a diverse background of people from Mexico to which were added local Native Americans as wives and, more often, as servants. With the opening of the province of California to foreigners under the new Mexican regime, a variety of men of European and American descent including merchants and sailors arrived at San Diego and entered the village. For a short period (1825-1830) San Diego was the seat of government for the two Californias (Alta and Baja) under the leadership of José María de Echeandía. Recent research on the peopling of San Diego has expanded our knowledge of this diverse community, including the sizable number of Indian servants who have generally escaped the attention of historians. This paper seeks to broaden our understanding of how this cosmopolitan community worked.

Fash, William (Harvard University)**[366]** *New Approaches in Archaeological Research, Heritage Management and Community Engagement for the Copan Valley*

Archaeological sites in the Copan Valley have benefited from a number of large-scale Honduran government-sponsored and international research projects over the past 80 years. Those efforts have contributed strongly to the broad dissemination of knowledge about the ancient city, and the conservation of many Copan monuments and residential sites. However, even before the global recession and the traumatic events of the coup in 2009, it was clear that the State was challenged in trying to address all of the urgent needs detailed in the various Copan Site Management Plans. Two locally based non-profits created to support Copan archaeology and education (with which we are involved) have accomplished a great deal and remain very active. Nevertheless, to maintain heritage management initiatives, community engagement, responsible sustainable tourism, archaeological awareness, and continued research and rescue operations, requires establishing flexible and responsive collaborative endeavors in the region. We explore some of our own efforts to those ends with our ongoing Santander Program for Research and Conservation of Maya Sculpture, including the Proyecto Arqueológico Rastrojón Copán (PARACOPAN), and introduce the diversity of approaches that will be presented in the session.

[366] *Chair***Faugere, Brigitte (University Paris 1)****[88]** *The Bajío (Guanajuato/Michoacan) during Epiclassic: Cultural Assertion and Macro-regional Interaction*

In the North-Center region of Mexico, the Bajío reached its peak population during Epiclassic period. From the Preclassic background of the Chupicuaro Culture, emerges a rich ceramic and architectural tradition. Following the fall of Teotihuacan, the Bajío has extensive networks of sites organized around ceremonial centers with frequently sunken patios and I-shaped ball courts. The ceramics are nevertheless far from uniform, denoting a will of cultural assertion for each polity. From A.D. 800, evolutions appear in connection with phenomena of interaction with the nearby regions, in particular in the East Acambaro's basin and, on the West side, near Penjamo/Penjamillo. This paper will present these aspects, placing them in a macro-regional perspective.

Faught, Natalie**[93]** *These Stones Will Destroy Us*

This poster presents a critical reflection on the dialectical and power-imbued relationships of archaeologists and stakeholder communities, focusing on the ongoing Stélida Naxos Archaeological Project in the Cycladic islands, Greece. While much has been written about archaeologists' interaction with neighboring populations, Stélida provides a complex case due to the transitory and heterogeneous nature of what constitutes its "local" community. Residence is both seasonal (summer) and fluid in nature, the population a mix of well-heeled native Naxians (including hoteliers and their resident tourists), holiday home-owners from mainland Greece, plus a handful of long-term foreign seasonal occupants.

This poster charts the negotiations of these relationships in the broader context of debates on 'community engagement' (e.g. Ian Hodder's work at Çatalhöyük), where the 'local' voices are often those of economically and/or culturally powerful characters who have divergent interests in the future of Stélida and by extent their relationship with archaeologists ("these stones will destroy us!" proclaimed an angry hotelier). Various forms of outreach and engagement are detailed, together with the challenges for developing such relationships in the context of our responsibility to the desires of the state's Ministry of Culture and Naxian cultural and political figures.

Faught, Michael (SEARCH, Inc)**[243]** *Spring Surprise: The Lessons Learned and Unexpected Results of the Chassahowitzka Headsprings Archaeological Assessment and Monitoring Project*

In 2013 SEARCH conducted underwater archaeological investigations and monitoring at the

Chassahowitzka Headsprings restoration project in Citrus County, Florida. Although the initial underwater survey yielded a sparse artifact count, hundreds of artifacts were recovered during the monitoring of commercial diver's as they removed substantial amounts of algae, detritus, and cultural materials from the springhead with 6-inch induction dredges. Diagnostic and rare artifacts include a Suwannee Paleoindian projectile point; a bone fishhook; an intact Pasco Plain bowl (Woodland aged); 17th Century Spanish majolica fragments; a hand-carved, radiocarbon-dated prehistoric wooden paddle; a large radiocarbon-dated prehistoric wooden fin effigy; and over 100 soda bottles dating from 1885 to present. The project is important not only for the cultural materials it produced, but for the lessons learned; the results of which will undoubtedly influence future compliance work in Florida springs. Many springs in Florida are slated for similar restorations.

[105] *Maritime Adaptations and Indian Ocean Trade in East Africa: The Role of Small Offshore Islands*

Decades of pioneering archaeological research have firmly established East Africa's offshore islands as important localities for understanding the region's pre-Swahili maritime adaptations and early Indian Ocean trade connections. While the importance of the sea and small offshore islands to the development of urbanized and mercantile Swahili societies long been recognized, the formative stages of island colonization – and in particular the processes by which migrating Iron Age groups essentially became 'maritime' – are still relatively poorly understood. Here we present an overview of recent fieldwork by Oxford's Sealinks Project in the Mafia and Zanzibar archipelagos, which aims to understand these early adaptations and situate them in a longer-term trajectory of island settlement and proto-Swahili cultural developments. We focus on the results of detailed zooarchaeological, archaeobotanical and material culture studies relating to early subsistence and trade on these islands to explore the changing significance of marine resources to the local economy. We discuss the implications of these maritime adaptations for the development of local and long-distance Indian Ocean trade networks and the coastal migration of early farming communities into southern Africa.

[216] *Ceramic Paste Distribution and Market Exchange in the Tlacolula Valley, Oaxaca, Mexico.*

Over four decades ago, economic anthropologists recognized the importance of marketplace exchanges in the contemporary Valley of Oaxaca, Mexico, but the historic roots of this region's exchange system were less clear. Was the Oaxaca market system a product of recent capitalism, Spanish Conquest, Aztec imperialism, or were underpinnings even deeper in the past? Here, we examine INAA studies of ceramic assemblages from two Classic-period (ca. A.D. 200-850) sites in the Tlacolula arm of the Valley of Oaxaca, in conjunction with the distribution of other commodities, to argue that the roots of this modern economic institution extend back to at least this period, well before an Aztec or European presence.

Fauvelle, Mikael (University of California, San Diego)

[32] *Calories, Canoes, and Cross-Channel Trade: Exploring the Efficiency of Maritime Subsistence Exchange*

The exchange of botanical subsistence resources such as nuts and seeds is well documented in ethnohistoric accounts of Chumash trade across the Santa Barbara Channel. But on what scale was such exchange carried out? Due to the perceived marginality of island environments, it has long been assumed that the need to import subsistence goods from the mainland to the islands was a

central instigator for cross-channel exchange. Recent research, however, has shown that the islands were characterized by more extensive terrestrial subsistence resources than previously understood. This paper will provide new experimentally determined caloric values for a number of important plant resources in southern California. Caloric values will be compared with canoe volumes in order to determine the caloric returns for cross-channel shipments. The resulting values will be compared with estimates for island populations with the goal of evaluating the efficiency of subsistence exchange in the channel area. Our results will provide important new data on several indigenous coastal plants and will have implications for the understanding of maritime exchange systems used by hunter-gatherers in island and coastal environments around the world.

[243] *Excavation of an Inundated Shell Midden: Methods and Preliminary Findings at a Classic Maya Saltwork*

The mangrove peat comprising the sea floor at the ancient Maya saltworks in Paynes Creek National Park, Belize, provides an ideal matrix for the preservation of wooden architecture. The acidic peat has preserved wood, charcoal, and botanicals at other inundated saltwork sites in the area. The unexpected discovery and subsequent excavation of an underwater shell midden at the Eleanor Betty Site in 2013 allowed for a greater comparison between the two matrices and their preservational properties. Although the peat matrix does not preserve bone, the calcium carbonate composition of the shell midden is suitable for such preservation. In this paper, we describe the excavation methods, screening, mapping, and preliminary results of this shallow submerged site. In addition, we address the wooden architecture and spatial distribution of the accompanying shell midden.

Fecher, Franziska (University of Bonn)

[100] *An Interactive Map of Honduran Archaeological Sites*

Honduran Archaeology has long focused on the investigation of Copan and the ancient Maya culture in the western part of the country. The non-Maya region has only been investigated intensively in the past 50 years, despite the fact that as a bridge between the cultures of Mesoamerica and South America Honduras offers an exciting area of investigation. Access to information about the non-Maya archaeology of Honduras is difficult, given that there are hardly any introductory summaries. In order to make this material more accessible, and to offer a new investigation tool, the MayaArch3D Project has developed a 2D Web-GIS for the documentation and analysis of archaeological sites in Honduras. While some interactive maps for Central American archaeology do already exist, none of these offers more than an overview function and none enables complex analysis. The MayaArch3D 2D Web-GIS facilitates GIS analysis and complex queries. Hence, the tool holds a great potential for educational purposes, for the documentation and administration of archaeological sites and also as an investigative tool to answer particular research questions. This user test case analyzes the spatio-temporal development of the southern frontier of the Maya region in Honduras.

[295] *Diversity of Wetland Form, Historical Ecology, and Human Use in the Maya Lowlands: The View from the Yalahau Wetlands*

Two major freshwater wetland systems of the eastern Maya Lowlands are the riverine-associated wetlands around the New and Hondo Rivers of northern Belize, and the wetlands of the Yalahau region of northern Quintana Roo, Mexico, which are found in karstic depressions associated with the Holbox fracture zone. Both of these wetland systems are linked directly to the freshwater aquifers of the respective regions. In northern Belize the nature and timing of ancient Maya manipulation of the wetlands has been a source of long-standing debate. It has been suggested that ancient Maya use of wetlands in northern Belize has been significantly impacted by changes in the water table resulting primarily from changes in sea level. Recent and ongoing research in the Yalahau region has documented widespread evidence for manipulation of the wetlands by the ancient Maya, as well as evidence from wetland sediment studies that indicate a highly dynamic hydrological history. Comparing the historical ecology of the two major wetland systems has implications for the trajectories of ancient settlement and economic change in the eastern Maya Lowlands.

[2] *Lauricocha v2.0: Ancient Highlanders Grant New Insights into the Precolumbian Population History of South America*

The Lauricocha caves in Peru were the first known evidence for an Early Holocene presence of humans in the high altitude Andes. However, critical examination of the excavation reports cast

doubts on the status and significance of Lauricocha in the archaeological record of South America. Here, we present a thorough revision of site data including new radiocarbon dates, as well as morphological, craniometric, and genome-wide genetic data obtained from the human remains found at the site. Our results not only challenge suggestions that Lauricocha was occupied no earlier than 7000 BP, but also prove the site to be a valuable archive with regards to the population history of the Andes and South America. We show that the earliest Paleoindians and later inhabitants of the high Andes shared the same genetic history despite pronounced variation in their cranial features. Our observations support the hypothesis of a single-wave expansion/colonization scenario for South America, in which both early and later precolumbian populations derived from a continuous, single source population.

[279] *The Kapoor Case: International Collaboration on Antiquities Provenance Research*

Manhattan antiquities dealer Subhash Kapoor faces trial in India as the alleged mastermind of an international idol smuggling network. A year-long investigation by researchers, journalists, art aficionados and law enforcement on three continents established the illicit origins for more than a dozen ancient objects allegedly trafficked by Kapoor. In September 2014, Australian museums returned two of those objects to India -- a 10th century Shiva Nataraja purchased by the National Gallery of Australia for \$5 million, and a 900-year old Ardhanarishvara sculpture purchased by the Art Gallery of New South Wales for \$300,000. More returns are expected in the coming months. The case provides a model for collaborative inter-disciplinary provenance research.

Felling, Danielle (University of Nevada, Reno)

[150] *Lithic Technological Organization at Last Supper Cave: Reconstructing Paleoindian Mobility and Landscape Use at an Upland Site in Northwestern Nevada*

Excavations at Last Supper Cave (LSC), Nevada by Tom Layton and Jonathan Davis in the early 1970s revealed an extensive record of occupation including a Paleoindian component recently re-dated to ~10,300 14C B.P. Despite the potential for the site to reveal information about Paleoindian lifeways in the Great Basin during the Terminal Pleistocene/Early Holocene (TP/EH), analysis of these early artifacts, including numerous Great Basin stemmed projectile points, tools, and debitage, was never completed. LSC overlooks Hell Creek in the High Rock Country of northwestern Nevada and is located ~20 km away and 350 m higher than the nearest pluvial basin that would have sustained a wetland during the Terminal Pleistocene. As a result, LSC represents a rare type of Paleoindian site in the Great Basin. Further research on the collection has the potential to reveal how groups operated away from wetland environments. Here, I present the final results of my analysis of lithic debitage and tools from LSC to reconstruct the lithic technological organization and settlement strategies of Paleoindians in the northern Great Basin.

[101] *Ancient Glass Studies from 1st-2nd Millennium A.D. Africa: What Have We learned and Where Are We Going*

The study of ancient glass in Africa has undergone resurgence in the past 10+ years, particularly with regards to the integration of new and varied analytical approaches. Glass from Roman,

Byzantine and Islamic Era contexts are increasingly undergoing scrutiny to explore modes of manufacture, access to raw materials, provenance of raw materials and finished glass goods, and the role that glass production and consumption played in those societies, to name a few. Advances in instrumental analytical techniques (e.g., LA-ICP-MS, MC-ICP-MS, etc.) have allowed for the generation of more accurate, precise and comprehensive elemental and isotopic composition data. These data are providing new means to examine issues of production, trade, and consumption patterns in Africa through time. This paper will present a “state of the research” for ancient glass studies in Africa to highlight important contributions to our understanding of this issue in Africa. Important new methodological approaches also will be discussed. The paper will conclude with a consideration of future directions in African glass studies.

[231] *La minería en la Cultura Chalchihuites.*

La minería fue un recurso económico importante para el desarrollo de la Cultura Chalchihuites. En este trabajo se realizará una revisión a la forma en que se pudo haber organizado esta tarea productiva desde una perspectiva económica política.

Ferguson, Jeffrey (University of Missouri) and James Allison (Brigham Young University)

[6] *Obsidian Provenance Studies of Sites in Northern Utah*

Previous studies of obsidian from archaeological sites in Utah Valley and the Salt Lake Valley have used relatively small samples to document temporal shifts in obsidian procurement, with southern sources (especially Black Rock) dominating Fremont assemblages, while most post-Fremont obsidian comes from the Malad source to the north. Our greatly expanded XRF analysis of almost 4,000 obsidian artifacts from sites in Utah and Salt Lake Valleys confirms the temporal change noted by earlier researchers, but also shows site- and source-specific patterns of obsidian use, as well as variation in the frequency of different obsidian sources in tools, debitage, and micro-debitage.

[239] *Fire Adds Richness to the Land: Ethnographic Research for the FHiRE Project*

One component of the multidisciplinary FHiRE project included ethnographic research with 50 members of four tribes. Specific historical and traditional information about fire ecology related to the occupation of Hemish ancestral sites in the Jemez Mountains was collected at the Pueblo of Jemez. More generalizing information about the role of fire in Southwestern lifeways was collected with research participants at the Hopi Tribe, Pueblo of Zuni, and White Mountain Apache Tribe. Our ethnographic research provides information about the traditional uses of fire in agriculture, grazing, and cultural practices. It also documents the personal experiences of many tribal members in fighting forest fires, and tribal research participants contributed information about native concepts of healthy and unhealthy forest structure. Although wildland fire plays a relatively minor role in tribal discourse and oral traditions, numerous references to fire in the remote past and “traditional times” focus on domestic, agricultural and hunting contexts. The choice of wood harvested for construction and fuel has implications for modeling fire behavior. Tribal research participants explained how there are both destructive and beneficial aspects of forest fires.

Ferguson, Tim

[415] *Human Ecology and the Economy: Illogical Responses to Resource Risk in Southern Nevada*

Research in the Virgin Branch Puebloan region indicates that during the middle Pueblo II Period there were strong socio-economic mechanisms linking the lowlands in southern Nevada to the uplands on the Arizona Strip. Ties between these areas are demonstrated by the presence of large

numbers of ceramics produced in the uplands that have been recovered from lowland sites. Traditional ecological and economic models suggest that these trade networks may have been a way to reduce risk by diversifying the resource base; however, by the end of the early Pueblo III Period the trade networks with the uplands had collapsed. Coincident with the collapse of these networks there was an increase in the production of Tusayan Virgin Series ceramics in the lowlands. Compositional analyses were undertaken to understand if Tusayan Virgin Series ceramics were being traded between southern Nevada and the St. George Basin during the Pueblo III period to counteract the loss of a diverse resource base after the collapse of the trade networks with the uplands. This study proposes that Tusayan Virgin Series ceramics were not traded between the two regions. This suggests that ecological models of the economy may not fit preconceived notions of logical responses.

[273] *Mugs of the Mesa and Old Chocolate: Evidence of Prehistoric Cacao Use in the Mesa Verde Region of the North American Southwest*

Undergraduate Anthropology and Chemistry students at the University of San Diego (USD) collaborated on the application of analytical chemistry to archaeological ceramics. USD curates 1000's of prehistoric Southwestern artifacts, all of which are available for student research. We examined some of the collections vessels for cacao, which is the raw form of chocolate. Patricia Crown and W. Jeffrey Hurst recently found cacao residue in cylinder jar fragments from Chaco Canyon. Crown's methodology was adapted for our project, using the university's mugs from the Mesa Verde region near Durango, Colorado. The chemical analysis of residues extracted from Pueblo II to Pueblo III period (A.D. 1100 to 1300) Mesa Verde mugs indicates the presence of theobromine, a chemical component of cacao. In all, 24 vessels were tested using liquid chromatography-mass spectrometry. Two mugs had positive indications for chocolate. Cacao is endemic to Mesoamerica and was used in ritual practice that made its way north with other exotica. The chemical results will be discussed along with an analysis of long distance trade networks as well as the morphological, iconographic and use-wear characteristic of each vessel.

[177] *Debating Early Urbanization in Temperate Europe: From Heuneburg to Bourges*

The genesis of large fortified central places is one of the most important phenomena in Later Prehistoric Europe. In Temperate Europe, the origins of urbanism have long been identified with the emergence of the Oppida of the 2nd-1st centuries B.C., considered to be the 'earliest cities north of the Alps'. However, large-scale research projects carried out over recent years have started to challenge this long-established view, to the point that nowadays it is possible to assert that the term 'urban' already applies to some of the so-called Fürstensitze or 'princely sites' of the 6th and 5th centuries B.C. These sites, among which names like the Heuneburg, Mont Lassois, Bourges, Hohenasperg, Glauberg or Závist stand out, stretch across an area from central France in the West to Bohemia in the East. They are testimony to a process of differentiation and hierarchization in the pattern of settlement that was at the same time both an expression and a catalyst for increasing social inequality, and saw the establishment of aristocratic, in some cases even monarchic forms of rule that cultivated close contacts with the Mediterranean world.

[74] *The Impact of the 8.2 kyr cal BP Event on Late Mesolithic Demography in the Central Mediterranean Region of Spain*

The central Mediterranean region of the Iberian Peninsula witnessed two major environmental processes affecting early and middle Holocene hunter-gatherers: rapid sea-level rise, with the consequent flooding of coastal plains; and the replacement of open-landscape by forest- taxa. In this context, much less is known regarding how the 8.2 kyr cal BP climatic event impacted Late Mesolithic human populations. Using multiple lines of archaeological and paleoenvironmental evidence, in this paper we investigate the effects of the 8.2 kyr cal BP event on human demography, subsistence, settlement distribution and socio-ecological interactions at local and regional scales.

New multi-proxy paleoenvironmental reconstructions on lake deposits and geologic studies on the continental shelf allow an appraisal of the changes produced by the 8.2 kyr cal BP event on hydrological systems and eustatic changes. In addition, we used an audited database of geo-referenced radiocarbon dates, transformed to occupation events, as a demographic proxy to compare relative population levels before, during and after the 8.2 kyr cal BP event.

The regional radiocarbon record suggests a chronological correlation between the reduction of Late Mesolithic sites and the 8.2 kyr cal BP event. However, the paleoenvironmental and archaeological results indicate differences when comparing local and regional scenarios.

Fernandini, Francesca (Stanford University)

[134] *Change and Continuity in Ceramic Production at Cerro de Oro, Cañete*

Cerro de Oro, a 150ha settlement located on the lower Cañete valley presents a long term occupation that spans from the Early Intermediate Period through Colonial times (0-1600 A.D.). Research performed by the Cerro de Oro Archaeological Project at the site during 2012-2013 has focused on the Early Intermediate-Middle Horizon occupation (500-1000 A.D.) yielding important information regarding the nature of the settlement, the sequence of its construction and use, as well as its possible relations and interactions with nearby settlements both within and outside of the Cañete valley. Following this line, this study will present the result of XRF and SEM analysis performed on ceramics excavated from well controlled contexts within the site. These analyses have been oriented towards understanding how the production of ceramics, both in terms of paste and pigment use, changes throughout time. In turn, these results are contrasted with the detailed study of the sequence of change presented by iconographic motives in these ceramics.

[267] *The Object Is the Thing: Developing a Framework for Understanding the Culture of Looting*

Objects are central to looting. The illegally excavated object has a relationship to the past person who produced it; the landscape that held it; the person who clandestinely excavates it; and the people who sell and buy it. To date, in the United States, there are no systematic multi-State data assemblages that can be used to analyze the culture and behavior of looters. Studies of dealers and collectors examine object relationships after the looting has occurred. Understanding the connection between the looter and the object happens in the dirt. I propose a framework for assembling multi-State information about the relationship between looters and objects at the site where they engage with one another. The information can be collected from archaeologists, NPS professionals, conservationists, recreational hikers and campers, and assembled in a computer file for analysis. Relevant information might include GPS coordinates; remaining artifactual remnants; culture and phase designations; environmental surroundings; and a photograph of the style of the excavation/backfill. Assembled on a multi-State scale, aggregate information can be used to address such questions as: do successful looters sample the landscape systematically? Are there trends and "fashions" in the kinds of sites that are targeted in a given time-frame?

[190] *New Evidence for Complex Occupation Patterns at Dmanisi, a 1.85-1.76 Ma Site in the Georgian Caucasus*

Recent excavations and geoarchaeological testing at Dmanisi have revealed a large and complex site structure. Up to 7 meters of stratified deposits, with nine artifact and fossil-bearing strata, are now documented over an area of at least 35,000 square meters on the Dmanisi promontory. These new data indicate that the site was visited repeatedly for a considerable period, indicating a well-established pattern of group cohesion, mobility and planning. These patterns are rarely evidenced in the archaeological record of earliest Homo, and may reflect adaptations to temperate seasonality by the first Eurasians that are characteristic of much later populations. Geomorphic-soils records indicate that differential densities of artifacts and faunas, both within and between strata, mainly register primary accumulation with minimal post-depositional movement or weathering. From this perspective, Dmanisi appears to have multiple "site types" as traditionally recognized in east Africa. Although Dmanisi's variable hominin fossils exhibit many primitive characteristics, including small brains and stature, this geoarchaeological record provides evidence that those populations survived and thrived in Eurasia the old fashioned way: as cohesive, cooperative social groups with well-defined subsistence strategies. In this sense, the earliest members of our genus may have been less "primitive" than traditionally assumed.

Ferris, Neal (University of Western Ontario)

[13] *Archaeological Heritage as State Nuisance: Object Lessons from Accidental Burial*

Discoveries

State control of archaeology has tended to originate from the agendas of archaeologists - altruistic, capitalistic, and entirely self-serving. This has framed practice as aiding and abetting State processes and societal differentials that play out over land and resource consumption. Despite this, a chronic phenomenon of this process is the need to resolve unmarked burial discoveries. These occurrences are typically achieved within vague regulatory frameworks, and often lack direct State intervention, reflecting their desire to actively avoid "owning" the issue or outcome. Indeed, from the State's perspective, burials are idiosyncratic, chronic nuisances. More by consequence than by design, then, commercial archaeologists finding themselves in the middle of such occurrences are expected to be less experts managing "their" data and more service providers mediating outcomes between the primary stakeholders: landowners and representatives for the deceased. This in turn enables resolutions to be negotiated below and beyond State expectations, and as such become object lessons at redefining archaeological identities and archaeology's relationship with the State. The past and present application of the Ontario Cemeteries Act to unmarked Indigenous and Euro-Canadian burial localities illustrates this critical dimension of chronic nuisance heritage management leading to reimagined roles and relevances for archaeology in society.

[225] *Vesicular Basalt Provenance Analysis: A Collaborative Research Effort among Southern Arizona Native American Communities and Archaeologists*

Vesicular basalt was a preferred material for groundstone manufacture in central Arizona, and identification of source areas for raw materials will provide important information regarding prehistoric and historic exchange and interaction patterns in the region. As part of archaeological research under the Pima-Maricopa Irrigation Project, the Gila River Indian Community's Cultural Resource Management Program has recently devoted considerable effort to the creation of a vesicular basalt geochemical database that is essential for conducting geographic provenance analyses of groundstone artifacts from sites in the Phoenix Basin. The development of this database has required collaboration among several Native American communities, federal agencies, and public universities. Additionally, community members were trained in cutting-edge archaeological techniques (portable XRF) as part of the research. This presentation highlights some of the benefits of collaborative investigations among archaeologists and Native American communities, and summarizes the initial results and importance of the vesicular basalt research program.

[99] *Digging without Dirt: An Excavation Simulation*

Efforts to simulate archaeological excavations typically include the seeding of objects in plastic tubs, sandboxes, and even cakes. Although these activities may spark excitement in students at the discovery of artifacts, they are often simple caricatures of the methods employed in actual archaeological investigations. Far worse, this treasure-hunting approach tends to reinforce the quest for "things", while also undermining key aspects of excavation that educators hope to instill, namely, the importance of context and provenience in making sense of these same objects. Simply eliminating the dirt mitigates much of the problem by directing student interest towards observing, recording, and interpreting different archaeological materials. Instead a seeded sand box, the highlighted activity utilizes craft paper units, unprovenienced artifacts, and painted features to simulate modern, historic, and prehistoric residential deposits. While highly effective in introducing students to in basic artifact recovery and interpretation, this approach is also highly flexible and can be easily modified to suit different age groups, time constraints, and a variety of course goals.

Fiedel, Stuart (Louis Berger Group)

[87] *The Spore Conundrum: Does a Dung Fungus Decline Signal Humans' Arrival in the Eastern US?*

In pond sediments in Ohio, Indiana, and New York, *Sporormiella* (dung-fungus) spore declines at ca. 14,000 cal BP are followed first by charcoal particle peaks, and then dramatic shifts in tree pollen percentages. This sequence has been interpreted as the outcome of initial human predation on megafauna. New dates push "classic" Clovis back to ca. 13,500 cal BP, but this still leaves a 500-yr gap between the ecological signals and the earliest Paleoindian artifacts. How can this gap be explained?

Fiehring, Benno (Instituto Nacional de Antropología e Historia) and Guillermo Cordova Tello

[217] *The Political Organization of the Tampaón River Region, San Luis Potosí, Mexico*

During the past eighty years, a succession of investigators has carried out reconnaissance surveys in the Huastec region of San Luis Potosí, and has recorded a lot of prehispanic settlements. Based on a focus on regional aspects and incorporating a survey program, the archaeological project "Origin and Development of the Urban Landscape of Tamtoc, S.L.P.," aims to understand the character and scale of the social, economic and political integration of the society in question, which empowered itself of and transformed its territory diachronically, as well as it pretends to explain the social relations between individuals and groups, and different modes of the exercise of power we suppose. Pretending to understand the sociopolitical organization, beside archaeological excavations we realize a systematic survey in the region, which will allow us to comprehend the ancient settlement patterns. The preliminary results obtained during the first research seasons give us a chance to assume that, at least during the Postclassic period, the urban society of Tamtoc had been able to integrate a large population and produce a settlement pattern similar to the one proposed by the Segmentary State Model, political organization theory of a society composed by central and peripheral entities.

[296] *A View on Late Pleistocene Megafauna Extinction in Sahul: An Emu Hunt Revisited*

The extinction of megafauna across the globe generates lively and sometimes heated discussion on timing and cause. In the case of Sahul (Pleistocene Australia-New Guinea), the debate is divided into two distinct camps – those that hold a firm belief that humans were responsible, and those that consider the current datasets too thin to provide any definitive answer. These big picture issues are reliant on the acquisition of data from individual sites and data on megafauna comes predominantly from cave sites, as well as rockshelters and fluvial deposits where material is rarely identified in a primary context. Yet, as Jim O'Connell so clearly articulates in the Emu Hunt paper, the likely location for interactions of humans and these large beasts are open sites such as ephemeral waterholes. Currently there is only one site in Australia where a record of megafauna and humans co-occurs and it falls into this category. Cuddie Springs is an ephemeral waterhole in the modern semi-arid southeast of Sahul, and was part of the arid zone when the site was formed. Here I will revisit the Cuddie Springs evidence to consider the likely role, if any, of people in the extinction of the Sahul megafauna suite.

Field Murray, Wendi (State Historical Society of North Dakota)

[230] *Revisiting Like-A-Fishhook: Coalescence and Community on the Missouri River, North Dakota*

Critical attention to the concept of "community" in archaeological research over the last decade has recast communities from homogeneous groups of people living at a site to emergent networks of social interaction that both derive from and are reproduced by a sense of common interest and affiliation (Wernke 2007). Coalescent communities are in a constant state of becoming, as residents

must continuously negotiate aspects of their identities in ways that mitigate conflict. Historical records describing the coalescence of the Mandan, Hidatsa, and Arikara people at Like-A-Fishhook village in North Dakota during the nineteenth century often refer to it as the "uniting" of these tribes, implying a sense of community that has never been critically examined. Integrating archaeological, archival, and ethnographic data, this paper problematizes the essentialized Like-A-Fishhook "community" construct that permeates the written record. I resituate the village as an "imagined community" (Anderson 1991), in which the threat of a common enemy (the Dakota), the shared experience of epidemic devastation, and the imposition of a singular "tribal" identity by the U.S. government created an ideological-historical (rather than a socio-spatial) basis for long-term co-residence.

[152] *Production and Distribution of Fishing Artifacts on Mussel Shells (Choromytilus chorus) during the Middle Holocene on the coast of Taltal, Atacama Desert, Chile*

Two Middle Holocene residential camps (7500 to 45000 years cal B.P.) on the Atacama Desert Coast show differences in their mussel shell fishing tools (MSFT) assemblages. One archaeological site has a high abundance of fishhooks and mussel debris, together with the absence of fishing weights. The other site, 50 kilometers north, has low abundance of fishhooks and mussel debris, and the presence of fishing weights. The differences observed in the MSFT assemblages of these two sites, suggest the emphasis of differential activities towards the production of mainly fishhooks at one site and fishing weights at the other. Are these differences related to coastal conditions and resource availability, fishing strategies or socio-economic contexts? Spatial variability of upwelling activity and its consequence on fish community and productivity, together with increasing maritime subsistence, specialized technology and social complexity may have played a role. The Middle Holocene is a time period when maritime economies flourished all around the world. The appearance of fishing tools such as hooks and canoes have been linked to processes of social transformation and complexity and the coast of the Atacama Desert in Chile does not seem to be an exception.

[233] *Modeling Climate Impacts and Human Predation on Marine Populations Using Prey Age Profiles: An Agent Based Model*

Archaeological assemblages provide data on marine prey age that can inform researchers about the influence of human predation and climate related habitat change. While human predation may generally lead to a reduced mean prey age, climate related impacts may produce different age profile patterns. In this paper we model the impact of both human foraging and climate change on prey age using an agent based model. We assess our model results using zooarchaeological marine assemblages from Tokelau.

Filimoehala, Darby (International Archaeological Research Institute, Inc.)

[233] *Agent Based Modeling (ABM) Approaches to Understanding Prehistoric Forager Ecology in Tokelau*

Exploring the complex relationship between humans and the environment is essential for

understanding important mechanisms of cultural change. The last decade has given rise to advances in zooarchaeological research and computer-based modeling that provide tools to examine the links between environmental variability and human cultures. This paper draws on assumptions derived from evolutionary ecology using Agent Based Models (AMB), to test predictions regarding foraging and marine exploitation in Tokelau, a group of atolls in the South Pacific. At present, marine resource use and foraging patterns in pre-Contact Tokelau are poorly understood. Agent based models will help to more adequately inform our interpretations of the archaeological record.

[342] *Intra- and Inter-Site Geometrical High-Resolution Analyses of Deep Natufian Bedrock Mortars*

Bedrock features such as mortars and cupmarks are known in the southern Levant at least from the late 1920's. Many were dated to the Natufian and the Pre-Pottery Neolithic A periods (15,000-10,500 cal BP). Likely, the appearance of large and diverse bedrock feature assemblages, reflecting a variety of functions, has played an integral role in the earliest transition from hunting-gathering to food producing economies. So far, research was limited due to the lack of precise documentation of these complex features. Recent advances in photogrammetry provide new methods for high-resolution three-dimensional documentation even of deep narrow shafts. We have recently published the first relevant protocol, where the characterization of each feature is based on a high-resolution 3D model and includes its dimensions, volume, shape of the rim and the shaft, symmetry and regularity. Here, we extend our analysis and use our characterization method to analyze and compare deep mortars from Natufian sites in two ecological settings: Raqefet Cave (Mt. Carmel) and Rosh Zin (Negev Highland). Our goals are to characterize several mortars in each site, and then conduct intra- and inter-site comparisons. This is the first attempt of its kind, and results are assessed against the Natufian economic and social background.

Filini, Agapi (El Colegio de Michoacan)

[129] *Death, Ritual, and Social Space in the Cuitzeo Basin, Michoacán, México*

The Cuitzeo Basin in Northern Michoacán was a key area at the local and supralocal levels for its rich lacustrine resources, and its geographic position that facilitated interaction between the Central Highlands and West Mexico. Mortuary rites were fundamental for the social reproduction of regional elites. The continuous occupation of some sites for more than a thousand years underscores the ritual and religious significance for the lacustrine societies. The comparative study of both biological and social death, and their associated material culture and rites, reveals that the use of ritual space was highly symbolic and reflected processes of culture change and sociopolitical complexity. Through references to specific archaeological sites it is suggested that ritual activities defined a specific social space which formed part of the lacustrine way of life.

Fillios, Melanie (The University of Sydney)

[28] *Do Dingoes Hold the Key to Understanding Human Behavioral Change in Ancient Australia?*

Archaeological evidence suggests dingos were brought to Australia sometime during the mid-Holocene (ca. 5,000-3,500 years ago). Their introduction coincides with significant changes in human behavior, specifically in technology, settlement patterns and diet. While their relationship with Aboriginal people is commonly held to have been commensal, this interesting amalgamation of changes certainly begs the question of whether there may be a dingo 'signature' in the archaeological record. Zooarchaeological data from numerous sites across Australia suggests there was a shift in human diet around this time, with Aboriginal people favoring smaller animals in place of larger kangaroos. Previously, we drew on modern ecological studies of dingoes and postulated that this change could be a result of human-dingo competition, whereby dingoes suppress kangaroo populations, thereby decreasing human encounter rates, and resulting in the exploitation of smaller

bodied species. However, what if hunting with dingoes actually just increased the encounter rate with smaller bodied prey, rendering hunting of larger macropods unnecessary? This paper explores both possible explanations using a multi-disciplinary approach combining ethnography, zooarchaeology and ecology to understand early dingo-human relationships as a pivotal factor in changing human subsistence strategies.

Filloy, Laura (Museo Nacional de Antropología) and María Olvido Moreno Guzmán (Instituto de Investigaciones Estéticas-UNAM)

[194] *The Chapultepec Castle Chimalli: A Habsburg-Repatriated Mexica Feline-Hide Shield*

This paper examines a well-known Mexica chimalli (shield), possibly from the sixteenth century, currently found among the holdings of the National Museum of History, Chapultepec Castle, Mexico City. The importance of this study lies in three fundamental aspects: 1) very few Mexica shields have survived; 2) the examples found outside of Mexico have not been fully analyzed; and 3) the chimalli now residing at Chapultepec Castle was originally taken from the Basin of Mexico to Europe during the sixteenth century and subsequently returned to Mexico in the collection of objects brought by the Habsburg emperor Maximilian in 1866 for his new Imperial Museum. Data obtained in our analysis of the shield will be compared with information contained in the historical sources. The various materials utilized in the shield's design will also be discussed, along with a final section tracing the ways and means, primarily tributary and commercial, by which its constituent raw materials arrived in Tenochtitlan, the Mexica capital.

Fincham, Derek (South Texas College of Law)

[279] *The Ka Nefer Nefer and Federal Intervention in the Illicit Antiquities Trade*

The Federal Government has taken a more active approach to the illicit trade in looted and stolen antiquities. In some cases this Federal role has produced increased awareness and produced some notable seizures and returns. However the Federal intervention in a dispute between Egypt and the St. Louis Art Museum over an ancient Egyptian mask known as the Ka Nefer Nefer offers a cautionary tale. The Museum purchased the mask in 1998, after a cursory examination of the object's history. Egypt called for its return in 2006 when it became aware of its location in the St. Louis collection. At the last few days before the expiration of a statute of limitations, in 2011 the United States attorney for the Eastern District of Missouri initiated a civil forfeiture action against the mask, seeking to intervene on Egypt's behalf. The result in the case for the federal government provides an unfortunate but helpful example of how the federal government should not be intervening into disputes over the illicit antiquities trade.

Finkelstein, Aviva (SFU/Kleanza Consulting)

[9] *Understanding the Health of the People of Pender Island (B.C.) Through Portable X-ray Fluorescence of Human Remains*

Bioarchaeology has undergone some amazing advancements since the 1970s. Due to ancient DNA and isotopic analysis, we are now able to understand health, ancestry, and diet, among other topics. Unfortunately, these methods of investigation are largely inaccessible to many descendant communities due to prohibitive costs and the destructive nature of many forms of analyses on human remains.

Archaeologists are beginning to respond to these concerns, by developing non-destructive analytical tools. More recently, archaeologists have made use of portable x-ray fluorescence (pXRF) to analyze the chemical composition of lithics, ceramics, and the geochemistry of living floors. However, its applicability as a bioarchaeological analytical tool has yet to be determined.

This study applies pXRF to an assemblage of human remains from Pender Island, B.C. with the intent of investigating the application of pXRF as a bioarchaeological tool. If successful, I will employ pXRF to study the presence of health issues among the human remains recovered from Pender Island, using the information collected to expand our understanding of the health status of the people of Pender Island and of the applicability of the instrument as a bioarchaeological tool.

Finlayson, Bill (Council for British Research in the Levant)

[210] *Community and Agency in the Early Neolithic of SW Asia*

The accepted Neolithic narrative involves increasingly sedentary behavior within a context of villages composed of houses. Yet, although the novel way of life represented is given center stage, there is little discussion of the nature of the communities that were developing, other than passing references to nuclear families, ancestor cults and the emergence of lineages and households. There is still less reference to human agency, with Neolithic people being buffeted around by a number of big factors, such as climate change or demographic pressure. More recently a rise in symbolic behavior or even a cognitive revolution have become perceived as prime movers, although both are invoked as a response to life in larger communities. To understand the role of human agency in these processes, we have to consider the nature of society, how communities were constructed, and how agency operated. We know of no recent autochthonous transition from hunting and gathering to farming: the early Neolithic of SW Asia is essentially non-analogous. We have to study society through architecture and settlement configuration. Recent work has indicated that individual identity was less important than community identity, and that group agency may be an appropriate starting point for our study.

Finley, Judson [6] see Jones, Hillary

Finley, Judson (Utah State University) and Matthew Rowe (Indiana University-Purdue University at Indianapolis)**[35] *Rockshelters as Late Quaternary Geoarchaeological Records in the Bighorn Mountains, Wyoming***

Rockshelters in Wyoming's Bighorn Mountains have a long history of archaeological research resulting in a rich dataset of geological and paleoecological information that provides a context for the region's 12,000 year cultural record. In this study we focus on three deeply stratified and well-dated rockshelters to meet three primary objectives. First, we apply Bayesian statistics to each record to create an age model that contextualizes stratigraphic variability and contrasts autogenic and allogenic sedimentation processes at each site. Second, we correlate the stratigraphic record with a recently published regional temperature and precipitation record that provides a paleoclimatic reconstruction at 50-year intervals spanning the last 13,500 cal years BP. Third, we propose a biogeomorphic process-response model that examines complex linkages between Late Quaternary climatic variability, ecological response, and human foraging behavior. The results of this study complement recent archaeological reconstructions in the Bighorn Basin that demonstrate distinct, long-term relationship between climate conditions and human population densities in this part of the semi-arid Rocky Mountain west.

Fino, Nazih (William Self Associates)**[416] *GIS Model Development for Historic Census Data in San Francisco***

This article demonstrates how to build historical data sets from the 1800-1900 San Francisco census/city directories, using GIS model to enhance the meaning of the census data and add a micro-depth, and to enable researchers to depict and analyze the spatial pattern of their study. The raw data of the census/city directories is organized according to addresses (parcels). The historic census GIS model integrates the city parcels to the census/city directories to spatially process and map the census data as entered and to aggregate data as needed.

[101] *Some Suggestions for Archaeologists Who Have Glass at Their Site*

What are some of the potential pitfalls archaeologists can avoid when dealing with glass at their sites? First and foremost, archaeologists need to recognize the importance of glass as an artifact class and what it can do for them if examined and interpreted competently. This presentation will focus on glass from Old World sites, especially the Mediterranean region, but many of the concerns are universal in nature and can be applied to any site with glass. Drawing upon the experience of many glass specialists, best and worst case scenarios will be described.

Fisher, Christopher [21] see Urquhart, Kyle

Fisher, Philip (Washington State University) and Luke Premo**[84] *A Spatially Explicit Model of Lithic Raw Material Composition in Archaeological Assemblages***

Lithic studies have benefited from the increased availability of raw material provenience data. The ability to determine the source locations of obsidian artifacts through X-ray fluorescence, for example, provides archaeologists with another line of evidence for addressing questions concerning mobility, settlement patterns, trade, adaptations to environmental conditions, and subsistence strategies. Brantingham (2003, 2006) previously demonstrated the importance of “null” model expectations in interpreting raw material provenience data. Here, we present a spatially explicit model that provides “null” expectations of raw material composition in assemblages across a landscape for a given set of raw material source locations and simple assumptions about forager mobility and artifact deposition rates. We combine a landscape archaeological approach with simulation experiments to explore how different assumptions about forager mobility, raw material quality, and raw material procurement affect the relative frequencies of raw materials in assemblages. Although we focus on the results of a simple abstract model in this paper, the ultimate goal of the study is to develop a tool that can be used to produce “null” expectations of raw material composition in empirical archaeological assemblages given the locations of the actual raw material sources of a region.

Fisher, Jacob (California State University, Sacramento)**[127] *Patch Choice Model Predictions for Jackrabbit Processing at Antelope Cave, Arizona***

Zooarchaeological research conducted under the conceptual realm of behavioral ecology has generally focused on the decision-making processes made during and immediately after hunting activities, at the cost of studies that explicitly attempt to predict culinary processing according to ecological or social conditions. It is critical that archaeologists develop tools for predicting and identifying culinary processing methods if our goal is to fully understand prehistoric foraging decisions. Since an individual animal is a clumped resource, a patch-choice model may be used to determine the amount of time a processor should spend on extracting nutritional benefits through cooking. The predictions from the patch choice model are tested using the faunal assemblage from Antelope Cave, northwestern Arizona. The assemblage is strongly dominated by jackrabbits with a high level of preservation that allowed for the building of inferences regarding acquisition, butchering, cooking, and consumption activities. As predicted by the patch choice model, the occupants of the site were maximizing the extraction of nutritional benefits from jackrabbits during a period of relatively poor environmental conditions.

Fisher, Lynn (Univ of Illinois Springfield)**[223] *Discussant*****Fisher, Chelsea (University of Michigan)****[249] *Water Management and City Founding at Yaxuná, Yucatán***

Like many other sites in the northern Maya lowlands, Yaxuná and its environs incorporate a number of cenotes (natural pits in the limestone bedrock that expose underlying groundwater) into the built environment. Interestingly, all but one of these permanent water sources lie beyond the limits of the site's public and residential core. Residents of the ancient city compensated for this, at least on a

seasonal basis, by constructing an aguada (a natural, or in this case human-modified, pond) in the site center. How did water access factor into the initial layout of settlement and construction of public/ceremonial buildings at Yaxuná? Using data from surface collection conducted in 2014, this poster will address how some of the earliest urban planning decisions incorporate water and other natural resources during the Formative period at Yaxuná. This approach will stimulate further discussion on the specific nature of Maya cities and on the variability of ancient urbanism more generally.

Fisher, Erich (Arizona State University)

[356] *The P5 Project Archaeological Reconnaissance along the Pondoland Coast, South Africa*
South African sea caves preserve evidence for early modern humans' longstanding interest in coastal resources. However, changes in coastlines location throughout the Pleistocene prevented the development of long-term and continuous records of coastal foraging and there are still many outstanding questions about when, where, and how coastal foraging developed. Pondoland (Eastern Cape Province) is one of the few places where we may be able to fill in these gaps. An exceptionally narrow continental shelf provides a unique opportunity to study coastal occupation and foraging in an area where coastline changes may have had negligible impacts on hunter-gatherer foraging patterns throughout the Pleistocene. Here, we summarize our results of a survey of the Pondoland coast that described >20 near-coastal rock shelters and open-air sites revealing occupation from the Early Stone Age onwards. We also describe the first direct ages of the coastal red sands that contain Acheulian and early Middle Stone Age stone tools. These OSL ages show that humans have inhabited Pondoland for >300,000 years, predating the currently-known origins of the modern human lineage and systematic coastal foraging. Pondoland, therefore, is anticipated to be a productive area for discovering long-term and continuous records of coastal occupation and intertidal resource use.

[397] *Identifying and Applying a "Canopy Effect" as a Marker for Deforestation: Stable Isotope Analysis of Small Artiodactyl and Rodent Fauna from Hunter-Gatherer Sites in Central Africa*

Applying stable carbon isotopic analyses to discern anthropogenic and natural deforestation events is both useful and important to current deforestation and landscape modification research. The goal of this project is to identify a shift in $\delta^{13}\text{C}$ content of mammalian teeth caused by the thinning of canopied forests using the "canopy effect" hypothesis. This pilot study tests the merits of the canopy effect hypothesis as applied to deforestation signatures using two extant village sites on the edge of the Central African Republic's N'Gotto Forest Reserve, which each have different deforestation histories and differing levels of canopy cover. The two species of fauna, giant pouched rats (*Cricetomys gambianus*), and blue duikers (*Philantomba monticola*), chosen for this pilot study represent commonly and similarly hunted genera, thus allowing for widespread application of this method. Future studies will encompass multiple varieties of forested environments (e.g., tropical, island, temperate, etc.), to test the limits of this hypothesis and its applications.

Fishman, Susannah (University of Pennsylvania)

[214] *Pots and Production: The Secret Agents of the Urartian Empire*

In archaeological analyses of empire, certain aspects of material culture, such as specific architecture, metal work, and ceramic styles are often interpreted as diagnostic of imperial presence, the corporeal residue of political change. But these materials must be understood as agents of change working in concert with the people whose lives shift with the political reality. Elite ceramics are an essential component of the Urartian "State Assemblage," the material signature of the first empire in the northwestern highlands (800-600 B.C.) of the Near East. This paper will explore how the selection and rejection of Urartian ceramic elements in Oğlanqala, Azerbaijan, an administrative center on the periphery of Urartu, instigated changes in local production and exchange. Petrographic analysis demonstrates that new styles required new methods, which in turn required shifts in the organization of production and exchange. The limited adoption of Urartian ceramics does not simply reflect imperial affiliation, aspiration, or mimicry, but performs an important role in technological shifts that have implications for local practice and identity. Most of the ceramics mediating these changes do not appear typically Urartian, but demonstrate the creative ways that the inhabitants of Oğlanqala employed technology to negotiate their position in the Urartian network.

[53] *Geochemical and Physical Characterization of Lithic Raw Materials in the Olduvai Basin, Tanzania*

The study of raw materials has traditionally been deeply embedded in analyses of the Early Stone Age, and the impact of source rock characteristics on early human ranging behavior and technological variation is now widely acknowledged. Olduvai Gorge, Tanzania, apart from being one of the most well-known paleoanthropological sites in the world, is also home to a great diversity of potential sources for the production of stone tools. While the lithology and mineralogy of these sources have been well described, quantitative data on inter- and intra-source geochemical and physical characteristics are still rare, which makes it difficult to rigorously test models of early human home ranges and raw material selectivity. This project reports preliminary quantitative studies of variation in the geochemical (via portable x-ray fluorescence) and physical (via standard engineering tools) characteristics of primary and secondary rock sources that presumably served as important supplies of toolstone for Early Pleistocene hominins at Olduvai Gorge

[204] *A Novel Method of Stature Estimation for Fragmentary Femora*

Stature estimation formulae for native populations in North America have historically been problematic, utilizing incorrect reference samples, for example; however recent research has allowed for the creation of more precise formula for evaluation of adult remains. Incomplete bones, however, can hinder stature estimation. There are a number of methods which can provide estimates of the overall length of the bone, or of stature, based on segments of a bone. A method that uses a simple to collect measurement based on easy to identify skeletal markers, designated as Upper Epicondylar Length, was initially tested on skeletal remains in Africa. It was subsequently tested on modern populations in the United States and continues to show moderately high correlations with both femur length and stature. This research, which is an extension of the work completed in the United States on modern individuals, reflects the first stage of a larger project which the authors hope will be a useful tool for skeletal research in archaeology. The results herein will include data collected at the University of Wyoming Human Remains Repository.

Fitzsimmons, James

[244] *Territorial Boundaries and the Northwestern Peten: The View from Jaguar Hill*

What actually constitutes Classic Maya political units? One way to address this question would be to examine ancient Maya conceptions of territory. Certainly, many major Maya sites had emblem glyphs, and these did provide—for those who could read—the sense of a geographic place controlled by a ‘holy lord.’ The real issue for understanding territory, however, is not an emblem glyph but what a Maya kingdom was to the people within it; how territorial boundaries were perceived by different socioeconomic strata, or whether or not clear boundaries were even in effect, are things that an emblem glyph simply cannot tell us. In exploring the situation at the archaeological site of Zapote Bobal, Guatemala (ancient Hiix Witz, or ‘Jaguar Hill’), this paper argues that territorial boundaries are largely dependent upon authority. That is to say, if and where boundaries exist, they exist only because people believe in them. It need not be everyone; boundaries are ultimately enforced by those who have respect for them. Ultimately, then, it is the authority of the belief in the territorial boundary that sustains it and, arguably, the polity.

[343] *Access, Accumulation, and Action: The Relationship between Architectural and Depositional Patterns at Homol'ovi I*

Throughout its occupation, Homol'ovi I, a Pueblo IV site in northeastern Arizona, underwent continuous alteration reflecting the movement of groups both internally and externally. The constant attention to rebuilding, redirecting, and resurfacing rooms, and the meticulous patterning of depositional material within structures indicate a continued endeavor to reform the built environment to better reflect the identities, needs, and memories of the current residents. In order to analyze the relationship between occupied and closed space at the site, a theoretical and methodological framework, social syntax, was developed. This involved the combination of multiple theories to track shifts through space and time in architectural access and closure activities involving the filling of structures with sediment and artifacts. Specifically, social syntax combines tenets of spatial syntax, practice theory, behavioral archaeology, and social memory to address the negotiated use of space through time. In this paper, three room blocks from Homol'ovi I are analyzed to discuss the complex relationships within the site and their impact on the use of space. In particular, the patterning of architectural and depositional choices is examined to better understand identity as it pertains to power dynamics across the site.

[6] *Decisions in the Desert*

This is a study of stone tool raw material procurement utilizing archaeological sites located in and around the Sheeprock Mountains in north-central Utah. In an effort to apply Metcalfe's and Barlow's "Field Processing Model" (1992) to prehistoric lithic raw material procurement, the researcher collected culturally deposited obsidian from archaeological sites in and around the Sheeprock Mountains. Over the course of three field sessions from 2011-2013, 250 samples of obsidian lithic debitage were collected to ascertain the samples' geological sources. It is anticipated that the volume of lithic debitage found on the sites will be consistent with expectations set forth in the Field Processing Model. The model will be supported if the geological obsidian sources nearest to the archaeological sites are represented by a higher volume of lithic pieces of non-utility or low utility versus geological sources that are significantly further away from the archaeological sites that have been sampled.

Fletcher, Roland (University of Sydney)

[36] *Difference, Non-correspondence and the Material Contexts of Sociality*

Human beings use three signaling systems, words, actions and material which differ in their replication rates, the degree to which the signals persist and their magnitude. Speech replicates rapidly and transmits a signal over a small distance that last only briefly. Action in the form of positioning and gestures replicates more slowly and can carry its signal for somewhat longer. Material by contrast is replicated more slowly, sometimes very slowly. Material signals, such as the dimensions of buildings, can also be very durable and massive. An event may be expressed in all three kinds of signals but each records a different aspect and hence a complementary difference. In addition, versions of speech can be recorded materially. Several profound operational outcomes derive from the differing replication rates, durability and magnitude. Because copying error is a function of replication rate, changes cumulates in the various signal systems differentially and they cannot therefore assuredly remain in synchrony with each other. Differing physical durability creates differing degrees of inertia in cultural phenomena leading to varying degrees to which sociality can manipulate or change material features, such as infrastructure. Signal non-correspondence and the risks of operational dissonance are therefore inherent to cultural evolution.

[388] *Towards a Historical Archaeology of Heiau: Hawaiian Traditions, Colonialism, and Religious Transformation in the Recent Past*

Hawai'i occupies a somewhat unique position as one of two Polynesian archipelagos thought to have been the location of "primary" or "archaic" states in the time before European contact (the other possible example being Tonga). Hawaiian people created an elaborate ritual hierarchy that accompanied the emergence of state religion, which was associated with the construction of monumental stone temple complexes known as heiau. Heiau have long been a staple of archaeological investigation in the islands, combining physical evidence, local informants, and oral traditions written down in the 19th century to identify and interpret these sites. It is generally assumed that after the abolition of kapu (the traditional religious system) in 1819, and the arrival of missionaries in 1820, indigenous Hawaiian religion declined and eventually disappeared. Archaeological and ethnohistoric evidence suggests that this was simply not the case, and we argue for a re-evaluation of Hawaiian religious practices, specifically surrounding heiau, through the 19th century and into the present.

[152] *Effect of Past Ecological and Oceanographic Variability on Shellfish Harvesting and Suitability of Coastal Locations. A Case Study from two Late Holocene (2200-500 cal B.P.) Sites on Santa Cruz Island, California*

The islands off California have long been recognized for their predictable and abundant shellfish resources, which provided a wealth of food for ancient people. Although fluctuations in the marine environment through time affected resource availability periodically (for example El Niño Southern Oscillation), the effects were variable on a local scale, resulting in local marine microclimates. California mussel (*M. californianus*) is the most abundant shellfish species in the archaeological sites along the California coast. Isotopic analysis ($\delta^{18}\text{O}$) on archaeological mussel shells was used to reconstruct local sea surface temperature (SST) through the occupation of two Late Holocene (2200-500 cal B.P.) sites on the south and western coast of Santa Cruz Island. Compared with regional paleoceanographic SST records and modern long-term mean SST values, local SST sequences show variable microclimates through time, influencing marine productivity and settlement decisions.

Local variability in upwelling patterns provides important insights to interpret stable isotope records obtained from archaeological sites around the Channel Islands. As spatial variability in intertidal ecology and nearshore oceanography is an intrinsic characteristic of coastal environments around the world, it is important to identify and understand the differential effects of local vs regional oceanographic fluctuations.

[281] *Community Connections from Archaic to Present in Southeastern Massachusetts: Insights from Halls Swamp and Beyond*

The Halls Swamp Site represents a newly identified Middle and Late Archaic multi-component occupation in Kingston, Plymouth County, Massachusetts. Community interest and insight in archaeology through the local historical commission, along with dedicated Native American monitors, prompted a professional archaeological survey resulting in an overwhelming municipal response to the importance of preserving a unique cultural landscape. The Halls Swamp Site is also yet another piece of an ever evolving and growing puzzle about Archaic Period settlement patterns in the Northeast that questions what we can still learn from the limited amount of research typically allowed through cultural resource management, and reflects the importance of choosing the most efficient interdisciplinary approaches for mitigation as well as preservation. Excavation of just two percent of the Halls Swamp Site yielded over 24,000 artifacts and 78 cultural features, including a stone row feature and evidence possibly associated with Archaic Period house structures.

Foarde, Chip

[193] *Maya Graffiti and Sacred Spaces*

This paper explores the nature and possible implications of graffiti identified inside presumably abandoned Maya architecture. There exists a wealth of ancient iconographic graffiti scattered throughout the Maya world. It has been argued that such graffiti was, in many cases, created after the spaces in which it is found had ceased to be used for their original purposes. Therefore, graffiti in this context is a possible example of the repurposing of Maya architecture by members of a society with ever changing needs and intentions. Through a comparative study of various examples of these images, along with the new-found graffiti at the site of Xultún, an attempt will be made to draw inferences on the significance of Maya graffiti and how it contributed to the repurposing of "sacred" spaces. Consideration will be given to the possible ways in which this practical change in artistic space is related to the constant and often volatile shifts in the history of Maya society.

[244] *The Land of the Windy Water Lords: Secondary Centers in the Motul de San Jose Polity, Guatemala*

Motul de San José dominated a swath of the northern shore of Lake Peten Itza in central Peten, Guatemala, during the Late Classic. Its Ik' Emblem Glyph has now been translated as "Windy Water," an apt name for this zone. Excavations at two small sites in the periphery of Motul de San José, Kante't'u'ul (approx. 3km northwest) and Chachacklu'um (approx. 5km east) aimed to investigate the relations between these secondary centers and their political overlords at Motul de San José. Settlement patterns, architecture, burials, and material culture in general will be compared to reflect on the territory controlled by Motul at its apogee during the eighth century A.D.

Foin, Jeremy (University of California, Davis)

[302] *Comparative Faunal Analysis of Four Early Thule House Features from Cape Espenberg, Alaska, and Inglefield Land, Greenland*

The Thule expansion was the extremely swift colonization of the eastern Canadian Arctic and Greenland by Thule Inuit moving east out of Alaska ca. A.D. 1000-1300. The rapid pace of the migration implies that it may have taken these pioneering Thule groups some time to “settle in” to their new environment. Poor familiarity with local conditions should be reflected in the zooarchaeological record as highly uneven, low-diversity faunal assemblages, with a heavy bias toward small phocids in the earliest sites (e.g., Darwent and Foin 2010). In addition, houses should have similar internal organization owing to their shared ancestry. In 2009, two well-preserved early Thule house features were excavated at Qaqaitut, northwest Greenland, radiocarbon dated to ca. A.D. 1300-1400 and A.D. 1350-1450. In 2010, two well-preserved early Thule house features were excavated at Cape Espenberg, Alaska, dated to ca. A.D. 1270-1320 and A.D. 1450-1500. The faunal assemblages from all four features were subjected to detailed zooarchaeological analysis in order to explore similarities and differences in species composition, cultural and natural bone modification, discard patterns, and use of space by early Thule peoples on opposite sides of the Arctic.

[213] *Using 3D Geographic Information Systems to Understand Settlement Decisions at Calakmul*

In 1982, fifty years after the Carnegie Institution of Washington surveyed and mapped sections of Calakmul, a project under the direction of William J. Folan began mapping the site. The completed map published in 2001 covers 30 square kilometers of the ancient site. Many printed maps or datasets like those from Calakmul created with laser total stations or conventional surveying equipment can provide the essential geospatial information to produce accurate topographic maps and 3D map objects within a Geographic Information System (GIS). The methods we developed to transform and integrate published maps of Calakmul into a three-dimensional GIS provide new perspectives about the site. Archaeologists can employ methods presented in this paper to represent archaeological sites as three-dimensional interpretations while preserving iterative analytical capabilities designed into modern GIS. The GIS preserves the fidelity of projected geospatial map entities, allowing the researcher to perform complex analytical operations to reveal new information related to organization of the settlement and location rationale.

Follensbee, Billie (Missouri State University)

[187] *Imitation is the Sincerest Form of Flattery: Gulf Coast Olmec Sex, Gender, and Dress as Reflected in the San Bartolo Murals*

The murals within the Pinturas structure at the site of San Bartolo, Guatemala have provided invaluable information for understanding the Late Formative period Maya, as well as for understanding their emulation, adoption, and adaptation of Epi-Olmec culture, religion, and iconography. As noted by a number of scholars, the figures depicted in the murals have the distinctive, graceful, and relatively naturalistic body forms of early Maya images, but the facial types, clothing, and adornments reflect Olmec and Epi-Olmec types. In their emulation and imitation of Olmec garments and accouterments on the more sexually identifiable Maya-style figures, therefore, the San Bartolo murals also serve to provide clear evidence confirming recent identifications of sexed and gendered features, gendered clothing, and gendered accouterments in Gulf Coast Olmec sculpture.

- [337]** *Beetle, Lice and Flea Sub-Fossils as Evidence for Resource Exploitation, the Use of Space and Ecological Conditions at the Pre-Contact Eskimo Site of Nunalleq, South-Western Alaska*

Samples collected from the permafrost-preserved floors of 14-17th century Eskimo winter sod houses at Nunalleq, south-western Alaska, have yielded thousands of insect sub-fossils. These diverse and exceptionally well-preserved insects are invaluable indicators of the ecological conditions which prevailed inside the structures, but also of the activities that took place inside them. Indeed, while external parasites such as human lice, bird fleas and dog lice reveal details about hygienic practices and animal resource use, the numerous beetle fossils identified from these samples suggest that despite their seasonal character, the sod houses at Nunalleq and the activities that took place inside them had a profound impact on the local insect fauna. The results of archaeoentomological analyses at Nunalleq are used to explore how the study of insect remains from northern hunter-gatherer sites could potentially enrich our understanding of past Arctic life-ways by illuminating details about animal and plant resource collection, storage and processing practices and their influence on local conditions and ecosystems.

- [401]** *Sourcing Late Neolithic and Chalcolithic Obsidian from Iraq and Iran: New Perspectives from Tell Nader and Yanik Tepe*

Historically Near Eastern obsidian characterization studies have focused on south-eastern Anatolian and Levantine assemblages of the Pre-Pottery Neolithic as a means of contributing to debates upon Neolithization. This study contributes to redressing this spatial and chronological bias, by detailing analyses of artifacts from 6th-5th millennium B.C. contexts in Iraq and Iran. The first assemblage comes from the new excavations at Tell Nader, a Ubaid to Assyrian period settlement near Erbil in Iraqi Kurdistan, the second from the 1960's work at Neolithic Yanik Tepe in NW Iran. Further brief references are also made to material from Tell al-'Ubaid, Seh Gabi and Arpachiyah. The artifacts were elementally characterized using the non-destructive technique of EDXRF. Our results indicate a variety of different sources being exploited by different communities at different times, including products from both Cappadocia (many hundred kilometers to the west), plus eastern Anatolia, north-eastern Anatolia and Transcaucasia. Our results reflect the general trend for an expanded range of source materials being consumed after the Pre-Pottery Neolithic, the discussion focusing on the significance of the various exchange networks and the other media and ideas that would have flowed through them alongside the obsidian, not least the early circulation of metals.

Forde, Jamie

[253] *Material Culture Change, Continuity, and Innovation at Postclassic and Early Colonial Achiutla, Oaxaca, Mexico*

In this poster, I present results of an analysis of ceramic materials recovered from domestic contexts at the Postclassic and Colonial site of Achiutla, located in the Mixtec highlands of Oaxaca, Mexico. Materials from distinct household middens corresponding to the Postclassic and Colonial periods, respectively, facilitate intra-site comparisons of domestic ceramic assemblages, providing insights regarding cultural change and continuity at the micro-level over the course of the Spanish Conquest. Results suggest intriguing patterns that confound traditional models of acculturation. For example, despite indications that indigenous peoples of Achiutla rapidly adopted European-introduced ceramic technologies, such as glazes and the potter's wheel, Spanish-influenced pottery did not replace traditional wares; in fact, far from it. Certain native-style decorated serving wares, such as polychromes, not only persist from the Postclassic period into Colonial times—they become significantly more frequent, though with considerable changes in formal characteristics and design motifs. This suggests not simply the endurance of an indigenous ceramic tradition, but instead a reformulation and florescence of one.

Forman, Steven (Baylor University)

[80] *Assessing the Accuracy and Precision of OSL Dating against Well Vetted Radiocarbon Ages*

OSL dating has advanced in the past decade with refinements in single aliquot and single grain regeneration (SAR) dating of quartz and feldspar. There are now many independent studies to evaluate the accuracy and precision of OSL dating, particularly for eolian and littoral sediments where solar resetting is often assured. This assessment will examine the potential meaning of radiocarbon ages that are > 45 ka in light of corresponding finite OSL ages for fluvial and marine sediments from the Hudson Bay Lowlands, Canada. A robust data set for evaluating the finite range of radiocarbon ages is the eolian stratigraphic record in the central U.S. where over the past decade an OSL chronology has emerged. In turn, OSL has utility in dating sediments < 1 ka, when radiocarbon ages often have poor precision. OSL can date distinct historic events, like eolian sand deposition during the 1930s Dust Bowl Drought. Lastly, the inherent limitations of OSL dating will be discussed including concepts of data overdispersion, precision versus aliquot/grain number, the assumptions behind statistical models, and associated errors. OSL can date many sediments but there remains a poorly defined population of quartz that defies the SAR protocols and yield spurious results.

[300] *A Multi-Scalar Chipped Stone Analysis in the Northern Rocky Mountains: Comparing the Bridger Mountains, Montana to the Absaroka Mountains, Wyoming*

Conducting research in montane settings, while rewarding, comes with a set of challenges which can result in a relative paucity of data from these locations. However, this problem can be mitigated by various analytical techniques. One approach is to employ a multi-scalar analysis on available data, a method that has produced richer results from limited data in other archaeological contexts. We have applied a multi-scalar analysis to the Pre-Contact era archaeological record of the Bridger Mountains in southwestern Montana and of the Absaroka Mountains in northwestern Wyoming and found interesting differences in raw materials types at different scales that might relate to varying site types and landscape use in the Rocky Mountains.

[93] *A Story Told Two Ways: Exploring the Intersectionality Between the Archaeological Record*

and Social Context of Undocumented Female Migrants

The number of undocumented women crossing from Mexico into the United States has been increasing since the 1980s, leading to a steady upsurge in studies focused on the experiences and strategies of this subpopulation of migrants. Much of the discourse thus far has been focused on the social contexts of female migrants, that is, the interpersonal and informational networks that influence their experience and survival strategies while crossing. In this poster we investigate how these social conditions during crossing do or do not map onto the material culture used and discarded by women migrants crossing the Arizona desert. Part of our analysis includes juxtaposing recorded narratives of female border crossers with gendered artifacts collected by the Undocumented Migration Project. Specifically, we discuss how women are underrepresented in the overall archaeological record and yet are traceable through the examination of intrinsically feminine artifacts, such as feminine hygiene products, bras, etc., and microfacts (i.e., small and often-fragmented artifacts that remain after migrant sites have been cleared). We posit that some gendered forms of migration-specific capital are visible in the archaeological record.

Forste, Kathleen and Mac Marston**[268]** *Paleoethnobotanical Investigations of the Economy of Islamic Ashkelon*

The coastal city of Ashkelon, in present-day Israel, was a key economic port in the commercial system that connected the Mediterranean and Middle East from the Bronze Age into the Crusader Era. The advantage of its position is attested by its continued occupation as well as the luxurious and finely made, often imported, objects recovered from various time periods. The Islamic period (640-1153 CE) is considered a time of great expansion and growth, with evidence of fine craftsman having resided within the city's expanding jurisdiction. However, there is a need for greater systematic study of plant remains to more fully understand the importance of plant goods to the inhabitants and the merchants of Islamic Ashkelon. By examining the distribution of archaeobotanical remains, including charcoal, we assess patterns of plant use and attempt to differentiate between domestic and mercantile contexts. Evaluating patterns of distribution in such contexts allows us to recreate economic practices at various levels, and opens the door to investigate differences in products used for household purposes versus those used for commercial purposes. Plant-use patterns at Ashkelon are then compared to those of contemporary sites in the region in order to assess its role in regional economies.

Forste, Kathleen [291] see Allen, Susan

Forsyth, Donald**[408]** *The Ceramics of the El Mirador Region: An Update*

Investigations in the Mirador Basin over the last thirty or so years have demonstrated that the region was one of intense occupation over a long period of time, particularly during the period that has come to be known as Preclassic. This period was marked by evidence of changes in the complexity and increasing uniformity in various cultural characteristics such as architecture, sculpture and iconography. In a similar manner the development of the ceramic industry provides evidence of a process towards uniformity that, as in other cultural characteristics, is not limited to the El Mirador region, but also is found in a large area that includes a large part of the Maya Lowlands.

[408] *Discussant***Fort, Joaquim (Universitat de Girona)****[73]** *Neolithic Transitions: Demic or Cultural?*

[401] *Digital Archaeology at Çatalhöyük: New Inferential Methods for the Interpretation of Neolithic Buildings*

The 3D-Digging Project started at Çatalhöyük in 2009 with the intent to digitally record in 3D all the archaeological stratigraphy in some areas of excavation assembling different devices and technologies for virtually reconstructing all the process in desktop and virtual reality systems. The introduction of 3D data recording and 3D simulation marks a qualitatively new phase of the research process at archaeological sites. This shall facilitate a new mode of inference that can fundamentally change the excavation process. The project, focused mainly on the B89 East mound has demonstrated in 5 years of experiments that it is possible to integrate different tools and methods during the excavation, achieving important results in terms of standardization, information quality, virtual interaction and reliability of the digital workflow. The “mediated experience” of digital documentation devices is always assisted by an empirical observation of data on site. Since the 3D models are visualizable and ready in a very short time, the interaction between empirical observation and mediated experiences creates new forms of knowledge and interpretation. Finally the paper will present the realization of a specific software platform for the 3D visualization and reconstruction of archaeological excavations.

[250] *From Bedrock to Biface: An Examination of Wari Lithic Technology within the Moquegua Valley of Southern Peru*

This research investigates lithic artifacts, and debitage recovered from Middle Horizon (A.D. 550 – 1000) households in the Moquegua Valley, Peru to assess models of Wari state expansion and polity interaction. While lithic technology, in the form of formal and informal flake tools, are present throughout complex societies, they are traditionally overlooked by archaeologists and result in few published studies. This study examines two Wari sites (Cerro Baul and Cerro Mejia) in the upper Moquegua Valley of southern Peru. The research presented expands upon our current limited knowledge of the lithic assemblage through the utilization of retouch analyses for formal chipped stone tools, as well as expediency indices to determine the overall curation, or tool use, of the lithic material. Gephi, a visual exploratory data analysis tool usually reserved for social network analysis, is incorporated into this analysis in order to define intra-site variations in lithic attributes among households and inter-site variations among the two sites.

Forton, Maxwell (Binghamton University)

[278] *Ground Stone as a Migration Marker: Using Finger-Grooved Manos and Fully Grooved Axe-Heads to Trace Kayenta Influence at Salado Sites.*

The Salado phenomenon in southern New Mexico and Arizona includes a set of cultural traits that are believed to have been stimulated by the arrival of Kayenta migrants in the late 1200s from northern Arizona and southeastern Utah. Identifying the influence of these northern migrants at Salado sites has been one of the ongoing goals of Archaeology Southwest's field excavations. In addition to perforated plates and certain architectural features, the presence of particular ground stone tools at Salado sites may serve as markers of Kayenta influence. Manos possessing finger grooves and axe-heads displaying a full groove are tool styles associated with Ancestral Pueblo peoples. The presence of these tools at the Dinwiddie site is further evidence of Kayenta influence in Cliff phase communities. Further analysis of the distribution of finger grooved manos and fully grooved axes among Cliff phase ground stone assemblages may lead to a better understanding of the dispersal of migrants and cultural influences associated with the rise of the Salado phenomenon.

Foster, John

[27] *Examination of an Archaeological Legacy Collection from San Fernando Mission, California.*

The 1971 San Fernando Earthquake severely damaged several buildings at San Fernando Mission, which had been established in 1797. In May 1973, the church was slated for demolition and during the course of that activity several burials were encountered. Students and volunteers from California

State University, Northridge (CSUN) were asked to assist in the removal of the burials, artifacts, and documentation of features that had been found. I had been one of those volunteers and was the “dig foreman” for the project. Forty years later to the month (May 2013) I returned to CSUN with the intent to analyze and publish those findings. Coincidentally a revitalized Anthropology Department had repackaged and assembled the artifacts and records into a coherent body of data that could easily be accessible just prior to my arrival. The result was a challenging and rewarding experience in working with old collections. Piecing together notes, maps, photographs, artifacts, and fragmented catalogs was as much an excavation as the original work albeit with paper and files. This paper summarizes the trials and tribulations of revisiting these collections, and makes recommendations for future researchers.

[76] *Firing Pots in Durango: Craft Manufacture of Glazed Wares and the Origins of Consumption and Production Inequality in Northern Mexico*

The historiography of nineteenth century industrial development in the northern Mexican state of Durango has tended to focus on the biography of a few successful businessmen, rather than on the local production and consumption of daily material culture. Specifically, the inhabitants of this northern territory experienced greater socioeconomic inequality, as only the minority that belonged to the entrepreneurial class reaped the benefits of industrialist projects. Thus only a small number of agents participated in the consumption of non-local luxury goods. In this paper, we use the results of the analysis of ceramic wasters and partially finished vessels from a Republican-period pottery workshop on the outskirts of the city of Durango as an entry point to the study of the organization of craft production by local artisans. Furthermore, we consider changes in the production of these simple vis-a-vis the influence of industrialization, in the making of the region itself.

Fowler, William (Vanderbilt University) and Jeb Card (Miami University)

[393] *Structure 4G1, Ciudad Vieja, El Salvador: A Sanctuary of Earth and Stone*

The archaeological site of Ciudad Vieja, El Salvador, represents the ruins of the Conquest-period town of San Salvador. Although founded as a Spanish conquest town with a small Spanish population, the inhabitants of San Salvador were mainly indigenous Mesoamericans including Mexican warriors and their families who traveled with their Spanish allies during and after the initial military conquest and transplanted members of colonized Nahua-speaking Pipil groups from western and central El Salvador. Previous investigation has revealed domestic and economic activities within the villa, but a new phase of mapping, remote sensing, and excavations conducted in 2013 and 2014 on the eastern edge of the site have revealed Structure 4G1. Preliminary results indicate that this structure may be the sanctuary of an open-air chapel used for baptisms and acts of worship for newly converted Indians who inhabited or visited the town of San Salvador. While similar “sanctuaries of earth and stone” are known from indigenous towns in central Mexico and Yucatan, this structure appears to be the only known example of indigenous religious architecture in a Spanish conquest town in Mesoamerica. The historical and archaeological evidence call into question how we view this “Spanish” colonial settlement.

Fowles, Severin (Barnard College, Columbia University)**[400]** *On the War Machine*

This paper takes up the writings of Clastres, Deleuze and Guattari on the core premise that war is a driving sociological principle in societies that have successfully opposed the development of state organization. My first goal is an attempt at clarification: if predatory military exploits are involved in the consolidation of most, if not all, states, what did Clastres mean when, in contrast, he wrote about the centrifugal logic of the war machine in non-state societies? My second goal is to extend this analysis to the case of equestrian warrior society of the Comanche during the eighteenth and nineteenth centuries.

Fox, Georgia (California State University, Chico)**[15]** *Gazing Upward: New Directions at Betty's Hope Plantation, Antigua, West Indies*

Plantation archaeology in the Caribbean region has been grappling with the complexities of plantation life through studying asymmetrical power relationships, spatial organization, and other important avenues of research. As there is no one "size fits all," this provides an opportunity to explore new approaches and methodologies in plantation research. For my presentation, I propose that Betty's Hope—a 300-year-old sugar estate located on the island of Antigua—serves as a laboratory to test new methodologies in excavating and interpreting a British colonial site. At Betty's Hope, we have adopted new technologies and scientific testing to address such questions of sustainability and ecological devastation resulting from monocrop agriculture. Using drone technology, we have been able to explore the landscape from an aerial perspective to further ascertain the scope of imprint on the island landscape. Scientific testing in soil sampling is being conducted to test ideas about ecological devastation, while the use of a Bruker hand-held x-ray analyzer allows us to source locally made coarse earthenwares made by enslaved Africans. Such methodologies, in combination with new theoretical approaches are helping us attempt to understand the many facets of colonial plantation life and its impacts, both short and long term, locally, and regionally.

Fox, Jacqueline (Arizona State University)**[96]** *Comparative Social Inequality and Class Structure in Ancient Cities*

Using the Gini index and associated Lorenz curve, this paper compares representative measurement of wealth across ancient cities dispersed throughout several cultural areas and from varied temporal periods. Using residential house size in several sites where the complete extent of the residences is mapped, calculated area and volume will be used as the standard for comparison. The volume of each structure is a more representative measurement of wealth because it encompasses the cost of labor more appropriately, however the limited number of sites with this level of detailed measurement available may not allow for as wide a sample. Area will also be measured in order to have a larger sample from which to derive conclusions. The comparison of these calculations with the Gini index will provide a new insight into variable levels of inequality with a consistent measurement that can be correlated with specific contexts to provide new insight into site variation within culture areas as well as variation between culture areas.

Fox, Keri (Wichita State University) and David Huges (Wichita State University)**[260]** *Where the Buffalo Roam and the Antelope Play: A Comparison of Soils in the Walnut River Valley of South-Central Kansas and associated Woodland and Late Prehistoric Period Settlements Using ArcGIS*

Huges's (1988) dissertation showed a relationship between late prehistoric settlement patterns on the Washita River of Oklahoma and the soils of that region, among other variables. This paper is an effort to extend that research north into the Walnut River Valley of Kansas. The valley of the Walnut in Butler and Cowley Counties is a rich archaeological area that has had little synthetic analysis conducted. As a first step in the process of a new regional synthesis, this project will specifically look

at the soil distribution of the area to determine correlation with settlement patterns. The resultant model will enhance our management capabilities for the area and serve as a building block for a more comprehensive settlement and distributional analysis.

Frachetti, Michael (Washington University in St. Louis)

[146] *The Common Sense of Institutions and Modalities of Happiness*

Love, money, success, purpose, identity, companionship, family, enlightenment: these 'things' and more have been proposed as measurable indexes of happiness. Recent scholarship on the theme of happiness presents it paradoxically as something seemingly tangible and sensory -- a common-sensical object of pursuit -- and something ethereal and subject to existential contemplation. Does one choose "the red pill or blue pill" (to quote the film "The Matrix"). Yet setting its existential reality aside, the topic of 'happiness' and how it manifests itself in real social context leads one to examine a compelling intersection of sociality and materiality, rendering the topic within broader institutional frameworks that can be explored archaeologically. While this paper inevitably falls short of defining happiness (either here and now or in the past), it explores happiness and its expression among prehistoric communities of Central Asia as a cross section of common-sense and institutionality, with the goal of contextualizing a number of practical and material signatures available in the archaeological record.

[412] *Exploring Hominin Cognition via Paleolithic Obsidian Provisioning, Transport, and Technology*

A central issue in paleoanthropological research is understanding the cognitive and behavioral variability of Lower and Middle Paleolithic hominins, including differences with respect to the modern humans who replaced them. Some scholars argue that these hominins had fundamentally different cognition and behavior than *Homo sapiens*, whereas others hold that their capabilities are essentially indistinguishable from those of modern humans. In obsidian-rich landscapes, artifact sourcing and lithic analysis can yield insights regarding hominin provisioning strategies, settlement patterns, and social interactions and, consequently, their cognitive abilities. Various data from Eurasia, including an apparent reliance on local cherts, have been interpreted as evidence for local, relatively "intimate" LP and MP societies, whereby hominins exploited small seasonal territories, slowly migrated through them, and maintained small social networks. In turn, the apparent scales of Neanderthal and modern human interactions have been incorporated into arguments regarding cognitive differences between them. For example, it has been proposed Neanderthals did not develop larger networks because they lacked the cognitive abilities to do so, and the larger-scale interactions envisioned for modern humans are frequently cited as a factor in the Neanderthals' demise. New obsidian research, however, has yielded data at odds with such ideas regarding Paleolithic cognition and behavior.

[73] *Embedding Artificial Intelligence in Agent-Based Models*

Agent-Based Models (ABMs) have been increasingly used to study social phenomena, from the emergence of social norms to population dynamics or cultural transmission processes. Key to this method of computational simulation is the tension for explaining how macroscopic phenomena emerge from the interaction of agents behaving in a plausible manner. However, the behavior is too often encoded as a simple set of condition-action rules. We consider this kind of rule-based behavior too simplistic, specifically when simulating human action and exploring the impact of decision-making

processes on the simulation outcome. Therefore, we experiment with a novel type of agent whose decisions are based on casting the surrounding world as a Markov Decision Process, a decision-making model widely used in Artificial Intelligence. The performance of this type of agents is assessed on a simple ABM simulation and compared to that of traditional rule-based agents. We then analyze the interplay between decision-making processes and relevant simulation parameters such as the distribution of resources. Finally, we present the results of applying the insights thus gained to a concrete case study within the Simulpast project concerning the dynamics of Hunter-Gatherer populations in North Gujarat, India, in the mid and late Holocene.

[290] *Breaking the Untold Rule: Community Archaeology a Bond of People and Information*

The relationship between the academia and non-academic individuals is often challenging, as there are tensions between who owns the power to produce knowledge. Citizen science is breaking this untold rule by incorporating the communities, fostering interactions that help transform segregated relationships. Recovery of knowledge from traditional and local perspectives has shown that individuals and communities hold very valuable, deep knowledge regarding their specific surroundings and daily life. In community archaeology the line that separates the archaeologist and the community is blurred, permitting the development of bonds between people that stimulates sharing of information. When information is shared knowledge grows and can inspire teaching others, permitting the formation of strong bonds between the groups sharing it. With the creation of information flows from multiple perspectives, it is possible to reach a better understanding of the topic at hand. These interactions not only benefit the research at the academic stage, but can also enrich the personal development of all the parties involved. In this presentation I shall be discussing these ideas of interaction between academic and community environments, from a personal perspective, including possible doubts and benefits, and how both communities and researchers can both develop relationships starting from equality.

Franklin, Jay [8] see Menzer, Jeremy

Franklin, Kathryn (University of Chicago)

[258] *Prosthetic Angels: Empirical Anxiety and Rationalizing Vision in Archaeology*

Working from tensions within historical and landscape archaeology, this paper examines the stress expressed by the question: "how can we know what happened in the past if we weren't there?" This query shapes much of the analytical framework within archaeology and underlies anxious discussions of archaeology's status as a 'real' science. At the heart of both this anxiety of "how do we know" and the ways in which we cope with it methodologically are assumptions about what facts are and how (or whether) they can be made. Among these assumptions is that of a close (if not identical) relation between observation and knowledge, and a privileging of empirical facts over other forms of truth. These assumptions spring from an entrenched western conviction that vision is the prime route to understanding, which persists despite progressive reflexivity among archaeologists. This conviction drives ongoing ambivalence towards history as data, and motivates fetishization of the visual in practices such as landscape archaeology, a prime example of making-visible so as to make-knowable. This paper argues that, rather than maintaining narrative in opposition to observation, the benefit of an expanding barrage of empirical tools is in enriching the stories we construct about the past.

[333] *Migration Terminus? Late Pleistocene/and Early Holocene Archaeology at Rock Creek Mortar Shelter, Upper Cumberland Plateau, Tennessee*

Rock Creek Mortar Shelter (40Pt209), in Pickett State Forest on the Upper Cumberland Plateau of Tennessee, possesses a more or less continuous 11,600 year occupation history. This history may be consistent with previous ideas of first colonization of upland rock shelter zones at the end of the Younger Dryas with significant climatic amelioration. However, we have not yet encountered culturally sterile deposits and believe the site may be older still. We focus here on the late Pleistocene and early Holocene components paying particular attention to unifacial and blade tool technology, use-wear analysis, and depositional history. Variability in blade production during the late Pleistocene deposits suggests a residually mobile family group. It could also represent the colonizers' struggles with adapting a blade tool technology to the locally abundant small, rounded Monteagle chert cobbles. We present our current understanding of the site based in our field work through January 2015.

[275] *A Comparison of Lithic and Ceramic Artifacts from Two Adjacent Late Woodland Villages*

The later Late Woodland period (A.D. 1200-1650) in Southwest Virginia saw the development of circular palisaded villages as the common settlement type. Two of these villages – 44PU8 and 44PU72 – are located 300 meters apart along the floodplain of the New River in Pulaski County, Virginia. Survey and limited test excavations of these sites between 2011 and 2014 defined the site boundaries and resulted in the identification of several features and the recovery of substantial samples of lithic and ceramic artifacts, as well as bone and shell ecofacts. This poster compares the lithic and ceramic artifacts from major contexts at these sites by examining the attributes of raw material and manufacturing stage for lithics, and vessel portion, temper, and surface treatment and decoration for ceramics. Because of their spatial proximity, this study provides an opportunity to compare sites in identical environmental settings. Even though 44PU72 dates earlier than 44PU8, similarities between the classes of artifacts and attributes examined reflect a use of similar resources and a successful adaptation to this riverine environment by these Late Woodland populations.

Frazier, Mechell (Arizona State University), Leslie E. Drane (Indiana University) and Ricardo Higelin Ponce de Leon (Indiana University)

[188] *Engaging the Public Through Women's Emergence in Archaeology*

As we live in a world in which the social sciences continually undergo negative publicity in the public sphere, spreading our knowledge is more important than ever. Since archaeology depends on the support of non-academic communities, we must combat negative portrayals of social science through outreach events and public portrayals of our work. We explore the impact of doing archaeology through women's life experiences. Through this lens, we discuss the passive and active manners in which archaeologists and our audiences comprehend public archaeology, archaeological scholarship, heritage, occupations, and contemporary issues. Three cases are discussed: 1. Graduate students creating a community outreach event, which demonstrates how we can cultivate young girls' interest in archaeology, 2. How women in field supervisor positions can create different dialogues and alter group dynamics amongst field crews, and 3. The emerging cultural heritage in southern Mexico, developing from the shared identity between an ancient priest woman and contemporaneous indigenous women. Through these three examples, we investigate different manners in which we can captivate wider audiences and the meaning this may have for public archaeology and the current position of women in academia and the public sphere.

Frederick, Kathryn (Michigan State University)

[139] *Holes: The Beginners Guide to Food Caching*

The Michigan State University Subterranean Storage Research Experiment (MSU SStoRE) employed experimental archaeology to better understand the storage efficiency, capacity, and reliability of hunter-gatherer food storage pits. Drawing on archaeological, ethnographic, and ethnohistoric information the project accurately recreated below ground storage pits for the late Late Woodland period (A.D. 1000-1600) of northern lower Michigan. Over three consecutive yearly cycles, subterranean storage pits were constructed with appropriate lining materials, filled with dried blueberries, acorns, and corn, and cached from November until late March. During the five month period the pits were monitored for temperature and humidity multiple times daily. Revisions were made each annual cycle, culminating in a successful storage episode. The most recent caching of foodstuffs was tested for microtoxins, pathogens, and water activity level in order to determine food safety. This paper discusses the lessons learned, resulting degree of success, and the importance of MSU SStoRE for archaeological research.

Freeman, Jacob (Arizona State University)

[167] *The Social Opportunity Hypothesis*

My work is motivated by the finding that the first farmers of the deserts of Northern Mexico and Southern Arizona formed settlements near and farmed reliable and productive flood plains. To understand why, I investigate to the processes that lead hunters and gatherers to invest in the low-level production of food in general. I use a dynamical systems model to investigate the effect of low-level food production on the ability of foragers to predictably allocate time to reaping the fitness benefits of social opportunities. I propose that there is a social-ecological Goldilocks zone where investment in low-level food production leads to a positive feedback cycle. Multilevel selection dynamics drive the coevolution of foragers and resources into a state of committed food production at the expense of hunting and gathering. Specifically, low-level food production makes the time budgets of individuals more robust to environmental variation at an annual time scale, but leads to

population growth at longer time-scales. Population growth eventually feeds back to affect the ability of individuals to maintain a robust time budget. This feedback, in turn, creates an environment in which foragers who adopt more effective food production strategies gain a fitness benefit over foragers who do not.

Freeman, Jeremy (Shumla Archaeological Research & Education Center), Victoria Munoz (Shumla Archaeological Research & Education Center) and Carolyn Boyd

[353] *Preserving Our Legacy: Understanding Transformation Processes for Rock Art Conservation*

The Lower Pecos Canyonlands of southwest Texas retain hundreds of rock art murals exhibiting varying degrees of preservation. Since 2009 Shumla Archaeological Research and Education Center has been documenting the murals, some of which date back 4,000 years. As part of this project, we collect Legacy Photographs to assess historic deterioration of the art. Analysis of these photographs has revealed significant changes in the imagery over the past 50 years; however, the factors affecting its preservation are poorly understood. Shumla is now launching a project aimed at understanding the transformation processes affecting its preservation. This will be a long-term study aimed at collecting data for inter- and intra-site comparisons. Some of the tools we are using include: protimeters (to collect substrate moisture readings), light meters (to record light intensity), FLIR thermal imaging cameras (to monitor temperature variation), game cameras (to monitor human and animal traffic), and weather stations (to record relative humidity, temperature, rainfall, wind speed, and wind direction). This data will help us better understand the processes affecting preservation at each site. Working with conservators, we will be able to offer recommendations to site stewards who are working to preserve the art for future generations.

Freers, Steve

[352] *Pictograph Handprint Analysis in Southern California--Stature and Gender Projections*

Pictograph hand impressions (n=288) from 42 rock art loci in southern California were analyzed to infer the physical stature and gender of the most likely Native American participants against contemporary assertions of regional rock art style and function. The analytical underpinnings were as follows: anthropometric data of Mission Indians (Boas 1895); ethnographic accounts of young adolescent female participation (e.g., Oxendine 1980:39) and the statistical difference in female adult stature (Gasser et al. 2000); research correlating human stature with hand length measures (e.g., Jasuja and Singh 2004); and, research utilizing finger-length ratios to infer gender (e.g., Nicholls et al. 2008).

A data plot created a bimodal distribution suggesting both young adolescent (expected) and adult participation at many sites. Several San Luis Rey Style (Hedges 1990) loci suggested male participation; however, pictograph handprint panels qualitatively presenting as consistent with an intensive puberty ceremony did indeed have impressions measuring in the stature range of young female adolescents. Conversely, qualified handprint panels categorized as Rancho Bernardo Style (Hedges 1979) contained hand prints analytically suggesting males in the range of late adolescence to adulthood.

Freestone, Ian (UCL)

[89] *Microanalytical Perspectives on the Evolution of Glass-making Technologies*

Glass has a number of distinct chemical types which are restricted in space and time and reflect several processes including (1) the spread of a dominant glass-making technology from an inferred single place of invention by the transfer knowledge and skill through the movement of people; (2) modification of the parent technology due to restricted availability of materials or selective improvement; and (3) the re-invention of glass making due to stimulus diffusion in the form of exposure to imported objects. In the present paper, I suggest that in addition to the widespread evidence for technological transfer, there is evidence for the re-invention of distinctive glass-making technologies in at least three regions over the past four thousand years, and probably others. Glass technology is thought to have originated in Bronze Age Mesopotamia but evidence is extremely limited due to poor preservation and recovery. However, a comparison of the materials

science of Near Eastern vitreous materials with those of glass characteristic of other regions and periods, especially first millennium B.C.E China, allows insights into the likely trajectory of early glass-making technology and the desirable properties which gave rise to what was, in the first instance, a purely decorative material.

[116] *Genetic Impact of Slavery Abolition in Mauritius: Ancient DNA Data from Le Morne and Bois Marchand Cemeteries*

From a demographic point of view, the island of Mauritius can be considered a multicultural melting-pot derived from forced and free labor, as it was there where the British conducted the 'Great Experiment' to replace slaves with indentured workers after abolition.

Despite the huge potential that Mauritius offers for studying admixed populations, it has remained uncharacterized from a genetic perspective until now. Several genetic markers have been analyzed in the current Mauritius population with the aim of understanding its present-day structure. However, to better ascertain the temporal evolution of its composition, the analysis of ancient human remains is required.

Ancient DNA data was retrieved from two different archaeological sites in Mauritius. The cemetery of Le Morne dates from the 1830s and is thought to contain the remains of slaves or freed slaves, within the maroonage movement of slaves' freedom. The Bois Marchand site is a nineteenth-century cemetery that is expected to reflect the population composition during the indentured worker period.

Here, we present a comparison of the genetic composition of historical and modern samples to interpret population genetic changes in Mauritius over time, within the historical context of European colonialism, transoceanic slave trade, and Indian and Chinese diasporas.

[413] *Inland Ports in Northwestern Peten, Guatemala: A Preliminary Assessment*

Northwestern Petén is characterized by an extensive wetland system subject to flooding during the annual rains, connecting what appear as isolated bajos in the dry periods of the year into larger, intermittent drainage networks. The San Juan, Chocop and Xan rivers drain these flooded areas into the San Pedro Martir River, which flows west, ultimately joining the Usumacinta River. We hypothesize that El Achiotal, a Preclassic center located within these seasonally occurring flood lands, and the Classic center of El Peru-Waka', functioned as ports on water routes connecting northwestern Peten with regions to its west.

[301] *The Application of Strontium Isotope Analysis to Historic Cemetery Contexts: A Case Study for the Creation of Robust Individual Identifications*

Following the 1991-1992 excavation of the Milwaukee County Institutional Grounds Cemetery (1878-1925), up to 190 individuals were preliminarily identified using historical documentation, material culture, and geospatial analysis. Subsequent bioarchaeological analyses have provided an additional line of evidence for the identification of these individuals. The cemetery population of Western

European immigrants and local/nonlocal native born Americans is composed of paupers, the institutionalized, and the unidentified of the city of Milwaukee during this period. The limited recovery of discrete individual burial markers and the complex depositional sequence of interments necessitate further interrogation for the secure identification of these individuals. Improvements in strontium isotope testing have led to its increased applicability for the study of population movement, and for the purposes of this project, applicability as an additional line of evidence for the identification of individuals in this cemetery. Sample material will be obtained from the tooth enamel of select individuals with robust preliminary identifications. The natal strontium signatures of each sample will be compared with the expected local strontium levels of southeastern Wisconsin and the known strontium levels of the geographic regions ascribed to individuals in the historic burial record, thus supporting or rejecting previous preliminary identifications.

Freiwald, Carolyn (University of Wisconsin), Katherine Miller (Arizona State University) and Tim Pugh (Queens College)

[219] *The Effect of Missionization on the Itza Maya from Isotopic and Biodistance Evidence*

The Spanish victory over Itza factions in 1697 initiated a period of significant change in the Petén Lakes region, where the construction of Spanish missions and resettlement of indigenous populations likely altered patterns of population movement. We present trace element and isotopic values for eleven individuals buried in Structure T-31 at San Bernabé, a newly discovered mission near the modern town of San Miguel. Markedly different burial patterns, combined with new material culture, suggest that population changes also may have occurred. However, the majority of the isotopic values suggest an origin within the region and show little evidence for in-migration, either voluntary or forced, from centers under varying levels of Spanish control such as Tipu or more distant locales in the northern Yucatan. We incorporate biodistance analysis of the cemetery sample to identify kin-based mortuary patterns and to interpret the beginning of the Colonial period in the Petén lakes region.

[40] *Human Responses to Late Pleistocene Environmental Change in South-Western France*

A key question for archaeologists studying the late Pleistocene is how human populations responded and adapted to the dramatic, and often rapid, global climatic changes which characterized this glacial period. Using a range of archaeological data attributed to the Upper/Final Magdalenian and Azilian techno-complexes (15 000-10 000 uncal BP), this paper assesses the evidence for changes in settlement patterns and human demography during the Late Pleistocene in South-Western France. Data on numbers and location of archaeological sites, site size, and densities of material culture remains were analyzed for differences which correlated chronologically with, and could potentially be attributed to; 1) the climatic warming of the Bölling/Alleröd interstadials (Greenland Interstadial 1), and; 2) the subsequent Younger Dryas cold period (Greenland Stadial 1) which interrupted the general trend of late-glacial warming. Drawing upon ethnographic data, I interpret these results with recourse to the ways in which hunter-gatherers both respond to, and are affected by, climatic and environmental change and the expected archaeological signatures of these effects and adaptations.

French, Kirk (Pennsylvania State University)

[266] *In and Out: Initial Investigations from the Palenque Pool Project*

Emblematic of Palenque's ancient name, Lakamha' or Big Water, the city is scattered with natural cascades and uniquely constructed aqueducts, bridges, and pools. In May 2014, the Palenque Pool Project began excavating and consolidating the largest of the three pools in the Picota Group, one kilometer west of the site center. Prehispanic construction of the feature required the Maya to excavate through bedrock and below the water table. The main pool is equipped with entrance and exit drains as well as a monumental staircase to access a perennial source of fresh water. Although likely a ceremonial feature, the pool's true function remains unknown. This paper introduces a few

interpretations from the first season of the project.

Freund, Kyle (McMaster University), Robert Tykot (University of South Florida) and Andrea Vianello (Oxford University)

[412] *A Longue Durée Approach to Obsidian Consumption and Social Value in Prehistoric Sicily (Italy)*

This study focuses on the long-term exploitation of obsidian in prehistoric Sicily and the factors that influenced the procurement and consumption of these raw materials from the sixth to second millennia B.C. A detailed study of 6,287 prehistoric artifacts from 43 sites shows that the vast majority of obsidian found in Sicily comes from a single Lipari subsurface, with smaller quantities of Pantelleria obsidian found in the west. Despite differences in the color and physical properties of these raw materials, there is a remarkable continuity through time in the use of both Lipari and Pantelleria obsidians to produce pressure-flaked blades. While obsidian undoubtedly served as a raw material for the production of stone tools, it is argued that much of the social value of obsidian rested in its capacity to facilitate social relations, where the circulation of these products through maritime networks of interaction both underpinned and reflected social structure. This paper presents new data on the long-term use of obsidian on the island of Sicily and in doing so makes an important contribution to the study of the various symbolic, ceremonial, and functional roles that these raw materials played in prehistoric society.

Friberg, Christina (University of California, Santa Barbara) and Gregory Wilson (University of California, Santa Barbara)

[173] *Cahokia's Western Frontier: Consolidation and Collapse as Viewed from the Big River Valley, Missouri*

Cahokia was the largest and most complex precolumbian Native American society in North America. Its cultural influence extended throughout the Mississippian period Midwest (A.D. 1050–1400). A diachronic investigation of greater Cahokia from its western periphery provides insight into the polity's consolidation, fragmentation, and collapse. Cahokian groups appear to have annexed portions of the Big River Valley (BRV) in southeast Missouri as part of the polity's formational Big Bang. However, by A.D. 1200, the population of Cahokia and the surrounding American Bottom region had significantly declined and Cahokia's pan-regional influence had markedly diminished. At this time, the BRV witnessed a major increase in Mississippian occupation. A detailed examination of these patterns provides insight into Cahokia's long-term developmental trajectory. This is accomplished through (1) a diachronic settlement pattern analysis of the BRV; and (2) a more focused analysis of the Long site mound center (23Je9), including a gradiometer survey and an analysis of architecture and ceramics from Robert McCormick Adams' 1941 excavations at the site.

Frie, Adrienne (University of Wisconsin-Milwaukee) and Patricia Richards (University of Wisconsin-Milwaukee)

[301] *Historical Craniotomy and Autopsy Practices at the Milwaukee County Institutional Grounds Poor Farm Cemetery*

The Milwaukee County Institutional Grounds Poor Farm Cemetery (MCIG) served as the burial ground for county institutions, including the coroner's office and the Milwaukee County Hospital. This paper describes craniotomy practices in particular, and autopsy practices more generally, evidenced by the population from the MCIG Cemetery. In addition, this research attempts to distinguish between craniotomies and autopsies carried out by the coroner's office versus the Milwaukee County Hospital to determine how these individuals came to the MCIG Cemetery. The attempt to differentiate which institution carried out the perimortem intervention is based on the hypothesis that the craniotomies and autopsies performed by the Milwaukee County Coroner's Office were more standardized due to the low number of active coroners and the standardization of perimortem intervention. This is expected to contrast those carried out at the Milwaukee County Hospital by pathologists and local students, which may be more idiosyncratic due to their exploratory and pedagogical goals. Investigating perimortem interventions will not only shed light on historical craniotomy and autopsy practices, but more importantly, determining through which institution these individuals came to the MCIG Cemetery will aid in ongoing attempts to identify these individuals.

[184] *Feasting, Exchange, Sociopolitical Interaction: Assessing the Tiwanaku Presence in the Kallawaya Region*

In the Tiwanaku era, the Kallawaya territory was part of a web of an inter-ecologic exchange networks that provided altiplanic polities with a myriad of resources flowing from the valleys and tropical Yunga mountains. In this context, Tiwanaku centers were important places of exchange, storage, and ritual celebrations. By looking at the botanical remains, this paper will explore the changes in feasting and consumption patterns, and the ways in which various resources were utilized in funerary and commensal activities. Further, such comparison will illuminate the nature of the Tiwanaku presence in this strategic corridor, and the ways in which this polity influenced the local political dynamics after its collapse.

[415] *The Birth of Economic Woman*

Modern humans have been living in the Arctic for over 30,000 years and their ability to adapt to the ecological limitations and challenges is relevant to questions of human adaptation and evolution. However, we know very little about the actual technologies and nutritional implications that were necessary to develop in the northern latitudes. Here we focus on two aspects of Arctic dietary practices that are little understood in the literature and yet would have been essential to successful occupation of the extreme Arctic environments—the seal poke storage system and the fermentation of foods. We present our original research on the construction and nutritional benefits of this kind of storage and the ways foods have been fermented. Embedded in our discussion of Arctic nutrition is the critical role of women and their applications of transformational technologies and their essential contributions to the Arctic diet.

[345] *Prospects and Challenges toward Globalization for Crops in the Eastern Agricultural Complex of North America*

Two crops domesticated in North America north of Mexico before European colonization have achieved global economic success: (1) sunflower (*Helianthus annuus* var. *macrocarpus*); and (2) eastern squash (*Cucurbita pepo* ssp. *ovifera* var. *ovifera*). Other members of the Eastern Agricultural Complex became extinct as domesticates before European contact or shortly thereafter, forfeiting potential to figure in the Columbian Exchange. Both sunflower and the domesticated eastern chenopod (*Chenopodium berlandieri* ssp. *jonesianum*) might have spread via long-distance exchange to Mesoamerica and the U.S. Southwest, but the molecular and archaeobotanical evidence is equivocal and controversial. Scholarly resistance may stem from overly strict adherence to centric models in which “advances”—agricultural and otherwise—diffuse from major civilizations to less politically complex regions. A key factor in all discussions of the demise of native eastern North American crops other than sunflower and squash is the intensification of maize agriculture at approximately A.D. 1000. Maize, of course, went on to become a huge success beyond the Americas after 1492, so its economic dominance in late prehistoric North America is one chapter in the wider and longer-term saga of globalization.

[317] *Can Government Be Self-Organized? A Mathematical Model of the Collective Social*

Organization of Ancient Teotihuacan, Central Mexico

Teotihuacan was the first extensive urban civilization of Mesoamerica and one of the largest of the ancient world. Following a tradition in archaeology to equate social complexity with centralized hierarchy, it is still widely believed that its origin and growth was controlled by a dynastic lineage of powerful individuals. However, much data is indicative of a government of co-rulers, and artistic traditions expressed an egalitarian ideology while deemphasizing individuals. Yet this heterarchical alternative keeps being marginalized because the problems of collective action, such as the tragedy of the commons, make it difficult to conceive how such a coalition could have functioned even in principle. We therefore devised a simplified mathematical model of the city's hypothetical network of neighborhood representatives, serving as a proof of concept that widespread cooperation was realizable in a fully distributed manner. In this model, political decisions become self-organized into globally optimal consensuses, even though local representatives always behave and modify relations in a rational and selfish manner. The network's self-optimization of connectivity crucially depends on occasional communal interruptions of normal activity, and becomes impeded when groups are too independent. We relate these insights to theories about community rituals at Teotihuacan and the city's eventual disintegration.

Frost, R. Jeffrey (California State University-Stanislaus)**[393]** *Pueblos, Palenques, and Dual Organization in Sixteenth Century Costa Rica*

Contact era Spanish descriptions from central Costa Rica through western Panama offer compelling evidence that many indigenous settlements throughout the region were arranged as two spatially discrete parts, implying that these societies were similarly organized as two social groups.

Documentary sources further indicate that there were at least three regionally distinct spatial arrangements of villages. Spatial patterns of settlements recorded in these documents closely resemble those identified in late precolumbian archaeological sites from throughout the region. I present and evaluate documentary and archaeological evidence to propose new interpretations of political and ethnic boundaries throughout southern Costa Rica and western Panama at the time of Spanish contact.

Fry, Robert**[295]** *Into the Unknown: The Uaymil Survey Project 1972-1976*

As his first major project following his dissertation research on the Central Acropolis at Tikal, Peter Harrison chose a challenging topic: a site reconnaissance and survey in the recently accessible territory of south-central Quintana Roo. In this paper I will discuss the genesis of the project, the challenges of fieldwork in this at that time remote region, and the results of this reconnaissance and survey. I will place the project in the context of the often tumultuous debates, and new approaches in archaeology during this contested period.

Fu, Janling (Harvard University)**[214]** *The Expression of Ideology in Levantine Submission Scenes: The Black Obelisk of Shalmaneser III as Feasting in a Neo-Assyrian Context*

Cultural appropriation of Levantine feasting forms by Neo-Assyria was an expression of agency that effectively subsumed, subverted and captured the dynamic of traditional Levantine polities. For those, the feast had represented an act of royal legitimation depicted iconographically by the figure of a king drinking from a cup. The rise of the Neo-Assyrian empire and the prominent appearance of this image, particularly in the 9th century B.C.E., deserves consideration as a probable co-opting of this ideological trope, but now directed toward the Assyrian ruler. The Black Obelisk of Shalmaneser

III provides a case in point. Here, one panel represents the figure of Shalmaneser III, standing and drinking a cup before the figure of Jehu, prostrated in submission. I will argue that this monument performs an affective function that recalls at once the Levantine tradition while also redirecting its ideological focus. Understanding the monument then involves acknowledging the junction between its materiality, historical context and the referent .

Fu, Qiaomei (Harvard Medical School, Max Planck Institute for Evolutionary Anthropology)

[264] *The Complete Genome Sequence of a 45,000-Year-Old Modern Human from Eurasia*

We have sequenced to high coverage the genome of a femur recently discovered near Ust-Ishim in western Siberia. The bone was directly carbon-dated to 45,000 years before present. Analyses of the relationship of the Ust-Ishim individual to present-day humans show that he is closely related to the ancestral population shared between present-day Europeans and present-day Asians. The over-all amount of genomic admixture from Neandertals is similar to that in present-day non-Africans and there is no evidence for admixture from Denisovans. However, the size of the genomic segments of Neandertal ancestry in the Ust-Ishim individual is substantially larger than in present-day individuals. From the size distribution of these segments we estimated that this individual lived about 200-400 generations after the admixture with Neandertals occurred. The age of this genome allows us to directly assess the mutation rate in the different compartments of the human genome. These results will be presented and discussed.

[92] *Timing the Introduction of Arrow Technologies in the Salish Sea*

A substantial amount of recent literature has re-examined the applicability of dart-arrow indices for hafted chipped stone tools from archaeological assemblages ranging from the Columbia Plateau to Californian Coast. As yet, these approaches have not been employed to examine variation in Coast Salish lithic traditions. We critically apply Hildebrandt and King's (2012) recent-dart arrow index and also employ a discriminant function analysis (DFA) to a data set of chipped and ground stone points from 49 archaeological sites spanning the past 5,000 years in the Salish Sea. These indices yield different timing for the introduction of arrow technologies in the region, ranging from 3500-2000 cal BP. However, all suggest that darts and arrows were complementary technologies. Following Erlandson et al. (2014), we argue that applying metric indices for functional interpretations overlooks the complexities of coastal lithic assemblages and the wide range of potential functions for hafted chipped stone technologies.

Fuller, Dorian (University College London)

[414] *Pastoral Pathways to Plant Domestication: Current Evidence for African Pearl Millet and Sorghum in Comparative Perspective*

Recent archaeobotanical evidence has provided important, although limited evidence, for the steps on the domestication trajectory for Pearl Millet in western Africa (Mali, Mauretania) and Sorghum in eastern Africa (Sudan), during the middle Holocene (3000-1000 B.C.). Both were exploited by and

domesticated by societies that in the Sahelian and northern Savannas practiced mobile herding alongside hunting and low-level cultivation, but full-scale agricultural dependence may not have emerged until after 1000 B.C. While these data can fit a protracted domestication process like that known for other cereals, we will argue that the particularly mobile form of early cultivation may have promoted a somewhat faster selection of non-shattering but with less marked selection for large grain size, and differing developments in the cultural evolution of crop-processing and storage, that were more expedient to mobility. Domesticated cereals, however, provided the basis for the development of sedentary village societies, demographic increase, full agriculture, and free-threshing cereal varieties. These particular pathways suggest parallel processes and similar causative processes to savannah transitions elsewhere, such as mid-Holocene Western and Southern India.

[95] *Making History Personal: Community-Focused Archaeology in the Nevada City Cemetery, Nevada City, Montana*

The small cemetery overlooking Nevada City, Montana, holds this history of the town in a unique and personal way. To the nearby descendants, the cemetery symbolizes the continuity of family, community and history. In August, 2014, Extreme History partnered with Project Archaeology to map and assess the cemetery as part of a Teacher Workshop. The project revealed the value of the personal community connection to sacred places. By working with descendant members of the community, we were able to assess the needs of the historic 1864 cemetery, then provide manpower with teachers attending the Project Archaeology workshop. The work will continue with the Montana Site Stewardship program, subsequent Project Archaeology Workshops and additional Extreme History volunteer hours. Developing the community relationship was crucial to the relevance of the project which will ultimately give back to the community accurate, digitized records of the cemetery for future use. These Records will help support efforts for future maintenance and preservation needs. Continued plans for the project include a community presentation and volunteer day as well as a possible website telling the story of the cemetery and its people. Community-focused archaeological projects such as this validate and support community identity by honoring its history.

Fulton, Kara (University of South Florida)

[248] *Shared Practices and Identities in the Northern Settlement of Actuncan, Belize*

This poster examines how urban families developed and shared neighborhood identities at the Maya city of Actuncan, Belize, ca. A.D. 800-900, a time when the city experienced rapid population growth as surrounding centers, including Xunantunich, declined. To investigate household relationships, this research considers the nature and location of activity patterns in and around three commoner households to infer shared practices and the shared identities that those activities both enabled and constrained. Multiple methods were employed, including subsurface testing, soil chemical residue analysis, and macro- and microartifact analysis. The data were examined spatially using geostatistics as well as with quantitative assessment. This research contributes to the understanding of urban processes of growth and decay in this region, and how they are linked to the behaviors of social factions in neighborhood communities.

[119] *Human and Environmental Histories of the Rat Islands, Western Aleutians, Alaska: The 2014-2015 Research Season*

Our multidisciplinary research team is beginning to model the role of humans in shaping the characteristics of existing southern Bering Sea and North Pacific terrestrial and marine ecologies in the Western Aleutians. During this past research season, we defined new cultural loci, acquired on and off-site pollen/tephra cores, and surveyed the coastal zone on areas of Kiska, Segula, and Little

Sitkin Islands. The cultural occupations span Aleut prehistory and the World War II Japanese occupation. They include several large Aleut villages, a previously undefined type of Aleut mound feature, and previously unknown Japanese military construction. Coastal biological sampling paired with isotopic studies of modern and archaeological fauna are providing initial data for a regional, long-term marine food-web model. Pollen cores are allowing us to define volcanic activities, examine local climate trends, and test for Aleut manipulation of local landscapes. Our research is changing commonly held perceptions of human impacts on what have traditionally been considered "pristine" natural land- and seascapes.

[307] *A Life in the Mountains: Spanish Identity in 17th-Century New Mexico*

As opposed to typical well-defined urban areas, 17th c. Spanish colonial New Mexico consisted of a series of small, dispersed, rural, isolated settlements. The colonists were also isolated in the sense that they had extremely limited and irregular access to trade goods and communication with the broader Spanish Empire. Furthermore, they stemmed from diverse ethnic backgrounds, often lumped as mestizo by modern researchers. Given these challenges to maintaining a perceived Spanish identity, how did the initial Spanish settlers in New Mexico define themselves? What, if anything, united 17th c. settlers as Spanish at a regional level? This paper examines the cultural identities of secular Spanish colonists through a synthetic analysis of material culture, focusing on identity proxies of culinary practices and self-adornment, from four households in the foothills of the Manzano Mountains, south of Albuquerque. The archaeological proxies brought to bear on colonial identity include demonstrably European introductions, such as metal, glass, and domestic Old World fauna, but also locally available material and technology (e.g. ceramics, flaked stone tools, and ground stone).

[203] *Ethnic Disparity and Stress in Prehispanic Peru: A Contextualized Analysis of Cranial Pathology and Facial Asymmetry*

This study evaluates the effects of stress on a prehistoric population from the south-central highlands of Andahuaylas, Peru during the Late Intermediate Period (LIP: A.D. 1000 - A.D. 1400). This era was characterized by skyrocketing violence, resource competition, and increasing social inequality. We test the impact of these phenomena by examining cranial lesions and fluctuating facial asymmetry-- both indicators of non-specific stress-- among different ethnic groups, identified by the absence, presence, and intensity of cranial modification. Skeletal analysis of 76 crania informed on age, sex, pathologies, and modification patterns. A Microscribe digitizer and attendant software programs were used to gauge facial asymmetry. If stress disparities between ethnic groups increased during the LIP, then we hypothesize that: 1) groups with modification will have higher rates of lesions than unmodified groups, 2) groups with modification will display more facial asymmetry than unmodified

groups, and 3) cranial modification intensity will directly co-vary with facial asymmetry. Preliminary results suggest that individuals with modification indeed have higher rates of cranial lesions and greater facial asymmetry than the unmodified group. Finally, since facial landmarks appear unaffected by modification, these results support a model of increasing stress disparities between ethnic groups.

[83] *The National Park Service Archeology Program Role in Protection and Management of International Cultural Heritage*

Since it began exporting the national park idea nearly a century ago, the National Park Service (NPS) has become instrumental in the protection and preservation of cultural heritage throughout the world. Cultural heritage conservation activities conducted in partnership with other nations enable NPS to disseminate important messages about the dangers of looting and the importance of protecting heritage sites. They also help to spread contemporary preservation practices and technologies to partners overseas.

Working in conjunction with the Office of Foreign Affairs, the NPS Archeology Program has conducted several initiatives related to the cultural heritage of other nations. Most recently, NPS has executed a memorandum of understanding (MOU) with Spain and a MOU with the United Kingdom, regarding the management of cultural heritage in United States National Parks. Additionally, the Archeology Program continues to participate --as part of a long-term partnership with the United States Department of State and the University of Arizona -- in a training program for cultural heritage managers and scholars from Afghanistan. This paper reviews those recent programs, and explores possibilities for future international collaborations in the domain of cultural heritage conservation.

[347] *"Good to Eat and Good to Think": Interpreting the Role of Plants in the Tiwanaku Temple of Omo M10, Moquegua, Peru*

Much is known nowadays about the role of plants in Tiwanaku households and political economy, yet, their function in ceremonial contexts is still unclear. Unlike the state's heartland in the Bolivian altiplano, where preservation conditions are not always favorable for the systematic recovery of paleobotanical remains, excavations of Tiwanaku sites in the hyper-arid environment of the Moquegua valley in southern Peru have resulted in the recovery of a wide array of ancient organic finds, including botanical remains. This research focuses on the Tiwanaku site of Omo M10, A.D. 600 - A.D. 1100, that features the only Tiwanaku temple found as yet outside the Altiplano. Based on the systematic collection, analysis and study of spatial distribution of the paleoethnobotanical samples collected from the temple's three excavated platforms we interpret the multiple roles of the plants recovered in this ceremonial context. In particular, we focus on local species such as *Zea mays*, *Schinus molle* and *Prosopis pallida*, among others, which were "good to eat and good to think" in the Tiwanaku Temple of Omo M10.

Gagnon, Celeste (Wagner College)

[404] *To Live and Die in the City: Investigations of Health at the Huacas de Moche*

During the last two decades of work at the Huacas de Moche site a large number of human interments have been excavated. Although the remains of human sacrificial victims have been well studied, those buried as part of the daily course of events at the site have received less attention. Yet, if we are to understand how the Southern Moche Polity developed, thrived, and ultimately declined, then we must investigate the everyday lives of the women, men and children who were the polity. In this paper I detail the results of bioarchaeological analysis of 117 individuals recovered from tomb contexts either located in the urban core or in the plazas of Huaca de la Luna. The collected

data concerning diet and health, provide new insights into the Moche society.

Galeazzi, Fabrizio (University of York)

[221] *A.D.S 3D Viewer: an example of open 3D real-time visualization system in archaeology*

In this paper I will present A.D.S 3D Viewer, a project designed to develop a 3D real-time system for the management and analysis of archaeological data. The main aim of this interactive application is to give users the ability to access archaeological data to ground-truth interpretations. Thanks to the A.D.S 3D Viewer, in fact, multiple experts will share and analyze 3D replicas of the archaeological excavation record, which can be revisited and subject to new analytical techniques over the long term. In the past ten years 3D technology in archaeology has become a strong tool to support the communication and recording of cultural heritage. However, its efficacy for data analysis and interpretation has not yet been fully tested. The 3D viewer is being developed as a tool for the A.D.S (Archaeology Data Service), a major UK-based cyber-infrastructure hosted at the University of York. This paper will discuss specific case studies that will help clarify the potential of the 3D viewer. The possibility to share complex 3D models of archaeological sites and monuments, and the interpretations made by archaeologists during the excavation process, on the web, will promote discussion between scholars and represents a significant opportunity for the discipline.

[156] *The Rancho Santa María II: An Archaic Site In the Galeana Valley, Chihuahua*

In the summer of 2014, we conducted a rescue project in the Galeana Valley, Chihuahua on a site recorded earlier. The site name is Rancho Santa María II, has a surface of 30,000 m², and was identified by the high amount of FCR on the surface mainly from ovens (several of them identified on surface). In addition, nearly 350 projectile points were found (70% as fragments and 30% complete), some of them from the Paleo-Indian period. Four excavation units were dug at the site, mainly on ovens to collect radiocarbon and soil samples. In one of these units a burial was encounter. Although dating analysis is in progress, we presume it is 4-5,000 years old. If this is correct, we could have one of the oldest human remains from this area.

[23] *Material Complexities in Dispersed Communities: Archaeology of 2nd Millennium CE Southeastern Burkina Faso (West Africa)*

In several regions of the West African savanna, the pre-colonial complex polities described in oral and written histories have left a minimal archaeological signature on the landscape. One such region is the Gobnangou escarpment of southeastern Burkina Faso, where from the early second millennium CE, the archaeological record consists almost entirely of small, ephemeral sites, likely resulting from short term occupations of household compounds. Broadly dispersed on the landscape, and almost certainly associated with an extensive agricultural land use practice that involved regular shifting of fields and residences, these sites represent an anthropogenic landscape in which physically distant households were likely linked in close political, social, and economic networks. Associated with the emergence of this new landscape was the development of an elaborate material culture tradition that incorporated multiple specialized ceramic wares, each associated with the use of unique decorative techniques. This paper explores the ways that this shared tradition may have provided a sense of persisting collective identity throughout the region.

[346] *Clothing for the Mexica Gods: Shell Garments from the Great Temple of Tenochtitlan*

El presente trabajo aborda el estudio integral de los restos de prendas rituales elaboradas con textiles y elementos laminares de conchas nacaradas, que se depositaron en cuatro ofrendas del sitio arqueológico del Templo Mayor. A pesar del mal estado de conservación que actualmente se observa en la mayor parte de estos objetos, fue posible identificar cuatro prendas rituales, a través de una investigación que observa varios aspectos relevantes y complementarios. Así, el estudio comprende: la identificación y procedencia de sus materiales constitutivos, la importancia de su forma y disposición originales, la significancia de los motivos ornamentales representados, la vinculación de los diseños con determinadas deidades y la función que estos objetos representaron dentro de las oblaciones del sitio. El trabajo también incluye el análisis de aspectos relevantes de su manufactura y algunas propuestas para su interpretación.

[263] *Dissecting the Heart of a Puuc Royal Court: A Diachronic Analysis of Structure N1065E1025 and Associated Deposits at Kiuic, Yucatán*

Research on the site of Kiuic, in the Puuc region of the Yucatán Peninsula, has recovered evidence of a long and continuous period of building activity that dates from approximately 700 B.C. to A.D. 900. The construction sequence of Structure N1065E1025, a nine meter temple-pyramid located at the center of the site, evidences episodic changes that transformed the building from a raised platform in the Middle Preclassic to the center of a royal court in the Late Classic and finally a ceremonial precinct before it was abandoned at the middle of the 10th century. During the time it functioned as the heart of the royal court of Kiuic, Structure N1065E1025 was a knot linking the main ceremonial, civic, residential and service plazas of the larger architectural complex known as the Yaxché Group. Excavations in and around N1065E1025 identified numerous middens and special deposits associated with its evolving architectural history and its relationship with the ceremonial, civic and residential life of this Maya court. In this paper, we will discuss the content of these deposits in order to understand the changing activities and functions of N1065E1025, particularly as it represents the center of a royal court in the Puuc region.

[24] *Hilar y tejer en el Palacio y la periferia. Coincidencias y particularidades de dos espacios domésticos del Clásico Tardío en Comalcalco, Tabasco*

La variedad de atuendos que portan los individuos representados en las figurillas y los ladrillos decorados de Comalcalco, evidencian una actividad textil especializada que daba lugar a la indumentaria que caracterizaba los diferentes niveles de la sociedad local. No se observa en la iconografía existente la presencia de cuerpos desnudos. Por tanto, el hilado y tejido debieron constituir algunas de las actividades femeninas más frecuentes realizadas al interior de los grupos domésticos de esta ciudad. El objetivo de este trabajo se enfocará a dilucidar las coincidencias y particularidades de los malacates –ubicación, material, peso, forma, decoración-, y su asociación con otros materiales culturales –figurillas, metate miniatura y navajas de obsidiana-, en algunos espacios domésticos y entierros de la Gran Acrópolis y una unidad habitacional periférica.

Galm, Jerry, Stan Gough (Eastern Washington University) and Fred Nials (Desert Archaeology, Inc.)

[92] *Haskett Biface-Point Production and Occupation of the Pacific Northwest and Northern Great Basin at the Pleistocene-Holocene Boundary*

The Sentinel Gap site (Washington) lithic assemblage documents the sequential production of bifaces and projectile points stylistically associated with the Haskett type. Lithic workshop debris analysis identifies patterns in the reduction trajectory of large cores into bifaces and lanceolate projectile point/knives. An average of 10.2 ka B.P. for six radiocarbon dates place short term Sentinel Gap site occupation at the Pleistocene-Holocene boundary. Stylistic and technological evidence obtained from the biface-point sample, when combined with these dates, argue for a relationship to Agate Basin-Hell Gap complexes in the American Great Plains. In view of a probable east to west

movement of the Haskett point into the region, the inclusion of Haskett in Western Stemmed and Windust Phase point complexes is problematic. This analysis indicates the need for a revised assessment of the temporal positions and cultural affiliations of early-dating biface-projectile point records defined for the Western Stemmed Tradition, Windust Phase, and Lind Coulee site.

Gamble, Lynn (University of California, Santa Barbara)

[32] *Household Archaeology on the Northern Channel Islands of the Santa Barbara Coast, California*

House depressions are visible at many archaeological sites on the Northern Channel Islands, including some that are thousands of years old, yet household archaeology is a topic that is often overlooked in the region. Documenting the number, size, location, and layout of house depressions can help in understanding past settlement strategies, access to resources, the emergence of cultural complexity, demography, cultural landscapes, environmental change, and craft specialization, among other significant issues. In this paper, we present data on house depressions and structures from archaeological sites on Santa Cruz, Santa Rosa, and San Miguel Islands and situate this information in a chronological framework. These data are analyzed and compared to ethnographic and ethnohistoric records that provide details about Chumash Indian houses in the Santa Barbara Channel area, both on the mainland and the islands. Some of these accounts suggest that island settlements are marginal when compared with those on the mainland. The perception of island settlements as marginal places is addressed in this paper through the analysis of detailed empirical evidence in the archaeological record. Changes through time in household organization are noted and correlated with demographic shifts, cultural landscapes, significant resources, climate change, and other important issues.

[72] *In Defense of Archaeotourism*

Archaeotourism, the visiting of sites of historic and prehistoric significance, not only satisfies people's interest in the past, but more importantly helps to build greater support for cultural resource preservation and research. While protecting sites is paramount, professional archaeologists cannot ignore or risk losing the opportunities archaeotourism provides; namely creating a scientifically- and culturally-literate population that can help advance the protection of cultural resources and the appreciation of historic preservation for the future. For over 30 years, the Crow Canyon Archaeological Center has used archaeotourism to build a passionate and knowledgeable constituency for archaeology, cultural resource protection, and historic preservation. In this way, we have also built a donor base that can help sustain Crow Canyon as an autonomous, independent nonprofit organization.

[101] *Hyperspectral X-Ray Fluorescence of the Luni glasses*

To investigate raw materials provenance, date and models of production of archaeological glass it is essential to characterize and define compositional groups based on the elemental composition. However, obtaining such information traditionally requires performing micro-destructive analysis on micro-samples. Here, the use of hyperspectral X-Ray Fluorescence (XRF) is investigated as alternative tool for the examination of Roman natron glass. The full multichannel analyzer (MCA) data of the individual spectra is exported as a stack of images corresponding to every channel present in the XRF spectrum. The resulting hyperspectral image cube can be interrogated using image-based chemometric techniques, namely principal component analysis (PCA). A dataset of 31 glass fragments excavated at the archaeological site of Luni, Italy, and dated 1st to 4th century A.D., has been selected to illustrate the strong potential of this qualitative examination method for archaeological glass research. The good agreement with the compositional groups defined by LA-

ICP-MS analysis of the same glass samples strongly support the use of hyperspectral XRF as a powerful non-invasive and non-destructive tool for the analysis of archaeological glass, able to highlight the main differences in glass samples and discriminate compositional groups without the need for quantification.

Gann, Douglas (Archaeology Southwest)

[235] *Introducing CVR, a Content Management System for Digital Archaeological Interpretation*

With a wide range of digital tools now being successfully utilized for capturing and modeling archaeological data, public archaeologists have realized how entertainment software (aka video games) can be repurposed to create compelling visualizations and interactive experiences to share our research on the people, landscapes, places, and objects of the past. Archaeology Southwest, with support from the National Science Foundation, recently began an effort to develop one such interactive visualization to share the story of the ancient Chaco Phenomenon in northwestern New Mexico. However, a fortunate set of design choices resulted in the creation of both a digital touch screen exhibit called "Chaco's Legacy" and a flexible, database driven tool, built within the Unity 3D game engine, which we are calling Chronological Virtual Reality or CVR. The CVR system represents an open source tool that can be used to compile platform-independent digital exhibits featuring three-dimensional models of landscapes, sites and artifacts. The system uses a node-based tour system, utilizing multiple languages to share virtual archaeology with descriptive text, maps, audio and alternate viewpoints, through multiple time periods. We at Archaeology Southwest are pleased to celebrate the release of the CVR system at this annual meeting.

[290] *Into the Mind of an Undergrad: Personal Experience, Training and Archaeology*

Only in exceptional moments can we explore the thoughts of others. Community archaeology projects, together with the ethical practice of the discipline, foster communication between the academia and the communities. Being part of one of these projects as a research assistant has given me the opportunity of interacting with people of diverse backgrounds, and of learning about their concerns and interests towards archaeology and their historical and cultural heritage. This experience has taught me that the frontier between academia and community is a permeable gray zone. This experience has been transcendental in my formation as an undergraduate student. It is often difficult to discover our professional interests when we learn about the discipline from the abstract teaching of a classroom. Being part of a project has allowed me to apply what I have learned through my studies, and to develop awareness regarding the ethics in archaeological practice and the preservation and conservation of our cultural heritage. From my perspective as an undergraduate student, in this presentation I will be discussing how working as a research assistant in a community archaeology project contributes towards the solid formation of a student, both professionally and as preparation for graduate school.

[107] *Holocene Paleoclimate Reconstruction from $\delta^{18}O$ Isotopes of Neocyclotus Opercula a Morphometric Analysis of Variation at the Archaic Site of San Jacinto1 Colombia*

Neocyclotus snails produce opercula, a calcified plate attached to the foot of the gastropod serving as a protection mechanism from predators, and dehydration. Opercula are rarely found in the

archaeological record, and have only been recovered from few archaeological contexts. Excavations at the Archaic site of San Jacinto, Colombia have facilitated the unprecedented recovery of 3,542 opercula a presence that has not been recorded previously in the neotropics. These calcified plates form calcareous layers, which halt growth during yearly dry seasons, and are useful as markers for seasonality of deposition. The isotopic data from opercula samples is superior to that of shells as they display less natural variability, and preserve intra-crystalline proteins due to the greater stability of calcite. The particular characteristics in opercula make these structures ideal for analysis of stable isotope variability ($\delta^{18}O$) to infer seasonal variation. A random sample of the San Jacinto opercula was analyzed to determine spatial attributes, taxonomy, morphometrics, and human-modifications. Said analyses allow us to infer the opercula's function at the site, and determine the variation as well as the conservation of opercula samples for a future stable isotope analysis as a proxy for Paleoclimatic variation in Northern Colombia during the middle Holocene.

[156] *Patrón de Asentamiento en el Desierto Central de Baja California sur "El Estudio de Sitios Arqueológicos que Conforman un Corredor Sierra-Oasis-Mar"*

Como parte de los trabajos de localización, registro y protección de sitios arqueológicos durante obras de construcción de una línea de transmisión y sus respectivas Subestaciones eléctricas propiedad de CFE, se realizaron una serie de prospecciones a lo largo de 133 km, logrando así adquirir un nuevo cúmulo de información sobre esta vasta región, que en suma a los proyectos de investigación previos por parte del INAH, fue posible identificar patrones de asentamiento vinculados a una serie de condiciones tanto geográficas como geomorfológicas, las cuales permitieron el establecimiento de campamentos por grupos cazadores-recolectores-pescadores asentándose por periodos de corto, mediano y largo plazo para fines diversos. Este conjunto de sitios presentan características idóneas que nos ayudan a definir el área como de importante valor explicativo, ya que al estudiarse, es posible formular hipótesis sobre estrategias de movilidad por parte de estos antiguos Californios, que van desde el aprovechamiento de los recursos para la subsistencia, la organización social, incluso el ejercicio de manifestaciones con carácter simbólico, revelando así un complejo cultural propio de la región.

[408] *Virtual Graphic Representation and Urban Analysis Architectural Grand Central Acropolis:*

Main Access and Structure 4D1-20 El Mirador, Petén; Guatemala

El presente trabajo desarrolla el urbanismo y arquitectura Maya de este conjunto arquitectónico tipo acrópolis, del sitio El Mirador. Con el objetivo de realizar un análisis de esta edificación, proponiendo una representación gráfica que permita su reconstrucción virtual y escenográfico del mismo. Esta propuesta hipotética se modela en base a la información histórica y evidencias arqueológicas recientes en este sector. Esta gran acrópolis ocupa un área de 86,139m²; por la dimensión que abarca este conjunto arquitectónico, la investigación se centra en el epicentro de esta acrópolis, en el que presenta rasgos arquitectónicos tempranos como lo es el Patrón Triádico, enfocándose en su acceso principal y la estructura conocida como "El Trono" (Estr. 4D1-20), resaltando sus distintas etapas constructivas y momentos históricos. Al examinar el urbanismo, su arquitectura, y construir este recorrido virtual, permite conocer de forma dinámica este patrimonio cultural, que caracteriza el arte y complejidad de la cultura Maya temprana y su devenir a lo largo del tiempo.

García Gómez, Víctor Hugo (Instituto de Investigaciones Antropológicas) and Guillermo Acosta Ochoa (Instituto de Investigaciones Antropológicas UNAM)

[141] *Procedencia e Intercambio de obsidiana durante el Holoceno Medio en la Cuenca de México (ca. 6200-5000 calBP). Un análisis mediante pXRF*

Se caracterizó mediante análisis de Fluorescencia de Rayos X (XRF) un conjunto de obsidianas obtenidas en las excavaciones en el sitio de Tepexpan, Edo. de México y San Gregorio Atlapulco, Xochimilco, D.F. (n=149), procedentes de los niveles precerámicos de ambos sitios, a través del análisis de diversos elementos (Na, K, Ti, Mn, Fe, RB, Sr, Y, Zr, Nb y Ba); esto nos permitió conocer la composición química de cada uno de los artefactos líticos para posteriormente efectuar comparaciones con obsidianas de yacimientos sistemáticamente muestreados. Los resultados indican una amplia predominancia del sistema de Otumba (94%), además de otras tres fuentes menores que incluyen a Pachuca. Lo anterior tiene implicaciones importantes sobre los procesos de interacción de los grupos precerámicos del Holoceno Medio en la Cuenca de México, y permite vislumbrar la importancia de esta fuente en el desarrollo temprano de comunidades cercanas al yacimiento que controlaron su explotación durante periodos subsecuentes.

García González, Miguel (Proyecto Templo Mayor)

[298] *The Sun, the Xiuhcoatl and the Eagle: Incense Burners Found at the Great Temple of Tenochtitlan*

In 2009 a spectacular offering containing incense burners was excavated close to the area in which the Tlaltecuhli monolith was located. Three of these artifacts preserved complex decoration, similar to the iconography that characterizes the incense burners discovered in 1900. Two of the handles of these ritual objects represent disarticulated eagle legs, while the other symbolize the segmented body of a mythical creature, the Xiuhcoatl. The eagle was an essential animal for the Mexica: it was the representation of the Sun and their pelts were dressed by rulers and depictions of gods. It was considered the symbol of bravery and force. On the other hand, the Xiuhcoatl was Huitzilopochtli's weapon. The body of this animal was composed of trapezoid motifs, culminating in triangular design adorned with flowers of the species *Tagetes lucida*. This mythical being was related to the Sun and it was considered the nagual of the gods Huitzilopochtli and Xiuhtecuhtli. Designs from this incense burner also evoke the butterfly, insect that symbolized fire, rebirth and the soul of the dead warriors. In this paper I will address the symbolism and use of these complex ritual artifacts in the Great Temple of Tenochtitlan.

García Sanchez, Magdalena (El Colegio de Michoacán)

[129] *El río Lerma en la región de Angamacutiro en el pasado reciente*

En el siglo pasado, en su paso por Michoacán, el río Lerma influyó en la vida de los pobladores de la región de Angamacutiro, que abarca las localidades de Santiago Conguripo, Aramútaró y Añichuácuaro, entre otras. En éstas, la pesca, la caza y la recolección se llevaron a cabo sólo por algunos de los pobladores, pero existieron otras actividades hasta mediados del siglo XX que se

desarrollaron en mayor medida y constituyeron en conjunto la economía preponderante en la región. Es el caso por ejemplo de la elaboración de la cal, de la carpintería, de la herrería e incluso de la elaboración de retablos para los templos. Este trabajo explora esas otras actividades distintas y complementarias a aquellas esperadas en un modo de vida lacustre, y plantea el hecho de que la mera presencia de cuerpos de agua no conlleva a este modo de vida, como una posibilidad de análisis hacia las sociedades antiguas.

Garcia-Cosme, Elimarie

[11] *Spatial Patterns of Raised Fields and Linguistic Diversity in Mojos, Beni, Bolivia*

Throughout Amazonia, agricultural earthworks are found in diverse geographical settings, including Venezuela, Bolivia, and the Guianas. These earthworks can be seen throughout areas of diverse linguistic and ethnic backgrounds. This suggests that dynamic, multiethnic networks can be found in Amazonia, influencing the methods of landscape modification used by different groups. Being able to observe influences of diverse cultural interactions in the archaeological record could contribute to the complex issue of defining identity within the Amazon. This poster presents a GIS spatial analysis of raised fields, earthworks found along the Yacuma and Iruyañez Rivers in the Llanos de Mojos. With this spatial analysis, an understanding of the various forms of raised fields utilized in this area of Mojos could be achieved. The goal of the spatial analysis is to distinguish patterns within raised fields found along two sets of rivers and their connection with spatial patterns of linguistic groups in the area. Patterns within these areas could help understand the history of multiethnicity in Mojos.

Garcia-Des Lauriers, Claudia (California State Polytechnic University, Pomona)

[338] *Masking Practices and Layered Identities in Offering 1 from Los Horcones, Chiapas, Mexico*

Discovered in 2006, Offering 1 from Los Horcones, Chiapas represents a unique grouping of figurines deposited perhaps to commemorate the construction of Mound B1 from this site. Previous publication of this offering focused on deriving meaning from this cache based on its context and stylistic attributes. During the summer of 2014, the offering was reconstructed and new layers of meaning perhaps representing a more emic perspective emerged. The offering, made up of masks and figurine heads, sheds light on the practices of ritual masking and on discourses of layered identities taking place at the Early Classic site of Los Horcones. The ritual practices revealed will be viewed in light of Los Horcones' history of contacts with distant regions and centers such as Teotihuacan, the Maya region and the Gulf Coast of Veracruz to reveal how masking practices viewed here from analysis of small scale artifacts addresses larger scale social processes.

[396] *Spatial Distribution and Site Formation of the Schöningen Spear Horizon, Lower Saxony, Germany*

The discovery of the Schöningen 13II-4 Spear Horizon represents a major milestone in the study human behavioral evolution. Once viewed as a single mass kill site of horses, aided by wooden spears, it is becoming increasingly clear that the site represents multiple hominin hunting episodes along the margin of a middle Pleistocene lakeshore. However, there are still questions to be addressed regarding the spatial relationships between and within the spear, lithic, and faunal assemblages. Here we present the results of an ongoing spatial analysis of the complete faunal assemblage from the Spear Horizon to address hypotheses regarding the events that led to accumulation of the site. Detailed spatial data, combined with other multidisciplinary studies, provide important ecological and depositional contexts for the site, from which we can reconstruct hominin behavior on a high-resolution scale. Preliminary results indicate a complex depositional history, but spatial patterns provide clues to interpret the frequency, timing, and nature of multiple hominin

hunting episodes at the site.

García-Moreno, Cristina (Arizona State University)

[257] *Batacosa, a Río Sonora or Serrana site?*

In 2009 and 2010 we worked at Batacosa, an archaeological site first recorded in 1967 by William Wasley, and later visited by Victoria Dirst. Our work allowed us to determine the full extent and material culture present at the site. In addition it allowed us to date this site to the Batacosa (200 - 700 A.D.) and early Cuchujaqui phases of the south branch of what Richard Pailes defined in 1973 as Río Sonora culture, geographically located in the Sonoran lower foothills. In this paper we present the results obtained by the Proyecto Arqueológico Sur de Sonora and discuss the affiliation of this extensive site.

[121] *From Stone to Screen: Squeezing into the World of Digital Archaeology*

As the field of Digital Archaeology becomes increasingly prevalent, large-scale projects tend to dominate both thinking about and approaches towards the digital landscape. Scholars and students with smaller budgets and resources are often at a disadvantage; we believe renewed energy should be devoted to exploring the value and integrity of small-scale projects.

This poster presents From Stone to Screen, a multi-disciplinary, collaborative, and open-access digitization project launched in 2012 by the graduate students of the department of Classical, Near Eastern and Religious Studies at the University of British Columbia. From Stone To Screen is a successful, viable, and tested project that reveals the increasing potential of open-source digital tools for scholars and students with small teams and variable budgets. This initiative is completely student-run and focuses on the digitization of the departmental epigraphic squeeze (an impression of an inscription) and ancient Near Eastern artifact collections. While similar digitization projects exist, From Stone To Screen is unique in its accessibility objectives, its solely student-based administration, and the scanning techniques and subsequent quality of the scanned images, all presented in this poster, and all of which are replicable for squeezes and artifacts obtained from all corners of the globe.

[293] *Feeding the Ranks: Correlating Social Organization and Dietary Patterns at the Yukisma Mound (CA-SCL-38)*

The Yukisma Mound (CA-SCL-38), located in Santa Clara County, California, was used by the ancestral Ohlone as a mortuary site between approximately 940 and 230 years BP. Analysis of mortuary contexts within the mound revealed evidence of social differentiation in wealth, prestige, moiety affiliation and power. Special mortuary treatment, artifact abundance, and association with costly artifacts or culturally significant wealth items suggested that some individuals held higher status than others without these associations. These observations were enhanced by dietary evidence from stable carbon and nitrogen isotope analysis of bone collagen (n=127) and apatite (n=122). Measures of wealth were not correlated with advancing age, an indication that wealth was inherited. However, larger bead caches with adults suggested that wealthy status could also be achieved. Prestige, inferred from elaborate mortuary treatment (e.g. burning of possessions or offerings), was surprisingly not correlated with measures of wealth but did have dietary implications. Dietary patterns were only weakly correlated with measures of wealth, but elevated $\delta^{13}\text{C}$ values of bone apatite were observed in individuals buried with Haliotis pendants, likely a marker of moiety affiliation. Multiple lines of evidence revealed social complexity at the Yukisma Mound, characteristic of ranked social organization.

Gardner, A. Dudley (Western Wyoming College), Glade Hadden and Adreanna Jensen (Western Anthropological and Archaeological Research)

[386] *Eagle Rock: A Brief Look at Cultural Changes in One Rock Shelter between 13,000 and 6,000 BP*

Eagle Rock is a multi-component site with occupational horizons dating from 13,000 to 350 BP. This rock shelter is located in west central Colorado along the Gunnison River. Between 13,000 to 6,000 BP there is evidence of change in the lithic technology at the site. This is readily apparent in the artifact assemblage. However, there seems to be some continuity in food-ways at the site. This presentation will briefly put forward what we have learned as a result of micro- and macro-botanical analysis over the last seven years. We will also put forward how the faunal remains at the site indicate subtle changes in diet but also indicate some continuity in terms of the types of meat processed and consumed at the site. Over time the continuity in food selection seems to indicate a dependence on similar plant and faunal resources at this site. There is a tenuous suggestion that throughout the sites occupational history certain food sources were always available at this location contributing to the reuse of this rock shelter by a variety of groups from 13,000 to 6,000 BP.

[133] *Possible Functions of a Late Prehistoric Coarseware from the Estuary Zone of Eastern Soconusco*

Recent surveys in the mangrove zone of far-southern Pacific coastal Chiapas, Mexico, identified a coarse pottery, called "sewer-pipe ware," that was initially thought to have been used in sal cocida salt production during historic times. Distributional and excavation data along with functional considerations, however, point to a potentially more interesting hypothesis, namely that "sewer-pipe ware" vessels may be portable kilns or saggars used in the production of Plumbate pottery, a famous and widely traded ware of the Late Classic and Early Postclassic periods. The present paper presents evidence that supports the portable-kiln hypothesis, as well as evidence favoring alternative hypotheses.

[352] *Religious Symbolism In Eastern California Ghost Dance Rock Paintings*

Multi-colored, historic Native American rock paintings are found throughout eastern California. In a minimum of 21 locations, Native, indigenous, polychromatic rock paintings have been documented that apparently date to a time period between 1870 and 1900 (Schiffman et al. 1983; Garfinkel 1978, 1982, 2005, 2007). These rock painting sites exhibit subject matter that may relate to revitalistic religious movements popular during this short 30 year time frame. Such paintings have been described and detailed analysis provided as a basis for asserting that they relate specifically to Native American Ghost Dance religious observances. The present discussion provides more extensive and systematic analysis attempting to show how the element composition of one of the largest and most elaborate of these sites is a visual representation of an overall cosmology informed by Numic religion and Ghost Dance ontology (Goss 1972; Hittman 1997, 2014; Hultkrantz 1986; Vander 1997). Specifically, it appears that certain paintings in eastern California exhibit elements of Numic cosmology and Ghost Dance religion manifesting central ideational themes through their subject matter, use of certain colors, animal attributes, spatial arrangement of figures and order of color applied - reconstructed via superimposition.

Garlinghouse, Thomas (Albion Environmental, Inc.), Sarah Peelo (Albion Environmental, Inc.),

Linda Hylkema (Santa Clara University) and Clinton Blount (Albion Environmental, Inc.)**[310]** *Persistence and Change: Evidence from the Indian Rancheria at the Third Mission Santa Clara de Asis*

Recent archaeological excavations within the Indian Rancheria at Mission Santa Clara de Asís have uncovered a dense accumulation of Mission Period refuse, most conspicuously cattle bone. Analysis of these remains suggests a “matanza-like” event that was geared primarily toward supplying the indigenous community with beef. A variety of wild foods, especially fish and waterfowl, was also recovered. This variety suggests that mission Indians devoted considerable time, energy, and effort in securing their traditional resources. Analysis of the artifact assemblage suggests a similar scenario. Mission Indians were introduced to European tools; however, these new implements did not supplant the already existing Native material culture. The indigenous population continued to work stone, bone, shell, and fiber, while, at the same time, often using these new metal implements in wholly indigenous ways. Taken together, the evidence suggests that at least some Native values and lifeways persisted despite the constraints of the colonial system. Indeed, this evidence suggests that the Native inhabitants within the mission, rather than undergoing what some scholars have deemed a “cultural extinction”, actively engaged and negotiated the constraints of European colonialism. We argue that this negotiation can best be viewed as a dynamic process of both change and persistence.

Garner, Nancy (University of Tulsa) and H. Thomas Foster, II (University of Tulsa)**[327]** *Interactions with the Lower Creek: Historic Document Quantification*

Historic documents are a useful tool in understanding post-contact archaeological sites. Documents can show different forms of interaction between Europeans and Native Americans and chronicle events that are invisible in the archaeological record. Notations in archaeological reports often refer back to letters, journals, orders, laws, treaties, reports, newspaper articles and trade records, to support findings and give credence to interpretations of the past. However, use of historic documents has some troubling challenges, one of which, is the qualitative nature inherent in document use. Often a single document reference is used to support an interpretation. This paper offers a method by which historic documents can be quantified and seeks to create a more scientific approach to using documents to support archaeological conclusions. Using interactions between the Lower Creek and westerners as a case study, historic documents, written between 1620 and 1840, and containing information about events in North America's colonial period and early American Republic were analyzed and quantified. Preliminary results indicate that this method of quantification reflects historic events seen both in the document and archaeological records.

[327] *Chair***Garraty, Christopher (Logan Simpson Design)****[304]** *Settlement Dynamics in the Margins of Hohokam Villages in Canal System 2: Recent Investigations at La Ciudad*

Recent excavations at La Ciudad highlight settlement and socioeconomic changes along the margins of the larger village during the Pre-Classic period, especially the Pioneer-Colonial period transition. High-resolution chronological evidence was obtained based on a combination of radiocarbon, archaeomagnetic, and luminescence assays, including an unprecedented 34 optically and thermally stimulated luminescence assays from ceramic sherds. In addition, 36 archaeomagnetic assays from an early investigation in a more densely occupied area of La Ciudad were reexamined using the current archaeomagnetic curve for the U.S Southwest. This chronological information provides a refined diachronic perspective from which to evaluate and compare patterns of village development and growth in central and peripheral residential areas of the village. The settlement trends observed at La Ciudad are compared with settlement evidence from other Hohokam sites along Canal System 2 to infer broader patterns of Hohokam village development and growth.

Garrett, Timothy [248] see Duffy, Lisa

Garrett, Zenobie (New York University)**[289]** *Bridging the Gap: Understanding the Empty Medieval Landscape of Post-Roman Aquitaine*

The end of the Roman Empire is marked archaeologically by an impressive shift in material culture. Changes in land organization and the use of more ephemeral building materials created a largely invisible and difficult to detect post-Roman landscape. Archaeologists initially assumed such landscapes were abandoned as a result of the political and economic chaos resulting from Rome's fall. Work in northwest Europe in the past two decades, however has shown that new techniques can help locate these post-Roman occupations, and the issue of abandonment is much more complex than originally assumed. In the Dordogne area of France, the situation has been exacerbated by a lack of documentation both historically and archaeologically. Both Roman and post-Roman occupations are underrepresented; creating a map that is largely devoid of archaeological material. Using GIS analysis, I will address whether this "emptiness" represents cultural absence or simply new forms of cultural organization. In doing so, I will problematize the issue of site definition, particularly in regards to survey strategies and landscape analysis and posit ways archaeologists can include empty 'scapes' in their analysis.

[289] *Chair***Garrido, Francisco (University of Pittsburgh)****[46]** *Non-State Artisan Specializations and Exchange in the Margins of the Inca Empire*

Although most of the time is assumed that local economies were almost completely overtaken and transformed by the interest of Inca elites, there were situations where households behaved in more autonomous and probably unexpected ways from the point of view of the empire. Low-scale artisan specialization in mining related activities using imperial infrastructure such as the Inca road was one of the ways to thrive and succeed during times of political change, when isolated areas like the Atacama desert became more globalized and integrated into wider social systems. Opportunities for exchange were open and profited by some corporate groups who detached themselves from agricultural production. They became at least for some seasons full-time miners and artisans living and working far from home in the middle of the desert.

Garrison, Ervan [192] see Cook, Jessica

Garrison, Thomas (University of Southern California) and Brett Houk (Texas Tech University)**[244]** *Crossing Ancient and Modern Borders: Territoriality in the Three Rivers Region*

The lowland jungle environment of the Maya area presents numerous challenges to archaeologists in the study of ancient territoriality. Incomplete settlement survey data and fragmentary textual records hinder attempts to formulate comprehensive hypotheses comparable to those put forth for complex societies in other areas of the world. The Three Rivers Region of northeast Guatemala and northwest Belize is one area where some advancements may be made. Large portions of the region have been surveyed over the last 30 years on both side of the modern national border, and there is a firm understanding of the environmental history of the region, which played a crucial part in territorial dynamics through time. This paper presents case studies from the San Bartolo-Xultun territory in Guatemala and the Chan Chich territory in Belize to illustrate how a long record of regionally based research has allowed for some progress in our understanding of ancient political boundaries at local levels and argues that new technologies will only improve upon this knowledge moving forward.

Garrison, Andrew (Scientific Resource Surveys, Inc.), Connie "Destiny" Colocho (Scientific Resource Surveys, Inc.) and Nancy "Anastasia" Wiley (Scientific Resource Surveys, Inc.)**[310]** *Getting into the Groove: Replicating the Southern California Cogged Stone*

Cogged Stones are an ambiguous artifact often associated with Bolsa Chica in Orange County, California. Scientific Resource Surveys, Inc., has been involved in the study of the Bolsa Chica mesa for over 30 years resulting in the longest privately funded cultural resource investigations in Southern

California. This poster highlights one facet of SRSinc's, current studies on the cogged stones. It has been purposed that the manufacture of cogged stones took place on the Bolsa Chica mesa at the site known as CA-ORA-83. Cogged Stones from the Bolsa Chica collection range from gritty porous material such as vesicular basalts, to denser tough material, like andesite, indicating the manufacture of the artifact type would have likely followed a similar trajectory seen in the production of utilitarian groundstone implements. As highlighted in another poster by SRSinc, tools associated with groundstone production were prevalent within the lithic assemblage of the site. Drawing on past replicative experiments, SRSinc, developed a hypothetical manufacturing sequence for the cogged stones. Utilizing the proposed sequence, SRSinc conducted a number of replicative experiments to test how well beveled shaped hammerstones worked in the manufacture of cogged stones on different lithic materials.

Garvey, Raven (University of Michigan) and Robert Bettinger (University of California-Davis)

[135] *Cultural Transmission and Diversity among Hunter-Gatherers of the Subarctic and Subantarctic*

The behavioral ecological approach Kelly champions in the Foraging Spectrum has clearly enhanced our understanding of hunter-gatherer diversity. Still, despite important developments in modeling and comparative analysis in the twenty years since first publication, occasional stark contrasts between groups living in similar environments suggest that ecological factors and adaptive behaviors cannot alone account for the impressive record of ethnographic and archaeological diversity. We consider one such case—contemporaneous hunter-gatherers of the Subarctic and Subantarctic—from the perspective of cultural transmission theory to restate the special role of culture in explaining hunter-gatherer diversity.

Gasco, Janine (CSU-Dominguez Hills)

[194] *Life in the Tributary Province of Xoconochco*

Our work on Late Postclassic Xoconochco/Soconusco has been greatly influenced by research carried out by Frances Berdan, particularly her focus on the Codex Mendoza and other Aztec documents and her approach which integrates multiple disciplines. In this paper I use ethnohistoric and archaeological data to review the role of the Soconusco region as an Aztec tributary province. More specifically, I examine what these data seem to tell us about how the Aztec conquest and the subsequent collection of tribute payments impacted the local population of the Soconusco. I also discuss the process by which we sometimes have to reconcile the seemingly contradictory evidence provided by the documentary and the archaeological record.

Gaskell, Sandra (Tribal Archaeologist Southern Sierra Miwuk Nation), Danette Johnson (Tribal GIS Analyst, Southern Sierra Miwuk Nation), James Les (Past Chairman, Southern Sierra Miwuk Nation), Lois Martin (Chairwoman, Southern Sierra Miwuk Nation) and Sis Calhoun (Traditional Elder, Woman of the Bear, Southern Sie)

[66] *The Rights of Construction Design for Ancient Architecture Wah-ho-ga Village Traditional Ceremonial Structure of the Seven Affiliated Tribes of Yosemite*

As the exploration into the political and legal relationships between the United States and Indian Tribes continues into the area of building codes and regulations for non-modern and ancient traditional methods, what transpires here at Wah-ho-ga may have a broad range effect upon traditional structures in other Native American territories all over the nation where traditional ceremonial practices occur. The current building codes based upon far different construction methods and materials cannot grade the stability of a traditional ceremonial structure but have been used to degrade the cultural integrity and traditional significance of the current structure. The Seven Affiliated Tribes of Yosemite agree that ancient methods prevail

Gaspar, Maria (Museu Nacional) and Daniela Klokler (Universidade Federal de Sergipe)

[152] *Shell Mounds from Southern and Southeastern Brazil*

Systematic archaeological research focused for centuries on large scale shell mounds and now scholars have turned their attention to smaller sites located on the southeastern coast of Brazil.

Similar to large mounds, these sites were built with mollusk and fish remains, have a complex stratigraphy and high numbers of burials. Researchers have used data from the formation processes and funerary contexts to establish comparisons between regions. Results indicate that small mounds located around the Guanabara bay in Rio de Janeiro, despite their specificities related to size, were constructed following the same set of activities that resulted in the construction of monumental shell mounds at the Santa Catarina state. The repetition of funerary rituals, the inclusion of hearths and offerings and the care with bodies are present in both regions, indicating similar customs in a greater extension of the coast. An interest in "body" preservation through the deposition within shell valves is seen as a structuring element in these societies.

Gatsov, Ivan and Petranka Nedelcheva

[211] *Lithic Assemblages in NW Turkey during the 7-6 Millennium B.C.*

This paper deals with the main features of the lithic technology, which appeared at the settlements south and east of Marmara Sea and Eastern Thrace during the 7-6 mill B.C. The new results show evident invariability in those technological and typological characteristics, which may provide direct proof for common lithic traditions and possibly similar environment features in the region. A new question arises after the research of the Central Northwest Anatolia lithic artifacts. This empirical material could be related with the suggested earliest traces of PPNB occupation in the area of south and east of Marmara Sea and Eastern Thrace. In this connection it should be suggested that the region was penetrated before the appearance of the first pottery Neolithic bearers.

Gaudreau, Mariane (Simon Fraser University)

[374] *Oral Narratives and Archaeology: Telling Multiple Stories for Multiple Pasts?*

It is widely accepted that the study of material culture and oral narratives are two different but equally important avenues for looking into the past. While the distinct sets of data they produce frequently corroborate and/or complement each other, allowing for a deeper understanding of the past, discrepancies are not uncommon. In those cases, "scientific" data often take precedence and local knowledge is marginalized. While archaeologists see oral narratives as useful "tools" to archaeological interpretations, ones they can incorporate or discard, for First Nation groups, such narratives form the core of their identity and their history, and thus are essential to preserving their culture and their past. This ranking of knowledge is something Indigenous scholars have been denouncing for many years now on the grounds that knowledge systems should be evaluated within their own epistemological logic. Privileging archaeological interpretations over traditional knowledge can lead to substantial conflict between researchers and descendant communities, with negative impacts on communities, especially when the archaeological data challenges the latter's conceptions of "identity," "history," and "heritage." In this paper I consider the ethical and social implications of the bridging of knowledge derived from distinct epistemologies and of the use of oral traditions by archaeologists.

Gauthier, Nicolas (Arizona State University), Christina Luke (Boston University) and Christopher Roosevelt (Boston University)

[167] *Extreme Weather Events and 10,000 Years of Land-Use Change in the Gediz River Valley*

We analyze long-term community responses to extreme weather events in the Gediz River valley of western Anatolia. Today, as in antiquity, the valley is one of the most agriculturally productive in Turkey, and its agroecosystem is well-adapted to the seasonal variability of its Mediterranean environment. Nevertheless — and in spite of modern water-management infrastructure — unpredictable droughts, storms, and floods can still devastate the region's food production. How were the valley's ancient inhabitants able to sustain themselves, and even flourish, in the face of such risks? To answer this question, we draw on diverse lines of evidence — including aerial imagery, oral histories, early traveler accounts, municipal records, engineering reports, paleo-environmental data, and global climate models — to reconstruct the frequency and severity of droughts, storms, and floods in the valley over the past 10,000. We then couple these

reconstructions with simple computational models of agricultural production and land-use change in the valley, and test the results against data from 10 years of intensive surface survey conducted by the Central Lydia Archaeological Survey. We argue that the flexibility of small-scale agropastoral production and transhumant pastoralist networks is the key to long-term, sustainable settlement in the valley.

[416] *A Civil War Period Ossuary Pit, Point San Jose Hospital Site, San Francisco*

The United States Army reactivated Point San Jose, a military base established by Spanish in 1776, during the Civil War to protect the San Francisco Bay from Confederate threats. In 2010, the National Park Service undertook rehabilitation of several historic buildings dating back to the late nineteenth century. This paper examines a significant feature discovered during the refurbishment of the army hospital that was active from 1863 to 1903. Archaeological monitors discovered an ossuary pit containing human remains during removal of contaminated soils around the foundation of the structure. Careful excavation of the pit revealed a profusion of waste material from the hospital that included unarticulated post-cranial and cranial elements from multiple individuals. Diagnostic bottles recovered from the feature indicate that the deposit dates to between 1860 and 1880. Historic research on the Point San Jose hospital and staff provide amazing insight into the nature of this feature and its formation.

[179] *The Diversity of Botanical Food of the Hemudu People: Evidence from an Examination of Food Residues in a Fu pot*

Carbonized black debris was found in many fu pots recovered from an early stratum at the Hemudu site (c. 7000–6500 cal. BP). The debris resembles food residues. Although this kind of debris has been regarded as residues of cooked rice for a long time, so far no specific research has been conducted. To clarify the nature of these residues, we carried out a microscopic morphological analysis and stable isotope analysis on one of the specimens. The morphological analysis found starch granules of a variety of plant tissues, including seeds of the genus rice (*Oryza* sp.), the bulb of the genus lily (*Lilium* sp.), seeds of *Quercus variabilis*, seeds of *Vigna* sp. and *Triticeae*. Stable isotope analysis shows that the residue was mainly composed of C3 plants, without or with very little animal material. These results prove that the residues in the fu pots of Hemudu were really food remains, but not purely made from rice. This study reveals the diversity of botanical food of Hemudu people and also provides new clues regarding the function of fu pots as cooking vessels.

[54] *Investigating Wood Acquisition Strategies from Archaeological Charcoal: Implications for the Bronze Age Site of Pecica Șanțul Mare*

The Bronze Age site Pecica Șanțul Mare is an important fortified tell settlement in Arad County, Romania. Situated along the river Mureș, Pecica lies within a unique resource zone between the ore rich region of the Western Carpathian Mountains and Carpathian Basin. While metal production and regional connectivity are associated with the site, it is poorly known how wood fuel for metal work was acquired. Archaeological charcoal remains are often used to reconstruct local woodland compositions of the past. Given the role of wood fuel as a potential limiting factor in metalworking, analysis of archaeological charcoal sheds light on the usefulness, abundance, and procurement of wood for fuel. Through analyzing archaeological charcoal, evidence of fuel management and acquisition strategies can be used to improve our understanding of the regional connectivity of

metalworking.

Geiger, B (University of California, Santa Barbara)

[131] *Cuts to the Bone: Using Scalping Evidence to Examine the Relationship Between Warfare and Gender in Pre- and Proto-Historic North America*

Stories of brutal cranial de-fleshing terrorized European settlers throughout colonial North America for centuries. Scalping was simultaneously dreaded by common settlers and promoted by European military leaders. In this context, scalping has often been viewed from a western, etic perspective. However, recent bioarchaeological studies of prehistoric scalping provide an opportunity to examine the cultural contexts of scalping and trophy-taking within American Indian culture, both before and after European contact. In this paper, I use multiple lines of evidence, including bioarchaeological sex and age data from scalping victims, to examine the dynamic relationship between gender and warfare as it changed over time in North America.

Geller, Pamela (University of Miami)

[146] *Love Never Dies?*

In this talk, I examine the contemporary commonsensical thinking about sex, gender, and sexuality that informs study of bioarchaeological remains. To this end, I focus on double burials whose decedents appear to be embracing—their discovery, investigation, and presentation in scholarly and popular settings. Images of and stories about these ancient embracers garner significant and often sensationalized attention in myriad global spaces. Here I deliberate about their representation in mediascapes, museum exhibits, and heritage sites. What dominant discourses and representations about sex, gender, and sexuality circulate in these spheres? In answer, I argue that proximity is cited as evidence by archaeologist and non-specialists alike of eternal, romantic, and heteronormative love. Dissemination and consumption occur with minimal consideration of the disparate cultures, geographic locations, and time periods from which these burials come. What, I query, is the consequence—intellectually, ideologically, economically, politically—of identifying these burials' ancient occupants as lovers? Ultimately, I argue that to interrogate our common sense about sex, gender, and sexuality in the past invites us to think more deeply about the naturalization of culture, consequences of scientific study, and ways evidence from the past is represented to the public.

[7] *Measuring Power and Influence: GIS Modeling of Political Spheres of Influence*

In an area where most of the written record is destroyed, modeling political interactions through spatial relationships with the environment and other political centers along with exchange relationships, can provide insight into regional inter-site relationships. This poster displays a theoretical model using Geographic Information Systems technology of regional heterarchical relationships between sites in the Northeastern Petén. The model is formulated by implementing hierarchical political markers and environmental elements as weighted variables to estimate political spheres of influence. Weighted Voronoi diagrams are used to create theoretical political boundaries that provide modeled perimeters of political economies, and by extension power and influence between sites. This theoretical approach can then be measured archaeologically by using the distributional model of network exchange. Modeled boundaries coupled with the distributional approach can then test proposed theories of political allegiances and/or conflict between centers.

Gentry, Jewel (California State University Monterey Bay)

[30] *Marking the Sacred: Reading between the abraded lines of Mission San Miguel the Arcángel*

The Californian Spanish colonial community of Mission San Miguel the Arcángel consisted primarily of Salinan, Tulare native populations and included neophyte Indians from previously established Missions of San Luis Obispo and San Antonio. Within the Mission Church examples of 19th century "graffiti" can be found etched throughout the sanctified interior. Researchers have suggested that specific sections of these stylized markings are analogous to California Indian rock art with parallels being drawn from regional archaeological sites. The present research works to broaden previous studies by relating spatial positions of proposed neophyte etchings within San Miguel to Catholic mandates which directed the use of sacred space. Spatial and liturgical organization of neophytes within the mission church was defined by many factors including; age, gender, musical aptitude, and level of religious training. By tradition and edict access to Catholic sacred space was linked to neophyte identity and status. Associated to this, proposed neophyte etching within the church of Mission San Miguel are found located in pronounced form in areas of access corresponding to prominent positions within the church community. This observation offers many compelling perspectives related to the continuance and conflation of indigenous traditions and the formation of sacred space.

[91] *Archaic and Formative Period Obsidian Exchange on the coast of Guerrero, Mexico*

Long-distance trade of obsidian formed an essential part of inter-regional Archaic and Formative Period Mesoamerican economies (~3,500 B.C.-A.D. 250). We analyzed obsidian artifacts (n=522) from Late Archaic through Late Formative Period deposits at the sites of Puerto Marques and La Zanja in the Acapulco Bay region of Guerrero, Mexico using X-ray fluorescence spectrometry to assess the economic importance of different obsidian sources through time. The presence of obsidian artifacts at Puerto Marques indicates that coastal populations in coastal Guerrero joined developing exchange networks by at least 3,500 B.C. Highland Mexican obsidian sources dominate the assemblages at both sites with Otumba (Estado de México) emerging as the primary source used during the Late Archaic Period (3,500-1,600 B.C.). Ucareo-Zinapécuaro (Michoacán) predominates during the Early Formative (1,600-1,000 B.C.) prior to the diversification of obsidian source use in the Middle Formative (1,000-550 B.C.). The number of sources used in the Late Formative Period (550 B.C.-A.D. 250) appears to contract, but our sample is small for this interval. These data contribute to our understanding of early exchange networks that ultimately provided the foundation for the emergence of more complex societies in Mesoamerica.

[28] *Paleolithic Dogs in Europe and Siberia*

Our group has demonstrated, on the basis of detailed morphometric analyses, the antiquity of the domestication of the wolf. The dog is the first domesticated animal and its origin can be traced to the Upper Paleolithic. Two canid morphotypes can be distinguished in Pleistocene Eurasian sites dating from before and after the Last Glacial Maximum (LGM): a morphotype that is similar to extant wolves, described by us as Pleistocene wolves, and a morphotype distinct from wolves. Relative to wolves, the latter morphotype is characterized by short skulls and snouts, and wide palates, and short mandibles and lower carnassials. The upper and lower carnassials of this morphotype are larger than those of modern dogs. To differentiate this morphotype from modern dogs, they are termed Paleolithic dogs. So far, sites with Paleolithic dogs dating from before the LGM are limited. Sites yielding material from Paleolithic dogs dating from after the LGM are more numerous and wide spread, as far as northern Siberia and the Far East. Here we present the fossil canids from these Pleistocene Eurasian sites, including a canid pup found in the permafrost of northern Yakutia.

[254] *Legal Responses to the Intentional Destruction and Looting of Cultural Sites: The Paradigm of Syria*

The civil war in Syria, now in its fourth year and with multiple parties, has engendered probably the most widespread and numerous examples of destruction, damage and looting of cultural sites since the Second World War. Several international legal instruments, including the 1954 Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict and its First Protocol, were drafted in the wake of World War II to prevent the repetition of such harms inflicted on cultural sites and repositories. More recently, the prosecution of military leaders by the International Criminal Tribunal for the former Yugoslavia, the increasing use of customary international law, and the adoption of the Second Protocol to the 1954 Hague Convention have raised awareness of the consequences of violating these international legal norms and treaty obligations. Despite these provisions, the parties to the conflict in Syria have continued to engage in cultural heritage destruction for differing reasons and motivations. This paper will explore the deterrents of international law and its limits in protecting cultural heritage.

Geurds, Alexander (Leiden University - University of Colorado Boulder)

[246] *Understanding Exchange in Late Prehispanic Central America. Current Thinking on Culture Areas and Ethnicity*

This paper argues that improving understanding of exchange in Central American prehistory is hampered by static cultural taxonomies, and traditions of thinking and publishing that are limited in terms of the 'archaeology of Costa Rica, Nicaragua, Panama', dividing the field to the point where scholars are uncomfortable discussing Prehispanic Central America as such. This has put an unsatisfactory halt to the discussion about how to understand and conceptualize this isthmian region. If ethnic and cultural containers were forgotten, then the diversity of material culture would become apparent. Clearly recognizable object forms such as circular earthworks, and monumental stone sculpture would still be apparent. A bewildering diversity of different 'styles', however, would predominate. In material culture terms, Late Prehispanic Central America is about the reworking and redistributing of such material forms. To allow for an analysis of such object mobility in Central America, an archaeological viewpoint is needed that studies the diversity from a global and local vantage point, perhaps using landscape characteristics as a point of departure. The argument is illustrated by the Late Prehispanic period coastal exchange routes between Mexico and Costa Rica that date back to the Middle Formative period, becoming part of the Mixteca-Puebla pottery complex.

[362] *Comparative Analysis of Incised Stone Artifacts from Gatecliff Shelter and Ruby Cave, Great Basin, Nevada*

As part of our on-going research on incised stones throughout Nevada, this poster presents the results of a comparative study we recently undertook of the Ruby Cave artifact collection and Trudy Thomas's (1983) illustrations of the Gatecliff Shelter collection in order to determine whether shared stylistic patterns exist between the two incised stone assemblages. Our analysis techniques are based on a combination of methods used by previous researchers in the Great Basin as well as new methods employed in the analysis of rock art.

Gibbons, Kevin (University of Maryland) and George Hambrecht (University of Maryland)

[154] *Icelandic Livestock Improvement and an Emerging National Identity: Biometrical and Genetic Markers of a New Landscape*

Early in the settlement of Iceland, social perceptions were imported along with herds of livestock primarily from Norway. Cultural identity and agricultural traditions can influence and react upon each

other. Iceland provides a unique location to explore these intersections as an island intellectually connected to Europe but isolated from significant trade routes. An exploration of Iceland's rich literary tradition suggests that the Icelandic social landscape coalesced and matured from the early settlement period into a new national identity with an ideological state apparatus related to the Church. During this process, statistically significant improvements to the size of livestock occurred. The increase in the size of domestic animals across Europe has often been characterized as a result of the Second Agricultural Revolution. However, biometrical data from the ninth to the eighteenth centuries suggest that significant increases in the size of caprine and bovine bone dimensions were occurring in the late medieval period. The possibilities of new aDNA data from Icelandic faunal remains are discussed in order to refine our understanding of the change in body size and population of livestock in Iceland throughout the millennium, in comparison to our deeper understanding of similar processes across Europe.

Gibbs, Kevin (University of California, Berkeley)

[89] *Inclusions and Innovations in Late Neolithic Pottery from the Southern Levant*

Discussions of variation over time in early Near Eastern pottery production often focus on linking changes in form or surface treatment to shifts in how pots were being used, either as a functional cooking or storage container or, in some cases, as a symbolic object. More rarely, compositional characteristics (clay, temper) are examined and these too have been considered in terms of vessel use. Some tempers, for example, are thought to be beneficial for the production of cooking pots because of their thermal properties. In this paper I examine developments in the production of Late Neolithic pottery from the southern Levant, focusing on fabric composition and texture. Rather than seeing a straightforward link between these properties and vessel use, I argue for a more nuanced perspective that considers the influence and continued impact of earlier technological innovations. In particular, drawing on evidence from petrographic analyses, the economics of increasing returns, and theories of object entanglement, I consider how similar ceramic fabrics might reflect a range of pottery uses, including expedient vessels that were not made with longevity in mind.

Gibson, Kathleen (University of Texas-Houston)

[33] *Primatology, Developmental Psychology, and the Birth of Cognitive Archaeology*

Charting the emergence of human cognition from archaeological remains requires reconstructing the probable behavioral capacities of the last common chimpanzee/human ancestor and delineating the cognitive, motor, and social abilities that underpin the production of hominin material cultures. Hence, the birth and growth of cognitive archaeology has long depended upon research findings in other disciplines. This paper provides a brief overview of historical perceptions of adult and immature human and non-human primate cognitive capacities, brain plasticity and genetic assimilation. It suggests that the clearest evidence of emerging human cognition derives from archaeological remains indicating the construction of tools, materials, and activities from multiple physical, motor, and/or social units. Even among populations with essentially modern genetically-based neurological capacities, adult cognitive and motor skills would have varied depending on material and social inputs during infancy and childhood.

Gibson, Heather [175] see Dietler, John

Gidding, Aaron (University of California, San Diego)

[402] *Assessing Ancient Vertical Integration: Copper Production in Early Bronze Age Southern Levant*

In the later part of the Early Bronze Age (~2800 B.C.E. - 2500 B.C.E.) the collapse of the first "urban" settlements was beginning. That collapse led to a period predominantly identified with ruralism and pastoralism, the Early Bronze IV (~2500 B.C.E. - 2000 B.C.E.). Within this context, the site of Khirbat Hamra Ifdan (KHI) was founded and sustained as a copper manufactory in the peripheral Faynan district of southern Jordan, unprecedented in scale and close to the source of copper ore. Before the foundation of KHI, copper production had been dispersed across the southern Levant, with multiple sites showing evidence of local production. This revelation highlights a conundrum regarding how an

export-oriented commodity like copper would flourish in the face of the social collapse occurring across the rest of the Levant and neighboring regions as the Early Bronze Age came to a close. Typically one would expect such an intensification to be impossible in the face of urban collapse. This paper will review data for copper production during the Early Bronze Age and present a revised argument describing the relationship of the copper production and distribution system originating in Faynan to the surrounding region.

Giersz, Milosz, Patrycja Prządka Giersz (Faculty of 'Artes Liberales', University of Warsaw) and Wiesław Wieckowski (Institute of Archaeology, University of Warsaw)

[227] *Entangled Encounters in the Wari World: Coast-Highland Interactions during the Middle Horizon as Revealed by the Archaeological and Bioarchaeological Investigations in the Castillo de Huarmey, North-Central Coast of Peru*

Wari (600-1050 A.D.) was the first prehispanic political organization that succeeded in the consolidation of vast lands in the central Andes into one multi-ethnic, cultural, and linguistic realm, creating the conditions of a mini world-system. The products and networks of exchange connected heterogeneous populations from distinct parts of the empire, whose political complexity was reflected in a variety of styles, due to the co-existence of local traditions, with production that imitated foreign styles, and the forced displacement of artisans. This paper shows that the Wari provincial center located at the site of Castillo de Huarmey was an important place of inter-group relationships and new identities established and negotiated by imperial elites. This is reflected not only in the monumental architecture that served as the physical focus of Wari ancestor worship, but also in the results of the bioarchaeological analyses of the human remains and grave goods from the burial chambers of 58 Wari noblewomen, considered to be the most complex set of rare Wari personal effects found to date in the previously undisturbed burial chamber which embraces diverse, and sometimes totally opposite, artistic, iconographic and technological craft traditions that originated from different cultural and technological backgrounds.

[232] *Expressions of Power in Public Architecture in the Lurín Valley*

This paper examines public architecture and expressions of power in the Lurín Valley of central-coast Peru. During the Late Intermediate and Late Horizon Periods adobe pyramids with ramps characterize the public architecture of sites in the valley. Analysis of the architectural configuration of pyramids with ramps in relation to domestic compounds within the public sectors of the settlement indicates a hierarchical arrangement. The conspicuous design and placement of the pyramids suggest a manipulation of physical space to articulate social order. An exploration of the use of public spaces at these sites can lead to a better understanding of the types of power used to create social organization in the Lurín Valley. The comparison of maps of the public structures at contemporaneous sites and information collected during excavations reveals a distinct pattern. This implies that elites used architecture to demonstrate power on a regional scale. Analysis of public and domestic architecture is based on fieldwork conducted during the 2012-2014 field seasons under the direction of Dr. Enrique Lopez-Hurtado.

[32] *Gathering Evidence: Terrestrial Plant Resources of California's Islands*

The abundance and diversity of terrestrial plant resources on the islands off the Pacific coast of southern Alta and Baja California vary in terms of island biogeographic distribution, ranging from pine forests and oak/juniper woodlands, to chaparral, cactus scrub and grassland habitats, among others. These plant resources provided food, medicine, and raw materials for island populations. However, island plant resources have long been described in the literature as "depauperate," an idea based largely on direct field observations of a flora decimated by historical overgrazing practices, yet one that has greatly influenced our interpretations of archaeological data. A growing body of paleoethnobotanical research demonstrates that macro- and microbotanical remains recovered from island contexts provide valuable data; however, interpretations vary on the extent to which recovered plants represent island resources versus mainland trade goods. We engage this discussion with a survey of the recovering modern island flora, combined with recent paleobotanical data including macrobotanical and starch grain analyses, indicating that island plant resources were significantly less marginal than previously thought.

[212] *Life on the Edge: An Investigation of 18th Century Spanish Colonial Subsistence Strategies in the Northern Rio Grande*

The 18th century Northern Rio Grande basin of New Mexico was a politically volatile and contested landscape. Hispano settlers, including those who established the aldea of San Antonio del Embudo (now Dixon, New Mexico) along the Embudo River in 1725, found themselves entangled in a complex web of socioeconomic interactions and, at times, hostilities with diverse indigenous peoples. To what extent did these Spanish colonists adhere to European subsistence strategies or embrace native foodways? Do trends in the relative dependence on wild versus domestic species reflect trade and contact with local indigenous groups or covary with periods of heightened hostility? This study presents the results of a recent analysis of faunal remains recovered during the 2013 excavation of a plaza midden from a residential structure at Dixon, New Mexico. The faunal record not only attests to the population's long-term reliance on European domesticates (sheep, goat, pig, and cattle), but also reveals the considerable importance of wild resources (deer, elk, bison, and bear) to village inhabitants. Further, the presence of worked bone artifacts provides tantalizing evidence for exchange with local native groups or perhaps indicates the presence of genízaro members of the San Antonio del Embudo community.

Gillam, Christopher (University of South Carolina (SRARP-SCIAA))

[4] *Not Your Ordinary Models: Exploring Time and Space with Ordinal Regression and Other Methods*

Advances in Archaeological Geographic Information Science and Informatics have enabled the refinement of archaeological statistics and other quantitative methods in recent years. Along the Central Savannah River of South Carolina, recent research on prehistoric site distributions and multicomponency has resulted in the development of several novel methodologies. Multivariate Analysis of Variance (MANOVA) enables the examination of the environmental context of archaeological sites through time. Likewise, Ordinal Regression analyses enable the development of predictive models highlighting the probability of multicomponency across the cultural landscape. The potential for these methods at various scales of analysis are promising.

Gillenwater, Collin (SUNY Albany) and Marilyn Masson (University at Albany, SUNY)

[413] *From Coast to Coast: Trade Routes and Commerce of Northwest Yucatán's Mayapán*

Late Postclassic Mayapán formed the nucleus of a complex system of trade routes in northwest Yucatán, some of which endured into the Contact Period. The importance of ports and overland trade routes to commerce in late Maya history has long been acknowledged, but landlocked Mayapán's specific connections to towns and exchange facilities has not been systematically considered from an archaeological perspective. Our analysis draws on Postclassic-to-Contact Period

historical and archaeological data with the goal of framing Mayapan's trade network within a regional perspective of connected and interdependent subject and allied towns. We consider settlement pattern evidence in order to identify secondary centers and smaller towns of greatest importance to trade, due to their strategic locations along overland routes that linked Mayapan to its ports. Sourcing of nonlocal artifacts exchanged into the urban center also sheds light on coastal trading towns of greatest importance to this city.

Gillespie, Susan (University of Florida)

[305] *Blocks, Bricks, and Material Practices of Inter-Subjectification at La Venta, Mexico*

La Venta, the Middle Formative Olmec capital, is famous for its unique structured deposits composed of thousands of serpentine blocks. The discovery of these "massive offerings" along with caches of fine jade artifacts was taken as evidence of a powerful ruling class who controlled this wealth and commanded the labor of countless commoners to bring the serpentine to La Venta, shape it into standardized forms, and bury it in a ritual precinct. This paper challenges that conventional interpretation, arguing that specific practices involving certain materials and the places of their use positioned some individuals as particular kinds of subjects in relation to other subject roles. Default categories of social difference, such as "elite" or "craftsman," are insufficient. A community of serpentine block-makers, engaged in hypertrophic production, emerged in relationship with both the stewards of the ritual precinct and with the producers of the more routine objects with which the blocks were juxtaposed: adobe bricks. The physical and design properties of these objects brought to bear in the bodily dispositions of their making made and reinforced subject positions, but these cannot be understood apart from each other or from the historical, material, and political contexts in which they played out.

[30] *The Sacred and the sacred*

The word sacred (or Sacred) can encompass many meanings. Some are tangible – others not. The sacred can exist in the mind or be defined on a map. Are there two sacreds – one with a small "s" and the other with a capital "S"? What constitutes the Sacred and who defines it, and with what parameters? How is sacredness determined, and who decides? Is it a legal term that is defined by the courts? Are there degrees of sacredness? Can sacred and profane co-exist? What role do Native oral traditions play in defining a sacred landscape? Is a sacred landscape static, or can it be fluid and change? From an archaeological perspective, the term sacred can be applied to rock art sites, formations on the physical landscape, rituals, artifacts, evidence of past activities, and even intangible oral traditions. Long before the word sacred entered the lexicon in the 14th century, evidence of the concept of sacredness was present. The papers presented in this symposium will explore the many facets of sacredness focusing on the concept of sacredness from an emic perspective.

Gilligan, Cheryl (Indiana University of Pennsylvania)

[165] *Moravian Ethnic Diversity: A Faunal Analysis of Northeastern Moravian Missionary Towns in Colonial America*

Moravian missionaries in the New World built towns in close proximity to Native American village sites in order to gain and house new converts. Although these Moravian town sites have received some archaeological attention, faunal remains have seldom been studied. A comparative faunal analysis between frontier-settled Moravian mission towns during the mid to late 18th century may reveal important information about the use of animals among the diverse ethnic groups inhabiting Moravian towns. Exploring topics such as wild versus domestic animal use, preferred cuts of meat, and the use of animal bone for tools or adornment can provide new insights into the interactions

between people and animals in Moravian missionary towns. This research provides a unique opportunity to reach an often silent group of people represented in the archaeological record during the tumultuous time period surrounding the power struggle for control of Colonial American lands.

Gilliland, Krista (Western Heritage) and Robin Woywitka (Alberta Culture)

[319] *Bring on the Boreal: Site Formation Processes and Archaeological Interpretation in Northern Alberta, Canada*

Archaeological sites in Canada's boreal forest are frequently difficult to interpret due to several factors, including (1) shallow archaeological stratigraphies, (2) non-diagnostic lithics dominate artifact assemblages, (3) low abundances of preserved organic materials, and (4) high potential for disturbance (cryoturbation and bioturbation). These difficulties can contribute to interpretations based on insufficient understandings of site formation processes, producing conclusions that undervalue boreal archaeological sites. In areas under high developmental pressure, such as Alberta's northern Oil Sands region, this can be devastating, resulting in irrevocable information loss.

However, in some areas of the boreal forest, the depositional context of archaeological sites appears to be largely intact, representing an under-utilized data source with which to better evaluate their cultural, archaeological, and/or paleoenvironmental significance. Here, we present the results from a case study in northern Alberta, employing geomorphology, stratigraphy, portable and formal optically-stimulated luminescence measurements, and soil micromorphology. We demonstrate that a formerly de-valued (i.e. "written off") site is actually largely undisturbed and represents two chronologically distinct occupations that likely pre-date the middle Holocene period. Our work has wider resonance in the fields of cultural resource management and regulating resource development in regions of rapid growth, particularly the north.

[399] *A Geoarchaeological Study of the Ancient Quarries of Río Bec (Campeche, México)*

The stone buildings of the Río Bec archaeological zone are a testament to the emergence of a new architectural tradition in the central Maya lowlands during the second half of the first millennium of our era. To understand this new architecture and the ways it has been conceived, a recent investigation has been carried out on the technological process involved in its production. Since construction practices can hardly be appreciated without considering the materials used by the builders, this investigation began with the study of the stones employed in Río Bec and the places from which they were obtained. Two different approaches have been followed. The first consisted in the lithostratigraphic and petrographic characterization of the limestone deposits that were exploited. The second was based on the examination of the distribution and configuration of the quarries surveyed and excavated during this study, as well as the documentation of all the traces of extraction discovered. The results of these works provided significant new data on building stone procurement in prehispanic times and, in particular, on the strategies and the technological choices adopted in Río Bec to extract stone.

Gilmore, Kevin (ERO Resources, Inc.)

[65] *Excavations at the Hurdy Gurdy Bridge Site (CA-DNO-1028), a Multicomponent Habitation Site in Northwest California*

The Hurdy Gurdy Bridge site (CA-DNO-1028), located 19 kilometers in a direct line and 45 kilometers along the Smith and South Fork rivers from the coast, was excavated because it was within the impact area of the proposed replacement of a bridge over Hurdygurdy Creek by the Federal Highways Administration. Data recovery consisted of geophysical investigations, the excavation of backhoe trenches, shovel probes, and 42 square-meter excavation units. These investigations recovered cultural material from the Early/Middle Period transition through late Contact Period occupations defined by obsidian hydration (OH), AMS, and temporally diagnostic artifacts deposited on the bar and swale surface of a Pleistocene debris flow. A round, expedient, Late Period

semi-subterranean plank house (Feature 10) dated to the late 14th Century may represent an intrusion into the Tolowa homeland by ethnically distinct people from the northern interior for trade. Comparison of OH defined occupations between the sites in the lower Smith River Basin and Hurdy Gurdy Bridge suggest that through time there were periods when upriver sites were occupied more frequently in favor of down-river sites, and vice versa. These population movements may have been in response to periods of drought.

[348] *Locating Events in Process: A Multiscalar Examination of Early Pottery in the Southeastern U.S. Using Bayesian Statistics*

One of archaeology's unique strengths is the ability to construct cultural histories that span vast spatiotemporal scales. It is imperative, however, that these so-called "big histories" be balanced with consideration of the actual events through which they were experienced and contributed to by real people occupying diverse contexts. In the southeastern U.S., the initial adoption of pottery technology has been variously portrayed as either a protracted diffusionary process with few discernable cultural impacts or a regionwide "container revolution" that set Archaic hunter-gatherers on an inevitable pathway toward farming, sedentism, and social complexity. In this paper, Bayesian statistics are applied to scores of radiocarbon assays associated with early fiber-tempered wares in South Carolina, Georgia, and Florida. The results are used to examine the adoption and spread of pottery technology at multiple spatial scales, ranging from the subcontinental to the local. Particular focus is directed toward two large, well-dated sites—Stallings Island and Silver Glen—that exemplify the diverse, context-specific manner in which pottery was incorporated into existing traditions and interactions. More generally, these examples help illustrate the complex and often contradictory relationships that exist between localized events and the larger historical processes in which they are implicated.

Gilstrap, William (University of Sheffield) and Peter M. Day

[79] *"A Burden of One's Own Choice Is Not Felt": Observing Ceramic Production Technology, Exchange and Consumption in the Late Mycenaean Saronic Gulf*

It is widely recognized that Mycenaean states varied in their structure and organization, were linked to different types of crafting industries, a range of trade networks and a host of consumer preferences. The Saronic Gulf is a paradoxical space that physically separates Mycenaean geopolitical states/regions, while its waters facilitate the interregional movement of people, goods and ideas. The application of thin section petrography and INAA to observe the movement of pottery, the most archaeologically visible good exchanged in this area during the Late Mycenaean period, has resulted in the identification of a restricted number of pottery production locations and the wide movement of their ceramic products. Taking into account complete vessel assemblages representing different activities within this landscape, we have identified patterns of availability of varied pottery types to ordinary consumers in the area. This paper examines links between the technical choices made during the production sequence of a select group of vessel types and the choices made at the consumer end of the spectrum. In this way, we are able to observe and characterize several key variables of the regional ceramic ecology, economy and social life of the region and to contextualize it within the wider Mycenaean world.

[333] *Archaeological and Geomorphic Investigations of Paleoindian Sites near Smith Mountain, VA.*

Identification of stratified Paleoindian components in eastern North America is rare. Because few stratified sites exist, cultural chronologies and depictions of Paleoindian lifeways have been drawn from large geographic areas and warrant revision. Recent work along the upper Roanoke River in

Virginia has identified several sites that show an almost complete cultural sequence from 8,000 to 13,000 calendar years ago. These sites also show the use of a unique suite of lithic raw materials during the Paleoindian period. This variation in lithic resource use expands our current knowledge of mobility patterns within the Southeast and may highlight specific transportation corridors. A combination of both continuity and change in lithic use between the early Paleoindian and later periods provide insights into shifts in range mobility and variation in landscape use over time. In this paper, we outline our current research strategy along the Roanoke River in the southwestern piedmont of Virginia. We report on new lithic sourcing and efforts to document intact and stratigraphically separate cultural components. This research is also contributing to our understanding of climate change by documenting the localized signature of the Younger Drays and the Pleistocene/Holocene transition, through change in soil development, sedimentation rates, and landscape formation.

Giomi, Evan (University of Arizona)

[273] *Hard Choices along the Rio Grande: Piro Trade Networks and Decision-Making during the 1680 Pueblo Revolt*

The Piro Pueblos along the southern Rio Grande did not join with the rebelling Pueblos in the 1680 Pueblo Revolt and instead left New Mexico with the retreating Spanish or migrated to other Pueblos. The events of the Revolt and the circumstances of Spanish colonialism required that the Piro make political decisions such as these. The same was true for the northern Pueblos organizing the Revolt, who decided not to include the Piro as part of the rebellion. For both groups, these decisions were made within the context of existing intra-indigenous relationships, the character of which is not currently well understood. Archaeology is particularly well suited to examining economic relationships, and the U.S. Southwest is an ideal location for archaeological sourcing. Data obtained through X-Ray Fluorescence of Piro obsidian and optical petrography of Piro ceramics will be the basis for initial characterization of the economic relationships between the Piro and other indigenous groups in New Mexico prior to the 1680 Revolt. These relationships will in turn help to describe some of the context for political decision-making during the Revolt.

[233] *Prehistoric Fishing Declines at Chelechol ra Orrak, Palau: Resolving Issues of Anthropogenic Impacts and Long-Term Resource Sustainability*

Previous research at Chelechol ra Orrak in the Rock Islands of Palau has revealed several critical shifts in marine resource exploitation between ca. 3000/1700 – 0 BP. These changes include a decline in fishing, increased reliance on molluscs, particularly *Mactra* clams, and statistically significant size increases in one of the most heavily exploited gastropod species, *Gibberulus* (*Strombus*) *gibberulus*. Commonly invoked explanatory mechanisms, such as broad scale climate change and anthropogenic resource depression, fail to account for these shifts. Here, we present our findings from further investigation into these temporal trends based on analyses of fish size change and marine resource patch use. Results indicate negative evidence for anthropogenic exploitation depression and suggest that fishing declines may be driven by alternative causes that bear no direct relation to trends in mollusc exploitation. We interpret the record for changing subsistence practices at Orrak in terms of interacting, complex sociocultural and environmental variables that altered foraging constraints and opportunity costs, leading ultimately to shifts in the way Orrak's residents interacted with their environment.

Giraldo Tenorio, Hernando (University of Pittsburgh)**[107]** *Prestige Economy and Leadership in Southwestern Colombia (400 B.C.-800 A.D.)*

The capacity of the leaders in the Intermediate Area of the Americas to amass power before 1000 A.D. has been usually explained as a result of the manipulation of a religious ideology or through the creation of social debts in the context of feasting. My dissertation research in the Malagana site, in southwestern Colombia, has provided evidence indicating that these were not the only factors involved in the development of social inequalities in the region. I discuss the importance of prestige goods in the creation of social and political differentiation in the Malagana community during the Early El Bolo period (400 B.C.-800 A.D.), the role of the elite in their production and distribution, and the social context which made their control possible by the elite.

Giron-Ábrego, Mario (Boston University)**[355]** *Architectural Caves and Glyphic Stepped Platforms*

Natural and man-made caves are clearly attested to in myth, iconography and the glyphic corpus as powerful features for the ancient and contemporary Maya. Caves are paramount for they function as entrances into the sacred earth, the most powerful entity of the sacred Maya universe. A third and less explicit category of these subterranean features, although extensively documented in the Maya area, are architectural caves. This latter category, due to their architectural nature, may elucidate an understanding the meaning of the still undeciphered T685 "pyramid" or "stepped-platform" glyph as an architectural CH'EEN "cave" based on the glyphic affixation of this logogram.

Gjesfjeld, Erik (UCLA Institute of Society and Genetics)**[89]** *Archaeometric Analysis of Hunter-Gatherer Pottery from Northeast Asia*

Traditional archaeological analysis of pottery remains in East Asia has often emphasized macroscopic features of pottery including decoration, vessel form and paste composition. While these features are important in characterizing the cultural and technological aspects of pottery, microscopic and archaeometric analyses have the potential for enhancing traditional pottery research in this region by developing novel insights into social processes such as the transmission of information and exchange of resources. In the remote Kuril Islands of Northeast Asia, the use of archaeometric methods is particularly appealing as a majority of the hunter-gatherer pottery remains from this region are surface collected and do not demonstrate diagnostic design elements or vessel forms. Therefore, in order to address meaningful archaeological questions concerning the exchange of information and/or resources in the Kuril Islands, this research utilized a range of archaeometric methods including luminescence dating (TL/OSL), organic residue analysis and elemental composition analysis by ICP-MS and pXRF methods. Overall, results of this research broaden the knowledge concerning the production and use of pottery in the Kuril Islands but also highlight how maritime hunter-gatherers may have used exchange networks and social partnerships to help mitigate the challenges associated with living in this extreme and insular environment.

Glascok, Michael [123] see Boulanger, Matthew

Glass, Dara [336] see Corbett, Debra

Glassow, Michael (Univ of Cal-Santa Barbara) and Jennifer Perry (California State University, Channel Islands)**[32]** *Importation of Deer Bone to the Channel Islands, California, during the Middle Holocene*

Although California mule deer never inhabited the Channel Islands during prehistoric times, deer limb bone fragments commonly occur at Channel Islands sites dated to the Middle Holocene, and fragments of worked deer bone also occur. In addition, mortuary collections obtained in the 1920s dating to the Middle Holocene contain artifacts of deer bone, including ornaments and hair pins. We summarize the evidence of deer bone importation to the Channel Islands and argue that the abundance of deer bone items implies regular and relatively frequent commerce between the

Channel Islands and the mainland, from where the deer bone was derived. We also point out that bone of animals living on or near the islands, such as dogs and sea mammals, also was utilized, perhaps as a substitute for deer bone when not available or when deer bone would not be the most appropriate material. We conclude that although the absence of deer on the Channel Islands may be construed as an indication of "marginality," Middle Holocene occupants were able to overcome marginality through commerce, despite boat technology seemingly less sophisticated than existed during the Late Holocene, and through substitution with bone from local sources.

Glatz, Claudia (University of Glasgow)

[14] *Thinking Through Mountains: A Perspective from the Ancient Near East*

The Middle East and surrounding areas are among the most mountainous regions of the world, where a combination of material and written records provides a unique opportunity to explore highland-lowland interaction in the distant past and over the long-term. This includes issues of relevance to current efforts to document, preserve and protect mountain regions and ways of life, such as the movement of people, goods and ideas, the environmental and resource contexts and consequences of such interactions, as well as issues of mutual perception and processes of identity construction that resonate with more recent popular prejudices and scholarly approaches to mountain regions and communities. In this paper, I take a critical look at the conceptual frameworks through which modern scholarship has come to approach past and present highland people and landscapes, and, using examples from the ancient Near East, explore avenues of investigation, which can provide a more balanced perspective of highland-lowland interconnectivity and the long-term socio-cultural consequences of such interaction.

[85] *Spruce Tree House: The Social History of a Thirteenth-Century Cliff Dwelling*

As one of the best preserved ancestral Pueblo sites in the Southwest, Spruce Tree House presents a unique opportunity to examine aggregation during the 1200s; a time fraught with significant social and religious changes, intensifying intraregional violence, and extreme climatic conditions that ends with widespread Pueblo exodus from the region. This paper presents our fine-grained reconstruction of how Spruce Tree House developed over time based on detailed architectural documentation and a complete tree-ring record and discusses important social organizational change to ascertain how stressful periods, such as the late 1200s, impacted settlement development and growth. Our reconstruction shows that much of the expansion and construction occurred in and after the 1240s with significant remodeling that reconfigured social relationships. Village growth in the alcove extended from North-to-South, and vertical expansion was a late development as most second and third story rooms were built years after the first story rooms. Even as the village grew and changed, residents continued to replicate specific architectural configurations, both defensive and ceremonial, indicating the intentional maintenance of key organizational canons regardless of the social changes happening. Evidence of conflict in the mid-1200s centered on important ceremonial structures

suggests some relationships within the village were contentious.

Go, Matthew (SFU-JLU Joint Center for Bioarchaeological Research, Simon Fraser University) and Xu Zhang (Research Center for Chinese Frontier Archaeology,)

[49] *Differing Methodologies in Computing for Smith's Mean Measure of Divergence between Chinese and Western Literature*

This paper compares different methods of measuring group biological distance in Chinese and western archaeological practice. In terms of Smith's Mean Measure of Divergence (MMD), which is used to estimate biological distances between groups, majority of recent Chinese publications have used the Grewal-Smith angular transformation method with Bartlett's correction and an MMD formula with the correction factor $1/n_{ik} + 1/n_{jk}$. Most MMD studies in English literature have moved to the Freeman-Tukey transformation and an adjusted $1/(n_{ik}+1/2) + 1/(n_{jk}+1/2)$ correction factor. The goals of this paper were to assess the potential differences between the two methods using raw data from actual Chinese publications. It was found that although not exactly the same, both methods are similar enough that compatibility between Chinese and Western research may still be feasible. However, it is recommended that the latter method be used for small sample sizes, and that statistical tests of significance be standard practice in the future.

Gobalet, Kenneth [105] see Rick, Torben

Gobalet, Kenneth (CSU Bakersfield, Emeritus) and Robert Leidy (U.S. Environmental Protection Agency, San Francisco)

[293] *An Update of the Prehistoric Native American Fishery of San Francisco Bay*

It has been a decade since Gobalet et al. (2004: Trans. Am. Fish. Soc. 133:801-833) summarized the fishes found in archaeological sites on San Francisco Bay. Numerous additional excavations have been completed in the last ten years and this report adds 32,000 bones to the totals from 23 archaeological sites from seven counties. By number of specimens found at the sites collectively, bat ray, sturgeons, herrings and sardines, northern anchovies, salmon and trout, New World silversides, surfperches, and minnows (freshwater) are found in the greatest abundance. This summary, however, obscures some fascinating regional concentrations of fishes. For instance, numerous longjaw mudsuckers dominate a site in the south bay, splittail (freshwater) are abundant at sites in northern Marin County, and Larkspur and Angel Island share characteristics of the fish fauna of the East Bay sites. Because of the attention to fine-mesh screening, it is heartening to see that the tiny bones of true smelt are now being recovered with regularity.

Goff, Sheila**[369]** *Moderator***Gokee, Cameron****[23]** *Beyond the Grave: Regional Interaction in the Senegambian Megalith Zone*

Over the past century, archaeological reconnaissance and survey in the Senegambia region of West Africa has identified more than 2000 megalithic cemetery sites dating to the Iron Age (circa 500 B.C. – A.D. 1500). Although a number of research programs have explored the histories of individual sites, it remains unclear how these related to one another within a regional tradition of mortuary practice and monument construction. This paper begins to address this issue through integrated geospatial and network analyses of data published in the Inventory of Protohistoric Sites of the Senegambia (Martin and Becker 1974). First, these data are compared to the results of two systematic surveys to identify and account for sampling biases. Second, the physical and socio-material distances among megalithic sites are used to trace interactions and the relational production of identities across the regional landscape. The preliminary results of these spatial analyses illustrate how the production of power and identity in the Iron Age depended both on exclusive participation in elite networks and local legitimation through corporate burial practices.

Gold, Claire [19] see Mires, Ann Marie

Gold, Jacob**[407]** *The Negotiated Wild: Khmer-Kuy Relations and the Politics of Habitat in Lowland Cambodia before 1970*

The Lon Nol coup in 1970 marks the beginning of the contemporary era in Cambodian habitat politics. This rupture fundamentally upset the "balance of power" between two symbiotic systems characterized by floodplain agriculture and forest groups. While the Khmer propagated "srok," with its high-yield agriculture and large sedentary populations, the Kuy and other ethnic groups exploited wild animals, the forest, furnishing the Khmer empire, along with a regional Chinese mercantile network, with a wide range of valuable forest products, including metals, elephants, medicine and wide-application resins. Traditionally, the limit of the Angkorian Empire has been delineated by the topography of the Tonle Sap floodplain. However, the contemporary rush of "homesteading" farmers to rapidly deforested provinces proves that wet rice agriculture can thrive in what was once "deep forest" with sufficient labor input. The presence of Angkorian settlements "buried" in the forest is

further evidence that earlier periods of Khmer history saw an ebb and flow of “srok” style settlement. My paper draws upon field data as well as archaeological, historical and climatological evidence from the literature, to argue for the importance of ethno-political interactions in understanding the history of mainland SE Asia's habitat distributions, particularly that of lowland Cambodia.

[35] *Aspects of Site Formation Processes at the Paleolithic site of La Ferrassie (Dordogne), France*

La Ferrassie is one of the best-known Middle and Upper Paleolithic sequences in Europe, playing a key role in the question of Neandertal mortuary behavior. Until now, geoarchaeologically-oriented research has focused on the long sequence exposed during the original excavations of Capitan/Peyrony and Delporte (early 20th century and 1968-1973, respectively) in the easternmost part of the site. Our research has exposed intact layers several meters away in the extreme western area of the site, next to the reported location of two adult Neandertal skeletons. We address here some preliminary results on the stratigraphic context of the human occupations in this western area by reconstructing the formation processes of the archaeological record. Our field and micromorphological evidence suggests that sedimentation in the west differs substantially from that that to the east, and the site is much more complex than viewing the eastern section alone. Furthermore, most of the human occupation in the westernmost part of the site was originally located on a topographic high NW of the current excavations, now destroyed by ancient road construction. These backdrops have implications for the context of the Neandertal remains and for understanding occupation strategies in different areas of the La Ferrassie site complex.

[50] *Exploration of Exchange Networks in Nineteenth Century Guinea*

For centuries European traders of human capital have impacted the African cultural landscape, resulting in significant consequences that have played a major role in shaping new identities, group memory, and trade relations. This influence did not end with the abolition of the slave trade by European and North American countries in the early nineteenth century; rather it simply prompted traders to explore new networks and more secluded trading establishments. This pattern is exemplified in several locations along the coastal lands of Guinea, where lowland tidewater routes provide access to the mainland resources. In the spring of 2013 an international team of archaeologists excavated known trade lodges in three rural Guinean villages. Through an analysis of artifacts recovered from the 2013 field season, and an exploration of their spatial distribution, this study investigates changes to local networks brought about through contact with Europeans and their goods.

[344] *Revisiting Bird Jaguar and the Sajal of the Yaxchilan Kingdom*

In “A Forest of Kings,” Linda Schele and David Freidel painted a vivid picture of the lives and relationships of kings, queens and courtiers expressed in images and texts from the Yaxchilan kingdom during the 7th and 8th centuries A.D. In the 25 years since that volume's publication, refinements in epigraphic readings and archaeological research in the rural hinterlands surrounding Yaxchilan and neighboring capitals have greatly enriched our understanding of the political world of the Western Maya Lowlands. In this paper, Golden and Scherer explore changes in our interpretations of the realm of Bird Jaguar and his compatriots, and examine how these political

relationships played out materially on the landscape of settlement, trade, and warfare across the Middle Usumacinta River Basin.

[53] *Modeling the Potential Effects of Cooking on Neanderthal Hunting Efficiency*

It is an enormous challenge to reconstruct the complex and dynamic interactions between Prehistoric human groups, their resources, and their landscape from the archaeological record. This poster presents a unique model for exploring the relationship between Neanderthals and reindeer during glacial phases of the Middle Paleolithic in southwestern France, using data from zooarchaeological assemblages and experimental values for Neanderthal metabolic rates. I have developed a set of calculations that test the effect of cooked versus raw meat on Neanderthal hunting efficiency in terms of available energy from a single kill. These calculations translate potential energy increases from cooked meat into hunting range distance and time spent in a single landscape patch. Initial tests indicate that cooking lean meat increases its caloric value sufficiently to offset up to 3.7 days' worth of locomotion, or 12 kills per year, thus extending the carrying capacity of a landscape patch, particularly during periods of resource scarcity. Ultimately, I will develop differential equations for modeling Neanderthal, early modern human, and ungulate populations. These equations will provide an innovative framework for addressing landscape patch viability, mobility patterns, and adaptive differences in subsistence behaviors between Neanderthal and early modern human populations.

Goldstein, Steven (Washington University in St. Louis)

[23] *Bringing the Mountain to the Mara: The Role of Obsidian Quarrying on Mt. Eburru in Structuring Early Pastoralist Socio-Economic Identities in Southern Kenya*

Despite recent advances in characterizing the socio-economic mosaics associated with early pastoralism in East Africa, how this diversity affected social boundaries and manifested identities remain underexplored. Exclusive exploitation of a single obsidian source on the upper slopes of Mt. Eburru in the Central Rift Valley by communities associated with "Elmenteitan" material culture is a strong line of evidence for dimensions of shared identity linking some of these herding communities in southern Kenya between ca. 3000 and 1400 years ago. Surveys of upper Mt. Eburru have revealed only a single quarry area associated with Elmenteitan material, suggesting it was a central locus for maintaining both the social and economic dimensions of a regional obsidian exchange. Data from new excavations at the Elmenteitan quarry site on Mt. Eburru (GsJ50) supports models for small groups traveling up the mountain and inhabiting short term occupations around the quarry while preparing obsidian cores for transport back to dispersed communities. This evidence of small groups at Mt. Eburru suggests that the exploitation of a geographically fixed resource node by otherwise mobile peoples allowed for the creation, renegotiation, and perpetuation of early herding identities.

[235] *Digital Public Archaeology Reconsidered: Lessons From Michigan State University's Campus Archaeology Program*

Since 2008, Michigan State University has had an official Campus Archaeology Program (<http://campusarch.msu.edu>) which trains students, engages with a varied public, and mitigates all ground-disturbing activity undertaken by the campus, regardless of whether it falls under state or federal law. I created and continue to direct this unique program. No other campus has the extensive mandate, budget, or administrative support that we have been able to create, and while I oversee all activities, undergraduate and graduate students conduct the bulk of the everyday work. Even with support, we are a relatively small group and employ a variety of social media tools to reach our varied audiences. This paper presents both our successes and failures in social media, and outlines some pitfalls and lessons learned that may help others in their social media work. In particular, we have had to learn that every year, our social media campaign must begin anew since there are continually new people on campus, in town, and around the world who are unaware that we exist. New audiences are great, but it is easy to forget that 5 years ago is another era on a college

campus.

[184] *"Tiwanaku VI" revisited: Postcolonialism and Ethnogenesis in the middle Moquegua Valley Province*

The Middle Moquegua Valley was home to between 10,000 and 20,000 Tiwanaku colonists during the Tiwanaku IV and V periods. This paper examines what became of these populations in Tiwanaku's postcolonial period. Three decades ago, the name "Tiwanaku VI" was briefly proposed to describe Moquegua's diverse "post-expansive" ceramic styles. Subsequent full coverage survey in the and excavations in the middle valley indicate that after Tiwanaku V settlements, temple, and cemeteries were largely abandoned in the 11th century, they were replaced by only 42 hectares of new Tiwanaku-derived settlement. This supports the partial depopulation suggested by the appearance of refugee populations in other regions, yet also indicates that some 4000 colonists stayed in (or returned to) the Middle Valley. Tiwanaku-derived settlement concentrated in defensible mountaintop or walled locations at Los Espejos, Maria Cupine, Cerro Chamos, Omo M11 and Echenique. This pattern indicates balkanization, conflict, and political insecurity, while the replacement of Tiwanaku V ceramics with distinct local derived styles indicates the rejection of state ideology and the loss of economic contacts and communication across the Tiwanaku realm. Yet peoples of altiplano Tiwanaku origin also curated earlier imported materials and retained Tiwanaku household and mortuary practice, indicating substantial cultural continuity.

[52] *Archaeological and paleo-environmental investigations in the Aitape area of northern Papua New Guinea, 2014*

We report on archaeological and paleo-environmental fieldwork carried out in the area around Aitape, northern Papua New Guinea during June and July of 2014 targeted at understanding human response to environmental and climatic variability during the mid- to late-Holocene. We employ a multi-proxy approach to paleo-environmental reconstruction including geochemical and paleo-botanical analysis of stream and river bank sediments to examine local manifestations of Holocene climatic variability and geomorphological change stemming from tectonic activity. Excavations carried out at rock shelters on the slopes of uplifted limestone hills provide new data on settlement and subsistence practices during the last two millennia of prehistory in the area, including evidence for connection into wider regional interaction networks.

Golubiewski-Davis, Kristina (University of Minnesota)

[121] *3D Scanning of Bronze: Repeatability and Reliability across Scanners*

As 3D scanning is integrated into the archaeological tool kit, more objects are being captured using a variety of scanning methods and specific scanners. This poster explores how laser scanning, white light scanning, and photogrammetry compare across the Next Engine, Breukmann (300mm and 90mm lenses), David SLS-2 (30mm and 60mm pattern sizes), and photogrammetry (compiled with Agisoft Photoscan) using a Gauge Repeatability and Reliability test. Five objects were scanned five times using each of the methods and compared to measurements taken with a micrometer accurate to +/- .004mm. These tests provide a way to measure the variability of the scan, and thus at what level differences between scanners may be important to the user. Bronze casts were chosen for this test in particular to examine how the glare of the material reacts with the different lighting mechanisms of the scanners. Discussion of the scanners and techniques are included alongside the results of the project and implications for analysis of scans taken with different scanners.

Gomes Coelho, Rui (Binghamton University)

[394] *Coffee and Captivity in the 19th-Century Paraíba Valley (Rio de Janeiro, Brazil). Landscape Archaeology and Phenomenological Recording*

The expansion of modern capitalism in the 19th century led to higher demands for commodities such as coffee, sugar, and cotton. The production of these commodities, however, was associated to an increasing industrialization of slave labor ("Second slavery"). The Paraíba valley in Rio de Janeiro, Brazil, produced most of the coffee consumed in Europe and North America. The central question is: how was the valley constructed over the 19th century as a landscape of enslavement? Labor routines dominated those who lived there, and they definitely determined the ways people defined their lives. Masters modeled particular architectures so they could try to frame the experience of their captives. Captives, on the other hand, tried to cope with the challenge of forced labor by creating their own sensorial regimes; for example, by producing songs on their labor journeys and using certain areas to perform social events. How can we as archaeologists create a comprehensive narrative that is able to acknowledge for the intersection of slavery's materiality as a productive system and its lived experience? My aim is to examine the possibility of exploring the former coffee plantations of the Paraíba valley archaeologically and discuss methodologies for landscape archaeology and phenomenological recording.

[231] *La necesidad del ritual, el movimiento y la regeneración. Interpretaciones desde la información arqueológica en la región chalchihuiteña*

La concepción del mundo como susceptible de representación y reducción a nivel arquitectónico y del objeto dentro de la denominada cultura chalchihuites (microcosmos chalchihuiteño), permite suponer un entendimiento del mundo ligado a la vida material y ritual, de tal manera que esta concepción se ve reflejada en los objetos arqueológicos desde el trabajo de investigación. Así, esta concepción se ve reflejada en la plástica cerámica, en la iconografía, en la estructuras arquitectónicas y en el uso del paisaje como referente natural.

Entendiendo así la concepción chalchihuiteña del mundo se pueden realizar inferencias más profundas sobre sus rituales, su significado y su relación con los materiales arqueológicos, tanto en la zona de estudio como en regiones afines, así como con culturas amerindias contemporáneas.

[53] *Mapping the Stone Age in Mozambique: Preliminary Results*

Under the auspices of the Portuguese colonial government, Leren Barradas and Santos Junior (within the Anthropological Mission of Mozambique) carried out field surveys that resulted in a data set that includes a total of more than 100 sites, mostly attributed to the Stone Age. This early research added to the previous work of Van Riet Lowe in the Limpopo Valley, in southern Mozambique. Recently, Mozambique has emerged as a crucial geographic area to understand human evolution. Specifically, its coastal location between southern and eastern Africa is ideal for testing ideas about the appearance of Anatomically Modern Humans and their relation to early coastal adaptations. Nevertheless, the number of researchers and projects focusing on this topic in Mozambique is still limited because of a general predominance of interest in later periods among archaeologists working in Mozambique. Based on the early maps from Santos Junior and more recent data acquired through various projects, we present preliminary maps for the Stone Age prehistory of Mozambique. The map is based on a critical evaluation of the sites, and a review of some of the materials found at many of those sites, that are presently curated at the IICT in Lisbon, Portugal.

[75] *Digging Ceren: Rounding up the Unusual Methods in Mesoamerican Household Archaeology*

The site of Cerén, El Salvador holds a unique place for Mesoamericanists conducting household archaeology. Its extraordinary preservation fuels the imagination like few other sites can. The fragile nature of this archaeological site requires hyper-alertness, combined with methods for properly extracting and preserving information. The material remains of this deep under-earth site come to light with only the most intensive of excavation methods, many of which are unlike those commonly used at other sites. For example, some artifacts and features don't exist at all, save for vacuums that are carefully uncovered and then filled in to create physical evidence of ancient lifeways. This plaster process literally pulls the past out of thin air. Comparisons with methods used at Copan, Honduras highlight the differences and similarities that household archaeologists use to uncover remains of everyday life of the Classic Maya and afford important discussion of the implications of these methodological practices at other archaeological sites.

[15] *Archaeologies of Latinos in the United States*

North-American ethnic archaeologies abound. The last several decades have seen the emergence of African-American and Asian-American archaeologies alongside the initiation of efforts to decolonize the archaeology of Native America. Considering the proliferation of ethnic and revisionist archaeologies, the current absence of any archaeology of Latinos in the historical and contemporary

United States is a striking thing. Why has no such field yet been developed? How might such a field come to be developed? And how might the adoption of the analytical category of Latino archaeology be justified? This talk addresses those questions by drawing together several archaeological and material-culture studies of Latino migration, historical borderlands communities, and of everyday life in Latino households, past and present.

Gonzalez, Toni (California State University, Los Angeles) and Helen R. Haines (Trent University)

[147] *"Forth from this Dark and Lonely Hiding Place": Chultun Excavations at Ka'Kabish*

During three field seasons, chultuns were investigated at three small groups representing the settlement zone, public space, and core near the main plaza of Ka'Kabish. Puleston asserted that chultuns must have a utilitarian function because they are overwhelmingly found in rural, domestic contexts. This very processualist logic denies the possibility of domestic ritual that is so prevalent in Maya ethnography. Furthermore, at Ka'Kabish, Uaxactun, Nakum and other sites, chultuns are regularly reported from public spaces. All the chultuns excavated at Ka'Kabish contained multiple burials and objects that were likely left as mortuary offerings. The mortuary function of chultuns was noted by early investigators (e.g., Tozzer, Gann, and Ricketson) but was described as an "occasional" or "secondary" use. While the use of chultuns for burials is a secondary function that terminated further use of the feature, it occurs more frequently than previously appreciated. The presence of multiple individuals suggests the repeated performance of mortuary rituals, which constitutes a process of sacrilization of that space. The regular use of these spaces as burial sites is consistent with our hypothesis that chultuns served a ritual function, rather than the traditional, and somewhat improbable, idea that they were used as storage chambers.

[198] *On Olmec Niche Figures, Altars and Thrones*

The Olmec site of La Venta in southeastern Mexico has a wide repertoire of sculptures known as "altars". These will be reviewed in terms of form and compared to similar kinds of sculptures in the Gulf Coast lowlands and other regions, in order to thematically and functionally differentiate between them.

González López, Angel (UC Riverside)**[88]** *The Epiclassic from the Mexica Perspective: Stone Sculpture Evidence*

The ways in which human societies create a sense of history and incorporate it into daily life varies through time. In the Late Postclassic Basin of Mexico for example, cultural groups perpetuated, but also abandoned aspects of the stories of their ancestors. The uses, causes, and reasons for this practice depend on a combination of several factors. The use of the past and how it was conceived and incorporated into the perspective of the Mexica is of particular interest. Previous studies have explored this topic, focusing in particular on Mexica objects depicting the “archaizing” Xochicalco style, such as the clear examples of four fire serpent heads, now in National Museum of Anthropology in Mexico City. This topic requires re-examination, principally because recent research has uncovered valuable information about the duration of Epiclassic imagery for hundreds of years. The Mexica perspective informs our understanding of the Epiclassic due to the marked continuities in form and meaning displayed by sculptural works. This paper examines the continuity of these ideas and related concepts through the analysis of a number of examples, specifically unpublished stone sculptures that were recovered from the ancient imperial capital.

González López, Ángel [298] see Matadamas Gómora, Diego

Gonzalez-Licon, Ernesto (INAH-Monte Albán, Mexico)**[410]** *The Elite of Monte Albán as a Biosocial Group: Methodological Considerations*

This paper explores who were the elite in the Mesoamerican world and considers the primary archaeological indicators used to identify and/or define them. Here, the elite is approached as a biologically defined group set apart by different aspects such as demography, gender relations, funerary practices, health conditions, diet and disease, hierarchy and inequality among its members. This information will be presented within the context of the location and characteristics of their residences among other things. This will be an opportunity to better understand the role and implications of this relevant segment of the social structure of the ancient Zapotec society.

Gonzalez-Licon, Ernesto [410] see Marquez-Morfin, Lourdes

Gonzalez-Tennant, Edward (Monmouth University)**[400]** *Anarchy, Archaeology, and the Decolonization of Collaborative Heritage*

This paper explores the relationship between anarchism, collaborative archaeology, and the decolonization of African diaspora heritage in the US and Caribbean. The heart of anarchism as a political theory articulates a robust criticism of hierarchy, and neatly intersects growing interests in collaborative archaeology and heritage. This represents a crucial intersection as the majority of archaeological projects remains rigidly hierarchical, often resulting in the silencing of local stakeholder communities. Anarchism's attention to identifying and addressing hierarchy represents a living theory for the decolonization of archaeological practice. The author grounds these thoughts through two case studies. The first examines the importance of situating scholarly interests alongside, or even below local community concerns as they relate to the 1923 Rosewood race riot in Levy County, Florida. The second case study examines how this approach alerts researchers to new projects revealing the unique interactions between Afro-Caribbean and British soldiers in Nevis, West Indies. The author's ongoing experience with anarchism continues to transform his personal practice of archaeology. This paper concludes by highlighting anarchism's unique ability to address harmful hierarchical posturing, democratize archaeological knowledge, and support our roles as researchers, educators, and advocates.

Gonzalez-Velez, Carol (California State University, Fresno)**[246]** *West Mexico, the Missing Link with South America*

Cultures in the Intermediate Area served as the catalyst for the potential connections between north and south. Maritime trading routes were the most probable form of contact and dissemination of

information and artifact styles. Iconographic evidence points to contact between various people from Chupicuaro to San Agustin. Their styles are but a few of the missing links for the interaction between cultures from north and south.

[281] *Herring, Rattlesnakes and More: Recent Research on the Late Archaic in Southwestern New Hampshire*

Sites in Swanzey and Hinsdale, New Hampshire illustrate the dynamism of the Late Archaic period in the Connecticut River drainage of southwestern New Hampshire. Longstanding economic patterns centered around the hunting of timber rattlesnakes at the Wantastiquet Mountain site and the harvesting of anadromous fish at the Swanzey Fish Dam begin during this period, establishing practices that continue throughout the Woodland and even survive the tumult of the early decades of European contact.

Goodman-Elgar, Melissa (Washington State University)

[190] *A Microstratigraphic Perspective on Early Civic and Ritual Architecture: A Case from the Kala Uyuni Site, Bolivia*

This paper brings a microstratigraphic perspective to debates about the origins of sociopolitical complexity through a study of floors from nondomestic structures. Such civic and ceremonial buildings are central to models of community formation and leadership development. In the Bolivian Middle Formative Period I (800-200 B.C.E.) communities became aggregated and expanded the range of civic architecture as populations rose. Demonstrating these trends, the Kala Uyuni site expanded and developed two sectors with notable architecture: sunken courts in the older hilltop KUAC sector, and small nondomestic enclosures in the Kala Uyuni sector, where dense occupation remains are also located. Despite differences between in architecture, microstratigraphic analyses of floors found the practice of frequent reflooring is maintained between sectors. This documents a more frequent investment in the site than that observable from standard stratigraphy. Geochemistry of flooring sequences found that construction materials are also shared between sectors. This evidence challenges the tendency to contrast architectural forms in interpretation by showing that the people who maintained these sectors conserved longstanding practices and materials. This may indicate that founding community members precipitated the shift to smaller, less accessible ritual architecture as the site expanded, thereby entrenching their social positions within the community.

Goodmaster, Christopher (Versar, Inc.) and Erin Helton (Resource Data, Inc.)

[353] *The Panther Cave Digital Documentation and Visualization Project*

Recent digital documentation efforts at Panther Cave (41VV83) have yielded a detailed record of current site conditions and provide a wealth of geospatial data pertinent to the prehistoric art preserved at the site. Three-dimensional laser scanning (LiDAR) and digital photogrammetry were integrated to record a highly accurate digital model of the rockshelter and its immediate environment. This documentation effort provides a robust corpus of data for use in the digital visualization, analysis, and management of the site. This presentation will provide an update of continuing efforts to digitally reconstruct the surrounding Lower Pecos landscape and semi-arid environment of the site. In addition, issues involving the curation and archiving of large digital datasets will be discussed.

[19] *An Update on the Unidentified Persons Project, San Bernardino, California: The Good, The Very Good, and the Ugly*

In 2014, the Unidentified Persons Project transitioned from being a small scale volunteer-based project to a twenty-three student forensic archaeology field school, allowing for the exhumation and DNA sampling of a much larger number of individuals than had been previously possible. This paper will summarize the opportunities and challenges associated with this transition from the perspectives of multiple stakeholders, and will discuss the evolution of the project's research questions and methodologies during this transition. The paper will present the project's findings and lessons learned to date, concluding with a discussion of future directions in anticipation of additional field seasons.

Gorbahn, Hermann (German Archaeological Institute)

[31] *Pernil Alto – a Preceramic Horticulturalist Village in Palpa, Southern Peru*

In the Central Andes, plants and animals were domesticated during the Middle Preceramic period (8000-5000 BP). The earliest civilizations, like Caral (Shady 1999,2006), arose around 5000 BP. This process of increasing complexity, however, is far from being understood completely. Whereas most sites of the Middle Preceramic Period with early domesticated plants, like Chilca 1 (Engel 1988), La Paloma (Engel 1980, Benfer 1999) and Huaca Prieta (Bird 1985, Dillehay et al.2012) are located on the Pacific littoral and had a subsistence strategy based on the rich marine resources of the Humboldt current, the site of Pernil Alto is located some 50 km inland, in the middle Río Grande valley in Southern Peru. Pernil Alto dates from 5800 to 5000 BP and thus directly before the beginning of Caral. The site presents a six-phase structured village consisting of 19 huts in an arranged settlement system with 33 internal burials. It shows the development from a subsistence based first on plant collecting towards later plant cultivation. Marine resources were unimportant. Thus, in Pernil Alto we are documenting the shift from foraging to a productive plant based economy. The site is important to understand the process leading to early civilizations in the Central Andes.

Gorden, Mary

[352] *Beyond Boundaries: A Discussion of "out-of-place" Yokuts and Chumash Motifs*

Rock art research by Grant (1965) and Heizer and Clewlow (1973) revealed the prolific number of painted images that Chumash and Yokuts cultures produced in South Central California. Previous research (ibid; Lee 1991; Grant 1979) often focused on defining distinctive stylistic components and elements that characterize and differentiate these respective traditions, and define their cultural boundaries. Borderland rock art sites such as Carneros Rocks and Painted Rock have become continued points of discussion in terms of cultural affiliation and patrimony. Yet, many pictograph sites within these defined boundaries show diagnostic traits of the neighboring tribe. These sites have often been overlooked and have remained anomalies. We suggest these anomalous diagnostic elements indicate that cultural boundaries were permeable. This paper discusses a number of sites that possess distinct stylistic components and elements, which suggest extensive cultural

interactions between these two groups. These exceptions are discussed in the context of cultural patrimony, and the cultural identity of rock art sites are placed into a larger context, one that looks at the broader social, historical, and environmental pressures, which influenced the development of this magnificent rock art record.

Gorgues, Alexis (University Bordeaux-Montaigne/Ausonius)

[177] *The Dawn of Iron Age societies: Hillfort Morphodynamics in the NW Mediterranean*

Hillforts are a typical feature of the Iron Age settlement patterns of the north-west Mediterranean (Southern France and North-East of Spain). Their morphology appears as relatively homogeneous and gives a prominent importance to the domestic sphere, the stone ramparts being often the only clearly communitarian building. The development of these agglomerations –quite small according to central European standards- is broadly contemporary with the beginnings of Greek colonization and with the subsequent rise in the seaborne trade it provoked (6th century B.C.). This supposed synchronism has led to the development of models privileging trade as a stimulus leading to the development of a new kind of settlement often qualified as “proto-urban” or “urban”.

But reality seems to be more complex, from a chronological as well as from a “phenomenological” point of view. Relying on case studies, we will show that the emergence of such new settlement patterns is multicausal and that variability is very important from one region to another. We will emphasize the fact that the enclosure of a given settlement is part of a complex dynamic involving economic, sociological and symbolic factors, and is much more progressive than was previously thought.

Goring-Morris, Nigel (Hebrew University) and Anna Belfer-Cohen (Hebrew University)

[16] *Long-term Memory, the Individual and the Community in the Later Prehistory of the Levant*

Shared historical memory is a given feature of every human society as a basic component of group identity and cohesion. With increasing tendencies towards sedentism the material culture evidence for communal memory increases, as reflected in spatial correlates at both the inter- and intra-site levels. It appears that social stress, deriving from increased community sizes and staying together for prolonged periods of time in close proximity, amongst others, raised the need for mechanisms to booster the sense of cohesion. Emphasis upon shared history through repetitive actions became focal in the behavioral repertoire. This would enmesh the entire community through to its individual members in complex webs of activities. Such circumstances would have played a role in the creation and retention of social memory, with historical ties to locations and to ancestors prior to the emergence of agriculture.

[341] *Bighorn Sheep Processing in the White Mountains, California*

Previous research in the eastern Great Basin using stable isotope analysis of faunal remains suggests that bighorn sheep (*Ovis canadensis*) responded to climate change by shifting their ranges to higher elevations during warm intervals. A shift in sheep ranges would have increased travel and transportation costs for central place foragers based in lower elevation valleys. We expect that hunters responded to the increased costs in a number of ways, including altering settlement strategies and increasing in-field processing of sheep to reduce transport weight. These predictions are tested using a comprehensive analysis of skeletal part representation and taphonomy of faunal

assemblages from high elevation sites in the White Mountains, California. Results focus on differences in sheep processing by elevation, time, and site function.

[385] *Archaeology Underfoot on College Hill: Education, Outreach, and Historical Archaeology at Brown University (Providence, Rhode Island)*

Since 2012, a course on the Archaeology of College Hill at Brown University has undertaken a program of research and education – including pedestrian survey, geophysical survey, and excavation – to investigate the historic Quiet Green in the heart of the university campus. This class serves the dual purposes of promoting the material history of Brown during the university's 250th anniversary celebration and educating undergraduates in the methods, theories, and practices of historical archaeology. This paper presents the results of three seasons of study, including excavations outside of Hope College Dormitory and at the site of the university's first President's House, two of the university's oldest buildings dating to 1822 and 1770 respectively. Furthermore, we will demonstrate how a university campus can serve as an ideal space for training young archaeologists outside the confines of a more traditional field school, and how such an approach can be used to promote local history and outreach at the university and community levels.

[56] *The Copper Trade of Hatteras Island*

Excavations at the early contact Native American site on Hatteras Island, Outer Banks, North Carolina has yielded a number of copper artifacts in the course of the past six years of excavation. The excavations were run in conjunction with the University of Bristol and the Croatoan Archaeology Society in order to examine historic environment and settlement patterns of the island, as well as analyse the site's material culture of both the local Croatoan natives and the European imports. Analyses of the copper artifacts using a Portable X-ray Fluorescence device indicated that the majority of the copper was actually a smelted alloy that was predominantly of European origin. The lack of everyday native material culture such as fish hooks, harpoons and knives that is characteristic of other sites in North Carolina and Virginia, suggests that the majority of the copper artifacts was brought to the island not by exchange with other Native tribes but by trade with Europeans. This paper will discuss the evidence gained by the analysis of the copper with a view to proving the origin of the copper discovered on Hatteras Island.

[299] *The Bioarchaeological Evidence for Elder Care in Roman Britain*

The elderly are the most neglected demographic in archaeology. In today's youth-obsessed society the elderly are consistently denigrated, particularly those perceived to be physically or mentally frail. This negative construction is partly a consequence of an unprecedented ageing population, often conceptualized as problematic and burdensome to society. A related and growing concern in contemporary populations is the physical abuse of the elderly, believed to be an escalating, demographically driven, phenomenon. The utility of skeletal evidence in the identification of violent trauma has been detailed in cases of child and intimate partner abuse, both modern and archaeological. Investigating the skeletal evidence for elder abuse is potentially more complex due to the confounding physiological effects of the ageing process, the lack of clinical research, and

contemporary ageist attitudes. This paper synthesizes the available medical and social research on elder abuse and evaluates the potential bioarchaeological evidence for elder mistreatment in Roman Britain. Archaeologists have the potential to provide a long-term perspective on the care and treatment of past elders and are positioned to make significant contributions to important contemporary debates regarding this global issue.

[258] *Identity Performance and Material Culture: Exploring the Limits of Archaeological Inquiry Into Social Group Identity with a Massive Assemblage of Bar-Associated Trash from Urban America*

Social identity is an elusive subject of inquiry of the archaeological past. Even in the contemporary, we know that expressions of identities are temporary and relational, as well as an outcome of socially performative assertions, contestations, and negotiations. Nevertheless, the reconstruction of social identities is a driving aspiration of all archaeological inquiry at one level or another. This paper highlights a multi-year project that explores how discontinuous variation in socially performed identities might be visible in assemblages of consumer goods discarded near bars on an American urban landscape. We focus our analysis on over 41,000 artifacts, most of which are discarded cigarettes collected in a mere 32 days of fieldwork. The cigarette - perhaps the most ubiquitous and tolerated form of trash in urban settings - is ideally suited to the study owing to the fact that it is produced and marketed as an object to be incorporated into socially performed identity expressions. Combining the methodological rigor of scientific archaeological sampling and data collection with ethnographic and sensory anthropological techniques, we consider how reconstructions of past social group identities may be impaired by traditional archaeological methods as well as by the modest sizes and spatial limits of more typical datasets.

Graf, Kelly (Texas A&M University, Department of Anthropology)

[87] *Humans on the Siberian Mammoth Steppe*

The Siberian Upper Paleolithic is divided into three phases: early, middle and late. Middle Upper Paleolithic (MUP) archaeological assemblages are both lithic and osseous in nature. Most processing tools were made on blade and flake tool blanks, whereas projectile and sewing tools were manufactured from osseous materials and an astonishing array of portable art and personal adornment pieces were also made on ivory and bone. Procurement and use of faunal resources centered on a wide array of mammoth-steppe fauna. The Mal'ta site, located near Lake Baikal, was a MUP residential basecamp miraculously preserving semi-subterranean dwellings, a double child burial (one 3-4 years old, other 1-2 years old), lithics, fauna, and mobile art and dating to about 26,000-24,000 calendar years before present. Recent ancient DNA study of the human remains indicates they shared close genetic affinity with modern-day central Asians and northeastern Europeans, contributed to the genetic make-up of first Americans and shared mtDNA with their contemporaries living west of the Urals. The genetic relationship of these dispersed late Pleistocene populations has interesting implications for their behavior. In this paper, I will focus on the Siberian MUP and how this population responded to late Pleistocene conditions on the Eurasian mammoth steppe.

[332] *Garum and Graves: Bioarchaeological Interpretation of Cremations and Mortuary Architecture*

Mortuary contexts are archaeologically and anthropologically ambiguous. Moreover, multicomponent-use archaeological sites are difficult to interpret as the original purpose of these designated spaces reflects the ever changing living society. The ancient Roman site of Troia is a multicomponent-use site. Originally constructed as a Garum production and distribution center, in fact the largest known in the Western Roman Empire, Troia was also utilized as a cemetery throughout its use from the 1st to the 5th centuries CE. The function of the site's location culturally, socially, and economically in addition to the material artifacts and osteological remains must be considered in order to properly interpret Troia's mortuary behaviors and practices. Associated burial materials, however, often reflect the living population rather than the deceased. This paper considers the anthropological implications of cremation and associated mortuary architecture within a multicomponent-use space. From a bioarchaeology perspective, joint analysis of the osteological material and the mortuary architecture belonging to the cremations from the Necropolis of Calderia at Troia illuminates the true identities of the deceased as well as the function of Troia as a popular cemetery within the Western Roman Empire.

Graham, Shawn

[84] *Many Roman Bazaars: Exploring the Need for Simple Computational Models in the Study of the Roman Economy*

The study of the Roman economy is a battlefield of sometimes conflicting archaeological and historical models. Each model argues for different factors as the driving forces of the Roman economy. Yet, the model creators rarely make explicit how their descriptions of the functioning of Roman trade can be abstracted as concepts that allow comparison with other models. Moreover, the development of these descriptive models has not gone hand in hand with the development of methods that allow for them to be formally represented, tested, or compared. This paper explores the use of simple computational models for exploring the many descriptive models of the Roman economy. It presents two agent-based models developed using different conceptualizations of Peter Bang's (2008) descriptive Roman Bazaar model. It concludes that general patterns in diverse archaeological data types allow one to test different aspects of descriptive models through computational modelling. However, to facilitate this process, authors of descriptive models should provide guidelines of how their models can be expressed using common concepts, as well as describe the expected data patterns that would be the outcomes of their model, which would allow for their models to be tested against archaeological data and compared with other models.

[413] *Balance of Trade, Balance of Power: Marine and Riverine Networks in Belize*

The Caribbean sea, like the Mediterranean, was a facilitator of travel and communication. In the case of Belize, the relatively shallow waters of the coastal shelf sheltered water-borne Caribbean traffic, and the bevy of coral islands or cayes served as way stations for far-flung coastal trade. Essential to communities in the Maya area, however, was the transfer of goods from the coast to river and lake ports for inland distribution. In this presentation, we endeavor to summarize information from the Belize sites of Marco Gonzalez, on Ambergris Caye, and Lamanai, on the New River Lagoon, to explore the role of ports in Maya economy. In the case of Marco Gonzalez and Lamanai, we also examine their occupation longevity as a reflection of a commercial dynamic that seems to have been both dependent on, but in some way separate from, inland politics and power.

Granley, Elisabeth (UW La Crosse and PIARA), Rebecca Bria (Vanderbilt University and PIARA) and Elizabeth Katherine Cruzado Carranza (University of Memphis and PIARA)

[250] *A Lithic Analysis of Food Preparation and Resource Distribution in Recuay Ritual Feasting Contexts at Hualcayán (Ancash, Peru)*

The preparation and consumption of food during feasting rituals is an ancient tradition in the Andes, occurring both on a small scale (participation of one family or kin group) and on a large scale (community-wide involvement). This poster presents a recent analysis of lithic tools from Hualcayán, an ancient Recuay community (1-600 A.D.) in highland Ancash, Peru. Excavations at Hualcayán yielded a variety of ground stone and expedient chipped stone tools and debris from a range of different Recuay ritual contexts—in tombs, patio groups, and enclosures. The analysis and comparison of tool types and the variety of raw materials utilized within each ritual space will be used to identify the different food preparation techniques of Recuay rituals at Hualcayán, as well as examine how resources were differentially distributed amongst members of the community.

[91] *From Hunter-Gatherer to Nascent Farmer: Traditions of Obsidian Consumption At Epi-Paleolithic - PPNA Körtik Tepe (SE Turkey)*

Located on the Upper Tigris River, Körtik Tepe represents one of the earliest sedentary settlements in the Anatolian part of the Fertile Crescent (11th - 10th millennium B.C.). Its occupation spanned from the Pre-Pottery Neolithic A to Epi-Paleolithic, a transitional sequence from hunter-gatherer to farming economies. While the site has a strong local character, there is also clear evidence for interaction with communities at the larger regional level in southeast Anatolia. Using EDXRF to analyze more than 200 obsidian artifacts, we aim to produce a detailed characterization of the Körtik Tepe material, integrating source and techno-typological specifics, to clarify these intercommunity relations over time. Our results demonstrate the exploitation of at least three southeast Anatolian sources, the materials being consumed in multiple traditions, with blades, bladelets and various microlithic tools. Our results support the claimed close relations with Körtik Tepe's neighbors (Çayönü, Hallan Çemi, Demirköy), part of an Upper Tigris regional tradition. We next need to compare how these people were consuming these obsidians, to see if a focus on raw material alone masks community-specific practices (as with recent archaeobotanical / faunal reportage) that enable us to reconstruct the mosaic of cultural traditions within the complex processes subsumed by the term 'Neolithization'.

[31] *LA-ICP-MS Analysis of Nasca Ceramics from the Residential Sector at Cerro Tortolita, Ica, Peru*

Excavations in 2014 at Cerro Tortolita, an Early Intermediate Period (EIP; ca. 100 B.C.E.-600 CE) site located in the Upper Ica Valley, Peru revealed it to be a local ceremonial center with a dense, residential component. Work at the site revealed a high quantity of Nasca polychrome ceramics from the residential sector, many of which feature technical characteristics (e.g. paint and paste) that are distinct from Southern Nasca Region (SNR) polychromes, suggesting that they are of local origin. In this study, we present the results of Laser Ablation – Inductively Coupled Plasma – Mass Spectrometry (LA-ICP-MS), of the pastes of a sample of ceramics from the residential sector of the site. We compare the composition of Cerro Tortolita's ceramics with that of Nasca ceramics previously analyzed from the SNR. We aim to better understand the production and use of ceramics in the Upper Ica Valley during the EIP, and ultimately hope to inform our understanding of the wider pilgrimage network on the south coast of Peru during this period.

[231] *Llano Grande. ¿Un sitio chachihuiteño de explotación de la obsidiana?*

Durante los trabajos arqueológicos de salvamento con motivo de la construcción de la carretera Durango-Mazatlán se reconoció el valle de Llano Grande, en la parte alta de la Sierra Madre Occidental en el estado de Durango. Diseminados a lo largo y ancho del valle hay nódulos pequeños de obsidiana, desde algunos de escasos tres centímetros hasta los más grandes que apenas rebasan los 10 centímetros; de hecho, por lo general los nódulos no sobrepasan el tamaño de un puño. En los cerros que rodean el valle detectamos ocho zonas con evidencias de la explotación y procesamiento de la obsidiana, cuatro de ellos es las estribaciones del cerro La Bandera, en cuya cima registramos el sitio de mayor complejidad de los 62 ubicados en la zona serrana. Aunque está muy saqueado, logramos identificar las cimentaciones de piedra de ocho cuartos, tres construidos con piedra laja y los otros cinco con piedra braza. Desafortunadamente la escasa cerámica recuperada es monocroma; sin embargo, el tipo de artefactos, nos hacen pensar que su explotación se dio por parte de los grupos Chalchihuites, al parecer durante la fase Tunal-Calera (1000-1300 d.C.).

Gravel-Miguel, Claudine (Arizona State University)

[395] *Using Computer Models and Art Stylistic Similarities to Evaluate the Impacts of Geography and Social Processes on Magdalenian Social Networks*

Anthropological research has demonstrated the influence of climate and environmental resources on the lifestyle of hunter-gatherers. While most previous work has focused on environmental influences on hunter-gatherer economic and ecological behaviors, this research will evaluate the impact of different geographical and social environments on the social networks formed therein. This project will use an agent-based model to generate test expectations related to the processes that shaped the social networks of Cantabrian hunter-gatherers during the Magdalenian. The generated expectations will then be tested through a stylistic study of Cantabrian Magdalenian portable art objects. This study will increase our understanding of the different social dynamics operating during the Magdalenian, and demonstrate the potential of combining computer models with empirical data to further our understanding of the archaeological record.

[13] *Archaeology and Heritage in the United States*

In this paper we consider how the State, through law and practice, affects United States archaeologists' abilities to conduct innovative, humanistic research in the context of cultural resource management (CRM), and may become an impediment to inclusive heritage-management practices. CRM is, perhaps, best known for its accumulation of collections and data and its ability to answer middle-range-theory questions that remain broadly ecological in scope. Here, we consider how CRM can better contribute to a growing field of heritage and identity studies and the seemingly process-based barriers to such studies. We discuss the methods and goals of some projects in the Southwest United States that have attempted to overcome these limitations and the State's role in encouraging more inclusive and more socially relevant CRM and heritage-management practice in this country.

Graves, Michael and Joseph Birkmann (University of New Mexico)

[180] *The Landscape of Agricultural Engineering in Windward Kohala, Hawaii Island*

The Hawaiian Islands are known for extensive irrigation complexes that covered coastal areas of large valleys and were recognized for their high productivity. Hawaii Island, however, had limited areas devoted to irrigated cultivation. In the study area of windward Kohala with its narrow valleys and moderately sloping ridges, the landscape for irrigated farming presented challenges that our work explores. Between A.D. 1300 and 1850 dispersed fields were established as much as 5-10 km inland within narrow valleys and on ridge lands. In these areas stream-fed canals, excavated into

and through bedrock, extended across valley slopes to water a series of pond field complexes on the adjacent ridges and within impermanent drainages. These linked complexes formed agricultural systems reflecting detailed knowledge of the land's geography and Hawaiians' capabilities to engineer gravity fed irrigation. We describe the strategies involved in transporting water over this variegated topography. These systems also crossed contiguous community boundaries, hence integrating them as social communities and centers of production. By the late 18th century, Hawaiians had created an intricate landscape where streams, ridges, valleys, drainages, slopes, and communities were bound together by systems of cooperation and complementarity in settings of intensive food production.

Greaves, Russell (Peabody Museum, Harvard) and Karen Kramer (University of Utah)

[153] *Play, Learning, Games, and Chaos: Ethnoarchaeology of Children's Contributions to Archaeological Site Formation*

Children's activities represent an under-appreciated aspect of the formation of the archaeological record. Unlike many adult behaviors of interest such as hunting, gathering, agricultural work, pastoral activities, trading, or raw material extraction that have significant components performed away from archaeologically visible habitation locations, most of children's effects on the record occur within the confines of camps or villages. Children use and discard a wide variety of toys that shift in popularity on a much more rapid scale than most adult technologies. They employ unique work implements and miniature adult tools used very differently than older people's technology. Children also play with, modify, and break implements from adult tool suites. Children engage in play that involves digging, burning, building, destruction, as well as helpful work and self-provisioning that also structures the archaeological record of habitation sites. Systematic approaches to how children's activities may be distinguished from other formation processes require more than the recognition of children as potential contributing agents. Data from Pumé foragers of Venezuela and other comparative ethnographic data are used to explore behavioral regularities in how children's behaviors influence material and spatial patterns in the archaeological record.

[206] *Always Facing East...Except When They're Not: Preliminary Analysis of Mortuary Trends at Cahal Pech, Cayo, Belize*

Mortuary patterns and practices change over time and it is the goal of this poster to present preliminary analysis of the evolution of mortuary behavior of the Maya. This poster examines different variables pertaining to mortuary practices of the Maya throughout the Classic and Terminal Classic time periods at the core site of Cahal Pech in San Ignacio, Cayo District, Belize. The analysis

focuses on burial position, orientation, presence or absence of grave goods, temporal period, burial type, grave type, and structure. Basic frequency and distribution analysis will be performed to illuminate general trends in mortuary behavior. A multivariate analysis will be applied to locate clusters and patterns across the burials. This analysis will allow for critical evaluation of the evolution of mortuary practices throughout time at Cahal Pech.

[230] *Rocks in Our Heads: Recent Investigations in Knife River Flint Quarry Area*

The Knife River flint primary source area was one of, if not the primary source of lithic material in the Northern Plains. Knife River flint was a major trade item from the Paleoindian through the protohistoric. Over the past several years, archaeologists from Metcalf Archaeological Consultants, Inc. have conducted projects within the Knife River flint primary source area located in north-central North Dakota. Many of these projects either directly or indirectly have been in support of oil development in the Williston Basin. These projects have resulted in the identification of several new sites as well as updates to a predictive model of Knife River flint natural deposits and site locational/spatial distribution using both archaeological and geoarchaeological methods. These activities have expanded our understanding of the nature and composition of the primary source area. This presentation reviews these projects and summarizes key findings to date.

Green, Scott (California State Parks) and Richard Fitzgerald (California State Parks)

[392] *The National Register Nomination for CA-LAN-1, the Tank Site, a Millingstone Horizon Site in Topanga State Park, Los Angeles, California*

CA-LAN-1, the Tank Site, located in Topanga State Park has been nominated to the National Register of Historic Places. This paper will summarize the unique approach for the nomination because it considers eligibility for the site under both Criteria A and D. The Tank Site is eligible under Criterion A as an event because a major scientific discovery was made there during the archaeological field investigations from 1947-1960. The Tank Site is also eligible under Criterion D due to the fact that it has yielded and still may yield important information about the prehistory of this region of California.

[29] *The Distinctive Archaeological Landscape of the El Malpais National Monument Lava Flows*

El Malpais National Monument, located at the edge of the Colorado Plateau near the southern boundary of the San Juan Basin, was established to protect the rich diversity of volcanic geologic features that produced one of the longest sequences of volcanic activity in the United States – from about 700,000 to 3,000 years ago. Known collectively as the Grants Lava Flow, there are over nine lava flows each creating a new land surface with lava-influenced environmental conditions. The interaction of pre-contact peoples with this distinctive landscape has produced equally distinctive archaeological features: cairn trails with bridges, shrines, caches and other features including elaborate game traps, basalt architectural complexes and large, elaborate structural sites that may have served a particular function, such as water procurement camps. Studying the context of these features within the landscape and their unique architectural aspects provides an opportunity to examine past human adaptation to atypical land forms. Archaeological exploration within the flows is finding a network of trails and features that imply a sophisticated use of the landform going back hundreds of years. These preliminary archaeological investigations suggest that the trails and other site types may have served both economic and ritual functions.

Greene, Lance (Georgia Southern University)**[124]** *Virtual Curation as an Integral Part of the Conservation Strategy at the Camp Lawton Confederate POW Site*

The Confederate POW facility, Camp Lawton, was constructed in the summer of 1864 to relieve the horrendous conditions at Andersonville. Camp Lawton, a 42-acre stockade housing over 10,000 Union prisoners, was only open during October and November 1864. It was abandoned in late November as Sherman's men marched towards Savannah. Recent archaeological excavations by Georgia Southern University (GSU) students and faculty located the prisoner encampment. The area includes intact prisoners' hut features and debris from brick ovens. Hundreds of artifacts have been recovered, most of which need conservation. Many of these artifacts are delicate and require a stable environment for long-term preservation. As part of the curation process, GSU archaeologists are now creating 3D scans of selected artifacts. This process fulfills three goals: 1) creating a more detailed and expanded curation record, 2) enabling researchers around the world access to detailed, scaled 3D models of Civil War-era military artifacts, and 3) providing access to 3D models for the public. By posting a variety of digital formats, including mp4, 3D PDF, and video, we provide several means in which to view, compare, and analyze the material assemblage.

Greene, Alan (Stanford University)**[411]** *Local, Regional, and Supra-regional Political Economies in the Late Bronze Age South Caucasus: Unpacking the Contours of "Interaction"*

The Late Bronze Age (LBA) South Caucasus (ca. 1500-1150 B.C.) has long been understood as an important moment in both the economic and political development of the region's inhabitants. As local political authorities worked to produce formal governmental institutions and maintain social inequalities, they relied on trade networks of disparate lengths and intensities. The consumption of Mitannian cylinder seals from Mesopotamia and bronze weaponry from the North Caucasus can be contrasted with that of more mundane and locally produced products, recovered side-by-side, but embedded within smaller networks of distribution that were equally important to political projects. This paper explores the connections between these multiple scales of socioeconomic "interaction" and examines what they reveal about our conceptions of material flows more generally. Analyses of pottery and faunal data collected by the Project for the Archaeology and Geography of Ancient Transcaucasian Societies (ArAGATS) are used to shed light on the economic dynamics of Armenia's LB Tsaghkahovit Plain and its regional environs, contextualizing them within the broader trends that connected this prehistoric world to the ancient Near East in the south and the vast Eurasian steppe to the north.

Greenfelder, Megan (Texas A&M University)**[206]** *Examination of Mortuary Ritual Associated with Construction Events in Peripheral Sites of the Motul de San Jose polity, Peten, Guatemala*

This poster presents preliminary mortuary and human osteological data from the Proyecto Arqueológico Periferia de Motul de San Jose 2013 and 2014 field seasons, examining several aspects of mortuary ritual associated with periods of construction and site expansion at the sites of Kante't'u'ul and Chachaklu'um, located approximately 2 and 5km from the core of the Motul de San Jose polity, respectively. Occupation at Kante't'u'ul ranged from the Late Preclassic to the Early Post-Classic, while ceramics recovered from Chachaklu'um indicate occupation from the Middle Preclassic through the Terminal Classic Periods. Apparent similarities and differences in mortuary practice from these two sites are highlighted and compared to contemporaneous practices throughout the region, including Motul de San Jose and Tikal.

Greenlee, Diana (U of Louisiana - Monroe), Rinita Dalan (Minnesota State University Moorhead) and Thurman Allen (Natural Resources Conservation Service)**[220]** *More to the (Poverty) Point: Investigation of a Previously Unknown Mound*

Poverty Point, recently inscribed onto the UNESCO World Heritage List, is a monumental earthworks site built ca. 3700-3100 BP by hunter-fisher-gatherers. Until very recently, the original Late Archaic configuration was believed to include four mounds; six concentric, semi-elliptical, earthen ridges; and

a large interior plaza. A fifth mound was added about 1800 years later. In August 2013, a small, suspicious rise in the woods on the northeast edge of the Poverty Point monumental core was confirmed to be an artificial earthwork. Following convention, this sixth mound was named Mound F. Soil development within the mound fill is consistent with it being a Poverty Point-aged earthwork. Radiocarbon dates from a submound A horizon indicate it was likely built late within the Poverty Point chronology. We present the results of initial investigations, including soil coring and geophysical survey (downhole and surface magnetic susceptibility, electrical resistivity, and conductivity), undertaken to better define the limits and internal structure of the mound.

[57] *Viking Skeletal Remains in Northern Europe: A Survey*

This paper presents the preliminary findings of a systematic survey of Viking skeletal remains in northern Europe. The survey covers Viking Age skeletons from the homeland countries of Denmark, Norway, and Sweden, as well as putative Viking skeletons from several countries subject to Scandinavian colonization, including England, Scotland, Ireland, and Iceland. Among the attributes we are recording are the degree of skeletal completeness, chronological age of the specimens, and the evidence that supports their identification as Vikings. We are also including the results of previous osteoarchaeological work, with a particular emphasis on sex, age, stature, and pathology. Lastly, we are noting whether the specimens have been subjected to radiocarbon dating, isotopic analysis or ancient DNA extraction. The survey is not yet complete, but it is already clear that there are significant gaps in the literature. Perhaps most importantly, in a number of countries little attention has been paid to Viking skeletons. They have been reported as existing, but osteoarchaeological work has either not been performed or not been published. In the talk's final part, we will outline the steps we intend to take in light of the results of the survey.

Greenwald, Alexandra, Jelmer Eerkens (University of California, Davis) and Eric Bartelink (University of California, Davis)

[415] *Childhood Diet and Foraging in Prehistoric Central California*

Ethnographic evidence demonstrates that hunter-gatherer children may forage effectively, where ecology, subsistence strategies, and social organization are conducive to juvenile participation. We hypothesize that, in easily navigated environments with food items accessible to children, juveniles will engage in assistive or independent foraging after a period of exclusive post-weaning parental provisioning, and that differences in male and female diets will reflect the sexual division of labor among adults. We use stable isotope measures ($\delta^{15}\text{N}$ and $\delta^{13}\text{C}$) from bone collagen and serial-samples of dentinal collagen extracted from first and third molars to examine childhood diet patterns, and find evidence for independent child foraging in Late Holocene Central California among groups exploiting low-ranking, sessile resources. Our study includes 115 individuals from ten San Francisco Bay Area archaeological sites.

Greer, Mavis (Greer Services, Archeological Consulting) and John Greer (Greer Services, Archeological Consulting)

[300] *Rock Art Research and Ethnohistory on the Northwestern Plains and Adjacent Rocky Mountains*

Ethnohistorical sources in our region are mainly used for rock art explanation relative to warfare scenes, but they are equally important for tribal demographics and travel patterns and often more detailed than other sources. Ethnohistory can also provide support for theories about gender and age of rock art production and use when no other information is available. Such references supply details regarding religious practices and beliefs as they actually happened, not as they were later interpreted in ethnographic perspective as an idealized practice. Ethnohistorical documents can

provide information on clothes and hairstyles that reflect tribal affiliation as well as individual status within the group. Incidents of daily life that might be reflected in rock art can be found in ethnohistorical sources as well as messages that may have been left in that media as warnings to others not only relative to marking territory and warfare but also relative to possible encounters with animals and even diseases, such as smallpox. Various kinds of information are available in ethnohistorical records to answer these and other questions when investigating explanations for rock art.

Grier, Colin (Washington State University), Eric McLay (University of Victoria) and Michael Richards (University of British Columbia)

[80] *In Twos and Threes: Dating Multiple Samples and Materials to Address the Marine Reservoir Effect*

Shell and other marine-derived materials are common in Northwest Coast archaeological sites, particularly shell middens. Yet, uncertainties in the marine reservoir offset have produced a hesitation among some researchers to generate or utilize chronological information derived from marine samples. Clearly, marine-derived dates introduce significant complexities into chronology building that need to be addressed. Here, we present radiocarbon results generated through dating two or three samples of different materials, including shell, bone and wood, recovered from single contexts within archaeological sites in the southern Gulf Islands of coastal British Columbia. We evaluate whether dating two and three-sample sets can allow for a better specification of the marine reservoir offset, and more generally, whether doing so provides for more effective chronology building. We propose that targeted dating of sample sets can be useful in many situations, and that it is critical to find an appropriate balance between budgets, local research priorities and larger radiocarbon methodological objectives.

[114] *Sacred Artifact or Personal Totem: Results of an Analysis of a Carved Animal Sacrum Discovered Off the Oregon Coast*

In March 2009, a couple walking along Oregon's central coast found a large, old looking, animal sacrum floating in a tide pool that had been modified to look like the head of an animal with a garnet used as an eye. Where this bone had originated, whether it represented an artifact that could have eroded from a local shell midden, or was placed on the beach to stump local scientists all remained in question. Since its discovery, many scientists have volunteered their time to try and unravel this mystery. Lines of inquiry included an effort to determine what animal the bone originated from; its age and how it arrived on the Oregon coast; the origin of the garnet; type of glue used to attach the garnet to the sacrum; and the type of tool used to modify the bone to hold the garnet. This paper summarizes the findings of a four-year investigation.

[350] *Linear Features in the Bajo de Azucar, Guatemala: Multiple Origins and Uses*

Examination of satellite imagery in 2006 revealed a number of linear features of varying lengths in a remote section of the Bajo de Azucar, a large swampy depression in northeast Guatemala. Ground exploration and excavation of several of these features in 2007 and 2008 documented a combination of natural and anthropogenic origins. We argue that the ancient Maya modified and extended natural channels within the bajo for several possible reasons: 1) to facilitate transportation across a difficult landscape; 2) to access agricultural lands; 3) to create a water reserve, and 4) to facilitate aquaculture.

Griffith, Anne (St. Charles Community College)**[261]** *Archaeology Field School at A Community College: An Outreach Opportunity*

In the summer of 2014 St. Charles Community College (SCC) in Cottleville, MO offered, for the second year in a row, an archaeology field school. This project was an opportunity for people outside of a traditional 4-year college or university setting to engage first-hand in archaeological field work. By offering the field school through a community college, students who might not otherwise be able to afford a regular field term got valuable hands-on experience—many St. Charles students (and community college students in general) have children, are working nearly full-time, or have obligations beyond simple school work that make them unable to participate in multi-month-long projects. Additionally, community college field schools may be more financially feasible for those who have the desire but not necessarily the funds to work on digs throughout the US or abroad. This opportunity also served to create a vital connection between the local community and SCC. Field schools such as this can be a bridge to both students and community members who may not otherwise have an opportunity to participate in an archaeological excavation.

Griffith, Cameron (Missouri State University) and Brent Woodfill (University of Minnesota)**[338]** *All the Underworld's a Stage: Ancient Maya Ritual Stages of Xibalba*

Ancient Maya rulers dramatically gave offerings to the gods and ancestors on behalf of the local population, and the spectacle was central to the maintenance of the social hierarchy. Some of these public ceremonies took place in the subterranean realm of Xibalba, from the vantage point of visible, elevated areas within cave sites. The actors using the ritual stages described in this paper, whether from large urban centers or smaller villages in the countryside, would have used the ceremonies and setting to bolster their social standing with the people under their charge. However, the people were not the only perceived audience--supernaturals upon whom the populace depended also had to be present and impressed both with the offerings provided and a successful spectacle.

Griffith-Rosenberger, Jacob (Kenyon College), Reagan Neviska (Kenyon College) and Chelsea Katzeman (Kenyon College)**[314]** *Fashioning Meaning through Ceramic Candeleros in the Terminal Classic Naco Valley, Northwestern Honduras*

Candeleros are simply made ceramic artifacts that consist of one or more cylindrical chambers that are usually circularly arranged and often show signs of burning. These objects are found widely across Mesoamerica though they are rare in most locales. The 100 km² Naco Valley in northwestern Honduras diverges from this pattern in that: candeleros are frequently found in Terminal Classic (800-1000 CE) assemblages here; they vary in size from items containing a single chamber to others with upwards of 20 receptacles; and their range of decorative embellishments is considerable, from incised linear designs to examples shaped as various animals. In this poster we summarize research that describes how these items were manufactured, decorated, and what those adornments might have signified to those who used the items. The implications of our findings for understanding the interplay of people and objects within this ancient society are also considered.

Griffiths, David (University of Oxford)**[18]** *Long Distances/ Local Dynamics: Overcoming 'Culture History'*

This paper will begin by reviewing how 'Viking Archaeology' came about in the 19th and 20th centuries. Formed under the influence of a handful of key scholars, with their primary index of recognition based in Scandinavian museum collections, a widely-accepted paradigm of Nordic precedence was created. Aided by a series of influential Scandinavian publications, this stance produced a seemingly fixed series of cultural references, creating a strongly-identified intrusive ethnic grouping in material culture terms. This accorded almost too conveniently with the known proto-historical emphasis on conflict and oppositional cultural development. This paper critiques this approach as unduly systematic and normative, arguing for more attention to be given to intensive and nuanced local interaction in specific situations. The role of ancestral and long-distance cultural

allegiances will be balanced against inter-ethnic relations observable in microcosms of individual settlement scenarios and in human-scaled landscapes. The role of Scandinavian homelands as an ongoing cultural inspiration to diaspora-based communities will be questioned, and reverse and multi-dimensional influences stressed. The paper will examine how we can progress from an archaeology of a 'dominant other' to an archaeology of a fugitive and dispersed actor network embedded in its surroundings.

Griffiths, Seren (Manchester Metropolitan University)

[348] *Modeling the Chronology of Neolithic Ceramics in Eastern France*

The associations of decorative motifs on Neolithic pots from the Alsace region of the upper Rhine valley, eastern France, have been rigorously studied by Philippe Lefranc and Anthony Denaire using correspondence analysis. Separate sequences are available for the Early (LBK) Neolithic pottery and for a series of related Middle Neolithic ceramic styles, running from the later sixth to later fifth millennia cal B.C. Within the 'Times of Their Lives' project, the absolute chronology of this cultural sequence has been formally modelled by combining a suite of radiocarbon dates from graves and articulated animal bones in settlement pits with the partitioned seriations. In this way, much more precise estimates have been obtained for the rate and tempo of cultural change over a millennium or so. This has also thrown up an unsuspected possible hiatus between the late LBK and the Hinkelstein phases, in the early fifth millennium cal B.C. Traditional site-based analysis, close knowledge of the material, seriation and formal modelling in a Bayesian framework make a powerful combination with which to examine in more detail a long cultural sequence.

[362] *Numic Fire: Biogeography of Foragers and Fire in the Great Basin*

Fire is increasingly recognized as a central evolutionary force shaping the earth's ecosystems. This is especially observable in the fire-prone American West, where indigenous populations frequently used low-intensity burns to modify their habitats for myriad purposes. Given the variability of environments within the Great Basin, the effects of anthropogenic burning likely had different impacts depending on local ecological and subsistence contexts. To understand where and why anthropogenic fires may have had a significant impact within the region, we examine (1) the distribution of people across the cultural Great Basin at the time of contact, (2) environmental variation in habitats, and (3) the estimated wildfire frequency.

Grimm, Sonja (MONREPOS Archaeological Research Center and Museum, RGZM)

[389] *Every End Is A New Beginning. An Adaptive Cycle in North-West Europe during the Weichselian Late Glacial*

Change in human societies is encouraged by innovators and slowed by traditional behavior that provides the security of a running system. However, in times of significant climatic and environmental change traditional strategies might fail and innovations can become the more attractive option. 15,000 years ago, hunter-gatherers in north-western Europe were confronted with the important change from a glacial (Weichselian) to an interglacial period (Holocene) that was characterized by rapid fluctuations between stadial and interstadial conditions. Human groups had to adapt to these conditions. During this adaptive process, the Upper Paleolithic traditions were replaced by the Final Paleolithic way of life. Based on reliably dated archaeological assemblages from northern France, southern Belgium, and western Germany, variations in technical, economic, and spatial behaviors

are documented that reflect this replacement in the archaeological material. The distribution of the appearing variations over the studied time period gives an impression of the process of change in a human society and makes a comparison with the suggested developments in the concept of adaptive cycles possible. Furthermore, the contextualization of this process in the climatic and environmental changes of the Weichselian Late Glacial allows a discussion about the role of these factors in changing human societies.

[205] *Take Me Home Desert Roads...Stable Oxygen Isotope Analysis and Migration in the Dakhleh Oasis, Egypt*

Analysis of stable oxygen isotope ratios in adult bone apatite and tooth enamel from the Kellis 2 cemetery (50-450 A.D.) in the Dakhleh Oasis allows for greater insight into ancient migration between this remote locality and the Nile Valley. Analyses of 45 adult males and 35 adult females are compared against $\delta^{18}\text{O}$ values from three contemporaneous Roman-Christian sites and one New Kingdom site located along the Nile Valley. The average $\delta^{18}\text{O}$ value for the Nile Valley sample is $-31.61\text{‰} \pm 1.84$, while $\delta^{18}\text{O}$ values for individuals recovered from the Dakhleh Oasis average $-26.86\text{‰} \pm 1.31$. Comparison with $\delta^{18}\text{O}$ values from the Nile Valley suggests that 12 individuals from Kellis 2 cemetery spent significant time in the Nile Valley. Specifically, results show 33 of the 35 females sampled were local to the Dakhleh Oasis, while 10 of the 45 males sampled show evidence of extended time spent along the Nile. These results are supported by ancient sources that document males as traveling in caravans or participating in apprenticeships along the Nile and Delta. By evaluating ancient migration of individuals interred at the Kellis 2 cemetery, we can address pertinent questions regarding the social organization and gendered mobility of this ancient community.

[155] *Geoarchaeology at the Little John Site (KdVo-6), Yukon Territory, Canada*

The Little John Site (KdVo-6), Yukon Territory, Canada, contains the presence of Chindadn complex (East Beringian Tradition), Denali complex (Paleoarctic Tradition), Northern Archaic Tradition, and Late Prehistoric artifacts in unique stratified contexts. The site contains loess/paleosol stratigraphic sequences dating to the Wisconsin Interstadial ca. 44,000 years ago, and cultural deposits from the Late Pleistocene to the recent past. Optically Stimulated Luminescence and Accelerator Mass Spectrometry radiocarbon dates, macro and micro sediment analyses, and consideration of ancient and contemporary peri-glacial processes are presented to illuminate the environmental and depositional history of the site's unique geologic context and archaeological materials.

Grosman, Leore (Institute of Archaeology, The Hebrew University)

[40] *The Late Natufian Culture Dynamics during the Younger Dryas Event*

The Natufian culture coincided with the Terminal Pleistocene, a period of climatic unpredictability. In the Southern Levant the Late Natufian phase corresponds to the global Younger Dryas event and directly precedes the abrupt transition to early Neolithic entities at the beginning of the Holocene climatic regime. The unique cultural dynamics of the Natufian, shifts in subsistence strategies and the environmental setting of various sites are the key for understanding the process of Neolithization. Yet, the effects of the Younger Dryas on the Late Natufian population remain poorly understood. Did the climatic event delay or halt the cultural processes that promoted the shift to agriculture? Did cultural dynamics maintain their course toward Neolithization in spite of the short-lived climatic deterioration? New perspectives on these questions are provided by new evidence from two very Late Natufian sites in Israel—the burial cave of Hilazon Tachtit, and the residential village of Nahal Ein Gev II.

Grove, Matt (University of Liverpool)

[84] *Climatic Variability and Hominin Dispersal: The Accumulated Plasticity Hypothesis*

It has long been known that temporally unstable environments are likely to promote the evolution of plastic adaptations, whilst it is equally clear that such adaptations are characteristic of successful colonizers. These two established findings, however, are rarely related. This contribution bridges this gap using a very simple evolutionary algorithm that tracks the evolution of plasticity under various climatic regimes, allowing for the construction of an index of climate-mediated dispersal potential. Model results suggest populations accumulate high levels of plasticity during highly variable climatic phases and express such heightened plasticity via dispersal in subsequent low-variability phases. This putative scenario is referred to as the Accumulated Plasticity Hypothesis, and is tested using a high-resolution precipitation record from Lake Tana, Ethiopia, together with the dates of the first *Homo sapiens* dispersal out of East Africa. The primary dispersal phase identified in the Lake Tana record between 112ka and 97ka accords remarkably well with the timing of *Homo sapiens* arrival at the Israeli sites of Qafzeh and Skhul, and with dated 'Southern Route' sites in Yemen and Oman. This dispersal chronology is discussed in relation to recent revisions of genetic dates for the origin of non-African modern humans.

[12] *Modeling the Replacement of Atlatl by Bow Weaponry: Technological Learning Curves and Task Differentiation in Prehistory*

Understanding technological replacement is a ubiquitous problem in archaeology. Modeling the transition from atlatl to self bow has implications for elucidating the driving mechanisms behind why and how prehistoric culture change occurs worldwide. At different periods of human prehistory, atlatls were replaced by self bows as primary hunting weapons on all continents except Australia. Previous scholars have hypothesized that this shift may have occurred when changes in environment/subsistence strategies and/or a rise in social complexity and warfare favored the bow over the atlatl. Quantitative, diachronic data obtained from atlatl and self bow target shooting suggest that physical constraints and distinct patterns of learning inherent to using each weapon may have acted as causal factors of technological change under shifting environmental conditions when considered under a framework of human behavioral ecology. Furthermore, these data indicate that the transition from atlatl to bow would have necessitated changes in age and sex/gender-based task differentiation for prehistoric children, women, and men.

Gruner, Erina

[364] *Lithic Analysis from the Rainbow Forest Clovis Site*

During the late Pleistocene the Rainbow Forest Playa Paleoindian site at Petrified Forest National Park was an area where Clovis people procured lithic materials and took advantage of a local riparian microenvironment. This poster presents recent research on lithic tool assemblages from the Rainbow Forest Playa site, including microwear analysis from archaeological materials and the results of replicative experiments. Results suggest that while the site was clearly used as a lithic quarry, a high percentage of artifacts such as blades, flakes, and stage four bifaces were expediently produced for local processing activities, then discarded.

Grunwald, Allison (University of Wyoming)

[122] *Bashing Bones – Experimental Archaeology and its Application to the Carter/Kerr-McGee Site*

Thirty years ago, the Paleoindian bison bonebed at Carter/Kerr-McGee, located in northwest Wyoming, was interpreted as a winter kill-butcher locale with possible frozen meat storage. The recent complete analysis of these 9,000 year-old bones, originating from about 50 *Bison antiquus*, and comparisons of the bone fragmentation patterns at this site with those of experimentally broken bones, supports this initial assessment. Preliminary results confirm the presence of 15 regular spiral (fresh) breaks and two irregular spiral (non-fresh) breaks on long bones. Irregular spiral breaks, indicated by either a curvy or angled fragmentation line that follows the normal spiral or helical path around a long bone, is the primary exhibited pattern in bones that were experimentally hammerstone-cracked while frozen or thawed. The presence of this diagnostic feature on bones in the Carter/Kerr-McGee assemblage may indicate the practice of freezing long bones for delayed consumption of marrow as well as meat. This research has implications for interpreting winter subsistence activities of Paleoindians on the North American Plains as well as contributes significant data to our understanding of Quaternary bison morphology and evolution.

[179] *Residue Analysis in Chinese Paleolithic Studies: Perspectives and Case Studies*

Archaeological plant residue analysis has developed considerably in China during the last ten years. State of the art technology has been broadly and successfully applied by archaeologists at various Paleolithic sites. Issues about stone tool function, plant use, the origin of agriculture and the like can now be deeply discussed with the direct evidence of residues from stone artifacts. This is the case for either chipped stone or ground stone tools. However, this technology requires archaeologists to follow certain regulations and design the whole project from the beginning, before the artifacts are unearthed from the sediment. Also, the time range in which this analysis can be applied needs to be discussed. The question arises as to how long plant microfossils can remain on the surface of the Paleolithic artifacts. In this paper, we present the results of several case studies concerning the preservation of Paleolithic micro-remains from different sites.

[345] *The Introduction and Early Utilization of Barley and Wheat in Gansu and Qinghai Provinces, Northwest China*

Barley and wheat are now important cultivated crops in northwest China, especially on the Tibetan Plateau, and are suggested to have been firstly domesticated in West Asia before 10000 cal yr BP. When these two crops were first introduced to China and elsewhere in Eurasia has been widely discussed in recent years. Gansu and Qinghai Provinces are key regions of the "Ancient Silk Road," and may have formed important routes in "Food Globalization in Prehistory." Based on archaeobotanical study and direct radiocarbon dating of charred barley and wheat seeds, along with stable isotopic evidence from Bronze sites in Gansu-Qinghai Region, we discuss the introduction and early utilization of these crops in the area. Our results suggest barley and wheat were introduced into the area around 4000 cal yr BP, and became important cultivated crops and staple foods a few

centuries later.

[413] *Riverine and Maritime Trade Routes on Caribbean Side of the Yucatan Peninsula.*

Riverine routes from the Caribbean coast from Belize River north to Laguna Bacalar are examined in the context of the major centers, intensive agricultural fields, and patterns of production, transport and centers of power. By contextualizing our understanding of major sites in terms of the opportunities and limitations offered by the riverine transport systems, we can better understand the economic basis of how and why various important centers rose to prominence. Further, these trade opportunities offer insight into how some leaders acting as clever agents were able to orchestrate survival of their cities past the general depopulation of the region.

Gudiel, Lucia

[38] *An Ethnoarchaeological Approach to Understanding the Role of Root-crops in Ancient Lowland Maya Subsistence.*

Dr. Scott Fedick's research goals have always emphasized the importance of understanding the diversity and ingenuity of lowland Maya subsistence. Through his guidance and mentorship my dissertation focus was developed to explore the role of root-crops in ancient Maya subsistence. Recent paleoethnobotanical research has demonstrated that the ancient Maya diet included a wide array of plant foods. Currently lacking is enough evidence for the role of roots-crops. To begin to acquire an understanding of how to best recover evidence of root-crops it is important to understand all the biases that may affect their visibility and patterning in the archaeological record. Cultural and natural processes transform material remains morphologically, quantitatively, spatially and relationally, thereby transforming the archaeological record. My doctoral study examines the presence and significance of root-crops for the ancient lowland Maya by using a multifaceted approach. One such facet is an ethnographic study to document the cultural value of root-crops and the behaviors that would lead to the incorporation of root-crop starch into the archaeological record. Observing their use-history from cultivation through discard in modern communities may provide an understanding of the relationship between these behaviors and the location and condition that root-crop starch might enter the archaeological record.

Guebard, Matthew

[29] *Developing New Interpretations from Old Data at Montezuma Castle National Monument, Arizona*

This paper addresses recent archaeological work at the Castle A site (AZ 0:5:95 [ASM]), located within the Montezuma Castle National Monument boundary in Camp Verde, Arizona. Initially excavated and stabilized in 1934 by National Park Service archaeologists Martin Jackson and Sallie Pierce, the project is a historically significant event in the development of Verde Valley archaeology. Based on Jackson and Pierce's interpretation of stratigraphic evidence, they believed a catastrophic fire destroyed the site long after abandonment, an interpretation that has persisted for over 80 years. A recent reanalysis of ceramic data coupled with archaeomagnetic dating strongly suggests this initial interpretation is incorrect. Instead, evidence points to a large and intentional fire resulting in the abandonment of the site during the last quarter of the fourteenth century.

Guengerich, Anna (University of Chicago)

[78] *Chachapoya Domestic Architecture: Identity and Interaction within, across, and beyond Regional Boundaries*

Recent research among Chachapoya societies, who lived in Northeastern Peru between A.D.900-1500, has drawn attention to the diversity of material culture associated with different sub-regions

spanning this large area. In the face of this diversity, one basis that archaeologists have consistently used for grouping these societies together is domestic architecture. Communities across the Chachapoya region built circular houses out of stone, adorning them with functional and decorative features unique to this region, including platform-bases, cornices, and, in many areas, geometric friezes. At the same time, circular stone domestic architecture was also a hallmark of Late Intermediate Period (A.D.1000-1450) settlements throughout the highland Central Andes. Chachapoyas appears, therefore, to represent a regional instantiation of a much broader phenomenon. In light of this situation, this paper elucidates the relationship between domestic architectural form and cultural, ethnic, or social affiliation at the scales of sub-regions within Chachapoyas, of the Chachapoyas region as a whole, and between Chachapoyans and neighbors in other regions of the Andes. In the process, I pose a number of questions for future research on Chachapoya circular architecture, including the trajectory of its development and the significance of architectural diversity across and within settlements.

Guenter, Stanley (Southern Methodist University)

[306] *On the Fall of Copan, Teotihuacan, and the Origins of the Fate of 8 Ahau*

"A Forest of Kings" was groundbreaking for its integration of epigraphy, archaeology, and ethnohistory. In their book, Schele and Freidel discussed the Early Classic Teotihuacan-Maya cultural and political interaction as well as the fall of Copan, and the larger issue of the collapse of Classic Maya cities, and even the fall of Postclassic Mayapan. In this presentation I wish to expand on and integrate these disparate themes in an effort to answer the question of why the Colonial era Maya associated Katun 8 Ahau with destruction, collapse, and the abandonment of the great cities of their past. I will argue that a number of early major episodes of collapse in the Maya world, falling on 8 Ahau dates, led to this association and that the collapse of the last Maya kingdom, the Itza, in 1697, was an echo of the collapse of the first great Maya kingdom 1500 years earlier, both falling in Katun 8 Ahau.

[151] *Izapa and the Iconography of Water and Economics*

The stelae of Izapa have long been analyzed within a mythic framework, drawing heavily on longstanding interpretations of mythological narratives like those of the Maya maize god. Such interpretations, while fundamental to understanding the complex meanings of such imagery, nevertheless often neglect other salient aspects of the scenes, including elements that speak to more economic concerns, particularly those that revolved around water transport. This paper argues that a re-analysis of the Izapa imagery reveals elements of the iconography that allude to the sophisticated networks of economic productivity and exchange that were undoubtedly critical to the rise of Izapa during the Late Preclassic period, and which were couched in mythic narratives.

[78] *Assessing the Genetic Diversity in the Extant Chachapoya Population from Northeastern Peru Using Uniparental DNA Markers (mtDNA and Y-chromosome)*

The aim of this study is to elucidate the origin and population history of the human communities from northeastern Peru, with both contemporary and ancient DNA data. For the first phase of the study, contemporary Y-chromosomal (23 STRs) and mitochondrial (HVR1 and HVR2 sequences) data from four populations (Chachapoya = 276; Jivaro = 47; Huancas = 21 and Cajamarca = 34) distributed in the northeastern region of Amazonas (Peru), was assessed. At haplogroup level, the markers showed differential proportions of non-native genetic contribution (mtDNA = 11%; Y-Chromosome = 43%). This reflects the history of European colonization that took place during the 16th century, which favored male-mediated European gene flow into the native gene pool. However, even though the Chachapoya area shares a common history of European colonization with several other populations in the Americas, the levels and nature of genetic diversity suggest that the Chachapoya has had a distinctive demographic history, shaped by their geographical position between highlands and jungle. For instance, the Chachapoya population shows a pattern of population expansion seen only in a few other South American populations. Another interesting feature is that the Chachapoya assumes a basal position in mtDNA phylogenetic trees within South American populations, which may suggest an early origin for this singular people.

Guidry, Hannah (TRC Environmental)

[311] *Archaeological Investigation and Relocation of a Slave Cemetery at the Nashville Zoo, Davidson County, Tennessee*

Excavations on Nashville Zoo property, once part of the Grassmere Plantation established ca. 1810, identified and removed 20 individuals from an unmarked cemetery. Evidence from coffin and clothing remains indicates the cemetery dates from the early to mid-nineteenth century. The absence of elaborate coffin hardware common of the time, the cemetery location, and the known slave-holding history of the farm indicate this was a slave cemetery. Most of the wooden coffins were hexagonal with few examples of hardware beyond nails. A trend in button material from only handmade shell and bone to the addition of post-1840 porcelain buttons in the north portion of the cemetery suggests expansion in this direction through time. Additionally, blue and white glass beads were interred with two infant burials. The orderly nature of the cemetery arrangement demonstrates a lasting, organized method to the burial practices. Following excavation, the individuals were moved to the historic farm portion of the Zoo, and reburied in the same arrangement. Information gleaned from these excavations will be incorporated into the existing historic interpretive program at the Zoo. The remains and artifacts from this cemetery provide insight into the life, death, and burial customs of an enslaved population in Middle Tennessee.

Guilfoyle, David (Applied Archaeology International)

[336] *Local Contexts, Global Application - A Comparative Analysis of Collaborative and Community Archaeology Projects in Western Australia, British Columbia and Alaska*

Collaborative heritage management projects requires adaptation to local customary protocols, local structures, and local community goals, and so necessitates a uniquely, localized focus. At the same time, developing, formalized approaches to collaboration that have universal elements – structures and processes - that are applicable in any context, is a goal in the continual evolution and development of a fully integrated collaborative, community archaeology. This means identifying those structures and processes that operate to overcome the specific barriers and/or opportunities that exist within a local community context. The differences (and similarities) between one local context and another are due to contrasting restraints/opportunities derived from government regulations, historical contexts, social structures, land tenure/access, industry impacts, academic agendas, and prevailing land management regimes, among other factors. Using several case studies of projects currently underway in Western Australia, British Columbia, and Alaska, the paper outlines the challenges, opportunities, and outcomes when undertaking collaborative and community archaeology projects operating within different socio-political contexts. The goal of this analysis is to identify the similar mechanisms established that transcend the contrasting, external barriers and

opportunities. In so doing, the paper explores the wider applicability of developing a formalized, structural model of collaboration in cultural heritage management.

Guillen, Sonia, Gilmer Medina and Agustín Rodríguez

[78] *Redefining the Chachapoya Territory*

The number of studies in the ancient Chachapoya territory increased tremendously in the last two decades. It is clear that the concept of a Chachapoya unit does not have a strong basis. This is not a new idea, ethnohistorical documents refer to the differentiated communities included in the common denomination introduced since the time of the Inka conquest. This presentation reviews the distribution of sites referenced in the literature, introducing new data based on speleological studies, ancient agricultural technology, and the differentiation of mortuary practices. This evidence, in light of the ethnohistorical references to the ethnic groups that populated this area, shows a differentiation that is still claimed by local groups and which appears to be more in accordance with local history. The site of San Jerónimo near Pedro Ruiz in Amazonas, discovered in 2011, is used as an example of this complex scenario. Although still lacking a comprehensive study it shows a landscape with great variation in mortuary practices, intense agricultural activity and large settlements. The discussion aims to define whether clear ethnic boundaries are stronger than the association to a Chachapoya denomination.

[110] *Tree-Ring Sourcing of Great House Timbers and the Plaza Tree of Pueblo Bonito, Chaco Canyon, New Mexico*

Materials arriving in Chaco Canyon from A.D. 900 to 1150 came from many distant sources, and the necessary construction timbers for the great houses are no exception. Here we present tree-ring sourcing of great house construction timbers and the plaza tree of Pueblo Bonito (the “rooted tree”, labeled JPB-99). To source these trees, we compared their tree-ring growth patterns to a network of millennial-length tree-ring chronologies surrounding the San Juan Basin. For JPB-99, we present new documentary evidence regarding its discovery as well as new strontium isotope ratios for the tree and a set of extant ponderosa pine trees in Chaco. Results indicate that construction timbers were primarily brought from the Chuska and Zuni Mountains. The Chuskas only supplied wood after ca. 1020 and then became more important than the Zunis through the early 1100s, coincident with other materials (e.g. stone and pottery) that have been sourced to the same areas. In testing multiple hypotheses about JPB-99, we find that it most likely was brought to Pueblo Bonito from the Chuska Mountains sometime after it died in the early 1100s. Our findings support and expand on earlier sourcing efforts indicating long-distance timber procurement for great house structures in Chaco Canyon.

[402] *Iron and Glass: Reconstructing (Overlapping) Technologies in Early South India*

Recent survey fieldwork undertaken as part of the ongoing project, Production Landscapes of Southern Andhra Pradesh (PLoSAP), has revealed a complex material landscape. The scale and

variety of the remains seem to indicate that various technologies – and especially pyro-technologies – were consistently present in this area, while the spatial distribution of the remains suggests that these technologies were differentially distributed across the survey areas. A more detailed analysis of the production debris highlights the challenges in correlating technical processes with the recovered artifacts. Technologies such as iron production and glass-working engage with similar high-heat techniques and therefore result in overlapping material assemblages, both in the production apparatus and in the waste produced. Being able to distinguish between potentially closely related production practices is fundamental to delineating the crafting communities that populated the landscape of early South India, and therefore to understanding the relationships that may have existed between them.

[56] *Interpreting Ecclesiastical Mobility: A pXRF Study of Medieval Gravestones in Ireland*
Western Ireland's early medieval (700-1200 A.D.) landscape—dotted with stone cemeteries and structures—provides an ideal setting for studying ecclesiastical lifeways through methods of raw materials characterization. Archaeological analyses and oral history suggest that people living in small ecclesiastical communities between the 6th and the 12th centuries exchanged and transported gravestones. While traditional archaeological analysis of the shape and stylistic design of gravestones from five cemeteries in western Connemara, Co. Galway, illustrates clear similarities, this analysis alone cannot define systems of gravestone exchange or transport.

Using portable X-Ray Fluorescence (pXRF), we seek to understand broad provenience patterns for over 200 medieval gravestones from five coastal monastic sites by comparing their elemental signatures with those of local bedrock lithologies. Preliminary data analysis revealed that several gravestone lithologies are non-local to the islands where they were recovered, suggesting that people likely transported gravestones between islands. In light of recent debates surrounding pXRF reliability, this project highlights pXRF's utility as a tool for supplementing conventional archaeological and geological field methods. More broadly, this project offers a better understanding of medieval Ireland's ecclesiastical communities, their mobility patterns, and their interconnected monumental landscapes.

[74] *Environmental Change and the Neolithization of Southeast Europe: a Bulgarian Perspective*
Any discussion of Neolithization on the part of the Balkan Peninsula that lies within the territory of Bulgaria has to confront two seemingly long-established and incontrovertible 'facts' – the abrupt appearance of a fully developed Neolithic 'package' c. 6100/6000 cal B.C., and the virtual archaeological 'absence' of a pre-Neolithic substratum. This paper focuses on two inadequately discussed aspects of the ongoing debate surrounding the spread of farming across SE Europe: 1) the environmental potential of the region for pre-Neolithic hunter-gatherer settlement against the background of substantial climate and vegetational change during the Terminal Pleistocene and Early Holocene, and 2) the appearance of a distinctive raw material ('Balkan Flint') and toolkits that are one of the hallmarks of the supra-regional Karanovo I–Starčevo–Criș–Körös cultural complex.

[32] *Why Did Paleocoastal People Settle California's Islands?*

Islands have long been viewed as marginal habitats compared to mainland regions where terrestrial resources are generally more abundant and diverse. We examine this concept of island marginality by reviewing evidence for Paleocoastal settlement of islands off the Pacific Coast of Alta and Baja California. If the islands were marginal, we should expect human settlement to occur relatively late in

time and early use of the islands to be sporadic and specialized. For the Northern Channel Islands this is clearly not the case, with human settlement occurring by 13,000 years ago and extensive evidence for Paleo coastal occupations between ~12,200 and 8400 years ago. There is less evidence for Paleo coastal occupation of the Southern Channel Islands, but crescents found on San Nicolas suggest that Paleo coastal people visited this island. Off Baja California, there is evidence for sustained maritime occupation of Cedros Island by 12,000 years ago, although the island was connected to the mainland at the time. Although the earliest human history of California's islands is clouded by sea level rise, coastal erosion, dune building, and differential research, the evidence suggest that the Northern Channel Islands, at least, were optimal habitat for Paleo coastal people, with ample food, freshwater, and other resources.

[38] *Debt Peonage and Free Labor: Post-Caste War Sites in Northern Quintana Roo and Western Belize*

The Caste War left an indelible mark of the Yucatan Peninsula including helping to perpetuate an abusive labor system that continued until the Mexican Revolution. This paper explores the living conditions at sugar production facilities near the north coast of Quintana Roo, Mexico through comparison to a similarly-aged site in western Belize, San Pedro Siris. San Pedro Siris was a free village of primarily Maya families that were pushed south into Belize by refugees as the Caste War ended. Workers from San Pedro Siris worked as lumberjacks but remained independent. In comparison workers at sugar production sites in northern Quintana Roo worked under a system of debt peonage and land scarcity. As lumber and sugar production are of similar physical intensity, and as it appears that the primary source of imported goods for all sites under discussion were ships following a trade route that extended along the north and east coasts of the Yucatan Peninsula, it is proposed that the primary difference in way of life between these two areas was the ownership-labor regime in operation at each site.

Gustas, Robert (University of Alberta)

[320] *Least Cost Analysis of Peopling Events on the Northwest Coast of North America*

The peopling of the Americas continues to be a relevant issue in contemporary archaeology. Due to the small number of discovered sites that predate 10,000 years before present, the chronology and method of these migration events are not well understood. Previous research has been unsuccessful in consistently identifying sites from this time period and better models are needed to successfully locate sites in this landscape, which has gone through radical change over the last 16,000 years. This project developed a new method of modeling migration using least cost analysis (LCA) of Late Pleistocene maritime travel to determine the areas most likely to have been traveled through by Paleo-Indian groups. Using multi-criteria analysis, different cost weighting scenarios, and least cost corridors, possible movement routes along the Northwest coast of North America were reconstructed. These areas were ranked by probability of use and analyzed using spatial autocorrelation statistics. This project is one of the first to apply LCA to seascapes and marine movement and the results have the potential to lead to a better understanding of the Late Pleistocene through the discovery of new early sites.

Gutierrez, María De La Luz (Instituto Nacional de Antropología e Historia, B.C.S, México)

[156] *"El viejo" del cañón del azufre: un posible caso de pareidolia e hierofanía en el sistema volcánico Tres Vírgenes, B.C.S, México*

En Baja California central (México), se eleva el sistema volcánico Tres Vírgenes, el rasgo geográfico más conspicuo de la región. En sus dominios han sido encontrados yacimientos de pigmentos minerales, material esencial para la elaboración de la pintura con la que los indígenas que habitaron las montañas aledañas, decoraron sus cuerpos y pintaron sus moradas y recintos sagrados. Uno de los lugares que muestra evidencia arqueológica de extracción de óxidos de hierro y yeso es el Cañón del Azufre. Aquí se sitúan además, otros dos rasgos del paisaje excepcionales: un manantial de aguas termales y un abrigo rocoso que contiene un arte rupestre insólito. Adicionalmente, este abrigo rocoso manifiesta un fenómeno extraño: si se observa desde ciertos ángulos y ciertas

condiciones de luz, su parte frontal nos recuerda un rostro, cuyos “ojos” “observan” el manantial. La ponencia analizará este caso a partir de los postulados que surgen de la Pareidolia y la Hierofanía. Se propone que este rostro “se mostró” a los indígenas, quienes lo reconocieron como un ente divino, consagrando el lugar a través de la imaginaria rupestre.

Gutierrez, Gerardo (University of Colorado at Boulder, Department of Anthropology)

[182] *Acrobatic Games of Mesoamerica*

In this paper I examine the context and performance of acrobatic games in Mesoamerica using archaeological, ethnohistorical, and ethnographic representations of contortionists, tightrope walkers, equilibrists, dancers on stilts, jugglers, and participants in rotational devices, like the Palo Volador and the Huahua. I underline the importance of acrobatic games in ritual festivities and secular events where improvisational and professional performers staged spectacles and played tricks designed to amuse large audiences. Acrobatic games are part of a larger complex of ludic Mesoamerican practices that included theater and illusionism. I argue here that acrobatic games were an essential form of socialization and community-building that provided necessary moments of relaxation during the agricultural and ritual calendar.

[250] *New Radiocarbon Dates Confirm Late Pleistocene Human Occupation in the Pampas of Argentina at ca. 12,170 14C yrs BP: Evidence from Extinct Horse at the Arroyo Seco 2 Site*

The Arroyo Seco 2 site (AS2) is a multi-component open air hunter-gatherer site located in the Pampean Region of Argentina. A recently published monograph summarized the current interpretations of the site, which contains bone remains of 11 extinct Pleistocene mammals, including *Eutatus seguini*, *Glossotherium robustum*, *Megatherium americanum*, *Paleolama cf. wedelli*, *Toxodon platensis*, *Equus (Amerhippus) sp.*, *Glyptodon sp.*, *Hemiauchenia sp.*, *Hippidion sp.*, *Macrauchenia sp.*, and *Myodontinae*. While there is a concentration of selected anatomical parts of Pleistocene species and a spatial and stratigraphic association between them and lithic artifacts, the evidence of anthropic processing marks on the Pleistocene fauna bone surface remained scarce. Taphonomic analysis identified a proximal ulna bone fragment of *Equus (Amerhippus) sp.* with conclusive processing marks (two impact points with their respective negative flake scars on opposite sides of the shaft as well as notches produced by impact failures). A new AMS 14C analysis of this specimen yielded a date of 12,170 ± 45 14C yrs BP; which is consistent with a previously-obtained determination on *Megatherium* remains averaged to 12,172 ± 42 14C yrs BP (4 averaged dates). This date confirms the validity of the late Pleistocene human occupation chronology at the Pampas of Argentina.

[164] *The Breaking and Making of Ceramics in the Precolumbian Caribbean: A Technological Approach to Grog Identification*

Grog is a technological phenomenon present in archaeological assemblages spanning widely across time and space. Traditionally defined as a grounded down, previously fired ceramic used as temper during clay preparation, grog belongs to a wider category of additives, which increase porosity and reduce shrinkage, thereby lessening the likelihood of vessel crack progression during the drying and firing stages of ceramic production. Beyond this basic description of its functional properties, the

addition of grog has not received adequate scholarly attention as a complex, highly variable technological practice. Through the application of an array of technical methods including fabric analysis, petrography, microprobe study (EMPA), and experimental reconstruction, this study aims to refine overly-generalized, classic characterizations of grog and to develop an adjustable range of selection criteria, which can differentiate grog types with greater resolution. Building on a growing corpus of ceramic characterization studies in the Caribbean region, the project explores a micro-scale analysis of an assemblage of decorative lugs ('adornos') from the Precolumbian site of El Cabo (A.D. 800-1504) in the Dominican Republic. Preliminary research suggests an under-reporting of grog in the archaeological record and an under-representation of its potential compositional diversity. Together, these findings challenge normative definitions distinguishing natural and culturally occurring tempers.

Guzman, Rodrigo (SMU)

[287] *Advances and Changes in the Surveying and Mapping of Guatemalan Archaeology Aided by New Information Technologies*

Guatemalan archaeology is benefiting from new technologies for the monitoring and measurement of spatial information. Traditionally, archaeologists have relied on specialists in mapping and surveying to record spatial data and use it as the basis for the study of distribution of cultural traits. However, advances in mapping technology which allow non-specialists to collect multiple data points in shorter amounts of time is greatly aiding archaeologists working at sites in Guatemala. Other advances include the introduction of the new information technology, which provide users with free software, geographic navigation programs, and tutorials. Likewise, access to base maps in analogue and digital format have been improved, which in terms of accuracy, are presented in a local projection supported by a relatively new geodetic network. Institutions and projects that conduct archaeological research are increasingly using such technologies, with individual users being non-specialists or local specialized archaeologists. In this paper, I discuss the use of some of these new technologies by archaeologists working at specific sites in Guatemala, as well as the impact this technology is having on our interpretations of architecture and landscapes in the past.

Guzmán, Ana

[298] *Peces de las ofrendas asociadas a Tlaltecuhltli*

Se describe el contenido ictiológico de tres ofrendas asociadas al monolito de Tlaltecuhltli (1486-1502 d. C.). y se dimensionan los resultados comparándolos con otras ofrendas del mismo sitio (Complejo A: 1440-1469 d. C.). La Ofrenda 120 contenía escasos elementos de siete taxa; la Ofrenda 125, ocho taxa con un individuo cada uno (excepto un caso), con ejemplares completos y taxidérmicos; y la Ofrenda 126, siete taxa con uno a dos ejemplares, tanto completos como taxidérmicos. Las ofrendas a Tlaltecuhltli son poco diversas, pero muestran la continuidad del uso ceremonial para casi todas las especies, algunas con valor de importancia alto (Complejo A: *Hyporhamphus* sp., *Tylosurus crocodilus*, *Pristis pectinata*, *Diodon hystrix*). *Bagre marinus* es un elemento atípico (no arrecifal) y probablemente sea incidental. La alta abundancia de *Hyporhamphus* sp. de la Ofrenda 125 es equiparable a la de la Ofrenda 13, pero es anormal la ausencia de *Pristis* spp. Los peces tuvieron formas de preparación similares a lo hallado en las ofrendas de cista del Complejo A, excepto en la Ofrenda 120. Ante la falta de suficientes datos etnohistóricos, una adecuada comprensión del papel ceremonial de los peces y de su evolución requiere de continuar contrastando los datos de tipo arqueológico.

Guzmán, Eulogio (School of the Museum of Fine Arts, Boston)

[346] *Fabricating Political Constituencies, Artistic Production at the Templo Mayor*

The excavation of the Templo Mayor yielded a plethora of objects that testify to the supreme ideological importance this edifice held for the Mexica confederacy. While the offerings unearthed within the foundations of this structure comprised a variety of portable objects placed in intimate settings, larger sculptures seem to have articulated more public iconographic programs. My analysis of both portable and monumental sculptures shows these works emphasized the bricolage of incorporated and coerced Mexica political constituents. This talk outlines the emergence of politically

savvy, complementary, iconographic themes rendered on portable and monumental sculptures set onto the Templo Mayor that functioned as Mexica political stratagems. A contextualization of iconographic themes in relation to reported historical events adumbrates the role visual culture held in issues of statecraft for the Mexica. This paper contextualizes my findings with recent materials research, which shows many objects that referenced a number of the diverse cultures deposited at the Templo Mayor were created locally, to argue that this co-opted fabrication of materials provided a political representation in art. This successful artistic production, I argue, yielded high political dividends, was a materiality of Mexica authority, and proved seminal in contributing to the rapid rise of this powerful conglomerate.

[47] *Long-Term Changes in Settlement Patterns and Local Land Use on the Great Hungarian Plain*

Regional-scale archaeological surveys can reveal long-term patterns in human settlement in the landscape. However, many survey projects focus solely on defining the extent and age of settlements. A combined use of various methods is required to develop more nuanced understanding of changes in settlement patterns over time.

This paper presents the results of a multidisciplinary research project on the settlement history of the Szeghalom microregion in the Körös Region of SE Hungary. During our long-term investigations in the region, the Körös Regional Archaeological Project conducted high-resolution systematic field collection, paleoenvironmental studies, geophysical prospection, targeted excavations, and analysis of historic sources to model changes in settlement patterns and land use from the Neolithic to recent times.

Haas, W. (University of Maryland)

[328] *Forager Mobility in Constructed Environments*

As obligate tool users, humans habitually reconfigure material-resource distributions. It is proposed here that such resource restructuring may have played an important role in shaping hunter-gatherer mobility decisions and the emergent macro-structure of settlement patterns. This paper presents a model of hunter-gatherer mobility in which modifications of places, including the deposition of cultural materials, bias future mobility decisions. With the aid of an agent-based model, this simple niche-construction model is used to deduce hypotheses for the structure of hunter-gatherer settlement patterns. The predictions are tested against archaeological data from a hunter-gatherer settlement system in the Lake Titicaca Basin, Peru, 7,000-5,000 cal. B.P. Good agreement is found between the predicted and empirical patterns demonstrating the model's efficacy. Moreover, the model suggests an explanation for key structural properties of hunter-gatherer settlement systems that, in some cases, may have facilitated the emergence of socioeconomic complexity in human societies.

[229] *Social Shifts in the Late Prehispanic US Southwest*

The Brainerd-Robinson (BR) index is frequently used as a measure of similarity among disparate archaeological entities. We propose a number of novel alternative methods to gauge similarity among such entities. We base our analysis on similarity among sites (locations) inhabited in the US Southwest during A.D. (1200-1450) using a large corpus of artifacts excavated at those locations and maintained as a comprehensive database by Archaeology Southwest. In this work we first identify some vital limitations of the BR index. We believe these shortcomings significantly impair the actual picture of historical shifts in the US Southwest during that period. We propose a range of measures that have the potential to overcome those shortcomings while providing us with a more nuanced explanation of demographic movements. We define sites' similarities as a function of types and counts of wares found on each site. We further supplement the measures with factors such as containment, asymmetry, and relative ranking of wares as parameters. We build networks of probable movements and shifts within 50 years of time windows over the 250-year time period. Moreover, we compare the changes in population demographics across the 50-year time windows to get better insights into long distance movements.

[82] *Jomon Pit-Dwellings, Sedentism, and Food Diversity*

Archaeological data from the prehistoric Jomon period of the Japanese archipelago indicate that, by the middle of the Early Jomon period (ca. 6000 cal. BP), the presence of large settlements with dozens of pit-dwellings became common. Some of these pit-dwellings are quite deep, measuring more than two feet in depth. The residents of these settlements are considered to have been relying primarily on hunting, gathering and fishing. Environmental management may have been an important part of their subsistence strategies. What were the causes, conditions and consequences of the appearance of this type of large settlement with substantial pit-dwellings? Did it affect the resilience and sustainability of Jomon communities? Were these pit-dwellings occupied throughout the year, or were they the houses of seasonally sedentary hunter-gatherers? Was the development of these large settlements related to the emergence of social inequality? The large amount of settlement and subsistence data from the Jomon period provides an excellent opportunity to pursue these questions. Using archaeological data from northeastern Japan, I argue that long-term changes in Jomon subsistence, settlement and society do not fit into the classic, progressivist view of cultural evolution from simple to complex.

Hackbarth, Mark (Logan Simpson Design Inc.)

[304] *Canal System 2's Architecture, Chronology and Irrigation during the Pioneer Period*

Recent excavations at Pueblo Patricio and La Ciudad have uncovered Pioneer Period components that provide new insight about early Hohokam chronology, settlement, and irrigation in Phoenix. Red Mountain phase occupation at Pueblo Patricio began before the fifth century A.D. with seasonal use of small structures exhibiting highly variable architectural forms and small groupings of structures. A dramatic change in Pueblo Patricio settlement patterns occurred by the middle of the mid-sixth century A.D. when large P-3 and P-4 structures were constructed, whereas late seventh century A.D. structures at La Ciudad are forerunners of pit houses that have a typical Hohokam forms and groupings of houses. This paper reviews these architectural changes in terms of implications for irrigation, land use, and settlement organization within Canal System 2 before the late eighth century A.D.

[360] *Resource Intensification, Sedentism, Storage, and Ranking: A Visual Synopsis of Pacific Northwest History and Theory*

Resource intensification is a concept used in explanations of sedentism, storage, social ranking and hierarchy. Within the Pacific Northwest treatment of these concepts has developed through three orientations: evolutionary-ecology, political economy, and social agency. We compare performance criteria (dynamic and empirical sufficiency, and tolerance limits) for both synthetic works and archaeological studies. Our poster-sized visual synopsis is intended to elicit comment and revision that maybe supported on-line. Source works are diagramed with cog symbols showing interaction between different theorists. Lighter cog symbols indicate theoretical perspectives with less data evaluation. The darker cogs indicate theoretical models supported by data analysis. The larger cogs depict works with broader geographic scopes. Cog symbols with red outlines are used to highlight works that emphasize competition or conflict. We are also experimenting with cladistics analyses and graphs that may yield more formal models of theoretical and archaeological contributions. Given that almost all treatments of resource intensification and sedentism focus on the development of households (plank houses and house pits) and larger house settlements, our review shares a critical synopsis of major approaches in the anthropological archaeology of the Pacific Northwest.

Hacker, Stephanie (The University of Tennessee) and Howard Cyr (The University of Tennessee)

[120] *An Integrative Archaeological and Geomorphological Approach to Understanding Site Distributions and Prehistoric Settlement Patterns along the Little River, East Tennessee*

Over 15 years of archaeological research at the University of Tennessee's East Tennessee Research and Education Center, Blount County, Tennessee, has uncovered a number of archaeological sites that range in age from Early Archaic to Mississippian. Located within a complex alluvial system at the confluence of Ellejoy Creek and the Little River, the study area was part of a prehistoric trail system through the Great Smoky Mountains. Research at the University of Tennessee's Archaeological Research Laboratory integrates geomorphologic and archaeological approaches to better understand landscape development and its effects on temporal and spatial site distributions and prehistoric settlement selection in the area. These studies offer new insight into human-environmental interactions, site preservation, and landscape evolution in the inter-mountain Southeastern United States.

Hadden, Carla (University of Georgia), Maran E. Little (University of Georgia), C. Frederick T. Andrus (University of Alabama) and Gregory A. Waselkov (University of South Alabama)

[152] *Stable Oxygen Isotopic Evidence of Mobility and Site Seasonality on the Northern Gulf of Mexico, USA*

Stable oxygen isotope analyses are commonly used in archaeology to assess the seasons-of-death of fishes and molluscs, and to make inferences about seasonal aspects of human mobility and resource use. We present stable oxygen isotope sequences from 33 bivalve shells, representing four taxa, and eight fish otoliths, representing two taxa. These were recovered from two sites located on the Gulf Coast of Alabama: Plash Island (A.D. 325–642) and Bayou St. John (A.D. 650–1041). Specimens recovered from small, well-dated pit features were targeted for sampling. The stable oxygen isotope data indicate that shellfishes and fishes were collected at both sites during all seasons of the year, though frequency or intensity of site occupation may have declined during the fall. Most of the pit features included in the study appear to represent multi-season living and working areas. Although it is unclear whether these sites were occupied by a permanent year-round population or by groups who returned to these sites intermittently throughout the year, the results of this study do not support the hypothesis that the coastal landscape was vacated seasonally as part of a shifting settlement pattern.

[418] *Working Towards an Exportable Indigenous Heritage Management and Cultural Ranger Program in the Ikh Nart Nature Reserve, Mongolia.*

The creation of an exportable indigenous heritage management program for developing nations responds to a growing concern about the rapid effects of globalization and industrialization on the natural and cultural landscape. In 2010 an international partnership was formed between the Mongolian Institute of Archaeology, Denver Zoo, Anza-Borrego Foundation, and California State Parks with the goal of establishing a cultural heritage management program in the Ikh Nart Nature Reserve in the Northern Gobi region of Mongolia. Baseline resource assessment conducted by this cooperation was completed in 2014. This cooperation has produced a Cultural Ranger pilot program that provides funding, equipment, and a standard archaeological methodology for recording and monitoring cultural resources. The program utilizes a model of stewardship based on the California Archaeological Site Stewardship Program. The ranger is hired from one of the reserves local nomad families and has been charged with protecting the rich Cultural Landscape found in Ikh Nart. This program is designed to be copied and exported to any of the other protected areas within Mongolia allowing the Institute of Archaeology to establish management programs throughout the country in the future.

Hadley, Dawn (University of Sheffield)

[18] *Identities in a Viking Winter Camp*

From 865, Viking raids on England intensified with the arrival of an army much larger than any previously known. This so-called 'Great Army' (micel here) raided northern and eastern England, spending the winter at a number of sites recorded in the Anglo-Saxon Chronicle, but which, until recently, have remained archaeologically elusive. Recent fieldwork at a handful of these sites, some of which were first identified by metal detectorists, has now begun both to identify their precise locations and also to characterize them in terms of their landscape setting and the range of material culture that they have produced. This paper draws on the evidence from this recent fieldwork to characterize the impact of this period of raiding and associated interactions with the local populations on the formation of identities. The evidence from these briefly occupied overwintering sites presents a unique opportunity to explore identity - ethnic, gendered, social - in a very specific and chronologically precise context, offering a counterpoint to discussions of identity in the context of Viking-Age England which have hitherto tended to explore the subject by drawing on evidence that spans decades or even centuries; here, in contrast, identity formation over a period of months is addressed.

Hadlock Seeley, Robin [61] see Watson, Jessica

Haertel, Kirstie

[83] *The WHY and HOW of integrating archaeological findings into wildlife management efforts*

The relevance of archaeology to contemporary social issues has become a topic of concern for many in the discipline. Zooarchaeologists in particular have focused some effort in highlighting how archaeological interpretations can assist with wildlife management and conservation biology. While this work helps to amplify the social value of archaeology, the approach to date has been somewhat disparate. In order to implement the vision of integrating archaeological findings with wildlife management and conservation biology, a basic understanding of the appropriate scale and scope of available archaeological data and an avenue for effectively communicating the findings is needed. This paper will outline the potential value added to the management of species in National Parks in the west and provide a framework for integrating relevant findings into natural resource management decisions. A case study that merges archaeological information with the potential for reintroducing bighorn sheep to Lava Beds National Monument will illustrate how the data integration can be useful to those managing wildlife.

Hagen, Mary [230] see Hollenback, Kacy

Hager, Lori (Pacific Legacy, Inc and ARF, University of California, Berkeley)**[297]** *Who Will Remember the Dead? Embodying the People of the Past in Novel Ways*

Archaeologists encounter the people of the past as skeletons with some frequency, yet attempts to reconstruct the life histories of the dead have often been ordinary and predictable. As a scientist and a storyteller, Ruth Tringham's consideration of the dead, inspired by empiricism and imagination in equal measure, imparts multiple truths through multiple voices in novel ways, with a particular focus on visualization. The people of one house at the Neolithic site of Çatalhöyük, for example, are embodied, and ultimately remembered, as fleshed bodies, as avatars, as storied individuals with complex lives, and as operatic actors in gripping tales of survival and death. The dead come alive in Ruth's versions of the past, and guide us to a more complete vision and deeper understanding of each life recovered through the archaeological process. Ruth's rendering of the dead assures their remembrance through time in a manner like no other, providing models of interpretation that are expansive and creative, real and not real, and always within the realm of possibility.

Haggard, Alyssa (Humboldt State University) and Casey Hegel (Humboldt State University)**[7]** *A Geospatial Analysis of Landscape Modification in Relation to Burials and Social Control*

This poster examines burial construction in relation to landscape modifications in the Rio Bravo region of northwestern Belize. A geospatial analysis was conducted on burials and surrounding features, such as shrines, to determine the Maya social hierarchical system established during the Middle Preclassic, Late Preclassic, and Late Classic periods. This research addresses the interrelationship between altered landscapes and burial locations, which can yield insight into social control. Poor preservation of human remains in studied areas is a factor in the loss of burial and population data. For the scope of this research, population estimates for each time period were compared to the burial data collected from selected sites. The objective of this study is to compare population estimates to the burial data to see if the number of burials found correlates to these estimates. By analyzing this comparative data, we hypothesize most individuals were interred outside of the perimeters of selected sites, perhaps in communal burials. More investigation of the landscape outside of site centers is needed to determine the locations of other burials and how those are interred in relation to the landscape.

Hagin, Jason [310] see Everett, Mark

Hailey, Tommy (Northwestern State University of Louisiana)**[284]** *Archaeology as the CRO Flies, 2002-2014: A Retrospective of Twelve Years of Powered Parachute Aerial Archaeology*

After considering a number of alternatives for acquiring aerial images, in 2002 the Cultural Resource Office at Northwestern State University of Louisiana received a National Center for Technology and Training Research Grant to assess the suitability of the powered parachute as an archaeological aerial reconnaissance vehicle for site discovery, for detailed site investigation, and for cultural landscape studies. Since that time, this unique aerial platform has been successfully employed to acquire imagery of a wide variety of prehistoric and historical sites across the United States using a range of techniques, including digital still photography, digital videography, and thermal imaging. These images have been integrated successfully with aerial images from other sources, with historical maps, and with GPS, total station, geophysical, LIDAR, and 3-D laser scanning data by CRO staff members and by other researchers to provide a means of conducting detailed spatial analysis of archaeological sites and the landscapes in which they are located. This paper will present an overview of the equipment, the methodology, and the results, as well as other considerations involved in employing this extremely mobile, efficient, and cost-effective method of acquiring low-altitude, large-scale, high-resolution aerial images in a wide range of archaeological applications.

Haines, Julia (University of Virginia)**[116]** *Boundaries and Networks on the 19th Century Bras d'Eau Sugar Estate*

This paper discusses research on the most complete and well-preserved 18th and 19th century sugar estate on Mauritius and how communities and identities were constituted under the conflicting conditions of both physical control and local/regional connectivity. Established in 1786, the Bras d'Eau Sugar Estate (now a national park) grew in the following century when the island shifted from French to British colonial rule. The slave trade and the institution of slavery were later abolished across the British Empire, though industrial sugar production increased. Indian indentured laborers with different castes, religions and skill sets, came to Mauritius to work on plantations. Vagrancy laws were designed to reengage laborers legally to plantations beyond their five-year contracts. Preliminary research at Bras d'Eau revealed extensive road and railway networks, and the ruins of industrial structures, enclosure walls and houses. Roads are positioned as both passages and boundary markers that divide, for example, living quarters from industrial workspaces and cultivated areas. I argue that space on the plantation was simultaneously controlled by wall and road boundaries and strategically connected to intern and external exchange networks. Within this context, archaeological research will help us to understand the diversity of identities performed in the past.

[147] *"A Mischief that is Past and Gone": Situating Ka'Kabish in the Larger Ancient Maya Political*

Discussions of ancient socio-political interactions are most productive when site-specific archaeological data is incorporated into a multi-scalar analysis that includes centers of different distinction. The ability to integrate centers into a nuanced landscape is a luxury derived from a long legacy of archaeological work by different researchers. This work draws upon the increasing large corpus of data created for north-central Belize over the last 50 years. In this paper, we present a preliminary synthesis of data from Ka'Kabish and speculate about possible inter-site interactions in the region. Our goal is to situate what we currently know about the culture history of Ka'Kabish into the larger ancient Maya political landscape of North-Central Belize and to shed light on the political dynamics of this region.

[407] *Regional Settlement Responses of the Khmer Empire to Environmental Stress and Angkor Abandonment*

The Khmer Empire dominated Southeast Asia between the ninth and fifteenth century, but had all but collapsed by the time Portuguese explorers began documenting their discoveries of the jungle-strewn temple ruins over a century later. Historical sources, in conjunction with new paleoclimatic evidence, suggests that the royal court abandoned the central and administrative city of Angkor sometime in the mid-fifteenth century and migrated south to the Phnom Penh region after (among other things) a series of sustained droughts, interspersed with particularly intense monsoon seasons, caused irreparable damage to the city's water infrastructure system. It is undoubted that this event caused a disruption to the geographical and political dominance of the predominantly agricultural Khmers in Southeast Asia from which it never recovered, however the individual responses of the kingdom's regional agricultural settlements to these dramatic climatic fluctuations remains unclear. Was there a simultaneous or cascading collapse of populations in these secondary cities, or were they more resilient than Angkor? Paleoenviromental evidence, analyzed from sedimentary cores retrieved from two of these peripheral settlements, indicates that population dynamics throughout the

kingdom are far more complex than traditional collapse studies of Angkor suggest.
