

The ANNUAL MEETING of the Society for American Archaeology provides a forum for the dissemination of knowledge and discussion. The views expressed at the sessions are solely those of the speakers and the Society does not endorse, approve, or censor them. Descriptions of events and titles are those of the organizers, not the Society.

SYMPOSIUM ABSTRACTS

[1] Forum · PRESIDENT'S FORUM: WHAT WE HAVE LEARNED

What have we learned through the lens of the archaeological record that is really useful for society today? Why do we continue to do archaeology, and why is it important? Archaeologists with diverse perspectives, experiences, and situations answer this question for themselves, and for you.

Today, the political environment is characterized by individuals that embrace an anti-science hysteria, and are indifferent or hostile to the preservation of cultural heritage. We need to convince the general public that archaeology is not simply an esoteric exploration of a past that holds no real meaning to the problems that beset society today. Rather, we must communicate to the general public and politicians of all persuasions that archaeology can offer solutions to the present determined through our study of the past. This session explores ways of reaching a skeptical and sometimes hostile public about archaeology, using old and new techniques alike.

[54] Poster Session · A MEDITERRANEAN WORLD, 6000 BC–AD 2000: ARCHAELOGY AND HISTORY OF BOVA MARINA, ITALY

Southern Aspromonte (Calabria, Italy) represents a Mediterranean landscape of coastline and high mountains; between the Neolithic and today, humans have inhabited it in many different ways. Through excavation, field survey, history and ethnography, the Bova Marina Archaeological Project (1997 —) has investigated both long-term continuities and historical diversity, focusing upon its ecology, politics, and communities. The posters presented here highlight the project's diverse findings and provide a composite that together give a complex portrait of how humans have created a social world in this rugged Mediterranean world.

[55] Poster Session · NEW RESEARCH IN SOUTH CENTRAL MICHOACÁN MÉXICO

In the last five years there has been a new effort to understand the archaeology of the South Central Michoacan region. This particular area had previously only been studied by a few archaeological projects focused in specific archaeological zones. In recent years, the Instituto Nacional de Antropología e Historia has set up a large regional project that covers a portion of the Balsas river basin in the state of Michoacan. A large number of students from different Mexican and American Universities have participated; this group features archaeologists and researchers with diverse specialties. In this poster session we will present the ongoing studies of this multidisciplinary approach.

[56] General Session · SOUTHEAST AND SOUTH ASIAN ARCHAELOGY**[57] Symposium · ARCHAEOLOGICAL RESEARCH IN THE HISPANIC CARIBBEAN**

Historically archaeological research in the Caribbean has been mostly focused on human activity of the indigenous populations. In the last decades, there has been a considerable increase of investigations concentrating on the colonial period, especially to explain the dynamics related to the colonization and conquest processes, the coffee and sugar estates, government institutions, and slavery. This symposium will address research currently being conducted in Puerto Rico and Cuba. Case studies will showcase the types of documents that can be included in archaeological projects to further expand our understanding of land use, building modifications and commercial activities in rural and urban areas. The presentations will concentrate on intra and

extramural areas in San Juan de Puerto Rico during the 19th and early 20th centuries, and a sugar estate in Cuba.

[58] General Session · ETHNOARCHAEOLOGICAL APPROACHES

[59] Electronic Symposium · RECENT DEVELOPMENTS IN MEXICAN AND CENTRAL AMERICAN PRECERAMIC RESEARCH

Preceramic investigations in Mexico and nearby Central America have enjoyed some resurgence in recent years, with new projects and laboratory analyses conducted in both lowland and highland settings from West Mexico to Honduras. This research is targeting Archaic and Paleoindian periods, and increasingly exploiting the complementarity of rockshelter and open-air sites, while also incorporating information from off-site settings. This resurgence is helping to define a new era in preceramic research, one that moves beyond the primary themes of First Americans and agricultural origins to look more broadly at how early regional traditions developed. Growing regional databases and comparisons between these, including through provenience studies, are shedding light on several anthropological topics, many of which are presented in this electronic session. Discussions are organized around certain key themes: confidently identifying and dating earliest records; defining the emergence of the earliest "Archaic" adaptations; identifying early patterns of mobility and exchange; exploring environmental connections that contributed to important patterned, regional adaptations; and documenting the early appearance of key social innovations that intensify over time and are closely associated with post-Archaic Mesoamerica.

[60] Forum · CHALLENGES IN TEACHING NAGPRA

The teaching and learning of ethical practice is a central concern to all disciplines, and archaeologists have an ethical obligation to recognize how their studies of material cultures impact descendant communities and present-day stakeholders. The Native American Graves Protection and Repatriation Act (NAGPRA) was passed in 1990 to protect the rights of tribal and Native Hawaiian communities to control their heritage and create a process for federal agencies, museum professionals, archaeologists, and tribal representatives to work together. NAGPRA's mandate of consultation has been echoed by a growing body of national and international policies and instruments. A generation after the law was passed, however, there continues to be confusion about how and hesitancy about why to teach about NAGPRA. There is a need for qualified professionals who appreciate both scientific and tribal interests to implement NAGPRA projects and participatory research. But what knowledge, practical skills, and ethical considerations are needed and how can they be imparted by educators and mentors in the classroom as well as in field or museum settings? In this forum we invite the SAA membership to share their experiences with NAGPRA as educators and professionals in order to explore successes and challenges in repatriation education.

[61] Forum · ARCHAEOLOGY AND INNOVATIVE OUTREACH: BEYOND THE LECTURE

At a time when science funding is hard to come by, making science relevant in the eyes of the public is extremely important. While go-to forms of archaeology outreach, such as lectures, are still valuable, the number of places, real and digital, open to talk about archaeological information has increased the ways that we can interact with the public. This can involve expanding the presence of archaeologists on things like social media, through Twitter and Instagram, as well as embracing the myriad ways that people get information through blogs, podcasts, twitch, video games, and by attending non-academic gatherings. All of these avenues allow the public to interact directly with archaeologists quickly and regularly, keeping them abreast of new discoveries and informing them of what archaeology is really like. However, a common critique of technology based outreach is that it tends to be an archaeological echo chamber, with archaeologists following one another rather than getting non-archaeologists, and non-scientists involved. This forum is interested in discussing those outreach possibilities that go beyond the lecture and museum event to better fulfill our duties to the public and discuss the efficacy of these methods at building audiences.

[62] Forum · FORENSIC ARCHAEOLOGY

This session aims to discuss recent developments in the field of forensic archaeology in the United States. How can forensic archaeology work alongside, yet differentiate itself from forensic anthropology? What current issues does the field face? What sort of employment opportunities are there at the local, state, and federal levels? What sort of cases have recently utilized our colleagues? This forum brings together forensic archaeologists from across the country to discuss these topics and how our knowledge of site formation processes, scavenging behaviors, and artifact deposition contribute to analysis and site behavior interpretations. We hope to pool our collective experience with that of the forum attendees to strengthen this budding community.

[63] General Session · GLOBAL ISSUES IN PUBLIC ARCHAEOLOGY AND CULTURAL HERITAGE

[64] Symposium · NEW RESEARCH ON LATE PRECERAMIC PERU: PERSPECTIVES FOR AN INTEGRATED VIEW

Recent research on Late Preceramic Period (ca. 5800–3600) of the Peruvian Andes is showing a diverse scenario for the development of coastal and highland communities associated with the construction of monumental architecture during this period. New data shows a broader scenario for the origin of such social development and it is showing the importance of regional studies to understand the context in which those sites originated and how they transformed over time. Nevertheless, current archaeological theory about this topic needs to include this new data in order to gain a more integrated understanding of key social transformation of this period. This session aims to expose this new data discussing local scenarios under a more regional perspective.

[65] General Session · ANDEAN ARCHAEOLOGY: LATE AND LATE INTERMEDIATE HORIZONS

[66] General Session · MORTUARY ARCHAEOLOGY IN THE AMERICAS**[67] General Session · GLOBAL STUDIES ON SLAVERY****[68] General Session · DIGITAL LANDSCAPES II—PHOTOGRAMMETRY, REMOTE SENSING AND DRONES****[69] General Session · CERAMIC ANALYSIS****[70] General Session · CONSERVATION AND MUSEUM STUDIES****[71] General Session · SOUTHWEST ASIA: BRONZE, IRON AND HISTORIC PERIODS****[72] Symposium · RESEARCH AND MANAGEMENT OF TRADITIONAL CULTURAL PROPERTIES IN THE SOUTHWEST**

In this symposium, we critically assess how traditional cultural properties are identified and managed in the southwestern United States, focusing on the benefits and challenges for traditional communities, researchers, and historic preservation officials. More than twenty-five years have passed since traditional cultural properties were first defined in National Register Bulletin 38 in 1990. Since then, there has been substantial effort in the southwestern United States to develop protocols for identification and management of historic properties whose significance comes from the role they play in the retention and transmission of traditional beliefs and practices. As Patricia L. Parker emphasized, "It is necessary to try to understand traditional places through the eyes of those who value them." Doing this requires collaborative efforts between researchers and traditional communities, and it necessitates new approaches to management and mitigation of adverse effects by federal agencies. Perspectives on current issues in the research and management of traditional cultural properties are presented from people working for tribal, federal, and state agencies, and in the private sector.

[73] General Session · ICONOGRAPHY AND ROCK ART**[74] General Session · DATING TECHNIQUES****[75] Symposium · LANDSCAPES OF WARFARE: A COMPARATIVE PERSPECTIVE**

This session is an effort to put together different theoretical perspectives on the relationship between warfare and built landscapes. Through the comparison of cases from different parts of the world we aim to analyze and compare the following topics: How did violence between groups influence the ways people are distributed in the landscape? How were ritual landscapes affected and modified by warfare? How were economic activities allocated during violent times? How were collectivities and identities transformed by war? How did warfare influence the allocation of resources and labor? How did the built landscapes of warfare become a legacy that affect the life of their descents? How did past episodes of warfare were part of the political territory and fixed in toponymy?

[76] Symposium · EMERGING FROM THE SHADOW OF THE CEIBA: RECENT RESEARCH IN MAYA PALEOETHNOBOTANY

Paleoethnobotany has been employed in Maya archaeology for several decades, but remains underutilized. From early pollen analysis to the extensive wetland agricultural research in northern Belize, and most recently starch and phytolith studies, past research programs have shown that plant material can and does preserve in the tropical environs of the Maya lowlands. Today, Maya archaeology benefits from an increasing number of specialists who examine issues related to past plant use by looking at carbonized plant parts, microbotanical remains, and chemical residues. These studies continue to contribute to our understanding of Maya agricultural production and subsistence. However, paleoethnobotany is also beginning to enter scholarly debates on ritual, politics, power, and many other avenues. Despite making strides, most botanical research remains relatively isolated and few archaeologists understand the potential that botanical datasets can contribute to Maya archaeology. This symposium seeks to set the foundation for increased communication between Mesoamerican paleoethnobotanists and to create a more integrated work sphere. By acknowledging common grounds and research interests, as a group we can strengthen our field's outward projection. As part of the session, we will address current methodological innovations, theoretical directions, and issues that impact the field.

[77] General Session · ARCHAOMETRY AND MATERIALS ANALYSIS**[78] Symposium · MARINE ARCHAEOLOGY: RETROSPECTIVE/PROSPECTIVE**

Marine Archaeology is the interdisciplinary study of past human life, behaviors and cultures and their associated activities in, on, around and under the sea, estuaries and rivers. Originally focused on the study of shipwrecks, the field is transforming in response to current and emerging challenges. This session will explore the present and future contributions of Marine Archaeology in terms of techniques and technologies, analytical and interpretative methods and theoretical approaches. Drawing

on the experiences of practitioners from around the world, topics to be discussed will include the integration of different scales of analysis when seeking to understand the past, the need for gathering reliable and accessible data to enable the effective management of underwater cultural heritage resources and how to better understand the range of people's relationships to the sea in the past.

[79] Symposium · PAPERS IN HONOR OF DENNIS STANFORD

Contributed papers relating to the life and career of Dr. Dennis Stanford and his contributions to the Paleoindian archaeology of the Americas.

[80] Symposium · THE FLEXIBLE MAYA CITY: ATTRACTION, CONTRACTION, AND PLANNING IN CLASSIC URBAN DYNAMICS

Lowland Maya cities have witnessed intense scholarly debate concerning their "urban" nature. Recently, debate has shifted from largely demographic factors to the design and planning behind Maya urban layouts. While a welcome advance for the field, design theory in the Maya lowlands has often emphasized top-down processes of dynastic intent and meaning within monumental cores, to the near exclusion of bottom-up local, regional, and hinterland processes of settlement and community adaptation, mobility, and interaction in creating the broader low-density urban forms recorded by archaeologists. Maya towns and cities were not only central places resulting from "place-making" regal policies, but also, and even primarily, were urban entities with their own internal dynamics in relation to their hinterlands.

This session will offer a broadened perspective of Maya urban design and planning, viewing bottom-up and self-organizing processes, such as household decision-making and neighborhood clustering, dispersal/contraction as integral to the development and dissolution of Classic lowland cities. These approaches highlight the flexibility of lowland urban settlements over time and emphasize applying both household and hinterland perspectives to study Classic urban society, including its eventual failure. These approaches will improve interpretations of lowland Maya culture history, and simultaneously contribute to discussions of low-density urbanism world-wide.

[81] General Session · SOUTHEASTERN NORTH AMERICA FROM PREHISTORY TO THE CONTACT PERIOD

[82] Symposium · SOCIOPOLITICAL INTEGRATION IN PREHISPANIC NEIGHBORHOODS: COMPARATIVE PERSPECTIVES

(SPONSORED BY CENTER FOR COMPARATIVE ARCHAEOLOGY—UNIVERSITY OF PITTSBURGH)

In the last decade the neighborhood has seen a renewed use becoming a fruitful unit of analysis in the archaeology of complex societies. By applying this concept scholars have started to answer distinct questions, and at the same time new line of inquiry have been set. The neighborhood, as a methodological tool, allows for comparison to different kinds of urban forms such as compact and dispersed patterns. It also allows for comparison in different scales, such as within cities as well as local communities within regions. The Andes and Mesoamerica present rich and diverse examples of neighborhood organization. Our session explores the variability in ways that the Prehispanic communities of the New World were integrated socio-politically. We explore the neighborhood as the primary methodological unit of analysis in this exercise, as it formed the constituent units of many ancient cities. The primary question in our analysis is how well were neighborhoods integrated into ancient cities and/or polities in the Andes and Mesoamerica?

[83] Symposium · BEYOND CENTRALITY: BRIDGING NETWORK APPROACHES THROUGH ARCHAEOLOGICAL NARRATIVES

Network-based approaches have increased in popularity in archaeology, largely for their ability to quantify interactions across space and through time that otherwise are difficult to parse. As methods in network analysis advance, the greatest promise for answering questions about the past lies in the ability to bridge approaches and analyze data from micro- to macro-scales. In this session researchers are encouraged to use network-based approaches to examine archaeological systems through multiple lenses and/or multiple scales, moving beyond reporting statistics such as centrality to interpreting their meaning in light of varied approaches. How can combining social and ecological approaches to networks help illuminate past systems? How do empirical and experimental networks differ, and what does this tell us about the past? How does looking at multiple kinds of networks in the same area help to interpret social changes? How can researchers today use quantitative output from network analysis to interpret the past and produce compelling narratives? Ultimately each of these approaches will return to advancing archaeological narratives, helping to interpret long-standing questions in accessible terms, and even using the archaeological record to calibrate our understanding of present and future networks.

[84] Symposium · SHELL MIDDENS: FORMATION, FUNCTION, SURVEY, AND ENDANGERED CULTURAL/PALEOENVIRONMENTAL HERITAGE

(SPONSORED BY GIG)

Shell middens are widely distributed coastal archaeological features that contain a unique record of cultural and paleoenvironmental change. These aboriginal accumulations contain centimeters to meters of mollusk shells and frequently include artifacts and other faunal remains. As a result, they record past lifeways, terrestrial and marine species distributions/seasonality, and environmental conditions. The buffering effect of the decomposition of carbonate shells yields preservation of organic artifacts that are often not preserved in other settings. Additionally, climate-change driven sea-level rise threatens many of these valuable cultural and paleoenvironmental archives. This session invites presentations that describe various aspects of shell midden investigations; shell midden formational processes, potential functions of shell middens, interpretations of shell midden contents, noninvasive remote sensing techniques applied to shell middens, and monitoring and rescue strategies that seek to protect the valuable information contained in these important archaeological features.

[85] General Session · GLOBAL APPROACHES TO LANDSCAPE ARCHAEOLOGY**[86] General Session · GLOBAL APPROACHES TO PALEOETHNOBOTANY****[87] Symposium · THE ARCHAEOLOGY OF CHILDCARE***(SPONSORED BY SOCIETY FOR THE STUDY OF CHILDHOOD IN THE PAST)*

This session will examine the archaeological evidence for the myriad ways in which children were cared for in past societies, incorporating case-studies from both prehistory and historical periods. The contributors discuss aspects of social, cultural and physical care, exploring both the behaviour of adults and the social practice of children themselves. Care for the child commences with maternal health and the birth process and continues through infancy and childhood until social independence and adulthood are reached. It requires their physical, cultural and social needs to be met, and for children to become, through their own practice, social agents. The papers in this session will address each of these stages of childcare, drawing on evidence from biological anthropology, material culture, the built environment, ritual contexts and experimental approaches. The papers will enable us to explore the similarities and culturally constructed differences in the ways in which communities and families care for their children, and provide opportunities for them to become social actors. Whether deliberately or accidentally, care for children was sometimes deleterious to their well-being, and the session will also confront the realities of this in past societies. In sum, the session asks of children in the past—who cares?

[88] General Session · BIOARCHAEOLOGY AND FORENSIC ANTHROPOLOGY**[89] General Session · EXPERIMENTAL ARCHAEOLOGY****[90] Symposium · DISCS, FISH, SQUIRRELS AND SCAT: PAPERS IN HONOR OF WALTER KLIPPEL**

This symposium honors the career of Dr. Walter Klippel and his scholarly contributions to the studies of taphonomy, environmental change in the Southeastern United States, and subsistence practices in North America, the Caribbean Islands and Crete. Klippel began his career working in rock shelters in Missouri, and went on to run large field projects in Middle Tennessee and to create a world-class zooarchaeological comparative collection. Former and current students and colleagues cover a broad range of topics inspired by Klippel's interests in zooarchaeology and archaeology, including animal induced taphonomy, subsistence practices, morphological and range changes in species over time, species identifications, and allometry. These papers come from diverse temporal and geographic contexts and represent the broad impact Dr. Klippel has had on the careers of so many archaeologists and zooarchaeologists.

[91] Poster Session · STRONG CURRENTS IN GILA BASIN RESEARCH

The Gila River drainage crosscuts the Mimbres Mogollon, Hohokam, and Salado archaeological culture areas, providing an excellent perspective for examining social and environmental variation in the past. This session focuses on the upper Gila in southwest New Mexico, a poorly documented region that has recently witnessed a surge in archaeological research. Here Mogollon and some Hohokam influences are clearly visible until about AD 1300. During the fourteenth century, settlements characterized as Cliff phase Salado combined elements of earlier cultural patterns with new influences from the Kayenta region and beyond. Results from recent fieldwork in the area and new research on ceramics, ground stone, fauna, and other materials provide insights into local and regional patterns and variability. Additional research projects from the Middle Gila and Chaco allow regional comparisons, placing upper Gila research in a larger context within the U.S. Southwest.

[92] Poster Session · THE GREAT BASIN BEFORE 9000 BP

Despite accelerating research, the fundamental nature of Great Basin adaptations predating 9000 BP remains the center of debate. Researchers question whether hunter-gatherers of the Pleistocene-Holocene Transition followed lifeways that were fundamentally distinct from or similar to subsequent Archaic, broad-spectrum patterns. Sometimes sparse evidence regarding diet breadth, land use patterns, mobility and sedentism, and technological organization are interpreted in conflicting ways. This poster session convenes researchers at various career stages working across the region to evaluate the state of knowledge on Prearchaic subsistence, mobility, and technology to better synthesize this important period of North American archaeology.

[93] Poster Session · DESARROLLO POBLACIONAL, PRODUCCIÓN, APROVECHAMIENTO Y COSMOVISIÓN EN LAS ZONAS VOLCÁNICAS DE LA COSTA DEL GOLFO

La Costa del Golfo Mesoamericano fue un área que se caracterizó por la variedad y riqueza de nichos ecológicos y culturales. Las regiones volcánicas de Veracruz fueron escenarios de explotación y aprovechamiento de recursos comerciados a lo largo de Mesoamérica en diferentes temporalidades. Asimismo, sirvieron como referentes geográficos, ideológicos y sagrados en el paisaje prehispánico. Este simposio tiene como objetivo exponer y discutir resultados de investigaciones arqueológicas recientes que se llevan a cabo en las diversas zonas volcánicas que se encuentran en la Costa del Golfo mesoamericano.

[94] Poster Session · ARCHAEOLOGY AND ACTIVE LEARNING: THERE'S NO NEED TO REINVENT THE WHEEL*(SPONSORED BY SAA COMMITTEE ON CURRICULUM)*

Archaeology continues to be a misunderstood discipline among college students and the general public, young and old. Student/public learning remains a key goal of the discipline for reasons that range from preservation of the archaeological record to looking to the future for bettering society. Available pedagogical strategies range widely but discussions of teaching are sparse

in our discipline. Currently, pedagogies that emphasize active learning represent a best practice. Importantly, active learning is not one-size-fits-all but can take a number of forms. Here, presenters explore active learning strategies they have implemented by describing a pedagogical case study and discussing evidence for its effectiveness. While rewarding, implementing new teaching strategies is never easy. Thus, presenters also discuss barriers, costs, and logistical considerations for employing particular forms of active learning with the goal of smoothing the road for interested professors to incorporate innovative activities in their own archaeology courses.

[95] Poster Session · CERAMIC PETROGRAPHERS IN THE AMERICAS: PROMOTING THE ADVANCEMENT AND APPLICATION OF PETROGRAPHY IN ARCHAEOLOGY

A marked resurgence in the use of petrography to answer archaeological questions has resulted in the formation of Ceramic Petrographers in the Americas (CPA), a group that seeks to promote, discuss, and develop ceramic petrography in archaeology. While CPA members physically reside in the Americas, our research spans the globe both temporally and geographically as illustrated by the posters to be presented. The goal of this session is to provide a venue for the discussion and advancement of ceramic petrography and other characterization techniques among petrographers of all skill levels. In this session, ceramic petrography is used in a variety of archaeological cases to investigate social processes (i.e., cultural continuity, identity, migration, and mortuary behavior) by drawing on both qualitative and quantitative data related to raw material selection, ceramic technology, and provenance, as well as highlight additional sourcing techniques (e.g., SEM, EDX, XRF, and INAA) and tools (i.e., digital image analysis, ethnographic interviews, and experimental archaeology) currently used by petrographers.

[96] Forum · BEARS EARS, THE ANTIQUITIES ACT, AND THE STATUS OF OUR NATIONAL MONUMENTS

(SAA PRESIDENT-SPONSORED SESSION)

The Antiquities Act of 1906 has been an amazingly effective tool for the landscape-scale protection of cultural and natural resources in the United States. Crafted by archaeologist Edgar Lee Hewett, in consultation with Representative Lacy of Iowa, the bill was signed into law by President Theodore Roosevelt on June 8, 1906. Roosevelt immediately went to work. When he left office in 1909, he had made proclamations to establish 18 national monuments in 9 western states. In subsequent years 15 additional presidents, of both political parties, used the Antiquities Act to establish national monuments that number over 150 and total nearly 250 million acres. Until the Bears Ears National Monument proclamation by President Obama on December 28, 2016, there has never been a national monument effort where Native Americans took the lead. For Bears Ears, it was a coalition of five tribes that took the leadership role. Archaeologists were there as supporters as well. When Donald Trump was sworn in as the nation's 45th president, more than a century of preservation efforts under the Antiquities Act came under severe threat. This Forum brings together historical, tribal, government, and up-to-the-moment perspectives on the Antiquities Act through the case study of Bears Ears.

[97] Symposium · ADVANCES IN BIOMOLECULAR ARCHAEOLOGY

Biomolecular methods have become popular in answering a variety of archaeological questions because of the unique and complex information that can be derived from their application. This session is focused on methods that can analytically elucidate issues related to past populations' interactions. The emphasis of this session is ancient DNA, but will also include protein, lipid, and carbohydrate analyses. Ancient biomolecules are well suited to investigations of interaction and exchange between populations, in addition to understanding the patterns of past migrations and disease. Both human and faunal specimens will be addressed, as the molecular ecology of archaeofauna and other associated taxa is equally important in developing understandings of past environments, which are inherently essential to any robust archaeological analysis.

[98] Poster Session · EUROPEAN ARCHAEOLOGY: SCOTLAND AND IRELAND

[99] Poster Session · AFRICAN PALAEO-LITHIC STUDIES

[100] Poster Session · NEW DIRECTIONS IN INCA ARCHAEOLOGY

The Incas ruled the largest empire of the pre-Columbian Americas. With Cuzco as its capital, the Inca empire encompassed a multitude of peoples of diverse geographic origins and cultural traditions. At its onset, military campaigns extended power across a broad swath of the Andean region, bringing local societies into new relationships with colonists and state officials. This session is dedicated to revealing the origins, expansion and aftermath of this empire. It will explore the political economy and institutions that facilitated expansion, including case studies on provincial and frontier regions. At a finer scale, it will highlight the effects of state policies on the communities and individuals that made up the bulk of the population. Other papers will discuss religious power, and the special statuses that staffed the state religion, maintained records, served royal households, and produced fine state craft goods. The Incas did not disappear in 1532, and the session will also focus on the Colonial and later periods, exploring the effects of the Spanish conquest on the lives of the indigenous populations. Moving into the present, the session will provide an overview of the ways in which the image of the Inca is memorialized and reinterpreted by contemporary Andeans.

[101] Poster Session · A BEER IN THE HAND IS BETTER WITH AN OCULUS RIFT ON THE FACE: A MULTIMEDIA "POSTERS AFTER-HOURS" SESSION FEATURING HANDS-ON INTERACTIVE STATIONS AND IMMERSIVE VIRTUAL REALITY TECHNOLOGIES

(SPONSORED BY SAA DIGITAL DATA INTEREST GROUP [DDIG])

In the same way that GIS and Remote Sensing technologies quickly became indispensable components of the archaeologist's toolkit nearly two decades ago, 3D scanning, printing and modeling, digital photogrammetry, and immersive virtual reality represent new frontiers of tech that are rapidly becoming adopted for widespread use in archaeology. This symposium aims to take the traditional 2-dimensional poster session format to a new level commensurate with these fascinating and dynamic technologies. To that end, each presenter in the session is encouraged to transform their allotted poster space into a multimedia

“station,” which either presents the various tools of the trade that they are currently employing in the field, or includes a laptop, flat-screen TV, Oculus Rift headset (or any combination of all of these) in order to provide visitors with a hands-on, interactive experience.

[102] Poster Session · NEW APPROACHES IN SOUTHEASTERN ARCHAEOLOGY: RESEARCH FROM THE RENEWED FSU DEPARTMENT OF ANTHROPOLOGY

(SPONSORED BY FLORIDA STATE UNIVERSITY DEPARTMENT OF ANTHROPOLOGY)

The Southeastern United States has some of the oldest archaeological sites in the Americas, some of the densest concentrations of archaeological materials, and some of the earliest evidence for complex societies in the Americas. At the same time, Southeastern archaeology is challenging due to poor organic preservation, poor separation of components, poor site visibility, and modern site destruction from looting, development, and sea level rise. Further, much of the early cultural record was submerged offshore by the more than 130m of sea level rise from ca. 21,000–5,000 years ago, meaning that we know little about how early people may have used the coasts. Therefore, new methods of modeling and analysis hold great promise for mitigating these challenges and providing insight about how past Southeasterners lived and adapted to their changing worlds. The archaeologists in this session ask new questions of curated assemblages, analyze and interpret materials from recent excavations, and use new methods and techniques to shed light on some of Southeastern archaeology's most enduring problems.

[103] Poster Session · QUANTITATIVE MODELING OF ARCHAEOLOGICAL DATA

(SPONSORED BY SAA QUANTITATIVE METHODS AND STATISTICAL COMPUTING IN ARCHAEOLOGY INTEREST GROUP [QUANTARCH])

Quantitative data modeling is fundamental to archaeological inquiry. This type of modeling transcends material types, cultural phases, methodological approaches, and research questions to evaluate how well archaeological observations support theoretical expectations. The Quantitative Methods and Statistical Computing in Archaeology Interest Group (QUANTARCH) is sponsoring this symposium to exhibit the range of analytical techniques currently used to model data and evaluate archaeological hypotheses and theories. Symposium participants share an interest in testing archaeological hypotheses regarding cultural variability by harnessing a wide range of analytical modeling methods derived from computational, mathematical, spatial, statistical, and graphical approaches. In their presentations, they address archaeological questions across diverse sub-disciplines, geographical regions, and temporal ranges. We hope the broad nature of this symposium will appeal to a wide variety of participants of the Society for American Archaeology meeting.

[104] Poster Session · INVESTIGATIONS OF ETHNOGENESIS AT LA 20,000, A 17TH-CENTURY SPANISH RANCH IN NEW MEXICO

Ethnogenesis in colonial situations relies, in part, on the exchange and transmission of cultural practices between colonial actors and indigenous peoples. Missions are frequently identified as the most powerful venue for Spanish colonialism and the prime context for ethnogenesis during the first years of Spanish occupation in the American Southwest. However, the goals of the missionaries and their skewed demography made for distinct relationships with the Pueblo peoples among whom they lived. In New Mexico, colonists' households were another important location of cultural interaction, one that came with different goals, demography, and power relations. Exchanges of information between Spanish colonists and indigenous groups were critical to the survival of the colony as indigenous peoples' labor and knowledge were useful for basic subsistence activities. This session explores one such household at the Sanchez Site (LA 20,000), a 17th-century Spanish ranch in northern New Mexico. Here Spanish colonizers, Pueblo people, and most likely enslaved Plains people toiled in a household that produced livestock, crops, and textiles in a politicized atmosphere of information exchange. The posters in this session bring together a broad range of analyses to investigate activities at the ranch and the influence of all peoples who labored there.

[105] Poster Session · PEOPLE 3K: INVESTIGATING POTENTIAL TIPPING POINTS GENERATED BY THE CLIMATE-POPULATION-RESOURCE MANAGEMENT NEXUS OVER THE LAST 3,000 YEARS

(SPONSORED BY PAST GLOBAL CHANGES)

One of the least understood aspects of paleoscience is the role of climate in driving long-term human population change, and, in turn, how changes in population size and structure influence the strategies that individuals use to manage resources. The papers in this poster session will investigate long-term changes in the climate-human population-resource management nexus during the late Holocene (3000 years BP to present). Two broad questions drive the research: (1) Under what environmental conditions do small and medium scale human societies begin to grow and appropriate more energy from ecosystems, and (2) Why did societies undergo major reorganizations and experience population change during the last 3000 years (e.g., during the Medieval Warm Period to Little Ice Age transition)? This session is part of a long-term project sponsored by Past Global Changes called PEOPLE 3000. By analyzing case studies and developing formal mathematical frameworks and frames of reference for comparing cases, our session will advance theories of long-term human demography and more nuanced views of sustainability grounded in the long-term dynamics of the climate-human population-resource management nexus.

[106] Poster Session · STRATEGIES FOR MANAGING CULTURAL RESOURCES IN WILDERNESS AREAS OF THE UNITED STATES FOREST SERVICE

The United States Forest Service manages over 36 million acres of congressionally designated wilderness in 37 states from Alaska to Florida and from Maine to California. Cultural resource management within a wilderness setting can be challenging, but preservation for some of our nation's most important archaeological and historic sites is worth the effort. This poster symposium explores a wide array of strategies employed by Forest Service heritage program managers and archaeologists to manage, protect, preserve and interpret wilderness cultural resources for the public benefit.

[107] Symposium · “ETHICAL” ENGAGEMENT WITH HISTORIC CEMETERIES: FROM “ISSUES” TO A MULTIPLE CONSCIOUSNESS

It has become de rigueur to mention ethics in reporting research, creating a paradox wherein archaeologists want to engage with ethical questions but have so diluted these concepts through perfunctory lip service as to render them nearly meaningless. From

this comfortable position, archaeologists have failed to challenge the Western cultural basis for these “issues.” Growing urbanization in the United States presents moral challenges as the exhumation of historic cemeteries becomes increasingly common. These challenges generate wide-ranging questions: Is this unavoidable? Who is ultimately responsible? Are some groups more deserving of analysis than others? What research is prioritized when money is scarce? Professional codes of ethics provide an insufficient framework for responding to these questions, resulting in inadvertent entrenchment that limits the scope of potential hypotheses and epistemic growth and overlooks the power of counter-narratives. The archaeology of historic cemeteries is uniquely placed for social engagement. We propose a redefinition of “ethics” that encompasses syncretism between divergent modern communities and judicious excavation. Building on the work of W.E.B. Du Bois and Alison Wylie, we seek to embrace a multiple consciousness as a component of an evolving practice. This session presents field narratives that address the current conflict between “ethic” and action.

[108] Symposium · REAL, RECENT, OR REPLICA? AMERINDIAN (AND NEO-AMERINDIAN) ICONOGRAPHY IN THE CARIBBEAN

Collectors of antiquities have long sought the ornate pottery and carved wood and stonework of the pre-Columbian Caribbean—a quick search for “Saladoid” or “Taino” on internet gallery/auction sites shows a thriving black market. Its scale has remained largely unexplored, to the detriment of regional and international archaeology and museology. In response to the increasingly growing market, various attempts have been made to discourage looting via replica workshops, community archaeology, and other interventions. Many efforts prove unsustainable, however, and in some cases participants were left with the skills to both identify Amerindian remains and create forgeries that eventually end up on display in museums. This symposium will examine the unintended consequences, cautionary tales, and lessons learned from an often overlooked—but highly prolific—region of the antiquities market. In the process, we will illuminate new understandings and strategies for both combating the global antiquities trade and encouraging sustainable economic impacts for those who make a living creating new art forms, inspired by the past yet reinterpreted for the present.

[109] Electronic Symposium · DEBT IN PRE-MODERN STATE ECONOMIES FROM AN ARCHAEOLOGICAL PERSPECTIVE

Contributors will consider recent arguments about ancient state economies in David Graeber’s book, *Debt: The First 5,000 Years*, from the perspective of archaeological and interdisciplinary research. What archaeological evidence exists in Mesoamerica (and comparative regions) for: the importance of debt before markets and money, regularly extended debt amnesties, the nonexistence of barter markets, the use of tokens or units of account without the need for actual/plentiful monetary units, debt peonage, slavery, the interdependent relationships of political, social and commercial institutions, and challenges to “primordial debt” theory that citizens owed unfathomable debt to their societies and/or gods that could only be fully repaid at death. How does archaeological data reflect evidence of debt’s importance in ways beyond traditional understandings of tribute and taxation, and what changes correlate with “heroic” regimes or especially militarized periods? What approaches are useful in other regions? How can we document “human economies,” in which inalienable possessions (including human beings) are transformed into systems where preciosities assume quantitative values, i.e., morality-governed economies are converted to “impersonal arithmetic” in practices ranging from bride exchange to war captives/slaves. How do theoretical paradigms such as “moral economy” and “collective action theory” intersect with the debt theories advanced by Graeber?

[110] Electronic Symposium · PRACTICING ARCHAEOLOGY IN THE CONTEMPORARY POLITICAL CLIMATE

(SPONSORED BY ARCHAEOLOGY DIVISION, AMERICAN ANTHROPOLOGICAL ASSOCIATION)

Denial of fact, revisionist history, “Alt-right” rallies, creationism, monument controversies, flat-earth revival, climate conspiracy—the last year has caused many to question their assumptions about the state of American discourse and national consensus on a variety of scientific, social and political issues. The misinterpretation and misuse of scientific research is not new to anthropologists, however, since the days of Franz Boas and his students, anthropology has also included responses to racism through public engagement and community outreach. This panel engages with these histories and futures of archaeology in the political sphere. Structured as a roundtable conversation growing out of an electronic symposium, this session includes participants working on questions such as scientific and historical literacy in public outreach; how archaeologists can learn from Indigenous perspectives on heritage and history; the instrumentation of historical and archaeological narratives and symbols; debates surrounding monuments and memory; and the role of archaeologists in the recent March for Science and climate change debates. This panel brings together scholars working at the crux of archaeology and the contemporary to reflect on these problematic trends and to provide critical perspectives on potential ways toward a more socially engaged archaeology.

[111] Electronic Symposium · ENVIRONMENTAL CHANGES AND THEIR IMPACT ON DIETARY ADAPTATION IN SUBTROPICAL CLIMATES

The environment of Florida is a classic example in which fluctuating coastlines, water levels, and the emergence of tree islands led to significant human adaptation to the landscape. When examining the impacts of these hydrological changes to plants and animals over a broad period of time, it is clear that human populations have continuously adapted to make use of the available resources. As environmental adaptations continue to occur due to climate change, the dietary variation recorded archaeologically, or through Tribal Member oral histories, will prove useful in determining how climate change has affected animal populations and how humans have adapted to new environments. This symposium will provide an opportunity to review a regional analysis of sites impacted by environmental change, and how this has affected human subsistence patterns over a broad period of time.

[112] Forum · MENTORING UNDERGRADUATE RESEARCH IN ARCHAEOLOGY: THE GOOD, THE BAD, AND THE UGLY

(SPONSORED BY COUNCIL FOR UNDERGRADUATE RESEARCH [CUR])

Involving students in undergraduate research in archaeology is essential as research in the field demands hands-on experiences. At the center of any good undergraduate experience is high quality mentorship and collaboration at the student-faculty, faculty-administration, and project-general public (local, regional, national, and international) levels. This session will examine the best practices of archaeological research, mentorship, and collaboration. In addition to the “good,” the session also will address some of the “bad” and “ugly” experiences that researchers have faced and how the researchers have used those experiences to improve the research experience for all involved.

[113] Symposium · SEASCAPES, WATERSCAPES AND THE RELATIONAL

In this session we consider how seascapes and waterscapes relate to the many and varied people, things, and places with which humans live. While many aspects of the archaeological record can be interpreted as referencing the watery realm through association (e.g., shell middens) or visual cues (e.g., rock art), our goal with this session is not to focus on simply identifying these connections, but to interrogate the nature of these relationships—to consider how water acts as a relational presence, and one that is informed by epistemologies and ontologies. Writing in the context of maritime people in Australia, McNiven (2008:149) identifies a 'relational nexus between people, spirits, and the sea'—a useful observation that orients our thinking about the various elements that can be used to explore the water/people relationship. We wish to address the complex relational aspects between people, things, and water as a way of better understanding the social/cultural networks in which they are embedded, and the myriad ways people construct, maintain and express their identity. This session includes papers that draw on archaeological, ethnographic and historical resources to address the relational through the lens of the watery realm.

[114] Symposium · INDIGENOUS ARCHAEOLOGIES: GLOBAL PERSPECTIVES ON ENGAGING WITH HERITAGE AND INTERPRETING THE PAST

Recent research in archaeology, anthropology, and heritage studies has examined the varied ways in which indigenous communities interpret and (re-)construct their past. Ancestral places, structures, and things provide fertile ground (and physical evidence) for people to negotiate the meaning of the past, remember ancestors, and to build, maintain, and revive ancestral knowledge. Indigenous archaeology has been couched as a knowledge-producing partnership between Western scientific methods (e.g., subsurface excavation, radiocarbon dating, artefact analysis) and indigenous ways of knowing the past. This session aims instead to foreground indigenous people as archaeological practitioners, examining how people interpret their past through engagement with archaeological and geomorphological features such as ancient landscapes, ecological patterns, surface finds, and subsurface sediments. We aim to bring together worldwide trans-disciplinary case studies to consider these indigenous past-making methodologies. This session asks what our discipline can learn from indigenous archaeologies, and their associated theoretical, methodological, and interpretational perspectives.

[115] Symposium · RESULTS OF THE NEH- AND NGS-FUNDED EXCAVATION AND ANALYSIS OF ROOM 28 IN PUEBLO BONITO

Initially excavated by the Hyde Exploring Expedition in 1896, Room 28 in Pueblo Bonito is best known as the room where cylinder jars were first identified in the U.S. Southwest and the locus of a cache of 111 such jars. In 2013, a crew from the University of New Mexico, led by Patricia Crown and funded by NEH and the National Geographic Society re-excavated Room 28 to record the original stratigraphy of the room, remove datable materials, and determine whether the HEE project located the room floor. The six week excavations recovered a remarkable assemblage of artifacts, fauna, and plant remains. Analyses of this material and collections from AMNH and NMAI permit new understanding of this part of Pueblo Bonito, including the northern burial cluster. It also shows how looting and backfilling affected our understanding of Pueblo Bonito.

[116] Symposium · ANTHROPOGENIC RAINFOREST: LANDSCAPE MANAGEMENT IN THE AMAZON BEFORE THE EUROPEAN CONQUEST

The symposium will explore the human active role in the landscape management and in the creation of a distinctive anthropogenic landscape in the Amazon rainforest over the past millennia. The presentations in this session will show that the indigenous people in the past did not adapted to environmental limitations, as previous cultural ecology theories posited. Instead, they manipulated and modified the landscape to meet social-economic needs. The native Amazonian population built an anthropogenic landscape through the creation of causeways, well or ponds away from rivers, raised fields, earthworks, large settlement mounds, Amazonian dark Earth soils and anthropogenic forest. When the Europeans arrived in the Americas, large and diverse groups of people with extensive networks of communication and hierarchical social-political organization had developed across the Amazon, and they had been constantly manipulating and managing the landscape to meet their everyday needs. Therefore, the Amazonian landscape provides a very important database for understanding previous occupation in this region.

[117] Symposium · VOICING THE COLONIZED: AN EXPLORATION OF DIFFERING EXPERIENCES AND RESPONSES TO CONQUEST FROM THE OLD AND NEW WORLD

From the Romans to the Inca, empires have conquered regional ethnic groups to gain access to territory and resources. While past research has focused on the role of intruding colonizers and assumes a passive response from smaller ethnic groups, this session takes a bottom-up approach and explores how processes of colonialism, defined as practices of control between two asymmetrical powers, are reacted to by subordinate groups and how local active agency transforms their own identities through alterations in their daily aspects of life. Were foreign practices resisted, adopted, or combined and hybridized with current practices? Did different social groups respond differently to the foreign group? This session takes a multi-component focus in examining both cultural (ex. architecture, ceramics) and biological data in order to understand the many facets in how societies respond to conquest. Additionally, this session examines both old and new world examples in order to compare and contrast differing experiences of colonialism. Overall, this session adds to our current understanding of how local communities resist and conform during times of conquest and serves as an analogy for modern interactions between dominant and subordinate ethnic groups.

[118] General Session · ADVANCES IN DIGITAL ARCHAEOLOGY**[119] Symposium · 1300–1500 CE: MIGRATION, RELOCATION, AND ABANDONMENT IN EASTERN NORTH AMERICA**

The period 1300–1500 CE in eastern North America is marked by profound migration episodes and depopulation of large areas that created clustering of societies on a regional scale. This interval is also associated with dramatic events like the collapse of Cahokia, village formation among non-Mississippian communities, and significant outbreaks of intergroup violence. To date, there

have been no broad-scale comparative studies across the larger region to address whether these events and trends are linked at a near-continental scale, or else are relatively independent, serendipitous phenomena. By gathering researchers from several areas across the Eastern Woodlands, this session aims to provide a better understanding of where depopulation, migration, relocation, internal growth and change, and stasis occurred and how these larger settlement and demographic events relate to social, political, economic, and ideological factors. The ultimate goal is to describe and explain the movement and distribution of communities and societies across eastern North America and explore to what degree these events in various regions were interconnected.

[120] Symposium · FLUTED POINT TECHNOLOGY: VARIATION ACROSS A HEMISPHERE

The transmission of Clovis fluted point technology, the earliest well-dated fluted point industry, is considered to have spawned regional variants of point forms as a result of cultural drift and founder effects as Paleoindian groups dispersed throughout the Western Hemisphere and adapted to local ecological settings. Recent research on fluted point technology in North and South America has highlighted such variability in technology and morphology across both geographic space and time. Now more than ever, researchers across the Western Hemisphere focus on understanding regional variants in fluted point technology in terms of their evolutionary development, historical relationships to earlier forms, and functional advantage in specific ecological settings. Traditional methods of technological and morphological comparison are met with digital analyses of morphology and shape using geometric morphometrics, phylogenetic analyses using cladistics, experimental analyses of function and manufacture, and technological analyses of manufacture sequence and reduction protocols. The papers in this session discuss morphology and technology of fluted point variants, such as Folsom, Cumberland, Barnes, Northern Fluted, Gainey, Suwannee, Fishtail, and their relationships to neighboring forms, both spatially and chronologically, as well as evolutionary evidence of their historical development and origin.

[121] Symposium · URBANISM, TECHNOLOGY, AND IDENTITY: CELEBRATING THE COMPARATIVE ARCHAEOLOGY OF RITA P. WRIGHT

Rita P. Wright's hallmark contribution to archaeology is a suite of concepts and critiques that provide a comparative framework that is unrestricted to a single geographical area. In her early work on ceramic production and craft, Wright synthesized the anthropology of technology with the archaeology of the Indo-Iranian borderlands, laying the foundation for a technological approach that transformed the archaeology of South Asia. Her critical re-evaluation of early cities, states, and complex societies incorporated past people and groups previously omitted from investigation, bringing to the forefront the political and economic dimensions of households and other social entities. Her work also drove the archaeology of identity and gender, correcting traditional approaches that too often left humanity out of explanations of the past. She has also established a landscape approach that examines the social relations that connected the city of Harappa to its many surrounding settlements, she has revealed rural/urban interactions that drove the emergence and transformation of urbanism. Wright has set the agenda for a new generation of comparative archaeology. The papers in this session celebrate this legacy, reflecting many threads of her research and providing an opening statement for an anthropological archaeology that is more insightful, holistic, and comparative.

[122] Symposium · AGENT OF CHANGE: THE DEPOSITION AND MANIPULATION OF ASH IN THE PAST

The archaeological record has an incredible diversity of depositional practices within and outside structures and features. This symposium focuses on one particular understudied constituent of deposits, ash, which has an underappreciated, singularized role in deposit composition throughout North America. The association of ash with assemblages of rare or unusual objects, and in the transition or transformation of depositional patterns is notable and suggests ash deposition is involved with ritual practices. World-wide, ash has been associated with fire and thus representative of or possessing transformative properties including purification. This symposium explores the properties, uses, meaning, and cross-cultural patterns in the deposition and manipulation of ash as it relates to ritual closure, social memory, and cultural transformation.

[123] Symposium · MATERIAL CULTURE AND MULTIVOCAL CULTURAL DIALOGUE IN THE CONSTRUCTION OF THE CRIOLLO UNIVERSE OF THE CARIBBEAN

Studies on the emergence and development of the creole societies of the Caribbean have centered on the socio-cultural mix produced by the colonial processes without considering similar phenomena present in the region during Pre-Columbian times. The application of category of indio has blurred, denigrated, and homogenized these people and the plurality of ways in which they interacted, placed themselves, and were present in the creole universe of the Caribbean. The production of simplistic views of the creolization process is due to the focus on the inter-cultural engagements between Europeans and Indians or between Europeans and Africans. Moreover, such perspectives have obscured the plurality of the indigenous groups who resided in the Caribbean. In this session, we will also explore a range of theoretical and methodological perspectives used in the studies of the heritage and cultural continuity of the Indigenous presence in the Caribbean. Many earlier models are based on outdated reductionist notions that leave little room to study processes such as transculturation, hybridization and ethnogenesis. We hope to contribute to "rethinking" of traditional models and contribute to a better understanding of cultural mixture processes and the emergence of creole societies in the Caribbean region.

[124] Symposium · INTRA-SITE SPATIAL ANALYSIS OF MOBILE PEOPLES: ANALYTICAL APPROACHES TO RECONSTRUCTING OCCUPATION HISTORY

Site level spatial analyses provides a means to evaluate past human behaviors such as the types of activities performed, the duration of occupation, and size of groups. However, the record is often fragmented and disorderly. Mobile peoples leave a spatial structure that is particularly convoluted, often lacking the features used as proxies of organizational parameters among more sedentary groups. Discerning between continuous and repeated occupations is another major challenge. Intra-site spatial analyses offer a way to untangle the archaeological record. Such studies have led to a proliferation of approaches but these efforts are rarely quantified in a manner that makes results comparable. This session will present papers covering a broad range of time periods and regions intended to foster a comparative analytical approach presently lacking in spatial analysis studies.

[125] Symposium · GETTING TO KNOW THE NEIGHBORS: ARCHAEOLOGICAL INVESTIGATIONS OF COMMENSAL ANIMALS

Commensal animals have cohabitated with humans for tens of thousands of years and played numerous roles in past societies, including as cherished companions, pests, food sources, and cultural symbols. In contrast to domestic animals, the term 'commensal' is biologically defined as an interspecies relationship wherein one species benefits and the other species experiences no impact. However, the complexities of commensal relationships between humans and animals become readily apparent once the term is applied to particular taxa and societies. Commensal animals have adapted to anthropogenic environments by living alongside humans and becoming dependent on their dwelling spaces and resources for survival. Explicit investigation of the commensal niche remains an underexplored topic in archaeology, despite the information these species can provide regarding anthropogenic ecosystems, lifeways, and food webs. Occupying the realms between 'domestic' and 'wild,' commensal species are positioned to provide a unique perspective on the dynamic interactions between human societies and ecosystems. This symposium aims to bring together diverse geographic, taxonomic, methodological, and theoretical perspectives to synthesize and advance current archaeological research on commensal animals and investigate their impacts on past human societies, animal species, food webs, and ecology.

[126] Symposium · COPROLITE RESEARCH: ARCHAEOLOGICAL AND PALEOENVIRONMENTAL POTENTIALS

Coprolites are unique packages of information that can provide high-resolution snapshots of an individual's diet and health, and how this varied over different timescales. Coprolite studies have traditionally focused on gross morphology and the microscopic analysis of inclusions such as parasites and plants. These approaches provide important information on human subsistence, health, and the environmental context of human adaptation, but coprolites can be morphologically ambiguous, and digestive processes break down many bone and plant fragments making their identification difficult. What we can see under a microscope is therefore only a fraction of what was eaten. New biomolecular methods are beginning to show promise in coprolite studies, and provide important additional information on human diet and health by analysing 'invisible' dietary clues. This session brings together an international group of researchers, covering a wide range of methodologies for the analysis of coprolites. The session aims to showcase current state of the art in coprolite research, and to establish best practice guidelines for the multi-proxy analysis of these remains. The goal of this discussion is to explore how this high-resolution information can be better integrated into broader analytical studies using more traditional forms of evidence.

[127] Symposium · RECONSTRUCTING FORAGER LIFEWAYS AT THE PLEISTOCENE-HOLOCENE TRANSITION

New information concerning the Late Pleistocene-Early Holocene transition and concomitant human adaptations continue to renew and revitalize interest in Paleoindian studies. Recent volumes concerning Paleoindian adaptations emphasize lithic technology, economy, and relationships with environmental variability. Less well represented are factors affecting assemblage formation at the site and regional levels—including social behaviors and local historical circumstances—which also must be considered in evaluating Paleoindian lifeways. Reconstructing Late Pleistocene-Early Holocene forager lifeways must rely on an accurate understanding of the interaction between cultural and natural formation processes. This symposium aims to explore how these factors including, but not limited to, mobility, interaction, and aggregation, may have operated in combination with fluctuating environmental conditions globally and locally to produce the varied archaeological signatures that characterize the Late Pleistocene to Early Holocene.

[128] Symposium · CLASSIC VERACRUZ DEITIES

Classic Veracruz was home to a variety of visual cultures and material practices referencing the supernatural. While systematic studies of gods and rites have a long established history elsewhere in Mesoamerica, particularly Highland Mexico and the Maya region, there are relatively few studies of Classic Veracruz deities as a coherent system (or systems). In this symposium participants explore the challenge of recognizing and amassing a corpus of deities in the post-Olmec Gulf lowlands, ca 1–1000 CE, with special attention to attributes, cosmography, and materials analysis. To date, Classic Veracruz deities have largely been analyzed in relation to Postclassic Mexican correlates. More recently scholars have productively explored regional and temporal continuities between Classic Veracruz and the Gulf Coast Formative period and Classic Maya, respectively. The Epiclassic period offers a particularly fruitful set of iconographic relationships forged across Mesoamerica. Regional ethnographic analogy has also been applied. In a counter-movement to these comparative studies some iconographers question the merits of assuming synchronic and diachronic continuity. Working together with a rich array of theoretical and methodological approaches this symposium seeks to generate a more nuanced understanding of Classic Veracruz religion.

[129] Symposium · PALIMPSEST URBANISM: CHARTING THE LONG-TERM DEVELOPMENT OF THE ANCIENT MAYA CENTER OF ACTUNCAN, BELIZE

Research by the Actuncan Archaeological Project since 2001 has revealed a dynamic series of boom and bust construction cycles beginning with the initial occupation of the site around 1000 B.C. and continuing until the site's abandonment during the Terminal Classic period (A.D. 1000). During its two millennium of occupation, the site developed as a low-density urban center that housed social, political, religious, and economic institutions. Drawing on collective action theory, we view the establishment and progression of Actuncan's institutions as the outcome of bargains struck between state authority and non-ruling groups. These negotiations must be viewed as iterative—informed in each instance by internal political dynamics, community practices, and local memory, as well as outside influences. The result is a palimpsest urbanism where residents lived in a historic center in which monuments, houses, and agricultural systems were built, occupied, renovated, and differentially abandoned according to existing conditions. In this symposium, contributors draw on data collected in and around Actuncan's urban center to explore the long-term trajectory of households, agricultural systems, urbanism, civic planning, and exchange at Actuncan.

[130] Symposium · DIGITAL HERITAGE TECHNOLOGIES, APPLICATIONS AND IMPACTS

The recent 'digital turn' in archaeology has spurred methodological advances and new research directions, with wide ranging impacts at multiple scales. The proliferation of imaging, remote sensing, laser scanning and photogrammetry applications has, at times, outpaced considerations about data archiving, digital epistemologies, and accessibility. This can lead to circumstances in which the creation of digital datasets is privileged over public dissemination or scholarly output—a situation that ultimately undermines the democratization of science. The future of digital heritage in archaeology thus lies in the integration of

methodological approaches to digitization with explicit project outcomes targeted at various communities and stakeholders—an approach that might be thought of as “applied digital heritage.” This session will highlight recent work in the field of digital archaeological heritage, with a focus on documentation, analysis, and dissemination. It is not constrained by geographical setting or time period. Participants are encouraged to consider the following topics: (1) digital techniques in archaeological field and lab research; (2) digital epistemologies and the interpretation of archaeological material; (3) dissemination and public engagement; and (4) the ethics and politics of digital archaeological heritage.

[131] Symposium · PERSPECTIVES ON DOCUMENTARY RELATIONS, ETHNOGRAPHIC OBSERVATIONS AND ARCHAEOLOGICAL INTERPRETATIONS: PAPERS IN HONOR OF CARROLL L. RILEY

Archaeologists once considered ethnohistorical document analysis an essential component of interpreting the archaeological record of the Mexican Northwest and U.S. Southwest (e.g., Riley 1987, 2005). Example source material included Spanish entrada accounts and Mission-era correspondence. The role of historical text sources fell out of favor with the advent of processual archaeology. Present trends associated with particularistic theories of cultural change as well as practical concerns, such as the inclusive criteria for determining NAGPRA affiliation, provide impetus to again consider the information offered from these sources. This session is intended to highlight the variable ways documentary texts are presently employed in the interpretation of archaeological data in the NW/SW. Critical points of contention in present applications include how to reconcile conflicting documentary and archaeological data and appropriate frameworks for extending historical descriptions into the past. Specifics topics of interest include the scale of interaction, the nature of political control, population estimates, causal factors in social change, and establishing continuity between modern and ancestral groups.

[132] Symposium · ARE WE INKAS? INKAS AND LOCAL POLITIES INTERACTIONS AS SEEN THROUGH THE MATERIAL CULTURE

The Tawantinsuyu was the largest New World Empire ever known. During the Inka conquest of this vast region the Inkas encountered numerous polities of different sizes and degree of complexity. The Inkas conquerors had to establish their political, social and economic systems in very disparate environments. This required the development of imperial polities that considered local identity, local social organization, local tributing, crafts production, exchange networks, geographical location, available natural resources and finally Inka imperial interests. This Symposium presents recent research exploring these heterogeneous interactions between the Inka and the local polities they dominated, through analyzing the material culture.

[133] Symposium · CHASING HUNTER-GATHERERS AND EARLY FARMERS IN THE GREAT LAKES AND BEYOND—45 YEARS OF RESEARCH DEDICATED TO UNDERSTANDING THE DYNAMICS BETWEEN PEOPLE, ENVIRONMENT, AND BEHAVIOR: PAPERS IN HONOR OF WILLIAM A. LOVIS

William (Bill) Lovis has made significant contributions to the discipline of archaeology since the early 1970s. His research and publications have included a staggering array of topics including Upper Great Lakes prehistory, the European Mesolithic, geoarchaeology, analytical methods, ethnoarchaeology, hunter-gatherers, and pedagogy. He has been many things to many people including an archaeologist, mentor, colleague, and teacher. He has undertaken various roles in the Society of American Archaeology (SAA) including Chair of the Government Affairs Committee (1989–1992), and contributed much time and leadership in ensuring the success of NAGPRA for Native American heritage. In recognition of his many contributions, he received the SAA Presidential Recognition Award in 1998. The papers assembled in this session, presented by students and colleagues, reflect the broad impact of Bill’s career with an emphasis on his archaeological legacy in the study of prehistoric hunter-gatherers, emergent farmers, and archaeological methods.

[134] Symposium · NEW APPROACHES TO THE ARCHAEOLOGY OF RITUAL IN THE SUBTERRANEAN REALM

Subterranean spaces in Mesoamerica tend to have a special character because of their association with indigenous concepts of the sacred, animate Earth. Cavities in the Earth, even when created by the mining of tepetate or sascab, tend to be seen as important and appropriated for ritual. Subterranean spaces tend to be dark and humid which also limits their utility for mundane activities. Thus, these spaces become some of the best venues for doing the archaeology of ritual. This sessions brings together papers exploring both natural and man-made spaces across a variety of contexts.

[135] Symposium · BURNING LIBRARIES: ENVIRONMENTAL THREATS TO HERITAGE AND SCIENCE

(SPONSORED BY SAA CLIMATE CHANGE STRATEGIES AND THE ARCHAEOLOGICAL RECORD COMMITTEE)

In 2015 the SAA launched the Climate Change Strategies and the Archaeological Record Committee. CCSAR has since grown rapidly, reflecting widespread concern about threats posed by climate change impacts (including wildfires, retreating glaciers and ice patches, loss of frozen ground, and accelerated erosion) to both heritage and to the scientific record. Just as new analytical approaches (including stable isotopes, trace elements, ancient DNA) are broadening the contribution of archaeological sites as a “distributed observing network of the past” for global change science our basic data is suffering accelerated loss worldwide. Local and indigenous communities are facing rapid loss of heritage and access to their past. Managers and funding agencies are seeking guidance in prioritizing response efforts, and the archaeological community at a whole faces significant challenges to our own “business as usual” practices in terms of excavation, curation, and site conservation. In alliance with IHOPE and the European Archaeological Association the CCSAR teams are working to pool expertise and broaden connections among academics, heritage practitioners, environmental managers, and (critically) local communities on the front lines of climate change.

[136] Symposium · PERFORMING IN THE SHADOWS: RITUAL PRODUCTION IN CAVES AND ROCKSHELTERS

Performances are often highly structured events that have the ability to convey crucial information about social processes. Through the differential engagement of multivocal performers and audience members, performances can operate as distilled social metaphors that are enacted through bodily participation. Over the last few decades, scholars have engaged with performance in the archaeological record, particularly through the lens of architectural spaces such as theaters, plazas, and stages. While caves have been recognized as important venues for ritual activity, the actions employed in these spaces have not been traditionally interpreted through the lens of performance or incorporated into the growing corpus of performance theory. However, the study of performance in caves affords the investigation of the intersection between natural and modified space, the

spatial and social implications for how performance is conducted and structured, and the social and political implications of cave ritual. Through case studies that are broad in geographical and temporal scope, this session explores the mechanisms of performance by expanding and refining existing frameworks as they pertain to caves.

[137] Symposium · NEXT GENERATION ARCHAEOLOGICAL SCIENCE: EVERYTHING YOU WANTED TO KNOW BUT WERE AFRAID TO ASK

(SPONSORED BY JOURNAL OF ARCHAEOLOGICAL SCIENCE)

Innovations within archaeological science are being launched and developed at a rapid pace, leading to significant advances in how we understand the past. But how to keep up with all the new ideas and techniques? And how to assess whether both the archaeology and the science are valid? This session offers an unsurpassable opportunity to update your knowledge so that you can take advantage of new approaches, but, through participating in the discussion, also contribute critically to their development and application. Leaders across the broad spectrum of archaeological science will select what they predict are the most important advances on the horizon. And, importantly, they will explain the hows and whys using language appropriate for a generalist archaeological audience. Expect to look into the future of dating, bioarchaeology, microfossils, geochemistry, isotopes and specialisms so new they don't yet have names!

[138] Symposium · ARCHAEOLOGICAL COLLECTIONS CARE FOR THE COLLECTIONS SPECIALIST: CURRENT TOPICS AND INNOVATIVE TRENDS IN THE REPOSITORY

(SPONSORED BY SAA COMMITTEE ON MUSEUMS, COLLECTIONS, AND CURATION)

Archaeological curation and collections management is an ever-changing field that draws upon new techniques and strategies for the long-term care, management, and use of objects and associated records. Technological advances continue to augment a professionally-established set of curatorial and conservation practices. This symposium, designed specifically for practicing collections managers, curators, and conservators, will explore current trends and topics in archaeological collections care including: care and management of anthropology collections; preventative conservation; creating and managing digital data; public outreach, education, and scholarly research; and curation of anthropology exhibitions. There will also be two opportunities to personally discuss your institution's unique challenges with the speakers.

[139] Symposium · CONTEXTUALIZING MUSEUM COLLECTIONS AT THE SMITHSONIAN INSTITUTION

As the archaeological community continues to grapple with the ongoing curation crisis, coupled with the lack of funding opportunities for large-scale excavation projects, museum collections are seen as valuable and sustainable resources for archaeological investigation. Nevertheless, too readily museum collections remain overlooked and underutilized. This mostly stems from the misconception that provenience and quantitative control are inadequate. Compounding this dilemma is the lack of democratized information concerning the breadth and vastness of collections in museums and difficulties gaining collections access. The Smithsonian Institution's mission is "the increase and diffusion of knowledge" and the National Museum of the American Indian (NMAI) and the Anthropology Department of the National Museum of Natural History (NMNH) make available for study some of the largest and most comprehensive archaeological and ethnographic collections and accompanying archival material representing Indigenous societies from throughout the world. This session includes a survey of archaeological and ethnographic collections under Smithsonian's stewardship and highlights research that has contextualized the collections through archaeometric techniques, comparative and archival studies, iconographic analysis, and tribal collaboration. These studies demonstrate the monumental potential of museum collections for advancing our understanding of the past.

[140] Symposium · EXTRACTION SITES AND CULTURAL LANDSCAPES

(SPONSORED BY SAA PREHISTORIC QUARRIES AND EARLY MINES INTEREST GROUP)

Archaeological research on raw material extraction sites provides opportunities to explore the scope and organization of activities that take place outside of settlement or residential contexts. For example, researchers working on extraction sites often examine reduction sequences, facilities and methods of material processing, questions of specialization, access, and apprenticeship, and transport of materials to other locations on broader cultural landscapes. In addition, sources of raw materials important to activities including tool or ceramic production, construction, or ornamentation may be used simultaneously by diverse cultural groups. Extraction sites are thus uniquely suited to addressing questions about regional processes and linkages between regions. This session brings together researchers from around the world that apply diverse theoretical and methodological approaches to the study of activities at extraction sites and their relationships to surrounding cultural landscapes.

[141] Symposium · ARTIFACT CHARACTERISTICS, PRODUCTION PROCESSES AND SOCIAL INTERACTIONS IN THE ANDEAN LANDSCAPE

While reference to established artifact terminologies is essential, new data and new analytic purposes often create a need to expand or modify style categories. Archaeometric techniques provide insight into the sources and movements of raw materials, as well as their transformation in production, artifact use, and post-deposition processes. Thus, integration of longstanding archaeological concerns and techniques with contemporary materials analysis can lead to new proposals on ways that the analysis of objects created and used by Andean peoples can inform proposals regarding their social relationships and ways of life.

Intersecting analyses of artifact style, techniques and practices, material composition and use wear provide insight into the organization of production and exchange. Leroi-Gourham's concept of chaîne opératoire and Lechtman's concept of technical style inform a close examination of components and their transformations, production practices and their sequences, formal similarities and distinctions, and evidence for transport and use. Architecture, lithics, metallurgy, ceramics, textiles and other objects created from mineral and organic materials all provide data that can inform models of communities of practice and exchange relationships, structured by the natural resources and nodes of interaction of the Andean landscape.

[142] Symposium · RECONCEPTUALIZING RURALITY: CURRENT RESEARCH IN THE ANCIENT MAYA HINTERLANDS

As scholarship continues to shift away from urban- and elite-centric perspectives, research in the ancient Maya area has increasingly included rural populations in archaeological interpretations. This symposium brings together current research from various Maya regions and time periods to illustrate the vast spectrum of rural settlement and to highlight the diversity and complexity found among ancient Maya hinterland populations. The topics of everyday life and interactions, heterogeneity and inequality, material culture, identity formation, the use and construction of landscapes, and the relationship between hinterlands and centers are considered, among others. Theoretical and methodological approaches suited to hinterland archaeology are discussed. This symposium aims to foster dialogue and future collaboration to answer the following questions: In what ways are hinterlands similar and/or distinct from heartlands? Can we discuss and define rurality without reifying the false dichotomies of urban-rural and elite-commoner? How might we challenge traditional yet persistent conceptions of hinterland people? In what ways does hinterland archaeology enhance our constructions of the past and of theory building? By engaging in critically meaningful analyses of the rural Maya on their own terms, these studies offer a unique vantage from which to investigate the constitution of complex societies.

[143] Symposium · BIOMOLECULES AND MUSEUMS COLLECTIONS: CHALLENGES AND BEST PRACTICES FOR DESTRUCTIVE SAMPLING

Biomolecular analyses of archaeological materials are rapidly expanding, providing new information on past peoples, pathogens, and ecosystems. Museum collections are a promising source of biomolecules but present many challenges when making decisions about collection access including increasing requests for destructive sampling. The types of materials sampled, how collections' requests and committees proceed, methodological limitations of biomolecular analysis, and how living decedents are engaged are all important considerations for discussing and developing best practices for museum collections. With biomolecular information being available from a variety of sources, including bone, teeth, soil, plants, feces, and pottery, this session will highlight the burgeoning possibilities, limitations, techniques, and questions for archaeological biomolecular investigations. Ultimately, this session aims to incite continued interdisciplinary discussion of how biomolecules are studied in museum collections.

[144] Symposium · “THE BRITISH ISLES”: ARCHAEOLOGICAL REALITY OR MODERN GEOPOLITICAL CONSTRUCT?

The archaeological literature often groups England, Scotland, Wales, and Ireland under the moniker of “The British Isles.” This grouping is particularly apparent in studies of interregional interaction, in which engagement between Continental sources and any of the above areas is argued to have been routed through southern Britain. This serves to justify the extension of southern British archaeological characteristics to outlying areas; such a practice risks the subsumption of archaeologically distinct areas of northern Britain, Scotland, Wales and Ireland under a category dominated, and therefore defined and driven by, southern British archaeology. The present session seeks to examine internal differences in material culture within “the British Isles” as well as differential exchange relationships with distant locales, in order to ascertain the degree of homogeneity within the imposed area. It asks whether the concept of “the British Isles” reflects an archaeological reality characterized by consistency in material culture and robust exchange relationships, or whether it constitutes an unjustified subjugation of several archaeologically distinct regions under a term derived from modern geopolitical constructs.

[145] Symposium · CASE STUDIES FOR THE SALALAH DOCTRINE: ARCHAEOLOGICAL HERITAGE MANAGEMENT OF WORLD HERITAGE SITES

(SPONSORED BY ICAHM)

In 2015 and 2016 the ICAHM (International Committee for Archaeological Heritage Management) scientific committee met in Florence and in Salalah, Oman to develop a doctrine for management of archaeological world heritage sites. Archaeological sites present management challenges distinct from monuments and landscapes preserved at other world heritage sites. The ICAHM doctrine seeks to recognize those differences and to propose strategies for sustainable conservation and preservation. This conference session is a forum to report the doctrine (on the agenda for consideration at the ICOMOS General Assembly in New Delhi in December 2017) and to present on case studies, including Nan Madol in Pohnpei, Federated States of Micronesia and in Petra, Jordan among others.

[146] General Session · PROTOHISTORIC AND HISTORIC RESEARCH FROM AROUND THE MEDITERRANEAN BASIN**[147] Electronic Symposium · RAPID ABANDONMENT, DE FACTO REFUSE, OR PILGRIMAGE EVENTS: DECODING THE ARCHAEOLOGICAL SIGNIFICANCE OF TERMINAL “PROBLEMATIC” DEPOSITS IN THE MAYA LOWLANDS**

Maya site cores often contain artifact deposits from around the time of abandonment. Following terminology established at Tikal, these are sometimes called “problematic deposits” to distinguish them from middens and burials. They have been interpreted in several ways, for example as de-facto refuse, as evidence of rapid abandonment, the remains of termination ritual, or as evidence of post-abandonment deposition (e.g., pilgrimage). Many of these deposits have been found in Western Belize over the last decade. This symposium brings together researchers with expertise in different artifact classes who have looked at problematic deposits in a variety of places. The goal of this electronic symposium is to reach some consensus on the significance of these deposits.

[148] Forum · SO YOU WANT TO WORK?: A DISCUSSION ON NON-ACADEMIC CAREERS IN ARCHAEOLOGY

(SPONSORED BY SAA STUDENT AFFAIRS COMMITTEE)

This forum presents a variety of non-academic (and perhaps non-traditional) career paths that rely heavily upon archaeology and anthropology. Additionally, it provides students and recent graduates an opportunity to ask archaeologists questions regarding how they obtained work in non-academic career paths, including research institutions, cultural resource management firms, and regulatory and non-regulatory government agencies. Panelists come from a variety of career stages, genders, and ages. Furthermore, they fulfill different roles within their organizations, including field archaeologists, researchers, project reviewers, and liaisons. This will allow for a variety of viewpoints and experiences as they answer questions asked by the audience.

[149] Forum · COLLABORATING ON ARCHAEOLOGICAL COLLECTIONS CARE*(SPONSORED BY SAA COMMITTEE ON MUSEUMS, COLLECTIONS, AND CURATION)*

Archaeology shares collection management, preservation, analysis, and data retrieval issues with many scientific and cultural disciplines. Accessing the knowledge and expertise of colleagues in the natural history, museum, and other related professions can improve archaeological collections management and further scientific research. In this session, we seek to encourage collaboration with colleagues in a variety of professional organizations, such as the Society for the Preservation of Natural History Collections, Society of American Archivists, American Institute for Conservation of Historic and Artistic Works, Society for Historical Archaeology, American Cultural Resources Association, the Cuneiform Digital Library Initiative, the Biodiversity Heritage Library, and others. The goal is to learn from and then adopt or adapt some of their best practices for the benefit of archaeological collections. Data management and data sharing, conservation and preservation, and sustainable management of collections are among the topics covered by session participants.

[150] Forum · CYCADS, HUMANS, AND MAIZE IN MESOAMERICAN ETHNOECOLOGICAL AND AGROECOLOGICAL SYSTEMS: TRACING AN ANCIENT RELATIONSHIP THROUGH ARCHAEOLOGY, GENOMICS, AND CULTURAL GEOGRAPHY

Cycads (Cycadales) are an ancient order of gymnosperm, three genera of which are prevalent in Mexico and played a critical though underappreciated role in the agroecology and foodways of Mesoamerica. Their neglect appears to stem from their toxicity which, while requiring similar processing to that of manioc, seemingly diverted attention away from cycads despite considerable evidence indicating their utilitarian and symbolic use from the Pleistocene–Holocene transition to the present. As a botanical resource that occurs in diverse ecosystems, cycads are used in a variety of ways and figure prominently in regional mythologies in which they often possess a close relationship with maize. This forum explores the role of cycads in Mesoamerican agroecological systems, particularly its enduring relationship to maize, through a range of data, from genomic, archaeological, linguistic, art historical, to ethnographic and human geographical evidence with a specific focus on the geographic corridor running from Oaxaca to Tamaulipas. Preliminary results of an ongoing interdisciplinary research project are shared with the aim to present new data and stimulate further discussion on the significance of cycads in Mesoamerican beliefs, foodways, and ecology.

[151] Forum · CULTURAL RESOURCES IN THE AGE OF TRUMP

Cultural resource legislation, particularly the National Historic Preservation Act, has been under near continuous attack over the last several decades. The current administration has made it clear that deregulation is a priority, and we anticipate that the National Historic Preservation Act and other federal legislation will remain firmly in the sights of both the Executive and Legislative branches. The SAA anticipates that similar efforts to weaken cultural resources laws will be proposed at the state level as well. This session will provide a discussion of SAA's Government Affairs Network, State Representatives, and advocacy tools so that cultural resources professionals can become advocates for their resource.

[152] Forum · ADVANCES AND PROSPECTS IN THE ARCHAEOLOGICAL SCIENCES ON THE 40TH ANNIVERSARY OF THE SOCIETY FOR ARCHAEOLOGICAL SCIENCES (I)*(SPONSORED BY SOCIETY FOR ARCHAEOLOGICAL SCIENCES)*

The Society for Archaeological Sciences (SAS) is an international professional society of about 300 members dealing with natural science applications in archaeology, paleoanthropology, and conservation. The Society was founded in 1977, so this session commemorates the 40th anniversary of the beginning of SAS. These four decades have seen advances in techniques, applications, theories, and infrastructure surrounding the archaeological sciences. We take this occasion to reflect on some of these developments, as well as considering what the future may hold in store.

[153] Poster Session · PALEOETHNOBOTANY**[154] Poster Session · ARCHAEOOMETRY II****[155] Poster Session · HUNTER GATHERER ARCHAEOLOGY****[156] Poster Session · ARCHAIC LANDSCAPES: POVERTY POINT AND THE BROADER AMERICAN SOUTHEAST**

Archaeologists are increasingly interested in the broader social, political, and environmental landscapes found across the Late Archaic Southeast. Of particular importance is Poverty Point, one of the largest, most ancient, and most complex earthen mound complexes in the Western Hemisphere. As one of the most important sites in North America, Poverty Point has been studied for decades—yet current and ongoing research continues to produce new understandings of this iconic monument. Likewise, ongoing research along the Atlantic coast is revealing a complex landscape of human-made constructions that together form a web of interconnected sites spanning hundreds of kilometers of shoreline. This session brings together current research at Poverty Point and elsewhere in the southeast with a focus on how new technologies, new methods, and new theories are challenging traditional understandings of the Late Archaic.

[157] Poster Session · REPORTS FROM THE JUNGLE: NEW AND ONGOING RESEARCH FROM THE THREE RIVERS REGION OF THE MAYA LOWLANDS

In recent years the Three Rivers Region of Belize and Guatemala has seen some of the most intensive archaeological research in the Maya lowlands. Though studied for more than twenty-five years, new and exciting information at well-known sites such as

La Milpa, Blue Creek and Rio Azul, as well as surrounding areas, some never before investigated, are bringing fresh perspectives to research on the ancient Maya. This session brings together ongoing and new research, much of which has been conducted through the Programme for Belize Archaeological Project.

[158] Symposium · MAS ALLÁ DE LA ARQUEOLOGÍA OFICIAL: MODELOS DE CO-PARTICIPACIÓN CON SECTORES PRIVADOS Y COMUNITARIOS PARA LA INVESTIGACIÓN ARQUEOLÓGICA EN OAXACA

La arqueología en México se realiza por el estado a través del Instituto Nacional de Antropología e Historia, y en menor medida por instituciones académicas, principalmente universidades nacionales o extranjeras. A lo largo de la historia del INAH, este esquema ha producido importantes avances en el conocimiento del pasado prehispánico; sin embargo, diversos factores como el desarrollo del país y sus problemas económicos, y una creciente burocracia gubernamental han generado nuevas tareas que han mermado la capacidad de investigación, pues muchas de las labores se enfocan exclusivamente al manejo y protección de los sitios arqueológicos y a la atención de problemáticas derivadas de salvamentos y rescates arqueológicos.

Ante este panorama, en las últimas décadas, nuevos actores sociales -no necesariamente relacionados al gobierno o a instituciones universitarias- han propuesto novedosos esquemas de colaboración, con los que se han logrado importantes aportaciones al quehacer arqueológico mexicano. El presente simposio mostrará las aportaciones de los sectores privado y comunitario en la arqueología mexicana, especialmente en Oaxaca, ofreciendo una propuesta ética de trabajo, mostrando que con una colaboración responsable es posible llevar a cabo investigaciones adecuadas que no ponen en riesgo el patrimonio del país. Sin detrimento de la capacidad normativa del INAH.

[159] Symposium · ARCHAEOLOGY ON THE ATLANTIC SEABOARD AFTER HURRICANE SANDY

[160] Lightning Rounds · ENGAGING “ALTERNATIVE ARCHAEOLOGY” IN THREE MINUTES OR LESS!

Fantastic claims and fraudulent artifacts have formed a steady current of public interest in the archaeological past for more than a century, but the past two or three decades have witnessed a resurgence of books, magazines, films, TV shows, and websites promoting “alternative” readings of the past for an increasingly science-averse audience. One strategy for engaging with common archaeological myths—from the Atlantis Code to Ancient Aliens—is to promote critical thinking in the college classroom and non-academic venues, from popular media to public lectures. This session seeks to explore and share practical techniques for engaging university students and the general public in critical discussions of archaeological interpretations that professionals view as fringe ideas, all in three minutes or less!

[161] Symposium · ARCHAEOLOGICAL PERSPECTIVES ON THE ANTHROPOCENE

As a potential subdivision of the Geological Time Scale, the timing and scope of the Anthropocene is under consideration by the International Commission on Stratigraphy. There remain disagreements on how to gauge the scale of human impacts on the lithosphere and when (or whether) those impacts are measurable on the global scale. Some believe the Anthropocene began many millennia ago while others argue that ubiquitous, detectable human influences on landscapes are either a post-Industrial or post-Atomic Age phenomenon. Archaeologists are uniquely positioned to judge the ecological and geological circumstances associated with past human settlements, but generally work independently as regional specialists, which complicates assessing the global nature of these impacts. This session will critique whether a firm boundary (“Golden Spike”) can be established for the onset of the Anthropocene. By assembling a wide range of archaeological evidence from across the world, we seek to draw closer to an understanding of the ecological and social dimensions that underpin the Anthropocene.

[162] Symposium · PRECLASSIC LIFEWAYS IN THE NORTHERN MAYA LOWLANDS

Models for Preclassic Maya social and political organization have often been constructed with an implicit awareness that Classic period kingdoms would eventually develop. Yet archaeologists studying the Preclassic Maya of the Northern Lowlands have not only unearthed heretofore unknown sequences of cultural history, but have redefined the nature of social and political complexity for the Maya more broadly. Traditional archaeological methods such as survey and excavation have led to the identification of monumental acropoli, rural villages, and the construction of proto-urban spaces. These methods are increasingly being buttressed if not outright superseded by pioneering archaeological methods, including airborne LiDAR, chemical composition analyses, and sophisticated environmental studies. By exploring the adoption of new expressions of inequality, the effects of sedentary life, the construction of monumental spaces, and interaction with other Mesoamerican peoples, we seek to extend our knowledge of the Preclassic in this region beyond merely being a stepping-stone to the Classic period, and instead focus on its standing as a period of distinctive social and environmental adaptation.

[163] Symposium · PIEDRAS NEGRAS REVISITED: WAR, ECONOMY, AND POPULATION IN THE GREAT CLASSIC MAYA RIVER KINGDOM

Piedras Negras, Guatemala was the capital of a great Classic period (AD 250–900) Maya kingdom whose lords, at the height of their power, governed an area of perhaps 1,000 square km in western Guatemala and eastern Chiapas and Tabasco. Piedras Negras, with its impressive monumental architecture and unparalleled corpus of stone sculpture, was the subject of intensive archaeological investigations in the 1930s by the University of Pennsylvania and again at the turn of the millennium by a joint Brigham Young University-Universidad del Valle de Guatemala project. In the time since, research in the Middle Usumacinta River region has largely focused outside this great polity capital. Armed with knowledge gained from 15 years of regional work, the Proyecto Paisaje Piedras Negras-Yaxchilan returned to Piedras Negras in 2016 and 2017 to conduct focused investigation of the city’s defensive system, craft production, plant economy, and settlement in the near periphery. That work has been complemented by renewed efforts to protect the carved monuments that remain at the site. This symposium presents the preliminary results of those efforts, framed in broader discussions of ancient Maya war, economy, and population.

[164] Symposium · NEW FINDINGS FROM THE FAR WESTERN PUEBLOAN REGION: PAPERS IN HONOR OF MARGARET LYNEIS

This session commemorates the legacy of Margaret Lyneis, whose work has influenced countless researchers working in the

U.S. western deserts and in the Virgin Branch Puebloan region. An active scholar from the early 1960s until her unexpected death in 2017, her contributions have transformed our knowledge of these previously understudied areas. As well, her insistence as a young undergraduate that she be allowed to participate in fieldwork— at a time when few females worked, much less were allowed to excavate— helped pave the way for future generations of women. The papers in this session honor the life and career of Margaret Lyneis and highlight the continued impact of her legacy on scholars and on research in the Virgin Branch Puebloan region.

[165] Symposium · ANDEAN HOUSEHOLDS, LIVING SPACES

Houses and households vary across time and space, and many questions can be asked of household archaeology. Here we ask how Andean people used their living spaces, focusing on diverse lines of material evidence to build a sense of the conduct of daily life at home. How much space was appropriate for a dwelling? Were dwellings single-roomed or multi-roomed? How proximate were nearest neighbors? Can we argue from the spatial distribution of particular sets of material remains where particular activities occurred, for example cooking, storage, sleeping, crafting, discard? What activities occurred in adjacent external space? How did traffic flow into and through the dwelling? What degree of partitioning or privacy was relevant? Discussion focuses on comparisons of regional patterns and on the methodological strengths of different lines of evidence for building a fuller sense of how daily life was conducted at home.

[166] Symposium · FROM BEARDED ARCHAEOLOGISTS AND CLOSET CHICKENS TO MULTIPLE PASTS AND THE ARCHAEOLOGY OF YESTERDAY: HONORING THE CAREER AND IMPACT OF LARRY J. ZIMMERMAN

With a career spanning close to five decades, Larry Zimmerman has had a profound impact on archaeology and the broader discipline of anthropology, influencing how practitioners engage and collaborate with descendant communities, present their research to the public, and explore new avenues of inquiry and subjects. Along the way, Larry has mentored and collaborated with scholars from around the world, while also playing a pivotal role in early burial laws, repatriation efforts, and ethical practices. In this session, we aim to honor Larry and reflect upon his impact both personally and professionally. In doing so, we will also trace and assess changes in the practices and paradigms of American archaeology to be more inclusive in both methodology and subject matter.

[167] Symposium · TRANSFORMING MARGINALITY: EXPLORING MOMENTS OF RAPID SOCIAL AND ECOLOGICAL CHANGE

Moments of rapid transformation are often visible in archaeological data sets and are generally explored through either political or ecological lenses by focusing on social or environmental change. However, the reorganization of social and ecological landscapes tends to occur simultaneously, and it is through the interplay between such factors that archaeologically observable disjunctures materialize, including changes in settlement patterns, subsistence activities, or religious practice, among others. Widespread restructuring of labor or social organization can be brought to light by focusing on the moments in which such change takes place, along with accompanying transformations in the way social inequality manifests. Those on the margins—whether environmentally, socially, politically, spiritually, or otherwise—are often at the crux of these moments. Not only are people on the margins directly affected by the outcomes of rapid social and ecological change, their actions and day-to-day activities can also affect the process of transformation. This session will examine inflection points between political and ecological narratives: how do the structures of social inequality change as ecological practices change? Papers in the session draw from a variety of regions and time periods to explore these moments of transformation and their enmeshed social and ecological significance at multiple scales.

[168] Symposium · 21ST CENTURY APPROACHES TO ARCHAEOLOGY, EDUCATION, AND THE PUBLIC

(SPONSORED BY SAA PUBLIC EDUCATION COMMITTEE)

As archaeologists move further into the 21st century, we must be prepared for policy changes and funding cuts that can compromise advances in the field. A means of counteracting these challenges is developing informed citizens that engage in and value archaeological knowledge and preservation. Through relevant and innovative educational approaches, archaeologists can convey the value of our work to communities, policy makers, and funding agencies. This symposium presents new, innovative, and reimagined approaches to archaeological and heritage education that more closely align with current research-based educational practices as well as novel educational engagement that can broadly communicate the importance of the field. Examples of these approaches include STEM and environmental education, citizen science, and evaluation and assessment, among others.

[169] Symposium · THE STATE OF THE FIELD: CURRENT RESEARCH IN TARASCAN (PURÉPECHA) ARCHAEOLOGY: SESSION IN HONOR OF DOMINIQUE MICHELET

Over the past decade, research focusing on the Late Postclassic Tarascan (Purépecha) empire has been more prolific than ever before. Though the Tarascans have long been overlooked in favor of other better-known Postclassic kingdoms, today scholars are examining diverse topics that include political change, urbanism, environment, and economic trade and exchange. Ethnohistory does play a role in Tarascan studies, but new research increasingly focuses on archaeologically-driven questions, models, and interpretations. For 35 years, Dr. Michelet has worked to facilitate this proliferation of research into Postclassic western Mesoamerica. This session honors Dr. Michelet's career by bringing together papers that highlight current work in Tarascan archaeology. In doing so, we assess the state of Tarascan archaeology and its role for understanding the development, power, and decline of ancient empires.

[170] Symposium · THE ARCHAEOLOGY OF MONEY, DEBT, AND FINANCE

(SPONSORED BY SOCIETY FOR ECONOMIC ANTHROPOLOGY)

The relationship between money and debt in the ancient world has been the subject of investigation by many economic anthropologists and historians. Nevertheless, archaeologists have played only a minor role in debates about the origins of money, its chronological and functional relationship to debt, its materiality, its connection to finance and debt, and how these structure

power relationships. In this symposium, presenters use archaeological data to examine the material traces and social consequences of indebtedness; the processes by which objects become money; and the strategies used to manipulate money, finance, and debt to meet the needs of actors from the scale of the household to the state. An archaeological perspective expands the framework for studying the long histories of money, debt, and finance beyond written records or ethnographies of recent non-capitalist societies. By showcasing research from different parts of the world, the papers in this session also help to counterbalance a traditional emphasis on Eurasian economies in the study of money, debt, and finance. Together, the papers in this symposium show archaeological, historical, and ethnographic methods can be productively united under the common rubric of economic anthropology.

[171] Symposium · THINGS WITH A MIND OF THEIR OWN: THE ARCHAEOLOGY OF NON-HUMAN AGENCY

The concept of the Anthropocene is based on the premise that humans have had a profound, and increasing, impact on our environments. Yet many environmental conditions (such as earthquakes, storms, tsunamis, fire, disease, and other dramatic natural phenomena) can easily overpower human capacities resulting in moments of catastrophic change. Incremental processes of natural change, such as soil creep, vegetation growth, oxidation, and material fatigue similarly act against human intentionality by causing deterioration and decay whose denouement is unpredictable in timing and magnitude. The sentient world of animals, in which behavioral patterns have evolved for viability in a diverse world of predators and reproduction strategies, similarly presents challenges when managed under the assumption that humans are the primary determinant of comportment. In this session, speakers will consider the agentive effects of natural phenomena to which the direct human response is primarily reactive. The objective is two-fold: to highlight that even within the "Anthropocene" not all natural phenomena can be anticipated, much less controlled, by humans; and secondly, to critically evaluate the variety of human responses to natural and biological entities in the past as seen through the archaeological record.

[172] Symposium · AT-RISK WORLD HERITAGE AND THE DIGITAL HUMANITIES

(SPONSORED BY UNIVERSITY OF CALIFORNIA OFFICE OF THE PRESIDENT—RESEARCH CATALYST AWARD)

Providing viable solutions for the documentation and interpretation of at-risk archaeological heritage, digital and cyber methods in data capture, analysis, and 3D visualization have become widely adopted in excavations and surveys worldwide. However, research on the sustainability of the digital documentation process and on the data management, curation, and dissemination activities that follow the archaeological work in the field are still at an early stage. This session represents an important milestone in the dissemination of the results of the University of California Office of the President's At-Risk Cultural Heritage and the Digital Humanities project that is a collaborative research effort by four University of California campuses (San Diego, Berkeley, Los Angeles and Merced). This session is non-site and non-era specific and aims to bring together members of the archaeological community with technologists and heritage preservationists to discuss best practices and sustainability for the following main areas of interest: (i) digital documentation and analysis; (ii) online data curation; (iii) dissemination through hybrid print-digital publications and 3D scientific visualization (personal and large-scale Virtual Reality (VR)), and (iv) outreach in libraries and archaeological museums using visualization and computer graphics.

[173] Symposium · THE TIES THAT BIND AND THE WALLS THAT DIVIDE: PREHISTORIC TO CONTEMPORARY MAYA MANIPULATION OF SOCIAL SPACE

Boundaries define who we are, who we are not, and what we are and are not responsible for. At the same time, features that have been modified for transportation are symbolic of economic and political interactions. This symposium will focus on how ancient, historic and contemporary people living in the Maya region demarcated the use of space and formalized their landscapes with architectural features such as causeways, boundary walls, canals, plazas, and railways. It will also examine how interstitial communities related to major polities.

[174] Symposium · THE HUMAN ODYSSEY IN EARTH'S HIGH MOUNTAINS AND PLATEAUS

Mountain environments present humans with striking adaptive challenges, yet they also offer opportunities. That our genus pursued these is attested by widespread archaeological residues in such settings from pre-Middle Stone Age African populations, Neandertals and of course modern humans. Cross-cultural comparative research into montane hunter-gatherers in prehistory has focused on the settlement of expanses of contiguous high elevation terrain—the world's 'high plateaus.' But plateau peopling represents one chapter in a longer evolutionary story of when, how and why ancient people engaged with uplands, a history spanning hundreds of millennia, multiple hominin taxa, and most continents. To date, little effort has gone towards investigating the full variability of montane forager lifeways through time and space. This symposium brings together archaeologists and biological anthropologists studying hunter-gatherer biocultural adaptations in diverse upland settings across the globe. The presentation and discussion of new empirical data alongside novel methodological approaches and theoretical insights will help isolate key sources of variability that underwrote specific behavioral and biological records of montane adaptation. By exploring the timing, motives and modes of montane exploitation, we aim to elucidate the evolutionary processes by which our genus engaged with upland landscapes with increasing frequency and intensity.

[175] Symposium · URBANISM, PRODUCTION, AND EMPIRE: NEW CASE STUDIES FROM ANGKORIAN CAMBODIA

As populations move from rural to urban areas, understanding the processes of urbanization, regional networks, and production is critical for the continued existence and growth of communities today in urban and rural contexts alike. We investigate these themes through archaeological case studies from Angkor, Cambodia, one of the largest low-density urban complexes in the pre-industrial world. Recent archaeological investigations and remote sensing projects have revealed an expansive urban landscape with a long and complex history of occupation. In this session, we consider new lines of evidence on the themes of production, urbanism, and empire that contribute to inter-regional dialogs on the study of urbanism in the ancient world.

[176] Symposium · MAYA HIGHLAND AND PACIFIC COASTAL ARCHAEOLOGY: CONTINUING DEBATES ON INTERACTION

This symposium presents recent archaeological investigations on regional and interregional interaction in the Highlands and

Pacific Coast of Guatemala and Chiapas, a complex region of Mesoamerica. Studies using technologies such as isotope analysis, instrumental neutron activation analysis, and least cost routes applications of GIS are providing in depth analyses of the dynamic interactions of centers and nodes on routes of travel. In this symposium, case studies drawn from coastal and highland regions, will serve to highlight interregional exchanges while also focusing attention on key themes such as: economic systems, ideological and political evolution, migration, cultural stability and change, and identity. Researchers will discuss the theoretical, methodological, and technical approaches they are using to address these topics and present new data derived from recent analyses of material culture, sculpture, architecture, and settlement patterns. The symposium will serve to update scholars from neighboring areas of Mesoamerica on recent research, and will also stimulate increased communication, collaboration, and data-sharing among regional specialists.

[177] Symposium · WHAT'S HOT IN PYROTECHNOLOGY? CONTROLLING FIRE FROM CAMPFIRES TO CRAFTSPEOPLE

The defining characteristic of humanity was long thought to be the manufacture and use of tools. Toolmaking, though, has since been observed in not only other primates but also birds, otters, and octopi, among others. Making fire, however, remains an exclusively human skill. Much of our technology can be conceptualized in terms of the control of fire: pyrotechnology. Until recently in human history, the development of new technologies and materials depended on people attaining and controlling greater and greater temperatures. This process began more than one million years ago as the emergence and spread of our species depended on fire for warmth, cooking, and protection. Later we used fire to treat stone and wood implements and to create adhesives to join them together as compound tools. Baked clay eventually followed, as did ceramics, metals, faience, glass, and other substances upon which civilization was built. Additionally, fire is cross-culturally used ceremonially, and it is ascribed a variety of symbolic meanings. This session, organized by the Yale Initiative for the Study of Ancient Pyrotechnology, considers how our increasingly sophisticated control of fire, as evidenced in the archaeological record and in material culture, sparked behavioral, cultural, and societal complexity around the world.

[178] Symposium · NO LONGER A TRANSITIONAL ZONE: LOCAL DEVELOPMENTS, INTERACTION, AND EXCHANGE IN THE CEJA DE SELVA

The archaeology of the ceja de selva or eastern Andean slopes has long been framed by the region's position between the highland Andes and the Amazon lowlands. Largely understudied, scholars have typically regarded the region as either a barrier or conduit for highland-lowland interaction. However, recent investigations show that the ceja was not simply a transitional zone but rather a locus of complex cultural developments that occurred "in relation to" and "independent from" contemporary phenomena in adjacent coastal, highland, and tropical lowland environments. Similarities in material patterning from Ecuador to Bolivia suggest that autonomous ceja de selva societies were integrated within long distance intraregional interaction networks which potentially impacted local cultural change. These networks were oriented around rivers such as the Marañón and Huallaga which facilitated the movement of people, resources, and ideas. Unfortunately, understanding these relationships has often been hindered by models that emphasize highland or lowland developments, and either ignore the ceja, or treat it as a transitional environment exploited for resources. By analyzing ceja de selva societies as autochthonous and linked by intraregional and interregional interaction, this symposium aims to better understand ceja de selva cultural developments and their participating roles in the rise of Andean Civilization.

[179] Symposium · ARCHAEOLOGY, HISTORY AND OSTEOLOGY OF A 19TH CENTURY MEDICAL WASTE DEPOSIT AT POINT SAN JOSE, SAN FRANCISCO

In October 2010, while monitoring lead remediation efforts around the former Army hospital (1863–1903) at Point San Jose (now Fort Mason), California, archaeologists discovered a pit containing human remains. Further excavation of the feature revealed a plethora of waste material from the hospital in addition to the commingled skeletal elements of at least two dozen individuals. Recent historical research on the Point San Jose hospital and its staff and osteological analyses of the human remains, provides insight into the origin of the human remains and the surgeon responsible for their disposal in the pit. This symposium provides background concerning the history and archaeology of the discovery, and analysis of artifacts. Osteological assessments include skeletal element representation, paleodemography, stature, stable isotope analysis, paleopathology, and taphonomy. Although other possible explanations exist, the skeletal remains most likely represent discarded remains following anatomical dissection. The Point San Jose deposit offers extraordinary perspectives on late 19th century-era medical understanding, knowledge, practices, and education as well as the cultural context in which bodies were acquired for dissection.

[180] Symposium · METHODOLOGY AND INTERPRETATION IN THE ARCHAEOLOGY OF ROCK ART

In the pursuit of innovative instrumental technique, enhanced interpretive insight, and successful approaches to preservation, this Rock Art Interest Group sponsored symposium is intended to provide a context within which recent archaeologically informed rock art research can be shared. For the purposes of the session, the discussion of method will be just as welcome as the description and interpretation of the art itself. The symposium is without geographic or temporal restraint.

[181] Symposium · MATTERING IMPERIAL POLITICS: HUMAN-THING PARTNERSHIPS IN LOCAL PRODUCTIONS OF POWER

The material turn, involving a re-awakened interest in the role of things in the constitution of the social, has been naturally and productively embraced by archaeology. To date, however, many archaeological studies that identify with this turn have focused more on the symbolic and communicative role of things, e.g., what they mean, rather than on the pragmatic and political dimensions of what they do and how they do it. The papers in this session aim to analyze the political work of things in the context of early imperial ambitions and maintenance. They take as their point of departure the idea that power does not exist as an abstract, a priori concept but rather is constituted, registered, and enacted materially through a heterogeneous mix of human and non-human actors. Together session contributors offer a broad comparative investigation into how assemblies of people and things worked collaboratively at the local level to make and unmake political power. Admitting things as key players in the constitution of imperial practice promises new insights into how state power was conceived, enacted and sustained across different times and places.

[182] Symposium · 2018 FRYXELL AWARD SYMPOSIUM: PAPERS IN HONOR OF VANCE T. HOLLIDAY*(SPONSORED BY FRYXELL AWARD COMMITTEE)*

Vance T. Holliday is the 2018 recipient of the Fryxell Award for Interdisciplinary Research in archaeology. The Fryxell Award is presented in recognition for interdisciplinary excellence of a scientist who need not be an archaeologist, but whose research has contributed significantly to American archaeology. The award is made possible through the generosity of the family of the late Roald Fryxell, a geologist whose career exemplified the crucial role of multidisciplinary cooperation in archaeology. The 2018 Fryxell Award recognizes a scholar who has made significant contributions in the application of earth sciences to archaeology. It is fitting that Vance T. Holliday is the recipient, for few figures have in the last four decades been as prominent or prolific in contributing to North American geoarchaeology. Although best known for his meticulous stratigraphic and soil geomorphic work at Paleolithic sites on the High Plains, Holliday's substantive and methodological contributions span continents, and a range of Quaternary geological, geochronological, and archaeological settings, questions, and even a few controversies. In this SAA Fryxell Award symposium, we explore a range of topics that reflect and were inspired by his outstanding interdisciplinary research in support of archaeological questions.

[183] Symposium · WHAT TO DO WITH THE INTANGIBLE AND TRANSIENT: HISTORIC PROPERTIES THAT CHALLENGE TRADITIONAL RULES FOR EVALUATING SIGNIFICANCE AND INTEGRITY

Cultural resource professionals encounter a range of historic property types over the course of their careers. Certain historic property types, such as cultural landscapes and traditional cultural properties, may contain no observable evidence of human activity. Others, such as historic mining sites and historic trails, while textually-documented, were only temporarily used, abandoned, and physical evidence faded. Each historic property of this type is unique and provides challenges when evaluating its significance and integrity. This symposium provides different case examples for critical reflection.

[184] Poster Session · CHRONOLOGY**[185] Poster Session · BIOARCHAEOLOGY: THE OLD WORLD****[186] Poster Session · LITHIC ANALYSIS IN NORTH AMERICA****[187] Poster Session · ZOOARCHAEOLOGY: THE AMERICAN SOUTHWEST****[188] Poster Session · ZOOARCHAEOLOGY: MIDWEST TO THE EAST COAST****[189] Poster Session · ZOOARCHAEOLOGY: GLOBAL APPROACHES****[190] Poster Session · ARCHITECTURE, URBANISM AND MONUMENTALITY IN THE AMERICAS****[191] Forum · THE STATE OF INCLUSION: DIVERSITY IN NON-ACADEMIC ARCHAEOLOGY***(SPONSORED BY SAA QUEER ARCHAEOLOGY INTEREST GROUP)*

While archaeology's future seems to be grounded in diversity, with ever-increasing calls for multidisciplinary research approaches, this relates more to theoretical and methodological approaches—ideas—than it does to the archaeologists themselves. As an interpretive discipline, the views and experiences of archaeologists undoubtedly frame our understanding of the past. Consequently, having diverse archaeological practitioners is equally as important as having diverse methodological and theoretical approaches. Despite the fact that most archaeologists are employed by CRM firms, government agencies, museums, or community-based institutions, much of this discussion has occurred within and around academic environments. This panel will focus its discussion on how we can bring diversity to the forefront of non-academic archaeological practice by considering the following questions:

- What does inclusive archaeology look like when the work is client-based?
- How do we diversify the discipline, particularly in the areas of CRM, government, and museum archaeology?
- How do people's experiences of racism, homophobia, and sexism influence whether or not they pursue professional archaeology?
- What programs and initiatives are currently in place that focus on outreach and education to minority groups?

The panel will encourage the audience to discuss these questions and generate ideas about how to make archaeology a more inclusive, engaged community.

[192] Forum · SETTLEMENT, RESOURCE DISTRIBUTION, AND SUBSISTENCE IN COASTAL MESOAMERICA: INTERREGIONAL COMPARISONS

This forum focuses on the relationship of settlement patterning in Mesoamerican coastal environments to the distribution, use, and acquisition of subsistence resources. By including interdisciplinary data from across Mesoamerica, we seek to facilitate a comparative discussion on the reliance of coastal populations on aquatic versus agricultural resources. Researchers have found that Mesoamerican societies were more likely to depend on marine and estuarine fauna such as fish and shellfish before the Late Formative, when growing populations often moved inland. Such scholars assert that alluvial settings contained fertile soils with a higher surplus potential than estuarine habitats. Challenging this view, other scholars stress the abundance and protein values of

estuarine species. We will problematize this debate through three overlapping topics. First, to what extent have disciplinary biases underemphasized coastal productivity and settlement (c.f. Erlandson and Fitzpatrick 2006)? Second, are these biases linked to the obfuscation of coastal land use evidence via environmental changes (e.g., sea level rise or hurricanes)? Third, what potential factors contributed to variation in subsistence and settlement on Mesoamerican coasts? We will discuss factors such as estuarine ichthyofauna, coastal geomorphology, trade, boating technologies, and political shifts.

[193] Forum · NEW PERSPECTIVES ON HERITAGE PROTECTION

As documented by many videos posted on the Internet and other information sources, the cultural heritage of the United States, both terrestrial and submerged, is being lost at an alarming rate. There are the pat answers to the question of why this occurs such as the number of sites, the level of collector interest in the objects they contain, insufficient law enforcement and prosecutorial efforts, and the need for more and better public education. Answers like these and the solutions they generate have not solved the problem. Alternatively, there may be new perspectives on the cultural heritage depredation problem and, if so, they may suggest new and innovative approaches to preventing it. To deal with this situation, it may be necessary to address issues such as why many Americans disrespect other cultures, past and present, and believe they are entitled to damage and destroy the heritage of these cultures and why the views of Native Americans, other descendant groups, or responsible citizens apparently make so little difference to those who engage in these actions. The question of new perspectives on cultural heritage protection will be posed to a panel of representatives of the archaeological, Native American, and legal communities.

[194] Forum · ARCHAEOLOGY, OUTREACH, ADVOCACY, AND THE MEDIA

The goal of archaeology is to reconstruct the past. Inevitably the question arises as to whose past is being interpreted and who has the right to interpret it, and the discipline has sought ways to address those questions with the help of communities invested in that knowledge and of the media. Archaeologists now form part of the different communities invested in access to knowledge of the past where these communities seek to advocate for different voices to be heard. How these communities interact with the public and the role that broadcast, print, and social media play in those interactions is the focus of this proposed forum where members of the media, archaeologists, and stakeholder of the past communities share their thoughts to start a conversation about these communities' goals and expectations from each other and from the public, and how those goals and expectations play out on public medium forums and how these translate into other forms of civic advocacy such as activism, lobbying, legislation, and program implementation.

[195] Symposium · ECOLOGICAL JUSTICE AND THE LONGUE DURÉE: EXPANDING ACTIVISM, ADVOCACY, AND THE HISTORICAL ECOLOGICAL APPROACH

(SPONSORED BY NEW INTERNATIONAL COMMUNITY FOR HISTORICAL ECOLOGY [NICHE])

This session explores how archaeologists are using the historical ecology research program to guide their research design, praxis, and ontologies with a focus on improving our ability to contribute to social justice initiatives. It is clear that ecological degradation, including climate change, has not and will not affect all people equally due to structurally uneven access to social safety nets, mobility, knowledge, and political representation. Furthermore, sites of deleterious resource extraction are loci at which inequalities (in shared risk, representation, and benefit) are starkly experienced. In the spirit of the historical ecology framework, we call for papers that deal with the long-term roots and intersectional character of resource justice issues. We encourage contributors to share models for activism, advocacy, and improved collaboration demonstrated through social organizing, policy work, and knowledge production partnerships. Finally, we welcome critical challenges for academic structures and traditions of thought. The ultimate goal is to generously share and absorb perspectives that will improve archaeologists' abilities in advocacy and activism across the academic divide.

[196] Symposium · RE-CENTERING THE PERIPHERY: CONTEXTUALIZING THE FRINGES OF CONTEMPORARY ARCHAEOLOGICAL PRACTICE

What makes a periphery? In modern archaeological practice, certain regions and areas of study have been treated as peripheral to more central phenomenon. A considerable amount of literature since the 1990s has problematized unidirectional and monodimensional models of interregional interaction, premised on migration, diffusion, world-systems, state expansion, empire building, and more. However, despite considerable critique and increasing engagement with multidirectional and multi-scalar models for such interactions, many regions and moments in time remain outside traditional archaeological focus. This session examines areas of archaeological research that have been pushed to the margins of the discipline. Crossing chronological and regional boundaries, the papers presented here offer a global perspective on the causes and effects of disciplinary peripheralization in theory and practice. By more fully exploring the "peripheries" of human history, we can correct the interpretive biases that we create through the questions we ask and build more inclusive historical narratives.

[197] Symposium · PRIVATE RITUALS AND PUBLIC SPACES: THE ARCHAEOLOGY OF BELIEF AND PERFORMANCE

Ritual is often conceived of as a community effort, used to reinforce social structures, cultural mores and traditions, yet the variation between regions, shrines, burials and ritual spaces demonstrates that within the group, variation was often permitted. These variations allow for glimpses into the role of the individual and the flexibility of a culture. The regulation of ritual is a key aspect of social cohesion and status reinforcement, so what does it imply when there are variances in the performance of the ritual? Personal belief may diverge from public rituals as evidenced in burials and votive deposits, but are often included beneath the umbrella of the broader cultural norms. Rituals are represented in constructed spaces, feast refuse, burials, and votive deposits, all of which are conceptualized as reflecting an entire community, while being conducted by only a select number of individuals—making private belief a public ritual. This session will examine how rituals conducted in public spaces impact individual and group identity by examining ritual performance across social and geographic contexts.

[198] Symposium · THE RISE AND FALL OF THE AFRICAN HUMID PERIOD: CLIMATE CHANGE AND HUMAN RESPONSE IN HOLOCENE AFRICA

Modern climate change is fundamentally shaping our global social and economic future. Understanding its potential impacts requires looking to the past. While geological and climatological approaches reconstruct the physical impacts of climate changes,

archaeology is uniquely capable of evaluating their relations to social change. Africa's Holocene archaeological record offers an important perspective on human responses to some of the most extreme climatic fluctuations of the last 12000 years, beginning with the onset of the African Humid Period when lakes and rivers covered the Sahara, through the rapid return to aridity across many parts of Africa ~5500 BP. These shifts presented sequences of challenges to the diverse hunter-gatherers, farmers, and herders that coexisted across much of Africa. This session examines the ways in which societies across Africa responded to local environmental manifestations of larger Holocene climate changes, and the long-term legacies of both successful and unsuccessful responses. Papers will present new data-points and advances in relevant methods. We especially hope to develop theoretical approaches for studying the archaeology of climate change in the uniquely diverse social and economic contexts of Holocene Africa. While these discussions are of global significance, this session highlights emerging impacts of anthropogenic climate change in contemporary Africa.

[199] Symposium · MAKING MORE WITH LESS: REFLECTIONS AND NEW APPROACHES TO THE PROTOHISTORIC PERIOD IN THE NORTHEAST

Until 1990, with the introduction of NAGPRA, investigations of the Protohistoric Period (1500–1630) in the Northeast primarily focused on burial contexts stemming from 19th-century excavations. NAGPRA has been a significant, positive step towards a framework of respectful collaboration between Indigenous communities and archaeologists, but the amount of researchable materiality associated with this time period has significantly decreased due to repatriation. Contemporary researchers do not have access to the material upon which now outdated understandings of the Protohistoric Period are based and have struggled to find new approaches to the period. New theoretical perspectives are being applied to current Protohistoric research and are helping to define and interpret archaeological assemblages from the period as well as the ethnohistorical documentation. The introduction of ontological perspectives has provided new approaches to topics such as: change and continuity, memory, practice, hybridity, and sacred ecology. These new insights are allowing researchers to proverbially “shed new light” on this period by employing perspectivist approaches. By examining the current archaeological, ethnohistoric, and ethnographic collections ontologically, researchers are able to expand and provide further detail to the interactions between Indigenous Peoples and Europeans during the Protohistoric Period.

[200] Symposium · PALEOLITHIC SURFACE SITES: NEW SURVEYS, METHODS, AND DATA

Lithic Surface Sites are an ubiquitous but underutilized source of information about human foraging patterns, site formation processes, and landscape use. This symposium highlights new approaches to analyzing Lithic Surface Sites, with an emphasis on material from the Paleolithic. Researchers will present results from new surface surveys and discuss specific procedures for analyzing taphonomic effects on lithic surface material, survey methodology, and different lithic analytical techniques that can reveal important data about human behavior.

[201] Symposium · BEYOND ENGAGEMENT: ARCHAEOLOGISTS AT THE INTERSECTIONS OF POWER

In recent years, “engagement” has become a byword for archaeologists seeking to practice in ethical ways and many archaeologists currently seek to engage and partner with communities and the public. At the same time, archaeology is recognized as a powerful tool by governments, organizations, and communities around the world. Many of these groups seek to use archaeology for their own political purposes: to justify nationalism, to legitimize seizures of territory, and to assert certain historical narratives and rights. An archaeologist's commitment to engaged, ethical archaeology may prepare them to grapple with manifestations of colonialism and privilege, but what happens when that very ethics requires them to push back against the groups they hope to engage? How do archaeologists negotiate the practical issues that arise out of conflicting needs and desires by various stakeholders? This session explores how an ethics of engaged archaeology intersects with the dynamics of contemporary politics. In an age of rising, insular nationalism, “engagement” and “reflexivity” are insufficient guidelines when the archaeologist is situated within shifting and cross-cutting political dynamics. This session reflects this difficult position while attempting to chart a way forward for an ethical archaeology that recognizes archaeologists' position at the complex intersections of power.

[202] Symposium · WE DIG NATIONAL PARKS: THE PAST, PRESENT, AND FUTURE OF ARCHEOLOGY IN THE NATIONAL CAPITAL REGION

This session focuses on archeological research of the National Park Service National Capital Region which includes the greater Washington D.C. Metro Area. Through the presentation of a variety of case studies ranging from the precontact to the historic era, this session highlights the role the National Park Service plays in the excavation, preservation, and management of archeological resources in region. Underlying these presentations is an archeology of practice which promotes the narrative of our nation's heritage and its preservation.

[203] Symposium · THE CONNECTICUT STATE ARCHAEOLOGICAL PRESERVE PROGRAM: PROTECTION, PRESERVATION, AND PUBLIC OUTREACH

Connecticut is one of the few states that has a formal State Archaeological Preserve Program. That program was a legislatively-crafted initiative that provides public-private coordination for the recognition and preservation of the state's diverse archaeological heritage. The law creating the program is supplemented with significant penalties for vandalism or un-permitted collecting of archaeological materials from a listed preserve. Since its inception in 2000, 37 archaeological sites have been added to the list of State Archaeological Preserves. With public education and outreach in mind, funding has been provided by the state, supplemented by monies from local historical societies and environmental groups, for the publication of more than a dozen twenty-four-page color booklets, each focusing on one of these sites. This symposium will provide additional details about the State Archaeological Preserve Program and include presentations on a diverse sample of the individually designated sites.

[204] Symposium · BONES AND BURIALS IN PHILADELPHIA: UNMARKED CEMETERIES & THE ARCH ST PROJECT

Early American colonial settlements along the Eastern seaboard largely buried their dead inside the city's boundaries in much the same way as their European contemporaries. In cities such as London, Paris, and Rome it is not uncommon for modern urban construction projects to unearth human remains from burial grounds long forgotten. When this happens local and national

regulations dictate the process by which such remains are removed, studied, and reburied. In contrast, US cities often have no formal process and federal regulations do not address private development projects occurring on privately owned land. Nowhere is this more apparent than in Philadelphia, a city of cemeteries. When human remains were discovered at 218 Arch St the lack of regulation and legal precedent enabled a private developer to avoid conducting a salvage excavation of the burial ground until media pressure and concern from local archaeologists made it obligatory. This session will address the issues surrounding unmarked cemeteries in the Philadelphia region. We will examine the Arch St Project as an example of the pitfalls and research potential stemming from such projects including some of the preliminary findings from the site.

[205] Symposium · BLURRING TIMESCAPES: SUBVERSIONS TO ERASURE AND REMEMBERING GHOSTS

What happens when the memories of a place, people, and events are systematically erased, forgotten, and covered? How are the stories we tell shaped by the memories we have forgotten? A growing body of theory is emerging in the Social Sciences that focuses its inquiry on what might not be seen—on dimensions past what is recognized as traditionally empirical. This session seeks to explore and synthesize those growing bodies of theories and methodologies related to the discourses of Memory. Presenters examine the entangled and interrelated concepts of memory, materiality, nostalgia, trauma, and haunting. This collection of research critically evaluates perceptions and interpretations of the past and their impacts on the present. Contributors expose hidden narratives and examine the social mechanisms operating and organizing what is remembered, and what is lost to time. Others consider the material residues of remembering, how objects and their meaning transcend time and sometimes space. Researchers in this session take an activists stance, recognizing the emotional nature and empathy that can be evoked by the past.

[206] Symposium · CONNECTING COLLECTIONS: COLLECTORS OF PRE-COLUMBIAN AND INDIGENOUS AMERICAN ART IN THE AMERICAS AND EUROPE

This session examines the role of collectors of Pre-Columbian and indigenous American objects in the establishment of private and public collections in the Americas and Europe. Papers may address evidence of collecting during the Pre-Columbian era (e.g., as evidenced by Preclassic Olmec works found at the Mexica Templo Mayor) or collecting that initiated during the colonial period leading up to today. Speakers may also consider examining the formation and biography of particular collections, how they were assembled but also how they might have eventually been dispersed. What artworks and objects were deemed worthy of being collected and saved? Which were eventually purged from collections? What else did collectors of Pre-Columbian and indigenous American art collect? In which types of museums are these collections eventually housed and what how do they become recontextualized during the process of institutionalization? Or in exhibitions? What were the relationships between dealers and collectors? What is the relationship between looting and collecting (can be seen also from a historical perspective)? Can we reunite divided collections that ended up in different museums and continents by creating shared digital platforms? How have collections formed our understanding of indigenous art and culture in the Americas?

[207] Symposium · AYLLU THERE? HERDERS, FARMERS AND THE FORMATION OF COMMUNITY IN THE ANDEAN HIGHLANDS

The primary object of the session is to study the community—and the concept of the ayllu—in the Andean highlands. In brief, the ayllu has long been used as shorthand for community in the Andes, yet the parameters of the term—spatially, diachronically and culturally—have often been disputed. Here, we address the scope and limitations of this term in regards to cultural development, as well as archaeological analysis in the highland regions of the central Andes.

In this session, we focus primarily, but not exclusively, on the Late Intermediate Period (AD 1000—1450), examining what constitutes the community across the Andean highlands. In particular, we examine the role played by herders and farmers in the creation of community, and how the social and economic organization of these activities may have impacted the formation of such communities. The Late Intermediate Period is also seen as a period in which there was an increasing economic specialization by farmers and herders. This session includes contributions from the Central Andes—were the term ayllu has been most employed—as well as from other regions, including Ecuador, Bolivia, Chile and Argentina.

[208] Symposium · THE ARCHAEOLOGY OF “PROLETARIAN DRUG FOODS” IN THE CARIBBEAN

Sugar, coffee, and rum, what Sidney Mintz referred to as “proletarian drug foods” of the Caribbean, have had global socio-economic, political, and environmental impacts. The production, consumption, and exchange of these commodities from the late 15th century onwards quickly infiltrated the European social sphere. In the 17th century, the production of these commodities increased at a time when dispossessed European laborers were transformed into the new urban proletariat. Dubbed earlier as the “Commercial Revolution,” the expansion of these commodities directly altered the fabric of life across Africa and the Circum-Caribbean. Sugar, coffee, and rum were also influential in forming new European modes and ideas regarding capitalism and industry in the 18th century. This session seeks to evaluate how these products transformed from the exotic to the “...daily fare of even the poorest and humblest people” (Mintz 1985:6). How did the ever-increasing economic demand for such products alter the lives of enslaved Africans, alter the Caribbean landscape, and contribute to contemporary colonial legacies across the Caribbean? Session participants will draw from original archival, archaeological, and geoarchaeological research to explore the changing roles of these products and their differential impacts on societies, economies, and environments over time.

[209] Symposium · LOOKING TO THE EAST: CLASSIC MAYA LEGACIES IN ANCIENT MESOAMERICA

Traditionally, Mesoamericanists have focused on questions from the viewpoint of major Central Mexican metropolises such as of Teotihuacan and Tula, which dominated much of the cultural landscape of Mesoamerica over time. However, it has become increasingly clear that influence moved in multiple directions. As noted by Eduard Seler over a century ago, Nahua ethnohistories such as the Codex Chimalpopoca refer to the cultural region of the Maya as Tlilan Tlapallan, a land of writing and high art. In addition, archaeological evidence points to sustained artistic contact between Central Mexico and the Classic Maya kingdoms from as early as the Classic Period. While the geographic region of the Maya is famously known for its jade, cacao, rubber, copal, and tropical bird feathers, the peoples of these regions also actively participated in the borrowing and lending of artistic knowledge. This session will examine the legacy of Classic Maya art and culture within the wider cultural sphere of Mesoamerica, both in contemporary cultures and later peoples who inherited and innovated upon the complex visual artistic vocabulary

established in these earlier periods.

[210] Symposium · SPATIAL APPROACHES IN AFRICAN ARCHAEOLOGY: CURRENT THEORIES, NEW METHODS

(SPONSORED BY SOCIETY OF AFRICANIST ARCHAEOLOGISTS)

The social production of space has emerged as a significant theme in African archaeology and heritage studies over the past two decades. From local houses, to regional landscapes, to global entanglements, the spatial relations among people, places, and things at these multiple scales offer increasingly nuanced perspectives on cultural change and continuity both past and present. Meanwhile, a growing suite of spatial archaeometric techniques—including geographic information systems (GIS), satellite remote sensing, aerial and UAV imaging, laser scanning, and geophysical prospection—have become ever more valuable tools for documenting, interpreting, and preserving archaeological resources. The time thus seems ripe for a critical conversation among Africanist scholars about the ways in which we integrate geospatial analysis into our research. In this session we propose to explore the current interplay between spatial archaeometry and socio-spatial theory through case studies from historical and geographic contexts across Africa. By focusing on issues of practice, interpretation, and ethics, this session seeks to inform colleagues about the possibilities and challenges of integrating geospatial technologies with archaeology and heritage studies on and beyond the continent.

[211] Symposium · THE EMPIRE STRIKES BACK: NEW DATA ON WARI IN MIDDLE HORIZON PERU

Recent research on Wari imperialism from across Peru reveals both the diversity of local strategies of negotiation as well as the cases that demonstrate the imprimatur of Wari imperial influence. These papers interrogate the nature of Wari expansion and the role local communities played in creating a Wari empire. At the same time, they question attempts to characterize Wari as something uniquely Andino or to dismiss comparative perspectives on imperialism in the case of Wari. Rather, many firmly establish the case that Wari is an excellent exemplar of a first generation empire that drew on diverse sources of power to provide a political longevity over a broad area unparalleled in the prehispanic Andes.

[212] Symposium · INNOVATIVE APPROACHES TO HUMAN-CANINE INTERACTIONS

Human-animal relationships are a window into the daily lives of people in the past. Interactions with animals are ubiquitous across place and time in human history. Canids found in the archaeological record enrich interpretations about human and environmental interactions in the past. Papers presented in this symposium speak to the many directions research is taking to better understand the human-canine connection. Authors will present research that employs advanced interdisciplinary methodology to tackle varying questions about canids and their perceived interactions with humans across diverse geographic and temporal settings.

[213] Symposium · THE INTERSECTION OF SUSTAINABILITY AND CLIMATE CHANGE IN TROPICAL SOCIAL SYSTEMS

This session is part of a long-term agenda of analyzing the resilience of cultural life in tropical regions. Low-density urbanism, forest agriculture and 'gardens,' sustainable forest removal and regrowth, and the impact of climate change are key issues, especially with regard to the impact of changing climate on current sustainable practices. These topics address UN 2030 sustainability goals: sustainable management of water, consumption and production; resilient and sustainable cities; protect global heritage; sustainable use of ecosystems; forest management; decrease desertification, land degradation and biodiversity loss; and confront climate change impacts. What has been sustainable for millennia may be flexible enough to continue or may need re-evaluation in view of global temperature increase. For instance, with tropical belts expanding, new tropical regions will need to look to their tropical neighbors for guidance on future necessities. This session will present cases worldwide, derived from the archaeological record of tropical regions and discuss them in relation to policy issues in the modern world. The emphasis of these case studies is on sustainability and the impact of climate change; through which researchers should offer insights into past human behaviour that have relevance both for the past, and for today's issues in the tropical world.

[214] Symposium · ADVANCES IN ROCK-ART ANALYSIS: FROM PORTABLE INSTRUMENTATION TO NEW INTERPRETATIONS

Recent advances in portable technologies has opened up new interpretative vistas of rock art worldwide. From portable analytical instrumentation such as X-Ray Fluorescence, Raman, and FTIR along with imaging approaches such as dStretch, Reflective Transformation Imaging, and microscopic analyses, to a suite of innovative techniques analysing associated archaeological, geochemical, botanical, and archaeo-astronomical features, the study of rock art is advancing in leaps and bounds. Add in the increasing importance of digital, 3D, and Virtual Reality modelling for research, heritage, and dissemination purposes, and we can see that the future of rock art research will entail integrating many of these technological and methodological improvements into powerful interpretative and educational outputs. At the same time, each of these approaches has its own challenges and limitations. This session presents a series of case studies exploring how applying and even integrating new technologies and techniques can transform our understanding while considering the current limits and future possibilities of rock art research.

[215] Symposium · CELEBRATING LYNNE GOLDSTEIN'S CONTRIBUTIONS TO ARCHAEOLOGY OF THE PAST, PRESENT, AND FUTURE

Over the past four decades Dr. Lynne Goldstein has provided important theoretical and methodological contributions to mortuary archaeology and innovative insights into social organization through the analysis of space and place; significantly enhanced ethical dialogues within the discipline through her exemplary service, teaching, and research; furthered archaeological knowledge about the North American mid-continent; and been at the forefront of the evolving role of digital technology in public archaeology and cultural heritage studies. Now, at the inception of a new chapter in an illustrious career, colleagues, friends, and students gather to celebrate her impact on archaeology. The papers in this session demonstrate the depth and breadth of Goldstein's significant influences on the discipline of archaeology.

[216] Symposium · GENDER AND POWER ON THE NORTH COAST OF PERU

Given the extraordinary wealth and variety of data available, the North Coast of Peru offers an ideal context in which to study continuities and changes in the intersection of gender and power across millennia. While sustaining an underlying core of cultural continuity, this region was buffeted by a whole host of “natural” (e.g., earthquakes, ENSO flooding, droughts) and “human” (war, conquest) disruptions that led to disjunctions in practice as well as ideological and structural changes across time. Although traditionally many see gender and power as inextricably linked, we explore the validity of this of this notion more generally as well as the variety of ways in which this relationship was conceptualized, expressed, and practiced. The papers in this session draw on the rich domestic, spatial, mortuary, bioarchaeological, iconographic, and ethnohistorical data to consider gendered patterns of access to power, gender as a mechanism of control, and the role of gender in the ideological bases of power, among other topics. The availability of detailed, complementary data sets allows contributors to go beyond gender binaries to consider the evidence for multiple genders, gender inversion, and gender fluidity in both individual and normative cases.

[217] Symposium · IN THE SERVICE OF A GREATER GOOD: BROADER APPLICATIONS OF ZOOARCHAEOLOGY IN THE ERA OF INTERDISCIPLINARY RESEARCH

(SPONSORED BY SAA ZOOARCHAEOLOGY INTEREST GROUP)

In the pursuit of studying human-animal interactions in the past, zooarchaeologists have developed a range of analytical and methodological techniques used to extract meaning from archaeological animal remains. Zooarchaeology, however, is only one of many possible avenues of research into the past. Ironically, in the era of inter-disciplinary research, methodological and epistemological advances made by various archaeological subdisciplines, including zooarchaeology, are rarely combined and discussed collectively, as specialists overwhelmingly interact with peers in their own subdisciplines. In this session, we place zooarchaeology at the center of our anthropological and archaeological milieu to examine how zooarchaeological techniques and approaches can be made relevant beyond the more immediate reconstructions of human-animal interactions. Some issues to consider include: combining and reconciling zooarchaeological approaches with prevalent methodologies in other subdisciplines to produce more holistic and compelling narratives of the past; deploying zooarchaeological analyses as independent tests of inferences made based on other lines of evidence like ceramics, lithics, metals, botanical remains, etc.; using our understanding of human-animal interactions and animal behavior and physiology as the basis of investigations into settlement patterns, site occupation intensities, and patterns of mobility and migration; and using taphonomic histories of animal remains to assess greater site formation processes.

[218] Symposium · LEARNING FROM HOMOL'OVI: PAPERS IN HONOR OF E. CHARLES ADAMS AND RICHARD C. LANGE

This session celebrates archaeological research and public outreach in the Homol'ovi area of northeastern Arizona under the leadership of E. Charles Adams and Richard C. Lange. For more than three decades, Adams and Lange created foundational learning opportunities for dozens of professional archaeologists, as well as hundreds of volunteers and Hopi community members. The excavation techniques and recording procedures practiced by Adams and Lange have had an important impact on archaeological theory and methodology in the U.S. Southwest and beyond. Papers in this session highlight the influence of Adams and Lange, as well as the scale and diversity of information generated as a result of their work. Their contributions have enhanced understandings of settlement aggregation, the ritual closure of structures, and landscape use. Their efforts also demonstrate the benefits of public archaeology, experimental archaeology, and the integration of indigenous perspectives in archaeological research. The papers in this session speak to the impact of Adams' and Lange's work on archaeological research, as well as their personal influence on students and colleagues.

[219] Symposium · MOBILITY AS HUMAN-ENVIRONMENT INTERACTION

(SPONSORED BY HOMININ DISPERSALS RESEARCH GROUP)

This symposium takes a new approach to looking at human mobility through the lens of human-environment interactions by thinking of mobility as adaptation. The theme of Human—Environment Interaction encompasses aspects of human adaptation, environmental response, and environmental change through biological, behavioural, and technological means. Mobility as human-environment interaction combines a growing body of interdisciplinary and positivist approaches into a range of topics including but not limited to processes of human dispersal, ecological resilience, population dynamics, niche-construction and landscape approaches. This symposium will highlight an array of methodologies and regional studies in Old and New World archaeology that are concerned with the causes and contexts of human mobility within the coupled interactions of environmental and human social systems. Our objective is to bring together researchers that employ agent-based simulation, paleoenvironmental modelling, geographical information systems, landscape theory, and morphological analyses as we explore two key questions: what are the archaeological signatures of mobility as human-environmental interaction, and how should these signatures be studied? The symposium will also showcase current work from the Hominin Dispersal Research Group (HDRG), a multi-institutional, collaborative research cluster based out of l'Université de Montréal concerned with the study of dispersal events.

[220] Symposium · PONDERING GENDERED LANDSCAPES

In her landmark *Stonehenge: Making Space* (1998), Barbara Bender observed, “We can ponder an empowering and often gendered landscape...” This quote provided the epigraph for Wendy Ashmore's contribution to the *Handbook of Gender in Archaeology* (2006), where she observed that archaeological landscapes are often (if not always) gendered, making the pertinent question(s) “under what circumstances, in what ways, and by whom.” Ashmore briefly examined landscapes from a gendered gaze, gendered embodiment, gendered activity spaces, the marking of gender, and landscapes of gendered cosmology and history. Noting the heuristic and overlapping nature of these categories, she called for “more... pondering” to elucidate relationships between landscape and gender in the past. Ashmore's call provided the impetus for a 2013 conference of SUNY Buffalo's Institute for European and Mediterranean Archaeology (IEMA), “Engendering Landscape & Landscaping Gender.” This conference brought together scholars from various disciplines and institutions on both sides of the Atlantic to discuss the interplay of gender and landscape in Europe's archaeological record. Those present discussed questions of labor, mobility, community-building, cosmology, embodiment, and representation. This session seeks to extend the conversation begun at IEMA, pondering intersections of landscape and gender in the archaeological record within and/or beyond the confines of Europe.

[221] Poster Session · ENVIRONMENTAL ARCHAEOLOGY**[222] Poster Session · PUBLIC & COMMUNITY ARCHAEOLOGY****[223] Poster Session · EXPERIMENTAL APPROACHES TO ARCHAEOLOGY****[224] Poster Session · GEOARCHAEOLOGY****[225] Poster Session · TRADE & EXCHANGE I****[226] Poster Session · MESA VERDE ANCESTRAL PUEBLO VILLAGES: RECENT RESEARCH**

The largest Mesa Verde ancestral Pueblo villages were important loci influencing social, economic, religious, and political dynamics across the region throughout its occupation. These villages, also called community centers, were central places with complex social networks within and beyond the region that structured landscape use and settlement organization. Recent survey, mapping, in-field pottery analysis, and architectural documentation associated with stabilization has produced new information about agricultural systems, water management, roads and trails, and village and socio-political organization. This poster symposium brings together researchers from several institutions and projects to present the results of new fieldwork in the Mesa Verde core.

[227] Symposium · SOCIAL LEARNING IN THE PALEOLITHIC: EXPERIMENTAL APPROACHES

Since the discovery of the Oldowan it has largely been assumed that the social transmission of cultural information played a major role in the appearance and persistence of Paleolithic stone tool technology. However, detecting the presence and impact of cultural transmission in Paleolithic artifacts and/or assemblages remains problematic. Some researchers have begun to question whether the simplest Paleolithic stone tools were even cultural. This session brings archaeologists with a focus on experimental flintknapping together with modelers and human behavioral ecologists. Our shared goal is to improve our understanding of social learning in human evolution through study of the Paleolithic archaeological record. Participants will tackle some of the following questions: How is social learning embedded in lithic reduction? How is variation in tool form affected by social learning and ecological factors? Which tell-tale signatures of social learning should one expect to see over space and through time in the archaeological record, with special consideration given to the time-averaged nature of many Paleolithic assemblages? By mixing experts on lithics with experts on cultural transmission theory, we hope to build a foundation that will facilitate the development of the kinds of theory-driven expectations needed to identify social learning during the Paleolithic.

[228] Symposium · RECENT ADVANCES IN THE ARCHAEOLOGY OF THE CAROLINAS

Separated by geographic barriers, diverse colonial pasts and a formal historic split, the differences in the Carolinas have often overshadowed their archaeological connections. Shared regions, archaeological periods, as well as lithic and ceramic traditions, link the two states in addition to their rich Native American heritage and multicultural histories. The archaeological research programs of North and South Carolina have provided the discipline with innovations in historic, scientific, and underwater archaeology. This session will present the breadth and depth of contemporary work coming from both academic and cultural resource management work.

[229] Symposium · THE ATLANTIC IRON AGE AND THE CIVIDADE DE BAGUNTE IN NORTHWEST PORTUGAL

Abstract: Iron Age hillfort settlements, while outwardly similar, exhibit considerable diversity, resulting in problematic issues that continue to be debated. The papers in this session are based on several research seasons and address Bagunte's historical context and development and its relationship to other sites. Other topics addressed include the conundrums within the evidence; landscape and settlement; visibility and audibility; architecture and space; vegetation history and archaeobotany; and the production and economics of ceramics and metallurgy.

[230] Symposium · ARCHAEOLOGIES OF INFRASTRUCTURE: MATERIAL RELATIONS AND HUMAN HISTORIES

Archaeological discussions of infrastructure typically address the ways that the built environment fosters social cohesion or how technological interventions facilitate economic production. However, emerging transdisciplinary conversations on infrastructures are challenging social scientists and historians to rethink conventional, functional interpretations of infrastructures, and instead to assess their materiality in social and historical ways that go beyond simply fulfilling societal needs. Infrastructures are increasingly seen as unruly or fragile historical assemblages that can transcend or disrupt the historical conditions of their production. In this symposium, we ask contributors to pull on their expertise and case studies in studying the built environment, technologies, and landscapes to respond to one central question about infrastructures: how do physical and social dimensions of infrastructures relate across time and space? We urge contributors to address this problem through specific archaeological case studies and by considering issues that might be subsumed within them. These include: (1) infrastructures that facilitate some political projects, prevent others, and outlive still others; (2) infrastructures that are invisible and taken for granted or provide the material for spectacle, conflict, or violence; and (3) the multiple intended and unintended dimensions and consequences that stem from the coupling of social and physical infrastructures.

[231] Electronic Symposium · FUTURES AND CHALLENGES IN GOVERNMENT DIGITAL ARCHAEOLOGY*(SPONSORED BY SAA DIGITAL DATA INTEREST GROUP)*

Within the public sector, archaeologists and our agencies use a range of technologies to “do” archaeology in support of heritage management laws and mandates, thereby producing digital data. We are also faced with curating large volumes of digital media and datasets created by others. The quantity of data and speed of change pose challenges in making information useful and accessible internally, to researchers, the private sector, and the general public. But these factors also introduce new opportunities for understanding the material record and conveying its value.

Where are we now at various levels of government service and public outreach? Where do we hope to go? How can we collaborate across geopolitical boundaries? What would we build if we were free of financial and technological constraints? This electronic symposium will explore the possibilities, along with friction points and unintended consequences of the digital deluge through demonstrations, case studies, and discussion.

[232] Forum · MILITARY ARCHAEOLOGY RESOURCES SUBGROUP FORUM: ARCHAEOLOGICAL RESEARCH CONTRIBUTIONS FROM CRM ON MILITARY LANDS*(SPONSORED BY SAA MILITARY ARCHAEOLOGY RESOURCES SUBGROUP)*

In committing to their stewardship role for cultural resources, the Department of Defense funds a wide variety of archaeological investigations across military lands, from traditional inventories to creative mitigation and preservation endeavors. Cultural Resources Programs at installations, regional centers and headquarters offices continue to work to implement management protocols and methodology to properly identify, evaluate, manage and protect the archaeological heritage of the United States. This forum will share experiences across installations and include a discussion on what constitutes best management practices for military Cultural Resource Management and how this unique body of work might contribute overall to the discipline of archaeology.

[233] Forum · ENOUGH TALKING ALREADY: TIME TO DEFINE PUBLIC EDUCATION FOR THE NEXT 25 YEARS*(SPONSORED BY SAA PUBLIC ARCHAEOLOGY INTEREST GROUP [PAIG])*

It has been twenty-five years since the last Save the Past for the Future conference was held to determine how to prevent looting and vandalism on archaeological sites. Since that time, public education has become established in archaeology as an important preventative measure. Professional archaeological organizations have public education committees, CRM firms and museums regularly provide educational programming, and there has been an increase in community-based participatory research. Despite these advances, archaeological educators are not reaching all the “publics” we need to reach. In addition, we now find ourselves operating within the broader, interdisciplinary field of heritage studies, which unites practitioners from many fields. How do we navigate these new circumstances and incorporate the realities of this evolving profession? It is time to stop simply talking and to act. Participants in this session will consider how to incorporate past advances in public education, envision its needs, and provide new directions for growth in the 21st century. Come join in the discussion and help outline a Save the Past for the Future (3) conference!

[234] Forum · THE NUTS AND BOLTS OF AGENT-BASED MODELLING FOR ARCHAEOLOGICAL SCIENCE

Agent-based models (ABMs) are slowly becoming a common part of the archaeological science toolbox. However, even as they become more common there remains a lack of understanding among most archaeologists of what they are, how they work, and how they can contribute to broader archaeological research programs. Over the last few decades, articles and conference sessions applying agent-based models have demonstrated their utility to a variety of topics; however to the uninitiated agent-based models remain black boxes that are difficult to evaluate or to apply to non-ABM research. In this forum, we will attempt to dispel the mystery of archaeological agent-based models without delving too far into jargon filled computer code. Rather, we will present interactive and live-running agent-based models to show how archaeologists design and use them to address typical archaeological research questions. Presenters will highlight specific problems they encountered during their design, coding, parameterising, or validation phases and the choices they made to find a solution. The agent-based models presented will be available for forum participants to download and run themselves so they can follow along with the demonstrations and discuss their application.

[235] Forum · LEAST COST PATH TO REDUCE THE GENDER GAP: FEMALE VOICES CONTRIBUTING TO GIS AND REMOTE SENSING IN ARCHAEOLOGY

In the last two decades, archaeology as a field has increasingly integrated new and cutting-edge technologies from different fields. Archaeological field and laboratory research is positioning itself as a discipline in which technological experimentation has a growing role and is tied to new research questions, scales of study, and interdisciplinary approaches. However, as archaeology embraced new methods from traditionally male-dominated fields, it also inherited an under-representation of the continuous role of female scholars in advancing this new methodological approaches. This forum will discuss the presence of women in Geographic Information Systems and Remote Sensing as applied to archaeology, to explore current directions in the field, barriers to representation, and strategies for creating spaces for students and professionals to actively contribute in its development.

[236] Forum · HERITAGE STILL MATTERS: ARCHAEOLOGY AND COMMUNITY ENGAGEMENT THROUGH POLITICAL ADVOCACY*(SPONSORED BY COALITION FOR AMERICAN HERITAGE)*

Last year the Public Education Committee sponsored the first Heritage Matters panel to discuss forms of advocacy by archaeologists in reaction to the alarming trend of attacks on public funding. Under the guise of reform, the attacks on heritage preservation and environmental regulations have escalated over the past year. Attempts to decrease funding to the Historic Preservation Fund, redefine the boundaries of Bears Ears and other National Monuments, and weaken the National Historic Preservation Act, are among the many threats met with organized responses from the archaeological community. This panel will

continue discussions from a 2017 panel on advocacy by bringing together experiences ranging from city-specific advocacy to advising on national regulations and policy. We cannot do this work alone. It is more important than ever to engage local communities and be prepared to frame the benefits of archaeology succinctly given the limitations of public comment opportunities. Discussants will share recent challenges, successes, and lessons learned from their experience as local advocates, government employees, private sector employees, and leaders of professional and avocational organizations. This year's session is sponsored both by the Public Education Committee and the Coalition for American Heritage.

[237] Forum · THE INTANGIBLE DIMENSIONS OF FOOD IN THE CARIBBEAN ANCIENT AND RECENT PAST

The analysis of food remains has been key to understanding the lifeways of the Caribbean's earliest inhabitants. Drawing primarily on economic and behavioral ecology models, these studies have focused on subsistence strategies, carrying capacity, resource over-exploitation, extinctions, diet and health, and related questions such as the translocation of species. Food is integral to non-economic, social and cultural processes, though, and some anthropologists and food historians would argue that food is culture. The purpose of this forum is to discuss food-related issues such as identity and cuisine, performance, cultural taboos, status and social differentiation (i.e., the relationship between cuisine and social position), the symbolic meanings of some foods, creolization or transculturation, resistance and many others processes in the Caribbean's ancient and recent pasts. It is our hope that this conversation will challenge us to start looking at our food data in new terms. Discussion will also include planning a 2019 SAA session, and, second, the production of a publication addressing these issues.

[238] Poster Session · DIGITAL ARCHAEOLOGY: PHOTOGRAMMETRY, REMOTE SENSING, DRONES

[239] Poster Session · ARCHAEOLOGICAL APPROACHES IN GIS: NORTH AMERICA

[240] Poster Session · ARCHAEOLOGICAL APPROACHES IN GIS: SOUTH AMERICA

[241] Poster Session · HISTORICAL ARCHAEOLOGY OF NORTH AMERICA

[242] Poster Session · TRADE & EXCHANGE II

[243] Symposium · BELIZE CAMP 2017: EXCAVATIONS, ANALYSIS, AND INSIGHTS FOR THE COLHA ARCHAIC MAYA PROJECT

The archaeological site of Colha is located approximately 75 kilometers north of Belize City and spans an area of seven and a half square-kilometers. The site is bisected northwest to southeast by the Old Northern Highway, and further bisected perpendicularly by Rancho Creek. Cobweb Swamp lines the eastern boundaries of the site. Colha is located within the northern portion of the northern Belize chert-bearing zone. It is well-known for being one of the largest Maya lithic production sites with hundreds of chert workshops for the production of tools including adzes, celts, and stemmed blades. The site has occupation dating to the Archaic Period as well as the Middle Preclassic through the Early Postclassic.

The objective of the 2017 field season centered around fine tuning the chronology of the earlier occupation periods for the site during the Archaic and Middle Preclassic Periods, as well as investigations surrounding human environmental interaction during a critical cultural transition. Targeted excavations within the 4000 sector and the 2000 sector are the focal points of this session. An overview of excavation strategies and history of the site will lead into papers discussing preliminary analysis of burials, lithics, ceramics, faunal remains, paleoethnobotanical finds, and other analytical research.

[244] Symposium · INVESTIGATIONS INTO SUBMERGED PREHISTORY: METHODOLOGICAL APPROACHES, RECENT ENDEAVORS, AND NEW RESULTS

Archaeology seeks to interpret past human behaviors by placing sites, cultural features, and artifacts in their appropriate contexts. However, climate and other environmental shifts have left many formerly terrestrial landscapes submerged, obscuring them and rendering interpretation difficult. Despite this complication, submerged sites and landscapes can offer enhanced site preservation, unique taphonomic considerations, access to powerful remote sensing tools, and unique data for analysis. To take advantage of these benefits, archaeologists must overcome challenges that differ from terrestrial contexts. Nonetheless, these efforts on submerged sites and landscapes contribute significant data concerning human cultural developments during prehistory, especially when human groups faced rapid shifts in both ecology and climate.

This symposium explores the challenges archaeologists face when working on drowned landscapes and the range of new information these rich environments have provided. Papers presenting methodology and results for underwater landscape surveys, site testing and exploration, and underwater excavation demonstrate the growing importance of this area of research. With sites ranging in age from the terminal Pleistocene through the Late Holocene, explorations of underwater landscapes and drowned terrestrial sites are invaluable for current and future archaeological research.

[245] Symposium · ON THE SHOULDERS OF GIANTS: LONG-TERM COLLABORATIVE RESEARCH PROJECTS IN THE CARPATHIAN BASIN

This session provides an overview of collaborative prehistoric archaeological research in the Carpathian Basin of Eastern Europe. The past 20 years have witnessed an unprecedented increase in the number of international, collaborative, archaeological research programs in the region. Building on the long-standing tradition of innovative, ambitious, regional research in central and eastern Europe, recent long-term collaborations between North American and local archaeologists and specialists have yielded groundbreaking results in the prehistory of the Holocene. These projects are significant not only at the regional level but also have

contributed to major, continental and global, anthropological questions related to early village social dynamics and the emergence of hereditary inequality. The session includes papers by the directors of long-term, international, collaborative projects who will address: 1) the contributions their projects have made to major anthropological questions, 2) how the amalgamation of different research traditions, methods, and theoretical perspectives rendered their programs successful, and 3) a critical reflection of what they can do better to promote multidisciplinary international collaboration.

[246] Lightning Rounds · GEOCHEMISTRY AND IDENTITY

Compositional analyses have become an increasingly common part of the archaeological canon, particularly in investigations of craft production, exchange, and technological tradition and innovation. Whether the materials being studied are ceramic, metal, or glass, these compositional analyses all share the assumption that chemical data has meaningful parallels in the social world. Yet exactly how this connection is drawn varies substantially among projects. This session will take stock of how researchers working in contexts around the world are turning their analytical results into anthropological information, and how factors like production choice, raw material availability, mobility, and others impact these interpretations.

[247] Symposium · THE CLIMATE REALITIES OF CULTURAL HERITAGE AND ARCHAEOLOGY

We take it as a given that archaeology and the cultural heritage of which it is part have much to offer efforts to address climate change: from paleoclimatic data to models of adaptation and the roots of the modern global system within which modern climate change has developed. Evidence to date is showing that climate change presents an array of challenges for archaeology— from loss from erosion, fires, sea level rise, to disconnection due to migration and loss of contact of affiliated communities, and damage deriving from conflict and other social changes. If we understand climate change as a whole-of-society problem, then the fields of archaeology and heritage alone cannot realize its potentials for climate change or solve its challenges. So this session asks- where are we in connecting the past to efforts to address climate change? Where do we stand in engaging heritage and archaeology with climate policy, adaptation planning, community engagement, war and conflict, and to climate and migration solutions? This session brings together viewpoints from the local to global scale, projects completed and in progress, to share the current scope and state of the heritage and climate movement.

[248] Symposium · LOOKING DOWN ON MESOAMERICA: APPLYING GEOPHYSICAL PROSPECTION, UAV MAPPING, AND LIDAR TO THE ARCHAEOLOGICAL RECORD

The continued development of remote sensing technologies and the inventive ways in which archaeologists are applying these tools make this one of the most innovative areas of the field today.

The utilization of these applications in Mesoamerica, however, has traditionally lagged behind that of other areas—such as the US Southeast. This session assembles a number of case studies highlighting a variety of remote sensing methodologies, including ground penetrating radar, electrical resistivity, magnetometry, LiDAR, and mapping with the aid of unmanned aerial vehicles (UAVs) or “drones.” Furthermore, the papers focus on a range of scales and contexts, including monumental structures and public plazas, households, communities, and broader regions.

[249] Symposium · VARIABILITY THAT LIVES: ECOLOGICAL, POLITICAL AND SOCIAL ADAPTATIONS TO DIFFERENT ENVIRONMENTAL ZONES OF SOUTH AMERICA

Since the initial peopling of the continent, humans have been presented with an unparalleled diversity of ecological zones in South America, ranging from the vertical archipelago of the Andes in the west to the fluvial environments of the lowlands in the east. Consequently, humans responded to these challenges with a variety of cultural adaptations. These adaptations generated different types of societies whose identities are a product of economic systems derived from the environmental wealth that exists in South America. In this symposium, participants aim to explore the interdisciplinary ways in which adaptation is approached and contextualized within a variety of ecological zones across the continent. Key areas to be explored are mobility, subsistence strategies, cultural contact, exchange, and the intersections among these cultural adaptations. The goal of this session is to facilitate a running dialogue between scholars and to produce a more complete picture of anthropogenic influence on diverse environments in South America.

[250] Symposium · NOVEL ANALYTICAL APPROACHES TO ARCHAEOLOGY IN THE FAR NORTH

For decades, archaeologists studying the North American sub-Arctic have pushed disciplinary boundaries by combining innovative theoretical approaches and cutting-edge technology. With case studies spanning the late Pleistocene to the ethnographic present, this session will show that high-latitude archaeology continues to make invaluable contributions to interdisciplinary science-based research, both within and beyond the sub-Arctic. Presenters will describe emerging methodologies in geochemistry, geology, landscape analysis, and experimental archaeology that have the potential to change our understanding of prehistory. This session will explore on-going analytical contributions that cross theoretical, institutional, and chronological lines to showcase the new directions of anthropological archaeology in the 21st century.

[251] Symposium · ARCHAEOLOGY IN AND AROUND THE NATION'S CAPITAL

From early antiquarians and amateur archaeologists to modern professionals practicing in CRM, academic, and government settings, more than two centuries of archaeological exploration in and around the nation's capital have identified numerous pre-Contact and historic archaeological sites. Assisted by state, district, county, and local ordinances, archaeological investigations have exponentially increased our understanding of how the area evolved over the millennia and provided new insights into the history of this region. This symposium focuses on a broad range of projects across the capital region, ranging from the study of the area's earliest inhabitants to the twentieth century modernization of the area that transformed the landscape.

[252] Symposium · MONUMENTALITY AND THE PRECLASSIC MAYA

Recent work throughout the Maya world has increasingly demonstrated that construction at a monumental scale was widespread in the Preclassic Era. Examples of such architecture include temples and palaces, plazas and platforms, defensive walls and

canals, causeways, and other landscape modification to facilitate settlement or manage local hydrology. These discoveries serve to expand our understanding of the rise of Maya states, including the turmoil and likely collapse that attended the transition from the Preclassic into the Early Classic period. Additionally, they serve as the means by which a greater antiquity can be traced for some Classic period cultural practices, a continuity that is contrasted in other practices by exclusive association with one era or the other. Finally, as the regional specifics of the Preclassic come into better focus, the dynamics of the spread of cultural traits and political influence in the process of homogenization that established an identifiably "Maya" cultural appearance across the region are being brought to light.

[253] Symposium · THE CULTURAL AFFILIATION OF THE ANCIENT ONE (KENNEWICK MAN)

(SPONSORED BY SAA COMMITTEE ON NATIVE AMERICAN RELATIONS)

The Colville, Nez Perce, Umatilla, Wanapum, and Yakama utilized NAGPRA's preponderance of evidence standard to demonstrate a relationship of shared group identity with the Ancient One. The tribe's proactive approach with collaborative partners overcame the hegemonic ideology of a federal agency to repatriate the Ancient One for his final journey to the Creator. For over twenty years, the Claimant Tribes asserted their cultural affiliation. Our purpose here is to illustrate that, although he was repatriated under the WIIIN Act of 2016, there does exist evidence of a shared group identity based upon all available, population specific data for the Columbia Plateau. This information provided the evidentiary basis for the identification of an earlier group and cultural affiliation to the Claimant Tribes. The Ancient One falls within the variability exhibited at the same time period and throughout time on the Columbia Plateau. He was not outside of the norm for the population existing during the Early Cascade period and for the populations that followed for which he has a shared group identity. The Claimant Tribes are in fact culturally affiliated to the Ancient One and have never signed anything that legally says they are not.

[254] Symposium · PLANTS GOT A LOT TO SAY IF YOU TAKE THE TIME TO LISTEN: GARDENS IN THE AMERICAN NEOTROPICS

The purposeful cultivation of plants within settlements, in spaces referred to as infields and gardens, is significant throughout the tropics. Historically, archaeologists have focused on outfields to reconstruct ancient agriculture and subsistence practices. On the other hand, researchers studying contemporary gardening practices understand the cultural, economic, and ritual significance of gardens. Gardens are spaces where food, medicine, construction materials, and plants of aesthetic value are grown for household consumption and for sale in markets. They are also spaces to conduct household activities, generate supplemental income, and maintain cultural memory. Archaeological explorations of garden spaces, particularly in the American Neotropics, have tended to focus on their identification, through soil chemical, archaeobotanical, and spatial analyses. Now that we have refined our ability to identify garden spaces, we can turn to more anthropologically oriented questions. How do households use cultivated infield spaces, and what meanings are given to these activities? How do gardens serve as spaces for the display of wealth and status and as spaces of cultural memory? How do gender dynamics interact with physical garden spaces? Can changes in garden cultivation reveal larger shifts in the political economy? This session will situate gardens within social, cultural, and economic contexts.

[255] Symposium · BREAKING DOWN MATERIAL ASSUMPTIONS OF IDENTITY

Though anthropologists and ethnohistorians problematize terms like culture, ethnicity, and identity, archaeologists often attribute artifacts to a specific group of people and interpret identity based on static boundaries of time and space. Reducing cultural identity to the material ignores the complexities inherent in the constant negotiations and renegotiations by past peoples within their communities and between their neighbors. Perspectives written or spoken by the people studied and their descendants often remain ignored, and the reuse and reimagining of objects, raw materials, and places is rarely examined. These concerns can be addressed in variety of ways. Ethnoarchaeology connects the past to the present. Archaeometry traces the movement of pots, and microstyles investigate at a smaller scale than typologies. Historical documents offer corroborating or contradicting evidence, and contemporary artists provide nuanced perspectives of the past by reimagining traditions. These and other approaches offered by participants in this session problematize connections between past peoples and materials to inform interpretations and change our perceptions of the material and archaeological records.

[256] Symposium · RESEARCHING THE ANCIENT MAYA OF PACBITUN, BELIZE: A DECADE OF ARCHAEOLOGICAL DISCOVERY

Since the 1980s, the ancient Maya site of Pacbitun, Belize has been the subject of extensive excavations and research. The data accumulated, covering the nearly two-thousand year history of Pacbitun, has contributed to our understanding of the development and evolution of social, economic, and political institutions. The papers in this session will be a summary of the previous and ongoing research efforts at Pacbitun. Current research explores Pacbitun's modes of production and trade networks as it straddles the Belize Valley and Mountain Pine Ridge resource areas. Additionally, research efforts chart the use of environmental resources and the reshaping of the environmental topography. Expanding on earlier studies, excavations into plaza space have increased our understanding of the domiciles and production spaces of the site's earliest inhabitants while also adding a ceremonial dimension to their cultural repertoire. Other investigations have focused on Pacbitun's elite community and the events of the Classic period through an examination of residential, ceremonial, and causeway architecture. Finally, through the application of LiDAR and photogrammetry, we continue to technologically enhance our research capabilities.

[257] Symposium · COMPLICATING HISTORIES: ARCHAEOLOGICAL CHALLENGES TO NARRATIVES OF COHESION IN THE INKA AND AZTEC EMPIRES

Ancient empires relied on varying political and cultural strategies to emphasize the illusion of cohesion. For example, alliances, arranged marriages and ritual performances served to consolidate internal diversity and manage external challenges to the imperial façade. The historical record (a largely imperial perspective) often portrays encountered polities in subservient ways—as allies, as belligerent, as barbaric, or as the "other". Yet, empires were invariably constrained by the actions of competing and incorporated polities, who complicated the imperial narratives through their conscious or inadvertent engagements with the empire. The papers in this session center on material evidence from recent archaeological research to challenge historical imperial narratives, and explore the spectrum of imperial influence in local material cultural expression. Specifically, we look at the Inka in the Central Andes and the Aztec in Mesoamerica. In using a comparative approach, this session aims to characterize the

relationships that developed during the emergence, consolidation and maintenance of the two largest and most prominent American Empires.

[258] Symposium · THEORY, METHOD, DATA, AND THE ANTHROPOLOGICAL ARCHAEOLOGY OF MESOAMERICA: PAPERS IN HONOR OF JOSEPH W. BALL

Over a career spanning more than four decades, Dr. Joseph Ball's contributions to Mesoamerican archaeology can be characterized as having uncommon breadth and depth—from his seminal work at Becán, to his pioneering study of coastal Maya ceramics, to massive programs of excavation and analysis in the Belize Valley, to examinations of sites across the northern plains of Yucatan. Ball's work has led to a nuanced crystallization and use of a shared ceramic lexicon among Maya archaeologists. The larger impact of his scholarship, however, is seen in his broad syntheses of Maya culture history and his explicitly anthropological approach to archaeology. Through his work, for example, great strides were made in achieving a deeper understanding of Preclassic cultures and ethnicity in the northern and central Maya lowlands, particularly in the Belize Valley. Ball also developed the chronological framework for the Yucatan and introduced the conceptual structure for the segmentary state. Here, we bring together friends, colleagues, and students who have been influenced by Joe's work as an anthropological and Mesoamerican archaeologist, demonstrating how his legacy will continue to shape the future of our discipline.

[259] Symposium · DEEP ECOLOGIES OF NORTHERN NEW MEXICO

This symposium brings together papers exploring the idea of "deep ecology" in two primary ways: first, from an analytical perspective that addresses the nature and processes of ecological relationships, especially between plants, animals, and humans; and secondly, from a historical perspective that considers how these relationships change over deep time. Participants in this session present original research into the ecological history of the Northern Rio Grande from the Archaic through colonial periods. Individual papers consider the histories of particular anthropo-ecological practices, including hunting, herding, farming, and plant collection, and each emphasizes the way non-human agencies have shaped human communities in the region. In bringing these papers together, we hope to engage a deeper conversation about archaeological approaches to the emergence, persistence, and variability in human/non-human ecological relationships over time. In the process, we also report on the first ten years of work by the Gorge Project, an inter-institutional research collective formed to study the landscapes and histories of north-central New Mexico.

[260] Symposium · ADVANCES IN THE PREHISTORY OF SOUTHERN COSTA RICA AND WESTERN PANAMA: NEW PERSPECTIVES ON THE ARCHAEOLOGY OF GREATER CHIRIQUÍ

The Greater Chiriquí archaeological subarea comprises regions of the provinces of Limón and Puntarenas in Costa Rica and those of Bocas del Toro and Chiriquí in Panama. Like other cultural areas, its boundaries and distributions of distinctive elements by period remain ambiguous. New data allow us to distinguish subdivisions that are more in line with the distribution of elements in geographic units, some of which are transnational. These include the Térraba River basin, the Coto Colorado valley (Chiriquí plains), the Coto Brus valley (Chiriquí highlands), the Osa Peninsula, the Sixaola Valley, and Almirante Bay. Recent archaeological research has challenged previous models and addressed questions such as the emergence of horticulture, sedentism, and social complexity; paleoenvironmental reconstruction and human ecology; volcanism, and the cultural contexts of monumental sculpture—most notably sites with stone spheres in southern Costa Rica (recently declared UNESCO World Heritage). This symposium includes contributions on recent research by archaeologists of Costa Rica, Panama, and the U.S. Among the topics that unite them are issues of local culture change, intraregional networks of trade and communication, and the utility of the concept of Greater Chiriquí as an archaeological unit.

[261] Symposium · TOUGH ISSUES IN LAND MANAGEMENT ARCHAEOLOGY

Federal archaeology is framed by congressional direction through various statutes, including the Antiquities Act, the National Historic Preservation Act (NHPA), Archaeological Resource Protection Act (ARPA), and Native American Graves Protection and Repatriation Act (NAGPRA). Federal agencies are responsible for implementing these statutes while incorporating and adapting to changes in technology, land use, project scale, and public perspectives. The pace and trajectory of these changes have intensified and shifted in recent years. This symposium, focused primarily on the Bureau of Land Management, the nation's largest land manager, explores the successes and cautionary tales of governmental land management, while providing information on opportunities and efficiencies for future work.

[262] Symposium · DEVELOPING MACRO-REGIONAL PERSPECTIVES ON FORMATIVE CENTRAL MEXICO: INSIDE AND OUTSIDE VIEWS OF SOCIAL TRANSFORMATION

Recent research at the Formative sites in Central Mexico has provided new evidence on social transformations during the Formative period (ca. 1000 BC–AD 250), including early sedentary villages, interregional interaction during the Early and Middle Formative, and the rise of early cities during the Late and Terminal Formative. While Formative Central Mexico, especially before Teotihuacan, has been paid little attention until recently largely due to the fragmented nature of archaeological evidence, the new body of research has shed an important new light on some key aspects of social transformation during this period. The proposed symposium will address what constitutes Central Mexico as a macro-region, how it changed through time, key legacies for social change during the subsequent periods in Central Mexico and beyond, the changing nature of interregional interaction within Central Mexico and between Central Mexico and other regions of Mesoamerica, and the ways in which Central Mexico is similar to and different from other regions of Mesoamerica in terms of the scale of society, the degree of social inequality, and the economic organization

[263] Symposium · EXPLORING MOBILITY AND MULTICULTURAL LIFEWAYS IN PRE-COLUMBIAN CENTRAL AMERICA

Periodic changes in the pre-Columbian material culture of Central America are typically attributed to the impact of either migration to and/or conquest of regions by foreigners, or the diffusion of ideas along exchange networks. While technological and iconographic linkages are frequently raised as evidence for these events, very rarely are their mechanisms adequately defined or demonstrated archaeologically. Describing these changes, particularly involving groups of differing linguistic and/or ethnic

backgrounds, traditional linear narratives tend to focus on episodic cultural succession—the replacement of a passive (generally ‘indigenous’) group by a well-defined donor group or worldview—when some critical tipping point is met. In the material culture of Central America, this tipping point is frequently identified by shifts in choice of raw material, technology, symbolic content, function, and/or decorative style.

This symposium aims to transcend over-simplified notions of human mobility and social organization. In many regions, ethnohistoric and colonial records indicate that major centers frequently contained differing linguistic or ethnic groups at European contact. We welcome all papers that explore human mobility from multiscalar, nonlinear perspectives, and/or the potential implications of multicultural lifeways for archaeological reconstructions. How might we better access and demonstrate mobility and multicultural social organization in the record?

[264] Electronic Symposium · FROM CH’EEN TO WAK’A: HEMISPHERICAL VIEWS OF THE CEREMONIAL LANDSCAPES OF THE PRE-HISPANIC AMERICAS

Increasingly, archaeological, iconographic, ethnohistoric, epigraphic, and linguistic studies have shown the landscape was more than a passive backdrop upon which life was lived and from which resources were extracted for the people of the pre-Hispanic Americas. Instead, it was understood as being imbued with animate, generative forces such as Earth spirits and ancestors who were actively engaged on a regular basis as part of the culture-making process. These beings and forces were accessed through sacred landmark portals—caves, rockshelters, boulders, mountains, hills, and bodies of water—variably called wak’a, ch’een, and tzuultqu’a—where ritual petitions were made for gaining their favor, where community origins were celebrated, and where rulers demonstrated their supernaturally-sanctioned right to rule. As such, landmarks served as vital arenas of political power, markers of social memory, and fundamental loci of community identity. Yet, most such studies remain grounded within the culture area under discussion. Our goal for this electronic symposium is bringing together landscape archaeologists studying pre-Hispanic cultures of Mesoamerica and the Andes for exploring the related and contrasting ways past peoples of the Americas created and re-created their ceremonial landscapes through a variety of practices.

[271] Symposium · FORMATIONS OF BLACKNESS AND LATIN AMERICA

(SPONSORED BY SAA AFRO-LATIN AMERICAN ARCHAEOLOGY INTEREST GROUP)

The colonial metamorphosis from social classification to racial thinking centered on defining places, social and geographic, for and by Afro-Latin Americans. The Spanish American social classification schemes of types of people, castizaje or the casta system and racial thinking had its foundation in 16th- and 17th-century moral concerns related to maintaining the purity of Christian blood (limpieza de sangre). Ambiguous early terminology was tied to an imagined body of difference often focused on skin color, or colorism. Intimate relationships of blood mixing made it also fluid and opportunistic; the concept of caste retracted, stretched, and grew according to circumstance, eventually merging with the concept of race as it developed in the 18th and early 19th century. People constructed difference through the built environment, especially regarding by affecting mobility and invisibility, the selective use of kinds of ecologies (swamps, caves), urban space, and through bodies themselves. This topic offers a chance to discuss the gritty reality of the construction of race in different regions as well as assess differences among colonial powers.

[272] Symposium · ARCHAEOLOGY AND INDIGENOUS SCHOLARSHIP IN THE AMERICAS

Archaeology has increasingly been concerned with the ways that indigenous peoples’ perspectives can be acknowledged, honored, or made central in research efforts. However, this does not always translate into engaging with indigenous and Native American studies theoretical perspectives in representing the results of research, even if the research itself was collaborative.

Western epistemological traditions and the institutionalization of these understandings of the world—the academy—have constructed ideological and physical dichotomies between nature and culture, pre-contact times and post-contact times, and tribal and colonial state boundaries. Archaeologists are in a unique position to engage multiple datasets and knowledges in partnership with tribal communities to challenge these deeply rooted settler claims to intellectual and physical spaces.

Theoretical perspectives from Native American studies can help decolonize archaeological narratives to show how indigenous peoples in contact with Europeans continue their entanglements with land, ancestors, traditions and values. Archaeologists in this session use ideas developed in Indigenous and Native American studies to enrich their archaeologies with, by, and for indigenous peoples. The ideas used to clarify understanding range from Gerald Vizenor’s concept of survivance to Kim TallBear’s use of

“articulation” to address genealogical and genetic arguments.

[273] Symposium · HEGEMONIC PROCESSES AND STRATEGIES OF STATE DOMINATION IN THE ANDES: LOCAL/REGIONAL PERSPECTIVES

This symposium aims to address the different hegemonic processes associated with the emergence, development, domination, strategies of conquest and collapse of the complex societies of state level that originated in the Andean cultural areas. A number of societies known as “complex” at the state level emerged in this region, understanding that they developed a series of economic, political and ideological strategies that went beyond community-based organization and had different levels of domination and hegemony even in contemporary times. Among its characteristics are the emergence and adaptation of political and economic institutions, the emergence of religious ideologies materialized in iconographies, specialized production of material culture (ceramic, lithic, metallurgy), and architectural evidences that show different levels of complexity. The contribution of different case studies is expected to focus on the elements that made possible the different hegemonic and domination processes in these complex societies seen as part of endogenous and autonomous processes in the South American region. These particularities of complex societies can help to generate comparative perspectives better documented taking into account contributions from local perspectives, and contributing from ethnohistorical, ethnographic and anthropological sources

[274] Symposium · SILK PURSES FROM SOWS' EARS: A SESSION IN HONOR OF JOHN R. WHITE

In a career that spanned five decades, John R. White devoted his considerable energy to implementing the holistic vision of anthropology in the field, the classroom, and the community. His research and courses covered prehistoric and historic archaeology of the Old World and New World, the ethnography of native North and South America, and the anthropology of law. As a student of Aidan Treganza at San Francisco State, and then of Melvin Aikens at Oregon, John's early research focused on the prehistory of the West Coast. During his 34 years at Youngstown State, John developed an expertise in industrial archaeology, with a focus on 19th century blast furnaces. Through work on historic and prehistoric sites in eastern Ohio and western Pennsylvania, and in Israel and Central America, John gave several generations of students an array of opportunities. In addition, he made archaeology accessible to grade school and high school students through programs in summer camps. Each field project was an opportunity to share the excitement of archaeology with students whom he mentored and groomed carefully, and to satisfy his scholarly interests. John developed a true community archaeology, the spirit of which his students have continued since his passing in 2009.

[275] Electronic Symposium · SPANISH COLONIALISM IN THE GLOBAL REALM: ARCHAEOLOGICAL AND ETHNOHISTORIC APPROACHES TO CULTURAL ETHNOGENESIS AND PERSISTENCE

Research on questions of identity within and outside colonial contexts has generated many conceptual frameworks and methodological approaches to hybridity, syncretism, creolization, hispanization, ethno genesis, etc. This electronic symposium focuses on ethno genesis and cultural persistence as dynamic processes of identity creation, manipulation, and co-constitution, as well as the persistence, reinforcement and reconstitution of elements of ethno-cultural identities.

Moving beyond dichotomies of colonizer/colonized, dominance/resistance, or aggressors/passive recipients of change, we offer a more nuanced, comparative exploration. Encounters between agents of the Spanish State and native communities quickly created a web of pluralistic, global cross-cultural interactions. Spanish colonies in each region were hotbeds of cross-cultural exchange and conflict, including the creation and recreation of identities, as well as the persistence of local and indigenous traditions in old and new places and contexts. Within these multi-cultural contexts, archaeological approaches to ethno genesis pay close attention to patterned material practices that signify identity formation, manipulation and reinforcement.

This electronic symposium brings together research in six world regions (North America; Mexico and Central America; Andean South America; the Caribbean; Africa; and the Pacific/Southeast Asia). Papers variably employ material culture studies, demography and settlement patterns, household and community research, ethnohistory, and a variety of interdisciplinary approaches.

[276] Forum · KEEPING OUR SECRETS: SHARING AND PROTECTING SENSITIVE RESOURCE INFORMATION IN THE ERA OF OPEN DATA

For decades, cultural resource managers in the United States have protected sensitive site information by simply keeping it “under wraps.” However, this approach is becoming increasingly troublesome in the current information climate, which favors openness. In addition, the footprint of development activities and the information demands of associated compliance regimes are growing, and managers' and planners' ability to find and share large quantities of information is on the dramatic increase. As the manner in which we share and consume information has changed, some challenges inherent in the “keep it all secret” strategy have become apparent. Resource stewards find themselves forced to weigh the risks of keeping secrets with those of sharing across disciplines. For instance, under-sharing may mean that resources are overlooked by planners and first responders. However, disclosing certain information, such as specific locations, can enable resource theft or damage. Panelists with expertise in the management of cultural resources discuss how these tensions have affected their management strategies. Participants in this forum explore solutions for appropriate information sharing and resource protection, with special attention to climate change and incident response.

[277] Forum · SANNA: SOCIAL ARCHAEOLOGY OF THE NORTH AND NORTH ATLANTIC

Over the past 40 years, the archaeology of the North and the North Atlantic has seen ever-increasing numbers of researchers engaged in productive inter-disciplinary work crosscutting local, national, and regional boundaries. Research dominated by paradigms grounded in environmental archaeology have produced significant advances in methodology, collaborative practice, and zooarchaeological, paleoecological, and human-ecodynamic interpretations. However, approaches to the study of material culture in the North have been comparatively neglected. Relegated often to the field of “small finds” or examined solely for functional, chronological, or typological studies, analyses of Northern material culture participate only infrequently in theoretical discussions on materiality, the social lives of objects, symbolism, thing theory, etc., and have rarely been used to generate innovative methodologies or collaborations. SANNA (from Old Norse, “to prove, make good, affirm”) brings together papers by northern archaeologists interested in seeing beyond the immediate or visible characteristics of artifacts, architecture, and landscapes—material culture on multiple scales—to explore ways in which material culture can be used to develop new ideas

about past relationships and the social settings within which humans exploited their environments, made the North in their images and imaginations, or continue to use its material remains for contemporary agendas.

[278] Forum · COMMEMORATION, MEMORIALS, AND PRESERVATION: ARCHAEOLOGICAL INTERESTS, EXPERTISE, AND RESPONSIBILITIES

The role of public monuments and commemoration in political and social life in the United States became a focus of deadly violence in August, 2017, with demonstrations in Charlottesville centered on a controversial statue of Confederate general Robert E. Lee. A repeated refrain, echoed at the highest levels of national government, was that the removal of such statues was a destruction of “heritage” and “culture”. Some went further, arguing that it would destroy “history”. These words— heritage, culture, history— and the artifacts provoking their use all fall squarely within the domain of phenomena engaged with by archaeologists. Archaeological perspectives were represented, not only in the moment sparked by Charlottesville, but before it, in commentaries and professional articles in which archaeologists discussed the specific case of Confederate memorials, but also in broader debates about preservation and destruction of monuments that have assumed an aura of “negative heritage”. This forum invites participants to single out the key stakes in these debates, and to critically examine the positions archaeologists may have, or may be called on to take, on the intertwined questions of preservation of materials that cause pain, and the ways that painful histories are or are not embedded in public commemoration

[279] Forum · SKOPE: HOW WE ARE MAKING PALEOENVIRONMENTAL DATA USEFUL AND ACCESSIBLE

The NSF-funded SKOPE Project — Synthesizing Knowledge of Past Environments — is developing cloud-based and local computational tools that provide easy access to paleoenvironmental data and models. The SKOPE environment (demonstration available at <http://openskope.org/>) enables scholars to easily discover, access, explore, visualize, and synthesize data, information, and knowledge of both past and contemporary environments. Having selected a time period and area of interest, researchers choose from a menu of available environmental datasets that are visualized as time series graphs and maps, or downloaded for offline analyses. For select environmental reconstructions, users may adjust the model parameters, view the source code underlying each model, and even submit their own models to be run on the SKOPE infrastructure. In addition to the web application, the SKOPE project has developed FedData (<http://ropensci.github.io/FedData/>), an R package that automates downloading of geospatial data available from several federated data sources, and YesWorkflow (<https://github.com/yesworkflow-org/>), a declarative framework for recording and analyzing computational provenance within scientific workflows. In this forum, the SKOPE team will introduce SKOPE and perform live demonstrations of the SKOPE tools. Forum attendees will be invited to try the tools themselves, and provide feedback that will inform future SKOPE development.

[280] Forum · IN THE EYES OF THE LAW: CONTEXTUALIZING ARCHAEOLOGICAL LEGISLATION THROUGH TIME AND SPACE

(SPONSORED BY SAA GOVERNMENT AFFAIRS COMMITTEE AND THE HISTORY OF ARCHAEOLOGY INTEREST GROUP)

Due to the current political gridlock in the United States, it may appear as though nothing gets done in Washington—and certainly nothing of importance to archaeology. The purpose of this forum is to dispel this myth, while discussants look at how legislation has shaped the practice of American archaeology for more than a century. This forum is not simply a history lesson, but aims to be much more holistic. By concentrating on the struggles, lessons and loci of power within key pieces of archaeological legislation through time, as well as the people and circumstances that helped make these laws come to fruition, we urge members to consider our legislative needs from this point forward. As a discipline keenly focused on issues through time and space, it is particularly serendipitous that this forum will occur in Washington, D.C. in 2018. And while this forum is decidedly focused on the United States, discussants will offer broader lessons with a global reach.

[281] Forum · EXPLORING THE PATH FORWARD: THE BOY SCOUT ARCHAEOLOGY MERIT BADGE 20 YEARS LATER

(SPONSORED BY SAA PUBLIC ARCHAEOLOGY INTEREST GROUP)

The Boy Scouts of America created the Archaeology merit badge in 1997, providing archaeologists with an opportunity to excite future generations about archaeology while inspiring scouts to value and respect cultural resources. In 2017, members of the SAA's Public Archaeology Interest Group with prior experience of the archaeology merit badge, and drawing together the work of others who have studied the badge, conducted an evaluation of the archaeology merit badge, focusing on its strengths, weaknesses, and needed adjustments due to changing standards. Through their outreach efforts and contact with the Boy Scout organization, the group was then requested to submit a revised version of the badge to the Boy Scouts of America, which is currently under review for adoption. This forum will discuss the evolution of the badge, share the experiences of several current merit badge counselors as well as those who have staffed the archaeology merit badge booth at the National Boy Scout Jamboree, and will chart a path forward. The path forward includes improving outcomes and scout experiences with the badge; documenting and sharing current resources and best practices; and identifying and expanding the current network of archaeology merit badge counselors through recruitment and training.

[282] Symposium · US AND THEM: THE BIOARCHAEOLOGY OF BELONGING AND EXCLUSION

Building on a theme from the SAAs in 2017, this symposium contains the work of bioarchaeologists from across the globe who are exploring how to address the concepts of belonging and exclusion in the bioarchaeological record. The research included here utilized bioarchaeological methods, such as morphological variation, biodistance studies, anthropological genetics, isotopic analysis and paleopathological conditions, to address the possibilities of group admixture and segregation. The bioarchaeology work included is temporally broad and addresses research from various cultures around the world. Working from an anthropological perspective, the papers address notions of how bioarchaeological evidence of inclusion and division fits into the larger societal context.

[283] Symposium · THE HUMAN JOURNEY: UNDERSTANDING HUMAN MIGRATION IN THE PAST TO ADDRESS CHALLENGES FOR THE FUTURE

(SPONSORED BY NATIONAL GEOGRAPHIC SOCIETY)

Since our emergence out of Africa, humans have migrated across the globe in search of resources and new opportunities. In many ways, we are inherently a mobile species, albeit one that oscillates between settled urbanity and small mobile groups. With over 65 million refugees in the world today, and another 50 million “environmental refugees” estimated by 2020, the study of human migration has become both timely and urgent. What is the “tipping point” at which more people are on the move than settled, and what effects will this have on our cultures, our genes, and our societies? This symposium demonstrates how archaeologists are leveraging an array of techniques and evidence, such as ancient DNA, material science, isotopic analysis, and GIS, to address long-standing questions around the mobility of people in the past and the present.

[284] Symposium · EARLY NEOLITHIC IN THE LOWER YANGTZE: THE SHANGSHAN CULTURE

This symposium highlights progress being made by the collaborative Shangshan Culture Project based in the Lower Yangtze Valley of Zhejiang Province, China. The Shangshan Culture, identified just over a decade ago, was responsible for the first steps to agriculture in the region, if not all southern China. This symposium outlines our current understanding of the material culture, settlement, chronology, human ecology, geoarchaeology, and palaeoethnobotany of the culture, with emphasis on the Shangshan, Huxi, and Qiaotou sites. Shangshan dates to ca. 12,000–8,400 BP and is ancestral to the Neolithic Kuahuqiao and Hemudu Cultures. The Shangshan culture established substantial communities in elevated (40–100 m above sea level), intermontane river valleys well away from where the Kuahuqiao and Hemudu cultures eventually became established. Questions being addressed include what economically supported the occupations, how settlements were organized, the function and palaeoecology of substantial ditches at several Shangshan sites, the process of rice domestication, the meaning and technical skills behind the many forms of Shangshan pottery (including fibre tempered and thin, painted/slipped ware), and the relationships the occupations had with each other and to subsequent cultural developments in Zhejiang Province.

[285] Symposium · MESOAMERICAN CHIPPED STONE: A REGIONAL PERSPECTIVE FROM THE GULF COAST OF MEXICO

The analysis of chipped stone artifacts, which include both the products and by-products of reductive processes, provides an effective method with which to study a wide variety of behaviors, ranging from household quotidian activities to interregional interaction. In the Gulf Coast region of Mesoamerica, obsidian reigned as the primary raw material utilized throughout most of the prehispanic period. This material is ubiquitous within the Gulf Coast region, but of non-local origin, imported largely from sources in the Mexican Central Highlands, and, to a lesser extent, Guatemala. In this session, we present recent and current archaeological research focused on chipped stone from the Gulf Coast region, specifically the state of Veracruz, Mexico. These studies extend from the northernmost to the southernmost portion of the state, and span the Archaic period to the Postclassic period. With this session, we aim to disseminate findings derived from the numerous projects undertaken within the Gulf Coast region and foster greater collaboration among scholars working within this research area.

[286] Symposium · IS DIGITAL ALWAYS BETTER?

(SPONSORED BY NORTH AMERICAN CHAPTER COMPUTER APPLICATIONS AND QUANTITATIVE METHODS IN ARCHAEOLOGY [CAA-NA])

“Is Digital Always Better?”—The North American Chapter of Computer Applications and Quantitative Methods in Archaeology (CAA-NA) is sponsoring a session that examines projects or approaches where digital techniques have been particularly advantageous or disadvantageous. And, while digital technologies are becoming the mainstay of archaeological practice, they are not the end all, be all. In all the excitement, discourse often focuses on digital data acquisition at the expense of archaeological analysis and interpretation. Some topics addressed include: (1) How digital technologies allow us to address research questions that would otherwise be “unanswerable”? (2) When do analog techniques better serve archaeology? (3) Is data digitization enough? What are we actually doing with all of our digitized legacy data?, (4) What are the challenges of adopting digital technologies? How do we overcome these challenges? and (5) In what cases can digital technologies readdress old research questions?

[287] Symposium · POTTERY IN PRACTICE: THE PRODUCTION AND USE OF CERAMICS IN THE ANCIENT SOUTHWEST

Ceramic studies are a crucial component of the archaeology of the southwestern United States and northwest Mexico, encompassing a broad range of topics and applications from site chronology to material science and ancient ideologies. In this session, we draw together studies that take a robust theoretical approach to southwestern ceramics as physical objects in larger social and material contexts. Individual papers use data from a wide range of southwestern settings to examine topics such as production techniques; the distribution of vessels, including sourcing studies and the physical transportation of objects; the use of pottery in food preparation and serving; and the decision-making processes used by modern individuals in classifying pottery. By adopting a focus on “pots as objects,” these studies both build on a long regional history of materially focused ceramic studies and serve to shed new light on the roles played by ceramic vessels in the lives of past people and communities.

[288] Symposium · FROM EARLY FORMATIVE TO POSTCLASSIC IN THE MIXTECA OF OAXACA: THE FORMATIVE ETLATONGO PROJECT, 2015–17

Identified as an important Early Formative site from both a regional survey and archaeological testing by several previous project, Etlatongo, in the Nochixtlán Valley of Oaxaca, Mexico, has been the subject of a new research project, the Formative Etlatongo Project (or FEP), with three excavations seasons completed from 2015 through 2017. The new research confirms that Etlatongo would have been among the largest settlements in the Mixteca during the Cruz B phase (1200/1150–850 BC); the FEP excavations have also defined the presence of early public space at the site, with the focus a probable ball court that evinces two major Cruz B construction episodes. Comparative data from soil chemistry and obsidian analysis from different contexts at the site provide a more nuanced understanding of activities and consumption patterns between public space and different households at Early Formative Etlatongo.

Beyond the Early Formative, the recent excavations and ongoing laboratory research also provide new understandings of burial patterns and expand our knowledge of the Yucuita and Early Ramos phases, a time of early urbanism. The FEP has also encountered substantial Postclassic deposits, which allow interventions in ceramic production and exchange before the arrival of the Spanish invaders.

[289] Symposium · NOW THAT I HAVE MY DEGREE, WHAT DO I DO? GOING FROM THE CLASSROOM TO THE PROFESSION

Archaeology is changing. Technological advances, emerging social issues, and changes in the legal framework over the last quarter of a century are drastically changing how professional archaeologists conduct their business as well as opening new avenues of research. The result is diverse employment opportunities but these opportunities are still highly competitive. In order to succeed, students entering the profession need to understand what these new opportunities offer and what they will need to know to take advantage of them. This panel discussion brings together professionals representing different aspects of the discipline to discuss the current status of archaeology with respect to employment. Panelists will explore career opportunities, the skill sets graduating students will need to launch and advance their careers, and what the future holds. The session is aimed at those who have recently received or are about to receive their degree and are trying to transition into the profession. The session will be informal and attendees should come with questions.

[290] Symposium · MENTORING THE MISCELLANEOUS: PAPERS IN PALEOETHNOBOTANY

In 1957, Volney Jones articulated the idea that paleoethnobotanists, having one foot in anthropology and one in botany, were considered by those disciplines to be neither archaeologists nor botanists. This problem of “being miscellaneous” continues despite the role of paleoethnobotanists as vital members of research teams. One of the impacts of being a sideline speciality is the lack of structured training programs to develop the botanical knowledge alongside a standard curriculum in archaeology. Most undergraduates receive basic training in lithic or ceramic identification during field schools. However, paleoethnobotanical skills are not as frequently taught. Most training in paleoethnobotany has taken the form of a mentorship, often at great personal cost to the student. A great example of this is the summer Vaughn Bryant travelled from Texas to Canada for a summer at his own expense to study coprolite research under Eric Callen. These hours of one on one instruction under the fume hood, in front of the microscope, or in plant communities prepare students to become professionals who go on to establish their own research programs. This symposium emphasizes the importance of these mentorships and honors the many years that Vaughn Bryant has committed to mentoring generations of young scientists.

[291] Symposium · EXTENDING THE LEGACY OF THE LATE STEPHEN WILLIAMS

Stephen Williams (1926–2017) was the Peabody Professor of American Archaeology in the Peabody Museum and the Department of Anthropology at Harvard University. This symposium extends the legacy of his principal scholarly interests in North American archaeology, the history of anthropology, and “fantastic archaeology” by featuring contributions by his former students and colleagues. Among Williams’ principal foci was the prehistory of the Lower Mississippi Valley, with special emphasis on Woodland and Mississippian cultures. He also had a deep interest in the emergence of the discipline of anthropology in the United States, especially the use of ceramic analysis to systematize cultural chronologies and culture history. Williams developed a popular course on pseudoscience, using archaeology to teach hundreds of students the value of skepticism and the skills of critical thinking. These themes are represented in the scholarship of the symposium participants.

[292] Symposium · INTEGRATING CLIMATE CHANGE INTO ARCHAEOLOGICAL CURRICULA

Teaching students about climate change in the context of anthropology, and archaeology in particular, is more important today than it ever has been. While the evidence for the human role in climate change is increasingly clear, those who deny or ignore the situation, or even suppress critical data, currently have a powerful platform, making it difficult for students (and the public in general) to develop informed opinions. The archaeological record provides robust evidence of changing climate over time, as well as the increasing role humans play in the intensification of changes leading to the era we now define as the Anthropocene. Many archaeologists have created teaching approaches strongly integrating climate change and archaeology. In this session we will discuss successful pedagogical methodologies situating human beings in dynamically changing environments, both ancient and modern. The ultimate goal is to help students understand that if climate change is relevant to understanding archaeological questions, then there may be lessons learned for them to help with the future of our planet. The goal of the session is to bring together archaeologists who have developed curricula directed toward these goals, in order to share best practices.

[293] Symposium · PROJECT PLAZA OF THE COLUMNS COMPLEX: NEW INVESTIGATION OF A CIVIC-ADMINISTRATIVE COMPLEX AT THE HEART OF TEOTIHUACAN, MEXICO

We report on preliminary results from the first three seasons of the multidisciplinary Project Plaza of the Columns Complex (PPCC), centered on a civic-administrative complex at the heart of the ceremonial precinct of Teotihuacan, Mexico. Among its main objectives, this project investigates the sociopolitical dynamics of the residents of the complex through architectural, artefactual, and elemental analyses integrated into a city-wide LiDAR dataset. Using key markers to define areas of specialized activity within each excavation front and occupational layers across the entire site, we have begun reconstructing the history of the complex and the possible civic, administrative, and institutional roles played by its occupants. The site continues to yield fresh evidence, including an expanse of open plazas and other large-scale public works, remnants of elaborate feasting activities, and hallmarks of foreign artisans. By layering diverse datasets—derived from remote sensing, archaeomagnetic dating, zooarchaeological/paleobotanical analyses, and other methods—the project is generating a wealth of information pertaining to this previously unexplored complex and its relationship to the Teotihuacan polity. This includes the diverse interactions between ruling groups and foreign elites and the multifaceted social identities of the inhabitants of one of the largest multi-ethnic urban centers in the New World.

[294] Symposium · “WICKED AWESOME” ARCHAEOLOGY: NEW DATA AND DIRECTIONS IN THE ARCHAEOLOGICAL NORTHEAST

The prehistoric archaeology of New England and the Northeast presents many challenges. Archaeological sites in the Northeast are often perceived as less “visible” due to centuries of development following contact and poor organic preservation, making the purpose, patterning and interpretation of sites and material culture less apparent. Additionally, the region has seen a steady decline in academic research over the decades. Nevertheless, substantial data continues to be gathered from cultural resource management, academic, and state-level efforts using both traditional and non-traditional methods, that have expanded our understanding of Northeastern prehistory. These wide-ranging efforts from the different “branches” of archaeology are needed to maintain the legacy of Northeastern prehistory. This session highlights recent contributions and includes cooperative efforts between different archaeological “branches”, re-examination of existing artifact collections, and interdisciplinary research.

[295] Symposium · HUMAN ACTION AND DEEP TIME: A RETURN TO TIME AND SCALE IN ARCHAEOLOGY

This session explores the importance of long-term change and continuity in human society, culture, and environment through different archaeological perspectives. Archaeological discourse has largely shifted away from addressing long-term change and continuity, instead exploring human society in narrower slices of “ethnographic” time, with only superficial reference to larger time scales. This is partly a reaction to earlier examinations of large-scale or long-term change, which frequently produced deterministic explanations that reduced or ignored human agency, or was unable to explain how different time scales articulated with each other.

Yet this “ethnographic” approach has its own problems, and risks reconstructing archaeological “subjects” in ways that reinforce the divide between mind and matter, interiority and exteriority, or subject and object. How can archaeologists reinstate the “deep-time” perspective as one of archaeology’s greatest contributions to broader human knowledge? How could we turn to back to the *longue durée* in a way that addresses why people turned away from it in the first place? What should be the actual subject of archaeological history? How do objects, landscapes, materials, and other non-human entities contribute to deep histories? And how might we make room for agency and politics (if we can) in understandings of long-term change?

[296] Symposium · “IRISHNESS” WORLDWIDE: CONFRONTING THE VISIBILITY OF MATERIAL IDENTITY IN THE PAST AND PRESENT

What does it mean to be Irish? Archaeologists have long researched the ways in which cultural, ethnic, and national identities are expressed through material culture. But just how important is material culture to the expression of cultural identity? This session investigates the degrees to which “Irishness” is visible or invisible in the archaeological record, and how this identity is expressed intersectionally with other markers of identity such as class and gender. This symposium brings together research from Ireland and the Irish Diaspora to explore the local expressions of a cultural identity through material culture in the past and present.

[297] Symposium · RITUAL ECOLOGIES OF FOOD PRODUCTION IN THE ANCIENT WORLD

This symposium explores ecology at the intersection of ritual and food production. Food production, as a range of coordinated activities, is critical to the organization of society. Yet because it is necessary for survival, scholars often isolate it as a domain of domestic subsistence. Nonetheless, numerous ethnohistoric and modern accounts detail the important role that communal rituals had in organizing these activities, such as the intricate ritual-agricultural calendar of the Inka state or the elaborate water temple ceremonies in Bali. While these accounts articulate the sacred significance of food production practices and the collective rituals that organized them, these links are less commonly explored archaeologically. For example, although archaeologists often discuss the cultural meanings of consumption or the political economy of production-storage-redistribution cycles, few have addressed how rituals were perceived as essential to food production technologies. In turn, scholars often overlook how diverse kinds of labor, from ritual to food production, interlinked to organize ancient societies. By attending to these interconnections, papers in this symposium contribute to our anthropological knowledge of the complex practices that link people, plants, animals, land, water, and things and to address the imbrication of “sacred,” “community,” and “socioeconomic” landscapes and practices throughout the ancient world.

[298] Symposium · ARCHAEOLOGICAL SCIENCE MEETS THE CLASSICS: EMERGING KNOWLEDGE IN THE ANCIENT EASTERN MEDITERRANEAN WORLD

Archaeology in Greece, particularly Classical archaeology, with its emphasis on material culture, typology and historical narrative, has traditionally been considered distinct from theoretical and methodologically sophisticated anthropological archaeology. This divide has enhanced misconceptions on the state of current research, resulting in the perception that Greek Archaeology has a narrower scope than anthropologically-oriented archaeology. In recent years, however, archaeological practice in Greece has changed and become more integrative. Today it utilizes scientific methodologies and addresses problem-oriented research themes such as the evolution and impact of diseases, migration patterns, subsistence practices, the introduction of agriculture and animal husbandry, site formation processes, resource management, and the interaction between the environment and past human behavior. In this endeavor, the Malcolm H. Wiener Laboratory of Archaeological Science (American School of Classical Studies at Athens) has been a leader in interdisciplinary research merging Anthropology and the Classics in the fields of bioarchaeology, zooarchaeology, archaeobotany, and geoarchaeology. The goal of this session is to present work affiliated with the Wiener Laboratory to communicate the breadth of current archaeological research in the Mediterranean and to further ongoing discourse between archaeologists working in Greece and their colleagues around the world.

[299] Symposium · CURRENT ARCHAEOLOGICAL RESEARCH IN EASTERN, CENTRAL, AND SOUTHERN HONDURAS

While much of western Honduras has seen sustained archaeological research projects over the past several decades, due in part to the presence of Copan, other areas of the country are lesser known. A large portion of the research in the western region has been devoted to understanding both the Maya and non-Maya populations living along the border, yet very little is known about the groups living just beyond the edge of ancient Mesoamerica. Certainly, some groups in the rest of Honduras were influenced by the Maya and other Mesoamerican groups. Increasingly, influences from Lower Central America and the Caribbean are also being demonstrated. Given these diverse and often overlapping influences, current and future research in eastern, central, and southern Honduras necessitates communication across regions and borders. With this need in mind, this session aims to bring

together scholars currently involved in research in these understudied portions of Honduras. The goals of the session are to provide insights into recently initiated research projects in these areas, share current findings and results, and discuss common themes in future research questions and strategies.

[300] Symposium · PRELIMINARY RESULTS: 2017 FIELD SEASON, PROGRAMA ARQUEOLOGICO PREHISTORIA URBANA DE HUARI

The city of Huari was the first imperial capital of the Andes. Understanding the historically specific processes of developing urbanism in the city of Huari is not only key to understanding the Wari empire, but can also add a distinctive dimension to comparative analysis of early urbanism. Investigations at Huari have focused almost exclusively on monumental mortuary and ritual areas, leaving a gap in our understanding of quotidian life of the city. The Programa Arqueológico Prehistoria Urbana de Huari challenges generalizations about the nature of urbanism in early cities by investigating daily life and residential areas at Huari. Papers in this symposium offer insights from the first field season, 2017. With topics including subsistence and foodways, craft production, trade, ritual behavior, spatial organization, and vernacular architecture, we will build a picture of continuity and change in the activities of the people of Huari throughout the history of the city.

[307] Symposium · CASE STUDIES ON HUMAN INTERACTION WITH WATER RESOURCES

Humans have a complex and evolving relationship with water, and this relationship can be examined through many different methods and approaches. In this session, we assess this relationship through four case studies ranging from the middle-Holocene and Angkorian Period in Southeast Asia to colonial and contemporary water issues cross-culturally. The first half of the session presents results on a drought during the middle-Holocene period that led to societal changes. As more complex societies emerged, the Khmer state developed sophisticated hydraulic engineering projects to centralize water management and strengthen political power. The second half of the session discusses the changes in water management as colonial powers replaced traditional local practices with dichotomized systems that ignored established and effective water management strategies. Finally, we consider contemporary local populations in Chile that are in conflict with the national government over the development of water sources for hydroelectric power on ancestral land.

[308] Symposium · THE ARCHAEOLOGY OF COMPARATIVE SLAVERY

Comparative slavery. Can slave societies be compared? Is there any uniformity behind the idea that a human being can be enslaved? How many varieties of slave societies are there? How many conditions of enslavement? What can be gained intellectually by comparing slave states and slavery as a condition? To what intellectual and political end would there be comparative slavery?

Can archaeologists use the work of Orlando Patterson whose *Slavery and Social Death* legitimized the study of comparative slavery 30 years ago? Has Patterson's work gained currency with archaeologists? What have archaeologists done with it? Does Patterson's characterization of slavery hold up for comparative cases?

Is there an archaeological trace that identifies the existence of slavery? Can an archaeological intervention that uses historical or classical archaeology provide a useful way of understanding slavery better?

This symposium will discuss conditions of slaves, circumstances of manumission, and conditions for comparison all used by archaeologists as we attempt to try to understand whether slavery in Antiquity, the Caribbean, North America, Brazil, or slavery's modern equivalent called trafficking in human persons should be considered separately, or offer an opportunity to see the conditions that create slavery, as well as those that might eliminate it.

[309] Symposium · ARCHAEOLOGY AND THE SENSES

The way we understand how our bodies internalize knowledge of the world is culturally constructed and this biases all engagement with our environments. Yet in archaeology, a field that professes to investigate past peoples, scholars rarely have sought to understand these ancient sensory frameworks despite their importance in dictating life-ways and organizing systems of value. Only recently have such approaches become spotlighted in archaeological research. The theory and methods supporting these studies are wildly diverse and so there is difficulty in communicating across specializations. This session seeks to bring together scholars examining ancient sensory experiences that they might discuss with one another what it means to study

sensory archaeology and what is accessible in the ancient sensory past. Areas of dispute thus far include: the centrality of the body to sensory research, the enumeration of the senses, phenomenological approaches, the importance of materiality, and the incorporation of interdisciplinary techniques like residue analysis, experimental archaeology, and even art historical and literary analyses. The goal of this session is to encourage discussions across specializations to promote collaboration and a comparative approach to the trans-corporeal nature of the human sensorium.

[310] Symposium · RICH LAND, POOR LAND: USING STABLE ISOTOPES TO EXPLORE ANCIENT FARMING AND HERDING PRACTICES

Stable isotope analysis has proven to be a valuable exercise for enriching understandings of social and environmental topics, including but not limited to migration, weaning, diet, and climate. Recently, isotopic analyses have also been used to investigate ancient farming and herding practices. This symposium includes papers that go beyond basic environmental reconstruction to examine how people coped with climatic and/or social problems that may have impacted animal husbandry and food production. In doing so, we seek to recognize the value of stable isotope analysis in helping to elucidate the motivations, techniques, and repercussions associated with ancient land-use practices.

[313] Electronic Symposium · FROM THE GROUND UP: UPDATES AND LESSONS LEARNED FROM AN OPEN NORTH AMERICAN ARCHAEOLOGY TEXTBOOK

Open Educational Resources (OERs), including open textbooks, are one of the biggest changes in the educational landscape since the new millennium. Inspired by this momentum, a cohort of archaeologists have been working on an open textbook on "North American Archaeology" since last summer. This electronic symposium is meant to offer a space for them to share their contribution in its draft form and discuss their successes and challenges along the way, as well as next steps. While the textbook is not yet ready for adoption, it will be soon, and the authors hope that potential adoptees will join us in this important conversation.

[315] Forum · ADVANCES AND PROSPECTS IN THE ARCHAEOLOGICAL SCIENCES ON THE 40TH ANNIVERSARY OF THE SOCIETY FOR ARCHAEOLOGICAL SCIENCES (II)

(SPONSORED BY SOCIETY FOR ARCHAEOLOGICAL SCIENCES)

The Society for Archaeological Sciences (SAS) is an international professional society of about 300 members dealing with natural science applications in archaeology, paleoanthropology, and conservation. The Society was founded in 1977, so this session commemorates the 40th anniversary of the beginning of SAS. These four decades have seen advances in techniques, applications, theories, and infrastructure surrounding the archaeological sciences. We take this occasion to reflect on some of these developments, as well as considering what the future may hold in store.

[316] Forum · MAKING ARCHAEOLOGY FAIR

Most archaeologists today use computers and other digital technology to document their work. Many develop data management plans, as required by many funders of archaeology in recent years. Still, most archaeologists lack a clear understanding of both how to make their data widely accessible and intelligible for reuse, and why they would want to do so. This forum discusses the FAIR Data Principles, developed to guide data creators and publishers in making data Findable, Accessible, Interoperable, and Reusable (FAIR). Each forum discussant will select one FAIR principle to discuss in the context of archaeology. How well does archaeology currently address each of these challenges? Since archaeology can be a destructive practice, how much effort should we put into ensuring that our data is findable, accessible, interoperable, and reusable? What can we do to ensure that these goals are prioritized at a project's inception, rather than as an afterthought? How do we ensure that archaeologists collecting data also share algorithms, tools, and workflows that led to that data? Are there additional principles that define a "good" data dissemination in archaeology? Forum attendees can prepare for the discussion by reading "The FAIR Guiding Principles for scientific data management and stewardship": <https://www.nature.com/articles/sdata201618>.

[317] Forum · GENDER THROUGH THE GENERATIONS

(SPONSORED BY SAA COMMITTEE ON THE STATUS OF WOMEN IN ARCHAEOLOGY)

This forum brings together women across multiple generations from their 20s to their 70s to discuss the generational differences they have faced as women in the field, how things have changed over time, and the challenges that women in archaeology face today.

[318] Forum · ARCHAEOLOGY, SUSTAINABILITY AND ENERGY

(SPONSORED BY GRANTHAM CENTRE FOR SUSTAINABLE FUTURES)

Most energy and sustainability narratives have promoted an ahistorical view of Global Change, as they consistently highlight the western "industrial revolution" as the starting block for a race for progress (i.e., Steffen's "hockey stick curves") and concomitant environmental degradation. These narratives suggest that prior to this "revolution," communities lived in harmony with their environment and any impact was local and trivial. Archaeology has recognised the recurrent issues that diverse human communities have faced in managing energy and how this translates into food production, material acquisition, and social coherence, but, has failed to demonstrate the value of this research to wider Global Change and Sustainability Research Communities. Energy and sustainability are enduring problems for humanity and analyses of current conditions would benefit from a long term historical analysis addressing the relationships among innovation, materiality, subsistence and ideology. Although archaeology has produced extensive data sets relating to long-term human-environmental relations, it is not strongly featured within the Sustainability and Energy Research Community. This session therefore creates an opportunity for Archaeology to pronounce its unique perspective and rehearse its position in providing meaningful contributions to better understanding, modelling, and responding to the energetics of environmental, social, and political systems.

[319] Forum · 2018 EUROPEAN YEAR FOR CULTURAL HERITAGE: AN OPPORTUNITY FOR ARCHAEOLOGY AND ARCHAEOLOGICAL HERITAGE PUBLIC POLICIES

(SPONSORED BY EUROPEAN YEAR OF CULTURAL HERITAGE [EUROPEAN UNION AND COUNCIL OF EUROPE])

In 2018 the European Parliament and the Council of Europe celebrated the first European Year of Cultural Heritage (EYCH) with the goal of promoting cultural heritage as a shared resource to increase trust, mutual recognition and social cohesion as a means of promoting community identity across the European community as a whole. This comes at a time when the concept of the European community itself is questioned and weakened, including the use of cultural heritage in the construction of political or nationalistic identities that project the past onto the present, rather than examining shared interests and values. The role of international professional associations and NGOs active in the field of cultural heritage, particularly archaeology, is to ensure impartial and yet politically informed interpretation of cultural heritage, facilitating its preservation by engaging the public by engaging with the reflexive understanding of heritage. The forum will discuss how to relate the past with the present and make archaeological heritage relevant for the public.

[320] Forum · CITYSCAPES AND LANDSCAPES: BENEFITS & CHALLENGES OF 3D VISUALIZATION & ANALYSIS

3D is not new to archaeology. 2D drawings of architectural reconstructions and landscapes offer a 3D perspective that gives a sense of mass, scale, and spatial relations; however, these drawings are static and unidirectional. 3D digital technologies such as airborne LiDAR, UAVs, and terrestrial laser scanning and photogrammetry allow archaeologists to acquire x, y, and z data of extant features and terrain. While these reality-based technologies offer great advantages to capturing, visualizing, and analyzing data they are limited to what exists today—they represent the archaeological landscape, not the ancient landscape. To address questions of visibility, movement, and experience in the ancient landscape requires 3D modeling of partially standing, buried, or no longer extant architecture and landscape features such as shifted watercourses, elevated sea levels, or eroded mountains. But reconstructing ancient cityscapes and landscapes in 3D presents a suite of intellectual and documentation challenges that researchers must face. This forum discusses three key challenges: City and landscape reconstruction, focusing on the challenges of visualizing entire archaeological and/or historic cityscapes in 3D; visibility and movement in 3D + GIS cityscapes or landscapes; and scaling up data collection and visualization and/or analysis from the object/building to the city or landscape level.

[321] Forum · VIRTUAL AND DIGITAL ETHICS

(SPONSORED BY SAA ETHICS COMMITTEE AND DIGITAL DATA INTEREST GROUP)

The SAA Annual Meeting is replete with examples of emerging modes of archaeological documentation and production in virtual and digital realms: virtual reality (VR), photogrammetry, augmented reality (AR), 3D printing, LiDAR (and other means of landscape-level capture, analysis and appropriation), scanning and modeling of intellectual property, people, places and artifacts. The project of recording and producing 3D archaeological landscapes, sites, and artifacts with DSLRs, still and video virtual reality and immersive 360 cameras, unmanned aerial and underwater vehicles (drones), and laser systems extends to and beyond archaeologists.

A diverse array of discussants focus attention on issues appearing on the horizon of archaeological practice in order to prompt consideration of how and whether the existing ethical guidelines, that is, the SAA Principles, provide us as members with sufficient guidance for working in and planning the use of emerging and newer capture and presentation modes. These are now being used by the public, by scholars, entertainment and media, with and without government permits, so that intellectual property, appropriation, consultation, compliance, curation and access issues are being raised increasingly, whether or not they are being engaged.

[322] Lightning Rounds · IT'S HARDER THAN IT LOOKS: THE REALITIES AND COMPLEXITIES OF NAGPRA IMPLEMENTATION

(SPONSORED BY SAA COMMITTEE ON REPATRIATION)

Repatriation is a law, a profession, a calling . . . and sometimes a challenge. No matter your level of experience or training, you are likely to encounter novel situations for which the resolution is unclear. Curious about potential approaches to those situations and tips for addressing them? Our lightning round is your opportunity to bring questions directly to a panel of experienced NAGPRA practitioners who understand the reality and complexity of NAGPRA implementation. Each panelist will offer insights on specific aspects of the law based on their expertise. Topics will include the National NAGPRA Program, NAGPRA Review Committee, NAGPRA grants, Federal Register Notices, regulations on culturally unidentifiable human remains, international repatriation and the nexus between state laws and NAGPRA. Panelists will speak on tribal challenges, best practices for consultation, and the role of non-federally recognized tribes. Additional topics will include NAGPRA compliance in different museum settings (large natural history museums, tribal museums, and university museums), inadvertent discoveries and planned excavations, human remains documentation, and resources for research. A series of brief presentations will be followed by a moderated discussion and then a break out session during which attendees can network with experts on the panel and fellow audience members.

[323] Symposium · DISENTANGLING HUMAN-PLANT INTERRELATIONSHIPS IN ANCIENT CARIBBEAN SOCIETIES

Paleoethnobotanical information on the interrelationships between ancient human societies and plants in the Caribbean have been increasingly available in the last three decades because of the widespread application of novel methods for identification of macro and microbotanical remains. Consequently, the systematic identification of microremains such as starch grains, pollen, and phytoliths, along with the use of stable isotopes and other archaeometric techniques, has promoted renewed and more realistic visions on the use of plants by ancient Caribbean populations, and on the processes of domestication and dispersals of food crops in the area. During this symposium, lecturers will explore the results obtained from new methodologies regarding the identification and interpretation of different ancient plant signatures in the archaeological record. New plant-related (archaeometric) data and fresh archaeobotanical interpretations from different historic periods of the region will be exposed and discussed aiming to build needed and well-grounded interpretive tools to better appreciate cross-cultural and geographical variation of plant use, which have begun recently to be recognized from active researches in the area. The expected exchange of information and wide-ranging experiences of the researchers will provide an excellent opportunity to enrich our understanding on the long-term interrelationship between people and plants in the Caribbean.

[324] Symposium · THE EQUATORIAL ANDES: RECENT RESEARCH AND NEW PERSPECTIVES

Archaeological research in Ecuador is often overlooked compared to other areas of South America that have disproportionately captured the public eye, such as the Central Andes and the Amazon Basin. Ecuador has proven to possess an exceptional Pre-Columbian past, from a wide array of cultures to equally diverse environments. The purpose of this session is to highlight recent archaeological contributions from throughout Ecuador's many geographic regions.

[325] General Session · SOUTHWESTERN NORTH AMERICA**[326] Symposium · THE VETERANS CURATION PROGRAM: AN INNOVATIVE APPROACH TO COLLECTIONS MANAGEMENT**

The Veterans Curation Program (VCP) employs veterans of the Iraq and Afghanistan wars in the rehabilitation of archaeological collections under the administration of the U.S. Army Corps of Engineers St. Louis District's Mandatory Center of Expertise in the Curation and Management of Archeological Collections. Since its inception in 2009, the VCP has employed and trained more than 420 veterans who have worked with collections from 11 Corps Districts. In working with these collections, the veterans learn office skills including computers, records management, word processing, databases, and digital photography. Employed for five-month terms and provided support for personal growth and development as part of their employment, the VCP has also proven very successful in supporting veteran's transition to civilian life. Of the veterans employed at the VCP, 73% have obtained permanent employment while another 16% have pursued higher education. The presentations in this session provide perspectives on the VCP's engagement of veterans, the VCP as public outreach and advocacy, VCP operations, and collections based opportunities through the VCP.

[327] Symposium · FROM PROGRAM TO PRACTICE: PRAGMATIC PHILOSOPHY AND ARCHAEOLOGY

From the semiotics of Fredrick Peirce to the Philosophy of John Dewey and Richard Rorty Pragmatism has influenced social thought in North America for more than a century. This session presents a series of discussions of just how pragmatic philosophies have helped in reframing archaeological practice. Pragmatism has taken several forms in archaeology of late contributing to different form of community-based research, collaborative work with indigenous and descendant communities, as well as the way archaeologists communicate their results to different audiences. What all these approaches share is a commitment to making archaeology contribute in concrete ways to finding solutions to contemporary challenges. Those challenges can involve community stability or issues of heritage and identity politics in which archaeologists find themselves engaged with a large array of stakeholders. The papers in this session provide a range of examples of moving from program to practice in contemporary archaeology.

[328] Symposium · NATIVE AMERICAN SITES ARCHAEOLOGY IN THE MIDDLE ATLANTIC: CURRENT TOPICS AND CONTINUING INITIATIVES

(SPONSORED BY MIDDLE ATLANTIC ARCHAEOLOGICAL CONFERENCE)

As the archaeological practice of the Middle Atlantic region of eastern North America has evolved from culture history studies of the 19th century to modern research, archaeologists have always acknowledged the geographic complexity of the region as key to understanding prehistoric cultural developments and interactions. In settings ranging from the Appalachian highlands to the Atlantic coast, studies of the movement and interactions of Native American people demonstrate the significance of resources, alliance-making, and place-making to regional identities. This session illustrates the importance of enduring themes such as subsistence and settlement studies to our understanding of the cultural significance of specific foodways, landscapes, and persistent places. It highlights new initiatives, such as experimental studies in lithic analysis to understand mobility and regional interactions, and collaboration with descendant communities to better understand the diversity of Native American lifeways in the Middle Atlantic.

[329] Symposium · CHALLENGES AND ADVANCES IN THE ARCHAEOLOGY AND PALEOANTHROPOLOGY OF NON-MODERN HUMANS

The behaviour of non-modern humans (here defined as all archaic hominins not belonging to the species *Homo sapiens*) is a rapidly evolving area of research, in which new discoveries, both from archaeology and allied disciplines, regularly rewrite our understanding of the Pleistocene. This symposium will discuss recent advances in the study of non-modern humans, while also addressing the long-standing challenges, both methodological and theoretical. In particular we ask: how do we interpret material culture and investigate human societies produced by humans with different biologies and for whom comparable cognitive abilities with us cannot be assumed? What particular methodological challenges are associated with the limited material culture of the Pleistocene archaeological record, and how do we address, acknowledge, and overcome these in our research? And how can the fields of biological anthropology, genetics, and ethnography help to better understand the processes by which our early ancestors adapted to both internal and external pressures?

[330] Symposium · THE PROYECTO COSTA ESCONDIDA: RECENT INTERDISCIPLINARY RESEARCH ALONG THE YUCATAN PENINSULA'S NORTH COAST

Shorelines are dynamic places, both culturally and environmentally, and the Proyecto Costa Escondida (PCE) explores this dynamism by employing earth, biological, and social sciences to elucidate the linkages between human settlements and their coastline. Over the past three millennia, rising sea levels and fluctuating climatic regimes have dramatically transformed the north coast of Quintana Roo, Mexico, while Maya society witnessed the rise and fall of divine kings and the emergence of a market-based economy. By correlating multiple facets of the paleoenvironment with broader social and economic changes, the research team is beginning to reveal the challenges faced, and opportunities pursued, by these coastal peoples. The neighboring ancient Maya port sites of Vista Alegre and Conil are the focus of study. Located only 7 km apart, preliminary data indicate that human habitation along the coast was not continuous over the past, nor did the occupational histories at Conil and Vista Alegre mirror one another. Papers in this session highlight aspects of the interdisciplinary research being undertaken at these two sites ranging

from paleocoastline reconstruction to current attempts at developing a community museum with the community of Chiquilá, the modern port located where Conil once stood.

[331] General Session · EDUCATION, CRM AND PUBLIC ARCHAEOLOGY

[332] Symposium · CRM ARCHAEOLOGY ON FEDERAL LANDS: NEW CONTRIBUTIONS AND UNIQUE MANAGEMENT STRATEGIES

Archaeological research on federally managed lands in the United States is largely guided by development activities and changing government priorities. Government archaeologists and CRM companies manage and protect sites across the country with dwindling budgets, restricted field seasons, and shifting political pressures. Despite these hurdles, agencies are able to make significant contributions to the collective narrative of the prehistory and history of North America. This symposium highlights recent archaeological investigations and unique cultural resource management strategies employed by cultural resource professionals working on federal lands.

[333] Symposium · THE LEGACIES OF ARCHAEOLOGISTS IN THE ANDES

This symposium will focus on archaeologists working in the Andes during the nineteenth and twentieth centuries whose research and theoretical perspectives remain influential, whose students and students' students have pushed knowledge forward in significant ways, whose controversial work has been validated by later studies, whose publications continue to be read and analyzed and/or who have set up museum collections that continue to be consulted and interrogated with new questions.

[334] Symposium · GOVERNMENT, UNIVERSITIES, AND HERITAGE STEWARDSHIP: A STUDENT AND YOUNG PROFESSIONAL SYMPOSIUM

Federal, State, Tribal, and even Local Governments have formed partnerships with Anthropology and Archaeological programs at a number of American Universities. These partnerships have been mutually beneficial in many ways. The public-sector officials and agencies get cost-effective access to faculty expertise, a role in the development of young professionals, and the latest in research technologies and approaches. Universities benefit from new funding streams, practical and challenging research projects, and public service opportunities for both students and faculty. This session features 12 student/recent grad presentations representing 12 different projects, from seven different universities, five states, and eight government entities or agencies. It will highlight the programs, accomplishments, challenges and lessons learned from Public Sector-University partnerships, with an emphasis on student research, and propose ways they can be improved and expanded.

[335] Symposium · REGIONAL INTERACTION DURING THE ANDEAN MIDDLE HORIZON: ONGOING RESEARCH IN THE PERUVIAN SOUTH COAST AND YUNGAS

During the seventh century AD, fundamental changes occurred across the cultural and political landscape of the Central Andes. While the expansion of the Wari empire is largely responsible for some of these changes, it has also become evident that inter-regional interactions were increasing among the local communities along the south coast and yungas zones during this period. Recent archaeological investigations, for example, have revealed foreign-local interactions between the Nasca and Arequipa regions during the Middle Horizon (ca 600–1000 AD). This session highlights the cultural connectivity among the regions of the south coast and yungas (e.g., Ica, Nasca, Arequipa), or between coastal to mid-elevation and highland communities, specifically during the Middle Horizon. We welcome a variety of methodological approaches that demonstrate how these regions were interacting, from emulation and/or continuity in domestic and ritual practices to shifts in material culture.

[336] Symposium · HILLS, VALLEYS, AND PLATEAUS: EXPLORING HUMAN LANDSCAPE OF MOUNTAINOUS REGIONS IN EAST AND CENTRAL ASIA

Before 2000 BC, the Eurasian communities lived in a world of 'relative isolation': a protective rim of mountains and deserts centered by the uplift of the Himalayas and the Tibetan Plateau separate the warm and well-watered semitropical and tropical lowlands of South Asia from the seasonal and arid temperate Central Asia, and the monsoonal East Asia from the westerly southwest Asia. Only when arduous desert and mountain trails had been explored were farming and pastoralism opened up to wider contacts. In the symposium, we explore the human strategies on the edges of this mountainous rim. Drawing from numerous methodologies including ethnoarchaeology, geoarchaeology, zooarchaeology, archaeobotany and isotope studies, we explore the recurrent themes of foothill locations of early settlers in the context of the trans-Eurasian exchange.

[337] Symposium · LA CORONA ARCHAEOLOGICAL PROJECT: TEN YEARS OF RESEARCH IN NORTHWESTERN PETEN, GUATEMALA

The Proyecto Arqueológico La Corona (PRALC) has conducted research in the northwestern region of Petén, Guatemala for a decade, under the auspices of Tulane (USA) and Del Valle (Guatemala) universities. While the initial research in the area focused in proving the location of "Site Q", the interdisciplinary investigations carried out by PRALC have provided different types of information from a previously unknown zone in the Lowland Maya area. Architectural excavation, settlement research, epigraphic interpretation, artifact analysis, and paleoenvironmental study at several sites in the region have demonstrated that this area's culture history spans from the Middle Preclassic to the end of the Classic Period (600 B.C.E.—850 C.E.). All the data confirm that La Corona was the most important center of the region during the Classic Period, playing a major role in the broad geopolitical strategies executed by the Kaanul hegemonic polity between 520 and 750 C.E. This symposium will present a synthesis of the data collected during the first decade of the project, as well the interpretations derived from them.

[337a] Symposium · REPATRIATION UNDER THE NMAI ACT AT THE NATIONAL MUSEUM OF NATURAL HISTORY, SMITHSONIAN INSTITUTION

Since the 1989 passage of the NMAI Act the NMNH has returned thousands of Native American human remains and objects through over one hundred completed repatriations. This session will discuss the challenges and good practices developed during the repatriation process and will provide examples of the ways in which repatriation has led to new relationships between the museum and Native communities.

[337b] Symposium · AFRICAN DIASPORA ARCHAEOLOGY

The goal of this symposium is to present the most recent research pertaining to the archaeology of Africa and the Diaspora. Topics have focused on any number of broad topics pertaining to communities in Africa, the Americas, and the Caribbean integrating archaeological, ethnographic, and historical research.

[337c] Forum · NAGPRA MATTERS: REFLECTIONS FROM EMERGING PROFESSIONALS

The "Learning NAGPRA" project (2015–2018) looks to identify and understand the challenges to preparing professionals for work related to NAGPRA and repatriation and to create educational materials for several audiences. A core component of the grant through its first three years is the Learning NAGPRA Collegium, a workshop format that brings together graduate students, educators, museum professionals, tribal cultural specialists, and members of professional organizations to discuss and then create educational methods and materials for particular audiences in different disciplines and at all stages of career. The collegium setting, drawing from the scholarship of teaching and learning, is designed to create collaborative spaces where participants can evaluate information and brainstorm paths forward for teaching and learning about NAGPRA. In this session, organizers of the Learning NAGPRA Collegium and former student participants will reflect on how their Collegium experiences have enriched their understandings of Native American histories and rights, research ethics and methods, and their goals for their future careers. Attendees will be invited into discussion about such questions as why NAGPRA is important to teach, how it can be taught in the classroom and other educational settings, and how its application can be advanced in policy and professional settings.

[338] Symposium · STRIVING TOWARD EQUITY AND SECURITY IN ARCHAEOLOGY: ADDRESSING TITLE IX THROUGHOUT OUR DISCIPLINE

Discussions of Title IX have recently developed within our discipline as well as other field-based sciences. Instances of discrimination, harassment, and other civil rights violations have gained national media attention while struggles with widely accepted behaviors continue to place safety, well-being, and professional promise of many individuals at risk. If archaeologists intend to contribute to collective efforts to create safe and stable environments for students and colleagues to work and learn, it is important to address specific issues and collaborate to develop solutions and pervasively raise awareness. This session is designed to build upon efforts that are already underway and encourage their advancement for the benefit of the discipline as a whole. Papers and presentations will address improving environments and protections in the laboratory, institution, and the field, both domestically and abroad. It will conclude with a paper and discussion that addresses constructive ways to achieve these goals and raising the standard by which we adhere to as professionals. The session will be accompanied by an open mic gathering providing interested parties with an opportunity to share their experiences and informally continue to exchange ideas.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

The ANNUAL MEETING of the Society for American Archaeology provides a forum for the dissemination of knowledge and discussion. The views expressed at the sessions are solely those of the speakers and the Society does not endorse, approve, or censor them. Descriptions of events and titles are those of the organizers, not the Society.

ABSTRACTS OF INDIVIDUAL PRESENTATIONS

Abbott, David (Arizona State University), Caitlin Wichlacz (Arizona State University) and J. Scott Wood (Tonto National Forest)

[267] *Demarcating Spheres of Interaction in the Uplands of Central Arizona with Electron Microprobe Analyses of Phyllite-Tempered Pottery*
Various conflicting ideas pervade debate about how 13th century occupation was organized in the upland zone of central Arizona, which overlooks the Phoenix Basin to the south. Some researchers characterize the upland settlements as subservient and peripheral to the densely packed irrigation-based Hohokam communities along the Salt River. Others, instead, describe the upland populations as independent communities with rich histories of their own. Still others speculate about the extent to which different parts of the region were connected. As a contribution to this debate, we have used electron microprobe assays of phyllite-tempered ceramics to trace the movement of pots across the uplands and thereby demarcate networks of interaction among neighboring settlements. Several pertinent results have emerged. First, two disconnected spheres of interaction divided the upland region. One sphere included close connections with the Hohokam to the south; the other did not. One sphere engaged the populations on Perry Mesa to the north; the other did not. Second, Hohokam farmers probably imported seasonal agricultural labor from one part of the upland zone. Third, an integrated community along Cave Creek shared the same pottery until the area became an abandoned frontier, where unaffiliated farmsteads moved in without exchanging pottery with one another.

Abdelsalam, Heba

[32] *Implementing American Interpretative Methods for Better Preservation of a Cultural Heritage Site (Case Study: Mallawi Museum, Minya, Egypt).*

Heritage interpretation is one of the best methods for preserving cultural heritage since it assists a neighborhood in having a better understanding of the importance of its museums and historic sites. Lately, the world has witnessed the loss of many such sites in the Middle East. Therefore, the adaptation of the American models of interpretation would be ideal for addressing this problem. This paper provides an example of the use of these methods of interpretation for the preservation of sites in Egypt. The current research took place in the Mallawi Museum in Minya, Egypt. This museum was looted in 2013 when people broke into the museum and stole and destroyed its objects. After the reopening of the museum in 2016, it was important to establish a community engagement project to assist the stakeholders in understanding the value of its cultural heritage sites. Intensive workshops were held in the museum to inform people about the significance of historical and archaeological sites in Minya by using several interpretative methods such as storytelling and living history. An assessment survey shows that this kind of project can make a significant impact in the effort to protect cultural heritage sites in the Middle East.

Abdolahzadeh, Aylar (University of Pennsylvania), George Leader (Department of Sociology and Anthropology, The Coll), Tamara Dogandzic (Department of Anthropology, University of Pennsylv), Li Li (Department of Anthropology, University of Pennsylvania) and Harold Dibble (Department of Anthropology, University of Pennsylvania)

[304] *Raw Material Variability and Its Effects on Flake Production*

Archaeologists have long studied the effects of raw material variation on different aspects of lithic technology, primarily focusing on raw material availability and nodule size and shape. This paper presents the results of a controlled experiment designed to compare different rock types (obsidian, flint, basalt, quartzite, and silcrete) and assess their effects on flake production. The experiment utilizes a mechanical robot that applies force to pre-shaped cores, controlling for known independent variables such as exterior platform angle, platform depth, and angle of blow. Dependent variables include linear dimensions, surface area, and weight, as well as the force required for flake removal. All of the cores have been shaped to be of similar size and shape, and all have similar core surface morphologies. In comparing these results to those obtained using molded glass cores of similar design, we discuss and evaluate the applicability of previously published controlled experiments to a wider range of raw material types.

Abo, Stephanie (Brigham Young University)

[38] *Examining Fremont Snake Valley Black-on-gray Pottery through Neutron Activation Analysis*

Archaeologists widely argue that Fremont potters from the Parowan Valley, in southwestern Utah, manufactured Snake Valley pottery. I explore the distribution of Fremont Snake Valley Black-on-gray pottery using chemical analyses, metric data, and statistical methods. In my research, I compare neutron activation analysis data from Snake Valley Black-on-gray (SVBG) sherds found at archaeological sites within the Parowan Valley to SVBG sherds found at Fremont sites over 200 kilometers to the north. Through this project I hope to confirm whether the northern sherds were products of potters in the Parowan Valley, or if these sherds were made elsewhere.

Abraham, Shinu [137] see Dussubieux, Laure

Acabado, Stephen (UCLA) and Marlon Martin (Save the Ifugao Terraces Movement)

[275] *Rice, Rituals, and Identity: Resistance and Maintenance of Ifugao Agricultural Practice*

The shift to wet-rice cultivation and construction of rice terraces in Ifugao, Philippines has recently been associated with Spanish colonization. Previously thought to be at least 2,000 years old, investigations in the region have now established that wet-rice cultivation was a response of highland populations to the Spanish conquest at ca. 1650 CE. The shift to an intensive cultivation drastically changed Ifugao social organization that allowed them to successfully resist multiple attempts of the Spanish to place them under the colonial administration. Contemporary Ifugao identity is based on the narrative of being uncolonized as well as centered on wet-rice cultivation. Even when the market economy exerts pressure on the agricultural system, Ifugao families endeavor to continue producing wet-rice and sponsor rice-planting rituals. The persistence of wet-rice farming and rice rituals are interpreted as an active resistance of the Ifugao against assimilation to the larger Philippine society and conscious acts of maintaining their identity. Utilizing archaeological, ethnographic, spatial, productivity, and energetics data associated with wet-rice cultivation, this presentation aims to illustrate the continuity of Ifugao struggle against hegemonic cultures. As such, we show that resistance against Spanish colonialism became the foundation of Ifugao identity and resistance continues in the present.

Acabado, Stephen [117] see Echavarri, Mikhail

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Acevedo, Veronica (Licenciada Veronica J. Acevedo)

[95] *Tecnología cerámica, análisis petrográfico y técnicas arqueométricas en cerámicas policromas de las fronteras de Quebrada de Humahuaca, Jujuy, Argentina*

Los materiales cerámicos arqueológicos policromos denominados “vírgulas o comas” tienen una amplia pero desigual distribución espacial y son hallados en cantidades limitadas en sitios arqueológicos de las regiones de Puna norte, central y Quebrada de Humahuaca, Jujuy, Noroeste de la República Argentina.

Estas regiones mantienen límites ambientales y geográficos fronterizos. En el pasado los habitantes de ambas zonas sostenían una fluida comunicación, manteniendo formas identitarias diferentes entre el “Ser Quebradeño” y el “Ser Puneño”. Estas vasijas han transitado las dos regiones desde el 900 d.C. hasta el postcontacto con el español. Lo que nos ha conducido a reflexionar sobre la circulación de piezas cerámicas entre fronteras con importante uso y consumo ceremonial.

En este trabajo se presentan los resultados del análisis de caracterización petrográfica y pigmentaria de fragmentos de vasijas de sitios de la región de Puna y de Quebrada de Humahuaca, Jujuy. La aplicación combinada de técnicas arqueométricas con las cuales se estudiaron los materiales permitió reconocer las dinámicas fronterizas dadas en el pasado entre poblaciones de las regiones mencionadas. Las técnicas analíticas usadas fueron: análisis sobre cortes delgados, microscopía óptica, microestratigrafías, espectroscopia Raman, DRX, entre otras.

[134] *Caves, Copper, and Pilgrimage: Reinterpretation of Quimistan Bell Cave in Northwestern Honduras*

In 1910, A. Hooton Blackiston discovered a cave 25 miles from Naco containing a cache of 800 copper bells, a possible mosaic mask of turquoise, and other materials. Blackiston interpreted the cave as a place of worship dedicated to the bat god. Copper, however, has very rarely been reported from caves in Honduras. Metals enter Mesoamerican late in its history but quickly assume an importance equal to jade in the native value system. The only other cave known to have held copper bells is Tauleve Cave, near Lake Yojoa. The cave was known as a cache cave for a quantity of copper bells but these disappeared without being reported. Significantly, Tauleve Cave is known to have been a pilgrimage center of such importance that the Lenca in the area were known as the Taulepa. Interestingly, some of the copper bells from the Cenote of Sacrifice at Chichen Itza, another pilgrimage location, are reportedly from Quimistan. Copper bells may have assumed such importance that they were reserved as offerings only for the most important pilgrimages. I propose that the Quimistan Bell Cave was a pilgrimage center, possibly serving the people of ancient Naco.

[59] *Preceramic Cultures of the Basin of Mexico*

The period from early peopling until the appearance of pottery in the basin of Mexico is poorly known despite its importance to know the emergence of the early sedentary communities and the development of the first political centers in the area. This study summarizes the state of knowledge about hunter-gatherer communities in the basin and presents recent studies that have allowed us to expand our knowledge of this period, particularly for the so-called Archaic period. We highlight the profusion of findings for this period, mainly human remains, but with little information about the cultural, subsistence and environmental context of these societies. Recent studies in the areas of Texcoco, Tepexpan and Xochimilco allow us to obtain new data on cultural remains, paleoethnobotanical and paleoenvironmental data and also new 14C datings that allow us to expand our knowledge about this period.

[252] *Preclassic Landscape Modifications and Regional Networks at El Tintal, Petén, Guatemala*

The site of El Tintal, located in northern Petén, Guatemala, provides early evidence of monumental construction, initiating with the large-scale transformation of the landscape in preparation for the site's ceremonial core, followed by construction programs consisting of pyramids, elevated causeways, and a diversity of hydraulic features. Recent investigations at El Tintal have shed light on its Preclassic settlement, organized around what we propose was an ancient lagoon which settlers connected to the larger regional fluvial network by the construction of a 2.4 km-long artificial canal. Preliminary investigations show that this canal, although mostly constructed following a traditional open-channel design, appears to have had two sections flowing underground, with tunnel sections carved into the underlying bedrock, providing the first evidence of complex hydraulic engineering at such an early stage. El Tintal maintained a complex interregional network relying on both foot travel over causeways and trails, as well as canoe transportation across what is increasingly looking like a significantly more humid regional landscape. In this paper, we present our findings and supporting evidence, as well as initial interpretations which we believe are consequential in the understanding of Preclassic geopolitics.

Adams, E. (University of Arizona)

[122] *Complex Closure Practices Involving Ash at a Small Pueblo in Northeastern Arizona*

Excavation of a four-room pueblo in northeastern Arizona revealed complex closure practices that involved ash. A 5-cm thick layer of ash deposited on a defined, but extensive, exterior occupation surface adjacent to the pueblo, then covered with artifacts prior to the pueblo's wall being pushed on top, suggests the essential role ash played in the life and “death” of the pueblo. By reconstructing the pueblo's life history, the role of ash is examined and argued to be essential in the transformation of the village to its afterlife. The integral role of exterior space to the life (and afterlife) of the pueblo is a reminder that more of pueblo life was spent outside than inside pueblo rooms.

[92] *Paleoarchaic Occupations in the Eastern Great Basin: The Beast and Paleolandscapes in West Central Utah*

Within west central Utah, site locations dating to the Pleistocene-Holocene Transition (PHT) are generally associated with specific geographical features; such as, the Old River Bed (ORB), inverted stream beds/channels, and the barren playas of the Great Salt Lake Desert (Dugway). Over decades of cultural resource management inventories, numerous PHT-aged archaeological sites have been identified along the maximum extent, and subsequent shorelines and resulting feeder streams, of receding Lake Bonneville across the west desert of Utah. Sites include; The Beast—a massive PHT-age site identified at Dugway with an artifact assemblage consisting of over 800 formalized, a possible thermal feature, and 160 Great Basin Stemmed projectile points; as well as numerous PHT-age sites identified along Cove Creek. Here we explore the interconnectivity of these two areas separated by over 100 miles focused on the ORB. XRF studies conducted on obsidian artifacts provide more fine-grained information regarding PHT

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

mobility and transfer networks. Additionally, site formation processes at The Beast, suggest that intact buried cultural materials from the PHT may be present.

[218] *Food for Thought: Engaging Field School Students in the World of Plants*

Field schools run by Chuck Adams and Rich Lange introduced students to many archaeological disciplines. Together an archaeobotanist and a palynologist pulled students into the world of plants via introductory lectures on plant macrofossils and microfossils. Hands-on activities then focused on learning the important plant resources currently available. Student pairs were sent into three different plant communities to collect samples of all the different plants they encountered. When re-assembled the group learned the names and facts about these plants. Later, students accessed ethnographic resources for historic uses, and gave short presentations on plants of interest. Sessions ended with tasting edible wild plants.

[140] *Examining Patterns of Toolstone Procurement in an Edible Lithic Landscape on the Columbia Plateau*

Expansive outcrops of high-quality cryptocrystalline silicate toolstone occur in many localities within the Columbia Plateau region of North America. Archaeological evidence indicates that these locations were utilized extensively by pre-contact Native American groups. The geological processes that shaped these landforms and produced outcropping lithic material also created ideal conditions for the growth plant food resources, particularly root crops. These root crops thrive on the lithosols containing outcropping toolstone and were extensively harvested by Plateau groups in the past. The Columbia Hills of south-central Washington State exemplifies this pattern. Myriad lithic extraction sites cover the ridgelines and slopes of the Columbia Hills, a landform that is also blanketed with important root crops. This paper examines the relationship between food resources, toolstone, and settlements in the Columbia Hills area. The distribution of Columbia Hills quarry sites and their spatial orientation in relation to subsistence resources and habitation locales in the surrounding area is indicative of the intensified use of the landscape for both food and lithic resource procurement. Comparisons to other areas within the Columbia Plateau suggest the presence of a regional pattern of intensive lithic procurement coinciding spatially with collector systems involving intensified plant resource gathering.

[50] *Investigating Organic Residues on Prehistoric Cooking Technologies in the Aleutian Islands*

Stone bowls and griddle stones were in use in the Aleutian Islands for the past 9,000 years. People invested great time and effort into the manufacture and maintenance of these artefacts which insinuates their importance in prehistoric Aleutian food processing practices. A sudden increase in stone bowl occurrence around 3,500 years ago emphasizes their importance during this particular time. What was it that made these artefacts so important? We believe the answer to this question lies in their function.

Despite their importance these artefacts have never been thoroughly investigated and mention of them is mostly absent in the literature. Exceptionally well-preserved organic residues found on the surfaces of stone bowls and griddle stones offer the opportunity to investigate function through molecular and chemical analysis. Using GC-MS and GC-c-IRMS we identified organic residue origins and were able to carefully suggest function for both artefact groups. Additionally we explored environmental change in the light of artefact function as a factor in the sudden change of stone bowl occurrence during the Margaret Bay phase (4,000–3,000 cal BP) on Unalaska Island.

[35] *Preliminary Assessment of Recent Research at the Old Vero Site (8IR009), Vero Beach, Florida*

Intensive excavations and attendant analyses conducted at the Old Vero Site (8IR009) from 2014–2017 have revealed a long and complex stratigraphic succession which dates from ca. 30,000 B.P. to the present. The excavations have documented not only 195 species of plants and animals but also a human presence which extends back to at least 11,000 B.P. and, perhaps, earlier. Terminal Pleistocene extinction dates are provided on several taxa as well as observations about the environments within which they lived. Evidence of previously undocumented anthropogenic activities are also offered, including a very tentative Late Pleistocene tapir kill as well as later Archaic utilization(s) of this venerable site.

[243] *Seeds that Germinate: Models, Paleobotanical, and Archaeological Evidence for Colha's Early Inhabitants*

The archaeological site of Colha, located within the northern Belize chert-bearing zone, is well-known for being one of the largest Maya lithic production sites in Mesoamerica. The site has occupation dating to the Archaic Period as well as the Middle Preclassic through the Early Postclassic. Pollen and geomorphologic evidence suggest intensive forest clearance, wetland soil manipulation, swamp margin, and upland manipulation dating as early as the Archaic Period. Evidence for intensive blade production coincides with pollen evidence from Cobweb Swamp for economic species such as maize and manioc.

During the Archaic Period, a warmer, wetter environment jumpstarts an archaeologically visible trend in cultivation and domestication. Mesoamerica's biologically diverse landscape had much to offer its early revolutionary inhabitants. Research involving the cultural transition from complex hunter-gatherers to agriculturalists supports evidence that the early inhabitants of Colha can be studied as a regional model to understand their larger role during the commencement of the Maya civilization. These cultural phenomena and environmental trends are not exclusive to the region, but are also visible around the world. This paper discusses the chronology and significance of this pivotal era with preliminary archaeological and paleobotanical evidence recovered from the 2017 field season.

[34] *Chronological Investigations at Coastal Shell Mounds, Southeastern Brazil*

Shell mounds (sambaquis) are a focus of scientific interest in Brazilian archaeology since the 1950's and also for interdisciplinary approaches. Located along the Brazilian coast from north to south, they present geographical and chronological variabilities. This paper discusses the chronological aspects of large and small sized shell mounds located on the coast of São Paulo State, Southeastern Brazil. Radiocarbon dates suggest a long occupation of coastal hunter-gatherer-fisher groups spanning from 8,000 to 500 years BP. This culture collapsed after the arrival of inland ceramic groups. We will focus on the synthesis and analysis of the radiocarbon record, using a geo-referenced archaeological database of radiocarbon dates. The analysis of previous excavations and lab reports helped to understand the exact sample location, and the archaeological and paleoenvironmental contexts. The review and contextualization of the shell mounds chronology allowed the comparison with other Brazilian regions and the study of the occupation of coastal landscapes during the Holocene.

[327] *Pragmatism, Archaeology, and the Race Woman*

At the Phyllis Wheatley Home for Girls in Chicago, and at Pauli Murray's childhood home, in Durham, NC, black women were in motion, actively reshaping their social worlds. Pragmatism, a philosophy of actions, effects, and consequences is a useful framework for 1) drawing out their theoretical contributions to 20th century social thought and civic activism; 2) understanding their actions via the archaeological record; and 3) thinking through what archaeologies of their lives might mean for us today. This project considers the intersection of two domains—institutional culture and the world of work.

[337b] *Historic Kormantse in the Formation of the African Diaspora in the Americas: Migration Routes*

The impact of "Kormantse" as a cultural entity on the interpretations of the formation and transformations of the African Diaspora remains a major challenge among academics as many questions about the origins, migration episodes of populations, events and the process(es) involved remain unanswered. While bio-anthropologists explore DNA evidence, using various techniques of sequencing for possibly identifying common African ancestral connections or relationships, the need to review various routes and sources of the migrations, as well as the associated historical circumstances and places continue to be very critical. This presentation examines selected maps and other related documentation for speculating about the possible origins or combination of origins and routes that may have triggered off or played various roles in the processes of the creation of what we often consider today as "Kormantse in the African Diaspora." Maps of selected slave trade and migration routes are reviewed against the backdrop of selected recent speculations and interpretations of "Kormantse" in the history and culture of the African Diaspora.

Agostini, Mark

[269] *Technological Knowledge, Migrations and Ancestral Puebloan Communities of Practice in The Northern Rio Grande of New Mexico*

In the mid-late Classic period (AD 1250—1400), Ancestral Pueblo people living on the Pajarito Plateau of New Mexico experienced cultural change due to difficulties in farming during periods of drought. As a result, communities abandoned pre-contact plateau villages to join their Tewa-speaking relatives at the earliest historic period Rio Grande settlements. Oral histories from descendant communities from the 19th and early 20th centuries recount how the remaining members of these communities resettled at the extant pueblos of Santa Clara (Kapo), San Ildefonso, and Cochiti. In conjunction with ethnographic lines of evidence, this poster evaluates the possibility that the manufacture of ceramic vessels from sites in the Pajarito Plateau and the aggregating migrant sites of the Northern Rio Grande were crafted within crossing-cutting technological and belief based communities of practice that bridge the prehistoric and historic period divide. Time of flight-laser ablation-inductively coupled plasma-mass spectrometry (TOF-LA-ICP-MS) was used to characterize the chemical composition of a large sample of white ware sherds from ancestral sites within both culture areas, which can be used to better define the organization of production, the exchange of technological knowledge, migration, and the transformation of social networks in the pre-contact and contact American Southwest.

[285] *La lítica tallada de Estero Rabón. Un estudio durante la Fase Villa Alta en la Costa del Golfo*

El empleo de la lítica fue una constante desde los primeros grupos humanos, solucionando sus problemas cotidianos. Por ello, estos artefactos nos aportan información importante para la comprensión de actividades domésticas, sociales, rituales y económicas de una sociedad. El sitio arqueológico Estero Rabón está ubicado en el Sur de Veracruz. A través de las excavaciones en dicho sitio se recuperaron materiales arqueológicos de la fase Villa Alta correspondiente al Clásico Tardío/Terminal. En este trabajo se pretende dar un panorama preliminar del análisis de la lítica tallada obtenida en el lugar. Dentro de las líticas analizadas se pudo identificar la obsidiana de distintos colores como material predilecto para la fabricación de artefactos, siguiendo en menor cantidad el pedernal; con ellos produjeron navajas prismáticas, lascas con huella de uso, desechos de talla, etc. A pesar de que este material arqueológico se encuentra frecuentemente en la superficie y durante las excavaciones, no siempre es localizado con el contexto primario que nos indique sus actividades; pero debe haber algunos indicadores como su forma, huella de uso, calidad y diferencia de materia prima, etc. Así, el presente estudio busca alguna manera para comprender las actividades realizadas con la lítica a través de distintas perspectivas.

[52] *Range and Variation of Copper Tools from Two Archaic Localities in Wisconsin*

Great Lakes Archaic copper artifacts have been well documented and typed for many decades. However, there is a lingering tendency to think of copper as primarily a social signifier and to shy away from development of economically oriented copper theory. One component of the problem is rooted in copper's innately malleable nature. Copper was made into a wide range of tools and non-utilitarian items during prehistory. While most of these types have been enumerated, there are no published resources suggesting the morphological range or variation of copper artifacts one might expect in any given region. This paper will report the morphological range and degree of variation measured on a collection of over 1000 copper artifacts from two localities in central Wisconsin. This data is then used to characterize copper usage in these two localities and provides comparative context for artifacts recovered in small numbers or through unconventional means. Ultimately, the goal of this project is to illuminate the economic significance of copper artifacts, and to encourage the development of useful archaeological theory for this component of the Archaic Hunter-Gatherer tool kit.

[115] *Ritual Deposition of Avifauna in the Northern Burial Cluster at Pueblo Bonito, Chaco Canyon*

Birds are an important part of both modern and historic Puebloan ceremonialism: live birds, stuffed birds, and bird wings and feathers are used in prayers, in ceremonies, as sacrifices, and in the creation of ritual paraphernalia. Archaeological evidence suggests birds held a similar role in the past for some prehispanic Southwestern groups, including members of the Chaco phenomenon. Pueblo Bonito is one member of the Chaco system that might be expected to contain evidence of ritual use of birds, given other evidence for ritual activity at this site. Using a new avifaunal assemblage excavated from Room 28 in 2013, in this paper we assess evidence for ritual use of birds in Pueblo Bonito's northern burial cluster rooms. Multiple quantitative analyses establish the dissimilarity of this assemblage to other Chacoan sites and demonstrate that an unusually wide variety of avian species were recovered here. Wing elements are particularly abundant and may indicate the deposition of wing fans in the northern burial rooms.

Aitchison, Kenneth (Landward Research Ltd)

[32] *Who Works in African Archaeology?*

There are shortages of professional archaeologists in many African countries. It is a widely held view that there just aren't enough professional experts in Africa to carry out the work needed in projects, both large and small, that are affecting African cultural heritage and landscapes.

And these views are relevant, and important, and true—but they are often anecdotal rather than evidence-based. The first step in building capacity is to measure current capacity, then to use the results to identify what is needed and how to move towards.

The Heritage Management Organization, together with Landward Research Ltd, is developing a project with the support of the PanAfrican Archaeological Association and the Society of Africanist Archaeologists to measure African countries' professional archaeological capacities.

Learning from previous work in Europe (www.discovering-archaeologists.eu), we want to look at how many people work in archaeology across Africa (in all work situations—academia, private companies, governmental), what they actually do, what their ages, genders and qualifications are, and how archaeology "operates" in each country.

This project is building up a network of partners in Africa who want to share methodologies and results to support African archaeology today and to plan for its development tomorrow.

Aiuvalasit, Michael (Southern Methodist University)

[297] *Placing Ancestral Pueblo Water Management Practices into Ritual Contexts*

Across cultures, the ritual use of water is nearly ubiquitous, yet most archaeological studies of water focus primarily on its socio-economic importance. The large (~200–1500 person) mesa-top Ancestral Pueblo (AD 1100–1700) villages of the Jemez Mountains, New Mexico are particularly good contexts for the archaeological study of water because small water storage features, often referred to as reservoirs, are found at many villages across the region. Alternative hypotheses for feature function, such as water storage for domestic use, watery shrines, mortar mixing pits, or some combination thereof, have been proposed, but not tested. Also, archaeologists have given little consideration to how these features may serve as archaeological proxies for Ancestral Pueblo collective action surrounding water in domestic, social, and ritual spaces. As part of recent interdisciplinary investigations into the vulnerabilities of prehispanic Ancestral Pueblo communities to climate change, I used behavioral geoarchaeological approaches to reconstruct the use-life histories of fifteen of these features at nine sites. In this presentation, I focus on the potential ritual significance of feature use-life histories for Ancestral Pueblo of the Jemez Mountains by integrating ethnological and ethnohistorical records of Pueblo water use with geoarchaeological evidence from reservoirs.

[197] *"Filled with Faith and the True Spirit of Mormonism": Ritual and Belief at Iosepa, Utah*

In this paper, I investigate the intersections between ritual, belief, and practice at Iosepa, Utah, a historic townsite built by diasporic Polynesian members of the Church of Jesus Christ of Latter-day Saints (LDS). In 1889, the LDS Church assisted approximately 50 Polynesian LDS to establish and relocate to Iosepa for 28 years before disbanding the settlement in 1917. I explore how the Church leadership and the Polynesian LDS created and actively negotiated the landscape of Iosepa into a community and home according to often fluid social and religious ideals and practices. I argue that this case can lead to interesting questions on the archaeology of belief and ritual as well as how both can play into the archaeology of colonial entanglement and mission contexts. Focusing on an existing collection of materials from one LDS family's household along with spatial organization and historical documentation from the broader community, I first consider the implications of ritual, belief, and practice between the individuals and the community and second, I show how this understudied context expands the discussion on belief and ritual in mission studies and recent historical archaeology.

[89] *Lithic Micro-wear Traces at Morphological Junctions: Function vs. Typology Reconsidered in Terms of Technological Organizations*

The paper investigates some fundamental aspects of use-wear of lithic artifacts, concerning the relations between function and morphology. During the course of micro-wear research since the 1960s, it was often questioned whether tool typologies actually reflects their functions, or which morphological attributes are diagnostic of their utilization. Case studies in the Upper Paleolithic of East Asia also revealed variability in end-scrapers whose functions seem to be relatively consistent as hide working tools, to burins which exhibit diversified usage, as well as projectile points whose functions are less evident from traceological data. A more theoretical approach to use-wear is proposed here for understanding the complex diversity of tool function. The concept of "technological organization" (by Binford) combined with settlement patterns along a river basin, is applied to traceological research in the Paleolithic of northeastern part of the Japanese archipelago. The Mogami River archaeological project and standardized experimental program of the Tohoku University team provide concrete data bases for this methodological discussion. Investigations at the Kamino A site, the Takakurayama site, the Hakusan E and B sites of blade industry, the Araya and Kakuniyama sites of microblade industry, shed light on the theme of the organizational approach to lithic use-wear.

Alaica, Aleksa (University of Toronto) and Véronique Béliisle (Millsaps College)

[217] *Middle Horizon Cusco and Long-Distance Networks: Reconciling Spatial Variation through a Zooarchaeological Lens at Ak'awillay, Peru*

The ten years of research at the Middle Horizon site of Ak'awillay in the Cusco region of Peru have attested that local elites were the main interlocutors of trade with Wari colonists (Béliisle, 2013). In the era of interdisciplinary research, zooarchaeological methods have the capacity to shed new light on patterns that are seen in other material remains. In the case of the Middle Horizon (AD600–1000) contexts of Ak'awillay, new insights into the extent of trade networks and long-distance interaction are visible through the faunal record. The presence of sea lion, penguin, and coastal shell within house contexts dominated by New World camelids demonstrates that the villagers of Ak'awillay had access to long-distance exchange networks. A comparison between the public building and house contexts further reveals that these exotic species were not exclusively used and discarded in public areas but also kept within private domestic spaces. This paper will argue that the presence and use of exotic species, which could have been distributed by local elites to their loyal followers during large feasts, are possible evidence for the interconnectedness of Ak'awillay to coastal and highland communities without the dominance of Wari influence.

Aland, Amanda (Southern Methodist University) and Kylie Quave (Beloit College)

[100] *From Heartland to Province: Assessing Inca Political Economy through Material Culture Signatures*

Archaeological studies of Inca hegemony often focus on the intensity or degree of "Incanization," or assimilation to Inca material culture. These studies particularly rely upon well-preserved and highly visible remains, especially well-fired polychrome ceramics and monumental architecture. While Inca scholars have begun to analyze Inca hegemony in theoretically sophisticated ways that reveal how material culture legitimizes imperial rule, these approaches present several weaknesses: (1) sampling complications that can bias assessments of intensity; (2) insufficient consideration of the nature of Inca hegemony in diverse provincial settings; and (3) undue assumptions about the Inca heartland material assemblage to which provincial remains are compared. Because heartland sites have not been systematically reported in great numbers, we propose that more rigorous comparisons of horizontal excavations in the heartland are necessary for productively evaluating provincial contexts. Comparisons of Inca material signatures from recently-excavated heartland sites and one provincial site (Chao Valley) underpin our plea for more robust analyses of the nature of Inca hegemony. We further argue that rather than assess Incanization directed from center to periphery, we must acknowledge that the archaeological record was formed by local decisions and actions as much as by imperial policies.

Alarcón, Teresa [59] see Winter, Marcus

Alberti, Benjamin (Framingham State University)

[259] *Rock Art, Hunting, and Life*

Archaic rock art in the Rio Grande Gorge in northern New Mexico demonstrates an intimacy with the ecologies of which it is a part, from the microscopic life with which it shares its surfaces, to the talus slopes it occupies or watches over. Knowledge of materials and the ecological processes with which they were thoroughly entangled encouraged hunters to lay down tracks and traces of their own, including the geometric patterns and animal and bird prints that constitute the archaic rock art tradition of the area. The rock art appears as either isolated, often barely visible, communications with the heavily patinated basalt surfaces on which it is pecked; or as sites that are made up of the dense iterative marks left by itinerant hunters, marks that transformed boulders, reshaping them in line with the natural ecologies of which they are a part. Through a consideration of several sites investigated by members of the Gorge Archaeological Project in the light of recent work on ecology and hunter-prey relations, this paper examines the ways in which rock art exists on a continuum with other, older practices, rather than being indicative of a moment of radical separation.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Alcalde Gonzales, Javier I. (Universidad Nacional Mayor de San Marcos)**[273]** *Mito y rito, en tanto política y gobierno, en la costa de los Andes Centrales durante el Tawantinsuyu*

Las formaciones sociales de carácter imperial se articulan desde sus propias dinámicas, reproducidas desde sus relaciones y su territorio. Estos mecanismos deben ir reformulándose en el proceso de expansión, integrando las dinámicas sometidas políticamente, desarrollándolas y transformándolas, originando nuevas formas políticas dentro los antiguos procesos regionales y en el propio centro imperial.

El caso particular del Tawantinsuyu parece generar tres tradiciones integradoras diferenciadas, y que representan también los particulares procesos históricos previos de cada territorio social. Hacia el norte del Cusco nos encontramos con dos ejes, que son distinguibles a pesar de sus procesos complementarios: un eje cordillerano y uno yunga. Hacia el sur se puede distinguir un eje de “discurso legitimador” que desde la cordillera andina integra también sus flancos.

Nos interesa en este caso discutir la tradición del eje yunga, que como estrategia política se desarrolló desde Ica (Perú) hasta las costas septentrionales (Ecuador). Estrategia que se sustentaría en integrar los mitos regionales como una política de cohesión, y que se manifiesta en la particular arquitectura imperial que conjuga lo local, lo regional y lo imperial, como expresión de un discurso hegemónico, sobre la base material de estas sociedades: el paisaje entre el mar y la cordillera.

Alcantara, Keitlyn (Vanderbilt University Department of Anthropology)**[257]** *Conquering Aztecs and Resisting Tlaxcaltecas: The Body as a Site of Creating and Challenging State Narratives*

Narratives of Aztec grandeur dominate portrayals of Late Postclassic (AD 1325–1519) Mesoamerica. While imperial influence spread rapidly and thoroughly throughout the central valleys, Tlaxcallan appears as a rift in imperial control, resisting the encircling empire. Aztec narratives relegate Tlaxcallan to the peripheries, downplaying Tlaxcaltecas as one-dimensional barbaric enemies, unconquered by choice. In contrast, ethnohistoric accounts from within Tlaxcallan emphasize a state that intentionally separated itself from the Aztecs in ideology, social organization, and political and economic alliances, actively challenging the encroaching empire. For both groups, rising political tensions at the end of the Postclassic served as a catalyst for specific constructions of identity, demonstrating the political value of an image of cohesion. While these identities are often portrayed as fixed, this presentation will analyze human skeletal remains excavated from the urban center of Tepeticpac, Tlaxcallan to explore how the body serves both as a point of state defined identity, while also capturing lived experiences that depart from controlled social and political categories.

[257] *Chair***Alcock, Susan (University of Michigan)****[1]** *Discussant***Alconini, Sonia (University of Texas At San Antonio)****[100]** *To the East of the Titicaca Basin: The Yunga-Kallawayas and the Inka Frontier*

The Kallawayas region was an important imperial breadbasket of the Collasuyu, located to the east of the Titicaca basin. Formed by a set of narrow temperate valleys, this region was a natural corridor that led to Apolo and the Mojos savannas to the north, and to the east to the tropical Yunga mountains. Because of its marked altitudinal variation, this region was suitable for pastoralism, the production of corn and coca, and farther east, the exploitation of gold mines. The Inkas at their arrival expanded dramatically the system of agrarian terraces along the set of valleys, and promoted the influx of a large contingent of mitmaquna colonies for farming and productive ends. This was accompanied by the establishment of sizable storage facilities, including the control of key trading networks that crossed the frontier. Using a regional-scale perspective, this poster explores the scale of such socioeconomic shifts, and the ways in which indigenous Yunga-Kallawayas populations reacted and adapted to such changes.

Alcover, Omar (Brown University), Thomas Garrison (Ithaca College) and Stephen Houston (Brown University)**[248]** *Bridging the Gap: Spectral and Structural Analysis of Archaeological Settlement in El Zotz, Guatemala*

In the last decade, archaeologists have successfully employed active remote sensing technologies, such as LiDAR, to identify ancient settlement in the Maya lowlands. Near the site of El Zotz in northern Guatemala, this technology has aided in the identification of fortresses, terraces, and a network of raised roads. Archaeologists who employ LiDAR focus principally on the structural data acquired from the LiDAR point clouds. Building on these methodologies, we assess the benefits of incorporating both structural and spectral derived data from LiDAR sensors. Specifically, we address the use of intensity measurements attained during a 2016 flight over the northern Peten by a Titan Multispectral Mapping LiDAR. Intensity measurements are used to create multispectral datasets of above and below canopy measurements that clarify spectral properties of the archaeological landscape. These datasets allow archaeologists to assess how structural components of tropical environments (canopy height, varying vegetation, and surface elements) relate to their spectral properties. Additionally, these multispectral datasets allow researchers to regionally assess long-term effects of landscape use and change in Mesoamerica.

Alencar, Soraya**[25]** *Aging and Funerary Practices at Monte Alban, Mexico*

In the past decades, new theoretical and methodological developments in bioarchaeology and archaeology of death have allowed the exploration of age categories that are very challenging to access archaeologically: infants and older adults. Although Mesoamerican archaeology has largely used evidence for representations of aging in different sources of information (textual and iconographic) to engage in a broader consideration of funerary practices, approaches of old age as an identity category has been neglected by archaeological inquiry. This article explores the funerary practices of the elderly at Monte Alban and how it contributes to an understanding of the longevity in the past and the attributions based on age in the context of the organization of the domestic labor in complex societies. Aged bodies were selected considering pathologies and markers of senescence that include, for example, joint diseases, osteoporosis, traces of wear and tooth loss (n=40; 12.1%). Some symbolic aspects of longevity were introduced in the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

funerary practices to give meanings to the preservation of the memory of the house. Equally, older people are engaged in occupational specializations of the residential group, as ceramic production and trade of prestige goods, throughout the time of occupation of the site.

Alessi, Joe (Slippery Rock University)

[274] *John White's Playboy Black vs. Playboy White, Part 2*

John White once published a piece comparing the depiction of both Native Americans and Blacks in the cartoons of Playboy Magazine from its inception to 1970. In this work, John discovered that as a result of the Civil Rights Movement of the 1960's the image of Blacks in cartoons changed from ones oriented on cultural and racial distinctions to ones that merely displayed blacks in the cartoon. In short, the humor of the cartoon was no longer fixated on Black race or culture, but on other subjects such as politics. In contrast, John also discovered that the image of Native Americans never changed. That the humor of all cartoons in playboy fixated on Native American culture. In honor and at the encouragement of John, he asked me to pick up where he left off and to see if the dynamics changed. This work is the follow up to John's work and looks primarily at the images of Native Americans through not only the lenses that John used in his original research but also from the concept of Cultural Appropriation.

[173] *Cross Markers and Commemorating Place in the Titles of Ebtún, Yucatán*

Cross markers that consist of a wooden cross supported by a stone cairn (multun) are among the most pervasive landscape features encountered in rural Yucatán. They delimit water sources, features along roadways and paths, agricultural parcels, and the entrances of rural towns. The cross markers show substantial formal variation and are associated with material evidence indicating diverse practices of veneration. Cross markers were first established in the sixteenth century after the Spanish invasion, and they are documented in both Maya- and Spanish-language land surveys that run from the 1550s to the present day. These boundary markers, however, commemorate places long abandoned by inhabitants. They convey multitemporal notions of history and social memory, as well as spatial movement and circulation. In this paper, I examine how present-day cross markers in the areas surrounding the towns of Ebtún, Cuncunul, Kaua, Tekom, and Tixcacalcupul relate to the historical contingencies of movement documented in the Titles of Ebtún, a corpus of Maya-language land survey documents. Activities known as tzol pictun, taking a tour of the boundary markers, is a contemporary place-making practice that has continually reproduced local authority and renewed social memory from the sixteenth century to the present.

[283] *mtDNA and the Peopling of Fuego Patagonia*

Information regarding the prehistoric human migration into Southernmost Patagonia and Tierra del Fuego provides a baseline against which it is possible to compare interpretations regarding the colonization of the Americas, including its timing and rates of human dispersion. The earliest archaeological evidence in Fuego- Patagonia dates to the Late Pleistocene (c. 10.500 BP). By the Middle Holocene archaeological record (c. 8000–4000 BP) shows marked differences between the technological, economic, and cultural practices of inland and coastal peoples. These differences, indicate the presence of two divergent adaptations: nomad canoe/marine hunter-gatherers and pedestrian terrestrial hunters, although the archaeological record shows several complementary economies. To date, proposed migration routes into Fuego-Patagonia include the Pacific rim, the Atlantic coast, and inland or intermountain corridors. This study presents mtDNA results from 50 prehistoric individuals dated to ca. 6,000–390BP. The results identify three main haplogroups (C1, D1, and D4h3a) which distribution suggest the presence of at least two migration routes into the region, one through the inland and east of the Andes, and one through the coast, along the Pacific. The results agree with archaeological evidence, which reveal the sudden appearance of a marine adaptation strategy c.a. 6500BP.

Alizadeh, Karim

[71] *Climate Change or Muslims? Collapse of the Late Antique Sasanian Settlements, Mughan Steppe, Iranian Azerbaijan*

Recent research in the borderlands has increased our knowledge on the irrigation systems and urbanization plans of the Sasanian Empire in the late antiquity. In particular, surveys and excavations in the Mughan Steppe indicate that irrigation canals connected nearly all Sasanian settlements. Evidence suggests that after the 7th century AD most of the elaborate settlement system was abandoned and its irrigation infrastructure went out of use. While the exact date of this abandonment is unclear, it is possible that the collapse of the irrigation system itself could have brought an end to the Sasanian settlements which happened before the appearance of the Muslim army in the region in the mid-7th century. In this paper, I will present evidence of climate change that could have caused the abandonment of the Sasanian irrigation systems and associated settlements. Unlike a popular explanation of the decline of the Near East and the role of Islam, the evidence suggests that climate change could have contributed significantly to the collapse of Sasanian settlements before the arrival of Muslims. Understanding the causes of collapse is significant and may shed some light on the socio-political transformation of the southwest Asia at the end of late antiquity.

[214] *Testing the Trance Hypothesis: Identifying Hallucinogenic Compounds from Quids at Pinwheel Cave, California*

For decades, debates have raged over the role of trance in the origination of rock-art. However, there remains almost no direct evidence of the ingestion of trance inducing material at any rock art site world-wide. The site of Pinwheel Cave has a large element thought to represent the opening of the flowering Datura. Dozens of quid, or 'chews'—i.e. masticated fibres of unidentified plant material—are found within the ceiling of the cave. A sample of this was taken and analysed to determine if they contain the Datura plant. Extraction and analysis methods were developed for the two main toxic alkaloids within Datura: atropine and scopolamine. The alkaloids were successfully extracted, identified and quantified from standard solutions and spiked eggplant leaf samples. Low concentrations of atropine and scopolamine were detected within one 'chew' sample extract. A further six 'chew' sample extracts await analysis by high performance liquid chromatography mass spectrometry (HPLC-MS). This paper discusses this procedure and the implications of this discovery and the community aspects of both the past and present local Native population.

Allard, Francis (Indiana University of Pennsylvania)

[196] *Centering the Periphery: The Case of Southeast China during the Early Imperial Period*

First incorporated into China in 214 BCE, the southern region known as Lingnan (which consists of the present-day provinces of Guangxi and Guangdong), has traditionally been regarded as one of China's peripheral regions. Not only was Lingnan distant from imperial centers in the north, its native pre-literate 'Yue' inhabitants spoke non-sinitic languages and were known for their distinctive 'uncivilized' behaviors. Along with its location at the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

southern margin of modern China's territory, the fact that political, cultural and material elements originating north of it did have a significant impact on Lingnan's long-term development further helps mark the region as 'peripheral'. However, by focusing on unidirectional currents emanating from distant political centers, one risks underestimating the influence of areas 'beyond the periphery', as the case of Lingnan illustrates when one takes into account material and cultural elements which reached southern China along the 'Maritime Silk Road'. Having said this, the mere act of 'centering' so-called peripheral regions for the purpose of understanding local change is in itself insufficient, as the analysis must consider not only the origin of single elements of interaction, but also their magnitude, impact, and the extent of their social and spatial penetration at the local level.

[301] *Pottery Analysis as a Window into Site Function and Community Identity: A Haudenosaunee Case Study*

Previous analyses at two early contact period Haudenosaunee village sites in the Cayuga region of central New York State (Parker Farm and Carman) have provided evidence for differences in the intensity of occupation and in the distribution of activities. Interpretations of site activities have included a more intensive focus on pottery production and utilization at Parker Farm and greater emphasis on hunting and shell bead production at Carman.

Although differences in the reasons for the occupation of these sites have focused on seasonality, gender, and production, another possibility is that they may have been occupied by different groups moving into the area during the early contact period. Variability in the material culture might indicate increased interaction and entanglement with their neighbors. This paper presents results from an analysis of pottery designed to elicit patterns of design, function, and technique with implications for discerning community identities and activities during this period of rapid change. This analysis also sheds light on the processes of engagement with other groups and the environment in the early contact period.

[3] *The Iron Age Culture of Sistan, Afghanistan*

Our knowledge of the cultural history of western Central Asia is spotty and incomplete between the collapse of complex societies of the Bronze Age and the middle of the first millennium BCE. This is particularly true of the little-studied Sistan region of southwest Afghanistan and eastern Iran. The Helmand Sistan Project, conducted by the Smithsonian Institution and Afghan Directorate of Archaeology and Historic Preservation through the 1970s but hitherto unpublished, uncovered through survey and excavation an extensive settlement system along the lower Helmand River dating to this time period. This presentation will outline the basic elements of the Iron Age culture of this region. We will document the construction of a regional irrigation canal system that allowed for extensive desert cultivation in the Sar-o Tar region and along the Helmand River, describe the series of platform-based sites that anchored this system, and show key elements of material culture on those sites uncovered by the project. The presenters will situate these finds in the context of other cultures known from neighboring areas in the late second and early first millennia BCE

[298] *Preservation and Perception: Archaeobotanical Patterning and Site Formation Processes in Mycenaean Messenia*

Despite the increased application of spatially intensive sampling for archaeobotanical remains at large Mycenaean sites in Greece, the recovered assemblages are typically small and show poor preservation. Here, we consider the macrobotanical assemblage recovered through flotation of more than 7000 L of sediment at the site of Iklaina, in Messenia, in conjunction with microbotanical remains (starches, phytoliths) to illuminate cultural and natural site formation processes that have either negatively or positively affected plant preservation and recovery. We have observed three tentative patterns: the relative absence of materials in both natural and anthropogenic drainage areas, compounded by the downhill erosion of deposits leading to "shallow sites"; heavy clay content which is destructive for both micro- and macro-remains; and the importance of dumping episodes in relatively undisturbed areas that had fallen out of active use. This combination of patterns means that where evidence is preserved, it is rarely in primary contexts that can be used to discuss active-use spaces. Instead, it is better suited to discussions of disposal processes that reflect general and cumulative near-by activities and long-term patterns of resource use. Nonetheless, extensive horizontal excavation at Iklaina has revealed intra-site variation perhaps related to administrative zones vs. combined-use domestic/industrial areas.

[92] *Prearchaic Settlement Decisions in the Great Basin*

Researchers propose that the first people to occupy the Great Basin preferentially settled near pluvial lakes to exploit highly profitable wetland habitats. However, a systematic evaluation of this hypothesis has yet to be undertaken. Here we test predictions from an ideal free distribution model to determine if the settlement decisions of Prearchaic foragers were indeed biased toward pluvial ecosystems. The results not only elucidate Prearchaic settlement patterns, but also establish expectations about the subsistence practices and technology of central Great Basin foragers prior to 9000 BP.

Allison, James (Brigham Young University)

[164] *Ceramic Production and Exchange among the Virgin Anasazi, 30 Years Later*

At the 1988 SAA annual meeting in Phoenix, Margaret Lyneis presented a paper with the title Ceramic Production and Exchange among the Virgin Anasazi. In that paper she presented convincing evidence that, despite its abundance in the Moapa Valley of southeastern Nevada, Moapa Gray Ware was produced 70–100 km to the east, near the north rim of the western Grand Canyon. She also defined a new type of pottery, which she was calling Shivwits Brown at the time (later Shivwits Plain). Shivwits Brown (or Plain) was also abundant in the Moapa Valley, but Lyneis argued that it was made on the Shivwits Plateau, also north of the western Grand Canyon but west of the main Moapa Gray Ware production zone. That 1988 SAA paper inspired much subsequent research, including my doctoral dissertation, which (in part) examined the distributions of Moapa Gray Ware and Shivwits Plain across the western part of the Virgin region and within the Moapa Valley. In this paper, I update and expand on that study, adding data from recent excavations, from my unpublished fieldwork on the Shivwits Plateau and in the St George Basin, and from recent reanalysis of ceramic assemblages from the western Virgin region.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Alonzi, Elise (Arizona State University)

[23] *Traveling Monastic Paths: Mobility and Religion in Medieval Ireland*

Monasteries were powerful social institutions in early and late medieval Ireland that took drastically different forms over time. Medieval historical records, such as annals and Saints' Lives, and archaeological data, such as the layout of monastic buildings, suggest that small communities of monks at early medieval Irish monasteries followed ascetic or austere ways of life. Contrastingly, historical and archaeological sources indicate that monks at late medieval monasteries, founded by English and continental religious orders, lived in large communities and interacted with lay or non-religious people. Historical texts also record that high-status Irish monks and nuns traveled throughout Ireland, Scotland, England, and continental Europe. However, documents record little information about lower status monks and lay people. Thus, it is unknown how frequently people traveled as part of monastic life and how frequently local individuals participated in monasticism. This study leverages unique burial contexts of 88 individuals at five Irish monastic sites spanning nine centuries (8th-16th centuries AD) through biogeochemical analysis of human bones and teeth based on three isotopic systems (radiogenic strontium, oxygen, and carbon), compared to a geological baseline of plant samples, to uncover patterns of medieval Irish mobility in connection to the changing practices of Irish monasticism.

Alqahtani, Mesfer

[12] *GIS Investigations on Stone-Circle Structures in the North of Saudi Arabia*

The theme of the poster will address archaeological phenomena in the north of Saudi Arabia. The archaeological phenomena are stone-built structures that can be seen by satellite images. These stone-built structures have various types, and one of them is the circle type.

The poster will show the method of creating predictive models of stone circles by using the Geographic Information System (GIS). To create these models, two zones from the north of Saudi Arabia should be selected: study zone and applied zone. The study zone is where the distribution of stone circle locations will be analyzed to create predictive models. The applied zone is where predictive models will be applied to be testable in the future. The predictive models will be based on quantifiable attributes of stone-circle locations from the study zone. These attributes will include the relationship between stone-circle locations and environmental variables such as the landform and the distance of water resources. These attributes will be analyzed by ArcGIS to obtain environmental characteristics representing high, middle, or low probability models for the presence of stone-circle locations. In the applied zone, similar environmental characteristics will be identified to determine high, middle, low predictive models.

[155] *Quantifying the Exploitation of Faunal Remains by Pre-ceramic Societies in Southern Belize*

Beyond occasional reports of Pleistocene megafauna, there is a paucity of faunal data from the Mesoamerican Paleoindian and Archaic periods. This poster presents faunal data from three rockshelters in southern Belize located in two distinct environmental regions. Tzib'te Yux, is located in the Rio Blanco Valley in the foothills of the Maya Mountains and has an intact deposits from Cal. 14,000 to 6,000 BP. In contrast, Maya Hak Cab Pek and Saki Tzul, are both located in the interior of the Maya Mountains. They have intact deposits from Cal. 12,000 to 1,100 BP. Despite varying degrees of bone fragmentation, the analysis of the deposits from all three rockshelters during these early periods of human occupation provides a unique insight human subsistence choices and food processing. Our precise chronologies are anchored by over 100 precise AMS dates, giving us a high-resolution view into animal exploitation by pre-agricultural hunting and foraging societies in the Central American tropics

[108] *Archaeological Heritage Market and Museums in the Dominican Republic*

The first Dominican heritage legislation indicates that there were private collecting practices of local archaeological materials already by the end of the 19th Century. Heritage museums formed archaeological collections with donations or purchases from private collectors who often depended on individuals that made a business out of locating sites with the desired pieces. The continued institutionalization of collections without context that gave rise to several museums has contributed to the perpetuation of an antiquities market that has negatively impacted the community's connection to the country's indigenous heritage and its perceived value and relevance.

Heritage legislation regarding the protection of pre-Columbian archaeological materials continues to be weak. Despite the bureaucratic control over international scientific research, there are no local regulatory mechanisms that register the sale of archaeological objects by street vendors, huaqueros, or between private collectors that continue, at a lesser but impactful rate, to expand their collections, prestige, and market value.

Examining lessons learnt, museums can work towards a more coordinated effort to minimize looting of archaeological sites. Through collaborations, museums can develop internal policies that discourage acquisitions of looted objects, and create best practices to provide contextual information, improving the way communities access collections on display.

[26] *Burning Down the House: Evidence for Controlled and Uncontrolled Structure Fires among the Late Woodland and Mississippian Settlements at the Orendorf Site in Fulton County, Illinois*

The Orendorf site (11F107), located on a bluff overlooking the central Illinois River valley, comprises a mound group and a series of Late Woodland and Mississippian habitations. The occupation of the site is characterized by a gradual migration of the community to the west through successive abandonment and rebuilding. Burned structures have been found in all Orendorf settlements, and at least two of the abandonments followed complete burning of all structures. Intensive salvage excavations of the westernmost areas were conducted during the 1970s, and research has continued through the 2017 field season, during which a Mossville-phase Late Woodland/Mississippian structure was excavated in the easternmost habitation area.

Although structure fires appear to be common to all Orendorf settlements, there is substantial variation in several characteristics of the burned house features. An analysis of these variations suggests that both controlled (intentional) and uncontrolled (either accidental or malicious) structure fires are

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

represented among the settlements at Orendorf. "Controlled" and "uncontrolled" classes of burned structures are considered within the context of other archaeological, ethnohistoric, and ethnographic evidence for ceremonial burning, utilitarian burning, wildfires, and warfare. Special challenges in the detection and excavation of these different classes of burned structure features are also examined.

[180] *Rock Art at Chalcatzingo, Morelos: Methodology and Techniques for Recording, Documenting and Elaborating Preservation Strategies*
This presentation describes the process of recording and documenting the pictographs found at the site of Chalcatzingo, Morelos, in central Mexico. It shows the way in which state of the art technology is used for the first time at the site for this purpose. Iconographic analysis, landscape archaeology and the analysis of painting techniques and materials are as well employed to enrich the interpretation of rock art at the site. Upon this basis we elaborate a hypothesis about their relations with landscape, astronomical phenomena and the other elements of material culture. We also present a preliminary description of the preservation conditions of the pictographs.

Ambrose, Stanley (U. Illinois, Urbana-Champaign), Andrew Zipkin (U. Illinois, Urbana-Champaign), Douglas J. Kennett (Pennsylvania State University), Abigail Fisher (Southern Methodist University) and Jessica Thompson (Emory University)

[198] *Dietary and Environmental Reconstruction with Stable Isotopes of Early, Middle and Late Holocene Humans from Northern Malawi*
The early Holocene African humid period (AHP, ~12,000–6000 bp) was followed by the Middle Holocene dry phase (MHDP, ~6000–3500 BP), and the modern climatic regime was established during the later Holocene (~3500 bp to present). The relationship of environmental change to human social and territorial organization adaptations are fairly well-documented in northern, eastern and southern Africa. However, the Holocene terrestrial record of environmental change in east-central Africa is poorly documented. Stable carbon, nitrogen and oxygen isotope analyses of human bones and teeth from northern Malawi suggest that hunter-gatherers exploited humid closed woodlands during the AHP (low 13C, low 15N), drier more open habitats during the MHDP (higher 13C, very high 15N), and relatively closed, humid woodlands during the later Holocene (low 13C, low 15N). Iron Age peoples consumed substantial amounts C4 plants (high 13C, low 15N). Strontium isotope data for small subset of these skeletons are insufficient to reconstruct residential life histories. With a more detailed terrestrial environmental history, more human Sr isotope data and a strontium isoscape, it may be possible to test ecological models of hunter-gatherer social and territorial organization in changing Holocene environments in Malawi.

[212] *Friends in High Places. An Integrated Examination of the Long-Term Relationship between Humans and Dogs in Arctic Prehistory*
Dogs are arguably the most significant domestic species in the circumpolar North, in both their universal importance to life-ways and their near-uniqueness as a regional domesticate. The Arctic was the gateway for at least 4 independent waves of migration of dogs into the Americas, beginning as early as ~17,500–13,000 years ago, making this region particularly important for investigating not only the cultural and technological functions of Arctic dogs, but also the impact of successive introductions in the past 1,000 years on the high-latitude adaptations of prehistoric Arctic human populations.
This paper will focus on the integrated use of genetics, GMM and isotopes to reconstruct individual and population life-histories of prehistoric Arctic domestic dogs. This combination of interrelated analyses allows for a comprehensive investigation into genetic, morphological and dietary variability for the identification of domesticates from archaeological assemblages, and for examining the relationship between domesticates and wild canids in archaeological contexts. Our results demonstrate that this three-strand analytical investigation can shed new light on continuity and change in human-canid relationships during these periods of migration, providing valuable information about the relationship between humans and animals in prehistory, and the complex cultural and technological diffusions of successive human migrations across the Arctic.

Ames, Nicholas (University of Notre Dame)

[296] *Objects in Motion: The Materiality of Irish Emigration in the 19th Century World*
When departing one's home, how does an emigrant decide what to bring? In arriving at a destination, in what ways does an emigrant (re)construct their understanding of place? This paper addresses the question of materiality in emigration by investigating the objects surrounding the act departure, and (re)structuring of one's life in emigration. I focus on three facets of the material expression of emigration: the things they bring, the worlds they build, and the resulting influences they have 'back home.' Using the prism of local and regional experiences, I demonstrate how these acts of object-movement reflect wider narratives of national and international affect. Namely, how those emigrated objects reflect perceived values within a country; how the materiality of public and private spheres displays multifaceted identities and engagement with particular (and often overlapping) communities; and the ways in which emigrants shape, through remittances, letters, and return, the narratives of expectation and acts of consumption practiced 'back home.' By looking at the ways in which networks and social identities are expressed in the materiality of emigrant's lives, I aim to engage with the complex narratives of trans-locational experiences, and the act of movement, from an archaeological lens.

[171] *Animal Agents in the Human Environment*
Humans' increasingly close relationship to animals constitutes one of the most important cultural, social, and economic developments of the past ten thousand years of our history, as well as being a key factor in the changes in climate referred to as the Anthropocene. Animals are important resources of food, labor, and secondary products in many societies, as well as symbolically important features of the ritual landscape. As relationships with animals intensify, processes such as domestication ensure that humans are potentially able to control the behavior and deployment of large numbers of animals, altering ecosystems and creating an anthropogenic landscape. However, these types of relationships are heavily structured by the innate attributes of the animals involved. Pre-evolved characteristics create the set of possibilities on which human agents can act, and actions undertaken by

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

animals without the influence of humans can have major impacts on human behavior. Because of this, evaluating “human” environments as complete ecosystems with multiple players is an important part of understanding how we exist within the environment.

[257] *Inka Conquest Narratives along the Northern Frontier: Evidence from the Pais Caranqui, Ecuador*

When the Inka moved into Northern Ecuador at the end of the 15th century, they were met with fierce resistance from the semi-autonomous societies of the Pais Caranqui. Chronicler accounts and Inka narratives note that conflict occurred and fortifications were constructed before the Inka were eventually victorious and continued their conquest northwards. However, these accounts do not accurately highlight the true complexity of the groups the Inka encountered, the prolonged nature of the conflict that occurred, and the massive changes that were implemented in the region after conquest. Excavations and the resulting material evidence indicates that unlike elsewhere in the empire, the Inka had a high interest in control and fortification construction, with a low emphasis on imperial architecture, and locales within the Pais Caranqui were not all affected the same way.

Anderson, Arthur (University of New England)

[199] *Strategies for Exploring the Protohistoric Period on the Southern Maine Coast*

As investigations of the Protohistoric period move away from a reliance on the reliable material culture recovery found in burial contexts, our basis for investigation of protohistoric sites and landscapes in the Far Northeast often begins with European historical records. Recent excavations in the area described in 1607 by Champlain as the village of Chouacoet in Saco Bay, Maine highlight the fact that many of the equivalencies drawn between the archaeological record of the protohistoric and European accounts can be tenuous. This demonstrates that archaeologists must be wary of focusing on seeking the sites, or the types of sites, described by Europeans.

We should acknowledge that European visitors did not experience the same sensory or cultural landscapes as the indigenous populations. A fuller understanding of the experiences, cultural transitions and tragedies of the Protohistoric period can be gained by shifting focus to the way the indigenous inhabitants experienced and inhabited sites and landscapes. This requires a move away from European sources for exploring protohistoric archaeology, more detailed radiocarbon dating of potential protohistoric sites and components (with or without demonstrable European material culture), and an integration of the Protohistoric into wider understandings of the prehistoric Northeast.

[241] *A Study of George White through Flight and Light*

Imaging is a critical part of the archaeologist's toolkit. Likewise, the capture, manipulation, enhancement, and interpretation of images has been the subject of significant research in computing over the past 20 years. This project brought together five students studying archaeology and computing to collaborate on fieldwork—and the hardware and software that supports that fieldwork—to engage in an exploration of the life of George White, a freed slave and property owner in Madison and Jackson counties during the mid- to late-19th century, that would otherwise be impossible undertaken separately. This interdisciplinary research project relied on macro-scale, overhead drone images of sites as well as high-resolution, micro-scale RTI dome images of excavated artifacts. George White's story will add a new dimension to our understanding of the lives of freed blacks in the 19th century in Madison County and add to the growing database of significant archaeological resources located within the Berea College Forest. More broadly, this research will contribute to a greater understanding of how enslaved individuals in Kentucky purchased their freedom and established themselves as property owners in an unstable pre-Civil War world.

[135] *Drowning the Library: Sea-Level Rise and Archaeological Site Destruction in the Southeastern United States*

The impacts of past and projected climate change and specifically sea level fluctuations on heritage resources are examined across the southeastern US using site and environmental data integrated in DINAA (Digital Index of North American Archaeology). Minor changes in sea level have shaped human settlement from the late Pleistocene onward, including in recent millennia when shorelines are incorrectly assumed to have stabilized at or near present levels. In the near term, tens of thousands of known archaeological sites and historic structures, and countless more currently unknown or undocumented, will be lost given modest (1–5m) changes in sea level. Millions of people will also need to move, which, depending on where they relocate and how potential flooding is to be mitigated, will also lead to the vast destruction of heritage resources. Consideration of large linked datasets is essential to developing procedures for the sampling, triage, and mitigation of predicted losses to our collective heritage. DINAA is one of several emerging solutions to the challenge of working with the vast record about the past that has been generated. Positive, multi-organizational collaboration facilitating open access to linked heritage and environmental data from multiple sources is essential to saving the past for the future.

[146] *Like a Lion, as a Man: Seals and Poetry in Minoan Crete*

This paper investigates how parallels were drawn between lions and human in Bronze Age Crete, and how this parallelism potentially developed concurrently through material culture worn on the human body and oral narrative. I argue that the unique qualities of seal stones, namely their close association with human identity and their physical location on the human body, positioned them to be potent venues for asserting parallels between man and beast. I begin in the late Early Bronze Age, with a small group of seals engraved with a novel composition type that set humans in a direct visual and conceptual parallel with lions. I then trace the re-invention of this parallel in the glyptic of the subsequent palatial periods. Here the seal's position as a worn object was capitalized on, with the body of the beast engraved on the seal being juxtaposed with the body of the human wearer. I investigate how this parallelism was established and emphasized through the objects and compare it to the distinctive narrative device of the animal simile in Homeric epic, which was likely taking root in oral traditions at the same time.

[123] *Indian Ethnic Complexity in Hispaniola and Puerto Rico and Its Implications for the Study of European/Indian Contact During the Early Colonial Period*

Scholarly interest utilizing archaeological and ethnohistorical studies to understand the genesis and development of Caribbean creole societies has grown in the last few years. Perspectives have shifted to emphasize the diversity of groups in the Caribbean during precolonial times, and how this continued into the colonial period as Europeans and Africans coalesced in the area. The conflictual aspect of this interaction whereby Europeans imposed a system of forced labor, along with drastic Indian population losses have obscured the contributions of indigenous peoples to colonial societies and culture.

This paper summarizes archaeological and historical data for Puerto Rico and Hispaniola on the diversity of Indian groups in the early colonial period and the different ways they reacted and responded to Old World peoples. It postulates the concept of cultural transformation to explain the process of change occurring among these populations, and how they employed strategies which varied from island to island. It discusses the evidence for the persistence of Indian groups well into the colonial period and what this may imply for the formation of creole societies, and ends with a call for further archaeological research focusing on early colonial sites.

Andreou, Georgia (Cornell University)

[34] *Coastal Erosion Management in Archaeology: Turning Challenges into Opportunities*

Coastal erosion is a known problem in cultural heritage management, particularly in the Mediterranean, which lends itself exceptionally well to studies of maritime trade and connectivity. The loss of coastal land to erosion presents a serious obstacle to our understanding of the archaeological coastscape, due to the unpredictable rate in which it exposes and damages archaeological features. The exposure and subsequent disappearance of material culture is seldom accompanied by systematic archaeological recording. As a result, a wide range of past activities associated with the coast remain unrecorded, their context poorly understood and our understanding of past human interaction at local, regional and inter-regional scales impaired. Coastal erosion is, thus, both a predicament of cultural heritage preservation and an epistemological problem.

Since 2014 the Cyprus Ancient Shoreline Project employed integrated methodologies to record, monitor and contextualise the impact of coastal erosion on the cultural heritage of the south-central coast of the island of Cyprus. In this paper I present some of the results of the lab- and field-based methodologies we implemented to quantify and monitor the loss of information. I also demonstrate how we turned the problem of coastal erosion into new opportunities for understanding the Cypriot coastscape.

[176] *Not All Distance Is Kilometric... Obsidian Procurement and Exchange at Salinas de los Nueve Cerros and Cancuen*

During the Classic period most lowlands cities imported obsidian from the El Chayal source, the other two major high quality outcrops (SMJ and Ixtepeque), being in the minority by comparison. Despite the fact that much has yet to be understood about the way this material was transported from the Highlands to the Lowlands, the recent discoveries at Cancuen of a single cache containing hundreds of complete prismatic cores demonstrated that this site played a major role in the production and export of El Chayal obsidian blades to the rest of the Lowlands during the Late Classic period. However, Salinas de los Nueve Cerros, located only 40 km from Cancuen, happens to be the only Lowland Late Classic site presenting a higher rate of SMJ than the El Chayal material. This data raises many questions about the possibility of Salinas being related to another exchange sphere than the classic Lowland Maya one, and enables us to discuss questions of contacts, and frontiers between these two major sites.

[21] *An Early Archaic Melting Pot in the Southern Rocky Mountains: Early Holocene Mobility and Settlement Patterns in the Gunnison Basin, Colorado*

In comparison to the Late Paleoindian Period (10,000–8,000 rcybp), the Early Archaic (8,000–6,500 rcybp) in the Gunnison Basin, Colorado is a poorly understood time because of its relatively light archaeological signature. Not only is the archaeological record more ephemeral, but we also see a change in technologies, such as projectile points types, in this transitional period. Some archaeologists explain these observations as a result of changing environments and shifting settlement processes as new populations moved into the basin. Preliminary research has shown that Early Archaic projectile point types from the Rocky Mountains, Great Basin, Southwest, and Great Plains are all present in the Gunnison Basin. Using multiple lines of evidence, I investigate the settlement and mobility patterns of the people who lived in the Gunnison Basin during the Early Archaic Period.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Anklam, Andrew and Dan Wendt**[239]** *Modeling Proglacial Shore Lines of Glacial Lake Agassiz around Prehistoric Quarries in Northern Minnesota*

Since 2009 the Knife Lake siltstone quarries in the Boundary Waters Canoe Area Wilderness of Minnesota U.S. quarry district have been the focus of archaeological and geoarchaeological research. A recent survey conducted in 2014 and 2015 identified several relic beach features at varying elevations above the current water line of Knife Lake. GIS was used to model and predict these proglacial lake shoreline features to better understand the procurement patterns of Knife Lake siltstone, a prominent lithic material in Minnesota. It is believed that these beachlines were formed by successive phases of a proglacial lake and may relate to an eastern extension of glacial Lake Agassiz during the Late Paleoindian period when several of the Knife Lake quarries were active.

Using the elevation of relic beach features identified by survey, several different inundation maps were made using GIS to visualize the Knife Lake area during each of the different phases of the hypothesized proglacial lake. The maps were made using LiDAR data freely available from the Minnesota Geospatial office. These maps are being used to help archaeologists better understand the potential distribution of archaeological sites on relic beaches at an unexpected distance from the present extent of Knife Lake.

Anschuetz, Kurt F. (Rio del Oso Anthropological Services, LLC) and Richard I. Ford (University of Michigan, Emeritus)**[297]** *Earning Their Living: Archaeologies of Ideation, Ritual, and Agricultural Practice in the Southwestern Pueblo Landscape*

Agriculture among the northern Southwest's Pueblo communities traditionally and historically was more than merely an economic activity through which the people "made their living." Steeped in ritual and informed by principles of stewardship, spiritual ecology, and ensoulment that explicate their orientation within the Natural World and their obligations to the Supernatural World, indigenous agricultural practice was literally and figuratively a key element in each individual's everyday observation of their respective community's spiritual belief. Interacting with their plants, soils, and water in terms of these fundamental understandings, Pueblo people "earned their living." Our discussion draws from our ethnographic work with Tewa and Western Keres Pueblo representatives, as well as our field studies of the archaeological traces of late prehispanic and early historic agricultural fields and associated blessing features in the greater Tewa homeland of northern Rio Grande Valley and the Western Keres Culture Province of west-central New Mexico. We examine the organization of agricultural field rotation and short-term sedentism through the lens of the Pueblo cultural landscape theme of movement to contribute a richer understanding of the body of interrelated rituals metaphors expressed in the core Pueblo idea that "People are Corn."

Anthenien Jr., Ralph A. [46] see Sagripanti, Jose-Luis

Anthony, Alexander**[296]** *"Irishness" and Tea Consumption: The Materiality of Ethnicity*

Excavations at the McHugh Site (47WP294), a mid-to-late Nineteenth Century homestead in Wisconsin, resulted in the recovery of a large material culture assemblage. Historical documents reveal the site's occupants to have been pre-famine Irish emigrants who settled in Ohio before moving to Wisconsin in 1850. However, analyses of the material culture have thus far failed to uncover evidence of an Irish identity distinct from an American identity. This paper presents results of an analysis of the teaware component of the McHugh ceramic assemblage that attempted to identify potential markers of traditional pre-immigration behaviors. Since tea is consumed by cultures across the world, the presence of teaware alone is not enough to indicate "Irishness." Thus, this study explores the correlates of the material manifestation of tea consumption within the McHugh household and offers a comparison with selected contemporary sites as well as modern Irish and Irish American households. The aim of this study is to discover if there is an inherently Irish style of tea consumption and to determine whether or not the associated behaviors can inform our understanding of the McHugh assemblage.

Anthony, David (Hartwick College) and Dorcas Brown (Hartwick College)**[212]** *The Dogs of War: A Bronze Age Initiation Ritual in the Russian Steppes*

At the Srubnaya-culture settlement of Krasnosamarskoe in the Russian steppes, dated 1900–1700 BCE, a ritual occurred in which the participants consumed sacrificed dogs, primarily, and a few wolves, violating normal food practices found at other sites, during the winter. At least 64 winter-killed canids, 19% MNI/37% NISP, were roasted, fileted, and apparently were eaten. More than 99% were dogs. Their heads were chopped into small standardized segments with practiced blows of an axe on multiple occasions throughout the occupation. The repeated violation of the canid eating taboo, unique to this site, combined with the metaphor of human transformation into male canids, suggests that the participants entered a liminal state typical of a rite of passage. Parallels from comparative Indo-European (IE) mythology provide the indigenous narrative that gave meaning to this ritual: we argue that it was an initiation into the widely attested IE institution of youthful male war-bands, symbolized by transformation into a dog or wolf.

Antonelli, Caroline (University at Albany—SUNY)**[254]** *Landscape Modification Seen from Above: Remote Sensing Analysis at Postclassic Mayapan*

This paper examines shifting environmental paradigms in the Maya realm. Using Mayapán as a case study, a site long-considered to be located in a "marginal" environment for agricultural productivity, I will evaluate site resilience, sustainability, and self-sufficiency and use these concepts to create a more nuanced perspective of human-environment interactions. Data from Mayapán will be cross-referenced to other similar sites across the Maya region. I will show that assumptions about the environment in the Northern Yucatán Peninsula is rooted partly in culture historical interpretations of the previous century. Modern investigative techniques from the last twenty years have allowed for more robust scientific research that contrast the environmental perspectives of the past, challenging these long-held beliefs and opening up new avenues of research. These new investigations show that the environmental history of the Maya in the Northern Yucatán Peninsula is even more complex than previously understood. Occupation in this area is both highly adaptive and stable at different points in time.

Antonio, Luz (Proyecto de Investigación Arqueológica Prehistoria Urbana de Huari)**[300]** *Relaciones estilísticas y culturales en un contexto temprano del Horizonte Medio*

Enmarcado dentro del Proyecto de Investigación Prehistoria Urbana Huari 2017 se realizó un hallazgo peculiar de objetos cerámicos interrelacionados temporal y espacialmente. El grupo de objetos encontrados—que preliminarmente tiene relevancia simbólica temprana—fue hallado como un relleno de prepiso y con posibilidad de uso ritual. Su importancia es que es el primero en encontrarse de manera intacta e interrelacionado con una posible arquitectura doméstica.

Entre las preguntas preliminares que genera este grupo de objetos está su función, la filiación estilística y la temporalidad dentro de las actuales cronologías propuestas y al interior del propio sitio arqueológico Huari.

El trabajo se enfocará en el análisis de los rasgos estilísticos, para la cual se revisaran los estilos analizados y descritos por Menzel y los planteamientos de autores posteriores. La observación de pastas servirá para diferenciar estas vasijas de otros objetos cerámicos asociados que los

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

circundaban. El objetivo es establecer las relaciones estilísticas y culturales de este interesante hallazgo y lograr un aporte para este importante proyecto de investigación que ha generado inquietantes luces en su primera temporada de excavación.

Antoniou, Anna (University of Michigan) and Earl Davis (Shoalwater Bay Tribe)

[250] *Collaborative Archaeology in Willapa Bay, Washington: Supporting Communities through Scientific Research*

How can archaeologists and indigenous communities work together to transform an understanding of prehistory into something that serves the community's goals? Since the 1990's archaeologists have become increasingly dedicated to developing new ways to directly and meaningfully engage descendant communities. This paper presents a case study of collaborative and applied archaeology from the Pacific Northwest Coast. In it, we describe our ongoing efforts to collaboratively define the questions, methods, and outcomes of archaeological investigations at Nukaunanlh Village in Willapa Bay, Washington. Through rigorous scientific analyses of archaeological deposits, oral histories, and ethnohistorical accounts pertaining to prehistoric subsistence practices, we aim to support and reinvigorate culturally important foodways that are in danger of being lost within the current descendant community. In particular, we hope that results stemming from our collaboration will aid in the community's legal battle to regain their ancestral fishing rights.

Aragon, Leslie (Archaeology Southwest)

[91] *Identity and Ideology in the Hohokam Ballcourt World*

The Hohokam Ballcourt World encompassed much of the middle Gila River watershed from around A.D. 800 to 1100. The widespread ideology that many archaeologists associate with the use of ballcourts correlates with an expression of group identity that manifests itself in the archaeological record as the suite of traits that mark the Hohokam pre-Classic period. Despite the fact that archaeologists commonly define groups based on their material culture, these groups are not static. Parts of identity within them are often fluid, changing with the prevailing socioeconomic tides, while other parts of identity are more persistent. This project will combine multiple material classes into a framework capable of assessing multiple scales of identity during an important period in the Hohokam pre-Classic, when a new religious ideology—the Hohokam Ballcourt World—developed, spread, and eventually declined. The goal of this study is to use a multiscale approach to identity, emphasizing both active and latent expressions, to demonstrate that outward displays of cohesion at Hohokam sites mask underlying social diversity related to persistent local identities.

[2] *A Major Hiatus in the Mid-Holocene Archaeological Record of Eastern South America: Reassessing the "Archaic Gap"*

A decade ago, we suggested that the low frequency of archaeological sites dated from the mid-Holocene in several portions of Lowland South America (what we have called the "Archaic Gap") was due to an increase in the magnitude of dry periods. Since then, data regarding paleoenvironmental reconstructions for Lowland South America, coupled with an increase of the archaeological knowledge, allows us to reassess the idea of the "Archaic Gap" and redefine both the areal extent of the phenomenon and its possible causes. However, as expected when larger data sets are available, it is possible to perceive oscillations in the archaeological signal that suggest reoccupation of some areas. Although we maintain that the main reasons underlying these patterns are still related to climate, they are most probably related to an increase in climatic variability, and not necessarily to an increase in dryness.

Arbuckle MacLeod, Caroline (University of California, Los Angeles)

[32] *Ethnoarchaeology in Egypt's City of the Dead*

Many of the initial approaches to understanding ancient cultures were centered on ethnographic observations. These early studies tended towards overly simplistic arguments that often either overtly or inadvertently supported social Darwinism. Recent applications of ethnoarchaeology have also been accused of falling into similar pitfalls. While the critics are right to highlight the limitations of this approach, scholars can avoid making dangerous assumptions by working alongside the societies they wish to study. Working with modern communities to interpret the past is a valuable technique that can reveal different ways of doing that may not have originally occurred to the investigator. This paper shows how the assistance and guidance of carpenters living and working in Cairo's City of the Dead has enabled a more nuanced and realistic view of ancient woodworking practices. These modern artists have inspired hypotheses that, when tested against the material evidence, have led to a new understanding of technological processes and the position of craftspeople in ancient Egyptian society. Through this case study, the responsible application of ethnoarchaeology is explored in order to demonstrate its use as an invaluable tool for archaeological interpretation.

[88] *The "Provence-Alpes Côte d'Azur" Regional "Human Bone Library": A Tool for Anthropological Research and for the Preservation of Human Remains*

Following an evaluation between 2004–2006, it appeared that more than 200 anthropological series had been assembled following excavations led in Provence Alpes Côtes d'Azur (PACA) region. These extremely scattered series had not all been subjected to a precise inventory, were disparately curated or even lost. Therefore, most of these collections were not or no longer accessible to scientists. Faced with this question concerning the heritage preservation, different regional actors invested in anthropological research argued on the best way to improve this situation. It was decided to create the "human bone library of PACA region". Today, the "human bone library" is part of the regional archeological deposit of the French Ministry of Culture and Communication in charge of curating archeological material. The "human bone library" comprises close to about 6000 subjects overall dating from the Neolithic to the Modern period. Now, with a little perspective, we can confirm that this "human bone library" is starting to impact

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

anthropological research and valorises the collections on regional and national levels.

Besides presenting the "human bone library", this talk aims to highlight the conditions of the collections and of anthropological research in Southern France before and after this scientific management tool was implemented.

Ardelean, Ciprian (University of Zacatecas, Mexico)

[79] *The Chiquihuite Cave in Zacatecas, Mexico: Cultural Components, Lithic Industry and the Role of This Pleistocene Site in the Peopling of America*

The high altitude Pleistocene site of Chiquihuite Cave, in the Central-Northern Mexican Highlands, is slowly turning into one of the most important players on the sensitive stage of the debates about the earliest human presence in North America. After the first three exploration seasons and before the imminent continuation of the excavations at this multi-component archaeological site, we can surely talk about several important Late Pleistocene, older-than-Clovis occupational phases. Dozens of radiocarbon and luminescence dates confirm the chronological sequence of this prehistoric locality spanning over millennia. The sediments produced chemical signatures of human presence, as well as interesting palaeoenvironmental indicators. The complicated lithic industry at the Cave, based on silicified limestone, shows a large array of taxonomic units, revealing strange but consistent technological approaches: flakes and blades, scrapers, burinated points, points on transversal flakes, bifacial and unifacial tools, intentionally fractured calcite and quartz laminae and so on. The explorations at Chiquihuite are the result of an international and interdisciplinary effort. Novel techniques have been implemented and the results produced a complex view of the ancient archaeological record. Dennis Stanford himself and the Smithsonian Institution played an important role at the very beginning of this scientific endeavor.

Ardren, Traci (University of Miami)

[254] *Household Garden Plant Agency in the Creation of Classic Maya Social Identities*

Domestic gardens are a well-established aspect of Classic Maya residential settlement, and they are rightly considered important components of food security and even food sovereignty strategies utilized by the ninety-nine percent. Taking inspiration from the emerging field of human-plant studies, I argue daily interactions with household garden plants exerted a profound influence on not only the daily habits of ancient Maya populations, but also on their memories and sense of social identity. Tending gardens was a repeated behavior that almost all members of the social majority shared in common. Taking a perspective that common Maya garden plants such as chaya and chile were agents in, rather than objects for, the production of knowledge and social meaning, this paper argues that household garden plants actively helped shape crucial aspects of Classic Maya social identities along gendered and age based axes. Data on domestic compounds from the site of Yaxuna are used to illustrate how, through human circulations within garden spaces located between structures, plants and humans co-generated cultural values, practices, and relations.

Areche, Rodrigo (Qhapaq Ñan Project)

[65] *Evaluando la explotación de los recursos malacológicos en el Cerro Azul prehispánico*

El impacto de la expansión Inca a lo largo de los Andes Centrales ha sido documentado y conceptualizado de diferentes maneras. Ciertas elites de los grupos culturales locales inmersos en este proceso tuvieron un escenario beneficioso que permitió una reformulación en las relaciones políticas y económicas en diferentes grados y escalas. Presentaremos el caso de Cerro Azul o también conocido como la gran fortaleza del Huarco en el valle de Cañete de la Costa Centro Sur de Perú. Este sitio es reconocido etnohistóricamente por su fuerte componente inca, también como lugar de elites de pescadores locales. Los datos de excavación del Proyecto Qhapaq Ñan en Cerro Azul sugerirían un crecimiento y reorganización espacial a la llegada inca.

Los análisis y comparaciones del material malacológico proveniente de basurales en edificios de élite evalúan el rol de la explotación, se plantean áreas de captación y una variabilidad y densidad de especies malacológicas que indicaría una jerarquización económica y política entre las élites de pescadores en Cerro Azul durante la ocupación inca.

Arend, Tiffany [261] see Barnes, James

Arias, Pablo (Universidad de Cantabria)

[136] *Paleolithic Art and Ritual: An Exploration on Human Activity inside Caves in Southwestern Europe*

Caves provide a privileged context for the study of Prehistoric ritual activity. Inside them, we enjoy the unique possibility of directly observing and analyzing spatial features that have hardly changed (and in some cases have not changed at all) since the Paleolithic. However, the poor preservation of the archaeological evidence during the earliest years of the research, and particularly the enormous cultural gap between the Paleolithic codes and systems of beliefs and the modern observers hinder the reconstruction of the events that may have taken place in those places.

In this paper, the available evidence on human action in caves with rock art of southern France and northern Spain will be described and analyzed. We will address relevant topics such as the spatial relationship between Paleolithic graphics and scenographic features of the caves (visibility of the paintings and engravings, capacity of the chambers, sound properties of the decorated areas...) and the evidence of human actions inside the karst (footprints, paths, archaeological items in passages and walls, artificial modifications of the cavern space...). The case of areas of concentration of portable art inside caves, such as Enlène and La Garma, will also be included in the discussion.

Arias, Veronica (West Texas A&M University)

[44] *An Isolated Middle Archaic Bison Kill Site in the Northern Texas Panhandle*

The discovery of a nearly complete, articulated *Bison occidentalis* in association with a Calf Creek projectile point in the northern Texas Panhandle in 2002 constitutes one of the few known Middle Archaic archaeological sites in the region. As the remains were found incidental to the construction of a

new municipal swimming pool, documentation of the excavation and any subsequent analysis were less than ideal. A recently obtained AMS radiocarbon date of the remains at 5115 RCYBP falls within the established time range for the Calf Creek Horizon. This paper reports on the results of new faunal, lithic sourcing, and paleobotanical analyses conducted on materials from this site. It focuses on the context of the discovery of the Stinnett Bison Site, the material culture, and the implications for past human activity in the area. As the only Middle Archaic site excavated in the Texas Panhandle to date, it offers insights into the nature and timing of occupation during the late Allthermal period. The results of the present study both conform to what has been established about the Calf Creek Horizon elsewhere and expand our understanding of it.

[19] *Estudio arqueológico preliminar de un posible sitio olmeca: Antonio Plaza, Veracruz*

El objetivo de la ponencia es presentar los resultados preliminares del programa de mapeo intensivo en Antonio Plaza, Veracruz—un posible sitio olmeca ubicado en la cuenca alta del río Uxpanapa en la costa del Golfo de México—. Dicha etapa de análisis revela información proveniente de la superficie terrestre y es portadora de numerosas ventajas para el futuro planteamiento de un programa de reconocimiento de superficie. El estudio empleó el análisis de la información a través de Sistemas de Información Geográfica (SIG) lo que permitió la comprensión de la superficie y la ubicación geográfica y gráfica de los sitios. Se presentará el análisis espacial y la elaboración de mapas temáticos sobre delimitación de áreas próximas, costos y distancias, rutas mínimas, accesos, índice de vegetación de diferencia normalizada (NDVI), modelos de superficie en 3D. Los resultados preliminares dan cuenta de lo que se ha realizado en el proyecto, así como de la identificación de elementos claves para el planteamiento de una etapa siguiente en torno al recorrido de superficie sistemático, esta vez con información previamente valorada de manera intensiva a través de las nuevas tecnologías en la arqueología.

Arikan, Bulent

[71] *Modeling the Changes in the Surface Processes at Arslantepe (Malatya) during the Early Bronze Age-I (ca. 5000–4750 cal. BP)*

Agent-based modeling of land use not only illustrates how ancient production mechanisms evolve, but such models also have the power to reconstruct changes in spatio-temporal changes in the dynamics of surface processes in relation with the changes in climatic conditions and varying type and intensity of human land use. Early Bronze Age-I at Arslantepe represents a time period when the paleoclimatic dynamics changed towards more arid conditions while the economy of the site shifted from intensive irrigation farming to site-tethered pastoralism. Concurrently, the social organization moved from a hierarchic to a heterarchic structure. Extensive geoarchaeological research around the site suggests a low rate of sediment deposition for this phase. Under more arid climatic conditions, it is expected that various modes of land use would have different impacts on the surface processes. The results of numerous scenarios tested in agent-based models at Arslantepe during the Early Bronze Age-I show that the rates of erosion and deposition change as patterns of precipitation and the mode of land use change. The results of simulations prove that the shift in economic and social organization alleviated the environmental disturbance that the residents of Arslantepe were faced with at the onset of the Middle Holocene.

Arksey, Marieka (Office of the Wyoming State Archaeologist), Paddington Hodza (University of Wyoming Geographic Information Science) and Greg Pierce (Office of the Wyoming State Archaeologist)

[42] *WyoARCH: Increasing the Impact of Archaeological Repositories through Spatially-Enabled Collections Management*

The University of Wyoming Archaeological Repository (UWAR) is the largest archaeological collection and the only federally-regulated repository in Wyoming, providing an unprecedented centralized location for researchers and the public to discover and engage with the 16,000 years of human occupation in this part of North America. However, the current collections management system at UWAR does not facilitate public dissemination of this data, nor does it enable curatorial staff the ability to properly support researchers, educators, or the public in making effective use of the collections. The Wyoming Archaeological Research and Community Hub (WyoARCH) project seeks to resolve this situation through a collaboration between UWAR and the Wyoming Geographic Information Science Center (WyGIS) to develop a public access interface to interact with a new spatially-enabled collections management system.

Arkush, Elizabeth (University of Pittsburgh)

[207] *Land Use, Settlement Patterns, and Collective Defense in the Titicaca Basin: The Constitution of Defensive Community*

This paper starts from the hypothesis that “community” in the Andean highlands in the Late Intermediate Period (LIP) had a great deal to do, not only with kinship and territory, but also with collective defense, including the defense of important common resources. If so, how would the socioeconomic activities of farming and herding have affected the practical organization of defense, and the formation of communities based in part on common defense? I draw on the archaeological record of the Titicaca Basin for a preliminary exploration of this question. The production regimes used by Titicaca Basin peoples changed markedly over time, shifting from intensified agriculture in the Middle Horizon to relatively risk-averse strategies of pastoralism and rain-fed terrace cultivation in the LIP. But notwithstanding many basic cultural similarities among LIP Titicaca Basin societies, there are significant contrasts across this large region in the opportunities the land affords for farming and herding and the relative importance of these activities in late pre-Columbian times. These regional contrasts provide an opportunity to explore how farming, herding, and related settlement patterns influenced the organization of defense and the constitution of LIP communities.

Armit, Ian (University of Bradford)

[144] *Can We Define a British Iron Age?*

The Iron Age in Britain has traditionally been seen as a period of hierarchical, warrior-based, Celtic societies, characterised by hillforts, defended settlements and elaborate weaponry. The dominant interpretive models have emanated from Wessex—that area of central southern England where the largest and most impressive hillforts are found. In recent decades, however, archaeologists have increasingly recognised the marked regional differences inherent in Iron Age societies across different parts of Britain. As a result, the conventional, Wessex-dominated models have fallen from favour and been replaced by a myriad of regionally-focussed analyses. This approach, however, has its own problems. Different regions of Britain might have very different archaeological sequences in the Iron Age, yet there are some traits (including the uptake of continental La Tène art styles, the paucity of visible burial rites and the use of the roundhouse as the normative domestic form), that display a layer of cultural unity underlying this apparent variation. This paper explores how we might reconcile these tensions between regional distinctiveness and broad-scale cultural similarities across the British Iron Age.

Armstrong, Aaron and Martha Tappen (University of Minnesota (Twin Cities))

[217] *Implications of Efe Ethnoarchaeology for Recognizing Human-Derived Faunal Assemblages and Carcass Processing Decisions*

Archaeological analyses of faunal remains frequently rely on observations derived from ethnoarchaeological studies to identify bone surface modifications that were the result of animal capture, butchery, and consumption by humans. In addition to the accurate identification of human-derived modifications, ethnoarchaeological studies in which carcass processing and consumption were observed and documented can provide a more precise means to recognizing specific human behavioral choices, such as carcass skinning, defleshing, disarticulation, marrow and grease extraction, and, ultimately, culturally-mediated processing decisions. However, many zoo-ethnoarchaeological studies have focused on larger bovines, and it is not clear that smaller animals retain similar types and frequencies of human-induced surface modifications. In this paper, we present analyses of size 1 bovines (<20 kg body weight) captured, butchered, and consumed by Efe foragers of the Democratic Republic of Congo and ethnoarchaeological observations of animal capture, carcass processing, and consumption. We document the frequency, location, and morphology of bone surface modifications as well as skeletal part frequencies, butchery patterns, and processing decisions. Our study provides a control assemblage focused on size 1 bovines and reveals that their carcass remains exhibit numerous bone surface modifications that are the residues of specific behavioral choices of the Efe.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Armstrong, Chelsey Geralda and Christina Sam-Stanley (Research Office, Kitsumkalum First Nation)**[114]** *Fruits from the Ancestors: Tsimshian Forest Gardens in the Pacific Northwest*

The historical ecology of Dalk Gylakyaw, the ancestral village of the Gitsm'geelm Tsimshian, is a community-based research program that focuses on connecting the past to the present using a heterarchy of ethnographic, ethnohistorical, and archaeological methods that are organized from Tsimshian Adawx, worldviews, and community objectives. Traditional resource management and environmental wisdom are explored as a means of investigating the archaeological past in less invasive ways. In this context, we explore how descendant communities connect as intensely with the plants that continue to grow above ground at ancestral village sites—their names, smells, stories, tastes, and management practices—as they do with traditional archaeological materials and features found below the ground, such as stone tools or cultural depressions. Living heritage embodied by plants provide touchstones of memory and literally bring forth the fruits of the ancestors.

Armstrong, Douglas (Syracuse University)**[123]** *Indigenous and Transcultural Implications in the "Seasoning" of Early 17th-Century Settlers of Barbados*

The early 17th century settlement of Barbados is often projected as "Little England" and the settlers unidimensional as "Englishmen Transplanted" onto a rather blank slate of an abandoned island (Puckrain 1984, Gragg 2003). Current archaeological investigations of the initial period of colonial settlement on Barbados focusing on Trents Plantation, and the pre-sugar era (1627–1640s) project an all-together different picture. The archaeological and historical record projects a multivalent, multicultural, mix of engagements between Indigenous, African, and European settlers. This complexity is expressed in the material record, particularly with the mix of locally produced and imported ceramics from the early 17th century plantation context at Trents. The emerging colony on Barbados was English in name, but backed by the Dutch, and assisted by a group of Indigenous people who joined them from Guyana and Africans captured from a Portuguese ship. Moreover, this colony was established in the 17th century Caribbean, a theater contested by the Spanish, Portuguese, Dutch, and English, as well as a complex array of Indigenous peoples. The result was the construction of a complex multi-vocal cultural ensemble of cultural and material expressions that is consistent with the dynamic cultural diversity that emerged in the region.

Arnauld, Marie (CNRS)**[169]** *Cities on the Move across Northwestern Mesoamerica: Contribution by Dominique Michelet*

The paper aims at enhancing the contribution by Dominique Michelet and his teams to the knowledge of sedentism and urbanization on the northern and northwestern fringes of Mesoamerica (mainly San Luis Potosí, Guanajuato, Michoacán, Mexico). Distinct processes of mobility, migration and agglomeration developed in those regions, in particular with reversibility of sedentary life related to multiple factors, among which climatic and agrarian cycles are only partly known so far. Specific community organizations were plausibly experienced through a series of 'transformative relocations' (Nelson et al.). The latter would have produced Postclassic urban capitals like Tula, Hidalgo, as well as 'pre-Tarascan' and 'Tarascan' large and compact settlements like Milpillan, and Malpais Prieto, (Malpais de Zacapu, Michoacán). Michelet brought up detailed results of fieldwork explorations combined with acute perception of broad environmental, subsistence and cultural changes on a Mesoamerican scale.

Arnold, Philip (Loyola University Chicago)**[128]** *A Fettered Serpent? Quetzalcoatl and Classic Veracruz*

Great is the conflation of Ehecatl Quetzalcoatl and Topiltzin Quetzalcoatl: a mythical player in the world creation of Mesoamerican groups vs. a semi-historical personage who presaged the arrival of Hernán Cortés. Veracruz, a region implicated via the activities of both avatars, is particularly enmeshed in this duality.

The Postclassic narrative whereby Quetzalcoatl journeyed to the Gulf lowlands appears to be foreshadowed in the desecralization of Teotihuacan's Feathered Serpent Pyramid at the end of the third century AD. This ritual destruction has been linked to a political realignment at Teotihuacan, instigating the departure of refugee groups who fled the Basin of Mexico.

The founding of Classic Period Matacapán, in the Tuxtla Mountains of southern Veracruz, may have been linked to this exodus. This paper considers the regional impact of this relocation via the appearance of Quetzalcoatl imagery along the Veracruz lowlands, both through overt representations as well as potential proxies (e.g., Reptile Eye glyph, Venus symbolism, the Ehecaocozatl "wind jewel"). Variations in how Feathered Serpent imagery is manifest could well reflect autochthonous lowland ideals versus notions related to an intrusive highland cosmivision. Thus, not all Quetzalcoatl imagery is equal, nor is it equally unfettered.

[198] *From Bayira, the Earliest African Genome, to a Place of Refuge: Mota Cave's History in Southwestern Ethiopia*

Mota Cave located in southwest Ethiopia was found in 2011 in collaboration with local Gamo elders and partially excavated in 2012. The cave has exposed a long sequence of occupation (5295 Cal BP to 305 BP) revealing remarkable technological, subsistence, and cultural changes. We uncovered a burial of a male with the earliest complete ancient genome recovered from the African continent. We have named him Bayira, meaning "first born" in the Gamo language where the cave is located. Bayira begins to tell a story of how people were utilizing the Gamo highlands 4500 years ago. In addition to Bayira, Mota Cave contains a diverse lithic assemblage, as well as the onset of pottery. The cave has revealed evidence for the beginning of food production in the region. Fauna and flora remains suggest that agropastoralism began over the last two millennia. The excavations suggest that Mota Cave was utilized for a variety of purposes from a mortuary site to a living site to a place to seek refuge in times of conflict. The southwest Ethiopian highlands provides a unique perspective on the ending of the African Humid Period and its aftermath providing us with exciting insights on Eastern Africa's past.

Arthur, Kathryn (USF St. Petersburg), Sean Stretton and Matthew Curtis

[210] *Mapping Historical Sacred Spaces in Southern Ethiopia*

In 2011, we began a collaborative project with Boreda Gamo communities of southern Ethiopia to understand the spatial and historical relationships between settlements and sacred areas. Community elders guided us along winding footpaths that ascended 9 mountain tops leading to settlements that were first occupied in the early 13th century and have now been abandoned for nearly 100 years. Surrounding these historic settlements are sacred groves with springs, caves, and boulders that give physical evidence in their Indigenous religion of the animation of the non-human world. Yet, the canopy of trees also harbored cemeteries, Orthodox Churches, and stacked stone walls, berms, and trenches that reveal a history of conflict. We use Geographic Information Systems software in conjunction with collected locational data, physiographic and land cover data, oral traditions, toponymical associations, historic maps, and other documents to build historic settlement and environmental models. Using spatial data in collaboration with community knowledge we can begin to understand the complex local histories related to the introduction of Christianity, conflict, and environmental change.

Athenstädt, Jan (University of Konstanz), Lewis Borck (Faculty of Archaeology, Leiden University), Leslie Aragon (Archaeology Southwest), Corinne L. Hofman (Faculty of Archaeology, Leiden University) and Ulrik Brandes (University of Konstanz)**[287]** *Plain Ware and Polychrome: Quantifying Perceptual Differences in Ceramic Classification*

In the course of the NEXUS1492 project in the Caribbean we are interested in potential differences in the perception of archaeological ceramic sherds. A pilot study was conducted across four states in the US Southwest, to explore how different groups of peoples cognitively sift experiential information of ceramic sherds.

In different sorting exercises, participants of the study were asked to arrange the sherds according to their perceived similarity based on standardized questions. The spatial arrangement of the sherds is averaged within the groups and used to quantify variation and similarity between individuals and between groups.

In this presentation we will discuss the results of the study and evaluate the results in regard to the following questions:

- Does the perception of pottery differ within and between groups of peoples?
- Are there implications of these differences for archaeologists?

Ideally the results can help archaeologists refine their social interpretations of ceramic data.

Atici, Levent (University of Nevada, Las Vegas)**[217]** *Explanatory Frameworks in Zooarchaeological Research: Are Dichotomies Necessary and Meaningful?*

Zooarchaeologists have often employed binary oppositions such as “urban consumers” and “rural producers” and distinguished between centralized/regulated and decentralized/unregulated animal economies with direct/indirect food provisioning systems to elucidate pastoral economies of early complex societies. As zooarchaeologists, we are tasked with bridging more abstract and ideational anthropological variables with the archaeological hard evidence as well as with a narrower set of more explicit zooarchaeological measures, thus moving from heavily fragmented animal bones to complex and abstract human behaviors. A large corpus of cuneiform tablets from the Middle Bronze Age (ca. 2000–1750 BC) urban center of Kanesh (the archaeological site of Kültepe, Kayseri, Turkey) provide direct and indirect evidence for various aspects of agropastoral economy and offer detailed information on food ways with specific reference to animals. Thus, we have a unique opportunity to question the applicability and meaningfulness of dichotomized approaches to organization of every state or society in the ancient Near East or elsewhere. Theoretically, I focus on centralization and bureaucratic control, asymmetrical access and inequalities, and production-distribution-consumption dynamics. Methodologically, I bring together as many independent lines of evidence as possible with special emphasis on combined use of zooarchaeological and historical data to develop comprehensive and fine-resolution pictures.

Atkins Spivey, Ashley (Pamunkey Indian Tribe)**[255]** *“To leave a part of who you are here:” Reusing and Reimagining the Archaeological Record on the Pamunkey Indian Reservation*

Archaeologists rarely examine the reuse and reimagining of artifacts within contemporary Indigenous communities. The Pamunkey Indian Tribe, located in the Tidewater region of Virginia, has a long history of utilizing materials from the Reservation's archaeological record in a variety of ways. For over a century, tribal members have reused artifacts in methods similar to their intended function, and they have reimagined them to create artwork and encourage artistic inspiration. Archaeology has always played a visible role in the lives of Pamunkey tribal members, from the exhibitions displayed at the community's museum, to the multitude of artifacts one can find along the surrounding banks of the Pamunkey River. Unfortunately, this visibility and engagement on the Reservation is in stark contrast to the archaeology of Native Americans elsewhere in the region. Interweaving Pamunkey perspectives, opinions and memories with ethnographic and archaeological research, this paper contextualizes tribal members' reuse and reimagining of the Reservation's archaeological record throughout the past century. Recognizing that the purpose, use and meaning of the archaeological record are varied among Native communities, the research conducted with the Pamunkey community demonstrates those various perceptions can aid archaeologists in our interpretations of the archaeological and material records.

[255] *Chair***Attarian, Christopher****[37]** *Complementary Economic Specialization in an Emerging Decentralized Exchange System: A Case from the Late Classic Naco Valley, Honduras*

This paper describes the reuse of a small structure at Late Classic (CE 600–900) Site 426 in the Naco Valley, northwest Honduras. The structure shows evidence of being converted from residential use to firing ceramic vessels. The current interpretation of the structure's reuse is that it emerged as a center of ceramic manufacture as power waned at La Sierra, the valley's previous political capital. In this context, Site 426's residents, along with their immediate neighbors, sought some prominence and economic security by engaging in the complementary production of different goods for their own use and exchange with others within and beyond the valley. Recovery of a cached Peten polychrome vessel at the structure implies that this strategy enjoyed some success.

[337] *El Achiotal in Context: Settlement and Geopolitics in the Northwest Peten, Guatemala*

This paper presents research carried out by members of the Proyecto Regional Arqueológico La Corona at the site of El Achiotal since 2009, with emphasis on new findings since 2015. Occupation at the site spans the Late Preclassic and Early Classic periods (roughly the 1st to 5th Centuries AD, with the possibility of some earlier occupation). An inscribed stela discovered in 2015 provides critical insight into the geopolitics of the Early Classic period and establishes greater time-depth for some known aspects of Classic Maya statecraft. Moreover, an airborne LiDAR survey carried out in 2016 and ground-truthed during the 2017 field season indicates that El Achiotal may have been part of a larger and more complex settlement system than was previously recognized. The survival of this political and demographic system during the transition to the Early Classic period, when monumental construction decreased or stopped altogether at many large centers in the region, will be considered in ecological and political terms.

[143] *Strategies for Understanding Biomolecular Preservation within Archaeological Collections*

Technological and analytical advancements of biomolecular techniques allow scientists and museums to explore and assess archaeological collections from a new perspective, revealing new insights into past peoples, health, and the environment. One of the major challenges for biomolecular research on archaeological remains are uncertainties surrounding biomolecule preservation. Information on how samples were collected, washed, preserved, and maintained are valuable for generating and interpreting biomolecular data. This presentation will discuss reasonable tactics museums and researchers can utilize to help direct and optimize archaeological biomolecular sampling approaches and requests. Specifically, how and why museums should document collection-specific preservation methods and materials, and calling on researchers to assess biomolecular preservation for a collection prior to larger sampling requests. Together these approaches can preserve collections for the future while providing critical information about the potential of museum collections for biomolecular research.

[29] *Seaways to Complexity. Sociopolitical Strategies in Northwestern Scandinavia in the Early Bronze Age*

Along the northwestern coast of Scandinavia the reliance and utilisation of the sea set the stage for a more advanced sociopolitical organization. The technological innovations prompted by the Late Neolithic (i.e. ship technology), turned the sea into a connective arena of interaction and trade. This is seen with the widespread distribution of finely crafted Jutish flint daggers from Late Neolithic I, followed by a steady increase of metal, burial mounds, and settlement sites in Late Neolithic II and the Early Bronze Age. Despite having a material culture expressive of a region well-integrated within a Nordic World System, these societies are juxtaposed by a long coastline of climatic and ecological distinctiveness that forces insular practices in subsistence and organization. This paper will explore the contrasting practices in sociopolitical organization and the strategies implemented to take advantage of the local resource potential. The dependency of trade is identified as a key element to uphold power in certain regions, exercised through coercive strategies, but the paper also points to the inevitable fragility of such an organisation and the more long-term stability of cooperative strategies.

Avila Peltroche, Mary Claudia (UNMSM)

[7] *Camelids Consumption and Utilization at the Archaeological Site of Huayuri, South Coast of Peru*

In this work the author presents the preliminary results of the animal bones analyzes from the archaeological site of Huayuri. This site, located in the south coast of Peru, shows evidences of occupations since the Late Intermediate Period to the Late Horizon. The materials were recovered during the excavations that took place in 2002 and 2005 in the Compound 03, located at the south part of the site. The analysis was primarily focused on the camelid bones, taking into consideration the cultural modifications, pathologies and age groups present in the bone assemblage. The results give insights on the situation of the domestic camelids and the herd management in the archaeological site of Huayuri. These animals were usually used for consumption and also there was an exploitation of secondary products, giving them an important role in the foodway practices of the people at the site.

[238] *Study of Historical Visualization: Case Study in Process Documentation at Xno'ha*

The presentation of heritage sites is critically important to the perception of historical narratives. A key goal is to help both scholars and the general public to see heritage as dynamic and living. This project explores the visualization of archaeological excavations through preservation technologies, specifically photogrammetric data. Our study focuses on a patio group at the Maya site of Xno'ha (occupation dates range from the Late Preclassic to the Terminal Classic) in northern Belize, and the current excavation and photogrammetric documentation of three administrative structures (32, 33, and 34). Sequential photogrammetry was conducted throughout the entire stratigraphic excavation of Structure 34's unit, resulting in 9 layers of photogrammetric documentation. The same process was applied to a chultun feature (single chamber) at Structure 33, creating 18 layers of photogrammetric data at regular intervals. For Structure 32, a single-phase, 3D model was generated, successfully stitching the above-ground unit to its corresponding, subterranean chultun (three chambers). Additionally, photogrammetry was used to create a plan view of the patio group area, and to create wall elevations. This methodical documentation of the process of excavation, in the span of months, records a three-dimensional time-lapse dialing back architectural conditions of the site hundreds of years.

[257] *Constructing Local Identities in the Central-South Coast. The Coayllos in the Asia Valley*

Narratives regarding the response from local groups to the Inca conquest of the Peruvian Central-South coast portray two confronting scenarios: resistance and acceptance. Resistance to the Inca conquest would have required a more violent Inca military campaign meanwhile acceptance would have required specific diplomatic negotiations. Written documents describe the actions taken by the Incas when a group resisted to be conquered. These actions include removing original populations and dispersing them along the empire to repopulate the new region with groups loyal to the Incas. These relocation measures would have created disruption in the regional interaction networks. In the Central-South Coast, written documents indicate that the Coayllos from the Asia valley repopulated the Cañete Valley after the Inca conquest. Current archaeological evidence from the Asia valley, Central-South Coast of Peru indicates that interactions were maintained with Central South Coastal groups after the Inca conquest. This data provides insights to evaluate the relationship established between the Inca and the Coayllos after the conquest of this region and how these coastal groups (re)defined their position and affiliations within the Inca empire apparatus.

[2] *Holocenic Occupations on Central Brazil: The Archaeological Complex Morro Solteiro*

Central Brazil includes archaeological sites dating from the Pleistocene/Holocene transition, mainly rock shelters and more rarely open-air sites. However these are important for understanding patterns of subsistence and settlement of populations. In Mato Grosso, research on the left bank of the southern course of Rio Vermelho has revealed a complex of occupations, in shelter and open-air, pre-ceramic and ceramic, dated since the middle Holocene. On the opposite side of the river, in a conspicuous sandstone hill, Morro Solteiro exhibits shelters of rock art. Although Morro Solteiro I (MS1) and the contiguous open air site, Aldeia Morro Solteiro (AMS), have rich ceramics occupations, dated to around 1000 years BP, pre-ceramic occupations only have been recognized in AMS and dated from 6000 years BP. Homogeneous data obtained in AMS and MS1 indicate that this site was occupied successively by groups, at first hunter-gatherers then horticulturalists, from the beginning of the Holocene. Similarities between ceramics and lithic industries from MS1 and AMS suggest that it could be a unique archaeological ensemble in litho-ceramic horizons. This type of association shelter/open-air site is rare in the Rio Vermelho region, which makes the Morro Solteiro complex an exceptional site and probably an important center of occupation.

Bacon, Wendy (The History Center of Tompkins County NY)

[33] *The Dwarf Motif in Classic Maya Monumental Iconography: A Spatial Analysis*

Although scholars of Classic Maya art have described certain short-statured figures as dwarves and endowed them with mystical significance, the motif has gone undefined. This contextual analysis identifies the anatomical and cultural attributes of the dwarf motif and interprets its meaning within the ancient Maya conception of time and their ideological integration of the natural and supernatural.

A spatial analysis of 45 depictions of short-statured individuals on archaeologically provenienced monuments reveals that the dwarf motif follows the trajectory of political power in the Maya lowlands, beginning within the Caracol-Calakmul polity and expanding with its reach. The dwarf motif appears at Tikal, in new stylistic configurations, upon its defeat of the Caracol-Calakmul alliance. Sites with flexible allegiances display the dwarf motif as a combination of local and regional stylistic elements. Evidence from small, dependent sites and regional superpowers reveals ancient Maya artists adapting broadly shared iconography to express locally the relationship between identity and power.

Monumental depictions of dwarves associate with symbols of liminality, implying that the Maya channeled the 'otherness' of dwarves into a visual metaphor for transition. Such depictions reveal an ancient society in which the 'other' expressed the integration of the natural and supernatural realms.

Badilla, Adrian (Museo Nacional de Costa Rica)**[260]** *Arquitectura Habitacional: Sistema Constructivo y Organización Espacial en el Sitio Finca 6, Delta del Diquís, Costa Rica*

El Delta del Diquís en el sureste de Costa Rica se ha postulado como un centro diferenciado en la producción de bienes (cerámica, oro, esculturas de piedra) durante el Periodo Chiriquí (800—1550 d.C.) como parte de una sociedad jerárquica. La arquitectura y la configuración interna que presentan los sitios reflejan manifestaciones particulares donde destaca la construcción de montículos de tierra compactada con mampostería de cantos rodados y ornamentación de rocas calizas. Las estructuras varían desde formas circulares, rectangulares hasta formas compuestas en la que se articulan varios volúmenes. Recientes investigaciones realizadas en el sitio Finca 6 han permitido estudiar un conjunto de dos unidades habitacionales cuyo análisis se ha enfocado en la exploración del sistema constructivo, forma, distribución y uso del conjunto artefactual asociado a estas unidades. Lo anterior en procura de documentar los procesos de cambio social que ayudan a entender la organización espacial y complejidad social en el asentamiento.

Badillo, Alex E. (Indiana University) and Marc Levine (Oklahoma University)**[248]** *Mapping from the Heavens: UAV(Drone) Data Collection at Monte Albán, Oaxaca, Mexico*

The use of Unmanned Aerial Vehicles (UAVs) in archaeology has increased rapidly in recent years as drones have become more affordable and easy to use. Accessible commercial grade equipment can quickly capture data to produce maps and 3D models of high accuracy and precision. During the Summer of 2017, the Proyecto Geofísico de Monte Albán (PGMA) integrated the use of a UAV technology into their geophysical survey project at the UNESCO world heritage site of Monte Albán located in Oaxaca, Mexico. The main plaza and the surrounding monumental architecture was captured using aerial photographs and digitally reconstructed to scale in 3-dimensions. In this presentation, we present on data collection techniques, post-processing methods, and discuss some of the results of UAV mapping and photogrammetry within the context of the broader geophysical project at Monte Albán. Throughout, we discuss some of the successes and challenges of UAV mapping and post-processing. Finally, we explore the use of UAVs and 3D modeling in archaeology that go beyond visualization.

Bailey, Deanna**[85]** *Landscape Archaeology & the Irish Chalcolithic—Early Bronze Age: Discovering Termon, Co. Clare, Ireland*

The Burren is a region located in southwest Ireland containing the highest concentration of wedge tombs in the county showing a significance of place in the Chalcolithic—Early Bronze Age. Contemporary to wedge tombs are large complex systems of settlement enclosures, farm fields, and other ritual monuments, which can be seen at sites across the Burren, such as Roughan Hill, Coolnatullagh, and Carran Plateau. Excavations at these sites have provided cohesive radiocarbon dates within the Chalcolithic—Early Bronze Age. The context and patterns seen within this time period have yet to be explored at other locations across the Burren where wedge tombs are present. In 2016 a survey was conducted by the author as a part of a M.A. in Landscape Archaeology at the National University of Ireland, Galway with the central aim to identify Chalcolithic—Early Bronze Age farming, settlement, and ritual patterns in the Burren townland of Termon. A secondary aim sought out to compare patterns seen at Termon to Roughan Hill, Coolnatullagh, and Carran Plateau in effort to shed further light into the Chalcolithic—Early Bronze Age Burren. Cross-site analysis revealed several similarities between features with differences expressing complexities within the Chalcolithic—Early Bronze Age.

Baitzel, Sarah (Washington University in St. Louis) and Arturo Rivera**[100]** *In the Land of Llamas and Aji: New Insights into the Late Horizon Inca Occupation of the Middle Sama Valley, Southern Peru*

Since the 1970s, the Sama valley on the far south coast of Peru has been known to house the Inca site of Sama Grande since the excavations of German archaeologist Hermann Trimborn. Situated at the crossroads of the Quapaq Ñan running parallel to the Andean foothills and from the coast to the highlands, Sama Grande was assumed to direct people, animals, and goods across the region during the Late Horizon (14th–15th century AD). In 2017, full-coverage pedestrian survey of the coastal desert plain overlooking the middle Sama valley near the foothill zone (400–600 masl) revealed a wider Inca presence dating to the Late Horizon and early Colonial period in the form of architecture and other material culture. The predominance of Inca-Cusqueño and Inca-Altiplano ceramic styles, with an emphasis on depictions of llamas and ajies (chili peppers), suggests that under Inca control the valley was principally used for camelid pasture and ají cultivation.

These research results highlight the importance of the Sama valley, a previously unexplored area, within the broader regional network of Inca imperial presence on the far south coast of Peru, and add to current models of the transformative impacts of imperial strategies on local landscapes and resources.

Archaeological studies of the Upper Mantaro Valley region in the central Andean highlands have played an essential role in shaping current models of Andean complex societies and state expansion during the Middle Horizon (A.D. 500–1000) and subsequent periods. Among the pioneer studies of this

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

region was Browman's pedestrian survey of the Upper Mantaro valley between Jauja and Huancayo, Peru for his doctoral dissertation, during which he registered over 106 sites dating to the Middle Horizon. Using temporal data, qualitative descriptions of features and artifacts, photographs and maps from Browman's original field notes and dissertation, we reconstruct his findings in ArcGIS to re-analyze changes in settlement patterns, architecture and ceramic distributions through time and space. By integrating these patterns with newly available information about the environmental, social, and political contexts of the region, we build on previous work using technology unavailable at the time of the initial field research. Our re-examination focuses on the Middle Horizon period to specifically assess the influence of the Wari state on the Upper Mantaro region.

[85] *Pixellated Survey: Archaeology at Monte Bonifato, Sicily*

Site-specific archaeological survey of forested environments can be challenging, particularly when ground disturbance is prohibited. Site-specific archaeological survey serves as an essential component of archaeological exploration, delineating areas of past human activities on complex multi-component sites. This paper presents the preliminary results of the first season of the Alcamo Archaeological Project, a site-specific survey of the forested summit of Monte Bonifato in western Sicily. This area poses a challenge to archaeologists as Iron Age, Roman, and Medieval occupants have used and modified this landscape intensively. Field methods employed during the survey are presented as well as how these methods were adapted to local conditions and regulations, demonstrating the necessity for flexible survey strategies in conjunction with intensive data collection. Furthermore, this paper addresses the need for balance between collecting high-quality data and survey coverage during short field seasons.

[260] *The Role of Kinship Networks and the Lowland Ecology in the Interpretation of the Caribbean Archaeology of Greater Chiriquí*

Archaeological investigations in the Caribbean region of Greater Chiriquí conducted over the last two decades have documented occupations dating to the second millennium BCE. Similarities in material culture suggest local and trans-isthmian cultural relationships within Greater Chiriquí and a pattern of scattered hamlets associated with the exploitation of marine and lowland ecosystems. In order to provide a model for this settlement pattern, we offer a theoretical model based on ethnohistorical accounts, ethnographic information and current biodemographic research based on living indigenous populations of southern Central America. Kin-based population structure is the result of a migratory behavior of a familial group in which fragmentation, movement and relocation occurs among populations of high mobility such as hunter-gathers and mobile agriculturalists. The information provided by these lines of research suggests that ecological conditions and kin-based population structure may be responsible for the population aggregation along the Caribbean coast of Central America and can explain similar behavior seen in the archaeological record of the Caribbean lowlands of Greater Chiriquí.

[182] *Doc Holliday Goes to Tombstone*

In 2002 Vance won the role of Executive Director for the Argonaut Archaeological Research Fund (AARF) at the University of Arizona. The program provided immediate funding for a number of graduate students working on the archaeology and Quaternary geology of the Desert Southwest. A renewed investigation of the upper San Pedro Basin was among those projects. Vance endured every possible graduate student misstep, some of which are reviewed here, to assemble new information about long-term and hotly debated topics such as mammoth hunting, late Pleistocene paleoecology and extinctions, and even the question ET impacts. These new contributions were made under the shadow of his close friend and colleague, C. Vance Haynes, Jr. The combined efforts of "both Vances" is a case study in the scientific value and intrigue embodied by the Fryxell Award for Interdisciplinary Research.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Baller, Kendall (School of Human Evolution and Social Change, Arizona State University)**[267]** *Investigating Social Boundaries in Southwestern New Mexico*

Social network analyses provide insight into the strength and weakness of social connections across geographic areas. Discussions in the literature of the Mimbres region in New Mexico have stated that during the Classic period, the Mimbres ceramic tradition is confined to southwestern New Mexico, though this has not been tested with statistical assessments of data. Using ceramic style data from sites within and surrounding the Mimbres region, I investigate the levels of social 'boundedness' in the area through statistical computing methods. Social network analysis can determine whether boundaries were more clinal or rigid, and test whether or not this region is statistically more 'bounded' than others visible in the archaeological record. With access to deep archaeological time scales and the breadth of data from the Mimbres region, I will present my research on the impact of social networks on connections between groups of people living in the past. By furthering our understanding of social networks in the past, we can inform our understanding of how people today interact and exchange ideas across perceived social boundaries.

Bamforth, Douglas and Kristen Carlson (Augustana University)**[21]** *Oneota Expansion and Ethnogenesis on the Eastern Great Plains*

The late 1200s and 1300s saw substantial population shifts in the eastern Plains and Midwest. These occurred in the context of profound sociopolitical and demographic changes, particularly the political decline and depopulation of Cahokia, and regional climatic variation, including significant changes in northern hemisphere temperatures and severe regional droughts. Oneota groups expanded into the east-central Great Plains during this time, at the same time that indigenous Plains farmers abandoned the western parts of their ranges and moved east. Interactions between these groups remain poorly understood and likely varied in time and space. However, a series of sites in northeastern Nebraska show blended patterns of ceramic design suggesting that they may have lived side by side in at least some areas, interacting face-to-face and forming new communities with distinct identities. The assemblage from the Lynch Site (25BD1) includes classic Oneota shell-tempered pottery that is likely imported, classic Oneota and Central Plains Tradition pots made locally, and pots that blend elements of Oneota and CPT styles. We present data on inter-household variation in pottery derived from excavations at Lynch in 1936 and 1959 and consider some of the implications of these data for community formation.

Banghart, Thomas (University of California, Santa Cruz)**[10]** *From Shore to Mountain: Insights into Resource Selection and Processing along the Central California Coast*

Salvage excavations conducted in the 1970s at the Red, White, and Blue Beach site (CA-SCR-35), located in northern Santa Cruz County on the central California coast on Monterey Bay, recovered a large and diverse vertebrate faunal assemblage with a well-defined Middle Period (2800–900 cal BP) component. Few faunal assemblages from this area of the Central Coast have been thoroughly analyzed and little is known about resource selection and processing during this time. I use archaeofaunal data from SCR-35 to explore prey choice, handling practices, and seasonality of occupation, comparing these to recently published data from CA-SCR-9, a generally contemporaneous site in the coastal uplands of the Santa Cruz Mountains. This comparison contributes to understanding of Middle Period economic strategies by providing a synchronic and regionally specific comparison of coastal and inland extractive tactics in this currently understudied part of California.

Banikazemi, Cyrus (UNCC)**[154]** *Metal, Pigment, and Prestige: An Analysis of the Form, Decoration, Status, and Use of Inca Stone Vessels*

The ethnohistoric and archaeological records provide ample evidence of the ideological significance of metals and pigments in the pre-Columbian Andean world. This study explores the use of these materials in the complex decorative techniques utilized by the Inca when finishing stone vessels. This research integrates data generated from ethnohistoric sources, portable X-Ray Fluorescent (pXRF) tests, and reconstructive experimentation in order to provide a better understanding of how metals and pigments were used by the Inca to signify the elevated status of certain stone vessels. This project intends to show that the decorative processes implemented in the construction of stone vessels can illuminate on how these artifacts were used within Inca society.

Baram, Uzi (New College of Florida)**[53]** *Popular Beliefs of Safety in an Age of Rising Sea Levels: Public Archaeology as a Means to Counter Exceptionalism on the Florida Gulf Coast*

Before every hurricane season, the myth and popular belief that Sarasota, a medium-sized city on Florida's Gulf Coast, is safe from hurricane gets repeated in the local newspaper. Like many folktales, the story that pre-Columbian Native American burial mounds or Ringling Brother Circus performers knew of a special quality to the region or their spirits protect it comforts the ever growing population living on the Gulf of Mexico coastline. With the majority of the residents having no long-term connection to the region and the landscape displaying mostly the contemporary, with the historic being mostly the 1920s Boom Times, the past is nearly invisible. One of the tasks for public archaeology is exposing the hidden histories of the region, a rich but racially complex heritage that can counter the myth of exceptionalism. Over the past several years, the New College Public Archaeology Lab has hosted programs for community members and school children that teach about the archaeology and environment for the region's waters, specifically Sarasota Bay and the Manatee River. The activities instruct on the long history of people in the region, offering scientific approaches to addressing understandings of the past and offering cultural relativism for pre-industrial technologies.

Barba, Luis (Universidad Nacional Autonoma de Mexico), Jorge Blancas (Universidad Nacional Autonoma de Mexico) and Agustín Ortiz (Universidad Nacional Autonoma de Mexico)**[293]** *Geophysical Prospection at Plaza of the Columns Complex, Teotihuacan*

Geophysical techniques used in Plaza de las Columnas Complex, Teotihuacan has been successful to locate the buried remains of foundations, walls and other architectural features. As usual, magnetic gradient allowed to recognize linear patterns that suggests the wall remains usually made with volcanic stones with mud mortar. Electrical resistance was successful to recognize the presence of floors and verify the previously detected walls. Finally georadar survey verify the location and depth of buried architectural remains. This combination of techniques provided detailed information from most of the area requested by the project and allowed to locate the excavations to verify the presence of domestic units that are surrounding the main structures, in addition to detect some remains located in main plazas and the big wall that marked the western limit of this large compound.

[35] *Anchoring in the Gulf: Trans-species Dwelling and Building in Gulf Coast Florida*

Drawing inspiration from the work of Tim Ingold, I seek to find the middle ground of phenomenology, ecology, and materiality in describing how humans dwell and make their worlds among the various other communities around them. In the Lower Suwannee River Valley, Florida, human and oyster communities have interacted and intersected with another for millennia. Like people, oysters dwell and build creating their Umwelt, a concept introduced by Von Uexküll. This resulted in communities numbering in the millions. When the Umwelten of oysters and people are juxtaposed, it is argued that oysters 'anchored' people differentially throughout the history of the region. These oyster communities are argued to represent Heideggerian Buildings, as they are locations which make sites for several coastal Umwelten, people included. Prior to 1500 BC, human communities relocated their dead to keep pace with the rising sea, emplacing oyster shell midden during the process. After an occupational hiatus, changes in human building and dwelling after 750 BC were a direct result of inhabiting an area already full of history, including past interactions with oyster beds. Florida Gulf Coast peoples in the Lower Suwannee in many ways defined themselves through relationships with the oyster communities with which they interacted.

Bardolph, Dana (Cornell University), Brian Billman (University of North Carolina, Chapel Hill) and Jesús Briceño (Ministerio de Cultura, Peru)
[297] *Hidden Labor: Exploring Food, Gender, and Ritual in the Prehispanic Moche Valley of North Coastal Peru*

Archaeologists have successfully used spatial analyses of different contexts (elite/non-elite, ritual/domestic, public/private, etc.) to examine the intersection of food-related activities with status, political economy, gender, ritual, and the public/private division. In this paper, I consider the intersections of food processing, ritual, and gendered labor through an examination of paleoethnobotanical data from Cerro León, a Gallinazo/Early Moche phase (A.D. 1–300) highland colony in the Moche Valley of north coastal Peru. A variety of ancestor rituals, work parties, and other large-scale commensal events occurred in large public spaces in high status compounds at Cerro León. But where did food preparation occur for these events, and who was likely responsible for such preparation? Employing intrasite spatial analysis, I explore the movements through various spaces, public and private, that provided opportunities for social interaction or restrictions on visibility and community integration. Drawing on archaeobotanical and ethnohistorical evidence, I argue that household members (likely women) primarily prepared food in private behind-the-scenes contexts for supra-household ritual events and public displays. These women may have prepared for public events totally apart from, and without being included, in such events. This consideration of 'hidden' labor sheds light on a frequently overlooked aspect of ritual and food production.

Barg, Diana (Bureau of Land Management, Utah) and Nathan Thomas (Bureau of Land Management, Utah)

[261] *Education and Enforcement: How the Bureau of Land Management Is Confronting Looting on Public Lands in Utah*

Looting of archaeological resources on public lands has been an issue throughout the United States for over a century, and Bureau of Land Management (BLM)-administered lands are no exception. Looting can take many forms, ranging from a visitor looking for a souvenir to intense, large-scale, and intentional desecration of sites for personal profit. Looting issues can be exacerbated by the limited on-the-ground resources of federal agencies that manage millions of acres. The proactive actions the BLM is taking against looting has resulted in increased Archaeological Resources Protection Act investigations, the recovery of looted artifacts, and educational campaigns to curb unintentional, destructive behaviors. The BLM-Utah's dual approach of education and enforcement illustrates the active role the BLM is taking to reduce looting. The BLM-Utah manages large collections of archaeological artifacts recovered from law enforcement investigations and prosecutions, is currently determining best practices for the long-term curation of recovered artifacts, and is developing anti-looting centered interpretation of the collections. Site stewardship programs, Project Archaeology curriculum, and the Respect and Protect education campaign are major initiatives the BLM-Utah and its partners are using to educate the public about responsible public land use and citizen stewardship of archaeological resources.

Barker, Claire (Arizona State Museum), Samantha Fladd (University of Arizona) and Kelley Hays-Gilpin (Northern Arizona University)

[218] *Macaws on Pots: Images, Symbolism, and Deposition at Homol'ovi*

Widespread archaeological evidence—including egg shells and skeletal remains recovered from archaeological sites as well as imagery on pottery, kiva murals, and rock art—suggests that macaws, their feathers, and their imagery played important roles in ancient Puebloan society. Ethnographic accounts also indicate the importance of macaws to ancient Puebloan peoples and modern groups. Macaws have been interpreted as indicators of exchange, aspects of intricate ritual systems, and indexes of social complexity. This research attempts to further our understanding of the roles macaw imagery have played in Puebloan culture through an analysis of images on pottery and the depositional contexts of the vessels or vessel fragments bearing these representations at the Homol'ovi Settlement Cluster, a 13th-14th century ancestral Hopi group of villages located in northeastern Arizona. Is macaw imagery tied to certain wares, types, or vessel forms? How are these birds depicted on ceramics? Are items adorned with macaw imagery and macaw skeletal remains deposited in similar contexts? Considering the contexts in which objects decorated with macaw imagery were deposited in reference to macaw and other bird burial practices may provide a more refined understanding of the functions these artifacts served and the symbolism they evoked in prehistoric Puebloan society.

[223] *Revisiting the Function of Humboldt Points: Reflections from the Late Prehistoric Hackney Site in Mariposa County, California*

CA-MRP-283, the Hackney Site, is a late prehistoric/protohistoric site in Mariposa County, California. Excavated by California State University, Los Angeles in 1972, the flaked-stone assemblage includes debitage, projectile points, and flake tools. A reanalysis of the debitage shows that late stage

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

biface production, expedient flake-tool production, and the production, repair, and replacement of projectile points were all common activities at the Hackney site. A recent analysis of the projectile points that included a characterization of macro-damage, also showed distinctive use-breakage patterns that suggest it may be time to reexamine the hypotheses surrounding the function(s) of Humboldt/Sierra concave-base series points. Such points are hypothesized to have been used as knives, dart points, or even dispatching spears. The Humboldt points present in this assemblage are all broken with abundant evidence of impact damage. Moreover, an examination of reports on assemblages from other contemporaneous sites in the Sierra Nevada region and elsewhere suggests this is a widespread pattern. To examine the potential cause(s) of these features, we conducted experiments testing macro-damage created in use as a knife, dispatching spear, and atlatl propelled spear. We present here the results of the projectile point assemblage analysis and some preliminary findings from the use experiment.

Barkwill Love, Lori (University of Texas at San Antonio)

[91] *The Social History of Mogollon Village: A Bayesian Approach*

Emil Haury's excavation of Mogollon Village in 1933 helped to provide the first overview of pithouse occupation for the Upper Gila and Mimbres Valley areas as well as establishing the Mogollon culture concept. Tree-ring data from Haury's excavation suggested that the site was occupied from at least A.D. 730 to 900; however, the stratigraphy of the site suggested that the site was occupied prior to A.D. 700. Further excavation work at the site conducted in the late 1980s and early 1990s suggested that the site also had an Early Pithouse (~A.D. 200 to 550) occupation. Thus, Mogollon Village had a long-term history of pithouse occupation. For this poster, Bayesian chronological modeling of existing radiocarbon dates and new AMS dates is used to provide a structural narrative of the occupation of the circular pithouse structures at Mogollon Village. This refined chronology will then be used to examine pottery production and obsidian procurement at the site. Future research to further refine the chronology of the site will also be discussed.

[335] *Analysis of the Ancient Built Environment of the Millo Complex, Vitor Valley, Peru*

The Vitor Valley is an alluvial oasis linking the Arequipa highlands to the Pacific coast of southern Peru. The northern limit of the valley hosts a dense archaeological landscape of interspersed fieldstone structures and cemeteries known as the Millo Complex. This cluster comprises three principal segments referred to as Millo 2, Millo 3, and Millo 4; each of which preserves extensive architecture. Surface ceramics from across the Millo Complex and radiocarbon analysis of charcoal samples recovered from excavations at Millo 2 place the complex within the Middle Horizon (600–1100 CE), a period of profound social change and reconfiguration of geopolitical relationships across the south-central Andes. The exact role that the Millo Complex played in this period of regional transition remains unclear. While sizable Ramada cemeteries adjacent to these sites point to local origins and activity, the intrusion of an iconic D-shaped structure at Millo 3 may indicate the introduction of non-local traditions associated with the Wari state. We suggest that these segments operated as contemporaneous and interdependent components of the larger settlement.

[261] *Hard Questions for Hardrock Places: Integrating Academic-Based Research Questions into the Management of Hardrock Mining Sites on Public Lands in the Southern California Deserts*

Land-managing agencies have to make tough decisions about what archaeological sites are worth conserving—decisions that are getting tougher as the capacity of agencies continues to be stretched. Academics may disagree with these decisions, yet their approaches to research have long been crucial to defining what is significant. The Bureau of Land Management California (with Statistical Research, Inc.) has recently completed a comprehensive management program for hardrock mining sites on 10+ million acres of public lands in the southern California deserts. The program presents several original and innovative research questions (stemming from theoretical trends in academia) for evaluating National Register of Historic Places eligibility of hardrock mining sites that will advance management, as well as scholarly research, in the region. This presentation explores the challenges and benefits of integrating academic-based approaches into landscape-scale management of historic-era industrial archaeological sites on federal lands.

Barnes, Kelli (BLM-ID-SO)

[261] *Recognizing Redundant Data: Preventing Perseveration and Saving the Significant*

What is so fascinating about heritage resources? What is it that sparks the imagination and instills a sense of place and wonder? What great lessons can we take away from the past? The most important roles of a federal archaeologist are to try to encourage public interest in questions like those, while preserving select sites with the greatest potential to provide the answers. However, compliance work for federal undertakings often focuses our attention and limited resources on the least significant and most abundant resources such as lithic and historic debris scatters. We must avoid habitually collecting redundant data for upholding tested theories so that new questions can be posed and answered using more modern techniques. Applying the National Register of Historic Places eligibility criteria in standardized ways and other increased efficiencies can free up time to spend on outreach, scientific inquiry, and the protection of sites with greater heritage and data values. This presentation will demonstrate the need and means for a careful and scientific approach to making site eligibility determinations and management recommendations in order to facilitate a focus on the most culturally valuable resources.

Barnett, Kristen (Bates College)

[220] *Ellmig Qukaq. She is the Center: Indigenous Archaeology of Temyiq Tuyuryaq*

Ashmore and others have taken the time to observe and discuss the inherently gendered 'nature' of the landscape. As an indigenous scholar this discussion directs me toward concepts of "nature" and specifically, our mother earth, our peoples, and our celestial beings. Mother earth is impregnated with our past, cradling our lives and our ancestors in her womb, from which they once came, and returning (for matters within our discipline) to us in "archaeological context", if you will. I argue that it is irrelevant as to whether or not your ideology fits within this indigenous belief

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

system, archaeologists engaging in pre-colonial, indigenous 'sites' of study are entrenched in a gendered cultural landscape. In my research I explore Temyiq Tuyuryaq, named for the three women whose lives were taken at the mouth of the bay. Overturning concepts of the "colonial ghost" (Hokowhitu 2009) I approach the cultural landscape through a mode of continuity experienced by the Yup'ik community residing in Tuyuryaq, and consider the gendered experience of place throughout the last 1200 years in Bristol Bay Alaska.

[170] *Making Change: Currency Use and Social Transformation among the Classic Maya*

At the time of Spanish contact, the Mesoamerican commercial economy was highly elaborated, with an interconnected system of marketplaces, a large variety of goods bought and sold as commodities, and the widespread use of currency in the form of cacao and woven textiles. While much of what we know of this economic system is provided by written records, the presence of large-scale marketplaces and currency can be traced into earlier periods using archaeological evidence. This evidence suggests that, in the Maya lowlands, both of these features began in the 7th century, as the rival kingdoms of Tikal and Calakmul attempted to consolidate and centralize their regional economies. These economic strategies increased the demand for currency commodities, reconfiguring economic relationships far beyond these two kingdoms. This paper will address the archaeological evidence for rapid changes along the San Pedro River in Northwestern Guatemala, an important trade route for cacao importation. Focusing on the site of La Florida, it will discuss the rapid rise of this kingdom, its establishment of economic and political relationships with distant partners, and its strategic control of the San Pedro trade route.

[132] *Fortification on the Margins of the Bolivian Eastern Highlands*

Frontiers are usually spaces of interaction between multiple groups of people navigating through established cultural and political lifeways. The zone of Tumupasa functions as a peripheral site on the margin between the Yungas and the Amazon. This region will form the center of my study area to identify historical and archaeological lines of interaction between highland and lowland groups. I argue that the region of Tumupasa, Bolivia is situated on a natural geographic transit point between the Yungas and the Amazon Amazonian flood plains. This research will attempt to contextualize the region of Ixiamas-Apolo within a frontier centered framework by understanding the spatial and cultural characteristics of regional archaeological sites. The goal of this research is to explore the entangled networks of interaction between highland and lowland groups through taking a preliminary look at local site characteristics and their spatial relationship with the fortification of Ixiamas, Bolivia. I hypothesize the region between Ixiamas and Apolo was a Pre-Hispanic network of Amazon-Andean movement that was utilized prehistorically through the present (Saignes 1985, Tylanueva 2015). Specifically, I argue that the area of Tumupasa was a strategic crossroad of economic and cultural exchange between lowland and highland groups.

[275] *Placemaking through Objects: The Global World in 19th Century Towns in the Philippines*

This paper will explore the idea of placemaking in Philippine towns established in the latter part of 19th century AD under the Spanish colonial period. The Spanish regime through the Laws of the Indies significantly altered the indigenous concepts of territory and space. I propose that the Europeanised local elites straddled between the European and indigenous ideas of boundaries and space. Following the colonial religious and administrative boundaries and the customary notions of interactions, I hypothesize that the rise of the middle class, referred to as ilustrados, marked their new place in the landscape through the acquisition of foreign items. These foreign items, commonly seen as status symbols, have a wider impact in the notion of placemaking. I will integrate archaeological model of interactions, political economy model, and placemaking in urban planning to interpret the presence of foreign objects in areas considered to be peripheries.

Barrientos, Tomas (Universidad del Valle de Guatemala)

[337] *Charismatic and Religious Aspects of Maya Rulership: An Interpretation of the Coronitas Temple Complex of La Corona*

The Coronitas Group at La Corona presents a unique architectural setting, consisting of five pyramidal temples aligned in a north-south row and several attached structures. Excavations in this group have been carried out since the beginning of the project, providing important data concerning the function of these temples throughout the site's occupation. A detailed chronological analysis has shown that this architectural complex was one of the main ceremonial areas of the site, evinced by not only the presence of royal tombs but also the location of important hieroglyphically inscribed monuments. These texts suggest that these temples were related to the patron deities of the site who played an important role in the legitimation practices of the Corona rulers when they became vassals of the Kaanul hegemonic dynasty. This paper will present a synthesis of the archaeological and epigraphic data collected in 10 years of excavations, and the interpretations derived from them.

[142] *The Country and the City: Explorations of the Relationship between Río Amarillo and Copan, in the Copan Valley, Honduras*

Cities and the communities in their hinterlands are inextricably linked, and yet the objectives of their inhabitants can be starkly different. The archaeological sites of Río Amarillo and Quebrada Piedras Negras shared a fertile plain along the Río Amarillo and Río Blanco Rivers. Several scholars have suggested that the arable fields here may have acted as a bread basket for the urban center to their west. Research at Río Amarillo has yielded evidence of strong ties to Copan including architectural forms, and iconography on altars, a structure, and a censer that broadcast the power of

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

the city, and in particular, evince respect and veneration for the Copan dynasty founder, K'inich Yax K'uk' Mo'. Patterns of construction, destruction, and collapse in the center of Rio Amarillo suggest however, that the city to its west did not maintain its hold on this community throughout the entirety of the Late Classic period, but that this control faltered when the rulers of the city faltered. This paper will explore the various identities expressed in groups excavated in "the country" and the agency of the inhabitants who buffered their success by maintaining strong ties to both the west and the east.

Barse, William (Smithsonian Institution)

[69] *Ronquin Re-visited Yet Again: New Radiocarbon Dates and Their Implication for Orinoco Ceramic Chronology*

A series of radiocarbon dates obtained recently from carbonized encrustations on ceramics sheds new light on the Barrancas to Ronquin ceramic sequence, a chronology that has been long contested in the Orinoco River Valley by many investigators. These new radiocarbon dates clearly argue that the so-called "long chronology" suggested by Rouse and Roosevelt for the La Gruta to Ronquin sequence developed for the Middle Orinoco River, a chronology that was argued to extend close to 4000 years, is invalid and is in need of revision. The new radiocarbon dates supplement those obtained previously by the author, providing the basis for a more solid chronology, one that falls within the first millennium AD. It is a sequence that links well-dated Ronquin and cognate ceramic assemblages found within wide-spread paleosol horizons that are nothing more than allogenic stratum linked to broader climatic events both within and beyond the Orinoco Valley.

[179] *Region of Origin Predictions of Human Remains from a Late 19th Century Medical Waste Pit: Oxygen and Strontium Isotope Evidence from the Point San Jose Hospital, San Francisco*

In 2010, human remains were discovered in a medical waste pit behind the Civil War-era hospital at Point San Jose, San Francisco by National Park Service archaeologists. The commingled assemblage consisted of thousands of human bones, including cranial and dental remains. Extensive cut marks on these remains indicated they were used for anatomical dissection. Assessment of biological characteristics suggested that some of the individuals targeted for dissection are of non-European ancestry.

In this study, we use stable oxygen and strontium isotopes to predict region of origin of the craniodental remains of eight individuals from the medical waste pit. A molar tooth and skull fragment were sampled from each individual and were prepared for isotope analysis. Stable isotope data from bone suggest that these individuals may have had a common origin (possibly the San Francisco Bay Area). In contrast, data from teeth are more heterogeneous and suggest a variety of different places of childhood origin. Using isoscape prediction maps, we present possible regions of origin for these individuals, including in and outside the continental United States. We hypothesize that the remains in the medical waste pit at Point San Jose represent selective targeting of the dead from minority communities.

[219] *You're Going to Carry That Weight a Long Time*

Mobility is a phenomenon of importance across all past and present societies. For hunter-gatherers, mobility structures ecological strategies, social organization, and response to environmental change. For prehistoric societies, we cannot observe mobility but it is possible to study it through a proxy record of discarded material items and biological remains that form the archaeological record. Increasingly archaeological practice has shifted from proposing intuitive links between mobility and the archaeological record to developing testable hypotheses evaluated through systematic, controlled experimentation. Computational modeling is becoming an important tool applied to this effort, for testing intuitively proposed relationships and discovering unexpected, counterintuitive ones.

Building on prior modeling experiments on mobility and formation of the lithic archaeological record, we examine the impacts of the geographical extent of hunter-gatherer movement on technological and compositional characteristics of accumulated lithic assemblages. We situate these computational modeling experiments in a digital representation of a humanized landscape in which both stone outcrops and archaeological sites are potentially exploitable and potentially finite resources.

[77] *Pottery Production at Idalion, Cyprus: Investigating First Millennium BCE Politics and Culture through Ceramic Petrography.*

On the island of Cyprus, the first millennium BCE was a period of change in politics and culture brought about by new people, new governance, and new technology. This paper attempts to analyze these changes using one site. Idalion is located in the east-central part of the island. The polity went through many changes from its founding, c. 1200 BCE, through the first millennium BCE and I have begun to investigate some through petrographic analysis of pottery. Pottery production can represent social and political culture, as it is the result of the needs of society and the desires of economic elites. In craft production literature, much ink has been spilled theorizing how politics can effect production. My project attempts to validate some of these theories, as others in the field have done already; specifically one by Costin (1991) who suggests that craft production could be influenced by political power in some form or another. At Idalion, I have sampled pottery from several use-areas of the site and analyzed the sherds through petrography to track production practices through time and space. The results of this analysis show that some changes are related to political shifts and others are not.

Basanti, Dil (Northwestern University)

[32] *From Building to Connecting: Shifting Portraits of Complexity in Ancient Aksumite Monument Construction (50–400 AD)*

This paper looks at how network theory and materiality may challenge progressive evolutionary models of complexity. Archaeologists working on the African continent have long argued against neoevolutionary models of complexity, advocating instead for understandings that promote dynamism and fluidity. However, the spectre of neoevolution still claims the public imagination: bigger still seems to be better even if we agree it really shouldn't be. This paper aids in complicating these views by emphasizing how recent understandings of network theory and materiality shift the portrait of complexity from one of linear progression to one of social disconnection. More specifically, this paper explores how current ideas of materiality inherently flip our value system for how societies may be complex—so that bigger is not necessarily better, but the result of peoples attempts to deal with isolation, alienation, disconnection, and sometimes social instability. A case study on the construction of the Aksumite funerary monuments (50–400 AD) in ancient Ethiopia will be used to illustrate the two approaches.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Bascopé, Grace Lloyd (Maya Research Program/BRIT)**[173]** *An Ethno-ecological View of the Evolution of “Solares”: A Yucatan Maya Houselot Case Study*

Using a household ecology model, this longitudinal comparison of the flora and fauna of village yards attempts to show how and why solares and their contents have evolved over the last two and one-half decades. Particular emphasis is placed on showing how such changes might be detected in and impact current and future archaeological explorations of Maya farming communities. Changes in water usage, economic activities, family structure and social organization, religious beliefs, evolving house construction methods, the acquisition of material good, and population pressure all go to influence a new matrix in houselot use. Finally, these same elements of change are also reflected in the use of the milpa, traditional cornfield, and this presentation will touch on the evolution of this subsistence pattern, as well.

Basiran, Alper [41] see Yaman, Irfan

Bassett, Madeleine (William & Mary)**[32]** *Religious Conversion and Ritual Practice in the Horn of Africa: A Case Study from Islamic-Period Djibouti (ca. AD 800–1200)*

The Somali Coast has long been a center of global commerce. At the confluence of the Red Sea and the Indian Ocean, port cities like Zeila and Berbera witnessed the arrival of Greek and Roman traders (ca. AD200) and Chinese merchants (ca. AD1300). Contacts with Muslim merchants from the Arabian Peninsula (ca. AD800) were particularly transformative, and by the tenth century, communities across Djibouti and Somaliland were converts. Scholars have hypothesized that pre-Islamic “monument sites” across the region—specifically, ancestor shrines and cairns—remained centers of ritual practice long after communities converted to Islam. This study seeks to test this hypothesis by identifying evidence of changes/continuities in ritual practice at a complex of monument sites along the Wadi Buleh in eastern Djibouti. Results of pilot research (2015, 2016) suggest that several monuments (cairns) remained loci of activity throughout the Islamic Period.

Bates, Brian [159] see Farrell, Mary

Battillo, Jenna (Southern Methodist University)**[126]** *Reconstructing Diet from Combined Pollen, Macrofossil, and DNA Analysis of Human Paleofeces*

This work integrates multi-proxy data from 44 human paleofeces in order to study resource use among early farmers in the northern Southwest. Macrofossils and pollen were analyzed for all specimens. Since not all foods leave pollen or macrofossils identifiable after digestion, available resources unlikely to be visually identified were targeted for PCR-analysis in 20 samples using mitochondrial and chloroplast DNA primers. Separate cluster analyses of each of these datasets showed almost no discernable, cross-cutting patterns. Considering these datasets together rather than separately provides a broader view of the diet. However, the fact that they are measured by different metrics and do not necessarily represent the same time period thwarted statistical integration of the results. Pollen and DNA pass through the digestive tract intermittently and over a longer period than macroscopically visible food remains. Furthermore, the pollen or DNA present may be derived from multiple meals. As such, it was determined that the datasets were best examined separately and integrated through qualitative interpretation of the aggregate results rather than direct statistical comparison of separate lines of data from individual samples or groups of samples. While these conclusions may not be universally applicable, these results have implications for future multi-proxy paleofecal studies.

Battle-Baptiste, Whitney**[278]** *Discussant***Bauer, Brian and Matthew Piscitelli (National Geographic Society)****[100]** *Mapping the Cuzco Ceque System*

The Cuzco Ceque System was composed of 328 shrines (huacas) organized along 41 lines (ceques) that radiated out from the city of Cuzco, the Inca capital. Historic research indicates that the ceque system was conceptually linked to the fundamental social divisions of the Cuzco region. The ceque system of Cuzco has been frequently discussed in the literature, and anthropologists and historians have long speculated on the locations of shrines in the system and the projection of the ceque lines. The goal of this study is to develop an empirical understanding of the distribution of the Inca shrines and the direction of the ceque lines across the Cuzco region using field data as well as Google Earth Pro.

[211] *Discussant***Bauer, Alexander (Queens College, CUNY)****[327]** *The Pragmatic Semiotics of Cultural Heritage*

This paper interrogates the pragmatics of heritage in two ways. First, what are the discourses and rhetorics of heritage—how is heritage invoked and talked about, like a sign of history, in making statements about the world? How has that shifted over time, as the term is increasingly invoked to explain and defend a wide range of actions and attitudes, and how do the different discursive communities who speak about heritage engage (or not) with one another? Most importantly, why have these discursive transformations not been accompanied by similar transformations in policy? The answer to that last question requires us to consider a second mode of heritage, namely, what does heritage do, as a sign in history, when it is invoked, encountered, and circulated? What does heritage activate, and what are its “practical effects”? Drawing on several examples including the recent removal of confederate monuments in the US, I argue that while operating in these two modes—as signs of and in history—heritage’s greatest potential for transformational change is when it ceases acting as a rhetorical device and instead becomes itself the center of experiential social action, such as through its encounter, circulation, or being made visible (or invisible).

[196] *Discussant***Bauer, Andrew (Stanford University)****[230]** *Growing Infrastructure, Cultivating Differences: The Temporalities of Agricultural Assemblages and the Social History of the Raichur Doab, Southern India*

This paper examines the history of medieval (circa 500–1600 CE) agricultural infrastructure—assemblages of soils, irrigation wells, and processing facilities—in the semi-arid conditions of the Raichur Doab, Southern India. Despite some investiture from ruling elites and temples, the material evidence for agro-infrastructure development suggests that it was not merely a project of state or institutional design. Rather, its development might more productively be characterized as a process of “growth” in which socio-material systems for facilitating the movement and production of matter and things emerged in relation to a range of differentiated actors and unruly cultivation conditions. The durable associations of soils, cultigens, and water appear to belie the common characterization of the Raichur Doab as a space of inherent “fertility” and calls into question the assumption that the region’s unique multiculturalism during the medieval period was an outcome of competition for its economic resources, as is commonly emphasized.

[90] *The Diet and Identity of Enslaved African Americans in the Upper South*

Enslaved African Americans in the Upper South worked and lived in both rural and urban settings as farm laborers, cooks, house servants, miners, and roustabouts. Their quality of life and cultural identity may be best understood by how their food was acquired, the types of plants and animals eaten, and the recipes they created. This paper provides a summary of the enslaved African American diet in the Upper South and compares it with that of their white owners as well as with enslaved populations in the Deep South and Chesapeake Bay region.

Baumanova, Monika (Uppsala University)

[210] *Context-Specific Applications of Space Syntax on African Urban Sites*

Organisation of space in preserved buildings and town layouts in sub-Saharan Africa have increasingly been in the research scope of archaeologists and architectural historians alike. The methods of space syntax and its associated theory have, especially since 2000's, paved its way to African archaeology and used for new interpretations of architecture e.g. of Benin, Dahomey and the Swahili coast.

Traditionally, space syntax is undertaken using access analysis graphs for individual buildings, and axial maps for towns, which allow researchers to comprehend the configuration of space formally represented as connected points and lines in a network. This paper presents a selection of illustrative case studies on how space syntax can work with remote sensing data, GIS databases and other analytical tools, and adapted to address specific research questions and historical cultural contexts in Africa. Street network analyses of West African historic towns and structural examinations of preserved stone buildings on various sites along the Swahili coast are used to show in what ways space syntax graphs can be adjusted to the current research agenda. Investigation of the built environment using complex graphical representations of its spatial partitioning and culturally embedded properties may include sensory perceptions such as vision and kinaesthetics.

[325] *Tracing Lineages and Regional Interaction in the Upper Mimbres Valley: Preliminary Bioarchaeological Indicators at the Elk Ridge Site*

Three seasons of excavation at the Elk Ridge site in the Upper Mimbres Valley suggest close familial social structures within this Classic period community. As a part of this preservation project, excavation of endangered burials has revealed mortuary and biological patterns that renew thinking of community dynamics in the region. Previous research by Harry Shafer has proposed that Mimbres communities organized around the family unit and lineage groups. Data from Elk Ridge thus far support this in the continued use of architectural plots and numerous burials within pueblo rooms. In this paper, mortuary treatments and cranial characteristics (especially occipital flattening) of 20 burials are considered as markers of familial identity. Observations of adult individuals suggest multiple ethnic identities and contact with contemporary Mogollon groups to the north. Preliminary interpretations of Elk Ridge are presented and compared to other examples of regional interaction observed in skeletal remains during a period of reduced extra-local activities.

Bautista, Stefanie (Stanford University)

[335] *Quilcapampa: A Wari Colony on an Interregional Trail on the Coast of Southern Peru*

In the ninth century AD, Wari settlers founded the site of Quilcapampa in the Sihuas Valley of southern Peru. The first definitive Wari settlement in Arequipa, the site was founded astride an inter-valley trade route that had been used for at least a millennium. This paper will discuss both the site's clear link to Wari, as evidenced by its architecture, ceramics, and foodways, as well as the possible links to the Nazca region where Wari control was likely fractured due to conflict and possible drought. Founded some two hundred years after the Wari expanded along the coast of southern Peru during the seventh century AD, Quilcapampa residents arrived at the end of a period of increased interregional interaction, then abandoned the site only a couple of generations later as Sihuas and surrounding valleys were drawn more closely into a regional trade network. More importantly, who were the people of Quilcapampa and what was their relationship with people from Nazca and in the Wari state capital?

[238] *3-D Scanning, LiDAR, and UASs in Cultural Property Protection*

Archaeologists managing cultural resources on military installations have increasing opportunities to leverage unmanned aircraft systems (UASs), LiDAR, ground-based 3-D scanning, near-surface geophysics, and other remote sensing methods into their Cultural Resource Management (CRM) practices. These techniques are being integrated into CRM work under controlled conditions where adequate time and technical expertise is available. Military archaeologists are also developing Cultural Property Protection (CPP) approaches to assist U.S. forces and partner nations in protecting cultural properties outside the continental U.S. that are threatened by looting, natural disasters, and armed conflict. Such approaches must be cost-effective and scalable to austere circumstances that may include serious shortages in time and trained personnel and harsh, potentially dangerous conditions. Methods such as 3-D scanning, UASs, and LiDAR will play important roles in CPP because they can collect useful, reliable data very quickly. We present a decision matrix intended to help those engaged in CPP make sound decisions about the use of both aforementioned "high tech" methods, as well as traditional archaeological methods including surface collection, soil coring, and photography to collect meaningful data for particular threats, site types, and conditions.

Baxter, Erin (University of Colorado, Boulder)

[190] *Aztec Ruins, Architecture and Augmented Reality*

The mounds immediately south of Aztec West were partially excavated in 1916, 1934 and 1960. These data have not yet been synthesized. Taken together, information from pottery, photographs, sketch maps and grey literature indicate the presence of masonry walls, possible staircases, and depositional patterns that are analogous to the Pueblo Bonito mounds. This poster will show these data in both traditional (2 dimensional) and augmented (3 dimensional) formats. Augmented reality will be used both to bolster Aztec architectural data, and illustrate its potential as a means to enhance poster presentations in many formats with projected data (viewed through smartphones and tablets) for an enriched graphic, video, and data-enhanced experience.

Bayani, Narges (ISAW)

[3] *Borderland Processes and the Question of BMAC in NE Iran*

How frontiers and borders are conceptualized in archaeology is critically influenced by the approaches and perspectives in culture contact research. Absence of written documents from Bronze Age Central Asia severely limits the application of such theories. The nature of the Bronze Age civilization of Bactria-Margiana Archaeological Complex (BMAC) in Central Asia, and its dispersion to neighboring NE Iran has been a long-lasting question in study of Prehistoric Western Asia. This paper aims to examine the BMAC presence in NE Iran, using Tepe Hissar as a case study, to understand how

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

BMAC interacted with local cultures in this region. The evidence for existence of BMAC in NE Iran and the nature and extent of BMAC's dispersion out of Central Asia is revisited from the perspective of frontier and borderland studies. The goal of this paper is to identify different types of borderland processes that occurred in NE Iran, where these two cultures came into contact. In order to hypothesize about this interaction sphere, I turn to borderland theories, specifically the "continuum of boundary dynamics" and "borderland matrix" models in order to conceptualize the material culture evidence for BMAC in Iran as markers of various borderland processes.

[249] *Assessing Chronology, Spatial Setting, and Architectural Planning at Pampa de Llamas-Moxeke, Casma Valley*

The archaeological site of Pampa de las Llamas-Moxeke in the Casma Valley, Peru is an architectural complex comprising two opposing large platform mounds united by a sequence of aligned rectangular platforms and structures. The site was studied mainly in the 20th Century by various investigators; the most recent of whom carried out intensive excavations in the 1980s aiming to produce exact dates and explain the function of the settlement. This previous work suggested that the complex dates to the Early Formative Period, implying contemporaneity with local sites including Las Haldas, Sechín Bajo, Cerro Sechín, and Sechín Alto. However, the occupational history of Pampa de las Llamas-Moxeke is considerably more complex than what was originally proposed. New data contribute to explanations of the construction sequence, settlement planning, use of the natural setting, and the reasoning for the selection of the complex's physical placement, particularly in political and economic terms. As such, construction of Pampa de las Llamas-Moxeke began in the end of the Late Archaic and was subject to modifications according to the social transformations occurring with the introduction of ceramics and the Chavín phenomenon. In turn, its ruling class would have dominated the socio-political scene in the middle Casma Valley.

[168] *Gathering, Gardening, and Agriculture: Arkansas Archeological Survey's Plant-Based Public Archeology*

The Arkansas Archeological Survey has been practicing citizen science and developing educational tools for engaging local communities in the study of the past since the 1960s. In this paper, we discuss recent efforts by the Survey to develop educational content specifically aimed at highlighting the history of plant use through time in the southeastern United States. The Survey received grant funds to develop the 5th grade social studies curriculum, Gathering, Gardening, and Agriculture: Plant-based Foodways in the Southeastern United States. We designed the curriculum to improve students' scientific literacy and foster a greater sense of the importance of preservation among both students and teachers. Through this curriculum, teacher workshops, web-based content, and native gardens at several research stations, we have developed a suite of educational approaches to help teach how people in the past used plants, while emphasizing the important contributions that southeastern Indians made to the ways people use plants today. We discuss the success of our approach to public archeology and education, as well as our assessment and evaluation of our educational programming as we considered education and archeology in the 21st century.

[204] *Bioarchaeological Analysis of Human Skeletal Remains from the Historic First Baptist Church Cemetery, Philadelphia (ca. 1700–1860): Preliminary Results*

The inadvertent discovery of the historic First Baptist Church of Philadelphia cemetery resulted in the recovery of a large sample of human skeletons composed of commingled remains as well as discrete individuals associated with intact coffins. Analysis of the skeletal remains prior to reburial provides insight into demography, behavior, and living conditions among members of this congregation interred circa 1700–1860. While preservation of the remains is variable within the cemetery, preliminary results include a paleodemographic profile consistent with high infant and childhood mortality. Moderate prevalence rates of developmental enamel defects are also indicative of physiological stress experienced during early childhood. In addition to paleodemographic and paleopathological trends, we present the osteobiography of an adult male exhibiting multiple well-healed traumatic injuries and evidence of autopsy—a form of postmortem examination that appears infrequently in public cemeteries dating to this period.

[41] *Spatial Variation in Tool Use: Acheulean Forager Patterning at Elandsfontein, South Africa*

Despite more than a century of scholarship, our knowledge about the use of stone artifacts remains relatively sparse. Major advances in the analysis of microscopic wear have been the primary focus of much previous research. However, post-depositional processes and the logistics of microscopic analysis limit sample sizes in these studies. New approaches that quantify macroscopic damage patterns on the assemblage scale provide a robust basis for drawing behavioral inferences about hominin tool use. Here we apply these new techniques to a large assemblage of stone artifacts from multiple excavations at Elandsfontein (1 Ma—780Ka) from the Western Cape of South Africa. Measures of damage location, continuity, and extent provide intriguing insights into the variability in tool use patterns. This analysis is combined with experimental studies of tool use and their subsequent damage patterns. Results indicate differences in tool use across an ancient landscape. These differences correlate with complimentary data sets from across Elandsfontein. This further supports this method in the investigation of tool use in Paleolithic contexts. This research was supported by the National Science Foundation Research Experience for Undergraduates (NSF-BCS- 1620907).

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Beaule, Christine**[275]** *Ethnogenesis and Cultural Persistence in the Global Spanish Empire*

Ethnogenesis and cultural persistence are dynamic and variable processes of identity creation, manipulation, and co-constitution, which also include the persistence, reinforcement, and reconstitution of elements of cultural and ethnic identities. Our focus is not simply on indigenous groups or colonists, but rather on the larger context of agents within multi-cultural, pluralistic colonies. The colonies established by the Spanish throughout the Americas, the Caribbean, Pacific, Southeast Asia and Africa, brought together individuals and groups from both near and distant diverse cultures. Together, these colonies were economically, politically, and religiously connected to one another. Spanish colonies were, moreover, a catalysis of cross-cultural exchange, conflict, and persistence as colonists, merchants, and various indigenous individuals and groups moved throughout the empire. It is thus an ideal setting to explore questions of ethnogenesis and the persistence of local and indigenous traditions in old and new contexts. This paper offers a broad, comparative exploration of the archaeology and ethnohistory of ethnogenesis, persistence, and the many permutations of identity throughout the Spanish Empire. It sets up a conceptual framework for the case studies that follow, representing seven world regions.

[275] *Chair*

Bebber, Michelle and Michael Wilson (Kent State University)**[89]** *Why Wasn't the Ceramic Arrowhead Invented?*

In biology the concept of theoretical morphology has been used as a heuristic device for better understanding the evolutionary trajectories of organisms. Theoretical morphology proceeds by creating and examining hypothetical specimens not actually found in nature. So instead of asking "why does feature X exist?", a theoretical morphological approach asks "why doesn't feature Y exist?". Here, we use this approach to address the question of why ceramic technology did not evolve to replace stone technology with respect to hunting weapon tips (spear points, atlatl dart tips, arrowheads). In other words: why didn't the ceramic projectile point emerge? Clay is a readily available, economically efficient, and easily workable raw material. Likewise, objects made out of fired clay are extremely hard, sharp, and generally durable. We hypothesized that there was perhaps a functional constraint such that ceramic hunting weapon tips cannot perform as effectively as stone ones. We conducted an archaeological experiment using stone and ceramic replicas, and assessed point penetrability and durability. The results of this study will have implications for our understanding of prehistoric weaponry evolution.

Becerra, Gibrán (Universidad Veracruzana)**[93]** *Habitar en los bordes, ocupación Clásica en lomeríos y crestas montañosas al oriente de los volcanes de Los Tuxtlas*

Los sitios localizados sobre la planicie costera y en el pie de monte de los volcanes de Santa Marta y San Martín Pajapan, en el sur de Veracruz, se caracterizan por la presencia de arquitectura monumental, grandes áreas domésticas, sitios acondicionados como estaciones portuarias, talleres de artefactos de basalto en formato pequeño y posiblemente áreas de cultivo. En el periodo de mayor ocupación (650–1000 dC.) los terrenos bajos estaban totalmente ocupados, por lo que el asentamiento comenzó a crecer hacia los lomeríos y las crestas de la Sierra de Santa Marta y faldas del Volcán San Martín. Aunque sin arquitectura monumental, la ocupación de lomeríos y crestas montañosas fue una solución en el crecimiento del asentamiento; en la ponencia se exponen las principales evidencias de modificación del terreno de este tipo de sitios, los materiales arqueológicos asociados y se evalúan las posibilidades de aprovechamiento y explotación de recursos locales y su impacto en el desarrollo general de la población de la zona costera de Los Tuxtlas y del Sur de Veracruz.

[93] *Chair*

Becerra Alvarez, Marimar (Universidad Veracruzana)**[93]** *Paisajes aprovechados y causas modificados en el sistema portuario de la costa este de Los Tuxtlas, Veracruz*

En la zona este de Los Tuxtlas se ha identificado un complejo sistema de intercomunicación fluvial y marítima, construido a partir del aprovechamiento y acondicionamiento de corrientes acuáticas. Una gran parte de estas vías de comunicación confluyen en el sistema portuario de la costa este de Los Tuxtlas. La región se caracteriza por estar en un abanico aluvial, por lo que presenta un gran dinamismo fluvial, es decir los causes no son estáticos en el tiempo.

En los estudios arqueológicos debe considerarse estos fenómenos naturales como variables complementarias, pues ayuda a entender como fue la relación de las sociedades con su entorno. Para el caso del sistema portuario de la costa este de Los Tuxtlas, trataremos de entender la relación que tuvo el dinamismo fluvial de la región para la configuración de los sitios, en qué medida estas variables transformaron el paisaje y cuáles fueron los mecanismos que las sociedades adoptaron para apropiarse el entorno.

Becerra-Valdivia, Lorena (ORAU, University of Oxford), Thibaut Devière (ORAU, University of Oxford), Thomas W. Stafford Jr. (Stafford Research, LLC), Michael Waters (Center for the Study of the First Americans, Texas) and Tom Higham (ORAU, University of Oxford)**[184]** *Comparison of Preparative Chemistry Methods for the Radiocarbon Dating of Anzick Site, Montana*

Found in 1968, the archaeological site of Anzick (24PA506), Montana, contains the only known Clovis burial. Here, the partial remains of a male infant (Anzick-1) were found in association with a Clovis assemblage of over 100 lithic and faunal bone artifacts—all red-stained with ochre. The incomplete, unstained cranium of a separate individual (Anzick-2), dating to ~8,600 radiocarbon years before present (BP), was also recovered. Previous chronometric work has shown an age difference between the Clovis assemblage (represented by two antler rod samples), dated to ~11,000 BP by XAD-purified collagen, and the Anzick-1 individual, dated to ~10,700 BP by XAD-purified collagen. The discrepancy between the age of the human remains and the osseous artifacts has led to much speculation. Here, we present the results of a comprehensive radiocarbon dating program that utilized different preparative chemistry methods on osseous material from the site, including a single-amino acid extraction protocol using preparative High Performance Liquid Chromatography (prep-HPLC) optimized at the University of Oxford. This comparative approach has allowed us to obtain robust chronometric data for a key site in First Americans research.

Beck, Chase, Vaughn Bryant (Texas A&M University, Department of Anthropology, P) and Dennis Jenkins (University of Oregon, Department of Anthropology)**[290]** *Pollen, Contamination, and Interpretation at Paisley Caves Archaeological Site*

In studying the early inhabitants of North America, some of the frequently revisited questions involve how they lived, what they ate, and what their world was like. Archaeological Palynology is a well understood method for addressing these questions. Because of the constant pollen rain and the purposeful and incidental ingestion of pollen and spores, well-preserved pollen is repeatedly found in association with human habitation sites and human artifacts. Paisley Caves, Oregon, established itself as one such early human habitation site when human DNA was found in coprolites dating to the oldest associated with humans in America. In addition, the sediments within caves at the site contain an abundance of well-preserved pollen. Knowing more about the environment reflected by the sediments at Paisley Caves can tell us more about the people who lived there, the lives they led, and the obstacles they faced as they ventured into the undiscovered American continent. However, the cave setting as well as the presence of packrat coprolites, thoroughly mixed within the sediments, adds levels of complexity that makes the sediment at Paisley Caves a unique interpretive challenge.

[29] *From Mounds and Museums: Building a Bioarchaeology of the Early Bronze Age in the Apuseni Region of Transylvania*

The Apuseni Mountains of southwest Transylvania, Romania, are amongst the richest gold and copper procurement zones in the world. Metals from this region helped fuel the rise of inequality across Europe during Late Prehistory, and the area is also home to a rich mortuary record, with archaeological survey identifying over one hundred mounded tomb cemeteries belonging to Bronze Age communities. However, none of these cemeteries have been fully excavated and only a small sample of skeletons has been studied. Here, we describe the results of bioarchaeological analysis of human skeletal remains from a sample of previously unanalyzed Early Bronze Age sites that encompass a significant degree of environmental and cultural variability, including upland cemeteries with stone-covered cairns, as well as lowland cemeteries with earthen cairns. These cemeteries show evidence of diverse mortuary treatments, including primary burials, secondary burials, and commingled interments. Our analyses assess age, sex, health, and funerary treatment, providing preliminary information about how mortuary treatment intersected with aspects of identity and lived experience. This study builds a foundation for future bioarchaeology in the Apuseni region and emphasizes the need to supplement osteological analysis of the scant museum collections with larger-scale excavation of cemeteries.

[220] *Landscape and Labor: Bones and Bodies of the Tiwanaku State*

Modern, archaeological, and bioarchaeological accounts of South American Andean workers show labor divisions by age, then gender, with a focus on duality between the sexes. Within the Tiwanaku state (AD 500–1100) of Bolivia and Peru, labor was also divided across the landscape within its heartland and colonies, and especially within its multiethnic neighborhoods in the heartland city of Tiwanaku (Becker 2017). Pondering these labor communities further with a focus on data from these peoples' skeletal remains, this paper discusses the embodied physical changes noted on these Tiwanaku bones associated with varied task and subsistence-based lifeways. While it may not be possible to link certain jobs with each individual, locating gendered spaces and tasks may be conceivable spatially within the population. Further features may also be identified by focusing on certain parts of the anatomy, like hands, feet, and the spine, which would have been important body regions to show labor distinctions associated known Andean crafts like potting, weaving, and the movement of goods using backpacks across the highly variable elevations of this state. Hence, this research takes a wide-to-narrow scope across the Tiwanaku polity to understand labor, gendered activity spaces, and embodiment on human bone.

[58] *What Should We Call the Rocks in Living California Landscapes?*

As archaeologists in Central California shift towards understanding indigenous agencies within the indigenous landscapes of colonial contact (Panich and Schneider 2015) an opportunity has arrived for the field to consider the practical implications of autochthonous Central Californian relationships and ontological perspectives for research praxis. The question posed in this paper, is what are rocks as interlocutors in relationships; how do you think of a rock when it is a part of a place that is recognized to be vibrant, living, and interconnected with living and ancestral Central California peoples. Fire-cracked rocks, rounded river stones, and other rocks that are not obvious flaked or ground stone tools are a prominent component of archaeological sites that are little recorded and often not recovered from the field. While collection strategies are an important pragmatic part of archaeological investigations, the fields privileging of formal tools and chronologically significant artifacts miss potential information about many pieces of places that are not understood. In this paper, I discuss examples within the ethnographic archive that may help us consider the role that rocks have played in the autochthonous landscapes of the past and present, which might otherwise have eluded western eyes.

[330] *Coastal Hydrogeological Context of Potable Water Sources of the Vista Alegre Maya Port Site, Yucatan Peninsula, Mexico*

Ongoing investigation at the ancient Maya port site of Vista Alegre has revealed a multi-phased and significant occupation spanning the Preclassic to Postclassic periods. However, the vital source of potable water that would have supported this coastal settlement remains unknown. We present a hydrogeological assessment of the region to understand changing water sources over the last 2 millennia. Potential groundwater foci at the intersections of conjugate fracture sets are presently either mantled in sediments, and/or flooded by saline-hypersaline waters. Nearby surface drainage from rain-fed savannas also has seasonally variable salinity commonly exceeding potable limits. A number of shallow springs discharge a range of reduced salinity and cooler waters. These are locally called Ojos de Aguas, a form of flooded sinkhole. Casting the coastal landscape under the marginally lower sea levels of the late Holocene (-2m), some of the known ojos would have been terrestrial sinkholes/cenotes above sea level. Recent evidence indicates a downward tectonic movement of the Yucatan north coast, which would further leave the ojos unaffected by direct mixing with marine waters. Vista Alegre's inhabitants may have benefited from cenote potable perennial water sources that are now clandestine due to the sea level and tectonic shifts.

Bedell, John (Louis Berger)

[202] *The Potomac Gorge*

The Potomac Gorge is a canyon through which the river passes through the Falls Zone from Great Falls down to Washington, D.C. Ever since John Smith met Indians fishing below Little Falls in 1608, it has been widely assumed that the Potomac Gorge was a prime Native American fishing spot. The numerous prehistoric archaeological sites along this stretch of the river have often been interpreted as fishing stations. However, re-examination of the archaeological record in the Gorge, carried out as part of multi-year archaeological surveys in Rock Creek Park and the George Washington Memorial Parkway, suggests a more complex picture. Most of the known Archaic and Woodland sites are in places that make them unlikely fishing spots. This discovery directs attention to other ways ancient Native Americans might have used the gorge: as a boundary, as a transportation corridor, and as a possible approach route for dangerous outsiders that had to be carefully watched.

[214] *Deconstructing Rock Art—An Experimental Approach to the Application of Portable Analytical Instrumentation to Applied Pigments at Pleito, South-Central California*

The composition of background substrate, overpainted layers and admixtures can influence the data acquired from portable instrumentation at rock art sites. An understanding of the extent and impact of this influence is crucial when comparing in situ rock art pigments with potential source materials. This study uses an experimental process to assess the impact of factors such as a pigment thickness, overpainting, and addition of organic binders on the readings acquired using portable instrumentation including pXRF, Raman and FTIR. Approximately 150 samples collected from potential pigment sources in South Central California, are used to form experimental paints, as well as forming a comparative collection. In addition to these mineral sources various fats, plant gums and resins are tested. The aim is to establish a method to compensate for the background and overpainting effects. This method is considered a means to identify pigments and binders in situ and compare these between panels and with potential source materials. This experimental work forms part of the Gordian Knot Project based at the polychrome rock art site of Pleito and the results are applied to compare pigments at this site between panels and with potential sources.

[240] *Preliminary Investigations into the Site of Chullpa K'asa in Southwestern Bolivia*

The site of Chullpa K'asa, located in the Potosí Department of southwestern Bolivia, covers an area of around 45 hectares and contains the ruins of dozens of Prehispanic buildings. This poster presents the results of preliminary investigations of the site based on pedestrian ground survey and an assessment of artifacts housed at a nearby Indigenous museum. Systematic survey and mapping, which included the recording of surface artifacts at 43 locations across the site, revealed two areas of concentrated architecture, one area of tombs, abundant ceramic sherds, groundstone tools, and evidence of metal production. Based on survey data and the artifacts housed in the museum, the site appears to have been occupied from the Intermediate onward to the Late Horizon Period, roughly coinciding with the end of Tiwanakan influence, subsequent occupation by warring polities in the Late Intermediate Period, and finally the invasion of the Inca as they established the southern extent of their empire. Artifactual and architectural data provide a basis to interpret the function of the site as a frontier of the Incan Empire, develop research questions for future investigations at the site, and contribute to the sparse amount of archaeological information concerning this area of the world.

[299] *3D Imaging in Remote Areas, Rainforests, and Other Hostile Environments: Investigating Identity and Interaction in Eastern Honduras*

Ancient eastern Honduran populations utilized foreign symbols in limited elite contexts, such as site planning and architecture, but most elements of material culture reflect clear connections to Lower Central America. Iconography seen in petroglyphs appears significantly different from that seen in other media, and may yield additional information and insights into identity formation and interactions within the region. For many reasons, these petroglyphs have not been extensively studied. While some of the petroglyphs are easily visible, many are highly eroded, hard to access, and difficult to identify, document and interpret. Recent work in high resolution 3D imaging using rugged and portable structured light illumination systems may offer an inexpensive solution to identifying, documenting, and interpreting these important symbols in remote areas or hostile environments.

Begun-Veenstra, Erica (Grand Valley State University)

[205] *The Science of Souvenirs: Past, Present, and Future*

For many people, material objects hold the memory of a time and place. For some families, these objects, collected at meaningful and important times and places, can become heirlooms with an additional, familial significance tying generations to a distant time and place. For others, these objects reflect personal journeys and experiences. By examining two case studies—the Michoacan originating ceramics of the N1W5:19 compound at Teotihuacan and the exchange and collecting of lapel pins at an international children's competition—this paper seeks to address the importance of collecting keepsakes and souvenirs as markers of memory of distant lands, personal connections, and travels.

Behling, Emma (Augustana University) and L. Adrien Hannus (Augustana University)

[223] *Experimental Recreation of Shell Fishing Implements at Mitchell Indian Village in South Dakota*

Over the years of excavation at the Prehistoric Indian Village at Mitchell, several similar shell artifacts were discovered. Excavators came to the hypothesis that the shell items had been fishing lures, and set out to test it. The shell artifacts were replicated and used as lures on several fishing expeditions. These shell items functioned as lures, and we are led to believe that the artifacts found at Mitchell could indeed have been fishing lures.

[205] *Manifesting the Ghosts of Place through Archaeology and Empathy*

Hauntings rely on an ability to envision someone from the past retaining agency in the present, a ghost. Often barely perceptible, the ghost's actions tend to be routine (walking, sitting, etc.) but their message is profound (I was like you, until something happened). Archaeology relies on an ability to envision the past, present, and future as intruding into each other at a defined place, a site. Often missed by those without proper training, archaeologists recover mundane objects (plates, cups, etc.) and use them to speak about grand social issues (past peoples have left lessons for us). These parallels are not uncanny, they are noteworthy. By investigating how and why a space takes on the aura of a haunted place, archaeology can tap into the enthusiasm for the past that ghost hunters/tourists espouse. After seven years of incorporating ghost stories and hunts into my teaching and research, I've found a formula for manifesting the ghosts of place—summarized as “we remember what we fear and we believe what we can envision.” Any space becomes haunted once good storytelling taps into empathy. The objects made, used, and left behind by those we have lost aid the conjuring.

[33] *Ballgame, Ritual and Monument Reutilization at the Ancient Maya Site of Uaxactun*

During the 2017 field season of the Uaxactun Archaeological project new monument was excavated at Buena Vista, a minor center at Uaxactun urban periphery. It is a small carved altar or ballcourt marker, which according to its style dates to the Early Classic. High quality of the carving and the hieroglyphic inscription indicates that the altar/marker itself was a part of the monumental corpus of Uaxactun urban core; uncomplete text provides important new information on the dynastic history of the site. During the Late/Terminal Classic it was moved and reutilized by the occupants of Buena Vista as a ballcourt marker. Its importance probably lasted to the Postclassic when it became the object of the veneration and unusual offering was placed associated with the monument.

[117] *Reassessing Wari Power in the Central Andes: Local Agency, Trade, and Competition in the Cusco Region*

The Wari state of the Central Andes has traditionally been interpreted as an expansive polity that incorporated numerous provinces during the Middle Horizon (A.D. 600–1000). Most research has focused on the large Wari installations built in several regions of Peru, leading many scholars to conclude that Wari administrators established direct imperial control over these areas. More recently, scholars have started to adopt a complementary bottom-up approach to study changes experienced at the regional and household levels by smaller communities living outside the large Wari installations. This new perspective challenges previous interpretations of Wari as a strong, centralized, all-controlling colonial authority. In the Cusco region, survey and excavation data suggest that local populations were little affected by Wari presence. Continuity in settlement patterns and domestic and ritual activities reveal that locals did not adopt Wari practices. Like other early states worldwide, the Wari polity might have built enclaves that helped its settlers tap into the knowledge, authority, and networks of local elites. Obsidian, hallucinogenic snuff, and other exotic goods from Cusco further demonstrate that Wari colonists did not interrupt regional and long-distance exchange networks, but might have intensified prestige-goods competition and altered the balance of power among local societies.

[114] *Transforming Ideologies and Hopes of the Past in the Purari Delta of Papua New Guinea*

In the wake of several decades of resource extraction (logging and oil/gas exploration), the past as articulated in particular places, material things, names and narratives has taken on new urgency in the Purari Delta. For over a decade communities have struggled to marshal these assemblages of cultural heritage to demonstrate their traditional ownership to acquire resource royalties. An imperfect and highly political process, claimants must overcome the legacies of out-migration, Christianity, and iconoclasm which have unevenly configured the distribution and knowledge of the past. In the midst of these processes, aspects of this diffuse heritage emerge unexpectedly: a WWII airplane rising up from the delta, stone tools unearthed by bulldozers, or rumours of ancestral beings encountered in the forest. In this paper I examine these periodic returns as a way to think through the region's transforming ideologies, how the past is being marshalled by individuals and their communities to make a more hopeful future, and what role anthropology has in these processes.

[74] *Fancy Threads and Tree-Ring Dates: New Chronometric Controls for the Development of Cotton Weaving Technologies and Ritual Textile Production in the San Juan Basin, A.D. 1150–1300*

The introduction of cotton tapestry weaving traditions transformed Ancestral Pueblo ritual costuming traditions in the San Juan Basin ever after. After its introduction, documenting developments and changes of cotton-weaving technologies and ceremonial garment fashions is difficult because most of the associated materials are perishable. Arid conditions at the numerous cliff dwellings occupied in the Pueblo III period (A.D. 1150–1300) have fostered the preservation of abundant evidence of cotton-textile production in the form of loom anchors and spinning-and-weaving tools, but little synthesis of these data has been attempted in decades. Even less is known about spatiotemporal changes in weaving production technologies and the contexts where weaving took place. Newly developed tree-ring chronologies from rooms yielding weaving-related materials, cross-media stylistic studies of pottery and mural imagery, and archival documentation of weaving assemblages from cliff-dwellings in the region provide new data about the nature of cotton textile production in the region in the twelfth and thirteenth centuries. In this paper, I present the results of recent analyses that shed new light on the origin, development, and distribution of cotton-weaving technologies and ritual-garment production industries in the San Juan Basin.

[20] *"The Other Half of the Sky": Competitive Anarchy in Contact-Era Palau*

This paper explores the way in which contact-era Palauan society negotiated between hierarchy and heterarchy to ensure long-term sociopolitical stability, developing and deploying a theory of competitive anarchy. The evaluation critiques the frequent correlation of complexity with hierarchy and centrality and does so through a geostatistical analysis. This investigation begins with the development of a proposed model of Palauan sociopolitical structure, derived through ethnographic descriptions contextualized with re-readings of contact-era narrative accounts. This proposed model provides a hypothesis which is tested in a geographic information system (GIS) through the geostatistical analysis of regional settlement patterns and the distribution of village sites across the landscape at multiple scales. Through modelling clustering and dispersion of village sites across the landscape,

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

the evaluation of central places and authority in Palau suggests the presence of meaningful settlement patterns at both local and regional scales. The results suggest that intentional and complex social structures can allow competition while both limiting social inequality and ensuring group cohesion.

[153] *Diet among Marine Hunter-Gatherer-Fishers of the Northern Patagonian Channels (41°50'- 47° S): Assessing Plant Use and Consumption through Dental Calculus Studies*

In the western Patagonian channels, the archaeofaunistic record, technological and isotopic studies show subsistence strategies based on fishing, hunting and gathering of marine resources. Unfortunately the consumption of plant resources still has not been assessed for this area and the consumption of C3 plants is hard to detect through these type of analysis. Our aim is to evaluate the consumption of wild and domesticated plants and parafunctional use of the teeth for the processing of plant fibers. For this study we examined the microfossil evidence contained in the tooth calculus of 47 individuals from 17 sites from the Chiloé and Chonos archipelagos. In the cases that isotopic information is available, we shall compare and evaluate how the integration of both types of information -isotopic and microfossils- can contribute in the general overview of diet reconstruction. [138] *New Digs for an Old Collection: A Case Study in Rehabilitating Legacy Collections*

Legacy collections—those typically generated decades ago that do not meet current professional curation standards and require a substantial resource investment for long-term preservation—are housed in nearly every archaeological repository across the country. Many are the result of under-funded university field schools or public archaeology projects that didn't account for either the initial curation preparation or the long-term costs and maintenance of collections care. The deeply stratified and federally-owned Tillmont site, located on an island in the Upper Mississippi River, is one such collection that was recently rehabilitated to meet the federal curation regulations (36 CFR Part 79). This paper explores that rehab process, along with the challenges encountered and the solutions for overcoming them. The end result is a collection that is fully digitized, organized, indexed, and ready for a variety of uses, including research and education.

[227] *Pedagogy in the Paleolithic? The Influence of Verbal Teaching on Stone Knapping Skill Acquisition*

Teaching is uniquely developed in humans and was likely critical to the emergence of cumulative culture. However, the importance of various forms of teaching, including the use of language, in transmitting Paleolithic skills like stone knapping is less understood. Here we examine the knapping behaviors of 17 subjects who learned to make Oldowan and Acheulian stone tools from watching video demonstrations either with verbal instruction or without sound. Despite intriguing differences in brain activity (measured with fNIRS) between these groups, the mode of social transmission has yet to reveal significant effects on handaxe morphology, suggesting that verbal teaching may not have been necessary for the social reproduction of early stone toolmaking skill. We coded video-recordings of subject performance using BORIS event-logging software and a knapping ethogram to test for possible behavioral differences between conditions that might explain observed differences in brain activity and indicate influences of teaching on early-stage skill acquisition that are difficult to detect from artifacts. These data allow us to test for differences in the frequency and sequential structure of knapping actions across conditions and individuals, potentially guiding further artifact analyses and providing a more detailed picture of the influence of verbal teaching on knapping skill acquisition.

Benfer, Adam (University of Calgary)

[263] *The Archaeology of Travel in Greater Nicoya*

Sometime before AD 1, a dynamic interaction and exchange network developed among the villages and hamlets of Greater Nicoya. The range and frequency of trade within this region is demonstrated by geochemically sourced ceramic and stone artifacts. The travel routes along which these artifacts were traded remain poorly understood. Geographic information systems (GIS) offer a means to predictively model the optimal terrestrial and aquatic travel routes that interconnected the settlements of Greater Nicoya. Accounting for both pedestrian travel on land and canoe-borne travel in the rivers and lakes, I use a GIS to present a probable simulation of the travel infrastructure that facilitated the regional movement of trade goods. I then test and refine the results of my simulations against the rest of the archaeological record. By interpreting this simulated travel network and the given distribution of traded goods within an intersocietal interaction framework, I discuss the role that intraregional movement and mobility played in the evolution of the societies that once thrived in this section of southern Central America. While some trade goods traveled long distances, most interactions were oriented locally or among neighboring polities.

Benfer, Bob (University of Missouri-Columbia)

[64] *Late Pre-ceramic Peruvian Effigy Mound Imagery*

Here I report the use of multiple imagery for understanding the coastal valley site studied most intensively, El Paraíso. Photographs of carved bone figures, plane table maps, Total Station maps, kite orthophoto maps, aerial photos, Google Earth satellite maps, and planetarium maps provide images that, taken together, permit identification of the effigies.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Identities of both arms of the El Paraíso complex can be recognized: One is a bird. The other resembles the three mythical figures Bischof named the "Monstruo" in an incised bone.

The long axis of the Bird mound at El Paraíso is oriented from the corridor of the principal temple of the site through the body and eye of the bird. On evenings after Zenith days, both the Bird and Monstruo mounds have an azimuth of 32° towards the rise of the celestial river—the Milky Way—through its southernmost point. Other Late Preceramic effigy mound sites and the Late Horizon Machu Picchu site share this orientation. The figures likely represent Andean dark-cloud constellations in the Milky Way.

Bengtson, Jennifer (Southeast Missouri State University) and Amy Michael (Idaho State University)

[215] *Mortuary Analysis and Bioarchaeology: A Survey of Integrative Approaches*

In her chapter in the 2006 volume "Bioarchaeology: The Contextual Analysis of Human Remains", Lynne Goldstein considered the intersection of mortuary analysis and bioarchaeology through a survey of articles from eight prominent archaeology journals (1995–2000). She concluded that significant work remained to be done to appropriately integrate the two fields. In our paper, we summarize Goldstein's critiques and examine more recent publications in these same journals (2006–2016) to characterize the extent to which the potential for further integration noted in her chapter has been realized. We also discuss what Goldstein characterized as emergent foci of mortuary archaeology—namely gender, the individual, the emotive, and landscape studies—to gauge the extent to which such topics have been considered by bioarchaeologists since 2006. We end with reflections on Dr. Goldstein's influence on our own work, particularly as her guidance has inspired us to highlight mortuary analysis and use holistic approaches in our bioarchaeological research.

Benitez, Alexander (University of Alabama)

[139] *The Central American Ceramics Research Project: A Case Study on How to Make Old Museum Collections Relevant Again*

The Central American Ceramics Research Project, a student driven and collaborative research program carried out between 2009–2013, completed a scholarly survey of more than 13,000 ceramic objects in the collections of the National Museum of the American Indian (NMAI). The project originated as an effort to update old catalog information and bring to light important but largely forgotten collections of ceramics. However, it quickly developed into a major collaborative research effort that brought together university students, archaeologists and museum specialists from the U.S. and Central America, established new partnerships between the Smithsonian Institution and Embassy staff from various Central American countries, and ultimately served as the basis for the NMAI's longest running temporary exhibition, "Ceramica de los Ancestros: Central America's Past Revealed." This paper describes the CACRP's history and scholarly research, and offers it as one student driven case study in how to make old museum collections relevant again.

[168] *Deviating from the Standard: The Relationship between Archaeology and Public Education*

As a social science, archaeology utilizes disciplines within science, mathematics, and technology to answer questions about human behavior and our shared cultural heritage. With its interdisciplinary nature, archaeologists and educators over the last few decades have sought to promote archaeological lessons in K-12 classrooms. The presentation, "Deviating from the Standard: The Relationship between Archaeology and Public Education" uses the state of Georgia as a case study to examine the past, present, and future potentials and impacts of archaeological education in the classroom. By studying educational theory, current federal and state standards, archaeological outreach practices, and presenting data from questionnaire surveys and interviews of educators and archaeologists, this presentation will demonstrate the important contributions that archaeology can make to Georgia education.

[266] *Composing the Late Cahokian Countryside: A View from the Rhea Site, St. Clair County, Illinois*

The transition between early (AD 1050–1200) and late Mississippian (AD 1200–1350) in the American Bottom is recognized as a significant moment of socio-political and religious change in the historical trajectory of Cahokia. During this time, relationships between persons, places, and things transformed, resulting in different ways of engaging with both Cahokia and the non-human powers that underwrote it and the broader Mississippian world. With a goal of investigating a Moorehead phase occupation in the uplands, the 2017 University of Illinois field school undertook excavations at the Rhea site, uncovering an important site with an unexpectedly complex transitional Mississippian occupation. Specialized architecture suggests a possible "nodal" site, though that which constitutes such a site clearly was changing. Focusing on the material engagements evident at Rhea, preliminary results from ongoing investigations begin to address these changing relationships between Cahokia and its hinterland inhabitants during this pivotal time. Comparing Rhea to known regional patterns provides a basis for focusing on the practices, materials, and architectures that constitute extra-domestic, special-purpose sites after AD 1200.

[6] *Comparative Micro-Usewear and Residue Analyses on Late Pleistocene Unifacial Tools from Huaca Prieta, Peru, and Monte Verde, Chile*

This study presents the results of a comparative multi-year analysis of high and low power micro-usewear and residue patterns on 14,000–10,000 cal BP unifacial stone tools from the late Pleistocene archaeological sites of Huaca Prieta on the north coast of Peru and the Monte Verde I and II sites in south-central Chile. The archaeological stones from these sites are also compared with experimental assemblages employing various actions (e.g., scraping, cutting, gouging, perforating) to work several types of materials ranging from hard and soft plants to animal hide and meat to fish and shellfish, among others. The analyzed tools are contextualized within the specific activity areas where they were recovered within sites. The contribution of these results to the broader inter-assemblage interpretation of the sites is discussed.

Bentley, Heath (AmaTerra Environmental), Norbert Stanchly (Texas State University) and James Garber (Texas State University)

[43] *From the Sea to the Smoker: A History of Sea Turtle Exploitation on St. George's Caye, Belize*

Historic literature frequently mentions the exploitation of sea turtles throughout the Caribbean by indigenous populations and early settlers alike. Large and abundant, these animals provided a readily accessible protein source for European and African populations as they traveled. A review of documents held by the Belize Archives and Records Service reveals that sea turtle capture and sale was once a large contributor to Belize's coastal economy. Commonly called "turtlers", 25% of the population was involved in the capture and sale of sea turtles by the late eighteenth century. Offshore reconnaissance on St. George's Caye has led to the recovery of sea turtle remains associated with turtle corrals that were documented on a 1764 map. Per results of faunal analysis from the island, the majority of animal remains recovered belong to at least two different species of sea turtle. Turtle species varied in their preference by people as a food item, the method of capture, and their role in the economy. The distribution of the remains of

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

these different turtle species across the island helps to provide insight into the relationship of the many inhabitants of St. George's Caye with the various aspects of turtling.

[70] *From a Cave near Tehuacán? Reconstructing Object Histories of Looted Postclassic Mesoamerican Turquoise Mosaics*

The mid-20th-century market for pre-Columbian antiquities is notoriously opaque. Riddled as this moment in the market is with stories of looting, forgery and deceit, the period between roughly 1950 and 1990 is also the era in which significant parts of today's best-known museum collections of pre-Columbian art were formed. Because of the practices of art dealers many pieces that once formed part of the same original deposit are now scattered over the globe. Any possible information on the provenience of these clusters of objects can only be found hidden away in the archives of the institutions that hold them. The only way to bring these pieces back together and (partially) recontextualize them is through the study and publication of their object biographies.

In this presentation I attempt to reassemble a corpus of Post-Classic Mesoamerican turquoise pieces, that were probably looted in the late 1950s/early 1960s and appeared on the market between 1950 and 1980. All of these are said to come from caves near Tehuacán, but lack any further information on their exact provenience and provenance. Nonetheless, the pieces can be relatively securely traced to specific localities or regions through a combination of stylistic, archaeological and archival research.

[71] *An Israeli (real COOL) Dolmen*

Excavation in the Shamir Dolmen Field (comprising over 400 dolmens), on the northern Israeli basaltic terrains, was carried out following the discovery of enigmatic rock art engravings on the ceiling of one of the largest dolmens ever recorded in the Levant. Excavation of this dolmen, covered by a basalt capstone weighing some 50 tons, revealed a secondary multi-burial (of both adults and children) rarely described in a dolmen context in Israel. Engraved into the rock ceiling above the multi-burial is a panel of 14 forms composed of a vertical line and downturned arc motif. Building of the Shamir dolmens required a tremendous amount of labour, architectural mastery, and complex socio-economic organization well beyond the capacity of small, rural nomadic groups, thought that have lived on this era. The monumental megalithic burial of the Shamir dolmens indicates a hierarchical, complex, non-urban governmental system. The newly discovered rock art and the burial uncovered beneath it, brings new hope, to the dolmen culture research in Israel and the Levant. The dolmens of Shamir, bring us a new leap on the way knowing one of the most mysterious and underestimated cultures of the biblical landscapes.

Bergh, Sarah (Union Institute & University)

[188] *Changes in Resource Use during the Mississippian Period on St. Catherines Island, Georgia*

After more than forty years of zooarchaeological research on prehispanic collections from coastal Georgia, it is clear that people exploited the same suite of estuarine resources from the Late Archaic through the Mississippian periods, despite changing socio-political conditions. However, changes in resource use over time are evident when fine-grained recovery and multiple analytical techniques are applied to vertebrate and invertebrate collections from the Mississippian period on St. Catherines Island. Specifically, late Mississippian populations used different fishing techniques and exploited a wider range of shellfish habitats. In addition, these analyses suggest differences in length of site occupation and waste disposal practices. This research demonstrates that analyzing multiple datasets recovered with fine mesh can yield new information, and supports the hypothesis that societies with different socio-political realities have different relationships with their environment.

Bergin, Sean (School of Human Evolution and Social Change, ASU) and Grant Snitker (School of Human Evolution and Social Change, ASU)

[221] *Large-Scale Socioecological Transformation: The Effects of Subsistence Change on Holocene Vegetation across Europe*

During the early and middle Holocene, the introduction of agropastoral subsistence to Europe resulted in significant social and economic transformations. For decades, researchers have recognized that early agricultural communities had an ecological impact on the surrounding landscapes. As a whole, paleoecological records indicate increases in charcoal abundance and changes in vegetation communities' distribution or diversity related to Neolithic agricultural land clearing, burning, or pastoral activities. Yet, most research on the paleoenvironmental impact of Neolithic agropastoral systems have been limited to site-based or regional analyses—without a broader discussion of the ecological impact of Neolithic land-use across multiple ecoregions.

This study attempts to better understand the spread of Neolithic subsistence across Europe by contrasting the chronological and spatial patterning of the spread of agriculture with the palynology of Europe during this period. We utilize a database of over 5,000 radiocarbon dates from Neolithic contexts through Europe and a comprehensive pollen dataset adapted from the European Pollen Database. From these data, we construct and statistically compare chronosurfaces of Neolithic occupation and major vegetation transformations to track the pace and intensity of ecological change in Europe due to the initial shift to agropastoral land-use.

[154] *Assessing Food-Based Trade and Mobility in the Chincha Valley (Peru) Using Portable X-Ray Fluorescence Spectrometry*

Peru is commonly known for having the largest empire in pre-Columbian America, but comparatively little is known about the subsistence practices of the pre-Inca communities that existed in the inland valley of Chincha during the Late Intermediate Period (AD 1000–1476). The Chinchas formed a powerful socio-economic entity within the Chincha Kingdom in part of the southern region of Peru nearest to the Pacific Ocean. Our research tests the hypothesis that individuals relied more heavily on a food-based trade networking system with other coastal rather than highland populations, using a portable X-ray fluorescence spectrometer to measure strontium, barium, calcium, and other elements in twenty-six human bones from four tombs in the Chincha Valley as a case study. Although the use of a non-destructive pXRF has become a very beneficial tool for the analysis of archaeological materials, relatively little has been done on human bone to elucidate subsistence practices, mainly due to limitations of surface analysis on potentially degraded and/or contaminated material. In addition, newly created bone standards are used to calibrate and enhance the validity and reliability of our data.

[153] *Fuel Use and Management at the Specialized Fishing Site of Bayovar-01 in Northern Coastal Peru (5th–8th Centuries AD), Contributions of Charcoal Analysis*

The Sechura desert located on the extreme northern coast of Peru is one of the most arid places on the planet. Nonetheless, human settlements have been recorded from 5000 BC up to the 15th century. Recent archaeological excavations have been carried out at the site of Bayovar-01 (occupied from the 5th to 8th centuries AD). The new data provide insight into the activities and adaptations of the desert’s ancient inhabitants. The presence of two small structures, a large activity area containing a significant amount of fish remains, and traces of hearths, indicate that Bayovar-01 was an opportunistic settlement, benefitting from favorable environmental conditions: the presence of an ancient lagoon; and served as a specialized site for fishing and the preparation of fish.

The analysis of charcoal remains from three different features corresponding to large hearth remains sheds light on practices of firewood gathering and usage. Taxonomic and morphological analyses reveal strong preferences for certain taxa, possible gathering strategies combining dead wood collection and tree felling, the usage of several different tree parts, and consistent combustion conditions across the three features. Despite selection biases, taxa composition may offer yet another indication of the existence different environmental conditions in the desert.

[295] *Deep Time and Human Action: An Introduction*

The end of history has ended. Our social conditions, and indeed many of our greatest social ills, are now understood to have been generations in the making, the result of accumulations and sedimentations of quotidian human action. This introduction posits that such accumulations and sedimentations are not mere metaphor, and that the material world is the ongoing expression of the force of history. Following key post-structuralist insights, we argue that the contents of these histories are not internal to the human mind, nor to abstract ideological structures, but are produced through embodied practices that mobilize material objects and leave material traces, whether those traces be ceramic sherds, architectural remains, or bureaucratic documents. As such, archaeology is poised to not only engage with critical theoretical discussions in the social sciences but also to impact to our understanding of the “long now” of the present. Recent archaeological and anthropological publications have indeed proposed frameworks for conducting archaeological interpretation and analysis of the longue durée. This paper will review these important contributions, putting them in the context of the broader historical and archaeological turns in the social sciences, before opening the session to our contributors.

[324] *Las practicas funerarias del Formativo en la costa ecuatoriana: resultado de*

El presente estudio se organiza en torno a una doble problemática relacionado al Formativo de la costa ecuatoriana (4400—300 BC): el examen de los gestos funerarios y su comparación en una perspectiva diacrónica e intercultural. Con un examen teórico y estadístico se puede identificar normas funerarias propias a cada cultura. La comparación intercultural permite de subrayar similitudes y diferencias entre las diferentes culturas del Formativo.

Procede de los diferentes trabajos arqueológicos llevados sobre el sujeto y de ese análisis que las prácticas funerarias están caracterizadas por una gran variabilidad en cada cultura formativa y entre ellas. Detrás de esas costumbres se esboza un fondo espiritual y cultural relativamente homogéneo, subrayado sobre el plano arqueológico por construcción de tolvas, generalización de inhumación, presencia de elementos simbólicos similares en las tumbas. Ese vestigio son indicios de forma de organización complejas en aquellas los líderes podrían utilizar practicas funerarias para legitimar un orden social y cosmológico por un culto de ancestros por ejemplo.

Berryman, Judy and William Walker (New Mexico State University)

[122] *Ashes, Arrows, and Sorcerers*

Magic and witchcraft, like many classic topics in the anthropology of religion, involve everyday things such as dogs, plant pollen, ashes, and arrow points. As such the archaeological record offers a rich source of ancient religious practices if we can link formation of its deposits to past ritual activities. For example, strata exhibiting ash and projectile points deposited on floors and in the fill of abandoned houses may derive from protective magic. Rather than haphazardly tossed hearth detritus and/or lost arrow points, these common deposits may reveal uncommon evidence of ritual reactions to malevolent power. In the ethnographic record of the American Southwest, ash and projectile points offer protection against death and sickness caused by witchcraft and sorcery. Our case study at Cottonwood Spring Pueblo, a late prehistoric village (A.D. 1300–1450) in southern New Mexico, demonstrates that ash and arrow points prophylactically protected these places and their former occupants from harm.

[258] *Joe Ball, Friend and Mentor*

As one of the fortunate students who was at San Diego State University in 1975, I was present for the announcement that Dr. Joe Ball had been hired as a professor of Anthropology in the Department of Anthropology. As a contemporary of Joe, I had the opportunity to see his early contributions to the growth of the Department in the 1970’s and his willingness to give his time and energy to help his students be successful regardless of their focus in archaeology. It did not matter if the student’s interest was in Mayan archaeology or in San Diego County archaeology—academic or CRM they received the same time, effort and concern. Joe sponsored a field school at the La Fleur site in eastern San Diego County to help train students, most of whom would remain in the region. I had the good fortune to be involved in those early years of his tenure at San Diego State University and can directly place much my success in archaeology with having been a student and friend of Joe.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Bettcher, Katrina and Lidio Valdez (MacEwan University)**[333]** *The Archaeology of the Acari Valley and the Legacy of Francis Allen "Fritz" Riddell*

In 1954, newlywed archaeologists Francis Allen "Fritz" Riddell and Dorothy Menzel arrived in the Acari Valley on the south coast of Peru with the purpose of investigating the site of Tambo Viejo as part of the Inca Royal Highway Project directed by Victor von Hagen. Various sites in the region were recorded and investigated. After retirement in the early 1980s, Fritz was drawn back to Peruvian archaeology. With the California Institute of Peruvian Studies, projects involving Peruvian and foreign archaeologists, as well as non-professional participants from Acari and abroad, revisited sites and investigated new findings. Fritz was concerned about the destruction of sites that had been recorded in the 1950s so he worked with local officials and citizens to encourage preservation. Rescue excavations were carried out at Tambo Viejo. Materials from looted sites were recovered, catalogued and stored. Though he passed away in 2002, Francis A. Riddell's legacy endures in the Acari museum that has been named after him and in continuing work at the site of Tambo Viejo.

Betti, Colleen (The University of North Carolina, Chapel Hill)**[67]** *Porcelain Dolls and Marble Balls: The Role of Toys and Play in the Gendered Socialization of Enslaved Children*

Children comprised a large portion of the enslaved population on plantations in the American South, but their lives are often overlooked or ignored in archaeological studies of plantation life and discussions of changes in how children were viewed in American society. Over the course of the 18th and 19th centuries, there was a shift in how children and play were viewed, from miniature adults for whom play was utilitarian, to a separate life-stage where play was children's primary purpose and necessary for proper socialization. This paper examines the inclusion of enslaved children within larger shifts in conceptions of childhood in 18th and 19th century America through manufactured toys provided to enslaved children. Toys recovered from fifty-two slavery related archaeological sites in Maryland, Virginia, North Carolina, South Carolina, and Tennessee, cataloged into the Digital Archaeological Archive of Comparative Slavery (DAACS), show that toys given to enslaved children by white slave owners, and potentially enslaved parents, provided an important source of gendered socialization and are evidence of the inclusion of enslaved children within larger societal shifts in the meaning of childhood

Betts, Matthew (Canadian Museum of History) and Gabriel Hrynck (University of New Brunswick)**[84]** *Introducing COASTAL in Nova Scotia: Community Observation, Assessment, and Salvage of Threatened Archaeological Legacy*

While the technological and methodological challenges facing archaeologists seeking to address the coastal erosion issue are noteworthy, the responsibility to formulate ethical, engaged, and collaborative research methodologies is equally pressing. The impact of coastal erosion and sea level rise on archaeological sites creates significant challenges for Indigenous peoples engaged in reclaiming their own histories and rights. Archaeologists studying threatened sites must therefore also be deeply engaged with Indigenous partners, whose history is literally being swept out to sea. Our paper outlines the goals and aims of the COASTAL archaeology project, which seeks to develop a shared-authority partnership with Indigenous collaborators. We also outline methodological challenges and opportunities of working on Nova Scotia's coastlines, and highlight the need for tailored strategies to address the erosion issue. Consultation with local informants and collaborators, as well as public archaeology events, are critical for locating sites and saving precious survey resources. We also describe the advantages of using manual subsurface probes to delineate site deposits rapidly and accurately.

Bevan, Andrew [29] see Schauer, Peter

Bey, Bridget and Véronique Bélisle (Millsaps College)**[270]** *A Look at Local Populations during Wari Expansion: Bioarchaeology and Funerary Contexts at Ak'awillay, Cusco, Peru*

Although the climate and rich cultural history of Peru frequently offers a perfect setting for bioarchaeological analysis, the pre-Inca peoples of the central Andean highlands often lack full representation within that analysis. Yet, excavations at Ak'awillay, a village in the Cusco region, between 2006 and 2016, revealed 79 bodies. Most of the remains recovered from the site date to the Middle Horizon (AD 600–1000); however, previous analysis of the architecture and artifacts at the site suggest that this population did not emulate Wari lifestyle. This paper provides a profile of a substantial part of the local population of Ak'awillay, shedding light on living and health conditions in Cusco during the Middle Horizon. This profile includes both the demographic make-up and the skeletal pathology of this population, as well as an evaluation of grave goods and cultural modifications done to the bodies before and after death. Preliminary analysis indicates that the people of Ak'awillay maintained unique cultural practices but led a rigorous lifestyle. Since this population was not heavily touched by either violence or sacrifice, our analysis documents a large sample of individuals who died of natural causes and provides a rich comparative dataset for Middle Horizon Peru.

Bey III, George J. [162] see Kohut, Betsy

Beyin, Amanuel [103] see Lanza, Christopher

Bezerra, Marcia (PPGA/UFGA)**[63]** *Is There a Public Archaeology?: An Approach from Brazil*

This presentation aims to discuss Public Archaeology (PA) from a Brazilian approach. Based on a study that includes a bibliographical survey, and the analysis of the papers presented at scientific meetings in Brazil, I examined: a) the role of PA in the contemporary agenda of the archaeology in Brazil; b) the connections between PA, Heritage Education (HE), and the development projects, and c) its relationship with the decolonizing perspective of the discipline in Latin America. In addition, I also recognize gender issues in the domains of PA in the country, which is mostly linked to women, either as authors of academic literature or as coordinators of events, actions, and projects of PA (or HE). Finally, I critically analyze my own work within Public Archaeology in Amazon. Such questions have made me reflect about the concepts and goals that legitimate the category "Public Archaeology".

Bicho, Nuno (Universidade do Algarve), Célia Gonçalves (ICArEHB—Universidade do Algarve) and João Cascalheira (ICArEHB—Universidade do Algarve)**[124]** *GIS Tools for Intra-spatial Analyses: The Portuguese Mesolithic Cabeço da Amoreira Case Study*

The case of the Portuguese Muge shellmounds (Tagus valley, central Portugal), and specifically the case of the Cabeço da Amoreira site, is one of the most interesting regions to study the last hunter-gatherers in Western Europe. However, these sites, are very large with long and complicated sequences and, until recently, had very little excavation control and thus data were not appropriate for spatial analyses. During the last decade, our team used new and precise excavation techniques resulting in high resolution provenience data for all types of artefact classes. This paper focus on the Cabeço da Amoreira data, representing at least 7 time horizons, based on GIS analyses of intra-spatial distribution of different categories of artifacts. The use of the ArcGIS software was essential for the analysis of quantitative and qualitative data, allowing the establishment of intrasite spatial relationships through the use of statistical procedures such as the Average Nearest Neighbor and the Kernel Density Estimation. Distributions and correlations of artifacts allowed the identification of different functional areas, the use and organization of space, and the interpretation of relevant site formation processes.

[143] *Innovation and Curation: Conservation and Access of University-Held Collections for Research*

The Duckworth Collection is one of the world's largest repositories of human remains, numbering approximately 18,000 individuals. These range from blood samples, to hair bundles, single bones, complete skeletons, mummies, and decorated skulls, and are widely used for scientific research. Throughout the 19th and 20th centuries, anthropological and biological research gave us a greater understanding of human diversity, much of it based on anatomical evidence. Cambridge was at the forefront of this endeavour, and the result was the Duckworth Collection and Laboratory. Following best practice guidelines in the document Guidance for the Care of Human Remains in Museums by the Department of Culture, Media and Sport (DCMS) in October 2005, the Duckworth Laboratory created its own Policy for the Curation and Conservation of Human Remains. However, the past few years has seen a surge in biomolecular analysis of archaeological remains including human bone, teeth, tissue, hair, and dental plaque; innovative projects that require destructive analysis. A new position of Collections Manager for the Duckworth was created to facilitate this research whilst maintaining the integrity of the Collections. This presentation highlights the recent challenges in balancing both academic demand for sampling and the curation of human remains in the UK.

[167] *Coastal Geocatastrophes as Agents of Change on Multiple Time Scales: A Case Study from the Shetland Islands, UK*

The coasts of northernmost Britain and neighboring North Sea countries offer numerous examples of sand environments that have been both settled and completely abandoned by humans at various times. These areas' rich archaeological records reveal many examples of once-thriving human settlements that were challenged and eventually terminated by burial in aeolian sand over periods ranging from days to decades. The origins and socio-ecological dynamics of these geocatastrophes may reflect important patterns of human adaptation or mismanagement conditioned by large, inter-regional forces such as climate change and international politics, down to local phenomena that operated at the community or even individual landholder level. This paper reports on interim findings of research by the Shetland Islands Climate and Settlement Project on a prosperous farming community that was permanently destroyed by drifting sand in the late 17th century CE, a period of dramatic climatic and political changes that also offers a broad range of documentary, archaeological and environmental evidence for high resolution dating and interpretation.

[33] *The Shell Game: Maya Cosmology as Reflected in Recent Discoveries at Tutu Uitz Na*

The plaza held special significance to the ancient Maya, and across ancient Mesoamerica. In a reflection of Maya cosmological beliefs, the plaza was seen as a representation of, and a portal to the primordial sea, the watery underworld from which all things originate. This connection is evident in various ways throughout the region, from special dedicatory deposits to decorative architecture and iconography. This presentation explores that cosmological salience through the recent excavations at Tutu Uitz Na, a large intermediate elite residential and ceremonial group situated in the Belize Valley, in the hinterland of the Late-Terminal Classic (AD 700–900) polity of Lower Dover. Tutu Uitz Na rose earlier, during the Middle Preclassic (1000–400 BC). The initial founding of the group saw the placement of a consecratory ritual deposit of artifacts associated with the watery underworld: figurines, marine shell, and an estimated 26 million river snails, all laid beneath the plaza. Excavations at a nearby commoner patio group have revealed a similar Middle Preclassic deposit beneath the patio. This paper explores the importance of this deposit and seeks to situate it within other case studies from Mesoamerica, to establish a distinct pattern of intent on the part of the ancient Maya.

[86] *Testing Methods of Microbotanical Analysis on Samples from the Copan Valley, Honduras*

The Copan Valley in western Honduras has been the subject of a number of studies concerning human-environmental interaction, with particular emphasis on questions of ancient sustainable practices and whether or not land-use mismanagement contributed to the end of the Maya dynasty at Copan. The current PARAC project seeks to identify the range of foods consumed by the inhabitants of the Copan Valley during the Late Classic to Postclassic period. This paper will describe analyses conducted on artifacts recovered from residential contexts at the Late Classic site of Río Amarillo. The extraction of residues, as well as microbotanical analysis of ceramics and groundstones was used to test for the presence of comestibles processed using these implements. The results of this work are compared with the analysis of macrobotanical samples from local middens, thus providing a multivariate perspective on ancient foodways in this region.

[165] *Rooms, Houses, and Neighborhoods: Drone-Mapping and GIS Analyses of the Household Architecture at Cerro la Virgen, Moche Valley, Peru (AD 1100–1470)*

Here we explore the spatial patterning of the Small Irregular Agglutinated Residences (SIAR) at the Chimú town of Cerro la Virgen (1100–1470 AD) in the Moche Valley, Peru. Few examples of “Andean Households” are as enigmatic and iconic as SIAR, which were closely associated with the florescence of the Chimú Empire. Large barrios consisting of SIAR architecture are found at the Chan Chan (the Chimu capital) and at all Chimu provincial centers throughout the empire. Cerro la Virgen once lay in the rural hinterland of Chan Chan at the distal end of a vast system of state fields, which are believed to have supported royal activities at Chan Chan. At the site, well-preserved residential architecture covers 14 ha. We created a 3-D rendering of all the SAIR architecture at the site by processing aerial drone photography. Recent SAIR excavations at the site were used to identify room types, which were then employed in a quantitative analysis of household and community spatial patterning. As a result, we were able to identify household units, household clusters, and neighborhoods. Based on this study, we propose new quantitative methods for analyzing households, communities, and neighborhoods in the Andes and other regions.

[65] *Sistemas de arquitectura local e incaica durante el Periodo Tardío en las tierras altas de Arica y valle de Lluta, Chile*

Durante el Periodo Intermedio Tardío en las tierras altas de Arica, las influencias altiplánicas se encontraban en la sierra y valles altos, caracterizados por arquitectura funeraria (chulpas) y la cerámica, representando relaciones de poder y estatus social dentro de las comunidades locales. Durante el Periodo Tardío, con la introducción de elementos incaicos al altiplano boliviano, el área dominada por los pueblos altiplánicos fue influenciada por la cosmovisión y tecnología incaica, lugares como Tambo Incahullo (Sierra de Arica), Molle Pampa (Valle de Lluta) y Tambo Sabaya (Altiplano Boliviano) son sitios con una composición arquitectónica similar, pero con diferentes emplazamientos y materiales de construcción, destacando elementos como Chulpas, Plazas y un recinto circular aislado. Este estudio identifica elementos locales y de influencia incaica a través de la descomposición del sistema arquitectónico utilizando fotogrametría y mapeando estos sitios presentes en distintos pisos ecológicos y cambios desde el periodo Intermedio Tardío hasta el Periodo Tardío Inca para enfocarse en el sitio Molle Pampa (Valle de Lluta) y la identificación de Chulpas y elementos característicos de las influencias altiplánicas-incaicas adaptados a los sistemas arquitectónicos locales de este valle costero, entendiéndose como dinámicas sociales que pueden estudiarse a través de la arquitectura.

Binning, Jeanne (California Department of Transportation)

[140] *Prehistoric Tool Stone Acquisition and Use in the Central Mojave Desert*

Diverse rocks of the Precambrian to the Late Cenozoic are exposed across the greater Mojave Desert Region. In the central Mojave, locations with concentrations of knappable materials are prevalent. Most of these sources are deflated alluvial fan deposits; less than five percent are outcrops. Over the last 13,000 years people have been using the area, percussion biface reduction dominated at both the material extraction sites and habitation and special activity sites. Igneous materials were preferred by people using the area during the early Holocene and chert was preferred during the middle and late Holocene. The size of bifacial cores remains consistent throughout most of the Holocene; however, about 1500 years ago, there is a significant reduction in the size of these cores. Finally, there is evidence that much of the stone, after being tested, was found to be undesirable and left at the extraction sites. Explanations for these patterns are presented.

Birch, Jennifer (University of Georgia)

[119] *Migration, Dispersion, or Purposeful Relocation?: Flexibility as an Adaptive Settlement Strategy in Northern Iroquoia, ca. A.D. 1300–1650*

Flexibility is a defining characteristic of the Iroquoian settlement landscape. Population movement, amalgamation, coalescence, dispersal, resettlement, incorporation, and abandonment occurred at the local and regional scales throughout Iroquoian history. Even those groups that persisted within more or less the same territories from A.D. 1300 through the contact era had complex and dynamic settlement histories. This paper considers patterns of settlement relocation in Northern Iroquoia with an eye to clarifying how these processes relate to or differ from contemporaneous cultural transformations in the Midwest and Southeast. In particular, I consider how periods of collapse or instability in other parts of eastern North America coincided with periods of increased stability and complexity in Iroquoia. Data from recent Pan-Iroquoian social network analyses are employed as a means of characterizing the relationships between sending, host, and migrant communities. I posit that the flexibility inherent in Iroquoian settlement patterns and socio-political organizations conferred a degree of resilience on these populations that persisted into the historic era.

[105] *Rates of Change in Radiocarbon Date Frequencies and Population Collapse*

Recent analyses of large samples of radiocarbon dates shows a change in radiocarbon date frequencies between 3000 BP and 800 BP. There is either an exponential or super-exponential increase in radiocarbon date frequencies followed by a sudden decline. The goal of this poster is to test a population ecology model as to whether or not the degree of population overshoot can predict the degree of population collapse. We want to analyze if the rate of increase in radiocarbon date frequencies over time can predict the rate of the subsequent decline. We compare a global sample of radiocarbon curves, controlling for latitude, elevation, and distance to the coastline.

Bird, Douglas (Penn State University) and Rebecca Bliege Bird (Penn State University)

[114] *The Emergence of Dreaming Landscapes: Indigenous Disturbance and Representation of Ecological Homelands in Australia's Western Desert*

Martu are Traditional Owners of expansive estates in Australia's Western Desert. They maintain distinct networks of social interaction, mobility, and economic organization through which emerge novel ecosystemic relationships. Such networks in the Western Desert involve trophic interactions between people and many other species, and are sustained in patterns of consumption and renewal, especially anthropogenic disturbance via landscape burning for the purposes of hunting and sharing small game. Martu homelands are constructed in the weave of these interactions, and are represented in patterns that have clear archaeological signatures. Here we illustrate ways that Martu hold and represent their ecosystems and archaeological landscapes, especially in values of disturbance and consumption. We attempt to show how some notions of “conservation” (defined in

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

terms of archaeological heritage or otherwise) can work at cross-purposes with values of disturbance maintained by many remote-living Martu. We then discuss broader implications of Indigenous ecological representation for the ways in which our discipline typically investigates diachronic changes human-environmental interaction.

[100] *Movement, Inka Ceques and the Sajama Lines of Bolivia*

When the Inkas encountered them, the Carangas ethnic group in western Bolivia were highly mobile through lifestyles that relied on camelid pastoralism, caravanning, and ritual movement. Examples of Inka sites are known in the region, but it is not fully understood how they impacted movement through the Sajama lines—a network of ritual pathways that stretches over 16,000 kilometers. This poster compares new data from 2017 to previous work in the Sajama region to examine how movement along the Sajama lines changed over time, from prior to the Inka till recent memory. Through GIS, both archaeological and modern sites are compared to examine proximity to ritual pathways as well as logics of movement through termination points and directionality of geoglyphs. The goal of this research is to provide a comparison between the ceques of Cusco and the Sajama lines to examine how the Sajama lines may have been adapted to Inka understandings of ritual movement.

Birkmann, Joseph (University of New Mexico) and Bruce Huckell (University of New Mexico)

[186] *AZ BB:13:70 A Buried Middle Archaic Occupation in the Tucson Basin, Southeastern Arizona*

Although long known from surface sites, the Middle Archaic record in the Tucson Basin includes very few in buried alluvial contexts. AZ BB:13:70 is a Middle Archaic occupation site located along Brickyard Arroyo, a deeply incised tributary arroyo of the Santa Cruz River. First discovered in 1975, the site was revisited throughout the early 1980's and investigated formally in the summer of 1984 after monsoon rains created an extensive exposure of features and artifacts along the arroyo. The site yielded an assemblage of over 150 flaked and ground stone artifacts, several roasting pits, and the poorly preserved remains of a juvenile bison. We present a description of the site and its stratigraphic context, along with an analysis of the flaked stone and ground stone artifacts recovered. We conclude with a discussion of the importance of the site for current understanding of local and regional Middle Archaic subsistence and settlement.

Birmingham, Katherine and Christine Ames (Urban Archeology Corps)

[202] *D.C. Urban Archeology Corps: The Surveying is in the Details*

In the summer of 2017, the D.C. Urban Archeology Corps (UAC), jointly managed by the National Park Service, National Capital Parks-East, and Groundwork DC, conducted a Phase I shovel test pit survey at the Frederick Douglass National Historic Site, where Douglass lived between 1877 and 1895. The UAC is a summer program where urban youth learn about the field of archeology and how it applies to local communities and parks. Participants research the archeological significance of local parks, conduct excavations, identify and process artifacts, and create a culminating project to present to the community. The purpose of the survey was to fulfill the requirements of Section 110 of the NHPA. Simultaneously, the program goal was to train UAC participants in the process of conducting a Phase I survey from beginning to end. This paper will focus on the fieldwork findings, but also discuss the utility in teaching the archeological process in the context of a NPS site. The successful completion of the survey and the knowledge and skill sets UAC participants learned and developed along the way were products of this strong program structure.

[69] *Prehistoric Ceramic Production Variation during the Early and Middle Woodland at the Richter Site, Door County, Wisconsin*

The Richter site (47DR80) located on Washington Island, Door County Wisconsin was excavated by the University of Wisconsin field school during 1968 and 1973. Large quantities of ceramic materials were recovered. This site was identified as belonging to the Middle Woodland North Bay culture as defined by Mason. Among the body sherds were those with smooth or cordmarked exterior surfaces. Smooth surfaced sherds exhibited breaks along coil lines, indicative of coil construction technique. Meanwhile, coil breaks were not recorded on cordmarked sherds indicating a manufacturing technique based on fusing slabs of clay utilizing a cord wrapped paddle and anvil. The Richter site data indicate that surface finish results from variable manufacturing techniques, and may not be strictly decorative in nature. Furthermore, there is evidence of temporal differences in the two construction methods at Richter. Cord marked slab vessels appear to be associated with Early Woodland period site occupation, while smoothed coiled vessels, which are very similar to those found at Laurel sites, are associated with Middle Woodland occupation at the site.

[287] *An Examination of the Role of San Juan Red Ware Vessels in Social Interaction*

This paper evaluates the role that San Juan Red Ware played in social interaction. San Juan Red Ware was widely distributed throughout the Four Corners region between ca. A.D. 750 and 1100. Prior research has identified this ware as a marker of identity and established an association with communal feasting. A study of the distribution of this ware indicates that it was traded through specific social networks, which changed through time. While ceramics may profitably be used as stand-ins for actors in social networks, my focus is to investigate the roles that the ceramics themselves played in social interactions by evaluating how the material characteristics of these vessels helped to transmit and reinforce ideas of identity and community.

Bishop, Katelyn (University of California, Los Angeles)

[171] *Bird Behavior and Biology: A Consideration of the Agentive Role of Birds in Chaco Canyon, New Mexico*

As one of the only classes in the animal kingdom capable of flight, birds are privy to a realm of movement that humans can only partially control. Birds possess specific traits and engage in a variety of behaviors that directly affect the mechanics of capture and use, such as gregariousness and flock size, preferences in nesting and feeding locations, wing strength and readiness to flush, and aggressiveness and territoriality. Human-bird relationships also move beyond the semantics of capture to cases in which birds are kept in captivity as sources of feathers and/or awaiting sacrifice, as pets, and as domestic birds. Chaco Canyon, New Mexico was the center of a large regional system in the Pueblo II period (AD 850–1150). The avifaunal assemblages from one great house, Pueblo Bonito, and two small sites, BC 57 and BC 58, will be examined and compared. I will consider the qualities and behaviors of the avifaunal taxa in these assemblages that would have influenced human-bird interactions. I will then discuss the implications of

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

these behaviors and the unique ways that birds may have exerted agentive force and control over the experiences of bird capture, captivity, management, and use.

[34] *The Utility of Public LiDAR Data for Detecting and Documenting Low-Relief Archaeological Sites: A Case Study from the Pockoy Island Shell Rings, Charleston County, South Carolina*

This paper evaluates the utility of high-resolution LiDAR-derived elevation data for remotely surveying difficult-to-access coastal areas to identify possible archaeological sites, which can then be targeted for further investigation. To determine the effective limits of the elevation data to visualize low-relief structures, locations of previously-recorded Archaic and Woodland-period shell rings along the lower Atlantic coast were examined. Thirty-four rings were identified, including two previously undetectable at ground level without the use of shallow geophysics. To determine if undocumented rings could also be located using this method, the survey was then extended to an area along the South Carolina coast where shell rings were not previously documented, but which is situated a few kilometers from several known rings. In multiple LiDAR datasets, two faint ring-shaped anomalies were identified within the survey area. Fieldwork in May and July of 2017 confirmed that both anomalies represented low-relief Late Archaic shell rings. We conclude with preliminary data from the July fieldwork on the two rings, and contrast site maps produced using the LiDAR-derived data with those from ground-based topographical mapping, subsurface probing, and shovel testing. With moderate processing to filter “noise” in the dataset, high-resolution LiDAR-based maps rival those produced using ground-based methods.

Bisson, Michael (McGill University)

[219] *Uses and Limitations of the “Sangoan” for Understanding Hominin Mobility and Dispersals: An Example from Northeastern Zambia*

The Sangoan, a late Middle Pleistocene technological tradition widely distributed in Sub-Saharan Africa, follows the Acheulean and is considered by some to represent the earliest manifestation of the Middle Stone Age. It may coincide with the evolution of *Homo sapiens* and the initial appearance of evidence for complex cognition. Unfortunately, this archaeological construct has fallen in and out of favor and remains poorly defined. It has uncertain dates and environmental associations, and ambiguous hominin fossil associations. Using a new Zambian site as an example, the utility of the Sangoan construct to assess hominin mobility and dispersals is discussed.

Bittner, Jessica (College of William & Mary)

[255] *Paying Homage to the Past: Identity, Memory and Place in the American South*

Recent archaeological approaches to identity emphasize landscapes as dynamic arenas in which identities are communicated, generated, and negotiated. Focusing on several Cherokee heritage sites in Georgia and North Carolina, this paper examines the role of historical memory within place-based identity construction. Spatial expressions of identity within the landscape at each of these sites are examined throughout multiple periods of occupation. I trace distinctions in the ways in which Cherokees and local white communities engage with these past landscapes, and illuminate a persistent conflict between Cherokee peoples and white preservation groups over place, heritage, and identity. Paradoxically, for Native and non-Native visitors, these places evoke parallel visions of emplaced heritage. Cherokee heritage sites serve as emblems of the Cherokee Nation’s ancestral claims to their homelands in the American South, and of Anglo-America’s own deep connections to place in Georgia.

Biwer, Matthew (University of California, Santa Barbara)

[211] *Drinking Together: The Role of Foodways in the Wari and Huaracane Colonial Encounter in the Moquegua Valley, Peru*

Food is a unique form of material culture, representing a multiplicity of ethnic, gender, racial, political, and economic identities, that is consumed and reaffirmed through daily practice. In this way, food remains provide a nuanced perspective on a variety of archaeological issues. This paper focuses on Wari imperial expansion and how foodways enabled both Wari colonists and local peoples to negotiate the colonial experience during the Middle Horizon (AD 600–1000), Peru. Using paleoethnobotanical data, I present data from the Wari site of Cerro Baúl and the Huaracane site of Yahuary Alta in the Moquegua Valley, Peru. I investigate not only how Wari incursion impacted Huaracane foodways, but also how local environmental and social conditions shaped Wari food practices. A consideration of food remains will not only distinguish what can be considered uniquely Wari or Huaracane cuisine, but also how foodways may have developed on either side of the colonial encounter. More specifically, this study begins to characterize: 1) the alcoholic beverage chicha de molle as a medium of Wari culture that could be consumed by local communities; and 2) how the selective adoption and internalization of Wari chicha de molle by Huaracane communities may have shaped the colonial encounter.

[8] *Sand, Chute, Carts, and Waddles: Eagle Cave and Bonfire Shelter Restoration Project*

Eagle Nest Canyon, a box canyon draining into the Rio Grande in the Lower Pecos Canyonlands of southwest Texas, houses Bonfire Shelter, the oldest and southernmost bison jump site in North America. Bonfire was excavated in 1963–64 and again in 1983–1984, leaving open a 3m-deep excavation block. Nearby Eagle Cave was excavated in the 1930s and again in 1963, leaving the central trench unfilled. In 2015–2016, the Ancient Southwest Texas Project of Texas State University re-excavated the 4-meter deep trench bisecting this massive rockshelter to document and sample complex stratigraphy spanning 10,000+ years. In 2017, the ASWT project “restored” Eagle and Bonfire. At Eagle Cave the challenge was refilling the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

wide, 4-meter-deep trench bisecting the shelter. Most original backdirt had washed down the canyon decades earlier, so we added 20 dump truck loads of Rio Grande alluvium via a complex chute and cart system. At Bonfire Shelter the still-open excavation block was badly impacted by exposure and water erosion, as was the talus cone where bison fell. We stabilized the talus cone and installed erosion control features across much of the site to protect the extant deposits and allow time for new investigations before Bonfire is completely backfilled.

[270] *Non-metric Traits and the Influence of Cranial Modifications: A Case Study from the South-Central Andes*

Non-metric cranial traits and craniometric scoring are often used as a quicker and cheaper alternative to genetic markers when analyzing biological distance within and between populations. However, in populations with intentional artificial cranial modifications, the only option is scoring non-metric cranial traits since the craniometrics are too heavily affected by the modifications. Studies have shown that although non-metrics are the best alternative, some traits cause a bias that can differ based on the broad modification categories of annular and tabular. This study aims to add to these data by assessing the influence of the sub-categories of oblique and erect within the annular modification category and the degree of modification. The sample population consists of individuals from the Chanka cultural group located in the South-Central Andes of Peru during the Late Intermediate Period (AD 1000–1400). A total of 33 non-metric traits were scored on 102 individuals, 88 of which have modified crania. Analyzing the influence of sub-categories and degree of modification can point to a finer scale analysis of how and why certain traits are influenced by cranial modifications. These data can then be used in future studies to avoid collecting biased traits when assessing biological distance.

[110] *Racial Justice Matters: White Privilege and the Spectre of Scientific Objectivity*

We volunteer and engage with the public because we believe that history matters; that visibility of the everyday, of peoples and pasts marginalized and made invisible should be central to what we do. We can use our work, pre- and post-contact, as a means for public engagement and to dismantle political discussions rooted in ahistorical notions of human behavior and morality. But in serving the public interest, how do we also serve our membership, both in protecting their rights as human beings and as professionals? What responsibilities do we and the SAA have to our colleagues, students, mentors, and friends? In particular, how do our actions continue to marginalize people of color within our membership as well as minimize the importance of racial justice actions? This paper examines how white privilege and calls for scientific “objectivity” ignore the structural violence that continues to impact our practice as well as our participation in current political and social activism.

Blackwood, Emily and Kate Pontbriand

[84] *Seasonal Analysis of Four Coastal Archaeological Sites in Eastern Maine Using Mollusks*

Analysis of archaeological clam shells can provide important indicators of the seasonality of an archaeological site. To address the question of seasonality at four Woodland period archaeological sites along the coast of Maine, we have collected monthly modern samples of the soft-shelled clam *Mya arenaria* from nearby clam flats to establish a baseline to which excavated samples can be compared. The analyses of modern shells will show how seasons are recorded in the target species in Maine; analyses of the archaeological shells will provide a proxy for season of occupation at these archaeological sites. Two methods will be used with these shells. One method will utilize acetate peels to determine seasonal growth increments of modern and archaeological shell samples. The other will determine isotopic ratios of O16 and O18 to track temperature fluctuations at the collection sites. These data are integral to our understanding of the context of Native peoples’ subsistence and behavior patterns and will allow us to test theories regarding coast to inland seasonal movement along the coast of Maine.

Blair, Elliot (University of Alabama)

[275] *The Individual and the Group at 17th Century Mission Santa Catalina de Guale*

The individual as an entity in the past and an object of anthropological and archaeological study has often been debated. In this paper I consider the presence and role of the individual as an actor within colonial contexts. Using the methods of social network analysis, I explore the relationship between groups, individuals, and objects at 17th century Mission Santa Catalina de Guale, a Franciscan mission located on St. Catherines Island, GA. I argue that the methods of social network analysis can be used to identify and explore the roles that individual mission neophytes played in colonial interactions. Using these methods I examine how objects and individuals were involved in the material manifestation of social identities as pluralistic native communities aggregated in the Spanish missions of La Florida. Further, I consider the role of the individual in relation to broader frameworks of colonial interaction, examining how individuals engaged in sociopolitical negotiations and interactions within the processes of ethnogenesis and colonial identity formation.

Blair, Elliot [154] see Wright, Kevin

Blair, James (Mellon/ACLS Public Fellow and International Campaign Advocate, NRDC)

[195] *Splintered Hinterlands: Public Anthropology, Environmental Advocacy and Indigenous Sovereignty in Resource Frontiers of the Americas*

This paper analyzes the role of public anthropology in socio-ecological justice movements by examining conflicts over natural resources and indigenous sovereignty through policy-oriented research. It considers the Natural Resources Defense Council’s (NRDC) international projects to protect “special areas” and wildlife in the Western hemisphere, specifically rivers in Chilean Patagonia, and the boreal forest in Canada. Despite geographical, historical and cultural differences, these two priority campaigns involve a shared focus on developing communications strategies, as well as financial and corporate advocacy methods, in order to advance stronger environmental protections in alliance with social movements. Working with Mapuche indigenous leaders, international scientists and local environmental activists in the Aysén region of Chile, the NRDC has raised awareness to persuade public officials and investors to seek more sustainable energy alternatives to proposed hydro-electric dam development projects. In Quebec and Ontario, Canada, the environmental group has collaborated with members of the Waswanipi Cree First Nation and paper product consumers to halt forest degradation, which threatens woodland caribou habitats and exacerbates climate change. Taking an engaged anthropological approach to these projects, this transnational study sheds light on how different public advocacy strategies condition or limit possibilities for environmental justice and indigenous sovereignty across the Americas.

Blakeslee, Donald (Wichita State University)

[36] *Uncovering Etzana: A Megalith on the Southern Plains*

In 1601 CE, Juan de Oñate visited a large community in southern Kansas that natives described as taking two or three days to walk through. The location of the remains of the town was first clearly demonstrated in 2015. Since then, surface survey and work with collectors continues to document the scale of the community. Excavation in 2017 by Wichita State University and the University of Colorado in what was thought to be a midden mound

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

instead encountered a dense concentration of features that reflects the presence of one of the house clusters described by the Spanish visitors. A Spanish horseshoe nail from one of the pits is the third Oñate era artifact to have been found at the site.

Blakey, Michael (College of William and Mary)

[166] *The WAC Origins of the New York African Burial Ground Project*

This paper concerns the development of an interdisciplinary Project which studied 419 human remains at the 18th century cemetery for Africans enslaved in New York. The first World Archaeological Congress (1986) and Inter-Congress (1989) facilitated conversations among archaeologists and Indigenous peoples that would inspire change in archaeological practice. The African Burial Ground Project carried forward specific ideas of that encounter, joined with the activist scholarship and interdisciplinary habits of anthropologists from the African diaspora. The African Burial Ground Project (1992–2009) followed the first ethical bioarchaeology in the United States (enforced by NAGPRA in 1990) but concerned populations worthy of ethical treatment which were left uncovered by the law. By force of public pressure and scholarly cooperation, it became the first large and most visible example of publicly engaged archaeology. The results were affection between its scientists and “descendant community,” an international conversation about slavery, national linguistic transformation, sophisticated bioarchaeological reports, new methods, and a National Monument.

[248] *Archaeological Prospection at Cerro Coyotepetl, Tepeticpac, Tlaxcallan: Preliminary Results from the 2017 Field Season of the Proyecto de Arqueología Cotidiana de Tepeticpac*

In this paper we present the preliminary results of our field season this past summer in the Cerro Coyotepetl neighborhood of Tepeticpac, a señorío of Tlaxcallan. Archaeological prospection methods and remote sensing included magnetometry, electrical resistivity and photogrammetry by drone. Though our work is ongoing, and another geophysical survey season is planned, results were confirmed by excavations on one domestic terrace. These excavations revealed the remains of four rooms whose occupation spans the late pre-Hispanic and early Colonial periods. We reflect on the success and limitations of our methods in identifying the modification of the tepetate bedrock creating a habitable space, and in our ability to detect walls, hearths, and other domestic features.

Blank, John, Matt Chmura and Sarah Gilleland

[13] *Style vs. Function in Polynesian Fish Hook Shank Variation*

Polynesian i'a makau, or fishhooks, may stand in for ceramics for the purpose of generating culture-historical units, facilitating relative dating of the three Hawaiian assemblages under scrutiny (Allen 1996). Artifact assemblages at Waiahukini, Makalei, and Pu'u Ali'i contained over 1000 intact or partial fishhooks and fragments of shaped pig bone representing unfinished manufacture. Allen's (2015) conceptual style-function model of hook attributes necessitates a focus on stylistic shank variation, which reflects manufacture choices rather than fishing efficiency of the object. To test whether these attributes are actually stylistic choices, we propose a tensile strength test of experimental artifacts. To negate biases conferred by heterogeneity in the material or in manufacturing skill, we generate three-dimensional recreations of shank variation observed in the site assemblages. These models are subjected to conditions they would experience during use, given the physical properties of modern pig bone. If differential performance of shank “style” is quantifiable, then aspects of shank variation must be considered functional attributes.

Blankenship-Sefczek, Erin (Ohio State University) and Joseph Ball (San Diego State University)

[258] *Dentition, Kinship, and Status in the Mopan-Macal Triangle: Small-Sample Insights into Classic Maya Social Organization in Central Western Belize*

Classic Maya social status is more complex than an elite versus non-elite dichotomy. Research suggests that a “middle” status group exists. However, the social segment from which they arise is unknown. This study focuses on individuals from the urban center of Buenavista del Cayo who are below the ruling elites in the “middle” rungs of social status, and those from the neighboring farming community of Guerra who are recognized as nonelites. Previous research suggested that no biological affinity existed between the ruling elite and the “middle” status groups. Thus, we hypothesized that there would be a biological connection between the “middle” status group and the nonelites at these sites. Our study used a bio-cultural approach to interpret social connections by comparing dental characteristics (crown size and trait expression) and archaeological evidence to assess whether there was biological affinity between these two social groups. Our results indicate that there was shared affinity, suggesting that middle status individuals maintained biological and cultural ties with the nonelite group. Thus, the evidence in this study suggests that kinship, or biological affinity, was the basis for the social structure, organization, and membership patterns of these Maya communities during the Classic period.

[231] *Managing Digital Data at the North Carolina Office of State Archaeology: Challenges and Directions*

The North Carolina Office of State Archaeology (OSA) was created by the North Carolina General Assembly in 1973 to coordinate and implement a statewide archaeological preservation program. Central to this program is the OSA's management of records, including those documenting the more than 50,000 archaeological sites located in the state's 100 counties, and a library of nearly 8,000 associated reports. The OSA Research Center curates tens of thousands of artifacts and their associated records from across North Carolina.

While there are computer databases for the site forms, bibliographic entries, maps, and artifacts, there is variability in the extent to which all records have been added to these databases. Arduous and labor intensive, the process of digitizing our records has evolved with the available technology and been limited by staffing. Our goal is to have this data in GIS and electronic databases accessible to researchers and easy to query. We will discuss our efforts to reach this goal and the potential benefits of digitizing our records.

Blinman, Eric (NM Archaeology), Marvin Rowe (NM Archaeology) and J. Royce Cox (NM Archaeology)

[74] *Plasma Micro-sampling in Radiocarbon Dating: Approaching a Non-destructive Model*

The development of low-energy plasma oxidation as a sampling technique has created new opportunities for applying radiocarbon dating. Plasma oxidation can be carried out at energies below the threshold of carbonate and oxalate dissociation, dramatically reducing the need for pretreatment and subsequent loss of sample volume. Radiocarbon sample size can be reduced toward the minimum of the 40–100 millionths of a gram of carbon that is actually needed for standard AMS dating. This allows the dating of remarkably small samples, and it results in the imperceptible removal of carbon from more traditionally-sized samples, such as a charred maize kernel (the botanist will never know a dating sample has been removed). A surface-

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

active technique, plasma oxidation preferentially samples carbon molecules from object exteriors, allowing repeated stratigraphic sampling through accumulations such as soot on fragments of cave or rockshelter ceilings and the interpretation of sequential dates. Masking techniques can focus sampling on only portions of artifacts, and other innovative applications include the dating of organic pottery pigments, residues on artifacts, and organic binders in mineral pigments. Low temperature plasmas allow superficially non-destructive sampling of museum specimens, while higher plasma energies can sample carbide from the surfaces of historic metals.

[129] *Groundstone Manos and Metates as a Measure of Ancient Maya Political Economy at Actuncan, Belize*

Understanding the political economy of ancient Maya communities requires reconstructing the forms and scales of exchange, the articulated nature of exchange modes, and the degree to which elites controlled commoner access to goods. These issues are examined at the site of Actuncan, Belize, by documenting the chronology, morphology, raw material, and social context of a large sample of groundstone manos and metates distributed across structures ranging from a palace to large houses to patio groups. Results show no restricted access by context for mano and metate morphological types or material sources, including non-local stone, and thus no evidence that elites restricted access to groundstone. A significant chronological change in metate and mano shapes occurred, with flat and trough-type metates and square-type manos appearing at the Late Classic to Terminal Classic transition. Basalt manos and metates from distant sources also appear at this time, along with the ceramic comal. We interpret these changes in food-processing implements as marking the introduction of tortilla production. Using these data, we will examine continuity and change in exchange modes from Preclassic to Postclassic periods at Actuncan.

[81] *Analysis of Surface Treatments on Weeden Island Red Vessels via LA-ICP-MS*

One of hallmarks of Late Woodland period Weeden Island in Florida is the proliferation of ornate ceramics associated with ceremonial contexts. Recent elemental and petrographic analyses of Weeden Island ceramic pastes have established that despite visible standardization, these wares were traveling significant distances from large production centers, but also being made locally. This widespread movement of people and pots across the landscape provides a valuable context for exploring the spread of specialized technological knowledge. To better understand the production of these wares, we focused on the applied red surface on Weeden Island Red vessels, which previous analyses identified as among the most likely Weeden Island ceramics to have been locally made. In particular, we sought to define the recipe for this surface treatment, whether iron-rich ore or clay, and to identify the degree of recipe standardization across the ware type as reflection of shared production knowledge. LA-ICP-MS was used to independently analyze the elemental composition of the red surfaces of these vessels, complemented by NAA and petrographic analyses of paste composition.

[87] *Caring for Children in the Ancient Andes: Bioarchaeological and Biogeochemical Data from the Andean Middle Horizon (AD 500–1100) Tiwanaku Polity*

Bioarchaeological approaches can contribute much to our understanding of how children were cared for in the past. Here, we examine social, cultural, and physical care of children in the Tiwanaku polity of the South Central Andes between approximately AD 500 and 1100. Using multiple lines of evidence, we reconstruct patterns of childcare practices as well as the formation of different social identities at archaeological sites in the Moquegua Valley of southern Peru and the Bolivian Lake Titicaca Basin. More specifically, we use data from ethnographic and ethnohistoric sources, bioarchaeological data on cranial modification, paleopathology, and mortuary behaviors, and biogeochemical indicators of paleodiet, including weaning patterns, and paleomobility. By recreating individual life histories and lived experiences in the past, we examine how Tiwanaku-affiliated communities cared for their children in the past.

Blomster, Jeffrey (George Washington University)

[288] *Public Space, Sacred Place: Early Monumental Architecture and Corporate Identity in the Mixteca Alta, Oaxaca*

The Early Formative evinces the emergence of public space, and more complex communities, in Mesoamerica. Previous archaeological research at the site of Etlatongo, Oaxaca, Mexico, identified a large village during the late Early Formative/Cruz B phase (1200/1150—850 BC), including an area tentatively identified as early public space. The Formative Etlatongo Project has concluded three seasons, from 2015—2017, of large-scale excavations, confirming the identification of public space in the southern portion of the site. More specifically, this public space was focused during the Cruz B phase on two iterations of a ballcourt. We interpret the constructions of this ballcourt as a kind of public space that both linked emerging communal identity with socio-political complexity. Very specific kinds of materials were deposited in this public space; both these deposits, as well as the probable activities that occurred, transformed this into a sacred place, one that resonated beyond the Cruz B phase. The construction, subsequent maintenance and renovations reflect the collective effort of different social actors and corporate entities in the transformation of society at Early Formative Etlatongo.

[126] *Terminal Pleistocene and Holocene Adaptive Strategies at the Paisley Caves, Oregon*

There are key questions about the timing of the initial settlement of the northern Great Basin, how settlers adapted to the pluvial lake and wetland landscape they encountered upon arrival, and how these adaptations changed in response to Holocene climate change. The Paisley Caves in south-central Oregon provide a unique opportunity to investigate these questions. The caves produced the earliest evidence for human settlement of the Great Basin including coprolites containing human DNA dating to 14,300 calendar years BP, as well as an assemblage of morphologically human coprolites from terminal Pleistocene through late Holocene contexts. These coprolites provide an important resource for a diachronic study of human occupation and subsistence in the region. This paper presents the preliminary results of pollen, phytolith, and plant macrofossil analyses of coprolites from the Paisley Caves. The goal of these analyses are to identify human coprolites in the cave deposits, and test models emphasizing a broad-based wetland-focused subsistence economy in the terminal Pleistocene and early Holocene with increasing reliance on plant resources in the middle

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Holocene. This research is part of a broader project investigating site formation processes and human occupation of the caves using biogeochemical, plant micro- and macrofossil, and sediment micromorphological analyses.

[242] *Lithic Economy of Epiclassic Los Mogotes*

This study examines the flaked stone economy at the Epiclassic site of Los Mogotes, located north of the Basin of Mexico in central Mexico. We quantified obsidian and chert artifacts based on form and material in order to examine the nature of the lithic economy during this time. The findings suggest that the inhabitants of Los Mogotes were not primary producers of obsidian tools but were dependent on long-distance exchange for already manufactured goods. Despite being closer to high quality obsidian sources in Pachuca, Hidalgo, Los Mogotes relied on grey obsidian from sources located farther away (such as Ucareo, Michoacan). The lack of evidence of primary obsidian production suggests a down-the-line model of exchange of obsidian tools, many of which were later reworked into secondary or tertiary items. This pattern contrasts with evidence of primary production using more locally available chert. These findings conform to broader regional trends observed at contemporaneous sites during this time. Our interpretations focus on how the broader political economy shaped access to resources and the institutions necessary for their distribution.

[239] *Continuity or Change: A GIS Analysis of Artifact Distributions from Pre-colonial Housepit 54*

Housepit 54 at the Bridge River pithouse village in south-central British Columbia provides a glimpse into the complex cultural practices that occurred within this area in the past. This village, which includes approximately 80 semi-subterranean structures, was occupied during four time periods that together span from approximately 1800—45 cal. B.P., firmly placing the site within both a historic and a pre-Colonial context. Geographic Information Systems (GIS) will be used to explore the spatial distributions of artifacts from a subset of Housepit 54's pre-Colonial floors. This study should result in a more in-depth understanding of the structure's household organization and the past human behaviors that affected the creation of the assemblages under examination. Ultimately, if there were activity areas being used during the occupation of the Housepit 54 floors, then clusters of cultural material and possibly clusters of material types are expected. In addition, this study will also be looking for evidence of shared space and materials as well as trends through time, such as the continuous use of one area of the housepit for a specific activity. This should reveal more about how the housepit's organization and social structure changed over time.

[89] *Comparing a NextEngine 3D Scanner with Casting Mediums for Making Positives of Cord-Imprinted Pottery*

In this paper, I compare using latex and Sculpey molds with a NextEngine 3D scanner in creating positive copies of upper midwestern, Late-Woodland, cord-imprinted pottery for analysis. Making cast positives of these impressions in casting mediums present different hazards to the sherd. A NextEngine 3D Scanner may present fewer hazards to sherds, while allowing for digital copies that are easily manipulated and measured. It is also portable and relatively inexpensive compared to other 3D scanning technologies. I list the benefits and problems of each method based on tests of a small number of sherds from the UWM-ARL collections. Pressure exerted on sherd, whether or not residues are removed, manipulability of final product, shrinkage, and clarity of the impression structure will be recorded and compared. I will also compare cost, time consumed, and ease of use. I will include how long it takes to learn how to use the NextEngine Scan Studio as well as how long it takes to manipulate the scans in Meshlab. I will then make separate illustrations based on the molds and 3D scans that are blown-up representations of the textile structure and compare the ease of illustration for each.

[103] *The Energetics of Butchery*

Animal butchery is an important aspect of human evolution. While it provides obvious nutritional and non-nutritional benefits, the choice to butcher an animal involves costs. These costs are primarily time, energy. Most research investigating these costs has focused on time alone. By creating ranking schemes using post-encounter return rates, researchers usually hypothesize which animals or body parts hunters should butcher. Yet, the energetic cost of butchery and its effects on these rankings remain unknown. To shed light on this problem, we measured the energetic and time costs of butchers during butchery of domestic sheep using stone tools. We used a heart rate monitor to measure the energetic expenditure for each segment of butchery while documenting time during the event, and verifying it by reviewing video recording. These data were analyzed using basic Heart rate variability techniques using the RHRV package (v. 4.2.3) of the R computing environment. Adding energetic cost, an important yet often omitted variable, to quantifying the butchery sequence provides a basis to better understand the costs and trade-offs of processing animals. These data are applicable to all archaeological events involving the human butchery of medium-to large-sized mammals.

[217] *Testing the Stratigraphic Integrity of Shallow Deposits through Zooarchaeology at Lamanai, Belize*

Identifying formation processes of shallow archaeological sites can be difficult. At Lamanai, Belize, the main problem consists of distinguishing between pre- and post-Spanish contact deposits buried at a depth of 10 to 60 cm. Evidence of interaction with the Spanish includes a few European objects and two Christian churches. However, identifying pre-contact deposits is more challenging. Maya archaeologists typically rely on ceramic typology to establish chronology, but the main pottery type in use at Lamanai before Spanish arrival continued to be widely used after contact. Diachronic changes in the distribution of other archaeological correlates for pre- and post-contact assemblages, including structure features and lithics, are subtle and do not effectively demarcate deposit type. Here, I use the taphonomic study of animal remains to assess the integrity of the stratigraphic levels identified during excavations and determine whether these levels represent pre- or post-contact accumulations. The methods employed include bone counts, species composition, skeletal part distribution, refits on dry and green bone, and vertical distribution of elements. As Lamanai is one of few known locations of Maya and Spanish interactions in the southern lowlands, identifying pre- and post-contact deposits is essential for studying the impact of Spanish arrival on the Maya society.

Bolender, Douglas (University of Massachusetts Boston) and Eric Johnson (Harvard University)**[170]** *Marginal Lives and Fractured Families. The Hidden Archaeology of Household Debt and Instability in Medieval Iceland*

Archaeologists generally assume that the absence of market exchange implies an absence of financial debt as a mechanism of exchange and social control found in more “advanced” economies. This implicit logic is reproduced in contexts where identifying market exchange largely relies on tracking the circulation of specialized and imported goods, as is the case in medieval Iceland: a society largely made up of subsistence tenant farmers where archaeological indicators of market exchange virtually disappear after the Viking Age settlement of the island. But David Graeber urges us to look deeper for sophisticated systems of value and material exchange in societies that have been traditionally considered to have primitive economies. His work also calls attention to the ways that debt, as a social and economic phenomenon, structures relationships and the juridical status of individuals. Reevaluating medieval Iceland with this lens, we see the disappearance of imported goods following the Viking Age not as evidence of a primitive subsistence economy but rather the development of an entrenched system of financial debt that had profound implications for the juridical and personal status of individuals as a failure to pay debts frequently resulted in the fracture of the family and household.

Bolender, Douglas [167] see Welch O'Connor, Lauren

Bolin, Annalisa (Stanford University)**[201]** *Friends and Enemies: Heritage Ethnography in the Shadow of the State*

Engaged archaeology and public anthropology depend on the goodwill, or at least tolerance, of numerous publics. This is frequently understood to mean local communities and nearby residents, but projects can live or die according to the will of groups less often discussed as part of the target public: authority structures such as permitting agencies or even national governments. How do such organizations figure into the “public” of public scholarship? What happens when research is pressured to produce the narratives that authority structures desire? Is it possible to practice engaged and ethical research in these contexts, and if so, what practical accommodations can we reach—or must we abandon the project altogether?

This paper investigates these questions in the context of post-genocide Rwanda, where social science research has become increasingly constrained. Some researchers have found themselves on semi-official “enemies lists”, while others encounter pressure to be “friends of Rwanda” who can be counted on to produce complimentary accounts of the country. Drawing on my experiences as a heritage ethnographer in Rwanda, I examine the ethical and practical difficulties of conducting research under the eye of a powerful and sensitive government, and negotiating responsibilities both to communities and to scholarship itself.

The Digital Archaeological Archive of Comparative Slavery (DAACS) is a Web-based initiative designed to foster inter-site, comparative archaeological research on slavery throughout the Chesapeake, the Carolinas, and the Caribbean. The goal of DAACS is to facilitate research that advances our historical understanding of the slave-based societies that evolved in the Atlantic World during the eighteenth and nineteenth centuries. In this paper we argue that the digital methods encapsulated within DAACS enable archaeologists to conduct innovative analysis at scales that would be impossible to achieve using analog methods. These methods consist of: 1) entering archaeological data into the DAACS Research Consortium (DRC) Database Application using well-defined classification and measurement protocols, 2) serving that data for free through the DAACS website (www.daacs.org), and 3) providing training and assistance for those who conduct research with the data. We offer three case studies to demonstrate how these methods enable collaborators to address old research questions using legacy collections, answer new questions with data from recent excavations, and adapt the system to incorporate data from different regions. These case studies illustrate how DAACS has balanced the need to maintain rigorous data entry standards and reproducible methods with the needs of an expanding user base.

Bondura, Valerie (Columbia University)**[259]** *Ceramic Ecology as Deep Ecology in Northern New Mexico*

"This landscape is animate: it moves, transposes, builds, proceeds, shifts, always going on, never coming back, and one can only retain it in vignettes, impressions caught in a flash."

—Ann Zwinger, Downcanyon

We might think of ceramics as landscape "caught in a flash", a bringing together of different geological places into newly combined forms. Ecological thinking in Northern Rio Grande Pueblos frames this bringing together as a fluid gathering of forces that flow in and out of one another. "Deep ecology" is one current term the social sciences for this relational field of human and non-human interaction in the landscape—for Pueblo potters, it is how the world is.

This paper outlines a deep ecology of pottery from a Spanish land grant community and a neighboring Tiwa Pueblo. I present ongoing research on the composition of ceramics from these two places, a study that gives insight into how different communities engaged with the landscape. Comparative ceramic ecology offers a framework for thinking about historical relationships that includes but also moves beyond questions of ethnicity and identity to a focus on how people locate themselves within socio-environmental systems.

Bongers, Jacob (UCLA Cotsen Institute of Archaeology), Juliana Gómez Mejía (Universidad de Caldas) and Colleen O'Shea (Fine Arts Museums of San Francisco)**[66]** *Modeling Late Prehistoric Mortuary Practice in the Middle Chincha Valley, Peru*

This paper presents a model for mortuary practices associated with above-ground and semi-subterranean tombs known as chullpas, which date from the Late Intermediate Period (A.D. 1000–1400) to the Colonial Period (A.D. 1532–1825) in the middle Chincha Valley, Peru. Mortuary practices involve living-dead interactions that transform the status of the deceased. Historical sources and archaeological research suggest that chullpas in the south-central Andean highlands featured protracted living-dead interactions. Few investigations, however, have examined these tombs on the Peruvian coast. Here, we use data from five seasons of archaeological fieldwork and analysis to model sequences of chullpa mortuary activities in the middle Chincha Valley, located on the Peruvian southern coast. These data indicate multi-stage processes comprising tomb entry and reentry for depositing, manipulating, and re-depositing human remains, and making offerings of varying types to the dead. Throughout these sequences, local groups performed elaborate forms of postmortem body manipulation. Our model supports and nuances previous scholarship on chullpas by characterizing chullpa mortuary activities as part of a dynamic and extended program for curating and venerating the dead in the study area. This research contributes to Andean mortuary archaeology by expanding our understanding of variation in chullpa mortuary practice.

Bonneau, Nicholas (University of Notre Dame)**[204]** *An Accounting of the Dead: Historical Epidemiology and Big Data in the Arch Street Project*

As of the beginning of September 2017, the remains of over 250 individuals were recovered from the building site at 218 Arch Street. While the presence of bodies in what was once the First Baptist Church of Philadelphia burial ground should not surprise us, contemporary documents and written histories of the congregation state that all burials had been moved to the Mount Mariah Cemetery in the mid-nineteenth century. The abundance of human remains left on the original site raises questions for historians, archaeologists, and others concerned with the legacy of interments.

To create a foundation from which historians and archaeologists alike might explore these questions, I combine methodologies of big data management and analysis with more traditional historical research. This involved the collection of burial records for over 2,000 individuals interred in the cemetery and burial records for over 5,000 interred in other cemeteries in Philadelphia. I compare patterns of mortality in the larger Philadelphia community and those listed in the parish burial records, with data gathered from individual remains at 218 Arch Street. This allows us both the identification of the disease environment in which the burials occurred and suggests why connections with descendants may have faded.

Bonomo, Mariano [7] see Castro, Juan

Booher, Ashley (Rice University) and Brett A. Houk (Texas Tech University)**[173]** *Processional Architecture at Chan Chich, Belize*

Chan Chich is one of the dozen largest Maya ruins in Belize, reaching its apogee during the Late Classic period, ca. A.D. 750. The site has a number of notable site planning characteristics, including a massive public plaza, and two wide, radial causeways, that show connections to neighboring sites and suggest common ideas about city building. Some of these shared planning ideas reflect top-down design concepts related to specialized political and ritual functions for various buildings and features. Although plazas, buildings, and causeways may have had multiple functions, we use excavation data, comparisons to other sites, and depictions in Maya art to argue that the Late Classic rulers of Chan Chich designed some of their monumental architecture to function in part as the theater for public rituals and spectacles, including processions. The processional architecture at Chan Chich included the radial causeways, two possible terminus shrines, a massive range building, the ball court, and the main plaza. We suggest that the political need to host public spectacles as a way to create social connections between the non-elite and the ruling family drove many site planning decisions at Chan Chich and other sites in the region during the Late Classic period.

Boozer, Anna**[181]** *Material Collaborators: Making and Unmaking Roman Imperial Power at Trimithis (Dakhleh Oasis, Egypt)*

Egypt's Dakhleh Oasis preserves a Roman city, its hinterland, and a Romano-Egyptian house known to be occupied by a city councilor. We can do more than simply read these material remains as physical symbols of Roman political power. The intimate collaboration between imperial agents and the material world allows us to interpret the making and unmaking of Roman imperial power on the local level. This paper explores fluctuations in imperial power at Trimithis (Roman Amheida) through the changes inscribed in domestic, urban, and extra-urban material residues. This explicitly multi-scalar approach demonstrates how the entanglements between power, agents, and things reverberated throughout Romano-Egyptian society. Ultimately, I suggest that the same material worlds that collaborated in imperial power are also implicated in its collapse.

Borck, Lewis (Faculty of Archaeology, Leiden University), Corinne L. Hofman (Faculty of Archaeology, Leiden University), Manfred Schäfer (Computer & Information Science, Konstanz Univ.), Angus A. A. Mol (VALUE Foundation/Prince Claus Fund) and Daniel Weidele (IBM T.J. Watson Research Center)**[83]** *Fingerprints of Community: Decolonizing Archaeological Data Analysis through Networks*

This paper uses the Nexus 1492 database, built over approximately 30 years of fieldwork, to examine ceramic attribute variability throughout the Antillean Islands. Regional ceramic analyses often focus on the construction of ceramic typologies that are then used to compare typological proportions, differences, and similarities at various spatial resolutions across temporal periods. Long-standing critiques of the use of typologies and taxonomies in archaeology (*sensu* Brew 1946; Gnecco and Langebaek 2014; Henry et al. 2017; Wylie 1992) focus on the reifying power of their fixed

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

nature. Essentially, typologies become the epistemologies within which we examine the archaeological record, and create the historical narrative. This can become an issue when we also acknowledge that we interpret the past through our modern framework. Thus, in order to more fully separate ourselves from the analysis of the archaeological record, or to decolonize the analysis of archaeological data (sensu Rizvi 2015), we use a networked approach to examine the distribution of ceramic attributes within and between the Antillean Islands. Our goal is to approach a more emic understanding of how communities of practice emerged and to help construct an indigenous social history prior to, and after, the violent arrival of Europeans.

[59] *Yuzanu 36, a Late Archaic Site in the Mixteca Alta*

We report the discovery and excavation of a site radiocarbon-dated to 3000 BC near the village of Yanhuítlan in Oaxaca. The site is buried under alluvium at a depth of 5m. At the time of its occupation it was situated on the floodplain of a large seasonal stream. The excavation of 30m² revealed several superimposed features, including hearths, small refuse pits, and a bell-shaped pit. Debitage of different varieties of chert is ubiquitous, as is heat-spalled rock of different lithologies. Several observations suggest that the site was repeatedly occupied by large groups of people performing multiple activities. In the course of its existence, the function of the excavated area of the site seems to have changed from primarily residential to one that involved the periodic burning of the floodplain vegetation and churning of the soil, most likely in preparation for the planting of crops. Exposures of the same palaeosol at other nearby locales suggest that the site spans several hectares. In contrast to the majority of excavated Archaic sites in Mesoamerica, which seem to represent short-term occupations focused on very specific activities, Yuzanu 36 is a good candidate for a multi-purpose riverine basecamp occupied during several months of the year.

[200] *'To be or not to be...' A Taphonomic Perspective on Pseudoartifacts*

An anthropocentric perspective governs most of archaeological research into lithic assemblages. Hence, spatial and morphological trends in the lithic record are interpreted primarily in terms of human technological behavior without a systematic assessment of unintentional and/or non-human factors as sources of variation. Surprisingly, controversies on the natural vs. anthropic character of several lithic assemblages or 'industries' did not prompt the adoption of taphonomic approaches by lithic analysts on a regular basis. Here I argue that archaeologist's lack of knowledge about the effects of taphonomic mechanisms -whether natural or cultural- on stone and other knappable materials is the main obstacle towards a more comprehensive analysis of lithic assemblages. Furthermore, I propose that the study of taphonomic patterns (or background noise) in non-archaeological contexts is a mandatory task that researchers need to undertake in every region to achieve a more thorough understanding of lithic assemblage formation processes and trends. From the perspective advocated here both naturalistic and experimental constituents of actualistic taphonomic research are key to identify the agents involved in the formation of any fossil record. I present case studies from Patagonia (Southern South America) to illustrate the main contributions of lithic taphonomy to assess pseudoartifact components in the surface record.

Borrero, Mario (University of California, San Diego)

[30] *The Archaeology of the Southern Belize Region in Context*

The region of Southern Belize is part of the Maya lowlands, an area that is geographically circumscribed, and located in-between several larger regional centers such as Tikal to the west, Caracol to the north, and the sites of Copán and Quiriguá to the southeast. The general history of archaeological investigations for this area are presented, along with site-specific studies from the Southern Belize Region. The current archaeological data of four major ancient polities of this region are described: Pusilhá, Uxbenká, Lubaantun, and Nim li Punit. The review of this archaeological history consolidates the data to consider questions of regional economic and political integration, in light of a region that shared many common cultural and architectural attributes. Finally, I conclude by exploring the possible internal regional dynamics of the Southern Belize Region, and what might have connected it to its neighboring areas. A brief discussion of potential future research to be carried out in the area by the author is shared.

[37] *Provisioning the Household: Exploring Domestic Economic Integration within Two Lowland Maya Communities*

It is now well recognized that Late Classic Maya communities varied politically, economically, and environmentally. The corollary, however, that community and household variation went hand-in-hand in the Maya area often goes unrecognized or under problematized. Research that explores differences in household provisioning practices across a range of communities should help to rectify this situation. Referencing data from two large prehispanic Maya sites in northwestern Belize, this paper asks the question, "How were households integrated into their broader communities?" Those who study sources of household variation often invoke one of two determinants: either that 1) proximity to resources or 2) relationships to leadership dictated household subsistence and crafting activities. To understand how both positions might have value and relevance with respect to the same bodies of data, this study will explore how aspects of household provisioning were correlated with different kinds of community organizations, environmental contexts, and structures of leadership.

Boulanger, Matthew (Southern Methodist University)

[186] *Cultural Transmission in the Paleoindian of Eastern North America*

The Paleoindian (ca. 13,000–11,000 calBP) record of eastern North America has long been characterized as exhibiting a remarkable variety of fluted-point forms. The temporal, spatial, and cultural significance of this variety remains poorly understood owing to a sparse radiocarbon record as well as to inconsistencies in nomenclature and traits used to define point forms. Building on previous studies, paradigmatic classification is used to create replicable fluted-point classes from a large database of eastern finds. Outline-based geometric morphometrics is used to define and explore the morphospace of these classes, and character- and morphological-based phylogenetics are used to propose historical and spatial relationships.

[10] *Analysis of Sorting Errors of Animal Remains from Shell Middens: Lessons Learned from the Čixwicən Project*

Zooarchaeologists routinely analyze assemblages that were initially sorted into major animal type (birds, mammals, fish, invertebrates) by students or lab technicians with little experience in zooarchaeology. Sorting errors are likely made, which affect taxonomic representation and understanding of human-animal relationships. Recent study of the immense faunal assemblage (over 500,000 NSP) from Čixwicən, a 2800-year-old Lower Elwha Klallam village located on the coast of Washington (USA), allows us to systematically analyze trends in sorting errors. For example, 22.6% of the bird bones included in our sample were initially mis-sorted into other classes, primarily mammal (13.1%), but also fish (7.5%) and shell (2%). Fish bones were less frequently mis-sorted, but certain taxa with unusual elements were affected (e.g. ratfish dental plates, dogfish spines, skate dermal denticles, cod otoliths). 34% of all mammal bone chips (from tool production) were mis-sorted. Failure to recognize and mediate these errors could lead to significant biases. Projects should recognize the potential for sorting error at the beginning and train lab technicians in the kinds of faunal remains they will be encountering, including distinctive elements. Collaborative researchers need to develop protocols for transferring specimens, and those working with "legacy collections" should not assume the collections were sorted correctly.

[222] *Archaeology AskHistorians: Public-driven Inquiry and Outreach in the Digital Age*

With over 640,000 subscribers and 1.6 million unique monthly views, AskHistorians is the Internet's largest public history education forum. AskHistorians' simple Q&A format connects people with questions about the past to those with expert-level knowledge in the topic at hand, be it armored snails or erotic Moche pottery. Users of the popular, if controversial, social media site reddit post questions to the AskHistorians forum, and receive responses from a diverse panel of volunteers selected solely on demonstrated proficiency, not on outside credentials. AskHistorians is also an experiment in the public as a driver of historical education and research: users ask the questions, they vote on questions to increase visibility, and any user may answer, provided it meets the rigorous standards of scholarly quality. AskHistorians allows anyone with Internet access to set the course for the research and discussion of the past. This poster discusses the public experience, understanding, and misunderstanding of archaeology as represented in 6 years of AskHistorians, as well as the role of internet forums and social media in public archaeology. We examine how publicly directed engagement can inform our approaches, particularly in online context. Lastly, we evaluate social media strategies to connect with an alienated, misinformed public.

Bowers, Jordan

[229] *Space, Place, and Landscape at Cividade de Bagunte*

The Cividade de Bagunte is located on a prominent hill near the confluence of the Rivers Ave and Este. During the Iron Age, there likely would have been panoramic vistas that stretched well over 15 kilometers on a clear day, though this is mostly unnoticeable at ground level in modern times due to dense foliage. From the few areas that do not have trees and in combination with technology to 'see' through the trees, it is clear the site's viewshed includes several other Iron Age castros, as well as the hinterlands through which the two rivers run. This presentation uses landscape phenomenology and GIS to explore the sensory affordances granted to the inhabitants of Bagunte and investigates these factors in juxtaposition with other nearby settlements. The goal of this research is to highlight unique features of the settlement that may have allowed for exploitation of these sensory aspects to create an advantageous environment for the development of Bagunte into one of the largest settlements in the area.

Bowser, Brenda (CSU Fullerton)

[220] *Living Things in the Landscape: Gendered Perspectives from Amazonia*

Santos-Graneros writes about persistent places in Amazonia, places that have been used by generation after generation of people, because of their special qualities—waterfalls, mountains, caves. The current interest in the ontology of objects, inspired by the work of Ingold, Latour, Gell, and others

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

has opened the door for archaeologists to consider how we can investigate the meanings of places and objects in these ways, as living things. Like objects, places are alive. The headwaters of the Tigre River in the Ecuadorian Amazon provides a dynamic context for understanding the meanings of ancestral places in terms of Native ontologies and the complex relationships underlying memory, materiality, landscape, history at multiple scales, cultural transformation, and identities. Reflecting on long-term ethnoarchaeological research in the Ecuadorian Amazon, I consider how gendered perspectives on living things in the landscape contribute to a greater understanding of the material record and these complex phenomena, including ancestral claims to places of the past.

Boyd, Carolyn (Texas State University)

[180] *Soul Expression: Speech-Breath in Pecos River Style Rock Art*

Pecos River style rock art was produced in the Lower Pecos Canyonlands of southwest Texas and Coahuila, Mexico during the Archaic beginning around 2700 BC. This style is characterized by finely executed anthropomorphic and zoomorphic figures arranged in highly-ordered, complex compositions. Pecos River style anthropomorphs are frequently portrayed with a series of dots emanating upwards from an open mouth. Zoomorphic figures of felines and deer are also represented with this pictographic element. "Soul Expression" explores the significance of this recurring motif in Pecos River style rock art and proposes that it is a graphic representation of breath, soul, and speech. In ancient Mexico, breath was believed to be a manifestation of one's soul. Breath soul, when expressed in ritualized speech or song, was a powerful force engaged in both creation and maintenance of the cosmos. Graphic representations of breath soul and speech first appear in Mesoamerica during the Middle and Late Formative periods (900 to 100 BC) as volutes or scrolls issuing from the mouth of anthropomorphic and zoomorphic figures. The speech-breath motif in Pecos River style rock art may represent the oldest graphic expression of the vitalizing breath soul.

[223] *How Experimental Research in Forensic Archaeology Informs Archaeological Practice: Differentiating Perimortem Fracture from Postmortem Breakage*

Often perceived as a highly specialized and peripheral subfield of archaeology, forensic archaeology contributes to our understanding of not only forensic anthropology and forensic science, but also traditional archaeological practice. Forensic archaeologists' extensive knowledge of postmortem taphonomic effects on material objects has led to more precise interpretations of postmortem interval, environmental (including scavenger-induced) scattering and alteration of human remains, and site formation processes. Experimental taphonomic research has formed the core of these advances in site interpretation, particularly through its focus on differentiating perimortem (at or around the time of death) from postmortem events. This concept is illustrated through RU Forensic Science Institute (RUFISI) research aimed at differentiating perimortem bone fracture from postmortem breakage. A sample of 300 *Sus scrofa* ribs underwent controlled Blunt Force Trauma in the RUFISI at known periodic perimortem and postmortem intervals, ranging from 0 to 112 days of environmental exposure. Resulting rib fractures were analyzed macroscopically and microscopically to define signature fracture morphology across time periods. These results allow differentiation of perimortem fracture versus postmortem breakage and inform period of exposure and contextual history of field remains. Forensic archaeology research can therefore play an integral role in interpretations of traditional archaeological method and theory.

Boyer, Zachary

[43] *Nine Gal Tavern Faunal Analysis*

Over 400 pieces of bone and eggshell were collected during excavation at the Nine Gal Tavern site (11CH541) located in western Champaign County, Illinois in 1987 and 1991 by a team led by archaeologist Lenville Stelle. The majority of the remains analyzed were recovered within feature context in the immediate vicinity of the established Nine Gal Tavern structure. The purpose of this paper is to describe the identification of these faunal remains which are housed at the Anthropology Program at Parkland College. The identification of these remains was carried out as part of an Honors Project under the supervision of Steven Kuehn, Zooarchaeologist at the Illinois State Archaeological Survey (ISAS).

[40] *Places, Ports and Their People: The Rise of the Peruvian Post-Colonial State in the Arequipa Coast*

In this paper I provide insight into the earliest decades of the Peruvian post-colonial state (1821–1879) from the vantage point of the Arequipa coast. The Andean south, with its center in Arequipa, had a traditional mercantile basis that favored improvements in trade, particularly those that resulted in the rapprochement of the city of Arequipa to the sea. After independence (1821–1824), new ports were established; the operation of certain coves sanctioned; and extractive activities shaped the region. The ports on the Arequipa coast supplied markets across the Andean south and Bolivia, and were a necessary and desired stop for European and North American ships sailing the Pacific. The economic networks that operated throughout the Arequipa coast encompassed a vast portion of the population. The region was strategic for the mercantile classes across the Andean south, the national government and foreign dignitaries in charge of the Peruvian trade. Utilizing archaeological, cartographic and documentary sources, and modeling in Geographical Information Systems, this presentation outlines the ways in which ideas of development global commodity trade impacted the configuration of the southern coastal landscapes, from the extraction of guano to the establishment of new ports and the construction of railroads.

Bracewell, Jennifer (McGill University)

[219] *A GIS Approach to Understanding Post-sedentary Hunter-Gatherers: A Case from Northern Finland*

This paper considers post-sedentism in hunter-gatherers: how the fact of having previously been sedentary affects the behaviour of societies that increase their mobility in response to changing environmental conditions. The case-study in question is the transition in Northern Finland from a sedentary Sub-Neolithic, supported by high concentrations of marine resources in the river estuaries of the region, to an increasingly mobile adaptation in the Early Metal and Iron Ages. Although village sites disappear, the tradition of building cairns and other stone monuments continues, and there is evidence of re-use of the older monumental landscape. The shifting patterns of monument construction, situation and clustering at the regional scale are analyzed using GIS techniques, and interpretations draw on resilience theory to try to understand the specific constraints a less-mobile history has on post-sedentary societies.

Bracken, Justin (CUNY Graduate Center)

[252] *Preclassic Fortified Spaces: Within and Beyond the Ramparts at Muralla de León*

A third season of fieldwork at the fortified site of Muralla de León has expanded the scope of coverage for the project by mapping and excavating nearby hilltop occupations on the shores of Lake Macaniché. The work serves to contextualize the space contained by the site's enceinte, a physical barrier that serves also as a boundary feature. Earlier investigations into the site interior and the ramparts of the enceinte itself begged for a comparative data set, as the significance of a barrier apparently built to keep people out relies in part on an understanding of what existed outside of it.

The hilltop excavations uncovered a sequence of occupation containing multiple periods apparently corresponding to the chronology of Muralla de León. Further, evidence in support of dating the defensive architecture at the site to the early phase of occupation there emerged from one of these centers, where a possible rampart wall was uncovered beneath later construction volume and set atop bedrock. Regardless of the implications for their role in conflict, these walls represent concern with controlling the movements of individuals at a monumental scale, and with physically restricting movement into a space.

[90] *Flintknapping Experiments and Middle-Range Theory*

The manufacture of stone tools in the present and careful recording of resulting flake debris over the past thirty years typified middle range theory building and allowed new insights into past human behavior, especially regarding mobility systems. Walter Klippel, best known for contributions to zooarchaeology, encouraged our going down a rocky path of middle-range theory building. Flintknapping experimentation has generated a great deal of individual data sets but the promise of "big data" achieved in many other fields has not been reached by lithic analysts. Here, we examine various flintknapping data sets and the possibility of a flake debris meta-analysis.

Bradley, Betsy (Goucher College)

[201] *We All Need to Talk about Archaeology in the CRM Power Nexus*

The archaeological component of the National Historic Preservation Act Section 106 consultation embodies an intersection of power that has privileged archaeologists and their work at the expense of accomplishing all legal mandates and has elevated the practice of archaeology as a science above any need for negotiation for project-specific approaches. This cross-disciplinary conversation is necessary as the current situation increasingly affects the ability of other Cultural Resource Management professionals to serve the public and conveys a sense of insufficient reflexivity and disinterest in change from within the discipline of archaeology. The intersections of power and ethical framing of proposed work in this arena must include reflection on past and current practice and incorporate the expectation for flexibility that the regulations articulate. A complicated (non)negotiation of an archaeological program for an urban-renewal scale federal project in a legacy city illustrates the fault lines and power plays in historic archaeology practice. The difficult challenges include the consideration of both ethically and equitably providing mitigation for the loss of resources for the current, as well as some future, sectors of "the public."

Bradley, Bruce (University of Exeter)

[79] *Legends of the Dinsmore Hilton*

Learning to be an archaeologist is a craft that comes in many forms from formal academic training, field and lab work, to informal unstructured experiences. These become known through academic degrees, peer reviewed publications, project reports, conference presentations and interactions with peers, colleagues, the public and even the media. Formal training is listed in detail in personal vitae and may be measured and judged by the outputs but how we do archaeology as individuals is also the result of our personal experiences, not least of which are the projects we work on and the people with whom we work and interact. Legends of the Dinsmore Hilton chronicle these experiences. To date, these are primarily in the form of oral tradition as many of the participants are still extant and written versions might be subject to civil suits. As time passes my memory becomes ever more selective and inventive. Never the less, working for and with Dennis on the High Plains of Eastern Colorado in the mid-1970s has had a fundamental influence on who I have become as an archaeologist and person.

[92] *Technological Organization of Two Prearchaic Sites in Grass Valley, Nevada*

The research presented here works from the proposition that patterns in lithic assemblages reflect human organizational strategies. Preliminary investigations of 26La4434, a single component Prearchaic site in Grass Valley, reveal a pattern of large game exploitation in proximity to a Pleistocene shoreline. Standard metric, morphological, and edge-wear analysis of the flaked stone assemblage is used to evaluate whether the site facilitated access to local wetland resources and large game intercept hunting. We compare these results with the Knudtsen site (26La781), a dense site with a diverse assemblage that suggests a broad range of tasks and site functions. We argue that the observed technological organization is conditioned by several factors, including the local environment, raw material availability, and group mobility.

[113] *Referencing the Relational in 'Saltwater' Rock Art, Northern Australia*

Over the last decade, a major challenge for archaeologists has focused on understanding the relationship between people, things and the sea. As part of this effort archaeologists have increasingly focused their attention towards rock art as a symbolic means to referencing a maritime identity. At one level, identifying this connection can be relatively straightforward via marine-themed imagery (e.g. watercraft, marine animals) but what else can we draw upon to understand the nature and depth of this relationship? In this paper, we turn to the ethnographic record as a lens to explore how specific motifs and sites from two locations in northern Australia (western Arnhem Land's Wellington Range, and the Sir Edward Pellew Islands in the southwest Gulf of Carpentaria) are embedded in complex social and cultural networks for Australia's 'saltwater people'. At the core of our argument is the need to recognize how aspects of the ethnographic record such as song, kinship, cosmology and memory can play a pivotal role in accessing the meaning and symbolism of 'saltwater' rock art as well as how these images encode or communicate information about people's social identities.

[22] *Re-evaluating Wampum: Wearing Wealth in Native Southern New England*

For more than fifty years, scholars have been debating the role of the shell "currency" known as wampum (wampampeag), which began to circulate among the Native societies of New England in the seventeenth century, stimulated by the Dutch and English fur trade in the region. Following an assessment of current scholarship on the Dutch in New England in the early contact era, this paper further explores the role that wampum played within Native societies as a symbol of wealth, as well as its tangible embodiment. In particular, the rich embellishment of clothing using wampum, especially among Native elites and documented in many sources is considered in light of recently revived phenomenological theories of value.

Braje, Todd (San Diego State University)

[161] *A Meaningful Anthropocene?: Golden Spikes, Transitions, and Boundary Objects*

Despite opposition by a number of anthropologists, archaeologists, sociologists, and other historical and social scientists, a proposal to designate a geologic epoch of humans, the Anthropocene, is moving forward with a proposed starting date sometime in the last 50 years. The Anthropocene Working Group (AWG) and other, mostly, geological scientists have focused on the stratigraphic signatures for the boundary marker in lieu of understanding the long-term processes that have resulted in human domination of the Earth. As a growing number of papers that explicitly reference the Anthropocene are published, a theme that ties them together is the general lack of continuity on how we should define an Anthropocene. While the AWG strives to reach a consensus definition, we argue that the Anthropocene is best viewed as a 'boundary object,' where it can be adaptable enough to incorporate multiple viewpoints but robust enough to be meaningful within different disciplines. In doing so, we can maintain the original intent of an Anthropocene epoch, as a call-to-arms for future sustainable management of local, regional, and global environments, and fundamentally reconfigure established boundaries between nature and culture and the social and natural sciences.

[23] *Archaeological Traces of Consumption of Colonial Goods in Eighteenth Century Gothenburg on the West Coast of Sweden*

The fortified city of Gothenburg was established around 1620, constructed when the Swedish trade intensified its involvement in the world sea commerce. Parts of the fortification, a Garrison Cemetery and two old country estates have been archaeologically excavated as a result of large-scale development of infrastructure in the city.

The excavation results give new perspectives on the garrison and its cemetery. Osteological analysis contributes to the interpretation of everyday life among garrison soldiers and their families. Indications of social change in the population were discovered. Exotic commodities had become available and popular through world sea commerce; rapidly adopted by the gentry of the town. A widespread increase in consumption of colonial goods such as sugar, coffee and tobacco is evident.

During the 1800th century some of the old country estates developed large-scale specialised cultivation of a mono-cultural and industrial kind, for example growing tobacco. Knowledge of new commodities, such as colonial products, brought status and provided households with the possibility to advance in social position.

Branam Macauley, Kelly (St. Cloud State University)

[166] *An Ethical Anthropology—What This Cultural Anthropologist Learned from Larry Zimmerman*

From American Indian representations in film, to working with descendent communities and sacred sites, to understanding families experiencing homelessness, Larry Zimmerman's scholarship, guidance, and way of being an anthropologist has greatly influenced the intellectual and professional development of many cultural anthropologists. It is an ethical anthropology that transcends any one subfield of anthropology, which includes owning one's disciplinary history and identity, learning from it and changing the discipline from the inside by not just the work you do, but how you do the work, that is the focus of this paper. As my faculty mentor at IUPUI, Larry always led and taught by example, and I witnessed his ethical anthropology in constant practice. Part discussion of my own intellectual history, part analysis of pedagogy, and part examination of method, I discuss Larry's ethical anthropology and his contributions to not only archaeology but to four subfield anthropology.

[140] *The Rein Basin Chert Mine, Styria, Austria: A Neolithic Center for Tabular Chert Quarrying*

Since 2009, the Neolithic chert quarrying site in the Rein Basin in Styria (Austria) has been the focus of a multidisciplinary research project. A mining area for tabular chert, approximately 10 hectares in size, was established at this locale in the course of a series of archaeological excavations, core soundings and a geophysical prospection. At Rein, tabular chert occurs in residual loams and mined in up to four meter deep shafts. According to this evidence, the site is only the second archaeologically traced Neolithic chert mine in present-day Austria.

The extracted raw chert plates suitable for chipped stone tool production were either worked on-site or shaped into bars, and subsequently transported into the settlements for further processing. Radiocarbon dates from charcoal samples derived from the prehistoric backfilling of the shafts indicate the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Rein chert mine was in operation between 4500 and 3800 BC.

Additionally, the raw material was petrographically and geochemically characterized, allowing for accurate provenance studies of artifacts from prehistoric sites produced from Rein chert. These analyses revealed prehistoric distribution networks indicative of extensive contacts between Neolithic groups in the southeast Alpine realm, and afford the investigation of socio-economic developments on a supra-regional scale.

Brandt, Steven (University of Florida), Alice Leplongeon (Muséum national d'histoire naturelle, France) and Clément Ménard (Université Toulouse-Jean Jaurès, France)

[198] *Hunter-Gatherer Responses to the "Early" African Humid Period ~15–12 ka*

Recent paleoclimate studies indicate rainfall increased dramatically over many parts of northeastern and eastern Africa at the end of MIS 2 and the hyper-arid LGM ~14.7 ka, thereby marking the beginning of MIS 1 and the "African Humid Period" (AHP). These studies also suggest that not only should the "early" AHP be decoupled from the start of the Holocene some 3000 years later, it should also encompass the cooler, more arid Younger Dryas (12.9–11.7 ka). This paper explores two key questions: 1) can we identify archaeological evidence for hunter-gatherer activities in this region during the early AHP ~15–12 ka; and 2) if so are there technological, settlement, dietary and other behavioral changes that can be linked to climatic change or other possible causal mechanisms? A preliminary review of the early AHP archaeological record shows that despite a small data set and a limited number of chronometric ages, there appears to be few sites in the Nile Valley, while in eastern Africa there are substantially more. We conclude by discussing how a richer understanding of the early AHP archaeological record might better prepare and inform us of the significant human responses to the later part of the AHP ~12–5.5 ka.

Brannan, Stefan (New South Associates)

[5] *Settlement Scaling in the Eastern Woodlands of the United States, ca. 3500 BC to AD 1700: Size, Monumentality, and Public Space*

The concept of settlement scaling is increasingly being utilized in archaeology to empirically evaluate mathematical properties of urban and non-urban settlements. However, principles based on settlement scaling theory have yet to be tested in the Eastern Woodlands of the United States despite the existence of a robust sample of settlements, including those containing monumental architecture. As part of a broad regional study, I collected spatial data on settlement size, monuments, and public spaces at 70 sites located in the Eastern Woodlands occupied between 3500 BC and AD 1700. In general, sites exceeding 20 hectares exhibit distinct characteristics related to monumental architecture and public space when compared to smaller examples. A central question is whether these larger settlements possess fundamentally different scaling relations or if the former merely represent scaled-up versions of the latter. This paper explores the relationship between those attributes to determine quantitative patterns and qualitative differences between small and large settlement patterns. The results are used to develop a generalized theory of settlement scaling in the Eastern Woodlands which is then employed to explain the patterns of aggregation and dispersal in the lower Chattahoochee River valley of the United States, ca. AD 1100–1500.

[200] *Whole Assemblage Behavioral Indicators: Expectations and Inferences from Surface and Excavated Records at Elandsfontein, South Africa*

Large scale surface surveys represent singular insights into the landscape scale variation in behaviors. Detailed investigations of the spatial distribution of artifacts across large spatial extents allow archaeologists to investigate a landscape as a single site. Surface assemblages have the advantage of large sample sizes and large aerial extents. However, biases associated with the formation processes of surface assemblages often undermine our confidence in the behavioral inferences derived from these records. Here we investigate patterns of behavior recorded in several whole assemblage behavioral indicators for seven assemblages recovered from the Acheulean dunefield site of Elandsfontein (800 ka -1 Ma) from the Western Cape in South Africa. Large surface and excavated assemblages of stone artifacts from similar locations allow us to investigate the impact of deflation processes on behavioral inferences. We use agent based models to develop expectations about the spatial variation in behaviors across this ancient landscape. Results suggest that the processes that created deflated surface assemblages have varied impacts on whole assemblage behavioral indicators. Some of these proxies of behavior appear to provide faithful representations of patterns derived from excavated assemblages. We compare these behavioral inferences to contextual data collected from excavated contexts.

[100] *Recent Research in Copacabana, Bolivia, the Intinkala Sector*

Copacabana has been a pilgrimage destination and a site of extraordinary reverence from Formative times to the present. Together with the Islands of the Sun and Moon, it formerly comprised one of the most sacred ceremonial complexes in the Inca Empire. Recent archaeological research in Copacabana has focused on the Intinkala sector located just east of the modern basilica. The principal aim of the first season was to ascertain the nature of Inca engagement with this powerful locale as evidenced through spatial and material patterns and practices. Fieldwork conducted in 2016 included a geophysical survey of the area, photogrammetric documentation of the cutstones, topographic mapping of the site, and excavations. The excavations produced evidence of both large and small rectangular structures associated with the above-ground sculpted stones and outcrops, as well as an Inca midden. Subsequent analyses have focused on 3D spatial rendering of features identified, compositional study of the variety of Inca ceramics recovered using INAA, and comparative assessments. The study ultimately aims to provide insights into the ways in which topographies of the sacred are constructed; how attachments to place are formed and transformed over time; and how power, place, and identity are materially and mutually constituted.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Breault, Sarah**[288]** *Ceramics and Community: A Yucuita Phase Ceramic Cache at Etlatongo*

Feasting is a well-documented phenomenon in Mesoamerica as a means of community integration and interaction. Ceramic analysis of Op. B, Pozo 20, Feature 1 from the site of Etlatongo may point to one such feasting event at the site. This Yucuita phase (500–300 BC) feature was a primary refuse deposit of ceramic, lithic, and faunal artifacts intermixed with extremely ashy sediment, probably from a specific event. An overview of the stratigraphy of the feature and an inventory of the assemblage will be given, with a particular focus on ceramics, with a summary of primary data that considers pastes, forms, and slips of vessels as well as details of technological style such as wall thickness and angle, as part of an ongoing effort to explicate the full range of Yucuita phase pottery. Patterns will be compared with other Yucuita phase collections in order to verify if these patterns occur throughout the region or are specific to particular deposits and/or the site of Etlatongo. A consideration of possible depositional events will follow, based primarily on frequency of vessel forms as compared to other Yucuita contexts from both this site and the site of Yucuita.

Breiter, Sarah (Northwestern University)**[167]** *A Long Relationship: The Reuse of Monastic Stones after the English Reformation*

The English Reformation had a swift impact on the people of the rural landscape. The movement away from the Catholic church altered the relationship that people had to the physical manifestation of church authority. During the Dissolution of the Monasteries, Church landholdings were sold off to private owners, and the architectural core was repurposed for secular use. Most of the research on the Dissolution focuses on how the new landowners reused the land, or converted churches into manor houses. However, people who lacked the means and resources to make large-scale changes to the former monasteries still found a way to express their new relationship through removing and reusing the stone in the farms and villages near the monastery. At Thornton Abbey, multiple agricultural and village properties were surveyed for monastic stone. The stone was reused as building material, garden decorations, and, more recently, as gifts. How the stone is used appears dependent on the variety and the age of the property, indicating that the stone was interpreted in different ways based on the individuals and their social context. People continue to reuse the stone, marking the enduring presence of the Church on the landscape.

Brenskelle, Laura [217] see Emery, Kitty

Breske, Ashleigh (Virginia Tech)**[70]** *Politics of Repatriation, Formalizing Indigenous Cultural Property Rights*

This theoretically-oriented project engages discussions of historical arguments for the repatriation of indigenous cultural property that ultimately led to the creation of the Native American Graves Protection and Repatriation Act (NAGPRA) in 1990. I will investigate how institutions and cultural values mediated changes in repatriation policy both nationally and internationally. By examining ownership paradigms and institutional power structures, it is possible to understand the ramifications of formalizing repatriation. The current binary of cultural property nationalism/cultural property internationalism in relation to cultural property ownership claims does not represent the full scope of the conflict for indigenous people. Inclusion of a cultural property indigenism component into the established ownership paradigm will more fully represent indigenous concerns for cultural property held in museums and other collections. Looking at the rules, norms and strategies of national and international laws and curatorial policy within museum institutions, I will also argue that there are consequences to repatriation claims that go beyond possession of property and a formalized process (or semi-formalized approach internationally) like NAGPRA can aid in addressing indigenous rights.

Bretzke, Knut (University of Tuebingen)**[227]** *A Probabilistic Approach to Study Diachronic Patterns in Human Behavior: A Case Study from the Paleolithic Sequence at Jebel Faya, UAE*

Jebel Faya is a key Paleolithic site in Arabia. The site provides important data on the history of human occupation of desert environments during the Late Pleistocene. One central question is if the observed diachronic pattern of occupation is largely driven by climatic change, as often assumed, or if other factors such as adaptation processes play significant roles. Based on the assumption that survival in the often unpredictable environments of SE Arabia requires increased behavioral flexibility and risk minimizing strategies this paper examines Jebel Faya's Paleolithic stone artifact assemblages with regard to economization of lithic raw material and the intensification of social relations. Attributes such as production efficiency and re-use potential represent raw material economization, while technological complexity, occupation intensity and raw material provisioning are used to deduce an indirect estimate for the intensity of social relations. To assess the degree of economization and social relation, the archaeological assemblages are compared to data modeled under optimality assumption using a probabilistic approach based on Naïve Bayes classifier. These results were used to track changes in social relations and raw material economy through the archaeological sequence from Jebel Faya to see if these data provide meaningful information on differences in social learning.

Brewer, Katherine (University of New Mexico)**[115]** *A Comparative Analysis of Historical Artifacts Recovered from Room 28*

Historical artifacts from Room 28 in Pueblo Bonito provide a unique opportunity to investigate what the Hyde Exploring Expedition, Moorehead, and National Geographic Society excavations left behind during their excavations between 1896 and 1927. Using the 2013 UNM excavations in Room 28 as a starting point, analysis of the historical artifacts found in excavation and stabilization over the last century provides an important perspective on how those early excavators discarded their own material culture in the rooms of Pueblo Bonito. As a whole, this analysis provides an archaeology of the early "archaeologists" of Pueblo Bonito.

Brewington, Seth (Hunter College, City University of New York)**[34]** *Fowling and Food Security in the Faroe Islands*

Seabird fowling has long played an important role in the traditional domestic economy of the Faroe Islands, a small North Atlantic archipelago. Direct evidence for seabird exploitation in the earliest period of Faroese prehistory has been lacking, however. In this paper, I present new archaeofaunal evidence for substantial and sustained seabird exploitation in the Faroe Islands from the 9th through 13th centuries CE. The data suggest that seabirds represented a significant resource in the Faroese subsistence economy from the earliest Norse settlement onward. Fowling thus represented one component of a broad-based subsistence regime that was aimed primarily at decreasing vulnerability to food shortfalls, particularly those caused by failures in the agro-pastoral economy. When compared to typical contemporaneous archaeofauna from Norse Greenland and Iceland, the role of fowling in the Faroese domestic economy is quite large. The Faroe Islands in this respect appear more similar to some northern insular communities of the British Isles, and the Outer Hebrides in particular.

Bria, Rebecca (University of Minnesota—Twin Cities)**[297]** *Interlinking Practices and Community Assemblages: Agriculture and Ritual in Ancient Hualcayán, Peru*

This paper combines assemblage theory with ritual economy in the study of long-term community formation at prehistoric Hualcayán, in highland Ancash, Peru. In particular, it explores how the people of Hualcayán interlinked and coordinated their practices of building, food production, and ritual consumption to assemble a Recuay community during the Andean Early Intermediate Period (AD 1–700). It traces the archaeological evidence of how religious ideologies, social group divisions, and agricultural technologies shifted together during this process of community formation, including how ritual and food production practices and materials were integrated into particular events and local spaces. It concludes that the integration of these practices was essential to establishing common goals, consent, and material dependencies between a community of builders, ritual participants, and food producers. Ultimately, the paper argues that to examine community is to inquire into the overlapping ritual and labor practices that constitute social interaction and create meaningful relationships between people and non-human actors such as land, plants, animals, and supra-human beings.

Briggs, Rachel (University of North Carolina-Chapel Hill)**[220]** *The Mississippianization of Women in the Black Warrior Valley of Alabama, A.D. 1120–1250*

By A.D. 1120 in the Black Warrior Valley of west-central Alabama, a Mississippian identity, predicated on the dissemination and subsequent adoption of maize, had firmly begun to take root at what would become the ritual-ceremonial center of Moundville. Traditionally, researchers have modeled the origins of Moundville within a political-economic lens: the growing aspirations of elites, who are implied to be male, are supported and fueled by stores of and feasts of maize, which is treated primarily as a resource to achieve their ambitions. However, through a careful analysis of the early landscape of practice of the hominy foodway of the Black Warrior Valley, I suggest that during this early period, it was not the activities of men, but instead those of new and endemic women to the area that first sparked and then united the early Moundville landscape. This analysis further suggests that what has largely been interpreted as a homogenous cultural expression for all people regardless of gender within the area was instead more heavily driven by, and had a greater impact on, female gendered activities.

Brighton, Stephen (University of Maryland)**[296]** *The Materiality of Cultural Resilience: The Archaeology of Struggle and Transformation in Post-famine Ireland*

Cultural resilience or collapse has been the focus for the study of prehistoric and proto-historic societies. Little, if any work in historical archaeology, or the archaeology of the modern world, has linked the impact of traumatic natural events and social, economic, and political structures to how cultural groups respond. In this paper, cultural resilience theory is employed to discuss the capacity of a culture to maintain and transform its world-view, cultural identity, and critical cultural knowledge. In this context, extreme events, challenges, and societal or cultural stressors inhibit or test the structure of a culture. Such is the context of the decades following Ireland's Great Hunger. This presentation details the on-going research on Ireland's cultural resilience in terms of the impact of the mid-nineteenth century Great Hunger. This paper focuses on the author's archaeological research in Skibbereen, County Cork seeking to find the material manifestation of cultural resilience in the decades following the Great Hunger. The aim is to use the material remains to illustrate how Ireland's cultural structure once on the brink of collapse was resilient enough to transform after losing half its population to either emigration or death.

Brinkman, Adam (UMass Boston)**[104]** *Ollas and Inequality: Reflections on Space, Ceramics, and Power Relationships at the Sanchez site.*

Spanish exploitation of Indigenous people's labor was a foundational component of the initial colonization of New Mexico. Pueblo Indians and enslaved Plains peoples worked on Spanish public infrastructure projects, built Spanish Missions, tended friar's livestock, and helped with the daily operations of outlying estancias. At the Sanchez site, evidence of daily labors can be seen in broken manos and metates scattered around the site, the presence of the adobe structures that were built by Pueblo Indians, and the distribution of Pueblo Indian ceramics in the Spanish home and adobe barn. By studying the spatial distribution of these materials throughout the Sanchez Site, this poster seeks to explore how labor exploitation was reinforced and perpetuated throughout the early colonial period.

Brinkmann, Robert (Hofstra University)**[215]** *The Sustainability Lessons from the Archaeological Work of Lynne Goldstein: The Curious Environmental Stories of Aztalan, Fort Ross, and Michigan State University*

Sustainability can be defined as meeting the needs of the present without depleting natural resources for the future. With such a time focused definition, there is no doubt that the meaning of sustainability changes over time and by culture. An examination of three of Lynne Goldstein's field sites, Aztalan, Fort Ross, and Michigan State University, provides an opportunity to dissect our modern take on sustainability. At Aztalan, sustainability of Native American culture comes into question as there is evidence that social equality did not lead to sustainable conditions. At Fort Ross, environmental conditions created problematic challenges for a pioneer settlement. At Michigan State, economic and environmental changes caused rapid constructions of what it means to be sustainable. Each case highlights the significance of the three pillars of sustainability (environment, social equity, and economic development) in analyzing past and present cultures. When taken together, the three sites challenge today's thinking about the meaning of sustainability and how it can be achieved.

Britt, Krystal (University of Illinois at Chicago), Claire Barker (Arizona State Museum), Samantha Fladd (University of Arizona, University of Cincinnati) and Danielle Soza (University of Arizona)**[218]** *Sunset at Rock Art Ranch: Human Use and Occupation of the Middle Little Colorado River Valley before the Homol'ovi Settlement Cluster*

From 2011–2016 the Rock Art Ranch (RAR) field school, directed by E. Charles Adams and Richard Lange, surveyed about 17 square kilometers and conducted excavations at three sites to understand how groups utilized the prehistoric landscape of the Middle Little Colorado River valley. Research at RAR, located near the modern town of Winslow, Arizona, sheds light on over 10,000 years of human settlement and contextualizes over three decades of work by Adams and Lange at the nearby Homol'ovi settlement cluster. During six seasons, the RAR field school documented 220 sites

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

representing use beginning with mobile hunter-gatherer populations through Ancestral Puebloan communities of the Pueblo III period. Additionally, ceramic evidence indicates that visits by Hopi people continued through the early Historic period—demonstrating the continued importance of this area.

The intensive survey and excavation data collected by the RAR field school is regionally significant as very little of the surrounding landscape has been investigated outside of the Homol'ovi settlement cluster of the Pueblo IV period and the extensive rock art from which the ranch derives its name. In this paper we summarize our findings, which help to contextualize the social and physical landscape prior to aggregation at the large Homol'ovi pueblos.

[177] *Organic Molecular Proxies for Fire in Archaeological Sediments*

A number of different direct and indirect proxies are used to identify fire at archaeological sites. We propose a new organic molecular proxy for identification of anthropogenic fire in archaeological sediments, polycyclic aromatic hydrocarbons (PAHs). These molecules are a byproduct of the incomplete combustion of organic biomass, and are preserved well on deep time scales. We applied this proxy to Lusakert Cave, a Middle Paleolithic site in the Hrazdan Gorge, Armenia. From these same samples, we also extracted n-alkanes, the molecular remains of the epicuticular waxes of terrestrial plants. We analyzed the δD and $\delta^{13}C$ values of the n-alkanes to measure vegetation and hydrological changes at the site during its occupation. This coupled record of climate and fire from sediments containing archaeological material gives insight into the ability of Middle Palaeolithic hominins to control fire through changing ecological regimes.

[260] *El sitio arqueológico de Barrigón. Un cementerio precolombino del Gran Chiriqui*

We present a review of the data obtained during the "Proyecto de Rescate Arqueológico Estí (PRAE)" that took place between 2000–2003 in the context of the environmental mitigations of the Estí hydroelectric project; and with special attention to the Barrigón site.

Barrigón is a cemetery site from prehispanic times localized near to the Gualaca city in Chiriqui province (Panamá). This kind of "necropolis" was placed in the flat top of a little hill a few meters from the Barrigón river. We identify a typology of graves and explore at least two of each one, several artifacts were recovered in acceptable conditions in order to made conservation or restoration actions whit diffusion meaning. AES Panamá (the project promotor) build a little local museum in Gualaca fist square, to present this legacy at the region and national community.

The material cultural that has been rescued, both ceramic and lithic, has been identified as Aguas Buenas (Bugaba) tradition.

Brochado De Almeida, Pedro

[229] *The Cividade de Bagunte Archaeological Project*

The Cividade de Bagunte is the most publicized archaeological site of the Municipality of Vila do Conde and is classified as a Portuguese National Monument. Located on a mound with great visibility over the territories to the north and south of the Ave River, approximately 30km north of Oporto city, it called the attention and interest of various archaeologists such as Ricardo Severo and Martins Sarmiento, in the end of the 19th century, and F. Russell Cortez in the 1940s. F. Russell Cortez organized excavation campaigns at the site that uncovered a mixture of Castrejo and Roman type buildings and structures, distributed into orthogonal spaces that already have the seal of a Roman influence in the region. The urban reorganization of the town happened in the 2nd half of the century, with the Flavian dynasty. Since the 1990s, the Municipality of Vila do Conde is running a project to preserve, study and provide public access to the archeological site. This presentation is a way to publicize, in an international environment, the achievements made by this effort.

[215] *Mentorship, Professionalism, and the MSU Campus Archaeology Program*

In 2008, Lynne Goldstein founded the Michigan State University Campus Archaeology Program. I had the opportunity to serve as the first Campus Archaeologist, a position that I thought would give me much needed experience in conducting and leading archaeological excavations. In addition to this, I ended up learning more about becoming a complete professional and public archaeologist, the intangible skills that are so difficult to teach, but that Dr. Goldstein has bestowed upon many of her students and staff through this program. This paper will talk about the importance of the Campus Archaeology Program, the early years of its development, and how Dr. Goldstein's mentorship allowed me to learn about the elements of being a professional archaeologist that are so often ignored, go untaught, or viewed as being in the way of pure academic scholarship.

Brodie, Laura (University of WI-Madison)

[260] *Settlement Locations and Soil Fertility in the Volcán Barú Region of Panama*

Analyses of settlement locations (such as hamlets and farmsteads) within the Volcán Barú region of Panama and their associated periods of occupation suggest that during certain times, such as the Chiriquí Period, soil fertility was an important factor in determining the location. However, during other periods, it does not seem to have been significant. There also is a centralization of the population during the late formative, or Late Bugaga Phase, which correlates with previous findings of Barriles and Pitti-Gonzalez getting larger during that phase. Soil fertility does not appear to have been an essential feature of the first settlements in the region.

Brody, Rachel (Boston College) and Rebekah Mills (Barnard College)

[23] *Castles in Communities: Recent Findings in the Field*

The archaeological and anthropological field school Castles in Communities, organized by Foothill College, completed its third field season this past summer at the site of Ballintober Castle, County Roscommon, Ireland. The construction of Ballintober Castle (early 14th century) is attributed to the Anglo-Norman Richard de Burgh, Earl of Ulster. Shortly after its Anglo-Norman occupation, the castle came under Irish control (1381) and has been the property of the O'Connor family ever since. After being attacked in 1642, the castle was abandoned as a residence. The castle now lies in ruins, portions stand 4m high. Extensive non-invasive field survey and excavation have been performed, not only on the site of the castle, but within its surrounding landscape and adjacent fields. This paper will present the findings exposed in excavations conducted in the north-east tower of the keepless castle. Excavation has shown a complex stratigraphy and multi-phased building construction. It will be postulated that the identified different phases in castle construction can be linked to changed hands in ownership, reconstruction in response to outside attack, and period remodeling efforts.

[179] *Paleopathology and Non-specific Indicators of Stress from Point San Jose*

Paleopathology encompasses the understanding of disease processes that affect skeletal remains as well as the timeframe and context in which they occur. Although most such studies focus on changes observed at an individual level, the Point San Jose assemblage provides a challenging perspective on paleopathology because it consists of separate skeletal elements lacking association with whole individuals. Consequently, our focus is on the types of bony changes seen rather than specific diagnoses of the etiology of those changes. A total of 240 (12%) bones of approximately 2,000 observable elements show changes in bone shape, bone loss, bone formation, trauma, non-specific infection, or joint disease. Among the elements displaying pathology, the highest prevalence involves bone formation (68%, 163/240) associated primarily with traumatic and degenerative processes. Although bone formation is also associated with shape changes and trauma, joint disease accounts for the majority of bone formation (60%, 97/163). Of the elements that demonstrate trauma, most (83%, 20/24) are appendicular elements. In addition, all periosteal reactions from infection occur on appendicular elements, most commonly associated with fractures.

Brooks, Alison (George Washington University) and John Yellen (National Science Foundation)

[227] *Social Learning Among recent Hunter-Gatherers: Jun/wasi Examples*

While interest in the role of social learning in the Paleolithic has focused extensively on stone artifacts, very little attention has been paid to social learning in living forager populations. In this paper we report on many years of fieldwork among the Jun/wasi of northwestern Botswana and Namibia. We argue that most cultural transmission in relation to domains such as technology, language and food acquisition was informal, and was acquired in the context of close daily relationships between children (including ours) and Jun/wasi adults, as well as between younger and older children in the context of play groups as children grow. We will also discuss the transmission and acquisition of new technologies from contacts outside the Jun/wasi community. These ethnographic data have direct implications for interpreting the archaeological record, particularly the spatial patterning of culturally transmitted material cultural remains.

[38] *From Features to Figures: Quantitative Analysis of California Native American Baskets*

There are only a few recognized experts on California Native American basketry and their informed opinions establish the current state of knowledge. It takes years of experience under the guidance of a knowledgeable mentor and examination of hundreds of baskets to develop such expertise. While analysis by the few experts may be quantitative, scientific, and exacting, designation of a basket's ethnic identification continues to be subjective. In some instances, authors cite little but their own research. This raises the question whether statistical analysis of basketry attributes can be used to identify a basket's ethnic origin.

To answer this question, baskets of selected northeastern California Native American groups, will be statistically compared to test whether ethnic origin is indicated in the results, and whether linguistic affiliation or geographic propinquity best account for differences and similarities between basket weavers. The analysis will include sixty-five different basketry attributes from each of one hundred fifty to two hundred individual baskets. The potential for seeing previously unknown associations between ethnic groups is likely. Newly recognized associations have the potential to influence future research on population migration, genetic studies, and linguistics.

Brouwer Burg, Marieka

[133] *Certainty about Uncertainty: Lessons Learned from Modeling Human Land Use and Decision Making*

A cornerstone of William Lovis' career has been the investigation of human land use dynamics, with strong emphasis on methodological rigor and statistical analysis. He has led a generation of students to consider these issues in the Great Lakes and beyond. The modeling of past human decision making is useful as a heuristic for exploring goals and motivations, about which there is certainly a tremendous amount of uncertainty. Instead, modeling past behavior is inherently an exercise in balancing this uncertainty with assumptions, existing knowledge and theory, data (and their limitations), and technology. This paper will explore the role William Lovis played in inspiring and driving research in this vein. In the end, only deeper and broader insight about past natural and social-behavioral dynamics is to be gained when we push our research to the edge of uncertainty.

[85] *The Archaeology of Gossip: Delineating the Space of Interpersonal Performance*

Much of the literature on performance in cultural and political spheres in archaeology over the last 4 decades has focused on social memory. This paper shifts that discussion from the arena of public commemoration and cultural rites to the de facto performances of the domestic sphere. Private, interpersonal interactions are important in the transmission and creation of social memory as well- they place an individual's social world in the context of shared social memory, and vice versa. Gossip is cited with frequency in ethnographic accounts and anthropological analysis as containing a wealth of sociocultural meanings; is it possible in archaeology to gain perspectives from such "immaterial" interactions?

This study identifies and interrogates the physical environments in which gossip would have occurred, entertainment and congregation spaces in domestic contexts, by modeling Roman domestic space as a performative space in which interpersonal influence was crucial. In the Roman Empire, gossip was a notoriously influential sociopolitical practice that was enacted and documented in many public forums with great performative flair, and thus provides an excellent case for comparison of the material conditions of this practice with written accounts.

[263] *Nonlinear and Multiscalar Dynamics of Migration*

The quantitative model of diffusion traditionally studied in archaeology uses Gaussian statistics and Brownian motion to envisage a slow wave of advance. It originates from Fisher's model for the diffusion of advantageous alleles across the landscape, but was then applied in archaeology to the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

diffusion of agriculture from the Near East into Europe. More recently, Lévy flights, which are random walks with step lengths derived from power-law distributions, have been proposed as models for human movement, especially for foragers. The archaeological signatures for these two dynamical processes—Brownian motion versus Lévy flights—are potentially quite different, making them useful and practical to consider. It seems likely *prima facie* that both processes are good models for different kinds of prehistoric migrations, and, moreover, in each case tuning the parameters of the model yields different patterns. In this paper, I discuss historical and archaeological evidence for these two different dynamical regimes of migration models and their implications for our interpretations.

Brown, David (University of Texas at Austin), Mark Willis (Blanton & Associates, Inc.) and Chester Walker (Archaeo-Geophysical Associates, LLC)

[324] *The Late Prehistory of Ecuador from Above and Below: Remote Sensing in the Northern Highlands*

Remote sensing, including both low level aerial photography and subsurface geophysical methods, has become an increasingly key element in archaeological fieldwork over the last few decades. During that time, our team has used various techniques to accurately map late prehistoric Ecuadorian sites and to search for buried features. In the last two years we have used drone aerial photography, ground penetrating radar, and magnetometry to aid in investigations at the monumental site of Cochasquí. Photogrammetric processing of aerial photos has allowed us to create precise topographic maps, three-dimensional models of architectural features, and to calculate volumes of constructed features and adjacent quarry areas. Concurrent geophysical investigations have revealed numerous subsurface features, allowing the excavation team to selectively focus on appropriate loci for study.

Brown, Gabriel (VCP Alexandria) and Guillian Hurte Sr. (VCP Alexandria)

[326] *Forensic Photography and the VCP—Teaching Veterans and Capturing History*

One of the unique opportunities given veterans within the Veterans Curation Program (VCP) is professional training in high quality digital artifact photography that far exceeds the quality of photography practiced by most Cultural Resource Management firms. A representative sample consisting of 10% of every collection processed by VCP is photographed by the veteran technicians and subsequently combined with the finalized collection. These digital images are reviewed and a selection is eventually uploaded to the Digital Archaeological Record (tDAR), an international digital repository for the records of archaeological investigations. The process of training veterans with little or no background in photography relies primarily on well-established step-by-step methods, ongoing personalized training and mentoring, and an accessible reference guide designed specifically for the VCP. With the skills and experience acquired through the VCP, many veterans have discovered the value of photography not only as a therapeutic and satisfying hobby, but also as a possible career choice.

Brown, Ian

[291] *The Reuse of Indian Mounds as Historic and Modern Cemeteries*

Stephen Williams had strong interests in the history of archaeology, prehistoric Indian mounds, and historical archaeology. This paper combines aspects of each of these interests. Cemeteries associated with Indian mounds commonly occur in the Ohio and Mississippi valleys. Numerous reasons have been put forth over the years as to why early Anglo-American settlers decided to bury their dead on mounds, ranging from flooding issues, to avoidance of valuable farmland, to a preference for burying on high land. The fact that a number of mound sites along the bluffs of western Mississippi also have non-Indian cemeteries on them, despite even higher land occurring nearby, suggests that the story is far more complex than perceived. I suggest here that the use of mounds for burial purposes may be related to early nineteenth-century Anglo-American populations having made symbolic power statements over land that was still either being occupied or claimed by Indians. The erection of gravestones on prehistoric mounds targeted what were clearly the most visible and curious monuments of this contested landscape.

[129] *The Shifting Political Landscape of the Mopan Valley: A Diachronic Perspective*

The Mopan River valley of Belize is home to five closely spaced Lowland Maya ceremonial centers with extensive settlement occupying the landscape between. From south to north, the ceremonial centers are Arenal, Early Xunantunich, Classic Xunantunich, Actuncan, and Buenavista del Cayo. Archaeological evidence suggests that each of these centers was initially occupied by the Middle Preclassic, but they had distinct histories, evolving into ceremonial/political centers at different times, from the Middle Preclassic to the Late Classic. Additionally, the decline, collapse and eventual abandonment of these ceremonial centers occurred at different times and with varying impact on nearby hinterland communities. In this paper we present archaeological data from the Mopan Valley in order to place the site of Actuncan within this regional history. In doing so, we highlight the changing political organization of the Mopan valley, as political authority became more centralized and the institutions of divine kingship developed, flourished, and eventually collapsed.

Brown, Ryan (Superior National Forest)

[106] *Following the Voyageurs Highway: Cultural Resource Management in the Boundary Waters Canoe Area Wilderness*

Wilderness areas are generally managed as unpeopled landscapes, in the words of the Wilderness Act, "an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain." However, wilderness areas do have human histories, and these historical narratives and the archaeological record they left behind can greatly enrich the visitor experience. In the Boundary Waters Canoe Area Wilderness in northeastern Minnesota, visitors portage canoes over the same trails and paddle the same routes used by voyageurs and Native

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Americans centuries before, creating a tangible link with the past. This continuation of historical landscape use for modern recreation creates challenges for cultural resource management by concentrating visitor impacts on areas of high archaeological probability and significance. Of 2080 designated wilderness campsites, approximately 40% are collocated with identified archaeological sites. These sites are at risk of degradation through visitor induced erosion and campsite maintenance activities. Due to the remoteness of the area, only a small number (approximately 13%) have been surveyed to current standards. However this remoteness and the designation as a wilderness area has also served to help preserve the archaeological resources of the Boundary Waters region.

Brown, William (Department of Anthropology, University of Washington)**[118]** *Formal Theory in Demographic Temporal Frequency Analysis: Decomposing the TFD Data Generating Process*

John Rick's 1987 paper in *American Antiquity* presented the first systematic overview of theory underlying the "dates as data" approach (i.e., demographic temporal frequency analysis, dTFA), describing the general outline of a data generating process (DGP) linking paleopopulation dynamics to temporal distributions of archaeological materials (temporal frequency distributions, tfds). While research pursued in the dTFA framework has gained momentum over the intervening decades, questions regarding its reliability if not legitimacy have also emerged. Arguably, this critical pushback is the result of the tacit but persistent reluctance both of advocates and critics to give full formal expression to dTFA's core theory. In turn, this reluctance has led to the inadvertent conflation of the program's foundational principles and its special-case conditions, as well as to vague impressions regarding the degree to which non-demographic forces obscure demographic information in tfds. In response, I explicitly formalize Rick's framework as a functional decomposition of the tfd DGP. Features of this formal theory are highlighted that can be productively leveraged in the service of demographic inference, specifically in the context of inverse uncertainty quantification (e.g., backward uncertainty propagation and sensitivity analysis). Both paleopopulation size and growth rate estimation are considered.

Browne Ribeiro, Anna (University of Louisville Kentucky)**[254]** *My Grandfather's Castanhal: Plants, Community, Territory, and Memory in the Brazilian Amazon*

In contemporary Gurupá, a rural municipality in the Brazilian Amazon, life is largely shaped by movement of, and among, plants. Plants here are mobile, but spend most of their lives stationary. In this paper, I examine the relationship between people and plants—as living, but nonetheless spatially rooted elements of the landscape—in these agroextractivist communities. I explore the significance of planting and plant life in regulating territorial use and notions of rights, access, and possession, as well as social relations and family ties. Through *trabalho de campo* (field labor), both communal and solitary, Gurupaenses continually transform this forested landscape into a mosaic of greenery of varying sizes, shapes, shades, and meaning. The work of tending, weeding, cutting, and harvesting shapes gardens, dooryards, trails, and interstitial spaces, simultaneously configuring identities and social relationships within and beyond kinship groups. The present landscape is the result of generations of management of plants, as gardens, fields, stands, or trees—which are, importantly, individuated and associated with specific community members or families. These features regulate and communicate access to the spaces and fruits, literal and metaphorical, of *trabalho de campo*. Simultaneously, they materialize social relations, history, memory, and genealogy.

Browne Ribeiro, Anna [240] see Ellis, Grace

Brumbach, Hetty Jo (University at Albany) and Robert Jarvenpa (University at Albany, SUNY)**[220]** *A Comparative Ethnoarchaeological Approach to Gender and Landscape: Livelihood and Viewshed*

The sexual division of labor in many societies situates women and men in livelihood activities which differ markedly in their locations, facilities, and relationship to other features in both the built and non-built environment. The repeated juxtaposition of these behaviors and elements over time result in rather distinctive female and male viewsheds or vistas and, ultimately, gendered perceptions and interpretations of the landscape. Consider the perceptual field of a woman scraping hides on the side of a storage cache as contrasted with that of a man tending fish nets on a nearby lake. How do key livelihood strategies contribute to variable viewsheds and interpretations of the landscape by women and men? Under what conditions are these experiences and interpretations likely to change? Such issues will be addressed with data from a comparative ethnoarchaeological investigation of gender and subsistence in four circumpolar hunter-fisher and hunter-herder societies: Canadian Chipewyan, Siberian Khanty, Finnish Sami, and Alaskan Inupiaq. Suggestions will be offered for applying viewshed dynamics in living cultural systems to ancient archaeological landscapes.

Brunner, Kyle (New York University)**[196]** *Urban Spatial Relationships during the Early Islamic Period: Reassessing Investigations into the Market and Mosque at Sīrāf, Iran*

There has been much debate on what defines an Islamic city (*madīna*) and what made cities become "Islamic" after the Islamic conquest. These studies have often marginalized the Islamic period, associating street encroachment and overall shifts away from the "classical" model as signs of decline. Scholars have relied on western notions of what defines a city and have used strict urban typological models, which do not conform to the region or period. In addition, these studies have neglected to include examples of cities (*shahristan*) from the Sasanian empire and other regions of the Islamic world. This paper will use archaeological evidence to investigate the spatial relationship between the mosque and market at the site Sīrāf in southwest Iran. This case study furthers our understanding of the cultural forces that went into this shift from the *shahristan* to the *madīna*. By comparing Sīrāf to contemporary sites in Iran and Syria-Palestine, we see a similar spatial-layout where the congregational mosque is placed at one of the main entrances to the market, and shops are incorporated into the architecture of the mosque. Such a design allowed for the religious and economic systems of urban life to flow into a central zone.

Bruno, Maria C. (Dickinson College), Christine A. Hastorf (University of California-Berkeley) and Jewell Soriano (University of California-Berkeley)**[297]** *Landscapes and Agricultural Rituals on the Taraco Peninsula, Bolivia*

Generations of ethnographers have documented the many levels of ritual that contribute to Andean food production, from subtle coca offerings to community-scale canal cleaning festivals. Here, we discuss a ritual conducted on a yearly basis in the community of Chiripa on the Taraco Peninsula, Bolivia to ward off crop damage by hail. This ritual involves a group of community leaders specifically charged with protecting the agricultural lands and yields. They walk two specific routes and burn offerings at several sacred locations. Through audio, video, and spatial documentation of these routes, we examine the physical manifestations of this ritual, how it links agricultural practice to key natural elements of the landscape, and reveals the local understanding of where risk comes from and how to mitigate it. We will consider some of the ways this ethnographic case study can inform our understandings of past ritual ecologies in this landscape.

[29] *European and North American Mountain Archaeology and the Concept of Transhumance Applied to the Prehistory of Colorado's Southern Rocky and Poland's Tatra Mountains*

Significant advancements have been made in mountain archaeology throughout the world in recent decades. A central and rapidly expanding research theme has been that of seasonal transhumance, movement of human groups between lower to higher mountain-foothills-piedmont environmental zones in order to exploit annual economic resource variability. Emerging European mountain records suggest human transhumance, based in seasonal variability of both economic plants, migratory game species, and, much later, as pastoral nomadism, began as early as Neanderthal times, ca. 60,000 BP. The lead author, over three decades, has documented more than 12,000 years of persistent hunter-gatherer transhumance in the Colorado Rocky Mountains and, in collaboration with co-author Polish mountain archaeologist, Pawel Valde-Nowak, and co-author Michael Kimball have begun a project to investigate prehistoric hunter-gatherer and pastoral livestock transhumance in Poland's Tatra Mountains of the western Carpathians. This paper describes background, methods, and early results of the Tatra project which draws on the investigators' mutual and complementary experience in the Northeastern European Tatras and Colorado Rockies.

Brush, Emily (University of Wyoming)

[303] *High Elevation Land Use in the Cougar Pass Region of the Absaroka Mountains of Northwest Wyoming*

Historically, high elevations have been considered as peripheral to past human cultures. Indeed, high elevation areas are somewhat marginal given their increased energy demands and generally low productivity; yet, archaeological evidence shows that human use of high altitudes reaches far into prehistory. Here I present an analysis of human land use through time and its relationship to major environmental and climatic shifts to determine the conditions under which humans make more or less intensive use of high altitudes. The case study comes from the Cougar Pass Region of Wyoming's Absaroka Mountains and contains fifteen distinct archaeological sites situated near six permanent ice patches that have preserved dateable artifacts and paleobiological specimens. Projectile points also provide a means of determining occupation in broad chronological categories. Through the comparison of various artifacts and associated dates, the relationship between high elevation land use by prehistoric people and the environment can then be determined. This research has the potential to be applied to other, environmentally similar regions.

[290] *Is Traditional Pollen Analysis Obsolete?*

For more than 100 years, palynologists have relied on the traditional method of pollen analysis to provide essential information on paleodiets, paleoenvironments, archaeology, and other research such as forensics. The past traditional method has focused on the use of light and scanning electron microscopy and then used those results to obtain information and values which palynologists can use to interpret those. During the past decade, some scientists have turned to using other techniques such as DNA and isotopes of pollen grains to gain information about the above research goals. This paper investigates if these new techniques can in fact replace traditional pollen analysis. Ultimately, the current state of DNA and isotope research technology is unable to provide some of the most crucial information provided only by utilizing microscopic pollen analysis. Currently, the molecular and microscopic methods are complimentary. However, the relationship between the microscopic and molecular methods will need to be reevaluated as new technologies are developed.

Bryant, Vaughn (Texas A & M University)

[126] *Coprolite Analysis: The Early Years*

Volney Jones was one of the first to examine coprolites found in Eastern Kentucky caves. By today's standards, his technique was primitive, but it did provide information about early human diets. During the mid-1950s Eric Callen pioneered the study of coprolites when he looked at coprolites from the site of Huaca Prieta de Chicama in the coastal region of Peru. Later, in the early 1960s Callen worked in Mexico with Richard MacNeish at Tehuacan. Callen worked in isolation at McGill University in Canada where he was little appreciated for his coprolite work. By 1970 he joined Richard MacNeish in Ayacucho, Peru for the first major coprolite study in South America but died there unexpectedly of a heart attack. After his death others refined Callen's techniques leading to a slow expansion of coprolite analysis from different areas new ways to sample and analyze coprolite contents. Soon, studies included pollen, phytoliths, plant microfossil, faunal and insect remains as part of the analysis. Those studies advanced our knowledge of diets and laid the groundwork for the future of the discipline, which now includes not only the basic studies but also additional searches for isotopes, DNA, steroids, amino acids, parasites, and more.

[190] *Producing Community and Communal Production: Examining Evidence for Collective Practices at Complex B, Cerro de la Virgen, Oaxaca, Mexico*

Recent research in the lower Río Verde Valley of Pacific coastal Oaxaca, Mexico has indicated that, during the Terminal Formative Period (150 BC—AD 250), public buildings were loci of communal practices such as feasting, collective labor, cemetery burial, and object caching. Idiosyncrasies in these practices among Terminal Formative sites in the valley suggest that political authority and community identity was constituted on the local level. While the best evidence for these practices comes from ceremonial features, recent research at the secondary center of Cerro de la Virgen suggests that public buildings were also the setting for economic production. This poster examines evidence from Complex B, a public building located in the ceremonial center at Cerro de la Virgen. Research conducted in 2016 indicates that Complex B was the location of a "masonry workshop," where residents produced large, faced granite stones to be used in building foundations and terrace walls. The complex also exhibits evidence for mortuary ceremonialism and the use, maintenance, and discard of obsidian prismatic blades and groundstone axes. Overall, the evidence from Complex B suggests that the communal practices that defined local communities extended beyond the ceremonial to include those that were economic in nature.

Bubp, Rebecca**[81]** *Put What? in Your Pipe and Smoke It*

Holly Bend, a prolific and successful early 19th century plantation owned by Robert Davidson in Mecklenburg County, North Carolina has seen multiple excavations and research over the past several years. In particular, a collection of ceramic tobacco pipe fragments that have been excavated are analyzed to better understand the local smoking culture. Several methods are used, including X-ray fluorescence spectrometer analysis to determine local sourcing of the ceramic elements, residue analysis providing plant and material content of the pipe fragments, and a pipe typology identification. Residue analysis yields late 18th and early 19th century plant and material species associated with smoking and plantation life. Pipe typology identification provides the stylistic and economic elements attributed to smoking cultures.

Early medieval Britain witnessed dramatic changes to the socio-cultural landscape due to the withdrawal of Roman authority, climatic change, and the arrival of migrants from the continent and from different regions of Britain. The analytical and scientific analysis of the burial record, from a landscape perspective, allows an investigation of key questions related to the scope and nature of this migration, the development of social identity, and how portions of Britain expanded from small polities into a series of large and powerful kingdoms ruled by dynastic lineages. Northumbria was one of the largest kingdoms of early medieval Britain and at its greatest extent incorporated modern-day lowland Scotland and northern England. The Leverhulme Trust-funded People and Place: The making of the kingdom of Northumbria 300–800 CE project is undertaking a full reassessment of all known funerary evidence from the kingdom. The project is combining scientific assessments of skeletal and artefactual evidence, archival research, and spatial analysis in a multi-scalar GIS to refine chronologies, characterize communities, and investigate the results from a landscape perspective. This paper presents the preliminary findings of the project and how these results are reshaping our understanding of the formative processes in this period.

Buck, Paul (Nevada State College/Desert Research Institute), Sachiko Sakai (CSU Long Beach) and Cheryl Collins (Desert Research Institute)**[164]** *Prehistoric Population Aggregation of the Mt. Trumbull, AZ area*

More than 20 years ago Margaret Lyneis published a thorough review of the Virgin Anasazi, summarizing what was known at the time about chronology, settlement, subsistence, spatial aggregation, exchange, and other topics. Her summary raised a number of key issues needing resolution. Among these was the nature of aggregation in the Plateau area of the Virgin Anasazi. She noted, despite evidence from other places in the Southwest of increasing residential aggregation in PII, there seemed to be little evidence of this from the Mt Trumbull area. In this paper, we present evidence from two sites (Zip Code and Zip Code 2) suggesting a pre-aggregation phase in BMIII or PI times. These sites are interesting because, although they are quite large, extensive sites, they appear to be early in age because pottery is almost entirely unpainted and non-corrugated, projectile point styles also seem to pre-date PII, and radiocarbon and OSL dates suggest a BMIII or PI age. Other large sites at Mt Trumbull appear much more aggregated than the Zip Code sites, and have been identified as PII based on pottery styles, radiocarbon and OSL dates. It is likely populations were increasing and more densely clustering together in PII.

Buck, Rex**[253]** *Responsibilities to the Ancient One*

The tribes and bands of the Columbia Plateau have an inherent responsibility under our religious beliefs and practices to care for the ancestors buried within our homeland. The Confederated Tribes of the Colville Reservation, the Confederated Tribes of the Umatilla Indian Reservation, the Confederated Tribes and Bands of the Yakama Nation, the Nez Perce Tribe, and the Wanapum Band of Priest Rapids (Claimant Tribes) have stood by our knowledge and traditions which told us the Ancient One is our Ancestor. Annual ceremonies with the Ancient One ensured he knew he was not forgotten. The practice of guaranteeing the ancestors return to the earth and continued journey is an integral part of Plateau culture and tradition. In accordance with our spiritual and cultural practices we work together to achieve repatriation goals.

[322] *Discussant***[253]** *Chair***Buckley, Brendan (Lamont-Doherty Earth Observatory), Rosanne D'Arrigo (Columbia University), Caroline Ummenhofer (Woods Hole Oceanographic Institute), Michael Griffiths (William Paterson University) and Kyle Hansen (Columbia University)****[213]** *Climate Change (Global and SE Asia)*

We have developed millennial length reconstructions of regional hydroclimate using multiple collections of tree cores from throughout Southeast Asia. Several published records of seasonal hydroclimate from Vietnamese cypress represent the most robust and well-replicated tree ring records from the global tropics, and allow for detailed analyses of the regional hydroclimate for multiple seasons. We demonstrate zonal changes in the mean climate over the past millennium with strong linkages to the El Niño-Southern Oscillation phenomenon and the equatorial Pacific Ocean, with a high degree of decadal scale variability. We are actively pursuing improvements in the metrics used for climate reconstruction through ecophysiological measurements from rare Southeast Asian conifer species, such as Blue Light Intensity as a proxy for lignin content, which is strongly correlated with seasonal rainfall. While tree rings yield annual to subannual resolution, recent development of speleothem records add greater temporal depth over the region. This information, taken collectively, can be used to explore ecosystems health across mainland Southeast Asia in the face of a warming climate, and to analyze the arc of human development under dynamical changes of the regional climate over the recent Holocene.

Kennett (The Pennsylvania State University)**[184]** *Bayesian 14C Chronology of Tlajinga, Teotihuacan Compounds 17 & 18*

A high-resolution chronology of two residential compounds (17:S3E1, 18:S3E1) recently excavated in the Tlajinga district of Teotihuacan has been developed using high-precision AMS 14C dating and artifact seriation datasets. The Tlajinga district is located along the southern Street of the Dead and was a possible entrance for migrants and visitors to the densely populated urban center of Teotihuacan during the Classic Period. Ceramic evidence suggests this district was occupied during the height of the city from the Early Tlamimilolpa period (A.D. 170–250) until the collapse of the city in the Metepec period (A.D. 550–650). With over 30 14C dates with measurement errors below ± 25 14C yr from both human bone and charcoal specimens, Tlajinga is now one of the most dated districts at Teotihuacan. Combining high precision dating with ceramic evidence and utilizing the Oxcal Bayesian framework, this project explores the rise and decline of Teotihuacan's southern neighborhoods providing insights for apartment compound construction events and population dynamics during the apogee of the city's occupation.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Buckley, Michael and Muxin Gu (University of Manchester)**[43]** *Machine Learning Species Identification with ZooMS Collagen Fingerprinting*

The creation of a robust method of species identification using collagen fingerprinting, also known as ZooMS (Zooarchaeology by Mass Spectrometry) has been useful for objectively defining the composition of the fragmentary component of archaeological assemblages. The method usually works through the measurements of the sizes of collagen peptides following enzymatic digestion, which yield a fingerprint that can be genus or even species-specific. However, even these peptide biomarkers have been determined with a level of subjectivity, largely influenced by those most peaks that are commonly observed. In some taxa, particularly the domesticates, sequence data can be used to confirm this variation but ZooMS is being increasingly applied to a greater range of wild taxa. In the absence of sequence information, peptide biomarkers are proposed through observations from reference material, but often with less confidence. Here we apply machine learning to our assemblage of >10,000 Pin Hole Cave (Creswell Crags, UK) fragmentary Late Pleistocene microfaunal remains, demonstrating that an objective manner of biomarker determination can be achieved which builds upon those already determined manually. Most importantly, machine learning approaches appear able to rapidly identify not only known species but can reveal taxa beyond the expected, widening our knowledge of a faunal assemblage.

Budd, Tommy (Arizona State University)**[185]** *Biological Kinship and Cemetery Organization in Eastern Zhou Period China*

The social significance of large kinship structures such as clans and lineages has been demonstrated throughout Chinese history, and kinship has in part determined social ties and participation in various social activities. Clan emblems appear on artifacts from as early as the Shang Dynasty, and kinship remains an important element of social identities in modern China. In relation to mortuary practices, kinship identities may affect factors such as mortuary assemblages and burial location. This study focuses on biological kinship as it relates to burial location in an Eastern Zhou Period (771–256 BCE) cemetery. This study utilizes a sample of 45 individuals from the site of Tiancheng in Xinzheng, Henan Province, China. Cervical odontometric data were collected, and measures of biological distance were calculated to examine the relationship between geographical and biological distances among the individuals interred across the site to address the question of whether burial location was influenced by biological relationships. Results are presented, and their significance with regard to an understanding of ancient Chinese kinship and burial practices is discussed.

Bueno, Marilyn (California State University, Los Angeles)**[134]** *The Role of Rockshelters among the Lowland Maya*

Because of Maya religion's heavy focus on the sacred Earth, subterranean spaces tend to be seen as sacred landmarks. Caves in particular have been shown to be the most promising context for the archaeological study of Maya religion (Brady and Prufer 2005). Rockshelters, however, have received less attention and appear to have identities and meanings that are negotiable across the lowlands. Recent rockshelter excavations have uncovered skeletal remains (Bonor 1995; Glassman et al. 2005; Saul et al. 2005), suggesting that some of these features may possess the only true Pre-Columbian cemeteries in the Maya lowlands. As such, rockshelters are non-normal burial locations. Discussions thus far have not engaged Maya attitudes towards death and the afterlife in attempts to explain why such cemeteries were formed. As research on rockshelters move forward, it is imperative to establish a Maya cosmological model that incorporates religious beliefs. This paper will address such questions.

Buffington, Abigail (The Ohio State University) and Smiti Nathan (New York University)**[121]** *Transformative Trees: The Social and Ecological Impact of Woody Taxa in Prehistoric Southern Arabia*

While trees are often integral to the ecology of certain landscapes, the propagation of specific woody taxa can also reflect significant social aspects imbued on anthropogenic spaces. Following the seminal work of Rita Wright, we are utilizing a comparative approach in this paper. We examined woody vegetation management by early food producing societies in two regions of southern Arabia: southeastern Arabia (modern-day northern Oman) and southwestern Arabia (modern-day southeast Yemen). Despite their nearby geographic position, the trajectory of food production is distinct in these two regions. Nonetheless, both agrarian landscapes are impacted and developed by certain woody taxa. Using a niche construction framework, the concept of a "keystone species" is reenvisioned by utilizing archaeological, anthracological, and ethnographic datasets. These proxies enable us to investigate the social and ecological impact of the date palm (*Phoenix dactylifera* L.) in southeastern Arabia and the fig tree (*Ficus* spp. L.) in southwestern Arabia. This paper explores the modern social value of each tree type, the role of these woods in the agrarian history of each respective region, and how the southern Arabian landscape has been shaped and modified by association to these trees.

Buikstra, Jane E. (Arizona State University) and Jason King (Center for American Archeology)**[215]** *The Missing Years: Continuity and/or Change in Woodland Funerals in the LIV*

Lynne Goldstein has significantly advanced knowledge of ancient peoples in many theoretical and empirical domains, including her seminal studies of ancient cemeteries, especially their spatial organization and interpretation through the judicious use of ethnographic sources, critically evaluated. The senior author has had the pleasure of collaborating with Dr. Goldstein in several of these ventures, some under challenging conditions of heat and cold, which were bearable only due to Lynne's remarkable energy and good humor.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

In this paper, we address a long intractable issue for Lower Illinois Valley (LIV) mortuary archaeology, in a region that anchored Dr. Goldstein's long and productive career. While Middle Woodland (Hopewell) and late Late Woodland mounded tumuli are well represented in the archaeological record, not so for cemeteries from the several intervening centuries. Relying on data from the archaeological record, primarily radiocarbon dates, variation in cemetery structure, mound location, and material culture, we address this issue. Possible explanations range from the simple, depopulation and regional cultural discontinuity, to nuanced, complex interpretations of funerary activities and interment facilities from throughout the Middle and Late Woodland periods. Our perspectives are also enhanced through the judicious use of ethnographic and ethnohistoric sources.

[103] *Raising a Rafter: A Cost-Benefit Analysis of Ancestral Pueblo Intensification of Turkey Husbandry in the Northern Rio Grande Region, New Mexico*

Zooarchaeological research in the Northern Rio Grande shows that turkey husbandry became increasingly important to the Ancestral Pueblo during the Classic Period (AD 1350–1600). During this time, immigrant and local communities coalesced into increasingly larger villages and towns, with abundant evidence for turkey husbandry. Turkeys served as a critical resource for both subsistence and ritual uses. Yet, it remains uncertain at what scale (household, sub-community, or community) turkey management was organized. We develop cost-benefit models for the intensification of turkey husbandry, incorporating ethnographic and archaeological data with research into animal sciences on turkey raising. These socio-ecological models are then tested against the archaeological record of Sapa'owingeh (LA306), one of the largest Ancestral Pueblo communities in the region.

Burgio-Ericson, Klinton (University of North Carolina-Chapel Hill)

[139] *Revisiting the Rubber-Sided Museum: A Case Study in Collections-Based Research*

Archaeological repositories abound in significant but overlooked collections. This paper presents a case study based in one such collection: the Hendricks-Hodge Expedition to the ancestral Zuni pueblo of Hawikku, NM (1917–1923), which accumulated 25,000 artifacts now in the NMAI, many remaining unstudied. Drawing on current interdisciplinary research into its seventeenth-century Spanish mission, this paper considers challenges of extracting new interpretations from older collections. Research revisiting underutilized collections proffers opportunity for new questions, expanding insight, and refining disciplinary history. In particular, Hawikku's mission remains and primary sources indicate its residence was a working and living space for Native laborers alongside Spanish Franciscans, comprising an everyday arena of cultural negotiation. Revisiting overlooked collections also furnishes occasion for collaboration with source communities, often excluded from the original research. Multi-level engagement with Zuni Pueblo informs this research project, increasing its relevance to community concerns, and enriching Smithsonian collections data for future use. When financier Harmon Hendricks wrote in 1918 that the Museum of the American Indian should build expanding rubber walls to contain the large collections from Hawikku, he exposed the expedition's acquisitive motive but also presaged their rich and ongoing potential for research a century later.

Burgis, Harley (Indiana University of Pennsylvania) and Lara Homsey-Messer (Indiana University of Pennsylvania)

[52] *Using Microartifacts to Investigate Prehistoric Cooking Methods at the Archaeological Site of Dust Cave*

Microartifacts—generally considered to be artifacts measuring less than 6.35 mm (¼ inch)—have traditionally received little attention in North American archaeology. We argue that microartifacts are not simply smaller versions of larger artifacts, but rather provide different and complimentary data. This study investigates microartifacts from the archaeological site of Dust Cave (10,650–3,600 BCE), located in northwest Alabama, in order to better understand prehistoric diet and cooking technologies. Our goals are twofold. First, we examine microartifacts from four different feature morphologies (which vary in shape and size) to see if the micro debris reflects differences in what was cooked and/or how foods were cooked over time. We then integrate the microartifact data with previously published faunal and experimental results. Second, we advocate for taking a more robust approach to microartifact data analyses to include ubiquity and diversity measures in addition to the more commonly used density measures of comparison. Preliminary results suggest that while some features were multipurpose in function, others were more specialized for processing particular kinds of foods using cooking methods ranging from broiling, to steaming, to parching. Finally, cooking technologies appear to remain surprisingly homogenous through time until the Middle Archaic.

[37] *Understanding Maya Rituals of Power in the Candelaria Caves, Guatemala: A View from the Polychrome Ceramics of the Early Classic*

The Candelaria Caves System, with its approximately 18 km of passageways, forms the second largest underground karstic complex in the Maya Area. As a result of their location at the highland-lowland transition and close to Great Western Trade Route, it was an important pilgrimage center for people of different cultural and geographical regions. The Early Classic period (A.D. 250–500) marked the introduction of polychrome ceramics, mainly Dos Arroyos-group ceramics, which played an important role in ritual activity in practically all caves used during the same time. Ceramic analysis and its relationship with context have allowed scholars to understand certain patterns in rituals related to power and prestige as expressed through the use of specific vessels. On one hand, these ceramics are related to public rituals that took place in great chambers close to the cave entrance that would have been visible to an audience. On the other hand, although their production was standardized, there are at least two distinct ceramic traditions or

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

proveniences. In this paper, the authors present some conclusions related to these polychrome ceramics and their significance in regional ideology and interregional exchange.

[37] *Chair*

Burham, Melissa (University of Arizona)

[11] *Minor Temple Groups, Water Management and Community Formation at Ceibal, Guatemala*

Recent investigations of reservoirs associated with minor temple groups at Ceibal, Guatemala shed light on the role of water management in intermediate-level sociopolitical organization in ancient Maya society. Over the course of the Late and Terminal Preclassic periods (ca. 350BC-AD200), as Ceibal grew into an urban center, minor temples were built at regular intervals around the site core. These temples were the centers of local communities that were integrated primarily through ritual practices. Many temple groups are associated with reservoirs or other sources of water. As many scholars have noted, reservoirs would have been important locations for day-to-day interactions, and crucial to supporting local populations. In this way, water management was also central to local community formation and organization. This study examines water management at the community level by focusing on 1) excavation data and field observations of five reservoirs; 2) geospatial analyses that explore the distribution of reservoirs in relation to residential zoning patterns around minor temples; and 3) analysis of pollen in soils collected from the reservoirs. Overall, this research suggests that water catchments were managed at the household and local community level, and supports decentralized models of social and political organization in ancient Maya society.

Burke, Adam

[244] *Reevaluating Florida's Chert Quarry Clusters: An Update on Sampling Strategies, Methodological Approaches, and New Results from Northwest Florida*

This paper presents preliminary results from an ongoing study of Coastal Plains chert from Florida. Past research has demonstrated that Florida cherts can be coarsely differentiated into various quarry clusters on the basis of microfossil inclusions, and more recent research has suggested that geochemically characterizing these cherts may further improve provenance determinations. New methodological approaches include using a combination of microfossil analysis, NAA, and LA-ICP-MS to provide accurate qualitative and quantitative descriptions for Florida cherts. Additionally, the sampling and description of previously unstudied prehistoric quarry sites is improving our understanding of the geochemical and microscopic variability inherent in Florida cherts. By intensively sampling both terrestrial and inundated sites on a cluster-by-cluster basis, our characterization resolution will be significantly enhanced on regional and local levels, and new conclusions can be drawn about past human mobility within an improved geographic and temporal framework. Current advances in chert provenance studies will form the core of future research on Paleoindian lithic technological organization in Florida, and using modern analytical techniques on new and existing collections will greatly benefit this research.

[147] *To Eat, Discard, or Venerate: Faunal Remains as Proxy for Human Behaviors in Lowland Maya Terminal or Problematic Deposits*

Deciphering middens, feasting, ritual, or terminal deposits in the Maya world requires an evaluation of faunal remains. Maya archaeologists have been and continue to evaluate other artifact classes, but often simply offer NISP values for skeletal elements recovered from these deposits. To further understand their archaeological significance, we analyzed faunal materials from deposits at the sites of Baking Pot and Xunantunich in the Upper Belize River Valley. We identified the species, bone elements, bone artifacts, taphonomic signatures, and quantitative ratios recovered to test whether a deposit can be identified as a midden, part of a feasting ritual, terminal ritual, or other rituals significant to the Maya. Our analyses allow us to begin building a system for using faunal remains as a proxy for interpreting the significance of these deposits. In this paper, we present our results and hope to open the conversation for future evaluations of faunal remains in similar deposits.

[335] *Continuity and Change: What the Late Intermediate Period at Pisanay Can Tell Us About Middle Horizon Arequipa*

Data from excavations at the site of Pisanay, a Late Intermediate Period "sanctuary" with some remains of Early Intermediate Period ceremonialism, can be used to frame a sort of "before and after" picture of Middle Horizon developments in the Sihuas Valley of Arequipa and the changing nature of cultural ties to the region. Most striking of these is the shifting pattern of materials ties impacted by the intervening influence of the Wari cultural horizon, seen in the ceramics and textiles associated with funerary sites. At the same time, there is evidence for in situ development of funerary and other ceremonial traditions, only minimally influenced by the Wari culture.

Burks, Jarrod (Ohio Valley Archaeology, Inc.)

[190] *New Magnetic Gradient Survey Results from Two Intermediate-Sized Earthwork Clusters in Southern Ohio: Junction Group and Steel Earthworks*

Ohio is home to hundreds of Woodland period (ca. 300 BC- AD 400) earthwork sites. Most contain mounds and ditch-and-embankment enclosures in geometric shapes. Site size and complexity varies widely, from small, lone circles (often surrounding a mound) in the Early Woodland to the mega-large Middle Woodland Newark Earthworks. How and why earthwork construction moved from small to massive are enduring questions yet to be solved. Recent magnetic survey in southern Ohio at two sites of moderate size, Junction Group (33Ro28) and Steel Earthworks (33Ro62), provides mounting evidence for an intermediate level of size and complexity. Both sites contain a range of geometric shapes, including some that are unique. Enclosures are clustered in their spacing and orientation, suggesting growth through time. And at least three kinds of architecture were in use: traditional ditch-and-embankment enclosures of varying size, small enclosures demarcated by narrow trenches (perhaps without embankments), and circles of posts lacking ditches or embankments. Earthwork sites of intermediate size provide a link in time, complexity, and perhaps space between the small sites of the Early Woodland and the immense complexes of the Middle Woodland. They also signal a change in the organization of people and activities on the landscape.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Burnett, Paul (SWCA Environmental Consultants)**[103]** *Bears Ears Archaeological Probability Models*

Currently encompassing over 1,300,000 acres, Bears Ears is notable for abundant cultural resources and is in a renewed spotlight following the 2017 recommendation by the Interior Secretary to reduce its acreage. Archaeological probability models were recently developed for lands within the jurisdiction of the Bureau of Land Management, Monticello Field Office, which encompasses the Bears Ears National Monument. Regardless of the outcomes of that process, these models were developed to help land managers make well-informed decisions and implement its multiple use mission, including managing for recreation, grazing, and oil and gas. Modeled site types include up to four prehistoric site types and two historic site types. Given available site data, certain site types are not modeled for all areas. Stepwise logistic regression is used to combine significant environmental variables to produce probability maps with values ranging from 0 (low) to 1 (high). Certain site types are modeled more effectively than others. For example, prehistoric sheltered and rock art sites are more precisely modeled than open-air sites. The site type models were also combined into a composite sensitivity model, which shows that high and moderate probability areas cover much of the National Monument.

Burnette, Dorian (University of Memphis), David Dye (University of Memphis) and Arleen Hill (University of Memphis)**[291]** *Stephen Williams and The Vacant Quarter Phenomenon*

Stephen Williams proposed the idea of a Vacant Quarter based on the abandonment of numerous Mississippian polities throughout much of the Midsouth and Midwest. The unprecedented, large-scale depopulation of an approximately 130,000 square kilometer area has been linked with population movements as well as interpolity conflict. By taking a dendroclimatological approach we evaluate the role of climate change in this process, while also being cognizant of social processes. We postulate a staggered process of depopulation with distinct polity histories resulting from both climatic and social variables characterized by numerous, small-scale abandonments and regional population movements.

Burnette-Egan, Polly (Cornell University)**[189]** *Zooarchaeology and Spatial Analysis at Tepe Farukhabad: New Life for Legacy Data*

This poster presentation presents a reanalysis of legacy faunal material, collected by Henry Wright and the zooarchaeological analysis conducted by Richard Redding, during the 1968 excavation on the Deh Luran Plains in southeastern Iran at the 4th-millennium site Tepe Farukhabad. It behooves all researchers to give more attention to the existing data sets already collected and available for research. In that vein, this study re-evaluates the faunal data sets at Tepe Farukhabad and looks for patterns in architectural spaces during the Uruk period at Tepe Farukhabad. The Uruk Phases are isolated for the purpose of this study, as this is a period of major changes in social and political complexity. These spatial data are coded and the faunal material is organized by these zones, then is sorted by taxa, element, side, and the relative status of species and meat-cut to illuminate the lifeways of the people who lived and worked in this early town on the Deh Luran Plain. The research situates the zooarchaeological findings at Urukian Deh Luran in the wider context of the Uruk phenomenon in southern Mesopotamia

Burnor, Luke and Claudia Garcia-Des Lauriers (California Polytechnic University Pomona)**[118]** *Los Horcones, Offering 1: 3D Imaging, Analysis, and Reconstruction*

The three dimensional imaging of artifacts discovered at the Los Horcones site in Southern Chiapas Mexico has enabled archaeologists to approach artifacts in a brand new way. With the use of a 3D scanner hardware and 3D program software, objects and features of various sizes are scanned to create a proportional and scale digital version. The scanning of artifacts allows for minimal handling of the objects decreasing the likelihood of wear, damage, deterioration, and contamination, effectively lending to conservation. This technology facilitates a full range of examination capabilities in a manipulable high resolution digital format that is easily transferrable and portable. In addition, digital formats enhance teaching pedagogy and public outreach. The potential of 3D scanning promotes a new kind of research that provides a practical interactive interface to websites, e-books, and research papers that contributes an entirely new dimension to responsive learning. Furthermore, in conjunction with 3D printing, the data can be physically reproduced inexpensively and fairly quickly to provide a tangible object that can be used for a variety of research, educational, and demonstrative purposes.

Burns, David, Luisa Aebersold (UT Austin), Fred Valdez (UT Austin), Samantha Krause (UT Austin) and Anastasia Kotsoglou (Cornell University)**[243]** *Excavations at Two New Operations at Colha*

Colha, an ancient Maya site located in northern Belize, has undergone archaeological research interests since the 1970s. Previous investigations demonstrate a long occupational history at the site that spans from the Late Archaic (ca. 3400 BC) to the Early Postclassic (AD 1200). Building upon previous research, a primary goal of the 2017 season was to explore the transition between the Archaic (3400 BC) and Preclassic (1000 BC) periods while focusing on technological and social continuity. This paper reports on the general excavation strategies, results, and avenues of future research pertaining to two main excavation areas. The 4000 sector of Colha, located within the larger settlement zone of the site, focused on defining the Archaic-Preclassic transition. While excavations within the 2000 sector, situated within the main site plaza, concentrated on investigating an Early Middle Preclassic village that was partially exposed in previous seasons. Notable artifact assemblages and features include burin spalls and associated shells, an early hearth, a ceramic cache, and diagnostic lithic tools. The data from these excavations, as well as associated ongoing analyses, work towards the goal of developing a more holistic, diachronic understanding of the cultural history of the site.

Burrell, Jennifer (University at Albany SUNY)**[109]** *Ethnographic Perspectives on Debt & Political Economy: Contributions to a Conversation on Graeber*

This paper contributes contemporary ethnological perspectives and a case study on debt, moral economies, financial citizenship and human rights to a conversation among and between archeologists considering these perspectives in Mesoamerica.

Burrillo, R. E. (SWCA Environmental Consultants)**[39]** *The Mikesboy Site Complex: Historic Archaeology and the Utes of Bears Ears*

In 2016, SWCA Environmental Consultants conducted a limited Class II cultural resource inventory in the Bears Ears area in order to test a predictive model generated on behalf of the Monticello Field Office of the BLM for a Class I report. A historic stone-and-timber sheep corral with nearby rock inscriptions was located and mapped on the Butler Wash side of Comb Ridge during these efforts, and determined to be a historic Ute site with Navajo cultural elements. Subsequent revisits to the site revealed that it was part of a much larger site complex, including a second sheep corral, a temporary camp and wood-cutting area, and the remains of a hogan with badly-weathered inscriptions on an adjacent rock face that included the name "Mikesboy." This talk presents the results of research on Mikesboy and historic archaeology of the Utes of Bears Ears.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Burt, Nicole (Cleveland Museum of Natural History)**[205]** *Public Perception of the Ethics of Physical Anthropology*

The history of physical anthropology contains figures and movements that improperly used science to hurt or diminish other groups or was utilized by such movements after publication. This haunted past can manifest as a bumpy future for modern practitioners working under a shadow of racial typology, eugenics, and other horrific applications of their science. Anthropologists continue to be haunted where our peers in anatomy or biology are not, due in part, to our theoretical approach as a biocultural science, which used both culture and biology as a weapon. Scholars have begun to confront the past in student training and working with research participants (Weiss, 2006; Marks, 2017). In this talk, I approach the subject as a museum curator, who is engaging with the public about research and the science of physical anthropology. The encounters range from very supportive to hostile. The public perception of the ethics of the field can be a huge hurdle in engaging and educating. Physical anthropologists need to communicate the modern ethics of the field effectively while remembering and acknowledging that the history of the field cannot and should not be ignored. This presentation focuses on what has and has not worked for public engagement.

Burton, Margie [172] see Levy, Thomas E.

Burt, Amanda (Indiana University)**[212]** *The Diet of Dogs: Dental Microwear Texture Analysis to Interpret the Human-Canine Connection in Prehistoric North America*

The archaeology of dog-keeping by indigenous Native North Americans enriches our understanding of ways people conceptualized their environments in the past. Finding new ways to investigate this topic contributes to broader anthropological knowledge about relationships among humans and the natural world. In this paper, I present exploratory research to examine ways that domestic dogs were maintained and the assumed value of dogs among Native Americans who lived in the Ohio River valley, in Plains Villages, and in the foothills of the Rockies during the Late Prehistoric period. I employ Dental Microwear Texture Analysis (DMTA) to examine human-canine connections and dog feeding/provisioning strategies. Analyzing the diets of domestic dogs (*Canis familiaris*) provides a proxy for human intentions to sustain canine companions. Baseline data from members of the Family Canidae provides comparative microwear textures and a more contextualized insight into the dietary behavior of dogs that lived with humans in geographically and culturally distinct areas of North America.

[212] *Chair*

Bury, Rick [214] see Ryan, Christopher

Bush, Dominic**[7]** *Animal Use in the Last Maya Kingdom*

The archaeological site of Flores is a small, lacustrine island located in Northern Guatemala. Despite lacking in physical size, the island has a lengthy occupational history, dating from the Preclassic Maya period through the present. Flores, which became a provincial capital during the late Postclassic, was able to resist Spanish rule until 1697 AD, making it the last Maya holdout. Given this distinction, the island has been under much archaeological scrutiny and the subject of many publications. However, there has yet to be a thorough, diachronic study of animal use at Flores, and how the site compares to other Maya lowland settlements. Due to its proximity to freshwater, Flores was in an area of great floral and faunal resource abundance. This study aims to not only taxonomically identify faunal remains recovered on Flores, but also searches for patterns possibly tied to shifts in the social, economic, and political landscapes, especially as it relates to the Classic Maya "Collapse" and the arrival of the Spanish. By understanding the history of animal exploitation and past ecological conditions, part of the answer to why Flores outlasted its contemporaries in regards to resistance to the Spanish is teased out.

Bussiere, Lauren (Texas Archeological Research Laboratory, University of Texas at Austin) and Nadya Prociuk (University of Texas at Austin)**[21]** *Northern Gulf Coast Trade in the Mesoamerican Postclassic: The Evidence from Brownsville*

The Postclassic period (ca. 1000–1520 CE) in the coastal Gulf of Mexico was characterized by an increase in trade and interaction between groups moving along the coastline and larger inland polities such as the Aztec empire. While exchange between Mesoamerican groups is increasingly well documented, the extent of interaction between people in Mesoamerica and those living further northward is poorly understood. Evidence of the nature and strength of cultural ties between the Huasteca of the Gulf coastal lowlands and more northerly coastal peoples exists in several collections from south Texas sites, namely those of the Brownsville Complex in the Rio Grande Delta. Although they appear superficially to be a marginal culture isolated from the larger interaction spheres of both the Aztec tributary polities to the south and the Toyah and Rockport cultures of Texas, the people of the Brownsville Complex may in fact represent the northern periphery of Mesoamerican interaction. This paper reviews the evidence for Brownsville Complex connections to the Huasteca and other coastal peoples and characterizes the relationship between these groups within the greater context of Postclassic interaction along the Gulf Coast and beyond.

Bustamante, José (PRALC—Universidad del Valle de Guatemala)**[337]** *Early Political Changes in La Corona: Architecture and Function in the Palace Complex*

Over the past decade, the La Corona Archeological Project has been investigating the site's palace complex, focusing primarily on its final construction phases. The focus is common in lowland Maya archaeology because of the relative ease of conducting extensive excavations on terminal phase architecture. However, at La Corona, major tunneling efforts have also explored the earlier architectural phases of the palace. As a result, the project has identified three construction phases that date to the Early Classic, two of which date to before the beginning of the site's long-lived political alliance with the Kaanul kingdom. In this paper, we discuss the architectural patterns of an Early Classic palace in the Maya lowlands as well as demonstrate how this palace was modified after the La Corona rulers became Kaanul's vassals.

Büster, Lindsey (University of Bradford, UK)**[29]** *Death, Dying and Horlicks: Structured Deposits as Problematic Stuff in European Prehistory*

Personal possessions are inherent in the construction and maintenance of social identity. In some prehistoric cosmologies, artefacts may even have been integral to an individual's personhood. As such, they can become culturally and ritually charged objects within a community. What happens then to this social remnant of an individual when they die? Objects that are on the one hand redundant but on the other too problematic to be casually discarded. In the increasingly materialist and consumerist societies of the modern west, the 'stuff' we leave behind can be difficult to deal with. This is demonstrated, for example, in the establishment of dedicated 'house clearance' firms, while in other cases it becomes the focus of family feuds. In prehistoric societies, when the number of objects associated with specific individuals was far fewer, it is likely that such items carried even greater symbolic charge and that the problematic nature of the material residue of the deceased was further amplified. Can we detect these tensions

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

archaeologically? This paper argues that the 'structured deposits' of European prehistory represent the 'problematic stuff' of the past, and can provide greater insights into individual and communal experiences of death, dying and bereavement among past societies.

[202] *Retracing Reconstruction: America's Second Founding in Archaeological Perspective*

The National Park Service's release of a theme study on Reconstruction and the creation of Reconstruction National Monument in Beaufort, SC, mark the agency's commitment to scholarly and public engagement with the complex and continuing legacies of the post-Civil War period. The National Capital Region and the Organization of American Historians are conducting a historic resource study of Reconstruction sites in the region, including urban sites in Washington, DC, and small town and rural sites in parts of Virginia, West Virginia, and Maryland. This paper will discuss how spatial and archaeological perspectives on Reconstruction can enrich historical and political narratives. First, previous archaeological excavations at National Park Service units have uncovered insights into the conditions and challenges of daily life for rural and urban African Americans that can now be considered comparatively as part of a regional understanding of Reconstruction. Second, mapping the distribution of preserved and no longer extant historic and archaeological sites can help visualize regional trends and differences in African American community and institution building. It can also build connections to the present by revealing how urban development and demographic trends correspond with differences in site preservation across the region.

Bybee, Alexandra

[88] *Historical and Bioarchaeological Investigation of the Evansville State Hospital Cemetery (12VG598), Vanderburgh County, Indiana*

In 2014, Cultural Resource Analysts, Inc., conducted the archaeological relocation of graves from the Evansville State Hospital Cemetery. At the request of Beam, Longest, and Neff, LLC, on behalf of the City of Evansville and the Indiana Department of Transportation, the graves of 31 individuals who were patients at the reform-era hospital between circa 1890 and 1928 were relocated in advance of construction of a pedestrian bridge. The population consisted primarily of young to middle adults, with roughly even numbers of males and females. Numerous skeletal and dental pathologies were identified (e.g., osteoarthritis, degenerative joint disease, and healed bone breaks, along with dental caries, calculus, hypoplasias, and antemortem tooth loss). Other skeletal and dental pathologies that may have been associated with the admittance to or retention of a patient at the hospital were also identified, including deformities consistent with metabolic or other genetic issues. This paper provides a historical context for the treatment of mental health issues in the region during the nineteenth through early twentieth centuries, along with information about the health of the population and their treatment after death.

[105] *PEOPLE 3K (Paleoclimate and the Peopling of the Earth): Investigating Tipping Points Generated by the Climate-Human Demography-Institutional Nexus over the Last 3000 Years*

One of the least understood aspects of paleoscience is the interplay between climate, human demography, and how changes in population influence resource management strategies. With the goal of understanding such processes, we created the PEOPLE 3000 research network to study trade-offs inherent to the climate-human population-institutional adaptation system over the last 3000 years. We propose that strategies reducing variation in food production and institutions for protecting those strategies generate ever more complex socio-ecological systems (SES). The growth of complexity, accompanied by a loss in social and subsistence diversity, can result in major reorganizations due to external or internal changes that drive a SES across a critical threshold. We explore this proposition using case-studies from the Great Basin, northern Chile and western Argentina. We compare radiocarbon SPDs with records of palaeoecological change, and changes in the diversity of subsistence and social strategies. The results show that population increased from 2000 to 800 BP in all three locations, and populations declined and societies reorganized between 700–550 BP. Our analysis reveals possible trade-offs associated with simultaneous adaptation to population growth and climate change and provides a more informed position to understand relationships between social-ecological parameters and threshold changes in modern SES.

[293] *Macro- and Microbotanical Results from Select Archaeological Contexts in the Plaza of the Columns Complex, Teotihuacan, Mexico*

Paleoethnobotanical analyses provide significant information regarding past human behaviors, which include the selection, production, and consumption of plant resources, among others. This paper focuses on select archaeological contexts, domestic and ritual in nature, which have been investigated from a paleoethnobotanical perspective at the urban center of Teotihuacan, and more specifically in the area known as the Plaza of the Columns Complex. The recovery of macrobotanicals such as maize (*Zea mays*), amaranth (*Amaranthus* sp.), and tobacco (*Nicotiana* sp.), as well as starch grains belonging to chili peppers (*Capsicum* sp.) and manioc (*Manihot esculenta*) among others, indicates not only a wide range of plant taxa utilization, but also that the inhabitants of this particular sector of Teotihuacan had access to a variety of plants resources from both local and possibly

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

more distant landscapes. These new data will be briefly compared and contrasted to those obtained by previous investigations, in particular to the well-studied apartment compounds situated in different parts of the city.

Cagnato, Clarissa [337] see Ponce, Jocelyne

Cagney, Erin and Joe Dent (American University)

[239] *Of Palisades and Postmolds*

The fieldwork conducted in Tyler Bastian's 1969–1970 salvage trench at Biggs Ford revealed a unique window into two Late Woodland villages, a Montgomery Complex and a Keyser Complex. The post mold patterns observed in the initial analysis of the trench may indicate the footprints of both complexes. Linear post mold arcs and a ring of pits may be consistent with other known Montgomery Complex sites, namely the Winslow site in Montgomery County. Additionally, post mold patterns in the extreme eastern and western portions of Bastian's trench indicate possible palisade arcs, analyzed with CAD to reveal a consistency in spacing and diameter with at least three other Keyser Complex sites in Maryland. Since 2013, much more extensive fieldwork has been conducted, revealing the presence of more post molds at the site. This paper will utilize the site data collected from field sessions between 2013 and 2015 to further analyze the post molds and potentially determine the existence of patterns that can indicate the layout of both the Montgomery Complex Village and the Keyser Complex Village at Biggs Ford.

Cain, Tiffany (University of Pennsylvania)

[173] *Kept Out or Closed In? An Analysis of Civilian Fortification Strategies during the Maya Social War*

In this paper, I explore the ways in which albarradas, or the dry-laid enclosure walls ubiquitous to Yucatec Maya towns, can be manipulated to become defensive structures under the threat of attack. I discuss the results of a recent study that conducted a construction analysis on a series of wall features in the now unpopulated town of Tela—an auxiliary to and key commercial thoroughway for the burgeoning frontier hub of Tihosuco (since repopulated) during the 19th century. This town was located at the epicenter of the Maya Social War or Caste War of Yucatan (1847–1901). Preliminary archival exploration suggests that it was occupied as a stronghold for at least the first five years of the conflict. The transformation of everyday enclosure walls into blockades, both of roads and house lots, provide one line of evidence for thinking through the impact of this conflict on the daily lives of Tela's inhabitants. After detailing our team's findings, I link this practice back to the present with a brief discussion of the recent blockading of the major highway that passes through Tihosuco as a response to failures of Quintana Roo's state and municipal governments.

Cajigas, Rachel (University of Arizona)

[21] *The Early Agricultural Period at La Playa, Mexico, A Geoarchaeological Investigation*

La Playa (SON F:10:3), in Sonora, Mexico, has the remains of an irrigation canal system associated with the Early Agricultural period (2100 B.C.–A.D. 50), a period characterized by the development of agriculture in the southwest United States and northwest Mexico. Satellite imagery analysis and magnetic gradiometry surveys covering over 53,000 m² of the site, document almost 8,700 m² of agricultural fields, 15 km of irrigation canals, and over a dozen circular structures. Irrigation canals were excavated and examined for stratigraphic, textural, and hydraulic information. Finally, a dating strategy utilizing both AMS 14C on ecologically specific, short lived, semi-aquatic succinids and single grain Optically Stimulated Luminescence on canal sediments was used to constrain the timing of canal use. The environmental and geochronological data have been synthesized to gain an understanding of the changing depositional conditions on the La Playa floodplain throughout the Early Agricultural period. These data contribute to a comprehensive chronology of the archaeological site within the greater context of the origins of early agriculture in the Southwest U.S./Northwest Mexico region.

[34] *Marine Turtle Consumption: From Ancient Taboo to Conservation Management*

Remains of marine turtles occur regularly in the archaeological record. They provide insights into ancient subsistence and community practices. They also contain crucial information that can be used to create baselines for conservation. Their explanatory power is increased when the species exploited are identified. Here we describe an osteomorphological method which allows us to analyze fragmented postcranial elements of common Cheloniidae (*Caretta caretta* and *Chelonia mydas*) to species and reconstruct species-specific exploitation patterns. We focus on two case studies from the Eastern Mediterranean (Turkey and Lebanon) which demonstrate that humans were selective in which sea turtle species they exploited. These multi-period case studies, in combination with published information about marine turtle exploitation in the region, also indicate long discontinuities in the archaeological record, which may be related to food avoidance. Size and sex reconstruction point at differing capturing techniques. Results have interesting implications for understanding human-marine turtle interactions with deep-time perspective.

[33] *Preclassic Maya Ritual at Holtun, Guatemala: Analysis and Interpretation of the E-Group Architectural Compound*

Recent research in the Maya lowlands has shown that "E-Group" architectural complexes were intricately tied to the development of complex society during the Middle Preclassic period (900 BC—300 BC). First identified at the site of Uaxactun, Guatemala, E-Group complexes consist of a western radial platform and eastern range structure. For many years Maya archaeologists believed E-Groups functioned primarily as celestial observatories. However, recent data have shown E-groups were the locus of many activities, most importantly early ritual and religion. In this presentation we share the results of excavations in Group F at Holtun, or the "E-Group" ceremonial complex, from the 2015–2017 field seasons. Archaeological data suggest Group F served as a focus of ritual from the Middle Preclassic through Terminal Preclassic periods (800 BC—AD 300). In this presentation we discuss how finds from Group F, including monumental stucco masks, caches, burials, and the most extensive collection of Preclassic-period Maya graffiti, inform our knowledge of the development of complex society at Holtun, and offer insights into the basis of Preclassic Maya political power.

[199] *Revisiting Contact Interactions of the Keji'kewe'k L'nuk, or Recent People, and Europeans in the Mi'kma'ki*

The recent emergence of ontological applications in archaeological theory has developed the idea to "reject representationalism", where present archaeological taxonomic labeling comes into question. By adopting the "local" perspective of an indigenous group through the guise of "Amerindian perspectivism," archaeologists can integrate a holistic view of the Mi'kmaq pluriverse. Through perspectivist approaches of the ontological lens, the author will explore sensory worlds, and how sensory should be considered archaeological material. A proposal of investigating cultural landscapes during the Protohistoric Period (1500–1630), on intra and inter-site scales, not only illustrates continuity and change in land usage but also how sensory may perform as a deterrent or incentive in Mi'kmaq/European trade networks. Through examining the early fur trade during the Protohistoric Period via materiality, cultural landscape, and ethnohistoric documentation, archaeologists can interpret sensory worlds of cultural interactions through the perspective of the indigenous population.

[172] *Analytical Models for At-Risk Heritage Conservation and 3D GIS*

In the period 2011–2017, scholars from the University of California Merced and Cardiff University recorded the fragile earthen architecture of Çatalhöyük, Turkey employing cutting-edge conservation technologies to monitor the site and gather new data. Our goal was to model and analyze the site decay and plan conservation interventions. Tools and methods for this initiative include blending site monitoring data and digital documentation data from environmental data loggers, terrestrial laser scanning, micro unmanned aerial vehicles, ground photography, structure from motion, and thermal infrared imaging. Our workflow produced a comprehensive set of information that quantitatively describes the rate of decay of Çatalhöyük's buildings overtime and underpins potential causes. This paper discusses our recent effort to integrate our extensive corpus of digital information into a GIS for analyzing the state of preservation of the site. In particular, this paper proposes new methods in predictive modeling for conservation enabled by spatial analysis in 3D GIS. Our predictive models offer an opportunity of building a comprehensive view of the site in its current state and serve as the basis of a new best practice methodology that can be employed in the conservation of other heritage sites.

[55] *Ritual Human Sacrifice among the Tarascans*

This study reports on osteological remains excavated from the Great Platform at Tzintzuntán, the Postclassic (A.D. 1300–1522) Tarascan ceremonial capital. The osteological deposit was first uncovered by Alfonso Caso in 1937–1944, re-visited by Rubín de Borbolla and Roman Piña Chan during the 1960's, by Efrain Cardenas in 1992, and most recently in 2011 by the Proyecto Especial de Michoacán. In 1992, 194 skull fragments (MNI=40) and 28 modified femur fragments were recovered while the most recent project recovered 529.88 kg of human bone. Both samples contained males, females, and sub-adults. Multiple thin transverse-cut-marks were identified on 19 skull fragments near temporal muscle attachments. Microscopic analysis shows that cut-marks were postmortem and reflect distinct patterns of cranial de-fleshing, starting from the mastoid process, and pulling back towards the occipital. Seven obsidian blades were identified, some matching the dimensions of the cut-marks. No grave goods were encountered. The archaeological data support ethnohistoric descriptions of postmortem scalping, flaying, and decapitation. The context suggests that individuals recovered at Tzintzuntán were casualties of ritual violence. This analysis combines osteological, archaeological, and ethnohistorical data to generate a broader discussion about the significance of ritual sacrifice and postmortem body treatment in Postclassic Tarascan society.

[239] *Using ArcMap to Create a Database for an Historic Cemetery in Northeast Pennsylvania*

As a program designed to integrate and analyze geospatial data, ArcMap has the potential for broad archaeological application. Here we employ ArcMap to create a database for research and management of the historic cemetery at Stoddartsville, a 19th century milling village built along the upper Lehigh River in northeast Pennsylvania. Specifically, we use ArcMap to integrate: (1) spatial data from a total station survey of individual grave markers and cemetery boundaries; (2) descriptive data from grave marker inscriptions and attributes; (3) personal data for buried individuals from archival research; and (4) geophysical data from a ground-penetrating radar survey of the cemetery. As we demonstrate, this map and database provide a useful research tool for examining the Stoddartsville cemetery as a microcosm of the associated historic site, allowing us to explore the changing social composition of the village, evolving funerary customs, and demographic trends. Additionally, we have shared this interactive map and database with the Stoddartsville Preservation Society to aid in their preservation and management of the cemetery. Finally, we have made this resource available online to potentially serve others interested in learning about Stoddartsville, including descendants of those buried in the cemetery decades ago.

Cannon, Kenneth (Cannon Heritage Consultants)

[90] *Ecology of Bison in the Greater Yellowstone Ecosystem*

Bringing the geologically historic record to bear on questions of ecosystem evolution is a goal emphasized in recent National Research Council reports. Within this context one species has become significant, the bison of the Greater Yellowstone Ecosystem. Recent expansion of the population, and its subsequent migration outside federal lands, has created concern among federal managers, local ranchers, and conservation groups. However, much of what is known about pre-management herds is based on historic records and modern studies. While both are invaluable sources, they have limitations. For example, historic studies are often anecdotal and modern studies are based largely on small, isolated herds. The purpose of my research is to develop a longer-term historical perspective on the mammalian community of the GYE. The lack of knowledge of the mammalian community is notable considering all that is known about the glacial, climate, and vegetative history. An initial step in this research is the study of bison ecology through the application of stable isotope signatures (carbon, nitrogen, oxygen, and strontium) derived from discrete downturn samples of modern and prehistoric bison. The third molars from 14 adult bison were selected from archaeological assemblages providing a detailed time-resolution record of each individual.

[305] *Implications of Integrative Science Approaches for Site Documentation at Bia Ogoi*

Deep in the Washington Territory amongst American expansionism, one of the nation's most devastating conflicts occurred. On the frigid morning of January 29th 1863, the California Volunteers under the command of Patrick Connor attacked the Shoshone village at Bia Ogoi in response to ongoing hostilities between whites and Native groups, resulting in the death of at least 250 Shoshone and 21 soldiers. Over the course of the past 150 years, extensive landscape modification has occurred from both natural and human agents, obscuring the events of this fateful day. This poster presentation highlights an integrated science methodology to identify and record key landmarks including traditional on-the-ground geomorphic studies, historic cartographic reconstructions, and geophysical assay with implications for preservation at the Bear River Massacre Site.

[337] *Preliminary LiDAR-based Analyses of the La Corona—El Achiotal Corridor*

Located in the northwestern Petén, Guatemala, the Maya sites of La Corona and El Achiotal have been investigated since 2008 by a multi-disciplinary US and Guatemalan research project. While a primary goal of this project has been to reconstruct the region's political history, we have also investigated the management of local resources and general human impact on the landscape. In 2016, a LIDAR survey, funded by the Pacunam Foundation and operated by NCALM, was undertaken in a 410 square km rectangular zone encompassing both La Corona and El Achiotal. In the following paper, we present ground-truthing analysis and preliminary interpretations of the LIDAR data-set as it relates to ancient settlement, land-use strategies, and defensive features.

[249] *Habitar la diversidad: la transformación del paisaje y la construcción del territorio en el antiguo Perú*

La diversidad de zonas ecológicas que caracterizan a los Andes Centrales, dio lugar desde los procesos iniciales de poblamiento al despliegue de diferentes modos de vida, que se generaron en la interacción de los grupos humanos con estas distintas condiciones de existencia. El territorio es una construcción social que incorpora la historia de las transformaciones del paisaje, y las sociedades modelan su identidad cultural, memoria y cosmovisión en este profundo proceso de habitar el paisaje. Estos procesos, en los que se integran transformaciones sociales y territoriales, adquieren especial trascendencia a partir de la progresiva modificación de las originales características del medio, para favorecer en él los procesos productivos ligados a la agricultura, la pesca y la ganadería, resolviendo con la naturaleza el manejo del agua, de los suelos y del clima. En esta presentación expondremos casos representativos de paisajes culturales que comprometieron la articulación de conocimientos y de especiales formas de organización social, convirtiéndolos en instrumentos de producción de escala territorial. Paisajes que representan no solo un importante patrimonio ambiental y tecnológico, funcional al desarrollo territorial, sino también un referente de trascendencia para las comunidades que los heredaron, en cuanto se refiere a la conservación de su identidad cultural.

[173] *The Axis Connecting Classic Maya Economy and Ritual at Xunantunich, Belize*

The ancient Maya formalized avenues of movement between and within urban centers through the construction of sacbeob that both defined space and connected places on the landscape. In this paper, we discuss the ways in which a formally constructed sacbe at Xunantunich functioned as an axis connecting economic and ritual activities. The architectural arrangement of Classic Xunantunich emphasizes a north/south directionality. The site's

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

sacbe, however, was constructed on an east/west alignment. This site plan emphasizes a cruciform pattern, which we argue was intentional, and may symbolically represent the axis mundi. In the west, the sacbe is associated with a marketplace and ballcourt. The openness of this area reflects public participation in economic and ritual activities. As the sacbe narrows towards the east, access becomes more restricted. The sacbe terminates at a hilltop group (Group D) where excavations revealed evidence for repetitive ritual activities. We argue that the Xunantunich sacbe may have served as a processional route for periodic rituals that would have reinforced the connection between economic and religious activities, while at the same time legitimized hierarchical relationships within the society.

[76] *Investigating Ancient Maya Foodways in the Copan Valley, Honduras: Macrobotanical Analysis from Late Classic to Postclassic Middens in the Rio Amarillo East Pocket*

Within the Copan Valley a dearth of macrobotanical assemblages have been analyzed, and most that were focused on the area within or close to the Acropolis. As part of a larger project investigating ancient practices of sustainability within the Copan Valley, macrobotanical remains recovered through flotation from two commoner communities, Site 29 and Quebrada Piedras Negras, Group C, in the Rio Amarillo East Pocket have been analyzed. Due to acidic soil in the area both bone and other types of botanicals have not survived well, thus charred materials offer the best opportunity for gaining insight into past food practices in this area.

[68] *The Submerged Cypress Forest and the Paleolandscape of the Gulf of Mexico*

Submerged Paleo-geologic features with probability for associated prehistoric sites on the Gulf of Mexico shelf include coastal plain and fluvial valley-fill deposits (e.g. terrace and floodplains) preserved landward of the 60-m bathymetric contour, the approximate late Pleistocene (~12,000 ka) shoreline location. A site ~15 km offshore Alabama was discovered with exposed remains of a previously-buried bald cypress forest with stumps in growth position rooted in an organic-rich paleosol. It has been suggested that exposure resulted from seafloor scour during Hurricane Ivan in 2004. Results from radiocarbon dating and OSL analysis place the timing of tree growth and burial at ~40–60 ka. We hypothesize that rapid floodplain aggradation associated with upstream response to sea-level rise led to burial and preservation. Though much older than expected Paleoindian occupation in this region, this rare find provides an opportunity to study in situ formation and preservation processes of an extent and easily accessible sub-sea preserved Pleistocene landscape surface and paleosol. These results will be used to create a conceptual model to aid in developing geophysical/geological survey techniques to identify buried paleolandforms that could contain archaeological remains from the earliest human occupations along the Gulf of Mexico coast when sea level was lower than today.

Capriles, José M. (The Pennsylvania State University)

[105] *A Review of Paleodemographic Changes in Prehispanic Bolivia Using a Countrywide Assessment of Radiocarbon Dates*

In this poster, I introduce a new database containing the most updated and comprehensive series of geo-referenced radiocarbon dates collected from archaeological sites located within the entire country of Bolivia. The resulting Bolivian Radiocarbon Database reviews and incorporates data from previous syntheses as well as a number of additional dates mostly available in rare publications and recent research. Using recommendations posted in previous studies, I discuss some of the potential and limitations of the resulting series, including geographical and temporal biases. I then select a dataset of representative dates to generate a series of different sum probability curves for different ecological regions (highlands, inter-Andean valleys, and lowlands) and compare them to different sequences of paleoenvironmental change. I discuss the results in light of the questions and hypotheses posted by the PEOPLE 3K Working Group, including the impact of global scale processes of climate change such as the Medieval Warm Anomaly and the onset of the Little Ice Age to different food production systems, and their influence on trajectories of demographic change.

[64] *Reconstructing the Environmental History of El Paraíso, Chillón Valley*

By Late Preceramic Perú (3000–2100 BC) lomas environments were largely abandoned in favor of riparian and littoral ecozones, and hunting and gathering subsistence strategies were increasingly replaced by agriculture. This change coincided with the emergence of several hallmarks of complexity: monumental architecture, specialization, and hierarchical organization. The role that environmental degradation or climate change played in this transition remains a subject of debate. This paper presents microbotanical data from the Late Preceramic site of El Paraíso on the Central Coast of Peru and reconstructs the environment at the site-scale. In particular, the micro-remains indicate an ENSO event and a strong trend toward increasingly saline wetlands over time. These environmental factors are considered in the context of the occupation of the site.

Carballo, David (Boston University)

[293] *Activity Areas and Political Economy at Teotihuacan's Plaza of the Columns: Investigations in Front E*

Front E of the Project Plaza of the Columns Complex comprises the southern sector of this large civic-administrative complex, located in the heart of Teotihuacan. In initial project planning, its surface topography suggested the presence of open spaces and low structures that could have been used for activities of economic significance and/or as residential spaces for individuals not of high elite rank. Excavations over two seasons in Front E prioritized horizontal exposures in order to assess these possibilities. They confirm the presence of open plazas and residential structures in the south of the front, and larger, decorated structures of likely ceremonial function to the north, defining the central precinct of the Plaza of the Columns. In this paper we review the excavation contexts, architecture, preliminary artifact analysis, and working hypotheses concerning the diverse functions of the area, changes over time, and what both contribute to better understanding the political economy of Teotihuacan. Significant finds include sculptural motifs, elaborate drain features, a large domestic midden, and evidence of intensive obsidian blade use.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Carbone, Catherine**[223]** *Preliminary Study in Skeletal Weathering in the Southwest Llano Estacado*

Skeletal weathering is rarely addressed in archaeological contexts, despite its importance to archaeology, and other fields of research. Experimental studies in taphonomy should be completed on regional scales, because changes in the microclimate will cause taphonomic agents to express differently on skeletal remains. This research quantifies and calibrates the skeletal weathering cycle for the southwest Llano Estacado region of eastern New Mexico, by placing faunal remains in full sun, shade, and partial shade. Pig metapodials were used to represent human remains, while other faunal remains were selected to simulate indigenous fauna found in the archaeological record. Specimens are documented daily, or as needed, and one sample from each species will be collected at each weathering stage, until a full cycle has been completed. DNA viability will be tested at each stage, as DNA analysis plays an important role in both archaeological and forensic research. Raman spectroscopy is used to determine the microstructure of bone at each weathering stage. Once the skeletal weathering cycle is calculated for the region, forensic specialists and archaeologists will be able to determine the post-mortem-interval, or the time-of-exposure of subaerial remains, understand the expected macro and micromorphology, as well as DNA viability for each weathering stage.

Card, Jeb (Miami University)**[33]** *Reassessing Classic Maya Identity and the Southern Edge of Mesoamerica*

Certain classes of material culture found in Honduras and El Salvador have long been recognized as being related to "Maya style" artwork and artifacts from Copan and Classic Maya cities to the north and west. These objects have been framed through questions of "influence", ethnicity, and boundaries. The recent re-analysis of a ceramic flask from Tazumal, with an unusual inscription tying the object to a Copan king and imagery of tribute, suggests a more distinct political lens through which to view influence and interaction on the southeastern edge of the Maya world. The nature of other "Maya" objects found south and east of Copan not only clarifies possible political and cultural relationships in this region, they also isolate aspects of what may have been recognized and performed by people of the first millennium CE in Central America as the entity later labeled as "Maya". By examining the kinds of objects used to perform or express "Mayaness" on a potential boundary area, the nature of "Mayaness" comes into view.

Carey, Mia (National Park Service)**[77]** *Artifacts Addicts Anonymous: The Road to Recovery from Negative Data*

Have you recovered thousands of artifacts, but none from the time period of interest? Have you spent weeks or months in the field, with absolutely nothing to address your research questions so you keep digging? This is the phenomenon of negative data. While this can be a scary thing, it is okay. Archaeologists suffering from artifact addiction have developed an unhealthy obsession with the recovery, analysis, and interpretation of material culture. This addiction can result in delayed reports, articles, and dissertations. In this paper, I argue that the road to recovery begins with reassessing our purpose as archaeologists and looking beyond our data, reports, and artifacts as our cultural products. Overcoming this addiction may be challenging, but is possible using this novel perspective. Are you willing to acknowledge your negative data?

Carlson, David (Texas A&M), Michael Waters (Texas A&M) and Joshua Keene (Texas A&M)**[103]** *Intrasite Spatial Analysis at the Debra L. Friedkin Site, TX*

The Debra L. Friedkin site, located in central Texas along Buttermilk Creek, provides evidence of human occupation in Texas during the past 15 thousand years within a deposit approximately 1 meter thick. Excavation Block A consisted of 52 contiguous 1x1 m units excavated between 2006 and 2009. Excavations since the initial publication of the site include 14 units adjacent to the south end of the block and 32 units just northeast. Each 1x1 m unit was excavated in 2.5 cm levels. Currently we are analyzing the horizontal and vertical distribution of diagnostic artifacts and debitage to identify paleosurfaces across the excavation block. Four independent lines of evidence are being used. First, four OSL columns provide one basis for identifying contemporaneous layers across the blocks using Bayesian depositional analyses of each core. The slope of the modern surface and the basal bedrock surface provide a second line of evidence of the slope of the buried components. Third, the distribution of diagnostic artifact types, especially Clovis, Folsom/Midland, Golondrina, Angostura, and Ensor provides a way of identifying surfaces using robust linear regression models. Finally, analysis of debitage densities horizontally and vertically provides yet another approach to identification of paleosurfaces.

Carlson, John (Center for Archaeoastronomy, College Park, MD) and John Hoopes (University of Kansas, Lawrence)**[263]** *Chacmool or Not Chacmool? Was a Mesoamerican Monumental Stone Sculptural Tradition Adopted in Eastern Costa Rica?*

The unique monumental stone sculptural form known as a "Chacmool"—a reclining human with an offeratory bowl on its abdomen—first appeared in the late Epiclassic period in Mesoamerica, most notably at the Toltec site of Tula in Central Mexico and the Maya site of Chichen Itza in the Yucatan. The form is known across Mesoamerica in archaeological contexts from Michoacán, Mexico to Guatemala and El Salvador. It persisted in Central Mexico to the time of the Aztec empire and European Contact, when a Chacmool was a major feature at the Templo Mayor in Tenochtitlan. Carlson has identified the uniquely posed male human form as having derived specifically from the stance of a Mesoamerican ballplayer. Subsequent research has demonstrated clear associations between Chacmool sculptures and ballcourts. Several examples of a similar sculptural form have been found at the site of Las Mercedes in the Caribbean lowlands of Costa Rica. This paper evaluates the examples from Costa Rica with respect to possible Mesoamerican connections and the geographical limits of the rubber ballgame in the Isthmo-Colombian Area.

Carmen, Mayra (Pontificia Universidad Católica del Perú) and Krzysztof Makowski (Pontificia Universidad Católica del Perú)**[132]** *Styles, Technology and Identities: Origins and Uses of Provincial Inca Ceramics in Pueblo Viejo-Pucará, a Huarochiri's Mitmaquna Settlement in the Lurin Valley*

Distribution analysis of provincial Inca pottery in different layers of the residences of Pueblo Viejo-Pucará, including the palace of the curaca, will serve as a starting point to define the differences in access to diverse vessel forms and observe the contexts of use in domestic, funeral, public and ceremonial areas. The excavations in residential and ceremonial architecture carried out in Pueblo Viejo-Pucará, a Late Horizon (1470–1560 A.D.) urban settlement, provided rich and varied evidence of the privileged participation of this mitmaquna population in the distribution network of artifacts that are considered sumptuary. We will contrast evidence of ceramic production to the manufacture of metal artifacts. Previous studies of clays - regarding its origins, pastes and pottery types- suggest that the source materials for provincial Inca ceramics were obtained from the neighboring Rimac valley along with a large number of workshops that also produced ceramics in local styles. The coexistence of architecture, agricultural

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

technologies, pastoralism and funerary behaviors that are typical of the Huarochiri highlands, along with the coastal ceramics and elements of the Inca imperial material culture, demonstrates the complexity of acculturation processes, with multiple identities unfolding during the Inca period.

[131] *Archaeology and Ethnohistory in the Sahuaripa Region of Eastern Sonora*

There is little doubt that there exists cultural continuity linking the Río Sonora tradition and the Ópata (a term referring to an amalgamation of several groups, generally including Eudeve, Teguíma and Jova-cf. Yetman 2010; Spicer 1962). The socio-political organization of the late prehispanic Río Sonora archaeological tradition remains controversial though little studied. Carroll Riley (1982, 1987, 1999, 2005; see also Doolittle 1984, 1988, 2008) proposed that they constitute “statelets”, based principally upon the interpretation of the ethnohistorical and Río Sonora archaeological site settlement pattern data. Although, we have long been outspoken critics of this concept, supposedly, the renowned cacique Sisibotari counted some 70 settlements within his dominion (Spicer 1962:92), and requested Pérez de Ribas send missionaries to his people; we suspect that when Pedro Méndez established missions in Bacanora, Sahuaripa and Arivechi, these localities fell within Sisibotari’s dominion, and would seemingly indicate a semi-complex level of socio-political organization. This paper presents recent archaeological investigations in the Sahuaripa region. These data, along with the ethnohistorical accounts, indicate that this region was densely populated and figured prominently in regional and long-distance exchange systems in Northwest Mexico and likely served as the principal route followed by the early Spaniards.

[82] *Neighborhood Organization in Early States: Exploring Spatial Variability at El Palenque*

The late Formative polity centered at the El Palenque site, near San Martín Tilcajete, Oaxaca, Mexico was a densely populated settlement. The site was founded in the late Monte Albán I phase (300–100) during a period of hostility and violent conflict. The settlement at El Palenque consists of a 1.6 ha civic ceremonial plaza, a 28 ha core area of residential occupation, and an additional 43.5 ha with more dispersed evidence for residential occupation. There may be a number of factors influencing the structure and distribution of neighborhoods across the site including social and political status, a need for defense, kinship organization, and specialized economic production. In this paper, I investigate the underlying processes shaping neighborhood organization and composition in the residential sectors of the site. I use a combination of surface collections and excavated household data to define and compare neighborhoods at El Palenque. Specifically, I analyze the distribution of house foundations, the density of different materials collected during surface collections, and house size and architecture. Through this combination of artifact and architectural data I evaluate different models for neighborhood organization and identify the underlying processes at shaping neighborhoods at El Palenque.

Carpenter, Michelle (University of Texas at San Antonio)

[241] *Indications of Faunal Starvation in Jamestown Colony*

The interpretations surrounding the first English colony founded in Jamestown, Virginia has developed through analyses of historical documents and excavations of the archaeological record. Continued excavations have provided an analysis of fauna within the colony affected by the diminishing food stores during the starving months of 1609 and 1610. Faunal remains were sampled from two archeological water wells in Jamestown dating to 1607–1610 and the second well from 1650. Based upon the preliminary results of collagen extraction by IRMS, fauna from the starvation months indicate an increase of $\delta^{15}\text{N}$ within the bone. These findings could be the result of extreme dietary distress expected to be consistent with $\delta^{15}\text{N}$ levels of the starvation period. Bioapatite was also analyzed for the overall diet of fauna sampled from the starvation months and the 1650 deposition. Due to the aqueous burial context, samples were analyzed for preservation by ATR-FTIR and IRMS. Faunal remains were compared to the 1650 archaeological well for dietary stability and preservation of hydroxyapatite crystals within the bone samples.

[265] *Burial Garments of a Chimu Child Sacrifice from Pampa La Cruz, Huanchaco, Peru*

The site of Pampa la Cruz, located in Peru’s northern coast in Huanchaco, is situated just north of the ancient Chimu capital of Chan Chan. A multi-component site with occupations from the Salinar, Gallinazo, and Chimu eras (400 BC—AD 1470), excavations in 2016 recovered Chimu child sacrifices. Each body was interred wearing multiple garments, including mantles, loincloths, and tunics. Environmental and soil conditions enabled the preservation of these textiles. In July 2017 students in the MOCHE Inc Conservation Program completed a preliminary study of these textiles and carried out stabilization measures. In this poster we analyze a set of clothing one child sacrifice was interred in. The set includes a hat, head wrappings, a mantle, a loincloth, and a tunic. Through an analysis of the weaving technology of this set of clothing and comparison to other Chimu textiles, this research provides insight into Chimu sacrifice practices.

Carpio, Edgar

[37] *Contribution of Stephan F. de Borhegyi to the Archaeology in Guatemala: Investigation in the Borhegyi’s Archives at the Milwaukee Public Museum*

Archaeologist Stephan Borhegyi contributed significantly to the development of archeology in Guatemala in the late 1950s and early 1960s with his investigations both in the highlands and on the Pacific Coast. He was a pioneer in underwater archeology at Lake Amatitlán and carried out studies at other sites around the lake. He also made important entries on different archaeological sites in the Highlands and on the Pacific Coast, particularly on the Bilbao site. In Guatemala, his works were published in the journal *Anthropology and History of Guatemala*. He has an important role in the organization of the collections of the National Museum of Archeology of Guatemala. At the Milwaukee Public Museum are his field notes, as well as other valuable documents related to his research work in Guatemala. There are also some samples of ceramic objects and other objects on display, from Amatitlán and the Pacific Coast. Our interest is to recognize his important work in the archeology of Guatemala.

Carr, Christopher (University of Cincinnati)

[238] *Potential Method for Structure Alignment by the Ancient Maya*

It is well established that the ancient Maya favored certain orientations for the buildings in their major urban centers. In the southern Maya lowlands, an orientation of 14° clockwise from the cardinal directions is particularly common. How did the ancient Maya find this orientation? What was their surveying technique? Lidar from many sites shows that this orientation was not limited to major constructions. The smallest residential structures and patio groups, structures spread throughout the site, also were orientated to specific directions. The method of orientation had to be relatively simple, accessible to all levels of society, workable on all parts of the landscape (not just where the horizon is visible), and, most likely, usable at any time of

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

year (e.g., not just at solstice or equinox). A first step in orientating a construction to a particular direction would be to establish the cardinal directions (separately, constructions also could be orientated to features on the horizon). Two methods to determine the cardinal directions are presented here: the north method and the Gnomon E-W method. With the current lack of knowledge of ancient Maya astronomical instruments, examples from other ancient cultures are considered.

Carr, Kurt (The State Museum of Pennsylvania)

[328] *Paleoindian Research in the Middle Atlantic Region*

Paleoindian studies in the Middle Atlantic region have been at the forefront of Paleoindian research in the Eastern Woodlands. William Gardner's research in the Shenandoah Valley of Virginia in the 1980s emphasized a focus on micro-cryptocrystalline lithic sources in the settlement system; smaller territories on the order of 40 to 150 km in diameter and a flexible social organization during the seasonal round involving a pattern of changing micro- and macro-bands. These issues continue to be important in the analysis of Paleoindian adaptive strategies and now include more controlled examinations of community patterning; microwear analysis; refitting studies; and lithic sourcing based on trace element analysis. New sites have been discovered resulting in the definition of site clusters and sites associated with paths. Improved chronological controls have enabled researchers to speculate on changing settlement systems within the Paleoindian period. These studies have resulted in the definition of at least two different Paleoindian adaptive strategies in the Middle Atlantic region.

Carr, Philip (University of South Alabama)

[94] *Team-Based Learning in AN 101: Introduction to Archaeology & Biological Anthropology*

Team-Based Learning (TBL), a powerful pedagogical tool, has several essential elements: forming permanent teams; flipping the classroom; a specific sequence of individual work and teamwork; and immediate feedback. As a polar opposite of the traditional "sage on the stage" pedagogy, there are advantages and disadvantages for implementation of TBL in a moderate-sized (50+ students) introductory course. Specifics of the implementation are discussed for this first time use of TBL in AN 101 and lessons learned are reviewed. Comparison between student work from the traditional and TBL class are discussed. Expectations are that TBL will create a motivational framework in which students increasingly hold each other accountable for coming to class prepared and contributing, which will result in higher class performance.

[143] *Caries from a Museum Skeletal Collections*

Studying teeth in museum archaeological collections allows us to address questions about diet, health, and the environment. One common health indicator is the rate and frequencies of pathological indicators such as carious lesions (cavities) within a population. Changes in the amount of caries over time in a population show the changes in diet which may reflect cultural or environmental changes. Through museum collections we are able to look at caries and assess the relationship between oral pathologies and the environment. This presentation will discuss an effective example of collections based research to document the prevalence of carious lesions among ancient inhabitants of the Santa Barbara Channel region. Specifically, we aimed to build on previous research that showed prehistoric declines in the sexual differentiation and overall frequency of caries in the region, related to a dietary shift from terrestrial plants to marine animals. We found that over time there were less caries in the Santa Barbara Region hinting towards an increase in the dietary reliance of marine mammals. It is through the museum's collections that we are able to conduct research on previous human populations and assess their health and diet.

Carroll, Jon (Oakland University)

[133] *Assyrians at the Gate: Rethinking the Siege at Tel Lachish*

Sennacherib's destruction of Tel Lachish, Judah (now Israel) in 701 BC was accomplished using state-of-the-art technologies and tactics. We know through the Lachish reliefs once located at Nineveh and now housed at the British Museum, that the Assyrians used a siege ramp to conquer the city. Unfortunately, the ramp was partially destroyed by archaeologists in the 1930's and comparatively little is known about its original dimensions and use in the siege. Computational technologies including the use of drone-acquired aerial imagery are used to reconstruct the landscape and evaluate competing interpretations of the assault on the city.

[256] *Groundstone Production and Community Development at the Ancient Maya Site of Pacbitun, Belize*

The archaeological site of Pacbitun is one of the ancient sites that was inhabited by the Maya for approximately two thousand years. It is located in west central Belize near the modern Maya village of San Antonio. In 2011, investigations in the periphery of the site core revealed a small group of mounds, of which one contained evidence of groundstone production. This group, designated as the Tzib Group, was targeted because one of the mounds, labelled Mano Mound, yielded numerous mano fragments on its surface. Intensive investigations at Mano Mound revealed a production loci, namely the manufacture of manos made from granite, dating to the Late Classic (600–800 CE) period. Systematic survey immediately around the Tzib Group has produced numerous other small groups of mounds also engaged in mano production. Until the summer of 2017 we believed that this mano producing community was limited to the northwest periphery of the site core. However, recent investigations in the southeast periphery have identified yet another groundstone workshop for the manufacture of granite manos. This paper will contextualize our findings and discuss the role of these granite workshops as it relates to sociopolitical and economic development in the Late Classic.

[175] *Urbanism and Residential Patterning in Angkor*

Greater Angkor (9–15th centuries CE) was mainland Southeast Asia's largest low-density urban area. Some of the most visible aspects of this landscape are the large stone temples constructed by Angkorian kings and elites. While many scholars have hypothesized that these temple enclosures were loci of habitation, few have documented this archaeologically. In this paper, we present the results of two field seasons of excavation

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

at the temple site of Ta Prohm, part of a broader research program that was the first to intensively study temple enclosures for occupation. We used lidar data to focus our excavations and sample various locations within the enclosure. This work demonstrates evidence for residential occupation within the temple enclosure from the pre-11th century CE to the 14th century. A comparison with previous work exploring habitation areas within the Angkor Wat temple enclosure highlight similarities and differences in mound construction, organization of the internal grid system, intensity of habitation, and dates of occupation. We argue that temple habitation was a key component of the Angkorian low-density urban system and that investigating this unique form of urbanism deepens current comparative research on the diversity of ancient cities.

[141] *Making Bead Makers: Durability and Change in a Community of Practice among the Manteño-Guancavilca of Ecuador*

Shell beads are rarely considered a major artifact category. However, research on bead production among the Manteño-Guancavilca (AD 800–1532) of coastal Ecuador highlights the fundamental importance of this category of artifacts. By recording six measurements and four qualitative observations for each of 7651 beads from six sites (two regions, three stretches of time), this research has been able to recognize two distinct chaînes opératoires. At approximately AD 1200, bead makers shifted from a highly regular production sequence resulting in standardized chaquira (tiny beads) made from the ritually and economically significant shellfish, *Spondylus*, to one that is more opportunistic and results in irregular beads rarely made from *Spondylus*. This “destandardization” is associated with external economic forces, but also highlights the significance of the bead maker community of practice. Bead making endured the near complete loss of a market for chaquira, by becoming more flexible in their production strategy. That is, they tweaked their technological style to fit a new situation. In this way, bead makers retained their identity, as is demonstrated in the inclusion of raw material, production debris and tools in burials. This paper proposes some ways to think about change and durability in a community of practice.

Cartier, Meghan (California State University, Fresno)

[25] *Naked Huastecs, Anxious Aztecs: Male Nudity and Gender Identity in Aztec and Huastec Sculpture*

The relationship between the Aztecs and the Huastecs is complicated and often defined by Aztec reaction to Huastec culture. The Aztecs have often dominated the landscape of Mesoamerica while the Huastecs have been seen as something somewhat separate. At first glance the difference in Aztec and Huastec sculptural tradition might seem to reaffirm this disconnect. By focusing on male figurative sculpture and how it reflects the construction of gender identity we see that despite clear differences there is a core ideology which connects them through shared traditions and worldview. This examination also reveals how Aztec and Huastec depictions of, and reactions to, male nudity indicate how both cultures use shared ideas of gender and identity to address unique social and political concerns within each group. Ideas of maleness reflected in these sculptures reveal the anxiety of the Aztecs as relative newcomers trying assert themselves as a cosmic and political center of the Mesoamerican world while at the same time solidly giving the Huastec a home in that world. Ultimately this examination of Aztec and Huastec sculpture seeks to better situate both groups in terms of interactions with each other as well as their place in the broader Mesoamerican world.

[144] *A Distant Perspective: Characterization of Britain and Ireland in Studies of Large-Scale Exchange*

Archaeologists often characterize the Bronze Age by a pronounced expansion in long-distance interaction, which resulted in contact, whether direct or indirect, between disparate geographical areas. The centrality of this notion to the definition of the Bronze Age has resulted in numerous studies addressing such large-scale exchange of material culture and/or ideology. When incorporated into such studies, Britain and Ireland are often lumped together under the moniker of “the British Isles.” This paper examines the rhetoric surrounding discussions of long-distance communication and trade in the Bronze Age, specifically regarding use of the term “British Isles” in the archaeological literature. In particular, it considers whether the studies of long-distance interaction tend to homogenize Britain and Ireland under the umbrella of southern England, resulting in the glossing over of the rest of Britain and Ireland as marginal and insignificant, or in the blanket attribution of southern English characteristics to Britain and Ireland as a whole. Finally, this paper considers whether modern geographical understanding reflects that of groups in the Bronze Age, and how geographical understanding could have influenced the delineation of group identity. Particular attention is paid to methods of transport and communication, and how these may have shaped conceptualizations of geographical features.

[68] *Drone-Acquired Thermal and Multispectral Imagery as a Tool in Archaeological Prospection*

This paper presents results of recent research at several sites in North America and the Middle East in which aerial surveys have been undertaken using an advanced radiometric thermal camera and a multispectral sensor mounted on commercial-grade drones. While using drone-acquired color photography to produce ortho-imagery and digital surface models has become an increasingly standard practice in archaeology, thermal and near-infrared imaging offers the potential to detect both surface and sub-surface archaeological features including architecture, earthworks, and artifact concentrations. Overviews instrumentation, survey strategies, and processing methodologies, our results from fieldwork at sites including Khani Masi (Iraq), Tlaxcala (Mexico), Poushoquinge (New Mexico), and the Enfield Shaker Village (New Hampshire), demonstrate both possibilities and challenges of this emerging approach to archaeological investigation. Analysis reveals a great deal regarding the surveyed sites, and offers researchers a powerful means to explore the archaeological landscape in a way that is rapid, inexpensive, and non-destructive.

[238] *Digital Archaeology In Mongolia: Visualizing the Data*

This study presents results from data visualizations of archaeological sites in northern and western Mongolia. Unlike traditional site documentation techniques applied throughout the discipline, digitalization of data while in the field presents distinct advantages for the study and preservation of both cultural heritage and archaeological data collections. These methods include the production of digital 3D maps, from both aerial and hand-held photogrammetry, data collection with tablets using project specific and updatable forms, near real-time data entry into a secured locally hosted onsite database, and increasing data integrity through pre-printed unique barcodes for each artifact and sample collected. We implemented these techniques for the Northern Mongolia Archaeology Project located in Darkhad Basin, Khuvsgul province, northern Mongolia, and the Tsagaan Asga Project, located in Bayan-Ulgii province, western Mongolia. By creating high-resolution maps in both visible and near-infrared light combined with the spatially

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

aware data collected, the result is a fully digitized site to assist in data organization and analysis so that the focus is less on the data entry and more on the data queries.

Caseldine, Christopher (Arizona State University)

[307] *Irrigation Time: An Assessment of Time as a Factor in Hohokam Irrigated Acreage*

The Hohokam within the lower Salt River Valley, central Arizona, practiced large-scale irrigation that spanned thousands of acres. Previous studies examining Hohokam irrigation assumed that there was a direct correlation between the amount of available water within the lower Salt River and the amount of land that could be irrigated. The amount of available water is necessary for assessing where water was sufficient for successful crops and where insufficient water made agricultural production difficult; however, time is also important. A key component of modern irrigation strategies is the amount of time required to apply sufficient water to fields for successful crop growth. Despite its importance, time has not been included in assessments of Hohokam irrigated acreage. In this paper, I estimate the amount of time it would take to irrigate all agricultural land within Canal System 1, the largest of the four major Hohokam systems. This study will provide a further method for assessing the amount of land the Hohokam could irrigate during key points in the agricultural calendar.

[184] *New Data on Archaic Period Chronology and Raw Material Variation from a Stratified Archaic Site in the Appalachian Summit Region*

Excavations completed by AECOM documented deeply stratified Archaic deposits at the Weatherman Site (31YC31) in the Appalachian Summit Region of North Carolina. This site is located at 2,500 feet above sea level (10 miles north of Mt. Mitchell, the tallest peak east of the Mississippi River) and is situated in the floodplain of the South Toe River, which flows west to become the Nolichucky River and eventually the Tennessee River. The youngest Archaic component at the Weatherman Site is a Late Archaic horizon dominated by hearth remnants and dozens of broken and whole Savannah River projectile points made of local quartzites. The oldest and deepest component is an Early Archaic occupation dominated by cherts from East Tennessee, which produced a Kirk Serrated projectile point and multiple radiocarbon dates of circa 9200 calibrated radiocarbon years before present. These dates are among the oldest radiocarbon dates yet obtained in North Carolina. A summary of findings at 31YC31 is presented here and compared with other recent Archaic period site investigations in the Appalachian Summit region, with particular attention to spatial organization and changes in lithic resource utilization over time.

[180] *Portable X-ray Fluorescence of Lower Pecos Mobiliary Art: New Insights Regarding Chaîne Opératoire, Context, and Chronology*

Painted pebbles are the primary mobiliary art found in the Lower Pecos Canyonlands of southwest Texas and northern Mexico. Previous studies of these artifacts have focused on stylistic variation of the imagery and interpretation of the role these artifacts played within Lower Pecos societies. The focus of this study is the use of portable X-ray fluorescence on Lower Pecos painted pebbles to conduct elemental analyses, providing insight into the chaîne opératoire of painted pebble production. Using a sample of recently excavated painted pebbles, as well as a sample from a private collection, a total of 257 pXRF measurements were collected on 73 pebbles. We determined that charcoal was used as a pigment for black paintings and that iron-based mineral pigments were used for red paintings. The 30 excavated pebbles range in age from ~8000 cal BP to 550 cal BP, and the stratigraphic and chronological context of these pebbles provides a dataset for analyzing not only the chaîne opératoire of painted pebble production, but also allows us to analyze the potential for changes in production through time. This presentation summarizes the results from the pXRF analysis, and discusses the larger archaeological implications for Lower Pecos painted pebbles.

[251] *The Archaeology of Historic Laurel Cemetery in Baltimore, Maryland*

Laurel Cemetery was created in 1852 in Baltimore, Maryland, as a nondenominational burial place for African Americans in the city. By the 1930s, after perhaps several thousand people were interred at the site, the cemetery company had become insolvent, and the grounds were no longer being maintained. After the property was sold in the 1950s, the cemetery was demolished in preparation for what would become a shopping center. Approximately 300–400 burials were moved, but it was not known how many, if any, burials remained at the site. The Laurel Cemetery Project, conceived as a public anthropology endeavor, combines archaeology, ethnology, history, and community outreach. The main goal of the archaeology component of the project was to determine if any human remains were still located at the Laurel site. Archaeology fieldwork concluded in the summer of 2017, and involved remote sensing and the excavation of six test units. Wood and metal remnants of several caskets were uncovered in the excavations, in addition to several pieces of human bone. A ground penetrating radar survey, conducted in limited sections of the property, indicates that many burials remain, both in unpaved areas and under the parking lot.

[221] *Climatic Narratives across Eurasia: A Comparative Study of the 4.2k Event in Western and Eastern Asia*

In the last two decades, climatic narratives have returned as a central issue in archaeological discourse. The field has been flooded with publications on paleoclimatic reconstructions and we believe it is time for a critical evaluation—both as means of seeking better science, and for building better archaeological narratives.

Climate history is composed by an overlapping meshwork of long-standing trends, punctuated events and short-term phases, with impacts ranging from the local to the global/hemispherical scale. As pointed out by several authors, the perception of change, understanding within specific cultural framework(s), and reactions to those changes, are crucial elements in the understanding of human-climate relationship. It is in this context that the so-called Holocene Rapid Climatic Changes (RCCs)—must be understood.

Among the various RCCs, the so-called 4.2k event represents a special case-study—being often associated with hypothetical widespread changes in the archaeological record. Together with a fresh look at the 4.2k climatic event, we analyze and discuss the ways in which those ‘climatic narratives’ have been built by comparing the Near and Far Eastern cases. Through it we show that mismatches of scale, archaeological and climatic, have profound impact on the way we reconstruct the past.

Castillo, Karime (UCLA-Cotsen Institute of Archaeology), Patricia Fournier (ENAH) and Roberto Junco (INAH)

[69] *Dehua Porcelain in New Spain: Approaches to the Production of Fine Chinese Porcelains*

In the viceregal society of New Spain, Chinese porcelain objects were expensive objects consumed primarily by people of high status. The white porcelain objects produced in Dehua, located in the Fujian province of China, were incorporated into the household items of palaces and mansions, as indicated by archaeological evidence from Mexico City, Acapulco, Sinaloa, and some rural sites in the Otumba Valley. The production of this fine porcelain, also known as Blanc de Chine, involved complex techniques, particularly in its firing process. This paper will present several aspects related to the manufacture of Blanc de Chine porcelain and the kilns used to fire it based on ethnoarchaeological observations performed in active porcelain production centers in Dehua, where these fine products are still made following millennial traditions.

Castillo, Luis Jaime (Universidad Católica del Perú)

[216] *The Priestesses of San Jose de Moro*

Starting in 1991, more than 20 female elite burials have been excavated among the 800+ burials dug in San Jose de Moro, Jequetepeque Valley, Northern Peru. Female burials tell us stories of the rise to power of females in the Late Moche society, of their singular power, emanating from roles in Sacrificial Ceremonies, but mostly each burial is a representation of the specific life of each one of these females, where more is singular than common and shared. Rather than a repetitive pattern, each female burial allows us to imagine the construction and reconstruction of gendered power identities, the ontologies of self and power and meaning associated with these singulars in individuals.

[55] *Automatic Classification of Digital Images of Archaeological Arrowheads*

Currently there exist several databases composed of hundreds or thousands of digital images of arrowheads made by different ancient ethnic groups around the world. Extracting information or comparing and classifying the elements of these databases in an efficient and automated way, even without the need of arrowhead's metadata, would be of great help in carrying out a comprehensive study on this archaeological subject. This work deals with this problem by developing an image processing computational algorithm that performs the automatic classification of the arrowheads. Particularly, the algorithm was used in the study of a set of Mexican's arrowheads coming from the Michoacán state; these arrowheads were classified and compared with other databases consisting of hundreds of arrowheads from North America. The classifier uses these features: eccentricity of the arrowhead, blade kind (excurvate-incurvate) and base kind (concave-curved, straight, with handle, and concave with handle). Except for the eccentricity, the other features were obtained by the curvature scale space (CSS) method computed on the arrowhead contour. An important aspect of the algorithm is its robustness with respect to the image, as it performs satisfactorily even with images of medium quality and the only general requirement is to have a uniform background.

[7] *New Records of Pre-Hispanic Dogs (Canis familiaris) in Argentinean Northeast*

Canis familiaris has a limited record in pre-Hispanic archaeological sites of Southern South American, but in the last decade, more specimens were published. In this context, we present new remains of domestic dogs from five archaeological sites along the Paraná and Uruguay Rivers in the Northeast of Argentina, an area with few published records. We also discuss their roles within human societies. The studied sample includes seven cranial and one postcranial specimens corresponding to seven individuals, that comprise adults (n= 6) and youngs (n= 2). Estimated body size indicates that they belong to medium sized dogs (13–23 kg). Some of them show anthropic cut marks (n= 4) and carnivore marks (n= 2). Two specimens were dated, one at 1119 ± 23 14C years B.P., and the other at 1910 ± 29 14C years B.P. It is concluded that in the Northeastern Argentine *Canis familiaris* presents greater age variability and slightly larger sizes than previous records. The 14C dates extend the chronological range known for the region. Its presence is linked to hunter-gatherer-fisher and small scales horticulturalist populations with a marked fluvial adaptation. Evidence of anthropic processing indicates possible human consumption during the late Holocene.

Catanzariti, Antonietta (Smithsonian Institution)

[4] *Ban Qala, a Late Chalcolithic Site in the Mountain Region of Kurdistan, Iraq: A Report from the 2017 Excavation Season*

Ban Qala, a site located in the mountainous valley of Qara Dagh, was first identified by Iraqi archaeologists in the 1940s. In 2015, a survey performed by the Qara Dagh Regional Archaeological Project determined the archaeological relevance of the site, which was then chosen as subject of an archaeological investigation. A step trench on the southern slope of the site verified the presence of LC 1–2 (4800/4500–3850 B.C.E.) and LC 3–5 (3850–3100 B.C.E.) occupation levels. This paper will discuss the data collected and provide interpretations on the implication of the Late Chalcolithic period in the Qara Dagh Valley. The presence of stone tools, particularly obsidian, and the strategic position of Ban Qala on a corridor that leads east to the Shahrzior plain and west to Chamchamal, could suggest that the site participated in some form of trade. Finally, the recovery of several bevelled

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

rim bowls in situ suggests that local ceramic production was being carried out within the context of a wide-spread Mesopotamian ceramic tradition.

The Ban Qala excavation is one of the first conducted in the valley and will contribute to our knowledge on its occupational history, providing a regional perspective from the mountainous region of Northern Mesopotamia.

Catlin, Kathryn (Northwestern University)

[167] *Transforming Marginality in Medieval Iceland: Landscape Reorganization on Hegranes, Skagafjörður*

Eleventh century Iceland was a period of transition. The settlement of the island two centuries earlier set off cascading environmental and landscape changes whose agricultural consequences were then evident, including deforestation, erosion, and wetland alteration. Meanwhile, the rise of a wealthy landowning class altered the economic basis of society from primarily household production towards more centralized structures of rent extraction and tenancy. On Hegranes, a region in Skagafjörður, North Iceland, numerous small settlements on the margins of modern farm properties were abandoned during the 11th century. These sites are in localized areas of deep, dry soils between eroded bedrock and wetland, and while some may represent independent households, others likely served specialized functions in the service of larger farmsteads. After the sites ceased to be inhabited, they were used sporadically for livestock management over the next eight centuries. This rapid reorganization of settlement patterns and landscape use reflects simultaneous and interconnected transformations in ecological and social practice. This paper explores how the changing practices of marginal households both contributed and responded to this moment of transformation, as environmental and political factors came together to alter the material ways in which social inequality was organized and maintained.

[154] *Tracking Quartz: A Methodological Approach to an Elusive Type of Sources Using Chemical Characterization According to Their Geological Origin*

In the archaeology of the Sierras Centrales of Argentina more than one hundred years ago studies reported the presence of a lithic technology centered on the use of quartz as a predominant raw material. However, little effort has been made to try to characterize its chemical composition so as to understand the circuits of mobility or the exchange networks in the archaeological sites of the region.

The results of provenance studies have allowed us to advance in a geochemical characterization of quartz sources and discuss an appropriate set of chemical trace elements useful for comparison between archaeological sites and quarries depending of the geological origin (hydrothermal or pegmatite quartz). We report here a chemical characterization of archaeological and geological samples using thin sections, X-Ray fluorescence and X-ray diffraction.

The detection of trace elements of 100 quartz outcrops and its comparison with archaeological artifacts from 8 sites from the valleys of Ongamira and Copacabana (north of the province of Córdoba, Argentina) are going to be presented, related with samples that belong to different chronological periods (from hunter-gatherer societies—ca. 6000 BP—to more recent occupations—ca. 300 BP).

Cazares, Irma (Zona Arqueologica de Monte Alban, INAH)

[158] *"Teposcolula Viejo, Yucundaa, Oaxaca", Un proyecto Novedoso e Interdisciplinario, Modelo de Co-Participación Gubernamental y Privada en México*

En el año 2004 comenzó el Proyecto: "Teposcolula Viejo, Yucundaa, Oaxaca", en el sitio arqueológico de Pueblo Viejo de Teposcolula, una antigua ciudad mixteca sede de uno de los señoríos más poderosos de la época prehispánica en Mesoamérica, que recibió la incursión de la conquista española y tuvo que transformarse completamente; y esta transición cultural se muestra en los hallazgos arqueológicos.

Este proyecto dirigido por los Doctores Nelly Robles (INAH) y Ronald Spores (Vanderbilt University), conducido por el Instituto Nacional de Antropología e Historia (INAH) de México, contó con financiamiento de la Fundación Alfredo Harp Helú Oaxaca (FAHHO), apoyado por el municipio de San Pedro y San Pablo Teposcolula, Oaxaca, y también tuvo el soporte de Harvard University, del American Museum of Natural History, y de The National Geographic Society, entre otros; de esta manera, se contó con la participación de arqueólogos internacionales, laboratorios modernos y tecnología de punta que permitieron obtener más información de este sitio y este contexto tan particulares, y tan poco conocidos.

[19] *Arroyo Pesquero y su "otra" ofrenda*

Desde el descubrimiento de una ofrenda masiva de objetos rituales hallada fortuitamente en un arroyo, el sitio Arqueológico de Arroyo Pesquero enclavado en el área nuclear olmeca ha generado una serie de discusiones acerca de la autenticidad de piezas dispersas en museos y colecciones privadas. Las piezas más representativas son máscaras y hachas de piedra verde con una iconografía propia de la cultura olmeca. Sin embargo, una parte del material del sitio se ha subestimado. Por Medellín Zenil sabemos que se trasladaron otros artefactos de piedra verde erosionados al Museo de Antropología de Xalapa, posiblemente estaban en el fondo del río. Salieron de nuevo a la luz en el 2013 cuando algunos arqueólogos los localizaron en la bodega del museo. El contexto de estas piezas siempre ha sido enigmático, desde la exploración hecha por Manuel Torres en 1969 se perdieron datos acerca de éste. Durante el 2005 comenzaron nuevas investigaciones dirigidas por Carl Wendt y Roberto Lunagómez, que permitieron contrastar información. En esta ponencia nos enfocaremos en el trabajo efectuado sobre estas piezas olvidadas, y ahora trabajadas dentro de un proyecto arqueológico, en las bodegas del museo. Esto nos da la oportunidad de ver "otra cara" de la ofrenda.

[19] *Chair*

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Cercone, Ashley (University at Buffalo) and Zeynep Bilgen (Dumlupınar Üniversitesi)**[146]** *Double Handed Vessels at Seyitömer Höyük in Kütahya, Turkey: The Manufacture, Use, and Trade of Depas Cups*

During the Early Bronze Age, the site of Seyitömer Höyük in Western Anatolia, served as both a center for ceramic production and trade. Through the innovative use of a mold-making technique, as well as a clay coil and wheel combination method, potters were able to produce a standardized diverse ceramic repertoire at a fast rate. Within the site assemblage, a variety of ceramic types are represented, including the depas amphikypellon, a two handled drinking vessel. Depas vessels originating from both local mounds, such as Küllüoba, and foreign locals, like Syros-Kastri, Poliochni, and Kültepe are also present. In addition to these cups, used for both libation and everyday use, zoomorphic rhyta have been uncovered that depict two animals holding a depas cup. This paper reconsiders the daily and ritual uses of the depas cup in light of the Seyitömer Mound excavations and discusses the movement of this vessel type throughout the Aegean islands, Balkan Peninsula, and Anatolian and Syro-Mesopotamian mainlands.

[146] *Chair***Cerezo-Román, Jessica (Cal Poly Pomona) and Kenichiro Tsukamoto (Department of Anthropology University of California)****[37]** *Life and Death of Lakam Elites at the Maya Center of El Palmar, Campeche, Mexico*

During the Late Classic period (A.D. 600–800), Maya non-royal elites frequently appeared in courtly scenes, which are depicted on polychrome vessels and carved monuments. While epigraphic studies over the last two decades have gradually shed light on their political and ritual roles, little is known about their life histories and mortuary practices. One group of these elites held the title of lakam, which has been reported only at three archaeological sites. We detected tangible evidence of their residential cluster at the archaeological site of El Palmar, located in southeastern Campeche, Mexico. A hieroglyphic stairway found at El Palmar's northern Guzmán Group depicts the genealogical list of lakam elites. During the 2016 field season, 10 burials were recovered at the Guzmán Group and subsequently subjected to osteological analyses to document their biological profiles and life histories. By combining the osteological results with archaeological and epigraphic data, we attempt to reveal socio-political circumstances of these relatively unknown elites in Classic Maya society.

Cerling, Thure [198] see Chritz, Kendra

Cervantes, Gabriela (University of Pittsburgh)**[82]** *The Sican Capital: Neighborhoods and Urban Organization in Pre-Columbian Peru*

Cities which become capitals of large states provide unique information on the sociopolitical political organization and the nature of power, as they are home to a society's leaders and central institutions. In the Andes, scholars have highlighted the existence of cities dominated by a centralized single governing institution, like the Moche capital of Pampa Grande; while others have drawn attention to the empty ceremonial centers, such as Cahuachi, main settlement of the Nazca society. A different urban organization model based on extended, low density population has been studied for Mesoamerica but never for the Andes. I present recent work arguing that the capital of the Sican State (800–1375 AD) on the North Coast of Peru presents a dispersed urban pattern with several nuclei. The city is composed by the "Sican Core" that has a monumental center for political-religious activities and the "Greater Sican" forming a dispersed urban pattern with several neighborhoods each with public architecture and residential occupation.

Cesaretti, Rudolf [105] see Johnson, Amber

Cesario, Grace (The Graduate Center, CUNY)**[167]** *Zooarchaeology of Marginality: An Investigation of Site Abandonment in Hegranses, North Iceland*

The settlement of Iceland, a previously uninhabited landscape, began a series of human-induced environmental changes that have had lasting effects on not just the land but on social organization as well. As land claims were made for household farms, hierarchy developed and some were pushed to settle on the margins. In Hegranses, a region in Skagafjörður, northern Iceland, the sites that are on the margins are often much smaller than the others and may not have been farms at all but rather specialized activity areas. Examining marginal and non-marginal sites through a zooarchaeological lens can help decipher patterns of resource use which can act as a proxy for understanding environmental and social change. Current work on Hegranses has shown that the archaeofaunal assemblages from marginal sites are nearly always comprised of over 50% wild resources throughout the site's short occupational history, while those from proper farms are dominated by domesticates. These marginal sites also follow a pattern of abandonment by the year 1104 A.D., while many of the larger farms are still functioning to the present. This paper will examine the social and environmental variables of abandonment by using zooarchaeology to understand site function and status.

[167] *Chair***Chacaltana Cortez, Sofia (Universidad Antonio Ruiz de Montoya)****[100]** *A Local Perspective of Inca Imperial Influence in Coastal Colesuyo of the Southern Andes*

The effects of the Inca empire across the Andes were multiple and diverse. Relying on their sophisticated institutions, the empire originated a strong physical, political, and economic connectivity across the pre-Hispanic Andes that on occasions went beyond imperial boundaries or political borders. People, things and ideas travelled across the empire provoking a cascade of interactions some of which were not directly intended by the center of power. The multi-component site of Tacahuay located in the coastal region of southern Peru was inhabited before and during the influence of the empire (1,100–1540 a.C) at this region. This site resembles an Inca tambo, presents high frequencies of Inca-altiplanic sherds and chullpas (altiplanic funerary structures); however, it was not part of the Inca imperial system. Instead, Tacahuay was an enclave established by elites from the altiplano and coastal populations that allowed elites to have access to foreign resources and political benefits, respectively.

Chadwick, William (Indiana University of Pennsylvania)**[331]** *Geophysical Survey as an Exercise in Applied Archaeological Education*

Graduate and undergraduate students from the course "Geophysical Applications in Archaeology" conduct a geophysical survey related to a potential archaeological site or cemetery each year. The survey is undertaken as a final small group project composed of two to three students. The purpose of the survey is to determine if there is geophysical evidence of potentially buried archaeological features or burials within the survey area. Each individual group surveys a single 20mX20m geophysical grid using ground-penetrating radar and a gradiometer. The individual groups then process and interpret the geophysical data using standard processing software and geospatial technologies. The students present the methods, results, and interpretations as a final project in the class and produce a final technical report for their individual geophysical grid. The overall goal of the exercise is to provide students with field experience in establishing a geophysical grid, executing geophysical survey, post processing geophysical data, and producing a

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

technical report of the results and interpretations. A composite processing and analysis by the instructor provides the students with an overall “picture” of the results of their combined surveys. Here examples and results of this process will be presented.

[41] *The Scientific Method in Paleolithic Archaeology*

Paleoanthropological hypotheses are often qualitatively different from questions asked by scientists studying the evolution of other living groups. They are frequently complex and very specific. Rather than seeking to illuminate basic evolutionary processes and mechanisms, they focus on precisely reconstructing events in human prehistory. They are often driven, at least in part, by public interest. These characteristics can enhance paleoanthropological studies because they foster novel research approaches, but they may also encourage the formulation of hypotheses that are essentially untestable given the available data. Perhaps for these reasons, explicit hypotheses are sometimes omitted or never clearly stated in paleoanthropological research papers, and many studies are essentially inductive or descriptive.

We conducted a survey of Paleolithic studies published in 10 archaeological journals since 2000. We evaluated each study according to three criteria: (1) Is an explicit hypothesis stated? (2) Can the hypothesis be tested given the data that were examined? (3) Do the methods actually used in the study adequately test the hypothesis? We examined chronological trends throughout the study period and compared results for different journals. We examine our overall findings and specific examples to elucidate the nature of Paleolithic archaeological studies and their status as a hypothetico-deductive discipline.

[332] *Applying Continuous Process Improvement Methodologies to Evaluate and Rebuild the Air National Guard Cultural Resources Management Program*

The Air National Guard (ANG) Cultural Resources Program oversees historic preservation and tribal consultation for 160+ installations throughout the United States and its Territories. One government official and one CEMML Cooperator manage the program centrally from Joint Base Andrews, MD, but the volume of work has prevented officials from managing resources in a proactive and systematic way. As such, managers are applying the Continuous Process Improvement/Lean Six Sigma methodology to focus efforts on improving work flow, enhancing customer value, and eliminating non-value added activities. This methodology has been used primarily by private industry to minimize waste by reducing and controlling variation, but the method also complements cultural resources management practices by eliminating redundancies, clarifying tasks and obligations, identifying solutions to complex problems, and quantifying ambiguities in order to garner understanding and support from key management officials.

[304] *Zooarchaeological Analysis of a Late Pleistocene Cave Site in Northwestern Italy, Arma Veirana*

Italy serves as a critically important region for better understanding the late Pleistocene as it was home to Neandertals and other hominins. Archaeological excavation in northwestern Italy at the cave site of Arma Veirana, with layers dating back to 44 ka, intends to provide insight into this ambiguous period in prehistory. Preliminary data from zooarchaeological analysis of 1,414 specimens indicate that Neandertals primarily hunted medium-sized bovid/cervids, including *Capra ibex*, *Cervus elaphus*, and *Capreolus capreolus* to transport back to the site for butchering: 11.6% of faunal remains display cut marks and percussion marks. A number of these remains also show sign of burning (14.2%), and charred fat deposits have been found in micromorphological samples. This zooarchaeological analysis will help highlight behaviors used by hominins at this cave over time, and contribute to a better understanding of Neandertal subsistence behaviors shortly before their extinction ~40 ka.

Chase, Adrian (Arizona State University)

[82] *Understanding Infrastructural Power, Collective Action, and Urban Form: Situating Neighborhoods and Districts at Caracol, Belize*

Ancient Maya cities possessed a unique urban form characterized by two factors: mixed agricultural land use within residential areas and dispersed households consisting of extended family groups. These two factors contributed to the low-density nature of Maya cities, and conditioned urban form and the structure of neighborhoods and districts. The requirements of top-down administration resulted in the creation of districts to delineate areas of provisioning for the city's urban services. However, a variety of interactions between top-down and bottom-up processes create neighborhoods, especially when they occur in areas of frequent, repeated face-to-face interaction between residents. The use of neighborhoods and districts as scales of analysis permits analysis of various concepts, including: urban infrastructural power, collective action among urban residents, household autonomy within the city, and other concepts that span the spectrum from top-down to bottom-up administrative processes. While districts at Caracol can be reconstructed through the spatial distribution of architectural features that would have provisioned urban services, no such architectural features occur uniquely at the neighborhood scale. As such, Caracol's neighborhoods have been reconstructed through spatial methods utilizing the concept of frequent, repeated face-to-face interaction. These reconstructed spatial units help define the unique characteristics of ancient Maya urbanism.

[147] *Final Moments: Contextualizing On-Floor Archaeological Materials from Caracol, Belize*

Excavations within various locales at Caracol, Belize have recovered artifactual materials on the floors of epicentral stone buildings that were associated with the latest occupation of the site epicenter. These deposits are the result of both “de facto” refuse and rapid short-term abandonment processes. In many cases, complete vessels and other artefactual remains were recovered from the floors of Caracol's epicentral buildings. Other terminal deposits comprise thin sheet-like layers of broken ceramics, stone artifacts, and faunal materials that potentially indicate a break-down in garbage collection during Caracol's final days. Human remains were recovered from epicentral plaza and building floors, including both whole bodies interpreted to be the result of a sudden violent episode during Caracol's final days. Other cases are suggestive of ritual offerings of human remains. Still other contexts yielded isolated human long bones and teeth. This paper reviews terminal deposits from Caracol and places these deposits within the broader context of Maya archaeology.

[297] *Kinship and Cattle in Harappan Gujarat*

Pastoralism, the production and management of livestock, was integral to the lifeways practiced by the peoples of the Indus Civilization (2600–1900 BC), South Asia's first experiment with urban society. The integration of Gujarat (India) into the interregional flows of people, goods, and ideas that knit together the Indus Civilization, for example, is associated with the widespread adoption of pastoralism in a region that was formerly characterized by small-scale horticulturalist-hunting communities. Here, new data generated from recent faunal and isotopic studies are interpreted to infer the organization of pastoral production, circulation, and consumption. While economic and ecological models offer valuable insights into the adoption and practice of pastoralism in Gujarat, a comprehensive understanding of this process must incorporate consideration of the possible roles that livestock, especially cattle, played in the ritual life of local communities. Specifically, it is hypothesized on the basis of ethnographic analogies from South Asia and elsewhere that livestock may have circulated as ritual prestations between families associated with the creation, maintenance, and manipulation of kinship networks in this socially dynamic borderland region.

[213] *Sustainability and Climate Change in the Ancient Maya Area: Evidence from Remote Sensing and Long-Term Land Use*

The sub-tropical forests that once covered the ancient ruins of much of Mesoamerica are being rapidly removed due to modern subsistence practices. Yet, archaeological and ecological research shows that this is not the first time that extensive human-caused deforestation has occurred in this region, minimally representing the third iteration of such an event. Analyses of lake-cores and remote sensing imagery provide evidence for extensive land clearing around 1000 BCE and again after CE 250, with the central Maya area reverting to the tropical forests seen today after CE 1000. LiDAR data also reveal successive built landscapes associated with the earlier deforestations in the central Maya region, potentially correlated with substantial changes in rainfall. The LiDAR data also demonstrate how the ancient Maya terraformed their environments to manage the flow of water and engage in sustainable agriculture. At Caracol, Belize, archaeological data show that a successful urban system was created through the construction of integrative causeways to link public architecture and the purposeful spacing of residential groups among hundreds of built reservoirs and thousands of constructed agricultural terraces. This built environment fostered agricultural productivity, health, and long-term sustainability throughout the Classic Period (C.E. 250–900).

[177] *Identifying the "Why" Of Ancient Engineering Choices: Materials Performance and the Production of Ceramic Bronze-Casting Molds in Zhou-Period China*

Bronze ritual vessels from Shang- and Zhou-period China display a combination of features—complex, three-dimensional forms; exquisitely fine surface detail; and monumental size—that was achieved by casting in multi-part ceramic molds. The ceramic material used to form these casting molds is soft, powdery, and silica rich, making it altogether different from pottery clays in both its physical qualities and its production sequence. Why was such a material chosen? Which specific materials properties did foundry workers seek out in order to ensure adequate performance of their casting molds?

Casting molds and other ceramic artifacts from three bronze foundry sites (c. 1100–771 BCE) in the Zhouyuan area of Shaanxi province were chemically and microscopically analyzed to identify differences in processing and composition between object types. The consequences of these production choices for materials performance were then assessed by measuring mechanical and thermal behavior of lab-made facsimiles. On the basis of the results, this paper reconstructs the priorities that informed the selection of production techniques practiced at these sites.

Chatelain, David (Tulane University)

[337] *A Millennium of Sociopolitical Transitions in the PRALC Region: The View from La Cariba*

Excavations at minor centers provide us not only with a wealth of information about those sites, but they can also illuminate sociopolitical shifts over time within the broader region. The minor center of La Cariba, located four kilometers southwest of La Corona, has been investigated since 2009. A broad dataset including architectural, epigraphic, osteological, and artifactual evidence has provided a detailed narrative of political and demographic changes over a millennium at La Cariba. The site's origins in the Late Preclassic demonstrate the establishment of a communal ceremonial place with a substantial investment in labor, despite a strikingly low population density. Around the transition into the Early Classic, a notable demographic increase corresponded with a major construction episode at La Cariba. After a possible abandonment for a few centuries, during the height of Kaan influence in the region, La Cariba was once again renovated, this time with minimal effort, with architectural evidence implying a strong relationship between La Cariba and La Corona. Epigraphic evidence links La Cariba's Early and Late Classic occupations to two enigmatic periods in La Corona's history, greatly enriching our understanding of these important periods, both of which involved major sociopolitical transitions in the region.

[181] *Objects of Power and Power of Objects: Tiahuanaco Burial Assemblages in Cundisa (Copacabana, Bolivia)*

This paper explores roles played by objects in forging and cementing local and state identities at a Tiahuanaco cemetery at Cundisa in Copacabana, Bolivia. The cemetery consists of 98 Tiahuanaco burials excavated by the Yaya-Mama Archaeological Project. The majority of tombs contain a single individual. Most of the complete objects associated with these burials belong to classic Tiahuanaco style of decorated pottery, but there is also another peculiar pattern of unfired clay miniatures and large pieces of broken utilitarian pottery in the same burials. I propose that this dichotomy helped to reaffirm the participation of people who buried their dead at Cundisa in the broader Tiahuanaco cultural influence sphere, while at the same time cementing and/or underlying a separate local cultural identity (Copacabana lies within the Tiahuanaco hinterland, but relatively far away from the capital). Fancy Tiahuanaco-style pottery, used in life, during the burial ceremony, and accompanying the deceased in their tombs, helped to underline

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

or maybe even create ties with the larger Tiahuanaco polity. On the other hand, the pattern of unfired miniatures is rather unique within Tiahuanaco contexts. Hence, these objects might have played a role forging or highlighting a unique local identity of the local population.

Chazin, Hannah (Columbia University)

[297] *Ordinary or Extraordinary? Analytical Disjunctures between Production and Rituals in Pastoralist Societies*

This paper considers the connection between the quotidian practices of pastoralism and the role of herd animals (and their material remains) in ritual practices in the Late Bronze Age in the South Caucasus. Zooarchaeological and isotopic analysis of faunal remains from Late Bronze Age (1500–1100 BCE) sites in the Tsaghkahovit Plain, Armenia have revealed new, if perplexing, evidence about everyday practices of production, distribution, and consumption of pastoralist products and the incorporation of animals in ritual practices in walled sites and mortuary assemblages. Specifically, this paper examines the incorporation of isolated skeletal elements into ritual spaces, contextualizing this practice within the broader scope of Late Bronze Age human-animal relationships. Avoiding analytical reduction to tokens of economic transactions or singular items of ritual value, this approach situates both ritual and production as material efforts to stabilize the fluid and multiple connections between activities taking place within fortress sites and the suite of quotidian and extraordinary practices that constituted social worlds lived primarily beyond the confines of walled sites.

Chechushkov, Igor (University of Pittsburgh)

[75] *Winter Is Coming: Is 'Fortification' Always Fortification?*

The case study comes from the southern Urals, Russia. Since 1970's the walled settlements of the Sintashta archaeological culture (2000–1700 BC) have been interpreted as the fortified towns and centers of social life for the religious and war leaders of the local communities. However, settlements' primary locations on the bottoms of the rivers' valleys, as well as lack of other evidence for the warfare, cause doubts about such interpretation. Analysis of natural environments (e.g., local wind, precipitation, water tables) and strategic features of locations allows a different interpretation. With the equal chance, the Sintashta 'fortified' settlements can be artificial ecological niches that allowed pastoralists to keep and maintain livestock in the harsh winter conditions. If this was the case when the original interpretation is not fully correct, and at least in some cases we should be more critical about our understanding of warfare landscapes.

Cheek, Charles

[33] *Male Court Dress on Late Classic Maya Vases*

Dress is an object made up of other objects. I combine a practice approach with the chaîne opératoire and behavior chains methods to analyze technical and social acts involving dress objects. The analysis starts with one segment of the actions involving dress—the actual act of dressing. The study includes only court scenes that appear to memorialize historic events, although some of the observations and conclusions can be applied to other kinds of scenes and other media. After identifying the elements of dress, we can see how the Maya combined them into ensembles and then how these ensembles interacted with non-dress objects and social acts in the Maya court. Maya artists used dress and non-dress objects to help the Maya audience understand what the scenes on the vases were depicting. This paper will address three aspects of male dress as depicted on the polychrome vases commonly used for drinking various beverages. Head gear and material objects provide evidence for three propositions. Dress ensembles 1) were shared throughout the Maya Lowlands; 2) were connected to known titles; and 3) were used to represent a hierarchy of social positions within the court.

[64] *Fishing, Shellfish Collecting, Hunting and Planting from Late Preceramic to Initial Period: A Case Study from Huaca Nagea, Viru, North Coast of Peru*

By studying fauna and botanic remains unearthed from Huaca Negra Archaeological Project, this presentation seeks to understand subsistence system and daily life in Late Preceramic Period, and how it might have changed in later Initial Period.

Huaca Negra is a fishing village located in the northwest of the Virú Valley and is 1.2 kilometers from the current shoreline. The site was occupied between 5,000–3,200 CalBP, from Late Preceramic Period to Initial Period, which witnessed the transitions from non-sedentary activity to a settled village, from sedentism to the construction of the mound, and finally from the usage to the abandonment of the mound.

Along with these social changes, the long-term occupation provides a unique opportunity to study early coastal life. The comparison of four activities (fishing, shellfish collecting, hunting, and planting) and its diachronic change help to reveal the nature of subsistence system in both Late Preceramic and Initial Period. The preferred catchment zones, change of coping strategy and the implication of social change will also be addressed.

Chen, Xinzhou

[336] *Material Assemblage and Social Changes in Central Tibet, the Second and the First Millennium B.C.*

Compared to the relatively well-researched area of Eastern Tibet Plateau, the archaeology of Central Tibet has long been neglected. This paper offers a review of academic debates concerning the site of Qugong and analyzed the newly found materials in Bangga and Changguogou site. Based on the available materials and 14C dating data, I here propose a primary chronological framework in Central Tibet and revealed the cultural affiliations of Central Tibet with Central Asia, as well as the cultural change pattern throughout second to first millennium B.C.

[256] *If Ocarinas Could Talk: The Biographies of Ceramic Wind Instruments Used in a Late Classic Maya Funerary Ceremony at Pacbitun, Belize*
The Classic Maya crafted a wide variety of music instruments from clay and other materials. Numerous depictions of musicians on vase paintings and murals attest to the important role of music in ceremonial occasions. Music instruments were also interred with the deceased during funerary ceremonies; although their comparative rarity in burials suggests that their inclusion was not a common practice. At the site of Pacbitun, music instruments have been recovered from multiple Classic period burials, yet the complement of instruments, their placement within the grave and other characteristics is unique in each case. In this paper, we employ a biographical approach to examine the life histories of a group of ceramic wind instruments interred with a Maya woman who was laid to rest in a Late Classic residential building at Pacbitun. By integrating contextual data with the results of detailed macroscopic and petrographic analyses, we trace and compare the manufacturing origins, use lives and final treatment of these

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

instruments. We investigate the nature of their transition from objects used by the living to possessions of the dead and examine what they reveal about the life of the deceased and the funeral rites that were conducted upon her death.

[54] *Full of Water, Full of Life: Water, Resilience, Sustainability, and Built Heritage in the 19th to 21st Centuries San Pasquale Valley, Calabria, Italy*

In the early 1800s wealthy landowners acquired lands in the San Pasquale Valley, located 50 km from the provincial capital of Reggio Calabria in southern Calabria, Italy. Internal migration of farmworkers to establish commercial bergamot, olive, grape, and mulberry orchards in this valley created a large and thriving community of farmworker families who built the landowners' villas, the overseers' and farmworkers' houses, and the farming infrastructure of wells, cisterns, aqueducts, mills, canals, roads, sheds, barns, and animal stalls. Today, crumbling infrastructure, lack of governmental investment, and dwindling population in San Pasquale Valley mark a steep decline in the sustainability of the community, especially in the last 50 years. Our research tracks the birth, florescence and decline of community life in the last two centuries to investigate how people establish, nurture, and fight the decline of community through decades of political, social, and economic crises.

[175] *Changing Angkorian Stoneware Production Modes: Bang Kong Kiln and Thnal Mrech Kiln*

Stoneware ceramic production began in the 9th century CE in the Angkorian core region, and its cross-draft kiln technology, paste types, and vessel forms changed during its multi-century tradition. This paper compares kiln morphology, ceramic technology and vessel form from two Angkorian kiln sites: the 9th-11th century Bang Kong site, and the 10th-12th century Thnal Mrech. The sites are located in discrete geological regions: one in the Phnom Kulen hills (Thnal Mrech), and the other on the Angkorian plain (Bang Kong). Bang Kong was one of the earliest ceramic kiln centers for green glazed and unglazed stoneware, and employed both below-ground and above-ground, and contrasts markedly with kiln technology, vessel form, and paste variability in stonewares fired at Thnal Mrech.

[176] *Natural Corridor or Challenging Route? Rethinking Pre-Hispanic Communications across the Pacific Coast of Guatemala*

The Pacific coast of Guatemala has long been regarded as a natural corridor that facilitated travel and trade, and served as a route of migration and invasion, connecting eastern Mexico, the Guatemalan highlands, and El Salvador, with further regions of Mexico and Central America. At first glance, the natural configuration of the coast seems to provide unobstructed passage, especially when compared with the rugged terrain of the adjacent highlands. The maps in many publications feature vague arrows marking trade or migration routes, giving the false impression that the coast was a broad unimpeded passageway. They generally omit details of topography and hydrography, and make no distinction among different parts of the coast. A closer look reveals important distinctions in the feasibility and comparative advantage of communication routes along the coastal piedmont, the coastal plain, and the Pacific littoral. The torrential rivers that cut across the coast posed important restrictions for east-west traffic, and in some cases, for north-south access from highland and piedmont sites to the coastal plain and littoral. In this talk, I will use ethnohistorical and geographic data to argue for finer assessment of coastal communication routes.

Chiou, Katherine (University of Alabama)

[297] *Meat, Transport, Fertilizer, and Meaning: Considering the Role of Camelids and Ritual in Moche Food Production*

Camelids (i.e., llamas and alpacas) were domesticated in the Andean region of South America over 6000 years ago. Since then, camelids have occupied a place of central importance in Andean lifeways over the longue durée. Nevertheless, while camelid pastoralism in the landscape of the highland Andes has been well documented ethnographically, ethnohistorically, and archaeologically, the intimate relationship between people and camelids in the Andean coastal valleys is less understood. In this paper, I consider the social dimensions of camelids and their ties to food production using case studies primarily from the Moche (AD 200–800) sphere, including recent data from elite ritual and household contexts from the Late Moche (AD 600–800) sites of San José de Moro and Cerro Chépén in the Jequetepeque Valley of the North Coast of Peru. In doing so, I examine the unique role that camelids played in rituals related to the production and consumption of food—rituals that may have taken on heightened significance during episodes of social conflict stemming from environmental stress and diminished food production.

Chirinos Ogata, Patricia (University of California, Santa Barbara)

[273] *Building Statehood: Wari Architecture and Colonial Strategies in Cajamarca*

Wari expansion across the Central Andes involved the construction of colonies, serving as nodes in the state network from Cajamarca to Moquegua. Each colony, even considering local adaptations, was built following a precise sequence and setting up predetermined types of spaces. Monumental architecture exhibiting Wari features and design became an expression of power by itself, a symbol of Wari hegemony physically inscribed in the local social landscape. Large amounts of work were invested in the construction of colonial installations, as well as the roads that connected them with the other nodes in the system, and the agricultural infrastructure that supported the local communities. In this paper I examine the architecture of the two known Wari colonies in the Cajamarca region—El Palacio and Yamobamba—, and compare their construction and trajectories to other excavated Wari sites, to evaluate their role in the state hegemonic project. Research at these sites shows different motivations for their construction, as well significant changes in their use over time, providing evidence of a dynamic Wari agenda in the North Highlands.

Chisholm, Amelia (The Lost Towns Project)

[251] *A Cultural Landscape Study of Generals Highway*

Generals Highway (MD-178), a major roadway that stretches from Annapolis to the Severn River in Anne Arundel County, was paved in the early part of the twentieth century, but portions of the original colonial roadbed still exist. Anne Arundel County’s Cultural Resources Division, in partnership with Maryland State Highway Administration, conducted a multi-year investigation to identify, locate, record, assess, study, and share with the public the range of archaeological and cultural resources within a one-mile buffer of General’s Highway. This landscape study will assist the State and the County in responsible stewardship of those resources should there be future plans for road modifications as well as to ensure that it is appropriately managed, protected and made accessible to the public for the benefit of the citizens of Anne Arundel County. The work conducted during this period included historic resources survey, architectural documentation, archaeological field surveys, and intensive historic and archival research on the corridor, as well as more targeted investigation of individual cultural or landscape features that played an important role in shaping the corridor as it exists today. The results of this investigation clarify areas of significance which speak to the historic and physical development of Historic Generals Highway.

Chiykowski-Rathke, Tanya (Santa Clara University)

[287] *Deposition in Death and Domestic Contexts at Cerro de Trincheras, Sonora Mexico*

How sherds ultimately enter the archaeological record reflect the roles and beliefs regarding the discard, reuse and repurposing of pottery across the Southwest US and Northwest Mexico. This paper examines the deposition of whole vessels and ceramic sherds from Cerro de Trincheras, Sonora, Mexico. It compares two contexts: the debris of domestic spaces, and the careful internment of vessels as part of mortuary ritual. The ceramic deposition practices of Trinchereros (Trincheras Tradition peoples) reveal the life history of the pots themselves. Despite the ubiquity of pottery by 1300 AD, Trinchereros treated their vessels with great care and consideration, vessels were mended, repurposed and included in burial assemblages showing the cumulative effects of their life histories. These insights provide context for understanding domestic refuse. While sherds help date the site and track migration, archaeologists have incomplete knowledge of how Trinchereros used pots in their daily lives. In this paper, I will discuss the deposition of Trincheras funerary ceramics as they relate to household assemblages.

[171] *Unthinkable Opportunities: Managing Mass Mortality and Transforming Society in the Context of the Second Plague Pandemic in Late Medieval Sub-Saharan Africa, ca. 1300 to 1500 AD*

The sudden emergence of deadly infectious diseases compels societies to improvise ways to manage the dead, explore causations, and save lives. Such overwhelming demographic events are sources of trauma but also opportunities for individual survivors and for the social fabric as a whole. Sub-Saharan Africa, like many other parts of the Old World where past mass mortalities were not documented, has been omitted from the debate about the impact of pandemics on deep historical trajectories. This paper suggests that the second pandemic of plague—the infamous fourteenth century Black Death—was responsible for demographic crises south of the Sahara, which in turn created opportunities for new elite groups to emerge. I will discuss possible short- and long-term impacts of and responses to the plague crisis in the 14th century by different communities living in the forest environment of West Africa, as manifested in the archaeological and oral historical records of southern Ghana and south-western Nigeria. I will argue that these responses led to major socio-political upheavals that are relevant to our understanding of the rise of Atlantic Africa in the late 15th century.

Chovanec, Zuzana (University Albany)

[77] *The Organic Residue Analysis from the Early Bronze Age Site of Sotira Kaminoudhia in Cyprus*

This paper presents the final results of organic residue analysis from the Early Bronze Age settlement and associated cemeteries of Sotira Kaminoudhia. A total of twelve pottery samples were analyzed using Gas Chromatography/Mass Spectrometry (gc/ms) as part of a larger research program that aimed to identify prestigious, organic substances that would have been utilized on the eastern Mediterranean island of Cyprus during the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

prehistoric Bronze Age. Three categories of prestigious substances were targeted: 1) psychoactive substances that generate variable altered states in consciousness, 2) medicines, herbal infusions and other preparations that improve health, and 3) perfumes, ointments and other preparations that are hygienic in nature. This report confirms but also revises earlier reported preliminary results. Analytical methods, interpretative strategies, and anthropological implications will be discussed.

[331] *Countermapping, Data Visualization, and Archaeological Pedagogy: What Happened Here?*

Data and spatial visualization programs afford archaeologists various ways of showcasing their research. Programs, such as the Knight Foundation's free StoryMap JS, and Esri StoryMaps, are of particular use when sharing our research results with the public and, I argue, are useful for conducting collaborative research with communities. In this paper, I detail the experience of using online StoryMap programs in the creation of local history maps created by undergraduate students in collaboration with the Anti-Eviction Mapping Project (AEMP) of San Francisco. By combining information gathered from archaeological reports, oral histories, and historical documents, StoryMaps created through these collaborations showcase diverse histories such as the history of social movements on the UC Berkeley campus landscape, and the "life history" of city blocks in the SoMa neighborhood of San Francisco. These projects are situated in the rich tradition of counter-mapping, which juxtaposes maps created by or to showcase the perspectives of non-hegemonic actors with authorized 'official' maps. In creating these maps, students gain experience in conducting primary and secondary research, writing for public dissemination, and gain mastery of the histories beneath their feet.

Christie, Jessica (East Carolina University)

[132] *Inka Economic and Ritual Landscapes in the Cañete Valley: Strategies to Align the Lunahuana and Guarco*

I will assess strategies employed by the Inka state in interactions with local populations in the Cañete Valley and adjacent valleys. The Spanish found two señorios in the lower Cañete Valley: the Lunahuana, whom they described as well organized and inclined to submit to Inka rule and the Guarco who lived on the shore, offered fierce resistance, and were brutally subdued. The Inka built Inkawasi in Lunahuana territory, envisioned as one copy of Cusco. Inka presence in Guarco territory is documented at Cerro Azul, a primary Guarco center. Its protected bay served as harbour for a society whose economy was based on maritime resources, associated with documented fishing rituals, as well as on irrigation agriculture. The Inka built Cusco-style structures on the cliffs bordering the port, including a wall covering the rocky cliff surface with a staircase descending to the sea. My discussion will assess this exceptional wak'a in relation to Inka cults of the Sun, water, and stone ideology as well as in relation to other Inka installations in nearby valleys, such as Pachacamac, Cerro Bandurria, and El Salitre. The strategic position of Cerro Azul in the Inka road system will also be considered in the analysis.

[198] *Local Responses to Global Events: Regionally Distinct Dietary Changes among Eastern African Herders at the Close of the African Humid Period*

Changing human diets in eastern Africa across the end of the African Humid Period (AHP) have been inferred indirectly from cultural and faunal remains at archaeological sites. Stable isotope analysis (SIA, specifically $\delta^{13}C$) can measure diets directly, yet few studies have conducted SIA on human remains from this region. We present 25 new $\delta^{13}C$ values from human tooth enamel recovered from archaeological sites around Lake Turkana (northwest Kenya) and on Lukenya Hill and Rigo Cave (southern Kenya), whose material culture suggests economic strategies ranging from fishing-hunting-gathering (FHG) to herding. These data show pronounced regional dietary variability even after herding took hold. All samples from the Turkana Basin, including both FGH (GeJi11) and herding (GaJi4, GeJi9, GbJj1) sites, range from -4 to -8‰, indicating strong intake of either C3 plants or animals that consumed them. In contrast, samples from southern Kenyan herding sites of Lukenya Hill (GvJm202) and Rigo Cave (GrJh3) range from -2 to -4‰, suggesting more input from C4 grasses or herbivores feeding upon them. Overall, individuals from northern Kenya sites exhibit greater dietary variability than those from the south. Results suggest that post-AHP environments differed substantially within the eastern African Rift, fostering localized economic strategies by early herders.

[132] *Inka and Local Elite Interaction as Reflected at the Inka Site of Incahuasi, Cañete, South Central Coast of Peru*

Incahuasi, located at the mid-valley of the Cañete river, is the largest Inca administrative center reported from Peru's Central Coast. Although first built as a military base by the Inca Tupac Yupanqui in his war against the Guarcos, the site was completely transformed into an administrative center with an extensive and prominent storage facility. Recent research at the site has focused in Sector B, described as an elite residential complex. Excavations have found a significant number of finished khipus and elements for their manufacture, which would suggest that khipus were knotted within these compounds. Although khipus are assumed as clear evidence of Inka state exerting accounting and administrative activities at Incahuasi, neither the cultural material nor the architecture at the site are of Inka style, suggesting that a local elite was mainly in charge of the administration and operation of the site. This new evidence from the Cañete Valley adds a new perspective on our thinking about state/local relations in the Inka empire.

Chuchiak IV, John (Missouri State University)

[109] *Human Plunder: The Role of Maya Slavery in Postclassic and Early Conquest Era Yucatán, 1450–1550*

Upon initial contact with the lowland Yucatec Maya, the Europeans discovered that a significant number of Maya slaves existed within the Maya communities that they encountered. War captives, orphans, and forced and enslaved sexual servants from the lower classes, Maya slaves and their possession became by the late Postclassic and early colonial period the major source of wealth and power of the traditional Maya Nobility. Divorced from control over specified traditional patrimonial landholdings (which many recent scholars have shown did not exist for the precontact Yucatec Maya), and alienated from most other sources of wealth, Maya slaves and forced servitude became transformed into the most important system of patrimonial wealth and power for the Maya nobility. This paper will examine the political economy of Postclassic Maya slavery, its scale, nature and cultural practices in an attempt to understand the political and economic impact of indigenous slavery, and the continued role that Maya slaves and slavery played in the early development of the conquest credit system that led to the financing of the expeditions of conquest organized by the conqueror Francisco de Montejo and his family in Yucatan (1527–1545).

Church, Warren (Columbus State University, GA)

[178] *A Record of Changing Pulses and Pathways of Interregional Interaction from Manachaqui Cave in the Northeastern Peruvian Cloud Forest*
Results from analyses of deep, stratified cultural deposits excavated at Manachaqui Cave (3,620 m) in the ancient Chachapoyas region provide a "window" on changing patterns of interregional interaction in Peru's northern ceja de selva. Located beside a pre-Hispanic paved road, the rock shelter accommodated mobile foragers, cultivators, travelers, and llama caravans moving through networks connecting societies north, south, east, and west.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Despite several chronological gaps, Manachaqui's sequence extends from the Terminal Pleistocene through the Late Horizon. Diachronic analysis of Manachaqui's assemblages revealed two major patterns of movement and cultural connections. Early interregional interaction connected societies in regions north and south. By ca. AD 200–400, interaction involving llama caravans pivoted west toward highland societies. This new east-west network overlay, but did not replace north-south interaction that persisted throughout the latter centuries of the sequence. To evaluate subsistence self-sufficiency, it is more useful to examine data from the settlement complexes clustered to the east around 2,800 m in the forested Montecristo valley. Evidence from Manachaqui attests to the presence and intensity of interaction crisscrossing the ceja de selva. Mounting archaeological data from the Montecristo valley, and elsewhere along the ceja is revealing understudied, unique cultural developments unlike those in the Andean highlands.

[323] *Cookware and Crockery: A Form and Functional View from the Southern Bahamas*

Recent archaeobotanical research on the Palmetto Junction archaeological site located in Providenciales, Turks and Caicos Islands, provides new insights into the livelihoods and subsistence practices of the peoples who inhabited this coastal region from c. AD 1200–1500. Significantly, the plant microbotanical remains, identified as primarily seeds and tubers provide evidence for a continuation in the consumption and manipulation of plant resources. During the late precolonial period people used domesticated plants such as maize, as well as plant processing techniques that permitted the consumption of otherwise inedible geophytes. Some of the earthenware may have been used as serving vessels, others such as Palmetto-style griddles for cooking. Interpretations of foodway dynamics in this region will serve to build a unique Caribbean perspective of food patterns. In this regard, this research contributes to modern day global appreciations of ancient food ways, which offer significance and meanings to both socially learned practices and other life-ways. An in-depth analysis covering the style and form of the Palmetto Junction ceramics in conjunction with information from ancient starch grains creates a fuller interpretation of how the interrelationships amongst past human societies, plants, and material culture were entangled.

[4] *A Computational Approach to Initial Social Complexity: Göbekli Tepe and Neolithic Polities in Urfa Region, Upper Mesopotamia, Tenth Millennium BC*

Extensive archaeological field work and multidisciplinary research in recent decades shows that communities of sedentary hunter-gatherers during the tenth millennium BC built the earliest presently known monumental structures during the PPNA (ca. 9600–8800 BC) at the ceremonial site of Göbekli Tepe and nearby PPNB settlement sites in present-day Urfa province, southeastern Turkey. However, the earliest evidence of agriculture dates to a later period (early PPNB, ca. 8750 BC, terminus post quem) or began further south (e.g., the Levant). We present a novel computational analysis of initial social complexity in these early Anatolian communities, based on Canonical Theory of politogenesis, evolutionary dynamics, and lines of evidence drawn from Göbekli Tepe and related Urfa sites. Theory and data are then used to create an agent-based model simulating the emergence of worship sites, other diffused cultural patterns, and the emergence of cultivation as may have occurred in the region during the PPNA and initial PPNB periods. The model is implemented in NetLogo. Along with other computational models of early social complexity, it aims to contribute to multidisciplinary understanding of prehistory, origins of civilization, and long-term culture change. Extensions of the model to other regions of politogenesis are also discussed. Dedicated to Klaus Schmidt.

[24] *Baibalyk: An Early Fortified Town and Trading Center in a Nomadic Pastoral Landscape on the Mongolian Steppe*

Mongolia is well known for its history of nomadic pastoralism and Bronze and Early Iron Age burials and monuments. It wasn't until later in the Iron Age that the first large fortified towns and urban centers were built by the Uygher and Khitan Khanates. One of these, Baibalyk is believed to have been established in 758 CE by the Uyghur khagan, Bayanchur Khan, as a ceremonial and trading center in the fertile and strategically located Selenge Valley. Later in the 17th Century, Baibalyk is known to have been the site of a Buddhist monastery. Although prominent on the Mongolian landscape, Baibalyk has received little systematic attention from archaeologists. To address this deficiency, members of the Mongolian International Heritage Team have recently begun a long-term program of investigation to gain a better understanding of the role centers such as Bai Balik played in a nomadic pastoral economy. Preliminary investigation suggests Baibalyk has had a long history of use including Uyghur, Mongolian Empire, Buddhist, and recent historical occupation. In this presentation, we compile existing knowledge concerning Baibalyk and provide the results of a recent reconnaissance of the site and its environs.

petitions left at retreat and medicine shelters such as Cowboy Cave, Hogup Cave, and High Rolls. The ash may represent the burning of fertility offerings, including menstrual pads and diapers.

Clark, Alexis (George Washington University)

[288] *Designing Influence: Aesthetic Choices and Group Identity in Decorated Ceramics of Late Postclassic Etlatongo, Oaxaca, Mexico*
During the Late Postclassic (A.D. 1200–1520) in the Mixteca Alta of Oaxaca, Mexico, aesthetic qualities of ceramics were utilized as both decorative values and tools for negotiating the creation of group identities and ideologies within communities. Through a stylistic analysis of Yanhuítlan Red on Cream type ceramics recovered from excavations at the site of Etlatongo, in the Nochixtlán Valley, I explore how these vessels and the motifs depicted on them were used during the creation of identity-based meanings that were easily recognized during public ceremonies. Since these ceramic types were broadly accessible and relatively abundant, I compare the frequencies of design motifs to others found on at sites throughout the Mixteca Alta, including Yucuita, Chachoapan, and from survey data within the Tamazulapan and Teposcolula valleys. I argue that the stylistic qualities of Yanhuítlan Red on Cream wares were directly involved in dialogic social processes that promoted ideologies shared by elites and commoners within the site.

[124] *Knapping for the Thrill of It? The Non-conservation of Raw Materials at Middle Paleolithic Sites*
Open-air Middle Paleolithic sites in France are characterized by dense piles of lithic material surrounded by low density “empty” areas. Spatial analysis can be used to segregate lithic artifacts based on whether they are located in the high or low density zones. This analysis is supported by the spatial tracking of refitting sets. The results indicate that high density zones likely correspond with knapping locations and low density areas contain lithics selected from the knapped material for use. The dense knapping piles contain many lithic pieces thought of as manufacturing debris, but also many optimal blanks. This suggests that the conservation of raw materials was not a priority for Middle Paleolithic knappers at these sites.

Clark, Andrew (SUNY-Albany)

[239] *Warfare and Topography in the Middle Missouri*
The Missouri River Valley is a unique landscape for horticulturist settlements. The semi-arid Great Plains have wildly fluctuating weather patterns and resulted in a difficult growing environment with frequent changes in productivity. The terraces of the river valley offered relatively flat areas for village planning, the terrace-forming flood waters refreshed the flood plains with nutrient rich sediment for village gardens, and the terrace breaks provided protection from both wind and invaders. While archaeologists have inferred the relationship between topography and warfare among village dwelling farmers living in the Middle Missouri Subdivision of the Great Plains (A.D. 1000–1830), this concept has not been explored systematically. Topographic Position Index (TPI) is one measure that has gained popularity over the last decade as a tool to investigate an array of geographic variables. Using a pre-dam DEM, I calculated a TPI for the Big Bend geographical division to identify landform classifications within the model compared against site locations. The results show a fluctuation in village settlements among differing landforms over time and between taxonomic cultural units along with a positive correlation between topographic prominence and increased fortification construction.

[106] *Call of the Wild: Historic Preservation in Region 1's Wilderness*
Region 1 of the U.S. Forest Service manages more than 25 million acres in Washington, Idaho, Montana, and North and South Dakota, with more than five million acres designated as Wilderness and Wilderness Study Areas. Because of the Wilderness Act, NHPA Section 106 surveys that would identify potential archaeological sites are generally not undertaken in Wilderness areas. However, a number of known historic structures in these areas have been restored by the Northern Region Historic Preservation Team (NRHPT), which is a unique entity within the U.S.F.S. that completes historic preservation projects throughout Region 1. In particular, the NRHPT directs a wide range of historic building preservation projects, including the use of traditional tools. Several Forest Service employees have been trained by the NRHPT, enabling national forests to plan and implement their own preservation projects with minimal preservation team supervision or guidance. A wide variety of historic properties that might otherwise fall into disrepair or neglect are now maintained for continued agency operations and public use. In this presentation, we will provide examples of restoration projects of historic structures in Wilderness areas in Region 1, underscoring the importance of preserving these structures through this unique resource.

Clasby, Ryan (Central Washington University)

[178] *Through the Forest: North-South Interregional and Intra-regional Interaction along the Eastern Edge of the Andes during the Early Intermediate Period*

This paper will examine the intensification of long distance intraregional interaction networks among eastern slope (also known as ceja de selva) populations during the late Early Horizon and Early Intermediate Period. The centuries following the decline of the Chavín and Chorrera cultures are thought to represent a period of balkanization and (eventual) regionalization throughout much of the Central and Northern Andean coastal and highland valleys as previously established interregional interaction networks were discarded in favor of localized self-sufficiency. However, recent archaeological data from the site of Huayurco in the Jaén Region of the northeastern Peruvian Andes suggests that ceja de selva (and some highland) populations from Ecuador and northern Peru continued to engage in both interregional and intraregional long distance exchange through the end of the Early Intermediate Period. Based on the broad patterning of material culture, these networks were seemingly oriented around the Marañón River and its major tributaries. Through a diachronic comparison of the Huayurco data to artifact assemblages from the ceja de selva and Ecuadorian highlands, I will examine the nature of these intra and interregional exchange networks, the mechanisms that held them together, and their impact on long term cultural change within the Andes.

[216] *Emergence of Female Power on the North Coast of Peru: Exploring Priestesses' Identities and Their Influence within the Funerary Realm in San José de Moro*

After more than twenty years of investigations, the San José de Moro Archaeological Project has found a total of seven funerary chambers pertaining to the Late Moche “priestesses” (AD 600–850) in one of the most important ceremonial centres and cemeteries located on the North coast of Peru. The sudden appearance of that specific character is echoed in the sacred imagery where the priestess is depicted, as a supernatural woman enacting in complex ritual activities with other elite characters. This new imagery introduces an era where powerful women are made visible and contributes to the construction of a normative image of the Moche deity. While the necessary and contingent reasons for their sudden appearance remain unclear, some

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

questions still remain regarding the women who were buried as their personification. This paper fits into the broader issues of the emergence of women power in the Moche society, as we assess how identities are negotiated through the priestesses' burials by looking at the related data material, along with the architectural and anthropological data. We also propose to measure the influence of the new cult on contemporary mortuary population. By doing so, we aim to bring new light on those peculiar powerful women.

Clay, Elizabeth (University of Pennsylvania)

[208] *"A Wondrously Fertile Country": Agricultural Diversity and Landscape Change in French Guiana*

As a circum-Caribbean, non-island space on the coast of northeastern South America, French Guiana presents a distinct context in which to explore plantation slavery and Caribbean commodity production. The "sugar revolution" that overtook areas of the Caribbean at various historical moments reached French Guiana during the nineteenth century, yet monocultural production of the crop never took hold. Instead, plantations producing a variety of agricultural commodities including cotton, coffee, annatto, and spices were more typical for the region. Using archival, archaeological, and remote sensing evidence, this paper presents an overview of the diversity of agricultural production in 19th c. French Guiana and specifically explores how and why certain commodities destined for foreign markets came to be produced in this marginal space, how their production impacted the daily lives of enslaved Africans and altered local landscapes, and the contemporary legacies of these social and spatial transformations.

[221] *Stress and Sociocultural Reactions to Environmental Change in the Late and Terminal Lima on the Central Coast of Peru*

This project examined evidence of stress in 469 excavated human skeletons of the pre-Hispanic Lima population from Huaca 20 in the Maranga Complex in modern day Lima, Peru dating to the end of the Early Intermediate Period (ca. 200–600 AD) and the beginning of the Middle Horizon (ca. 600–900 AD). This period saw the movement of the populations on both the North and Central Coasts of the Andes inland to areas with greater access to the critical water supply (Shimada, 1994). While the majority opinion is that this transition was related to environmental stressors, their severity, effect, and manifestation in the population is unclear. The main objective of this study is to explore what types of stressors the Lima at the Maranga Complex, one of their principal ceremonial-population centers, experienced and how the population responded to those stressors.

Clindaniel, Jon (Harvard University)

[65] *Are Inka Khipu Knots Anything More than Numbers?: A Computational Investigation*

Inka khipus—the knot and cord recording devices of the Andes—have been said to have recorded everything from accounting, to histories and songs. Leland Locke demonstrated in the 1920s that Inka khipu knots often have standard numerical values. However, non-numerical Inka khipu signs remain elusive and undeciphered. Recent work by Gary Urton, however, has identified Inka khipus and individual khipu cords with knots that do not obey the standard numerical rules Locke identified. May Inka khipu knots also have had a non-numerical semiotic function?

Here, I use the Harvard Khipu Database, Python statistical libraries, and Benford's Law to evaluate this claim and potentially identify a non-numerical Inka khipu sign unit. Specifically, I compare knot value frequencies in extant Inka khipus to those expected in a numerical dataset, as predicted by Benford's Law. Benford's Law is used to identify fraud in a variety of disciplines—providing numerical frequencies that are characteristic of a set of empirically observed numerical values as a point of comparison. Thus, if knot value frequencies diverge severely from Benford's Law expectations for any set of khipus, these khipu knots likely functioned as non-numerical signs.

[329] *The First East-West Dichotomy?*

Hallam Movius proposed that the Lower Palaeolithic cultures of East Asia and SE Asia were derived from a different cultural trajectory than that of Europe and Africa. The chopper-chopping tool complex of East and SE Asia was argued to be more primitive in many aspects. The type-site assemblages of the Pacitanian and Tampanian cultures are two out of only five assemblages that Movius initially used to define the chopper-chopping tool complex. The Pacitanian was first discovered by Michael Tweedie of the Raffles Museum, Singapore, and Gustav von Koenigswald in 1935 in the Pacitan Regency of Java. Three years later, a scientific team, including Movius, travelled to Java to investigate Tweedie and von Koenigswald's findings. Also in 1938, Michael Tweedie's colleague at the Raffles Museum, H. D. Collings, published an article in *Nature* announcing a discovery of a similar archaeological assemblage in Malaysia that he named the Tampanian. This presentation provides a reassessment of the original Pacitanian and Tampanian assemblages that are still held in Singapore, highlighting reduction strategies that have been overlooked since the 1930's and how the postcolonial history of scientific research in Singapore coupled with the dominance of Movius's analysis may have led to this oversight.

Cobb, Allan, James Brady (California State University, Los Angeles) and Guillermo De Anda Alaniz (Gran Aquífero Maya)

[134] *Demystifying the High Priest's Grave: Investigations in the Cave/Cenote below the Osario*

One of the most enigmatic publications in Maya cave archaeology has been Edward H. Thompson investigation of the High Priest's Grave at Chichen Itza in 1896. Thompson discovered a masonry shaft running down the center of the pyramid that gave access to a cave/cenote beneath the structure. This was the first account of a cave with a pyramid built over it and Thompson suggested that the cave contained seven chambers, hinting at the possibility of a Chicomoztoc. J. Eric Thompson in editing and publishing the report in 1938 notes that there are a number of discrepancies in this early account and over the years, archaeologists have grappled with the meaning of the discovery.

The Gran Aquífero Maya project undertook a restudy of the pyramid, shaft, and cave. The stone floor at the base of the shaft was found to be the top of a small platform that predated the construction of the pyramid. Evidence suggests that the cave had been subjected to a termination ritual and no Chicomoztoc configuration was found.

Cobb, Charles (Florida Museum of Natural History)

[283] *Ancestral Chickasaw Migration and the Makings of the Anthropocene in Southeastern North America*

We describe recent investigations of Indigenous communities who vacated the Tombigbee drainage of eastern Mississippi in the mid-fifteenth century A.D. These and surrounding groups migrated into nearby uplands known as the Blackland Prairie. Populations continued to move northward within the prairie and coalesced around what is today Tupelo, MS, in the 1600s. The move from a riverine to upland setting involved a dramatic shift in practices of historical ecology. The rich soils and open terrain of the prairie system at the time of European contact were likely a result of repeated burning and other modifications by ancestral Chickasaw, leading to an early description of the countryside as "pleasant open forests of oak chesnuts and hickory so intermixt with savannas as if it were a made landscape." Our work describes how the historical ecology of migration was an outgrowth of climate change, regional social tensions, and the later arrival of Europeans.

[185] *Health and Mortuary Treatment in Early Bronze Age Transylvania*

Copper and gold resources from Southwestern Transylvania played a critical role in the emergence of inequality in European Late Prehistory. Communities in this metal-rich landscape, however, remain poorly understood. Though the highly visible tombs in the Apuseni Mountains where these communities buried some of their dead have been known to local archaeologists for decades, very little is known about the backdrop of health and disease in the region. Here, we present one of the first bioarchaeological analyses of skeletal and dental health for the Apuseni Early Bronze Age, focusing on a sample of human remains that incorporates individuals of both sexes and a range of ages, from very young children to older adults. Our results show relatively low levels of skeletal pathology, with age-related insults such as osteoarthritis predominating. In contrast, dental insults were more common and included caries, calculus, alveolar resorption, and abscesses. We present several case-studies of older individuals affected with particularly severe combinations of dental insults, and discuss the dietary and behavioral implications of handling such pathologies, at both the level of the individual and the community.

[67] *Geospatial Interpretations of Enslaved Landscapes in the Antebellum Georgia Lowcountry*

This project uses geospatial landscape theory to explore how enslaved people living in settlements on the Sapelo Plantation signaled their African and Caribbean roots through overt and covert materials and landscape patterns in Bush Camp Field and Behavior settlements. Enslaved people at the Sapelo Plantation were likely granted higher levels of relative independence, resulting in a different relationship with the landscape than enslaved people at contemporaneous lowcountry plantations. I hypothesize that the formative factors that created such an intricate network of places on the Sapelo Plantation landscape stem from three major variables: (1) the use of the task system at Sapelo Plantation for organizing labor; (2) the agricultural, political, and economic uniqueness of the late-antebellum Georgia plantations, including the impact of the cessation of the global slave trade; (3) and the impact of the Igbo Landing Rebellion. Throughout the antebellum south, planters defined how certain spaces were to be used by slaves; enslaved people created and cultivated places. The purpose of this research is to identify the location of previously unknown non-tabby slave cabins at Sapelo Plantation to understand how the three variables impacted slaves' use of the landscape leading to ethnogenesis of Gullah Geechee culture on Sapelo Island, Georgia.

[226] *The Final Frontier: Chaco Great Houses in the Great Sage Plain of Southwestern Colorado*

The expansion of the Chacoan regional system into Southwestern Colorado was relatively late compared to other areas, occurring for the most part from A.D. 1080 to 1140. This poster examines this late expansion by focusing on Chaco-style great houses located in the Great Sage Plain of southwestern Colorado. Information on these Chacoan sites has been compiled during a series of projects that began in the late 1980s and continued with 2017 fieldwork during the Community Center Reassessment Project. We present an inventory of all known great houses, assess their chronological development, document variation in their size, examine their association with other types of public architecture, and identify groups of great houses that occur in distinct clusters. We conclude by examining the connection between these sites and those in Chaco Canyon and at Aztec.

Cofran, Zachary (Vassar College), Reed Coil (Nazarbayev University) and Gabriel McGuire (Nazarbayev University)

[304] *Geoarchaeological Survey of the Irtysh River Basin, East Kazakhstan*

Evidence for the earliest human occupation of Eastern Kazakhstan is poorly known, despite it being part one of the largest countries in the world and flanked along its borders with important paleoanthropological sites in Russia and China. We sought evidence of prehistoric sites by foot and vehicle survey around the Irtysh Basin. At each major point of interest we took photographs geotagged with geographic coordinates, and collected global positioning system (GPS) data. Although much of the area we covered lacked clear evidence of human prehistory, we found several locations that merit further investigation. One exposed soil profile contained a large bovid humerus, a long bone shaft fragment with apparent green fractures, and two stone flakes. In addition to foot and vehicle survey, we consulted with local residents in many of the small villages we encountered. A resident of the village Balgyn led us to a small cave, in which he says he had found "arrowheads." This informant also told us there was a larger cave in the area, which we will investigate next season. Two other caves were found near the town of Ognevka, both following the same small river that drains into the Irtysh.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Cohen, Anna (Utah State University)**[169]** *Local Political Economies at Angamuco, Michoacán: Insights from Ceramic Archaeometry*

A key goal in the study of ancient artifacts is determining their provenance. Such information can provide insight into the production and consumption of artifacts, but may also inform discussions about local political economies. Our study uses qualitative optical petrography and geochemical analysis (NAA) to evaluate the tempers and paste recipes in ceramic fragments and raw clays from Angamuco, located in the Lake Pátzcuaro Basin, Michoacán. Angamuco was occupied before and throughout the development of the Purépecha Empire (1350–1530 CE) and is thus an important case study for understanding the impacts of political change on urban landscapes. Angamuco appears to have been relatively self-sufficient in pottery production, beginning in the Classic and through the Postclassic, including during imperial incorporation. While we did identify some temporal and spatial variation in ceramic production and consumption, pottery technologies and techniques of manufacture appear to have remained relatively stable over long periods of time. Our data point to multiple small-scale producers, who focused on local clays and tempers, generating numerous, complex paste recipes. The results of this analysis contribute to our understanding of ceramic production processes at Angamuco and may be compared to provenance studies in Western Mexico and elsewhere.

Coil, Reed (Nazarbayev University), Martha Tappen (University of Minnesota), Reid Ferring (University of North Texas), Maia Bukhsianidze (Georgian National Museum) and David Lordkipanidze (Georgian National Museum)**[41]** *Photogrammetry, Spatial Patterning, and Site Formation of the Hominin-Bearing Layers at the Lower Paleolithic Site of Dmanisi, Georgia*

The Lower Paleolithic site of Dmanisi, Georgia, is well known for its rich archaeological and paleontological deposits, which include bones from at least five individuals attributed to *Homo erectus*. Taphonomic analyses show that carnivores contributed greatly to the accumulation of faunal material, while contributions by hominins were present, but uncommon. Recent excavations in the hominin-bearing layers of Block 2 at Dmanisi have revealed a complex underlying basalt formation that likely dictated much of the site formation processes, both biotic and abiotic. Combining spatial patterning with a 3D model of the excavation generated using Agisoft Photoscan, we identify several areas where the basalt, and the pseudo-karstic pipe and gully formations, have constrained the deposition of material. 3D bone orientations in many areas show strong correlations to the underlying shape of the basalt formation. In addition, spatial patterning of the lithic and faunal material differs depending on stratigraphic layer, which is also controlled largely by the basalt and pipe/gully formations. The distribution of coprolites, however, is independent of these patterns, possibly indicating spatially discrete carnivore activity.

Coker, Adam (University of Illinois Urbana-Champaign), Kimberly Swisher (University of Michigan), Jennifer Birch (University of Georgia), Stefan Brannan (New South Associates) and Tiffany Yue (University of Georgia)**[266]** *Creating Community at Singer-Moye: Feasting and Craft Production in a Residential Precinct*

During its estimated 400-year history of occupation, Singer-Moye was a focal point of prehistoric settlement and socio-political development in the Lower Chattahoochee River Valley of southwestern Georgia (USA). Between A.D. 1300 and 1400, the site was a focus of regional settlement aggregation that included the expansion of the site's monumental core and the deposition of a dense occupational midden surrounding that core. In 2016 and 2017, excavations at Singer-Moye were focused on investigating geophysical anomalies in an area adjunct to Mounds A and H at the site, in what has been interpreted as an elite or ceremonial precinct. This poster discusses the results of those investigations and presents interpretations of activity patterns in a residential portion of the precinct during a pivotal period in the site's occupational history, including evidence for feasting and specialized craft production.

Colaninno-Meeks, Carol (Southern Illinois University Edwardsville)**[168]** *The Need for Discipline-Based Education Research in Archaeology*

Over the last several decades, STEM scholars have recognized the importance of developing and integrating discipline-based education research (DBER). As outlined by the National Research Council of the National Academies, the goals of DBER are to 1) understand how students learn discipline concepts, practices, and ways of thinking; 2) understand how students develop expertise; 3) identify and measure learning objectives and forms of instruction that advance students towards those objectives; 4) contribute knowledge that can transform instruction; and 5) identify approaches to make education broad and inclusive. Physicists, chemists, engineers, biologists, astronomers, and geoscientists have been among the first to adopt DBER, mostly at the undergraduate education level. Given research that demonstrates the effectiveness of instructional strategies derived from DBER, both at P-12 and undergraduate teaching, I call for archaeologists to adapt DBER, while developing infrastructure that supports and advances avenues of DBER and instructional implementation. Further, I argue that adopting DBER will be vital to sustain our field given current threats and actualized funding cuts.

Colantoni, Elizabeth (University of Rochester), Gabriele Colantoni (University of Rochester), Serena Cosentino, Maria Rosa Lucidi (Sapienza—Università di Roma) and Gianfranco Mieli**[29]** *The Copper Age in Apennine Central Italy and the San Martino Site at Torano di Borgorose (Rieti, Italy)*

Excavations at the San Martino site (Torano di Borgorose, Rieti, Italy) have uncovered the remains of a Copper Age settlement, with evidence of a daub structure and possible hearth. The present contribution reports the results of investigations here and situates these results within the broader context of the mountainous interior areas of central Italy, including parts of the Lazio region and especially neighboring Abruzzo. The quantity of data available from Copper Age sites in this geographical area has increased considerably in recent decades, and it seems clear that people were occupying the landscape fully by the third millennium BC. Evidence from excavation and survey includes abundant pottery, lithic assemblages, and bones, sometimes associated with structures. Sites were used for activities connected with pastoralism and are found along lakeshores, on raised terraces and hillslopes, and even at high altitudes. Still lacking are extensive explorations of individual sites, and absolute dating is needed to refine the traditional chronology, based almost exclusively on ceramic evidence. Nonetheless, the amount of information available from places like the San Martino site makes this geographical area ripe for the kind of regional syntheses already long since undertaken for the Copper Age in other parts of Italy.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Colclasure, Cayla (University of Alabama), Megan Belcher (University of Tennessee), Jon Russ (Rhodes College), Stephen Carmody (Troy University) and Martin Walker (University of Tennessee)

[86] *Analyzing Late Woodland Pipe Fragments from the Topper Site (38AL23): Exploring the Botanical, Social, and Ritual Intersections of Smoking*

Three pipe fragments uncovered during a 2017 University of Tennessee excavation at the Topper Site (38AL23) in Allendale County, South Carolina have opened a window into the social and ceremonial practices of the site's Late Woodland inhabitants. Morphometric, paleoethnobotanical, and residue analyses have enabled us to explore the societal role smoking played within this community. We compare the form, design, and contents of these fragments to similar artifacts from across the region and explore the multifaceted role smoking played at the individual and civic levels. Paleoethnobotanical and chemical residue analyses have been conducted on the contents of a pipe bowl from the site, the results of which will inform our interpretations and enrich our understanding of smoking's purpose within this Woodland community. Drawing on ethnohistorical accounts and comparative archaeological studies, we consider the known uses of various plant species in smoking rituals within the precontact Southeast. We aim to understand the role of smoking within this community specifically, and to situate this local iteration of the practice within the broader regional context.

Cole, Kasey (Dept. of Anthropology, California State University,) and Kelsie Hart (Department of Anthropology, California State University)

[179] *Faunal Remains from Point San Jose: Analysis of Butchery Patterns and Implications for Site Context*

The analysis of butchered archaeofaunal specimens from historic sites can lend important insight into diet, food preparation, discard practices, and socioeconomic status. In this study, we examine faunal specimens found commingled with human remains from a pit associated with a 19th century historic army hospital located in Point San Jose, California. The specific aim of this study is to relate observed butchery patterns on the faunal remains to diet and socioeconomic status at the site. Patterns of butchering are compared to two other historic assemblages in California, as well as historic accounts of army food rations and butchery practices. The results of this study will provide a deeper understanding of the role of the army hospital pit and the site in general, and has greater implications for interpreting butchery patterns in the archaeological record.

Collar, Anna (University of Liverpool)

[83] *Going Deeper: Can We Use Network Approaches to Reconstruct Memory, Meaning and Emotion?*

Understanding our past needs more than the long lens of nodes, links, and centrality measures: archaeology is bound to people's things and people's places. Although network analysis is concerned with relationships, it has not yet been harnessed to approach the meaning, memory and emotion encoded in our relationships with things and places. We must address this by ensuring that our network analyses incorporate these aspects of lived experience and make meaningful contributions to advancing the archaeological narrative. This paper explores how we might build a methodology for humanised archaeological network analysis in which the lived experiences of people in places and with material culture are considered as an 'entanglement of lines, not a connecting of points' (Ingold 2007: 81). I will focus on the material associated with Syrian cults in the Roman world, using different network approaches at a range of scales in combination to present place as a complex, ongoing result of multiple intertwined networks of experience, emotion, memory, narrative, material and landscape. Network analysis is only part of this project—which begins to look more like Ingold's meshwork or a 'deep map'.

Collard, Mark (Simon Fraser University), Brea McCauley (Simon Fraser University), Chris Carleton (Simon Fraser University) and Andre Costopoulos (University of Alberta)

[118] *Testing Dunnell's Waste Explanation for Monument Building with an Agent-Based Model*

The construction of shrines, tombs, and other monuments is one of the most puzzling human behaviors from an evolutionary perspective. Building monuments is costly in terms of time and energy, and yet it is difficult to see how it contributes to survival and reproduction. In the late 1980s, Dunnell argued that monument building and other apparently wasteful behaviors are in fact adaptive in environments that are characterized by severe and/or unpredictable perturbations. Such behaviors are adaptive, according to Dunnell, because groups that undertake them will have lower birth rates than groups that do not and therefore will be less likely to experience food shortages in bad years. In addition, wasteful behaviors are adaptive because they represent a reservoir of time and energy that can be devoted to subsistence and/or reproduction in times of difficulty. Here, we report the results of a study in which we tested the waste hypothesis with an agent-based model in which the severity and predictability of environmental threats and the agents' propensity to waste time and energy were varied systematically. Our results indicate that the situation is not as straightforward as Dunnell imagined.

[79] *Dennis Stanford at SI: The Man, The Place, The Career*

Dennis Stanford heads up the Archaeology division at the Smithsonian Institution and its Paleo-Indian Program. From the time he completed his graduate studies (PhD 1974, University of New Mexico), Dennis has held positions in the Department of Anthropology at SI, repository of the major archaeological collection in the United States. In his more than four decades at SI, he has fostered acquisition of archaeological (especially PaleoIndian) additions to the Department's collections, conducted scores of field investigations here and abroad, and produced numerous archaeological exhibits, publications, and films. He is curator of North and South American Paleolithic, Asian Paleolithic, and Western United States archaeological collections. Even though his office is nearly always busy with staff, interns, students, visiting scholars, and kibitzers, it exudes a welcoming atmosphere. Although beset with administrative and public service responsibilities, Dennis has maintained a research program of the highest quality and built the finest PaleoIndian collection in the Americas. His aura reaches far and wide. Our discipline owes him a huge, "Thank You."

Collins, Renee (Northern Arizona University) and Rafael Guerra (University of New Mexico)

[28] *Rising from the Bush: Investigations of Elite Households Adjacent to Site Cores in the Belize Valley*

Since 2010, the BVAR Project has conducted intensive research at the recently discovered site of Lower Dover, located directly across the Belize River from Barton Ramie. A major part of the BVAR investigations is to determine the socio-political relationship between Lower Dover, Barton Ramie, Blackman Eddy, and Baking Pot. Other research questions have focused both on the monumental architecture of the site core, and on plazuela groups in the periphery of site's epicenter. One such peripheral house group, classified as Group G, consists of 5 mounds that enclose a small plaza just north of center's ballcourt. This paper presents the results of our investigations on Group G, compares the development of this household with that of the site center, and discusses the potential relationships between site cores and adjacent patio groups.

[162] *Selective Surplus: Material Networks in Formation at Yaxuná, Yucatan, Mexico (900 to 350 BCE)*

Recent investigations of Yaxuná, Yucatan, Mexico have provided evidence to suggest that the earliest permanent spaces, by way of the site's E-group complex, in the Northern Lowlands were roughly contemporaneous with the early developments observed at Central Lowland sites. On the one hand, this data provides an outlet to better explore the large scale social processes impacting the early macro-region of the Maya area. However, material analysis of recovered shell, lithic, and ceramic artifacts assisted by stratigraphic context has revealed that many of the regional characteristics of later

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

periods, such as shared religious practices, systems of material value, and networks of exchange were much more distinct at the local level than anticipated in the earliest investigated contexts. As a result, the data make it clear that as time progressed from 900 to 350 BC, while Yaxuná underwent urbanizing processes, the presence of material objects increased while the selection of those materials gradually became focused on more fixed sources. In the same way, the previously recognized diversity of material objects became increasingly limited. This paper will focus on the implications of the Yaxuná data for the development of systems of value and exchange in early Maya society.

Coltman, Jeremy (University of California, Riverside)

[209] *Chichen Itza and the Early Postclassic International Style*

Chichen Itza has long deserved an approach based on an analysis of the art and iconography of the site for its own merits rather than the continually frustrating analysis that results from attempts to project Late Postclassic religious stories on to the site. Effortlessly blending themes of paradise and militarism, Chichen Itza drew on a wide array of styles that appear in strikingly similar ways indicating the workings of an Early Postclassic International Style that simultaneously integrated old and new, local and exotic. The sheer cosmopolitanism of Chichen Itza makes this site an excellent point of departure for examining how stylistic and iconographic elements came to be shared at such distant sites and in similar ways. While Central Mexican influence cannot and should not be ignored, other cultural areas in the Late Classic period such as Cotzumalhuapa and Ceibal deserve renewed attention as contributors to an Early Postclassic International Style.

[266] *Hidden in Plain Sight: Mississippi Plain Pottery as an Indicator of Movement on the Mississippian Periphery*

Shell tempered pottery with smoothed surfaces, widely referred to as Mississippi Plain Pottery, is a ubiquitous but understudied element of Mississippian assemblages throughout the Midwest and Southeast. Along the northeastern Mississippian periphery, shell tempered plain pots and body sherds are present but have not been formally considered. Through analysis and direct dating of early Fort Ancient (c. AD 1000–1300) ceramic assemblages, we suggest that Mississippi Plain pottery appears early at some sites along the Middle Ohio River. Comparing these assemblages to contemporary Mississippian and Fort Ancient sites in the Ohio Valley points to a dichotomy in the early Fort Ancient system. Sites along the Ohio River appear to be more “Mississippian” in nature while sites south of the Ohio River appear to be more “Woodland” in nature. Using ceramic assemblage composition as one line of evidence in a multifaceted project investigating agricultural origins, it is becoming clear that the development of Fort Ancient societies was tied to the movement of Mississippians throughout the river valleys of the Midwest.

[124] *Interpreting Small-Scale, Intra-site Spatial Variation of Finds from the MSA Deposits at Sibudu Cave, South Africa*

Sibudu Cave in KwaZulu-Natal, South Africa is a key Middle Stone Age site that provides a high-resolution stratigraphic record of cultural change. The sequence from Sibudu is well-dated and has been the focus of intense geoarchaeological research. This paper examines the spatial distribution of lithic artifacts, faunal remains, worked ochre, burnt materials and botanical finds to see if these distributions provide meaningful information on the changing use of space at the site. The study will focus on deposits overlying the Howiesons Poort and dating to ca. 58,000 years ago, a period when the site was occupied intensely and for which we have documented much short-term technological change. We examine the question of whether or not important behavioral information on the spatial use of sites can be identified through careful analysis of small areas with high stratigraphic resolution.

[190] *Inferring Iroquoian Architectural Variability from Magnetic Gradiometry*

Magnetic gradiometry is an affordable and preservation-minded method to detect a wide range of subsurface features at historic and prehistoric archaeological sites. Horizontal excavation is the only way to confirm the nature of features detected by magnetic gradiometry, but in some cases may be impossible or undesirable. Excavation-based understandings of local architectural practices can be used to infer the nature of magnetic anomalies, as long as those understandings encompass the full range of architectural variability that may reasonably be expected. Magnetic gradiometry was conducted at three sixteenth- and seventeenth-century Iroquoian villages in Ontario, Canada: Spang, Trent-Foster, and Hamilton-Lougheed. A search of extant excavation records was conducted to characterize the range of architectural variability likely to be found on these sites, including structure dimensions, hearth placement, and wall construction techniques. The different kinds of anomalies that these structural variations might present in magnetic gradiometry data were reproduced, and compared to actual data collected from the three sites. Based on these expectations and the identified anomalies, significant intersite and intrasite architectural variability is inferred. This approach has general methodological utility for interpreting subsurface anomalies in magnetic gradiometry data in the Eastern Woodlands and other areas with similar soil conditions and architectural traditions.

Conlee, Christina (Texas State University)

[335] *Nasca-Wari Relationships on the Greater Peruvian South Coast*

The Middle Horizon was a period of unprecedented interaction and change in the Nasca region. Nasca was one of the earliest places where Wari influence was found, extending back to the pre-imperial Huarpa culture of the Early Intermediate Period. It is also one of the few coastal regions with solid evidence of Wari colonization. However, the relationship was not a simple, unilinear one with Wari the dominant core society and Nasca the passive peripheral society. Instead a bilateral relationship developed in which many things were shared between the two. Wari colonies and foreigners are found in Nasca, along with changes in local settlements, new mortuary practices, and new long-distance prestige goods. Many aspects of Nasca

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

culture were incorporated by Wari including ceramic technology, iconography, flexed burial positions, and trophy head taking. The evidence from Nasca suggests a hybrid culture developed that is most evident in the Loro ceramic style and in ritual practices involving trophy head taking. It is possible that it is from the Nasca region that Wari influence, and this new hybrid culture, spread to valleys further south along the coast.

Conlogue, Gerald (Quinnipiac University) and Michelle O'Connor (Radiologic Sciences Programme, School of Medici)

[204] *The Role of Radiographer as a Member of the Arch Street Project Team*

The value of a radiographic examination of skeletal remains is unquestionable. Over the past several decades, technical innovations have resulted in more compact equipment making it easier to set up radiography in the field. Digital imaging receptors have replaced film and software has enabled post-processing image manipulation, further simplifying the logistics and efficiency of field imaging studies. Radiography systems are designed to minimize radiation dose in living patients leading to a concurrent loss of resolution. However, anthropological applications aim for optimal resolution with less regard for radiation dose. A radiographer, versed in the science of radiography, can be invaluable in planning field radiographic studies, selecting optimal equipment, and assembling an imaging team. A team should consist of at least three individuals for maximum efficiency. Including radiography students on a team provides an opportunity for classroom theory to be put into practice. It also exposes students to the realities of field research such as needing to modify plans onsite due to unforeseen challenges. The presentation concerns the examination of material recovered from Arch Street Project by a team that put the aforementioned ideas into practice.

[168] *Prioritizing the Expressed Community Needs in Educational Projects in Ancash, Peru*

This paper evaluates the efforts to create and implement a diversity of cultural heritage educational programs over a four-year period in the Ancash Region. The initial impetus for the development was in large part viewed as a means for obtaining community support for archaeological research projects and an increased commitment of local stewardship for cultural heritage resources. Over the four-year period, we made a decisive shift from an approach of creating products for the community to one where we worked directly with the community. We determined that a co-creative approach that prioritized the expressed needs of the community resulted in programs with an increased likelihood for being sustained increasingly by the local community. Finally, we consider on a Critical Assessment Framework as developed by Worts to evaluate the success of these programs.

[125] *A Commensal-Prey Relationship in Early Mainland Southeast Asia? The Case of the Burmese Hare (*Lepus peguensis*)*

Rabbits and hares are often a central part of human subsistence strategies in both the past and the present. However, the Burmese hare (*Lepus peguensis*)—the sole member of the family Leporidae indigenous to mainland Southeast Asia (MSEA)—is rarely eaten today, and its status in the past is unclear. Although this taxon is currently abundant across a wide geographic range, it has a poor zooarchaeological record during the Pleistocene and Holocene. Identified specimens occur sporadically in hunter-gatherer contexts, and increase in presence and abundance during the Neolithic, Bronze and Iron Age. Ecological data suggests that *L. peguensis* prefers anthropogenically modified agricultural environments and can be an agricultural pest. This species may thus represent a potential commensal-prey species for prehistoric agricultural populations in MSEA. In this paper, we use zooarchaeological evidence for Burmese hare and stable isotope analysis of prehistoric and modern specimens to assess whether this taxon represents a commensal species in prehistoric mainland Southeast Asia.

[253] *We know that our people have been part of this land since the beginning of time—A Cultural Statement for the Ancient One*

The assumption was made that because the Ancient One was so old, and because the court deemed him not “Native American”, the Claimant Tribes had no connection to him, and, therefore, no concern for him. Those assumptions were proven to be incorrect. Evidence demonstrating the Cultural Affiliation of the Ancient One to the Claimant Tribes can be found within the disciplines of indigenous knowledge, geography, biology, archaeology, anthropology, linguistics, folklore, oral tradition, and historical data. The totality of all evidence demonstrates cultural persistence and adaptive change resulting in the continuum of culture and kinship within Plateau peoples. The evidence clearly indicates the indigenous people of the Columbia Plateau adapted to changing spatial and temporal landscape over millennia. These adaptations encompass the cultural affiliation with the Ancient One’s remains. By virtue of a shared group identity directly connected to places,

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

resources, and people within the geographical context of a cultural landscape affiliation always was certain.

This presentation will provide overview and insight into the indigenous knowledge and contemporary scientific knowledge. Our reliance on our teachings, beliefs, and way of life necessitated our petition for his return, allowing us to fulfill our cultural duties.

[130] *Museums as Classrooms: Lessons in Applied Collaborative Digital Heritage*

Tech-centred courses in archaeology are becoming ever more present in university and college training programs, as demands for digital field recording, data management and analysis, and public engagement applications increase. Traditional classrooms and labs may be conducive to methodological training, however experiencing the complicated ethics, politics and logistics of applying these methods to heritage practice is limited in these settings. This paper reflects on a collaborative project that took students from the University of Victoria off campus to the nearby Royal BC Museum (Victoria, Canada) to develop digital applications to engage visitors in a pop-up event in local archaeology. In this rapid design, development and launch process, technical outputs were as important as critical explorations of indigenous archaeology, accessibilities, impact, and message. In applying digital heritage through collaborative practice for public engagement, the museum becomes a classroom at many levels, for students, for academic and museum professionals, and for the community.

Cook, Michael (Northern Illinois University)

[155] *Geographic Distribution Analysis of Elko Series Projectile Points across the Great Basin*

The Elko projectile point series is diagnostic of the early Archaic period throughout the Great Basin. Within the Elko series, two identified subtypes exist: Elko Eared (EE) and Elko Corner-notched (ECN). While morphologically distinct, both subtypes occur within the same chronological and geographic extents. In this study, I gathered a sample of 37 sites throughout the Great Basin with identified EE and/or ECN points, then developed an index representing the proportion of EE to ECN points in each sampled site. I then created several sets of geographic distribution groups and used Analysis of Variance to look for significant differences in index numbers between tested groups. Each geographic analysis yielded no statistically significant results, indicating no consistent geographic variation in frequencies of EE versus ECN points across the Great Basin. This result suggests that both subtypes were used similarly throughout the Great Basin and observed differences in frequencies at specific sites among these two point types are not indicative of any distinct culture.

Cook, Robert (Ohio State University)

[119] *When and Where Did They Go? More Fully Conceptualizing Fort Ancient's Descendants*

There were two distinct cultural systems in a key part of the Fort Ancient region—Anderson and Madisonville—with the general understanding that one changed into the other in situ ca. AD 1400 and then left the region en masse ca. AD 1650, becoming one of several contemporary Central Algonquian tribes. However, new data raise the possibility that this interpretation needs revision. First, through a biodistance analysis we learn that at least some Anderson and Madisonville groups were not closely related biologically. Second, we know from oral histories that Dhegiha Siouans departed the Ohio Valley at the same time as the Madisonville shift and have recently learned that the Anderson pattern is very similar to several Dhegiha accounts. Hence, it is now possible to question whether the Anderson cultural system relates to Dhegiha Siouans more so than the Madisonville one that may be more closely related to Central Algonquians. Reasons explored to account for the potential for multiple departures include various mixes of environmental and cultural push/pull factors, such as deteriorating climatic conditions for agriculture, increased interest in bison, and increased pressures from Iroquoians who were interested in the region for both the burgeoning fur trade and slave raiding.

Cook Hale, Jessica (University of Georgia)

[244] *Remnant Landscapes, Taphonomic Challenges and Middle Range Theory in Submerged Prehistoric Archaeology*

Submerged prehistoric archaeological sites have increased relevance in archaeology because they retain direct evidence addressing multiple questions, such as human dispersal patterns, use of coastal zones, and human responses to climate change. They also have potential for high degrees of preservation in some cases. However, just as often, they present significant site formation challenges including geochemical and mechanical degradation of artifacts and features, weathering and deflation of sediments during and after submergence, and resulting loss of stratigraphic integrity—all a direct function of coastal and marine processes. These problems must be addressed more thoroughly in the field by accounting for these alterations with appropriate middle range or higher level theory for behavioral versus ecological processes. This is also an issue in grant proposal/peer reviews wherein our “terrestrial” colleagues’ comments and critiques demonstrate they also lack an understanding of alteration of submerged offshore sites. This paper reviews, briefly, the development of investigative strategies for submerged offshore sites that operationalized theory and method for the location and study of submerged sites. We then propose some revision and revamping of these strategies that can more effectively address the unique issues involved in the study of a submerged prehistoric world’s remnants.

[21] *Investigating the Emergence of Ute Culture on the Uncompahgre Plateau, Colorado*

The Numic Expansion (A.D. 900 to 1300) and other explanatory models that have been used to explain the distribution of Numic speakers across the American West often fall short of providing specific methods for identifying peoples, such as Ute, in the archaeological record. This paper expands on previous investigations of this Numic Expansion narrative through the detailed reanalysis of lithics from two excavated sites: Christmas Rockshelter (5DT2) and Shavano Spring (5MN40). I compare lithic procurement and production strategies through time and between the two sites to characterize the degree of cultural continuity (or lack thereof) in the Uncompahgre Plateau, Colorado. I identify changes to projectile point and biface production and raw material selection strategies that are unit to occupations during and after the Numic Expansion. I conclude that these differences represent changes in the region reflecting the movement of people, development of new Ute communities, and exchange of materials, ideas, and knowledge. I argue these differences represent changes in the area and broader region and may reflect the movement of people, development of new communities, and exchange of materials, ideas, and knowledge.

Cooper, Angela

[26] *Mounds, Museum Visitors, and You (the Archaeologist)*

During the 18th century, European-Americans created a myth regarding the earthen mounds found throughout the eastern United States. This myth indicated that a western people, possibly the Lost Tribe of Israel, had inhabited North America and established cities throughout this region. They then succumbed to Native American savagery and brutality and were eradicated. Over time, archaeologists disproved the myth by conducting excavations and demonstrated the cultural similarities between the mound building Native Americans and the Native Americans of the region. Although archaeologists since then have condemned, dismissed, and constantly disproved the myth, this misconception is still prevalent in today’s society. Many people still believe that non-Native Americans built the mounds, and other people recognize that pre-contact Native Americans constructed the mounds

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

and cities, but that they disappeared or went extinct. For both groups, they do not recognize the cultural continuity from the mound building people to contemporary Native Americans. My dissertation examines whether museums combat or perpetuate the myth of the mound builders, what preconceptions visitors have of Native Americans and their mound-building ancestors, whether their preconceptions change after visiting a tribal or mound site museums, and what museums can do to begin changing preconceptions of Native Americans.

[283] *A Hundred Years of Human Migration in the Caribbean: Considering the Key Tipping Points of Cultural Transformation between AD1492 and AD1592*

This paper will review some of the ways in which unprecedented human migration and cultural encounter in the 15th and 16th century Caribbean is reflected in the transformative material exchanges made on Isla de Mona. Discoveries made during recent fieldwork on Isla de Mona will be used to illuminate and inform these thoughts by examining the dynamic ideological setting within which they are situated.

[27] *Developmental Period Migration in the Northern Rio Grande*

The origin of Tanoan language diversification is inextricably linked to the debate around the origin of the Tewa. While paleodemographic, bioarchaeological, linguistic, and DNA evidence support a thirteenth century Mesa Verde-Northern Rio Grande migration, the lack of clear material culture evidence of this migration is perplexing. Critical to this discussion is the possibility of an earlier, tenth century migration of (presumably) Proto-Tiwa speakers from the Upper San Juan region into the Northern Rio Grande. While scholars generally agree that Proto-Tiwa split from Proto-Tewa no later than AD 1000, the location of this split, and the subsequent movement of Tiwa speakers, remain unresolved. In this presentation, I evaluate the ability of two competing hypotheses to account for the paleodemographic, linguistic, and archaeological evidence underpinning this question. The first hypothesis posits that Proto-Tiwa split from Proto-Tewa in the Upper San Juan region, which would support the idea of a Mesa Verde migration. The second hypothesis suggests a split within the Tewa Basin, which would shift the argument in favor of in situ development. This research represents a small contribution toward a better understanding of the complexities inherent in the study of Ancestral Puebloan migration patterns.

Cootsona, Melanie (Barnard College)

[259] *Animal as Social Actor: A Case Study of a Pre-Colonial Northern Tiwa Structure*

This paper explores the role of animals as social actors, namely the way natural animal behaviors influence human religious settings. The paper focuses on the case study of a floor organization of a formally closed thirteenth century Northern Tiwa kiva in the Northern Rio Grande region of New Mexico. The worldview and beliefs of the Northern Tiwa were deeply shaped by the species and biomes with whom they co-habited. Through the synthesis of material data, ethnographic information and behavioral traits, we can begin to understand how the Northern Tiwa in the thirteenth century may have situated specific species within a landscape-based religion. The animal species highlighted within the case study of the kiva includes the North American porcupine, the American crow, the American bison, and four domesticated dog burials. This kiva at Pot Creek Pueblo (also known as T'aitōna) embodies a moment of heightened meaning, as it includes the floor burial of a young child (who likely suffered a traumatic death).

[85] *Landscapes of Mobility in the South-Central Andes: From Chiefly Networks to Colonial Markets (AD 1100–1800)*

The great silver mining centers of Potosí, Porco, and Oruro in the Bolivian highlands have long formed an important focus for understanding the Spanish colonial world, both for the colonial imagination and for the contemporary historian. In comparison with the contexts of production and exchange based around these mining centers, however, their wider contexts of mobility and logistics within the altiplano and the valleys leading west to the Pacific coast have been comparatively under-investigated by historians and archaeologists alike. This presentation considers these peripheral and 'interstitial' landscapes and the communities they constituted (particularly as they articulated with prehispanic legacies of mobility and infrastructure) within the context of ongoing research in southern Peru and northern Chile. The resulting discussion highlights some of the ongoing tensions between multiple scales of analysis and between textual and archaeological sources of historical data.

[95] *Ceramic Petrography of Woodland Period Swift Creek Complicated Stamped Pottery in Florida and the Lower Southeastern United States*

Swift Creek Complicated Stamped pottery from the lower Southeastern U.S. is a premier material for the systematic study of Woodland period social interactions. Petrographic analysis of Swift Creek pottery was undertaken as part of a research program that integrated materials analyses of pottery, including Neutron Activation Analysis, digital imaging of paddle stamp designs, technological analysis, and absolute dating, to identify patterns of social interaction. Over 200 samples have been thin sectioned from more than two dozen sites across Florida and Georgia, dating between AD 200 and 800. 91 clay samples from most of the sample regions were included for comparison. Petrographic analysis documented eight gross temper and/or constituent categories and eight matrix or petro-fabric groups (on the basis of presence/relative frequency of mica and siliceous microfossils). Most gross "temper" and petro-fabric categories are well represented in the sampled clays. The results indicate mostly local pottery manufacture within the northern regional site clusters, which encompass large ceremonial centers. Swift Creek pottery at the southern clusters contain an abundance of non-local vessels, especially at burial mounds. Integrative results indicate that interactions were geographically extensive, but clearly most intensive along particular corridors.

[105] *Demographic Change through Analysis of Age Profiles of Burial Data*

A series of mortuary sites on the Texas Coastal Plain provide a dataset useful for analyzing demographic change through examination of age profiles. Other archaeological data suggest that populations peaked during the Late Archaic period (4000–800 BP) and sharply declined during the Late Prehistoric period (800–350 BP). Analysis of the ratio of adults to young individuals has been used to identify rapid population growth among other populations. Hunter-gatherer groups living in the Texas Coastal Plain developed complex and stable human-resource systems that utilized a variety of habitats across the Coastal, Riverine, and Inland Zones. The heterogeneity of available resource rich environments within a short distance enhanced resilience to resource fluctuations. This adaptation appears to have remained relatively stable for much of the Holocene providing the ecological context for rapid population growth. As part of a National Science Foundation grant, we are using burial data from a series of mortuary sites to identify periods of population growth and decline and how they compare to archaeological expectations, Late Holocene climate change, and other factors.

[260] *From Coast to Coast: Recent Research in Southern Caribbean and Osa Peninsula, Greater Chiriquí Region*

I present new data of investigations conducted in two almost unexplored zones on both coasts (Pacific and Caribbean) of the Greater Chiriquí Region. An exploratory survey, and test pit excavations of selected sites in the southern coast of Caribbean Costa Rica, allowed recording materials similar to those found on the Pacific coast. This reaffirms the proposed extension of related groups on both sides of the Talamanca mountain range. I provide comments about the relationships maintained between people of the Sixaola valley and the Bay of Almirante; as well as the establishment of the cultural boundary between the archaeological regions of the Central Caribbean and the Greater Chiriquí.

In addition, explorations near the Tigre River, located in the Osa Peninsula, Pacific coast, have provided evidence of two phases of occupation. Of the sites registered, Cantarero is a main center of the Aguas Buenas period. Recent excavations carried out at Cantarero shed light about the development of complexity in the long and still unknown Aguas Buenas period. The documentation of late sites nearby the gold bearing Tigre River, provides elements to discuss relationships with the Diquís delta, based on long distance control of gold sources.

[2] *Paleoindian Site in Central São Paulo State, Brazil: Bastos Site, Dourado County*

Bastos site, located in central São Paulo State, provided ages between 7,600 and 12,600 cal BP. The lithic industry is composed by flakes on silicified sandstone, with rare unifacial retouch, without formal artifacts. The site probably represents a habitation area in a river terrace, later covered by alluvial fan. Refitting pieces attest the overall integrity of the spatial positioning of the archaeological materials. The site is the oldest found in São Paulo, and is contemporaneous to sites from Lagoa Santa and Pains regions, in Minas Gerais State. However, the lithic industry is unrelated to the ones found in these areas, suggesting the existence of a different Paleoindian group

[18] *Utilization and Field Testing of LiDAR in the Maya Hinterlands*

Airborne LiDAR (Light Detection and Ranging) is an active remote-sensing technique which records the surface of the earth using laser scanning. The recent acquisition of LiDAR data for a portion of the Three Rivers regions in northwestern Belize offered the opportunity for a new way to analyze settlement and landscape utilization by the ancient Maya. This paper will focus on the systematic analysis of the dataset, ground verification, and post-processing methodologies. ArcGIS was used for the interpretation, LAS classification, and tiling of the maps for hand-held GPS (Global Position System) units. Household groups, single mounds, courtyard groups, depressions, and sacbeob were identified and verified during field surveys. Ground truthing took place during the 2017 field season of the Dos Hombres to Gran Cacao Archaeology Project (DH2GC).

[331] *Archaeological Field Schools Beyond Buzzwords: Engaging with Critical Pedagogy while Connecting with Administrative Goals*

Although archaeological field schools are widely accepted as a prerequisite for employment in the field, a disconnect has developed between universities sponsoring these courses and the instructors who teach them. Field schools are unique experiential learning opportunities, the value of which can be difficult to communicate to university administrators who set course minimum enrollments and summer tuition rates. Instead of just thinking of field schools as a means to teach skills necessary for future employment, archaeology instructors should engage with critical pedagogies that help us better translate the utility of field schools in an era of financial shortfalls and Responsibility Centered Management budget models in higher education. In this presentation, I discuss how the Bighorn Archaeology Field School (Indiana University) not only trains students in field techniques but also embraces a more critical approach by taking into account students' experiences and preconceptions. The instructors frame discussions of ideology, race, culture, and landscape that shape perceptions of the western plains and mountains where they work, through media, fiction, and experience. In addition, I argue that making use of the unique advantage of undergraduate students' understanding of new social media platforms to engage with the public is beneficial for all parties involved.

[217] *High Resolution Chronology and Paleobiogeography of Bison and Pronghorn Occupation in Southeast Texas and their Implications for Human Paleoecology*

Bison and pronghorn are taxa that have relatively high visibility in the archaeological record of the southern Plains. Understanding when bison and pronghorn were present in regions located in the southern Plains periphery is important for our general knowledge regarding bison/pronghorn ecology, climate, and environmental change in North America, as well as providing insights into human responses during these periods. Previous studies of the extent and timing of bison expansion into the southern Plains of Central Texas suggest this group's presence and absence constitutes a series of events that correlates to specific climatic excursions, with associated human responses. A comparable situation appears to prevail in Southeast Texas where bison are occasionally reported from Late Prehistoric archaeological contexts. Pronghorn, an animal with requirements similar to yet unique from bison, may provide additional insights on the timing and manner of change witnessed in both paleoclimate and human paleoecology in Southeast Texas. Stable and radio-isotopic analyses of bone collagen from bison and pronghorn can provide high precision data on both the timing and effect of different kinds of environmental change on human lifeways. We discuss the application of these techniques and present new direct AMS radiocarbon data on bison from Southeast Texas.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Costin, Cathy (California State University, Northridge)**[121]** *Technology and Social identity on the North Coast of Peru*

Drawing on nearly three decades of inspiration from and collaboration with Rita Wright, this paper explores the relationship between craft technologies and social identities on the North Coast of Peru over the longue durée. The technologies used to manufacture goods were themselves meaningful, often considered to be divinely inspired and certainly a key element in determining the value and significance of both everyday and esoteric objects. As transformative processes, the methods and techniques of craft manufacture reflected the power of artisans to create and animate the material and social worlds. Importantly, within media distinct technologies were often associated with different genders, classes, ethnicities, and other aspects of social identity. Set within the context of the rise and fall of regional state-organized polities and waves of “contact” and conquest by more distant powers, I discuss how technological stability in some media reflected the persistence of autochthonic identities, “traditional” social structures, and indigenous claims to place, while the episodic introduction of new technologies—some developed locally and some “imported” by more distant conquerors—reflected the assertion of new loci of authority, the restructuring of sociopolitical relationships, and claims to different modes of prestige.

Costin, Cathy [95] see Lawrence, John

Costopoulos, Andre (University of Alberta)**[219]** *The Impact on Mobility of Regional Variability in Rates of Environmental Change: An Agent-Based Simulation Approach*

I use agent-based computer simulation to evaluate the impact of regional scale variability in rates of environmental change on residential and logistical mobility. Previous regional case studies and simulation work suggest that high variability in regional rates of environmental change (in shoreline displacement, for example) should favour settlement strategies that reduce residential mobility and rely on logistical mobility. Those strategies should select longer-term residential sites that are environmentally relatively stable at a very local scale, and are surrounded by more rapidly changing

landscapes that provide logistical access to a variety of resources. I will test whether this pattern holds up when variability of the rate of change in more than one environmental variable is tracked.

Cottreau-Robins, Catherine (Katie) (Nova Scotia Museum), Jacob Hanley (Geology Department, Saint Mary's University), Paige Fleet (Geology Department, Saint Mary's University), Christopher McFarlane (Earth Sciences Department, University of New Bruns) and Brandon Boucher (Earth Sciences Department, University of New Bruns)**[21]** *Bay of Fundy Provenance for Pre-contact Copper Artifacts from the Maritime Peninsula, Northeastern North America*

We used non-destructive laser ablation inductively-coupled plasma mass spectrometry (LA-ICPMS) to compare trace element concentrations in 50 copper artifacts from a variety of pre-contact sites in the Maritime Peninsula (Nova Scotia, New Brunswick, Prince Edward Island and Maine), to natural copper samples from 16 geological sources in Michigan, Ontario, Pennsylvania, New Jersey, and the western and eastern regions of the Bay of Fundy. Of particular note is the contrasting composition of Lake Superior copper (elevated arsenic) and Bay of Fundy sources (elevated zinc). A Bay of Fundy provenance is unambiguous for many artifacts analyzed. Importantly, no artifacts have chemical compositions consistent with Lake Superior sources. The results establish the importance of local (Fundy) copper to pre-contact period Indigenous peoples of Nova Scotia and the Maritimes, negating the Lake Superior model. Furthermore, recognition of distinct eastern and western Fundy copper provenance within the artifact collection has significance in the broader context of territorial procurement of copper and trade relationships.

Coughlin, Sean (ASC Group, Inc.) and Kelly Sellers Wittie (Row 10 Historic Preservation Solutions, LLC)**[90]** *Feeding New Orleans: Where's The Pork?*

In 2014 R. Christopher Goodwin & Associates, Inc., completed the analysis of the faunal remains from archaeological data recovery at the Colton School site (16OR562), Orleans Parish, Louisiana. Analysis of faunal remains from the site revealed a propensity for beef rather than pork, a finding that contrasts Sam Bowers Hilliard's statement on eating trends in the American South ca. 1860 as presented in his 1972 book *Hog Meat and Hoecake*. This article presents the result of this analysis and the journey taken based on those results. In many ways, like any good research project, this data raises more questions than answers and leads to avenues of research that need to be addressed by future research.

Coulthard, Ian [208] see Varney, Tamara

Countryman, James (University of Chicago)**[297]** *Ritual Production, Commodity Production, and Cultivating Agricultural Heritage in Ravni Kotari, Croatia*

Agricultural crops may be selected not only because they “work” from the perspective of agroecology, but also for their value in maintaining religious affiliation, historical memory, and community identity. Drawing on emerging archaeobotanical evidence from the Ravni Kotari region of southern Croatia, this paper discusses the challenges of understanding continuities of cultivation practices over multiple millennia in relation to changing political-economic contexts within which cultivation has taken place. I emphasize the production of *Olea europaea* and *Vitis vinifera*, two non-subsistence crops that emerged as central components of market-oriented production under the Roman Empire, and continue to provide the basis of commercial agriculture in the region today. The long-term transmission of these cultivars is complex. The ritual use of wine and oil within the Christian church may have sustained the cosmological importance of these crops through the geopolitically turbulent medieval period, while their commercial importance diminished. More recently, viticulture and oleiculture have become emblematic of “traditional” folk life and agricultural heritage, their consumption ritualized in new ways through agritourism. Ritual offers a lens for considering both the shifting social meanings of cultivated plants, as well as how and why certain practices can be sustained across social, cultural, and political disjuncture.

Courtright, Scott [268] see North, Chris

Coutros, Peter (Yale University)**[198]** *Flexibility against Fragility at the Diallowali Site System during the 1st Millennium BC*

The first millennium BC was a period of dramatic social and environmental change throughout West Africa. Along the Middle Senegal Valley (MSV), communities experienced rapid and dramatic changes to biospheric conditions accompanied by largescale technological, social, and economic reorganizations. On the western edge of the MSV, the inhabitants of the Diallowali site system developed a network of flexible institutions capable of

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

maintaining a thriving community throughout this turbulent period. Despite the rapid and profound changes to the surrounding landscape, varying degrees of reliance upon hunting, fishing, agriculture, and animal husbandry, as well as long distance trade and craft production, contributed to over 700 years (1100–400BC) of intense occupation of the site system. Through an examination of changes in local conditions, and the synchronous shifts in settlement organization and subsistence practices, this paper investigates the social implications of intense and unpredictable climate change on Late Stone Age and Early Iron Age populations along the MSV.

[27] *From Water to Land: Analysis of Prehistoric Shell from Wupatki Pueblo*

This research focuses on the prehistoric shell artifacts recovered from excavations at Wupatki Pueblo. The shell artifacts from Wupatki Pueblo were analyzed in order to accurately determine the genus and species, artifact types, trade routes, and uses of shell. By looking at manufacturing techniques, this research determined if shell artifacts were traded or brought to Wupatki Pueblo as finished products by the Hohokam or if shell manufacturing occurred at Wupatki Pueblo. To determine the significance of shell artifacts at Wupatki Pueblo, the shell assemblage was compared to shell assemblages of other prehistoric northern Arizona sites and to shell assemblages from Hohokam shell manufacturing sites. Ultimately, this research adds valuable information about trade, migration, and social networks between the Hohokam and the Ancestral Puebloans, which is important to the understandings of function, complexity, ideology, adaptation, resilience, and the foundation of modern Pueblo cultures.

Covey, R. Alan (University of Texas at Austin)

[100] *Rethinking Inca Social Power in the Imperial Heartland (Cuzco, Peru)*

It is commonplace to note that the Inca Empire was the most powerful indigenous state in the Americas before the time of European invasions. Retrospective sixteenth-century Inca accounts played up the scale and intensity of imperial social power, but the ethnohistory and archaeology of the Cuzco region of highland Peru—the Inca capital region—indicate more nuanced networks of power across the imperial heartland. Using Michael Mann's typology for social power as a guide, this poster develops documentary perspectives on networks of ideological, economic, military, and political power in Inca Cuzco. The ethnohistoric review will consider some distinctive features of the Quechua conceptualization of social power, which will then be compared with regional patterns from Cuzco's rural hinterland. Settlement patterns from the Sacred Valley and Xaquixaguana Plain demonstrate some socioecological patterns to the development of Inca social power, as well as some intriguing trajectories for building royal power on local landscapes during the generations of Inca imperial dominance.

[83] *'All things being equal'? Multiplex Material Networks of the Early Neolithic in the Near East*

Archaeological network research typically relies on material culture similarities over space and time as a proxy for past social networks. In many cases, a range of different types of material culture are subsumed into reconstructed connections between nodes. However, not all forms of material culture are equal. Different types of objects may be caught up in rather different forms of social relationship—crudely put, 'personal' items such as jewellery may perhaps have more social and cultural significance than commodities, for example functional tools—and may thus be traded/exchanged/gifted in different ways. Analyses including different types of material culture may thus conflate multiple different forms of social relationship and patterns of connection. However, 'significant' and 'functional' are rarely mutually exclusive categories, and are always fluid, culturally and contextually dependent. This paper will investigate the multiple lenses different forms of material culture provide for studying social networks in the early Neolithic of SW Asia. What would a multiplex perspective for archaeological network research look like, and how might it impact on our understanding of past material cultures and social change?

Cowell, Shannon (New Mexico State University)

[69] *Micaceous Ceramics at Los Ojitos, New Mexico*

Los Ojitos (LA 98907) is a Hispanic New Mexican site occupied between 1865 and 1950 on the Pecos River in eastern New Mexico. Excavators recovered micaceous brownware sherds alongside American goods in household deposits and refuse scatters surrounding historic structures. A single ceramic type encompasses all micaceous wares found in the region: Middle Pecos Micaceous Brownware, dating AD 800–1300. A lack of typological guidelines for distinguishing prehistoric and historic micaceous sherds found at Los Ojitos limits site interpretation and throws into question all previous temporal assumptions about micaceous wares in the Pecos River valley. Research into micaceous ceramics in historic Hispanic contexts sheds light on gendered, multi-ethnic trade economies and the persistence of indigenous ceramics alongside mass-produced tablewares in American-period eastern New Mexico.

[74] *Improving the Effectiveness of Archaeomagnetic Dating in the Southwest*

The theoretical foundations for archaeomagnetic dating are strong, and we enjoy more than 50 years of experience and practice in the Americas. Abundant independently dated burned sediments have supported the progressive refinement of secular variation (dating) curves as observed in the Southwest, improving the precision and replicability of date range interpretations. However, the performance of archaeomagnetic dating has not lived up to its potential as a source of reliable dating information, frustrating client archaeologists. This is in part due to the common use of an outdated statistical approach to deriving date ranges from the SWCV1995 dating curve. Despite curve refinements (i.e., SWCV2000), reliance on the old calibration and the statistical approach have often produced nonsensical date results. We address these issues through the use of a graphical approach to confirm the sensibility of dates and date ranges, and the use of alternative dating curves for some time periods. Further efforts to restore the credibility and extend the contributions of archaeomagnetic dating emphasize precision at all points in the process, including improved field sampling and laboratory measurement techniques, increased use of the recently available DuBois archaeomagnetic archive, and the initiation of new approaches to building and evaluating secular variation curves.

Cox, Kim and Carolyn Boyd (Shumla Archaeological Research & Education Center)**[73]** *Using Rules from the Texas Lower Pecos to Interpret Jornada Mogollon Rock Art*

Four principal rules of interpretation for Pecos River Style rock art of the Lower Pecos region of Texas are proposed. These rules were proposed based on a commonality between Pecos River Style and the iconography of historic Corachol-Aztec speaking tribes such as the sixteenth century Mexica of central Mexico and the present-day Huichol of western Mexico. This presentation shows how the same rules can be applied to the interpretation of the rock art of other prehistoric Corachol-Aztec speaking groups such as the Jornada Mogollon of New Mexico, where, for example, their glyph for the Sun contains certain linguistic characteristics that operate outside of mere symbology and are more of a depiction of the name of the Sun than a representation of the Sun itself.

Cox, Maria (California State University, Chico) and Valerie Sgheiza (California State University, Chico)**[179]** *Number Games: MNI and Element Representation in the Point San Jose Collection*

The Point San Jose skeletal collection was excavated from a 19th century medical waste deposit. Remains within the deposit were completely commingled and highly fragmented. As re-association was highly unlikely, careful assessment of the commingled nature of the collection was required. To establish the Minimum Number of Individuals (MNI) represented in the collection, two approaches were used: Max (L,R) and an age-informed MNI. The maximum count per unique element resulted in an MNI of 22 (right talus), the age-informed MNI yielded an MNI of 25. When the Most Likely Number of Individuals (MLNI) was calculated, the results ranged from 19–38 individuals. As this collection originated from a medical waste deposit, the larger estimations cannot be disregarded. To further inform and explain the MNI and MLNI results, element representation was assessed. Frequency counts per element were obtained, as was information on side, distal/proximal, axial/appendicular, and upper/lower limb. As many of the long bones were fragmented, data was collected as to which portion of the bone exhibited damage. The results of this study will enable a better understanding of the use and origin of the deposit, as well as which portions of the body were most likely to be included.

Crabtree, Stefani (The Pennsylvania State University)**[83]** *Using Food Web Models to Examine Desert Networks in the American Southwest and Western Australia*

Archaeological studies benefit from rich ecological data, yet linking ecological data to narratives of the past can be difficult. Here I use trophic network modeling to understand both Ancestral Pueblo and Australian Aboriginal food webs, comparing these systems for a greater understanding of human and environmental resilience. Here I show that Ancestral Pueblo people connected themselves into a greater environmental web and use network analysis to examine how the changing network properties of the Ancestral Pueblo food web led to vulnerabilities of the web to environmental stochasticity and anthropogenic change. I then calibrate the results from this study to ethnographic data recently gathered among remote living Aboriginal people in the Western Desert of Australia. I show how food web modeling can help us understand the cascading extinctions of small mammals following the removal of Aboriginal people to outstations in the 1960s. The utility of food web modeling for understanding the ethnographic dataset can then be extrapolated to the Pueblo dataset, indicating where and when the Ancestral Pueblo people became most vulnerable to environmental change. Ultimately I demonstrate that an unstable food web led to decreased resilience of the Pueblo people, forcing migration.

[234] *Discussant***[83]** *Chair***Craib, Alexander (University of Wyoming)****[81]** *Dalton Mobility in the Tennessee River Valley: An Assessment of Raw Material Use and Tool Curation*

Previous research in the Southeast has demonstrated that Dalton groups underwent a process of settling in to the landscape. This has been demonstrated through the identification of raw materials used for the production of Dalton hafted bifaces. A preference for locally available raw materials has been noted in previous studies, a departure from Clovis groups who routinely made use of non-local cherts. This trend has been well established outside of the Tennessee River Valley; however, little research has been done concerning the settling in of Dalton groups in this region. In order to test the hypothesis that Dalton groups in the Lower and Central Tennessee River Valley were also settling in, 187 Dalton points were analyzed for raw material type and amount of curation. All analyzed samples were originally collected by avocational archaeologists and subsequently donated to the McClung Museum of Natural and Cultural History. The collections used (Ernest J. Sims, Smeltzer, Cambron/Hulse) all possess exceptional spatial data with site-specific locational information. Results of this study are consistent with the trends previously identified, demonstrating that Dalton groups in the Lower and Central Tennessee River Valley were settling in.

Craib, Oliver [50] see Admiraal, Marjolein

Cramb, Justin (University of Georgia)**[20]** *Manihiki & Rakahanga: Archaeological Research on a Dual-Atoll Cluster in East Polynesia*

Archaeological fieldwork was completed on the atolls of Manihiki and Rakahanga, in the northern Cook Islands, from May to July of 2015 and from July to November of 2017. This includes survey and mapping on six islets, the documentation of extant and past fish traps and fishponds, lagoon to ocean shovel test sampling, and the excavation of habitation and resource production sites. This work identified village centers on each atoll and preliminary analyses indicate that the coral-cluster landscape of Manihiki and Rakahanga was intensively altered by past human practices. These include the creation of horticultural pits, coral fish traps, fishponds, curbed and paved pathways, marae, residential centers, and potential shoreline armoring. Furthermore, it appears that individual islets and marine areas were used differentially in manners conducive to the inherent production capabilities of each microenvironment. The data that continues to emerge from this ongoing research advocates that a complex human/environmental dialectic shaped these atolls and created the productive landscape present today. Additional research, including forthcoming zooarchaeological analysis and AMS dating, promises to improve our current understanding of these atolls' past, coral-cluster land use, and landscape creation practices.

[13] *The Ngake 001 Site: Surface Mapping and Subsurface Investigations*

The Ngake 001 site is located on Manihiki Atoll in the northern Cook Islands. In all, the site covers an area of roughly two hectares and consists of four coral-edged courts, two small coral-edged enclosures, a possible well, part of a lagoon shore path, and a mound and trench system that provides access to the islet's Ghyben-Herzberg freshwater lens. Multiple surveys, by the authors and others, suggest that the Ngake 001 site is situated at the center of a large prehistoric village complex that includes residential areas, marae, and cultivation areas. Furthermore, the site provides access to multiple resource zones including Manihiki lagoon, the ocean shore, and the shallow channel that connects the two. Subsurface investigations, include an ocean-to-lagoon shovel-test survey and multiple excavation units. Preliminary analyses of artifacts, including clam-shell adzes and pearl-shell fishhooks, indicate that Ngake 001 was utilized during the late prehistoric period before the arrival of missionaries in AD 1849 and possibly much earlier. Additional analyses will allow us to provide greater detail on the role of Ngake 001 as a habitation site, population center, and possible seat of chiefly power on Manihiki Atoll.

[28] *Terminal Classic Residential Groups at Holtun, Guatemala*

Holtun, located in the central lakes region of the Maya lowlands, was occupied from the Preclassic through the Postclassic. To date the Holtun Archaeological Project has mapped approximately 13 groups in the site core and over 30 residential groups in the periphery to the north. The majority of these surface residential structures date to the Terminal Classic and Postclassic. The residential groups excavated to date vary in their proximity to the site core, number of structures, construction investment, structure and plaza size, and patio space elements. Together these features can be used to discern possible socio-economic status of the inhabitants (Ashmore et al. 2004; Chase 1992; Gonlin 2004; Hirth 1993; Marcus 2004; Masson and Lope 2004:197; Robin 2013; Schwarz 2013). This paper presents an overview of the Terminal Classic residential groups excavated to date at Holtun from within the site core and the immediate periphery. Excavations focused on sampling residential groups across the site and cataloging the structures and plaza groups based on the above-mentioned criteria in order to better understand socio-economic status, access to resources, and local production patterns for a wide variety of inhabitants of a single site during the Terminal Classic period.

Crawford, Gary (University of Toronto)

[284] *The Shangshan Culture and Agricultural Origins*

The Shangshan Culture is among the first in China to be associated with at least one domesticated organism: rice (*Oryza sativa*). A decade of research on Shangshan is providing critical insight on events leading to Neolithic developments in the Lower Yangtze Valley. So far, some expectations are not yet confirmed: e.g., the Shangshan ancestors developed from a local Palaeolithic population, and the first farming developed in the rich lowlands. Collaborative research is documenting potential evidence of managed and domesticated rice as early as 11,000 BP and certainly by 8,500 BP. Research focuses on understanding the circumstances of Shangshan's location (upland, intermontane basins), settlement structure, technology, and human-environment interaction. In particular, by 9000–8500 BP sites are relatively large with, at least in some cases, substantial ditches constructed around or through them. The ditches appear to have been an important aspect of the Shangshan niche and they are hypothesized to have played a role in rice's early association with people.

[50] *Ancient Alaskan Firewood Management Strategies and the Role of Selectivity: Preliminary Results*

When historic Alaskans chose a settlement site, access to adequate fuel was as important as the availability of food and water. Despite its importance fuel use in the Arctic and Subarctic has received relatively little attention. Work currently underway aims to clarify the criteria used to select fuel in ancient Alaska by testing two hypotheses. The Efficiency Maximization hypothesis, derived from the prey choice model of human behavioral ecology, proposes that Alaskans ranked woody taxa according to net energy acquisition, and preferentially selected highly ranked taxa. The Firewood Indifference hypothesis proposes that Alaskans were not selective but rather sought to minimize the energy and time expended gathering firewood without regard for the specific properties of different taxa. This pattern is predicted by the prevailing fuel use model, the "Principle of Least Effort" (PLE), but is at odds with ethnography, which indicates that Native Alaskans discriminate between and seek specific wood(s) with preferred properties. This paper reports the results of preliminary statistical analyses designed to determine which fuel-use model best explains the anthracological record for three Alaskan sites. These sites differ in cultural affiliation, ecological setting, and chronological position, and thus illustrate how different constraining variables determined fuel selection strategies.

[91] *Classic Mimbres Phase Archaeology: A Contrastive Study of Two Sites at the Headwaters of the Upper Gila River*

Classic Mimbres sites can be seen across the Mimbres Valley and Upper Gila areas. For one tributary of the Gila River, Diamond Creek, there are several of these sites that lay alongside it. As a part of the "Northern Mimbres Project," two sites—Twin Pines Village (a large Classic Mimbres village) and South Diamond Creek Pueblo (a small four room site)—have been excavated by New Mexico State University field schools over the course of three years. Our excavations and research of these sites have led us to better understand the relationship between large and small scale habitation during the Classic Mimbres phase in the Upper Gila. The relationships between these two sites can be observed in the differences in: 1) architectural style, 2) pottery assemblages, and 3) amounts of exchanged items. Based on the results of our field work, we argue that data from the Twin Pines and South Diamond Creek Pueblo sites offer a deeper understanding of the Upper Gila region as well as a broad perspective of the Classic Mimbres culture in the American Southwest.

Creager, Brooke (University of Minnesota)

[197] *Individual Christianity: A Post-Roman Practice in a Changing Landscape*

The individual is often overlooked in reconstructions of ritual activity, particularly within constructed spaces, where the repetitious nature of ritual obscures the signature of individual variance. Ritual actions are attributed to a group, or community, even burials are not the action or pure representation of an individual. The identification of the individual within a ritual practice highlights the variance accepted within a culture. In this case study of Early Anglo-Saxon Britain, individual practice demonstrates the degree of integration between two cultures: the Anglo-Saxons and the Post-Roman British. Ritual continuance from the Roman period is evidenced through Christian practices within the Anglo-Saxon cultural framework. The use of Roman ritual spaces, such as churches, provides insight into the role of cultural continuity, where the remnants of actions can be attributed to a

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

small number rather than large groups of practitioners. This paper will explore the evidence for the use of Roman Christian spaces by a few Post-Roman peoples. Continuing ritual practices, in this case study of fifth- and sixth-century Britain, provide insight into the individual's role in maintaining, or rejecting, colonial ritual practices within the new cultural framework.

[22] *Iroquoian Longhouses and Sociotechnical Assemblages*

A better understanding of the role of domestic dwellings in shaping past social relations is needed. In this paper, Northern Iroquoian longhouses are studied as sociotechnical systems. This approach allows us to appreciate how social relations were generated and contested in the very activities of building and living in houses. I examine a sample of pre-Columbian longhouses from southern Ontario, Canada. Variation in aspects of house construction, spatial layout, and ritual indicates that sociotechnical networks associated with different houses were variable in scale, durability, and organization. What emerges is the sense that a dynamic, driving tension between forces of collectivization and atomization, inclusion and exclusion, lay at the heart of longhouse life.

Creswell, Ebony (University of Wyoming)

[44] *Culture and Disease: Modeling the Spread of Tuberculosis in Wyoming*

Until recently, the development and spread of tuberculosis in humans has been associated with the advent of Old World animal domestication and agriculture. However, recent evidence for the presence of *Mycobacterium tuberculosis* raises the possibility of a Pleistocene era dispersal. Poor bone preservation and small populations make finding Pleistocene-era bioarchaeological evidence of the disease difficult. Coupled with this, epidemiological studies suggest that population numbers were too low for an epidemic to take hold. Reconciling the epidemiological theory with the limited bioarchaeological evidence for the disease requires a closer examination of how behavior would influence transmission. I examine this possibility and report on several agent-based models I created in R to ascertain how tuberculosis may have arisen and dispersed. I incorporate archaeological, ethnographic, and biological data in order to understand how different human cultural behaviors, such as communal hunting, and other factors may have affected the spread of tuberculosis among hunters, gatherers, and foragers. I believe these models can also be modified and adapted to understand the spread and dispersal of other epidemic diseases during other periods in human history.

[15] *Accuracy of Museum Volunteer Measurements: A Study of Projectile Point Measurements at the Museum of Indian Arts & Culture, New Mexico*

In light of more and more museums relying upon volunteers, this study investigates the accuracy of museum volunteers taking measurements of projectile points for the purpose of documentation. Data collection was done by two archaeologists trained in lithic analysis, one anthropologist previously not trained in lithic analysis, and two retired volunteers with no previous training in lithic analysis. Volunteers received a crash course in measuring greatest length, width, and thickness prior to measuring hundreds of points from the individually cataloged collection at Museum of Indian Arts & Culture. Results of paired T-tests between categories of measurements indicated similar results between the archaeologists. However, statistical analysis between the archaeologists and previously untrained volunteers had various levels of significant statistical differences in various categories of measurements. This study also includes a discussion and analysis of re-measurements after additional training of volunteers.

[146] *Ancient Tokens, Communities and Cults in Sicily: A New Ongoing Research Project*

We usually consider tokens as 'alternative' coins or gadgets that are used for different purposes. When you visit a museum, you can store your jacket or bag in the cloakroom and then receive a token to claim your item(s) back at the end of your visit. Tokens were also commonly used in the Roman world. Archaeologists are still finding many tokens, also known as 'tesserae', but they often struggle to interpret and understand the tokens' functions and roles within ancient communities.

Luckily, the 'Token Communities in the Ancient Mediterranean' project is currently being undertaken by the University of Warwick to understand the scope of ancient tokens. As a research fellow, I am currently analyzing Hellenistic and Roman tokens discovered in Sicily and now kept in local museums. The scope of my paper is to provide a first-hand outline of this vital research. First, I present the whole project, assessing the archaeological evidence and describing a selection of Roman 'tesserae'. Then, I evaluate Sicilian tokens, offering a detailed account of unpublished finds. Such case studies are crucial for understanding the role of tokens within local communities, and reveal a wealth of information about economy, cults and religion on a regional scale.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Critchley, Zachary (Binghamton University)**[49]** *Iconographic Depictions of Spear-Thrower Use in the Ancient Andes*

Spear-thrower devices held a role around the world as a primary weapon and tool before slowly falling out of favor in certain areas for other projectile weapons. While it is widely accepted that spear-throwers were used by the people of the ancient central Andes, comparatively little research has gone into the role that they had as weapons of war, hunting tools, and objects of ceremonial reverence. Many Andean societies have rich traditions of art and iconography, often portraying human and supernatural figures wielding and using spear-throwers in a variety of contexts and with notable associated symbols, such as avian imagery. In addition, the Andes developed a unique style of spear-thrower and have produced many examples of spear-throwers with exceptional craftsmanship, leading me to believe that these tools were given special reverence.

This poster will present the findings of my project, in which I used a review of iconographic depictions of spear-throwers bolstered by physical specimens and associated artifacts to determine the wider significance that these tools played in society.

Crocker, Alicia [241] see Anderson, C. Broughton

Cromartie, Amy**[153]** *Mountain, Steppes, and Barley: GIS Modeling of Human Environmental Interactions In the Armenian Highlands during the Bronze and Iron Ages*

This poster investigates how Bronze and Iron Age communities around Mount Aragats, in central Armenia, managed their grassland environment through their subsistence strategies. I suggest that these distinct social and political societies not only participated in constructing a landscape of domestic cereal grains, such as barley and wheat, but also were participants in the ecology of this open mountain steppe environment dominated by Poaceae, Chenopodiaceae, and Artemisia. I investigate how the challenges of this volcanic mountain steppe such as microclimates, altitude, slope, and aspect may have influenced planting and grazing on this difficult, but fertile, terrain and contributed to the dependence on resilient cereal crops such as barley. To create these models, I combine regional digital elevation models (DEM), satellite imagery, with archaeobotanical datasets from the multi-period sites of Aparani Berd and Tsaghkahovit. I then use modern climate data and paleoclimate proxies to calculate growing degree days (gdd) for these cereal crops and predict optimal planting locations in relation to these sites. In addition, I consider how the unique social and political structures of these communities influenced these decisions and the impact of these choices on the mountain steppe ecology.

Cromwell, Richard-Patrick (University of Nevada Reno), Erin Herring (University of Oregon—Department of Geography—E), Chantel Saban (University of Oregon—Department of Geography—E) and Brianna Kendrick (University of Oregon—Department of Anthropology)**[38]** *Paleoecological Analysis Using Select Coprolites & Sediments Recovered from Paisley Caves, Oregon*

Coprolites recovered from archaeological context provide direct access to understanding past human interactions with their environments. The Paisley Caves of south-central Oregon are notable for the presence of hundreds of preserved coprolites, the oldest confirmed as being human in origin and approximately 14,350 cal. BP years old. Our project focused on analyzing a series of coprolites and their corresponding sediments to look for variabilities in the paleoenvironment in the area immediate to Paisley Caves during the late Pleistocene through the early Holocene. Using palynological, faunal, and parasitological proxies for evidence, the results showed a high degree of variability between coprolite and sedimentary sources, thereby allowing a comparison of mobile environmental signals versus stationary ones but related in temporal context.

Cross, Austin (Department of Anthropology, Florida State University) and John Sabin (Department of Anthropology, Florida State University)**[102]** *Predictive Modeling of Early Archaic Bolen Site Distribution in Northwestern Florida, USA*

Site visibility has long been an issue for late Pleistocene/early Holocene research in the southeastern United States, partially due to modern forest cover and partially due to large portions of the Southeast having been submerged by more than 80 meters of sea level rise. However, a large number of Late Paleoindian/Early Archaic Bolen artifacts have been discovered in Jefferson and Taylor counties in northern Florida, including dozens from underwater sites that were inundated post-depositionally. Surface collecting underwater and on land has occurred in this area has also occurred for well over 100 years, which has produced a robust database of site distributions. By using GIS to conduct spatial analysis, we aim to determine what environmental factors led to Bolen site preservation. This model will map out where Bolen points occur in situ to positively weight areas for site preservation and selection and negatively weight extensively collected sites where they have not been found, in order to create a robust model for discovering new Bolen sites.

Crothers, George [52] see Hummel, Rebecca

Crow, Kaitlin (New York University) and Norbert Stanchly (AS&G Archaeological Consulting)**[256]** *Preclassic Faunal Utilization at Pacbitun, Belize*

Archaeological excavations within the Belize River Valley region have produced robust faunal assemblages that have increased our understanding of the Maya use of animals during the Preclassic. At Pacbitun, located on the southern periphery of the Valley, large scale horizontal excavations are providing insights into animal utilization during the Preclassic period at the site (1000 BC—AD 300). These investigations have probed into plaza floors, residential and ceremonial platforms, as well as burials. The resulting conclusions have demonstrated a relatively narrow use of animals at the site as food resources but exemplify a significant use of freshwater and marine faunal resources, with evidence for the widespread use of the latter as raw material for Preclassic shell bead production. We offer varying interpretations for the substantial amounts of freshwater jute shells found at the site and discuss Pacbitun's role in long distance exchange networks to procure marine faunal resources. Investigations at Pacbitun demonstrate numerous avenues for the use of animals and help determine evolving space and social class dynamics over time. Finally, we contextualize faunal use at Pacbitun within the broader patterns of Preclassic animal use seen in the Belize River Valley.

It will also look at the contributions of local and state jurisdictions and organizations to establish avocational archaeology certification programs.

Crowley, Erin (University of Minnesota)

[197] *Performing Feasts and the Use of Animals in Ritual Contexts in Iron Age Ireland*

Activities at large ceremonial complexes are interpreted as regional community endeavors that form group identities and reify social and political structures. Imposing monuments such as Dún Ailinne, Navan Fort, and Rathcroghan have provided tantalizing glimpses into ritual and ceremonial performances of the Irish Iron Age (500 BC-AD 500). Communal feasting has been suggested to be a key practice at these sites during the later periods of use. At feasts, social structure and identity are reinforced, wealth is redistributed, and political alliances are formed. In this way, feasts become a space for community concerns to be negotiated. The large hilltop complexes, however, are not the only ritual spaces in Iron Age Ireland. During the later prehistoric period, there is a proliferation of smaller ceremonial enclosures and barrow burials. Variation in ritual performance at these different sites provide insights into cultural concerns across different scales of society. This paper examines the role of animals and feasting at smaller hilltop enclosures and burial monuments of the later Iron Age in comparison to activities at the large ceremonial complexes, in order to better understand both ritual and ceremonial performance in these more private spaces and the social framework from which these practices develop.

[265] *The 2017 Excavations at Pan de Azúcar de Nivín: Insight into the Middle Horizon Occupation of the Middle Casma Valley, Peru*

Pan de Azúcar de Nivín is located 23km east to the city of Casma, in the small town of Nivín, at the right margin of the Casma River Valley in the Department of Ancash, Peru. In June and July 2017, a team of archaeologists from Louisiana State University carried out mapping and excavation operations at this important archaeological complex. Through limited excavations, architectural mapping, surface collection and the analysis of associated materials, the Proyecto de Investigación Arqueológico Regional Nivín (PIAN) explores the cultural prehistory of middle section of the Casma Valley.

Preliminary results of the stylistic analysis of pottery fragments combine with the appearance of the architectural layout indicate the presence of Middle Horizon and early Late Intermediate Period components at the archaeological complex. In this poster, I will introduce the region study, present the methodologies used in the field, and discuss the preliminary results of the analysis of the distribution of the ceramic fragments collected during the surface collection at the different architectural features at Pan de Azúcar de Nivín.

Moreover, the 2017 field work provides an opportunity to compare Pan de Azúcar de Nivín with other neighboring Middle Horizon and Later Intermediate Period groups nearby the Casma Valley.

Cua, Zaakiyah (Indiana University of Pennsylvania, Department of Anthropology)

[334] *Loyalhanna Lake: A Geoarchaeological Approach to Understanding the Archaeological Potential of Floodplains*

Unlike uplands, floodplains generally yield stratified deposits that may include deeply buried landscapes and archaeological sites. Most state specifications for cultural resources surveys require floodplains to be geomorphically evaluated in order to identify buried landscapes. This is most frequently accomplished via trenching, an effective, but timely, costly, and sometimes destructive method. This project reports on an alternative technique utilizing a multi-proxy methodology coupling geophysical survey with auger sampling. These non-invasive and limited-impact methods produce accurate results without causing extensive destruction to cultural resources. The study area, located along Loyalhanna Creek in Westmoreland County in western Pennsylvania, is managed by the US Army Corps of Engineers—Pittsburgh District (USACE). As a federal agency, the USACE is mandated to identify and preserve cultural resources by Section 110 of the National Historic Preservation Act (NHPA). Unfortunately, federal agencies often face limited staffing, resources and funding to address management of cultural resources. In addition to proposing a method for identifying buried landscapes, this project also provides a case study of partnerships between federal agencies and public universities; a mutually beneficial collaboration which provides agencies with data essential to land management while simultaneously providing students valuable opportunities to conduct cultural resource management assessments.

[206] *"Cosas Extraordinarias": America in Early Modern Royal Spanish Collections*

This talk concentrates on objects from America placed in the Palacio Real in Madrid and the Escorial. They form various parts of several types of collections that in recognizing the heterodoxy of their appearance in display different contexts dispel the overarching notion of the cabinets of curiosity that predominates in histories of collections for this period.

Cuneo, Allison (Boston University)

[110] *Broken Minarets and Lamassu: The Propagandization of Heritage on the Front Line of the War in Northern Iraq*

The armed conflict in Iraq has produced a catastrophic humanitarian crisis, beginning with the take-over of Mosul by the Islamic State (ISIS) in June 2014 followed by their subsequent gains in its northern governorates. Since then millions have become internally displaced or left the country as refugees. These war-wearied Iraqis are struggling with a loss of identity and a lack of control over their lives, and these feelings are further compounded by the destruction of their as a result of the ongoing conflict. Thousands of cultural properties have suffered collateral damaged as a result of intensive armed combat, particularly as a result of aerial bombardment, and more directly by the systematic and overt campaign of genocide and cultural cleansing wrought by ISIS. The conflict has brutally underscored the linkages between cultural heritage, cultural diversity, and human rights. Based on personal fieldwork experiences in northern Iraq and activities with the American Schools of Oriental Research Cultural Heritage Initiatives (ASOR CHI), this talk discusses how the belligerents engaged in the current northern Iraq conflict have responded politically and militarily to the destruction cultural sites, as well as how Iraqi civilians in these war-torn regions are coping with the loss of local heritage.

Cunnar, Geoffrey (WCRM) and Edward Stoner (WCRM)

[87] *Thirty Years On, Considering Kelly's 1988 "Three Sides of A Biface", and Why It Matters for Great Basin Archaeology*

We argue that it is time to reconsider the use of the term biface in Great Basin archaeology and implement more heuristic terms in its place. In most instances, there is only one role or "one side of a biface" and that was to become a projectile point. It is time we recognize bifaces as such and acknowledge that preform morphology can be an indicator of temporal association and of social agents including children. Stage classification alone is limiting in terms of allowing us to broaden our understanding and interpretation of the archaeological record. We suggest projectile point preforms are useful proxies of skill and that the majority of complete preforms left in the archaeological record were terminal artifacts with so many mistakes they could not have been finished; hence they remain as complete preforms in the record. The use of refined terminology along with the implementation of the theoretical framework of the chaîne opératoire, careful technological assessments and recognition of the importance of lithic scatters gives us the opportunity to present more holistic site interpretations. These include the examination of the nurturing of children which will allow for a more comprehensive look and interpretation of ancient group composition.

[123] *Cultural Interaction and Creolization (or Transculturation or Hybridization or Mestización or Criollización) in the Studies of the Ancient Past of the Caribbean*

Traditionally, the ancient history of the Caribbean is viewed as one where one culture replaces or dominates another through time. These views were highly influenced by the perspective of the early Anthropologists who saw intercultural relations through the colonial lens of dominant cultures and acculturation. Despite this emphasis on cultural "purity," the history of Caribbean archaeology includes several scholars who viewed cultural interaction more as an exchange of ideas and material culture. Although called by other names, these models are similar to what today we call creolization. This paper offers a historical overview of these theoretical perspectives from the traditional Culture-Historic approaches and discusses how they compared with contemporary concepts of creolization and ethnogenesis.

[99] *Quantifying Basalt Artifact Weathering and Depositional Context: Insights from the Koobi Fora Formation, Kenya*

Stone artifact weathering is important for understanding the formational history of surface and in situ assemblages. While much of this work has focused on chert and other crypto-crystalline silicas, the weathering of basalt is under-studied. As a large proportion of the Early Stone Age record consists of basalt, it is necessary to explore the weathering process of this material. Characterizing basalt weathering currently relies on the subjective characterization of both mechanical and chemical weathering properties. This is problematic as the rate at which these processes accrue depends on the depositional context. Thus, it is necessary to systematically understand how various weathering attributes accrue in different contexts. Here, we present a systematic analysis of basalt weathering in a variety of different sedimentary contexts. Taphonomic attribute data was collected from lithic assemblages from the Koobi Fora Formation in different depositional and temporal contexts. Multi-variate analysis was used to determine whether quantitative color estimations, the presence of crystals, and degree of edge and ridge rounding could be used to discriminate basalts from different depositional contexts. A discussion of the preliminary results is presented.

Currie, Elizabeth (Department of Archaeology, University of York, UK) and Diego Quiroga (Universidad San Francisco de Quito)

[63] *How to Invent Your Past. Cultural Appropriation or Adoption of Orphan Cultural Identity?*

In January 2017, members of the indigenous Salasaca community of the central sierra region of Ecuador discovered a cache of pre-Colombian pottery during ditch construction work which passed through a site of ritual significance. The government organisation responsible for managing antiquities removed the artefacts, promising that archaeological investigations would be carried out in due course. They never were.

The cache of artefacts was a strange mixture of authentic ceramic figurines and vessels of a wide geographical provenience, none of which were from the Salasaca area. In the absence of formal excavations, it is unclear how they were deposited there in the first place.

The local community responded enthusiastically, seeing the artefacts as an important connection with their lost ancestral past. Some believed they were mitmakuna—peoples translocated by Inca conquerors in the 15th century from an alternative geographic location to replace rebellious tribes recently conquered. They had some oral traditions, but no ancestral connection with the land they had been brought to, suggesting this cache of artefacts filled a lacuna in their sense of cultural identity.

This paper discusses the importance of archaeology and material cultural in the construction of collective cultural identity and ancestral legitimacy.

[303] *Storied Landscapes and Cultural Resource identification on Oregon's Paleocoastline*

The significance of cultural resources along Oregon's dynamic coast continues to have a stronger presence and recognition in landscape management. As future projects look to develop off Oregon's coast, there is a need for predictive modeling and analysis of cultural resources in a landscape that today is submerged. Paleolandscapes having high potential for a variety of cultural resources are identified using isostatic rebound adjustments and bathometric data. One such landform is off-shore of today's Tillamook Bay. Through historic documents, oral histories, and stories the distribution of cultural resources is mapped and rated. This gathered information along with off-shore paleolandscape reconstruction can begin to show the landscape's potential through an understanding of cultural practice.

[63] *Analyzing Urban and Industrial Threats to Heritage in Turkey Using Remote Sensing and GIS*

In Akçalar, Turkey, the location of the Neolithic-Chalcolithic Aktopraklık site, urban and industrial development present shocking social, cultural, and economic changes to the community. The local landscape is transforming as towering apartment complexes are quickly expanding into areas previously occupied by sprawling fields of crops. As documented ethnographically, these processes have heightened local awareness of the decline of community heritage values, like neighborliness, agricultural livelihoods, and green space. Furthermore, a diachronic ground survey has confirmed these dramatic changes in the previously small village over the last 5 years. Ahead of recent urbanization, industrialization of the area has expanded greatly in the last 20 years, especially in the designated industrial zone that surrounds the archaeological site. Indeed, ethnographic data indicates that factory construction in this zone has previously destroyed archaeological finds in its path. This study triangulates on-the-ground research with GIS and remote sensing analysis of satellite imagery and land use/land cover data to track the rapid development of this previously rural area. In particular, this analysis aids in planning future measures aimed at protecting valued archaeological and community heritage.

[249] *Cajamarca: Identity through Movement*

The Cajamarca Valley, located in the northern Andes of Peru, is a space of encounter and movement of material from different ecological areas since early times to the present. This is mainly due to its strategic location within Andean geography as an enclave of natural points of access to different ecological zones (coastal valleys, Amazon rainforest, southern highlands). Cajamarca culture (100 BC—1400 AD) is characterized precisely by the mobility of its inhabitants, as indicated by their white pottery—a result of the use of the kaolinitic clay found in its mountains. Although we know much about this contact from the remains left outside its borders, we know little about cultural motivations and dynamics that took place in Cajamarca and what drove these people to move outside. Here, I will focus on two key points about the nature of this culture: its possible malleability in adapting to different ecological zones due commercial activity, and second, given its nomadic nature through the landscape, the way in which characteristic Cajamarca ceramic style was used as its seal of “denomination of origin”, and as a reminder of identity or political affiliation to the Cajamarca group.

[82] *A Tale of Two Cities?: Neighborhood Identity and Integration at Ventanillas*

Studies of Andean urbanism have often focused on contrasts: between elite and lower-class compounds or neighborhoods, between rural and urban communities, or between the “true” cities in regions like Mesopotamia and the “special case” of the Andes. Recent work at Ventanillas, a large Late

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Intermediate Period site in the middle Jequetepeque Valley at the frontier of coastal Lambayeque and Chimú polities, was initially designed to contrast what were presumed to be an elite coastal residential neighborhood and lower-class, possibly highland, hillside terraces. However, 2016 excavations on the terraces failed to confirm this easy assumption, and have complicated our view of who lived at Ventanillas. This paper compares subsistence remains, ceramics, and other artifacts across neighborhoods at Ventanillas, with the goal of elucidating similarities and differences between sectors, and, more importantly, exploring the extent to which residents living in different parts of the site participated in a shared cuisine, specialized in different economic activities, and expressed wealth and ethnic or cultural identities. We ultimately hope to speak to the ways in which Ventanillas neighborhoods were (and were not) socially and economically integrated at the community level and in the context of valley processes of social and political change.

[177] *Macro- and Microscopic Effects of Heating in Lithics: Potential Indicators of Human-Controlled Fire?*

Outside of clear association of human activities and fire features (e.g., a constructed hearth and artifacts), a perennial challenge persists in linking human/hominin behavior to the control of fire. This particularly vexes ongoing investigations to determine early human-fire interaction(s). Although natural landscape fires can be intense, their tendency to move quickly may limit modifications in lithic material at ground level. Studies examining the effect(s) of heating tool-stone at different temperatures and durations may provide insights on the question of human-controlled fire. As opposed to heat-treating material for improved flakeability, we report here on analyses examining macroscopic and microscopic modifications of various tool-stone (e.g., basalt, chalcedony, ignimbrite, etc.) at 250°, 500°, 750° and 1000° Celsius, and at different durations of exposure. Results indicate that consistent effects in lithics heated in high-energy, discrete, long-duration events (i.e., campfire) may corroborate other lines of evidence suggesting human-controlled fire. In that lithics are both a predominant human artifact and preserve well in the record, these techniques—in concert with other advances in the study of human-controlled fire—may be valuable to archaeologists, and in particular paleoanthropologists investigating potential human-fire features in early sites.

[201] *Sovereignty, Colonialism, and Collaboration: Reflections on Archaeological and Ethnographic Work on the Lower Columbia River*

Over the course of the last two decades I have been actively involved in anthropological research along the Lower Columbia River. This includes archaeological field work conducted within and just outside of the boundaries of the Ridgefield National Wildlife Refuge in Washington, as well as a heritage ethnography completed in collaboration with the Chinook Indian Nation. This research has happened on both federal and private lands and has involved multiple “stakeholders,” including both federally recognized and non-recognized tribal nations. This work has also been conducted in a region where heritage claims and archaeological sites are occasionally contested, and where the cultural connections and “authenticity” of tribal communities are at times questioned. In my presentation I'll reflect on the challenges of navigating my responsibility, and positionality as an anthropologist—especially one committed to “engaged,” ethical, and community-relevant research—in an arena where multiple interests and jurisdictions intersect. I'll argue that although negotiating my position as a researcher can be difficult, a focus on the centrality of tribal sovereignty (both as it's legally defined and enacted by communities), as well as constant mindfulness of the continuing manifestations of colonialism, can offer guidance for an appropriate and engaged research path.

Daggett, Adrienne (South Carolina SHPO) and Lu-Marie Fraser (University of Pretoria)

[32] *Subsistence Technology in Early Iron Age Botswana*

Analysis of the faunal assemblage from Thabadimasego, an Early Iron Age site in northeastern Botswana, contributes to the growing notion that hunting played a larger-than-expected role in the subsistence pattern of the area's communities. Beyond understanding what they ate, what do the faunal remains tell us about the subsistence technology of Botswana's Early Iron Age? Recent studies have focused on metallurgy and ceramic technology, but faunal patterns can provide information on the use of other technologies, including ones that don't usually survive in the archaeological record. This paper will discuss the evidence for the use of ephemeral materials as indicated by Thabadimasego's assemblage, as contextualized by evidence from other regional sites.

[45] *An Analysis on the Taosi Cemetery from the Late Neolithic in North-central China*

Taosi is one of the largest sites surrounded by the huge fortification during the late Neolithic in the middle Yellow River valley. So far the archaeologists have excavated a large cemetery, and uncovered a number of burials at Taosi. These burials can be divided into a few categories based on their scale, structure and grave goods, representing the different social ranks. The cemetery consists of several sections, which represent the different social groups. During the early Longshan period, some large tombs were arranged in an area according to their sex and status at first, and then the other large tombs were centrally distributed in another area. During the late Longshan period, a group of large tombs appeared in another district, and the largest one of them with very complex structure and abundant luxury goods was located in a special area alone, so that it looks like a king tomb. In general, this paper will discuss the social change of the Taosi site on the basis of its cemetery analyses.

[303] *Preliminary Analysis of Landscape—Social Complexity Relationship Changes from Neolithic to Bronze Age in South Carpathian Basin*
The onset of the Early Bronze Age saw increasing degrees of social inequality and institutionalized leadership in most of Europe. In the Carpathian Basin these changes are most evident in shifts in burial practices and settlements. This research aims to see if these changes are reflected in regional settlement patterns by applying spatial analyses to two periods of a regional settlement dataset. I will examine the landscape and the environmental characteristics of Neolithic and Bronze Age settlements and their respective catchments and compare the settlement pattern to a random distribution to determine the extent to which environmental and sociopolitical concerns shaped human settlement. Shifts in demographic focus from Neolithic tell settlements to Early Bronze Age cemeteries will be tested by examining network properties of 'centrality', and the emergence of new elite controlled trade by looking at the 'betweenness' of the settlement pattern. The importance of warfare during the two periods will be compared by examining defensive features like buffers zones or the utilization of less accessible areas.

[38] *Revisiting CA-VEN-1 and Millingstone Culture Re-examined*

The concept of Millingstone has long and intriguing history in California Archaeology. Millingstone conjures up visions of early, simple, crude tools, and a confusing legacy. Millingstone Culture is not easy to define, though it is quite consistent throughout its geographic distribution. Millingstone never fit clearly into earlier theoretical paradigms. Millingstone has been variously described as a technology, as a culture, as an adaptation, as a Horizon, as a tradition, as a regional pattern, and as a subsistence strategy. Perception and interpretation of Millingstone sites have often been colored strongly by early investigations of these settlements. Using an updated paradigm of the coastal migration theory can offer some new insights into redefining older interpretations of Millingstone sites. I use newer data from the "Little Sycamore" site to show how broader research questions and newer data collection methods can shed new light on Millingstone and its interpretation.

Dalpra, Cody and Hunter Crosby

[305] *Historic Evidence of Social, Economic, and Gender Issues at Petrified Forest National Park: Variability in the Archaeological Signature of Historic Homesteads*

The archaeological "wealth" in Petrified Forest National Park (PEFO) of Northeastern Arizona is not isolated to the well-known Ancestral Puebloan populations, but similarly includes Historic peoples. The westward expansion of the late 19th and early 20th centuries in Northern Arizona represents a time of clashing cultures and a period of uncertainty combined with untold risks and rewards. Along the Rio Puerco in and near PEFO are five homesteads from this period that display different and unique signatures that suggest varied occupants and functions. From "Cowboy Camps" occupied primarily by males working the range to significantly larger homesteads that display evidence of women with Chinese and other fine porcelain, which is not seen on other contemporary sites, demonstrates variability. The diverse signature of these sites represents a prime case study for the varied peoples who came to the area now occupied by PEFO. These sites demonstrate that even in seemingly homogeneous times diversity is present, describing more facets of the historic homestead populations than is previously thought. A contrast and comparison of these sites demonstrates the varied archaeological signature tied to the early historic ranching culture of the area; a ranching culture that continues today with the parks neighbors.

Dalton, Jordan and Paula Patricia Moreno Zapata

[100] *Exploring Local and Imperial Strategies in the Chincha Valley*

Inca archaeologists have regarded the Chincha Valley as a special case of imperial expansion due to the privileged position that the Chincha held within Tawantinsuyu. From the ethnohistoric documents we learn that the Chincha Kingdom was powerful, controlling long-distance maritime trade to Ecuador. The Chincha also relied on a highly specialized economy composed of fishermen, merchants, and agriculturalists. Previous studies of the Chincha Valley have emphasized coastal centers of fishermen and merchants, but in this poster session I present new research on how the large agricultural center of Las Huacas accommodated economic changes during the Late Horizon (A.D. 1470–1532). The archaeological site of Las Huacas covers 105-ha. and contains unique stratigraphy, a 2.5 m deposit that accumulated throughout the Late Horizon. This deposit is composed of various layers of fill and distinct floors, allowing us to establish a fine-grained chronology within the Late Horizon and explore changes that were brought about by the Inca occupation of the valley. By analyzing the cultural artifacts, plant material, faunal remains, and a series of architectural transformations associated with these distinct levels, this poster will present recent research on which activities at Las Huacas changed and which remained largely unchanged during Inca occupation.

[259] *Deep Ecology: An Introduction and an Inquiry*

Archaeology has engaged with ecology in various ways over the years. Recently, post-humanist thinking has gained popularity as an approach, urging us to think about human and non-humans relationally, as having contingent qualities that vary in relation to their interaction over time. Simultaneously, we see increasing attempts to think with indigenous philosophies and descendent communities about what the environment is and does. However, there remains a disconnect between approaches that seek to include indigenous philosophies and/or post-humanist approaches, and much work of the ecological sciences which are developing at a rapid pace, providing greater precision and clarity of information. This paper considers the history of archaeology's relationship to the idea and study of ecology, and proposes the concept of "Deep Ecologies" as an approach to human-nonhuman interactive pasts that offers the opportunity to bridge some of these perceived divides, while also being attentive to the politics of attempts to do so and the appropriative histories of archaeological work in this vein. It serves as an organizing thesis statement for the session, which presents attempts to grapple with the idea of "deep ecology" through ten years of archaeological fieldwork in northern New Mexico.

[128] *Making Sense of a Holy Trinity: The Dioses Narigudos of Classic Period Central Veracruz*

Dioses Narigudos are a series of ceramic figurines that are extremely frequent during the Classic period in a very restricted area of South Central Veracruz. They occur generally in ritual deposits under floors of major and minor buildings, combining female and male representations of different hierarchy. Current interpretations relate them to a solar deity or a water deity, none of which identifications apply to all three main figurine types. Their

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

attributes and the contexts in which they are found would suggest they are used not only to sacralize the space but also the persons who inhabit the built spaces under which they are placed. This leads me to relate them to a deity similar to the later Postclassic Nahua Tlaltecuhli; to argue this I use the model of numbered ritual deposit proposed by Dehouve for the investiture of persons of authority, and the female/male elements related to the Classic Gulf Coast Water/Earth Mountain supreme being as analyzed by Koontz and Wyllie.

[309] *Doing Senses: Methods and Landscapes*

In this paper we discuss methods for what Yannis Hamilakis (2013) has called “sensorially reconstituted archaeologies.” Rather than being strictly focused on single mode sensory experience in the past, such archaeologies cannot be done without a self-reflexive awareness of multisensorial elements in every experience and event of modern archaeology and the imagined past. The theoretical goals of such a large-scale shift in thinking about archaeology and the senses have already been laid out, but they have yet to be borne out in practice. Our goal is to guide the “doing” towards an expanded toolkit of methods, some from within archaeology and some from other disciplines, that access, interpret, represent, and evoke sensorial attention. We pay particular attention to methods linked to landscape archaeology and our personal practices in the North American Southwest and Turkey.

[71] *Metal and Vitreous Production Technologies at the Early Bronze Age Resuloğlu (Central Anatolia, Turkey)*

Modern day Çorum is the homeland of the Hatti people, the culture that later formed the Hittite Empire. Resuloğlu, dated to the Early Bronze Age (ca. 2500–2100 BC), is one of the few Hatti sites being systematically excavated. The site, located on a hilltop near the Delice River, consists of a cemetery area and settlement that spreads over two opposing–once connected–ridges with numerous extraordinary metal and vitreous artifacts. The settlement exemplifies well the self-sustaining pre-Hittite societies in the Halys basin.

This research focuses on the Early Bronze Age metal and vitreous artifacts at Resuloğlu to understand the production technologies by combining archaeometric methods with archaeological theories about integrated crafts. While comparing and contrasting the technology and raw material exploitation at Resuloğlu with the available local and regional data, we will also present the results of the new ongoing survey at the region. By using the archaeometric and survey results of Resuloğlu, we would like to bring a fresh look to theories of possible local production(s) region and trade relations of Hatti before the Hittite Kingdom emerges.

[72] *Nuh nuhy Himdag. The Role of Song in the Identification of O’Odham Traditional Cultural Properties*

The Gila River Indian Community Tribal Historic Preservation Office and Cultural Resource Management Program have been engaged in Traditional Cultural Property (TCP) inventory for more than two decades. This presentation considers the role of Nuh nuhy Himdag (song culture) in TCP identification with specific reference to a recent study of Vainom Do’ag (Iron Mountain), which, based on a ruling by the United States Board of Geographic Names in 2008, was named Piestewa Peak in honor of the first Native American woman to be killed in combat while on active duty in the United States military. New translations of the Vainom Do’ag song in the Ant and Oriole series reveal the significance of this TCP, while demonstrating the fundamental misunderstandings that can arise when the naming practices of two cultures confront one another. In spite of recent advances in the recognition of TCPs in cultural resource management, this study acknowledges that the O’Odham can never be free of the cultural appropriation that continues to be part of the national process and the accommodation that is required for Tribes to perpetuate their own culture within federally legislated frameworks.

Darras, Véronique (CNRS—University Paris 1 Pantheon-Sorbonne) and Brigitte Faugère (University Paris 1 Panthéon-Sorbonne)

[262] *Sociopolitical and Cultural Renewals during Late and Terminal Formative in the Lerma’s Valley: The Post-Chupicuaro Developments*

Chupicuaro reached its cultural and demographic peak between 400 and 100 BCE. This Formative culture was integrated into the western Mesoamerican sphere and was characterized by its homogeneity, with diversified but still poorly understood relationships with Central Mexico, particularly in the sites of Cuicuilco and Cerro de los Tepalcates, and Tlaxcala-Puebla area. The decades before our era underwent both socio-spatial reconfigurations, probably due to rapid environmental change in the principal cultural epicenter, the valley of Acambaro, which was massively depopulated. The synchronicity of these evolutions with the events that took place in the Basin of Mexico or the regions of Puebla Tlaxacala is particularly striking. The recent works carried out in two zones of the Lerma region, the valley of Acambaro itself, and the alluvial plain of Lerma some 100 km downstream, lead to revisit the current assumptions on the directions of population movements that signal the end of Chupicuaro and which mark the beginning of new processes embodied by Protohistoric societies in north-central Mexico. These societies are characterized by their diversity, at least through their material culture, and display more or less intense links with Teotihuacan.

[190] *The Map Results of an Integrated UAV-Based Remote Sensing Platform in the Northern Yucatán*

We report the results of testing a UAV-borne LiDAR and multispectral mapping system for archaeological mapping and modeling at the city of Mayapán, Mexico, located 40km south of modern Mérida. Mayapán was the largest Postclassic political capital and was one of the most densely nucleated of all Maya cities. The initial test is in an area adjacent to the south side of Mayapán's monumental center. Previous research indicates the existence of a dense and complex system of residential and public architecture covered by low dense surface vegetation and a high forest canopy. Additional zones were randomly selected based on types of surface vegetation. The resulting data are processed in a variety of geographical information systems, photogrammetric software, and 3D modeling applications to generate final maps and models of the study areas. We compare these products with previous maps of the region, including those of the Carnegie Project from the late 1950's, total station and GPS-based maps, and a digital elevation model from the 2013 Mayapán LiDAR Mapping Project.

[265] *Three-Dimensional Photogrammetric Modeling of Ceramic Whole Vessels from Pachacamac, Peru: Challenges, Considerations, and Applications*

In recent years, photogrammetry has emerged as a low-cost solution for the digital preservation of archaeological sites and artifacts. Beyond preservation, the creation of three-dimensional models allows archaeologists and researchers to ask questions of objects or sites remotely and at more refined scales. It also allows sites or active excavations and objects not on display to be accessible to the public. Whole ceramic vessels from Max Uhle's 1897 excavations at Pachacamac, curated at the Penn Museum, were recorded using photogrammetry. The sample was excavated from several locations at the site of Pachacamac, including the Temple of the Sun and the Temple of Pachacamac, and includes ceramics in Inka, Ychsma, and earlier styles. These vessels included both closed and open forms, like plates, bowls, and cups. This poster examines the challenges in using this method to record ceramic vessels, as well as the potential applications for academic research and public outreach using the 3D models.

Davies, Gavin (University of Kentucky)

[176] *Routes of Resilience and Dependency in the Lake Atitlan Basin of Highland Guatemala*

Combining archaeological, ethnohistoric and ethnographic data with an analysis of least cost routes, the current paper examines the network connections and craft industries that fueled Lake Atitlan's prehispanic economy and connected it to the wider Mesoamerican World. The documentary evidence, which I synthesize here, indicates that the lake's principle exports were perishable goods such as textiles, mats, rope products and foodstuffs. While insufficient to produce significant wealth, I argue that the diversity of products available in the lake area enabled its communities to weather broad scale political and economic fluctuations and to retain strong collective identities even during times of political integration. Correspondences between historically documented trade routes and ceramic imports indicate that the essential infrastructure for these industries was in existence by the Early Classic Period.

[322] *Discussant*

Davis, Christopher (University of Illinois at Chicago)

[73] *Conspicuous Knowledge Transmission through Amazonian Cave Art*

Among large-scale societies, esoteric knowledge is often exploited for power, prestige, or status. In such a social framework, it becomes important to guard the transmission of esoteric knowledge, restricting access by exclusive mechanisms of indoctrination or co-option. When discovered, evidence of guarded knowledge often flags the attention of the archaeologist because of its often meticulous preservation. However, if the same knowledge were conspicuous, unguarded, and socially mundane, evidence of it is less likely to preserve as well archaeologically, and archaeologists might be more inclined to underestimate its cognitive sophistication. Ancient rock art paintings conspicuously placed on the ceiling of a cave along the lower Amazon River conveys sophisticated astronomy knowledge that parallels knowledge chronicled during contact and historical periods from oral transmission. Archaeological excavations of the cave and region reveal low-density populations since the earliest period of human habitation over 13,000 years ago, during the same period that most of the red ochre pictographs were painted. Here, I argue that this small-scale society transmitted sophisticated knowledge through conspicuous rock art, which later transferred, or was re-imagined, through oral transmission. This example provides evidence for the importance and awareness of sophisticated knowledge maintained, and perhaps originated from (often overlooked) traditional cultures.

Davis, Dylan (Binghamton University)

[52] *Filling in the Map: Object-Based Image Analysis and Its Potential for Shell Ring Identification on Hilton Head Island, SC*

As a resource, the archaeological record is finite and remains largely incomplete. Within the context of Southeastern American archaeology, the incompleteness of the record can be seen in the study of shell rings. Many unidentified shell rings exist in the archaeological record, and their detection remains difficult—even with remote sensing techniques—due to the fact that many are located under heavily forested canopies. However, with the use of object-based image analysis (OBIA), such archaeological features can be rediscovered. Utilizing LiDAR data and a method known as "template matching," this study creates elevation and shape profiles to search for previously unknown shell mound sites throughout Hilton Head Island, South Carolina. This method has been successfully applied for similar purposes in other regions of the world, but has not been tested in the American Southeast. As such, this research offers a new means by which shell mounds and shell rings can be identified and further studied. Furthermore, this new method has the potential to be implemented worldwide for various archaeological purposes, including that of site and feature identification.

[37] *Terminal Deposits and Terminal Classic Collapse: An Analysis of the Proportional Distribution of Artifacts from Terminal Deposition Events at the Site of Baking Pot, Belize*

Throughout the Maya Lowlands, archaeologists have identified Terminal Classic deposits associated with the final activities in ceremonial and domestic spaces. These features include concentrations of cultural material deposited in the corners of plazas and courtyards. At the site of Baking Pot, Belize, the Belize Valley Archaeological Reconnaissance (BVAR) project has identified several of these terminal deposits. This presentation will shed light on the types of artifacts that were deposited during these final events to answer questions related to the nature of abandonment activities. We also employ this data to identify the cultural significance of ritual deposition of cultural materials, to ascertain how distinct combinations of artifact classes can yield

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

information on human behavior, and to demonstrate how the terminal deposits at Baking Pot offer additional information about abandonment activity in the Maya Lowlands.

Davis, Jennifer

[203] *The Walter Landgraf Soapstone Quarry State Archaeological Preserve: Honoring a Man and Preserving a Site*

Soapstone was a valuable raw material for the production of items used in food preparation, including cooking vessels, in eastern North America before the development and spread of ceramic technology. Durable, waterproof, fireproof, nearly impervious to thermal shock and, at the same time, soft and very easy to extract and then sculpt into a desired shape, the demand for this raw material was high but supply was geographically constrained. Designated a Connecticut State Archaeological Preserve in 2015, the Walter Landgraf Soapstone Quarry is an intact soapstone extraction site associated with a habitation, the Ragged Mountain Rockshelter. At least five unfinished and "unharvested" bowl forms are visible at Locus II, the primary soapstone source at the site. Excavation of the quarry, the discovery of numerous, primarily quartzite quarry picks, and a series of quartzite cobble workshops nearby the quarry provides an opportunity to investigate an important, multi-tiered industry in ancient Connecticut. The concept of "disruptive innovation" as initiated by the introduction of ceramic technology is offered to explain the abandonment of the Walter Landgraf quarry more than 2,800 years ago.

Davis, Kaitlyn E. (University of Colorado, Boulder)

[27] *Smoking Customs and Plains-Pueblo Interaction in the Southwest Border Pueblos*

This project centers on Plains-Pueblo interaction in the late-prehistoric and protohistoric periods. It analyzes how trade and inter-regional interactions were ritually mediated between these two culture groups, through the examination of pipes and smoking materials used in economic interactions at pueblos in the Northern Rio Grande area of New Mexico. Ethnographic and ethnohistoric literature indicates that pipe-smoking was part of rituals that cemented inter-tribal trade relationships. The data from this project support the idea that pipes were used in trade negotiations and ceremonial interactions and can be proxies for examining social interaction and regional mediation aspects of trade and decision making. The blending of Plains and Pueblo pipe forms and materials suggests that there may have been a certain level of integration, alliance, or partnership in these interactions. Three categories of data totaling 1,306 pipes were analyzed from known trade centers and comparative samples from interior sites not known to be trade centers in the Southwest and Great Plains. Methods used in this study included analyses and tabulations of particular physical attributes of pipes that provide information on pipe use and regional style, as well as spatial and temporal analyses of pipe concentrations and concentrations of particular pipe attributes.

Davis, Katharine (Ursinus College)

[17] *Libations and Meat: A View of the Construction of Social Capital in Tiwanaku Residential Spaces through Ceramics and Faunal Material*

In the latter part of the Middle Horizon (A.D. 800–1000) previously unoccupied areas around the megalithic ceremonial core of Tiwanaku came under settlement. A reorganization of space within the core coupled with the influx of new urban residents drawn to the site of Tiwanaku from the surrounding areas by the variety of social, economic, and ritual interactional opportunities meant that newly built households and neighborhoods further away from the monuments became the loci of quotidian activity. Experiencing population density never before achieved in this area of the Andes, families constructed their physical shelters as they built their interdependent social networks. This paper examines ceramic and faunal remains that suggests that feasting in one such household context, Muru Ut Pata, was perhaps more intense and integral an activity to building and maintaining social capital than in elite contexts.

[79] *Searching Oregon's Outer Continental Shelf for Submerged First Americans Sites: Theory, Methods, and Recent Discoveries*

If the First Americans initially migrated into the New World from northeastern Asia along a coastal route, we should expect to find the earliest evidence of human occupation in the Americas in submerged sites along the northeastern Pacific Rim. Late Pleistocene-aged human coastal migrants would undoubtedly exploit high ecological productivity zones of ancient estuaries and bays that once existed along paleocoastal landscapes. A systematic approach to the discovery of First Americans coastal sites requires detailed knowledge of these paleocoastal landscapes and how they evolved since the last glacial maximum. To this end, we constructed a digital model of central Oregon's paleocoastal landscape, which guides offshore exploration efforts. We present the results of recent geophysical cruises that reveal physical traces of modeled terrestrial stream networks and discuss potential archaeological targets that will be further explored through marine coring in 2018.

[304] *Domestic Craft Specialization and Social Spatial Organization of Harappa*

The site of Harappa, Pakistan, was a major urban center of the Indus Civilization with over two thousand years of occupation (3700–1700 BCE). The site did not have an obvious civic ceremonial center but was instead multi-nodal with walled sub-divisions. As an aspect of stone tool assemblage analysis at the site, the most functionally relevant attributes of the blade tools were differentially weighted to produce a soft hierarchical clustering classification scheme. These classes are considered temporally and contextually, across spatially distinct walled administrative districts and proposed social neighborhoods within these walled mounds. The relationships of the tool classes between and within the mounds were evaluated via correspondence analysis. Each of the districts is found to have a limited repetition of crafts, suggesting that some level of economic integration was a factor that contributed to the cohesion of this decentralized urban center. Analysis of chipped stone tools at the neighborhood level identified previously unknown centers of craft specialization of perishable products and craft specialist activities taking place in domestic contexts. Possibly two different textile traditions were important both for occupational specialization and neighborhood and community membership.

Dawson, Emily (University of Texas at Austin)

[259] *Plant Use and Deep Ecology in Colonial New Mexico*

Understanding the interactions between people and the landscape has long been a concern of archaeologists working in the American Southwest. A particular emphasis of this research has focused on understanding the way pre-colonial Pueblos altered the landscape for agricultural production. More recent studies have worked to incorporate indigenous voices into scholarly understandings of the landscape. So far, less attention has been paid to the way Hispano communities in New Mexico experienced and interacted with the landscape during the colonial period. Early accounts by Spanish colonists indicate that they brought wheat, lentils, melons, garlic, and other Old World cultivars with them. While these accounts indicate the colonists were growing the cultivars, previous archaeological work has produced limited evidence for the growth and use of these plants. This paper considers how the desire for specific plants impacted colonial views of the landscape and ecology of northern New Mexico through preliminary phytolith analysis. We use the evidence of everyday plant use over time to work towards a better understanding of the deep ecology of colonial life in the region.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

De Anda Alaniz, Guillermo (Instituto Nacional de Antropología e Historia (INAH))**[134]** *Reconceptualizing Chichen Itza: The Gran Acuífero Maya Project*

During the summer of 2017, the Gran Acuífero Maya (GAM) project initiated an investigation at Chichen Itza designed to define the site around its aquatic resources. The project is based on my previous work at Cenote Holtun, located 1.6 miles west of Chichen Itza, which found that a line drawn between Holtun and Cenote Kanjuyum on the east passed through the center of El Castillo. It has long been known that El Castillo is bisected by a line drawn between the Sacred Cenote on the north and the Cenote Xtoloc on the south so Chichen Itza defined itself around a cosmogram formed by its water features. Additional, Balankanche and other caves with water are being restudied as cenotes. GAM is employing high tech equipment to Chichen Itz's aquifer including sonar to search for underwater passages in the cenote Xtoloc and the Sacred Cenote; low level Lidar that has located four caves that may lead to the water table, and ground penetrating radar to detect subterranean passages. Our preliminary assessment is that Chichen is far richer in water resources than previously recognized.

De Anda Alaniz, Guillermo [134] see Verdugo, Cristina

De Carteret, Alyce (Brown University)**[36]** *Building an Empire: Spanish Colonial Encounters with Maya Houses and Housebuilding*

In the late sixteenth century, King Philip II of Spain sent out a request to the local administrators of his overseas colonies, asking that they complete a questionnaire designed to collect information about the lands he had conquered. The responses to this questionnaire, completed primarily between 1578–1586, form a set of documents now known as the Relaciones Geográficas. Question 31 asked respondents to describe the form and construction of the local houses and the materials used to build them. In this paper, I consider Question 31 of the Relaciones Geográficas and its responses, in conjunction with a survey of archaeological research, to assess the nature of Maya housebuilding in the Colonial period (particularly the sixteenth century). These data indicate an interest on the part of the Spanish Crown to understand indigenous building practices and labor in order to better control it. I argue that construction was targeted by Colonial reducción policies (i.e., the policies intended to mold indigenous communities into proper Spanish subjects); in the Colonial Maya world, Spain aimed to build its empire literally, through reformed building practices of reformed Maya communities.

De Juan Ares, Jorge (IRAMAT-CEB, UMR 5060, CNRS, Orléans) and Yasmina Cáceres Gutierrez (Universidad Complutense de Madrid)**[275]** *Archaeology, People and Identity in Cape Verde Islands*

The geographical location of Cape Verde islands made them one of most important places in early Portuguese exploration of African coast. The first European settlers were favoured by the Portuguese monarchy in the relations with African coast. Since 1472, they were forced to carry out exchange with local goods. This encouraged the development of cotton and sugarcane crops with slaves from the "Guinea Rivers", as was common in other Atlantic islands and the American colonies. The excavations reported here were carried out in Cidade Velha, the first capital of the islands. Archaeological materials from the Iberian Peninsula and other places of Europe, Africa and China have been recovered. Material evidence is useful to explore early Atlantic commercial networks. Over the fifteenth and eighteenth centuries, this commercial activity was accompanied by the circulation of people, languages and ideas. The loss of the slave trade led to a gradual economic decline which, coupled with environmental constraints, resulted in the shortage of European settlers and the absence of indigenous population from the islands, and encouraged an early fusion of people and culture, giving rise to the present Creole Cape Verdean national identity.

De La Garza, Mary**[231]** *10 Years, 3 Supervisors, 7 Assistants and 30 Students. How the Iowa Office of the State Archaeologist Managed, Manages and Plans for the Future of Archaeological Data*

Sustainable accessible data storage is as important to archaeologists as tractors are to farmers. In 2001 the Iowa Office of the State Archaeologist, (OSA), was archiving 20GB of data on a 100GB server. Sixteen years later the office is serving 32TB on several server systems and plans are in place to archive 60TB over the next 4 years. In addition to space needs the office must also make this data in its many forms accessible to outside entities. In the not so distant past archaeologists secured and stored paper, photos and film in Hollinger boxes stacked to the ceilings in many places. These days many archaeological agencies have scanned and archived massive amounts of data to server systems which takes up less space and can contain many times more data. The OSA has taken advantage of many grants to scan and archive over 400,000 sheets of paper and 58,853 photos and slides. The advantage of this undertaking; accessibility and scalability.

Moving into the future the OSA must develop and plan for the security storage and accessibility in ways that protect sensitive data. Security is paramount in any organization but especially so when culturally sensitive data is in place.

De La Peña Paredes, Juan (Juan D. D. Paredes) and Yamile Lira-Lopez (Universidad Veracruzana)**[93]** *La sociedad prehispánica del valle intermontano de Maltrata, Veracruz: Desarrollo poblacional, aprovechamiento y cosmovisión*

El valle de Maltrata, al oeste del estado de Veracruz, presenta un desarrollo poblacional que inicia desde el periodo Preclásico, continúa en el Clásico, Posclásico y Colonia, durante esos periodos de tiempo la población se fue asentando en distintas partes del valle, aprovechando los espacios naturales que se disponían. Desde el inicio de la ocupación se utilizó la posición estratégica del valle como una ruta de comunicación, comercio e intercambio, que fue usada por diversas culturas para la obtención de materiales diferentes, unos instalaron enclaves, otros intentaron conquistar el lugar para extender su dominio hacia otras regiones. Durante esos periodos de tiempo la cosmovisión de los habitantes está plasmada en distintos materiales culturales como el Monolito de Maltrata, así como en los lugares de culto.

De Lucia, Kristin (Colgate University) and Enrique Rodríguez-Alegría (University of Texas-Austin)**[63]** *Digging in Churches: Community Archaeology in Xaltocan, Mexico*

Xaltocan has a thriving community and its people have a strong connection to their long history, although this was not always the case. Elizabeth Brumfiel pioneered community archaeology at Xaltocan almost 30 years ago and initiated a long process of collaborative archaeology that continues until this day. As a consequence of the close interaction between archaeologists and the community, the past has become a vehicle for the construction of local and national identity in Xaltocan. We will discuss recent efforts and new understandings that have emerged from our recent archaeological project focused on the town's 16th-century church, which is in disrepair and at risk of collapse, and look ahead to new possibilities for future community collaboration.

[63] *Chair***De Marigny, Elizabeth (Department of Anthropology, The University of Texas at Austin)****[229]** *The Economics behind Pottery: The Impact of Romanization on Castro Culture Ceramics in the Littoral Northwest*

Through a comparative analysis of ceramic materials from several archaeological sites including the Cividade de Bagunte, this paper explores the effects of Romanization on the fields of production and consumption belonging to the Castro Culture of northwest Iberia. These sites were chosen because the archaeological materials uncovered reflect differences in social, political, and economic organization from the Iron Age to the Roman period. Further, the proximity of these sites to one another would have been ideal for trade and communication. By analyzing ceramic assemblages, it

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

is possible to determine the types of activities that dominated a settlement's economy, such as vessels used for storing or transporting agricultural products, or ceramic objects used in craft production such as loom weights and spindle whorls. Drawing from behavioral economics, this research will investigate how colonial interactions and economic restructuring brought on by Roman conquest led to the adaptation, adoption, or abandonment of certain ceramic forms. This presentation focuses on how the implementation of Roman standards of trade and commerce influenced the production and use of certain ceramic forms and led to separate but connected economies.

De Pena, Felicia

[304] *Lithics and Learning: Communities of Practice at Kharaneh IV*

Flintknappers during the Levantine Epipaleolithic were proficient at microlith production, these skills were learned and passed down from one flintknapping generation to another as no one is born with the innate ability to flintknap. By utilizing practice theory and a chaîne opératoire approach to the Epipaleolithic chipped stone tool reduction sequences of narrow-nosed cores at Kharaneh IV, I strive to identify how individuals learned to flintknap, from raw material acquisition to the production of the final tool. I view the knowledge transmission process as a proxy for culture: as apprentices took on new ideas and identities to fit within a community of practice, the apprentice may have lost (or maintained) kinship ties yet subscribed to a more meaningful relationship within their community of practice. Kharaneh IV is an Early and Middle Epipaleolithic aggregation site well-situated for this research due to its well-preserved stratigraphy, numerous caches, and hut structures, which allows for observation of repetitive practices and identification of changes in technique. Research is currently in the nascent stages of core refitting: future experimental work is planned to establish baseline knowledge regarding the relationship between skill level and social structures that influence the production process.

[27] *Remote Sensing to Identify Chaco Roads: A Case Study of the North Road*

The focus of this research is to demonstrate the efficacy of data processing methodologies of remotely sensed data to detect the Chacoan Great North Road between Pueblo Alto and Pierre's group. This research highlights a scaled approach to the analysis and processing of remotely sensed data to efficiently identify prehispanic roads. The data analyzed in this project includes: thermal infrared multispectral scanner (TIMS), light detection and ranging (LIDAR), orthoimagery from Google Earth and Worldview 3, and legacy historic aerial imagery. We also discuss the efficacy of additional remote sensing data types which have not been applied to this study area, including advanced spaceborne thermal emission reflectance radiometer (ASTER) and hyperspectral thermal emission spectrometer (HyTES). The use of novel processing techniques via proprietary and open access processing methods, improved road identification as opposed to traditional aerial image analysis. The use of a multi-scalar integrative approach to the identification of roads allowed us to avoid false positives (modern roads), understand modern impacts, and predict the long term future of these roads.

[199] *Early Seventeenth Century French Feasting in Acadia and Its Relation to Pre-contact Mi'kmaq Practices*

The early French settlers at the Port Royal Habitation relied heavily on the local Mi'kmaq to survive the cold Nova Scotia winters. In the winter of 1606–07 Samuel de Champlain initiated a social club, commonly referred to as "The Order of Good Cheer", primarily to battle against scurvy, but also to create camaraderie among the colonists and to strengthen their relationship with the local Mi'kmaq. The French developed elaborate rituals for the feasts, partly based on those of their homeland. Food for the feasts came from their own gardens, ship's provisions brought from France, locally available plants and animals, as well as generous gifts of meat, fish and fruit from the Mi'kmaq who were invited to dinner. The Mi'kmaq had their own elaborate feasting traditions which also influenced the French celebrations. French writings of this period allow us to explore these two rich traditions, and along with available archaeological evidence, shed some light on the nature of Pre-contact Mi'kmaq feasting.

Dean, Emily (Southern Utah University)

[70] *The Mystical Past and the Lucrative Present: New Age Archaeological Tourism in the Andes*

The last two decades in the south central Andes have witnessed the rapid growth of "Turismo Místico" or New Age Tourism to archaeological sites and monuments in the south central Andes. Using the Cusco Valley of Peru as a case study, this paper analyzes textual, visual, experiential, and ethnographic data in order to assess the economic and socio-political impact this industry has on the communities in which it thrives. In particular, I explore the implications New Age Tourism has on local and visitor perceptions of Andean prehistory and heritage management. What are the positive and the negative aspects of New Age Tourism. I conclude by discussing the ambivalence many professional archaeologists feel when confronted with these 'un-scientific' understandings of the past. How do we, as archaeologists, respond (or not respond) to perceived challenges to our professional authority? How do we share the past with people we may disagree with? While many of us are keenly interested in indigenous religious practices, we may be highly skeptical or even contemptuous of New Age spiritual beliefs. How do we negotiate the limits of our own professional cultural relativism?

Dean, Rebecca

[187] *Fauna from the Marana Platform Mound Site, Arizona, in Context*

The Marana Platform Mound Site is an Early Classic period (1150–1350AD) Hohokam site in the northern Tucson basin, Arizona. It was one of many sites in the basin, part of an entire landscape that was shaped by the Hohokam people, reflecting their activities and values as a community. Faunal remains from Marana and surrounding Early Classic period communities are an excellent source of information on labor constraints, social organization, diet, microenvironments, and the cultural meaning of prey species. Comparing the faunal assemblage from Marana to those of its neighbors provides a baseline comparison for understanding the ecological and dietary context of Hohokam fauna, while highlighting the unique ways in which the Marana community interacted with prey species, particularly in the greater diversity of their faunal remains.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

DeCorse, Christopher (Syracuse University)**[275]** *Contact, Colonialism, and the Intricacies of Ethnogenesis: Portugal, Spain and the Iberian Moment*

This paper examines Portugal's and Spain's varied contacts, intersections and colonial aspirations in West and western Central Africa. Portugal and Spain share centuries of culture history, religion, and governance, and were united under the Iberian Union between 1580 and 1640. Yet within the context of European expansion into the non-Western world, they have often been considered distinct with regard to their histories and as foci of study. Pushing beyond national pasts, this paper contextualizes Portuguese and Spanish intersections with varied African people and polities in terms of both the wider socioeconomic landscapes of which they were part and the local conditions and contingencies that mitigated policy, and structured locally articulated social, cultural, and economic interactions. While inescapably nested in European nationalist agendas and global economy, the cultural exchanges of Portugal and Spain in Africa were characterized more by variability than by unitary templates, more by persistence than hegemonic change. Often they were expressly non-colonial in aspiration or affect. Drawing on archaeological and historical data from West and Central Africa, this paper considers the varied African-European interactions that unfolded, the diversity of ethnogenesis that evolved, and their materialities.

Dedrick, Maia (University of North Carolina at Chapel Hill)**[254]** *Ritual Use of the Rejolladas of Tahcabo, Yucatán*

In Tahcabo, Yucatán, 5% of the town's municipal land is contained within rejolladas. Rejolladas, like cenotes, are sinkholes formed in the karstic bedrock of Yucatán, although they do not reach to the level of the water table. They make for ideal gardens when located within settlements, as their low elevation allows for the collection of deep and moisture-rich soil that provides an advantage for the cultivation of almost any plant. At the nearby site of Kulubá it has also been shown that rejolladas share some of the same significance within Maya cosmology as cenotes and caves. Their locations, deeper into the earth, may have been seen as places with additional potential for communication with the underworld. Ceramic, botanical and faunal data from units excavated within five rejolladas in central Tahcabo demonstrate garden cultivation within the features over the community's long history. One rejollada demonstrated consistent ritual use through time. Today it is a place in which the Ch'a' Cháak ceremony is practiced, and in the deep past it was a place in which at least one human burial was interred. This paper will provide new evidence about the role of rejolladas and gardens more broadly in Maya worldview.

DeFelice, Matthew (CAHR, Inc.), Chris Davenport (Palm Beach County), Mallory Fenn (Florida Public Archaeology Network), Jeff Ransom (Miami-Dade County) and Sara Ayers-Rigsby (Florida Public Archaeology Network)**[195]** *On the Front Lines-Addressing Climate Change at the Local Level in South Florida*

How do you place a value on heritage at risk, and who gets to make these decisions? In South Florida, sea level rise is an issue of paramount importance, yet preservation of archaeological and historical sites are rarely the focus of resiliency planning efforts. This paper summarizes the efforts of various groups to combat this, though engaging with local governments and city planners to raise awareness of how archaeological sites will be impacted by sea level rise and insert it into policy at the local level, as well how archaeologists can work collaboratively with marginalized communities, activists, and local tribes to draw attention to these issues. Examples will include discussion of the South Florida Regional Climate Action Plan version 2.0, which includes a new section on archaeological resources, and the Tidally United Conference, which was co-hosted by the Florida Public Archaeology Network and the Seminole Tribe of Florida. Ultimately, not all sites can be saved or excavated and the process of identifying and evaluating sites at risk must be a shared responsibility.

deFrance, Susan (University of Florida), Edana Lord (Department of Anatomy, University of Otago, Dunedin), Michelle LeFebvre (University of Florida), Catherine Collins (Department of Anatomy, University of Otago, Dunedin) and Elizabeth Matisoo-Smith (Department of Anatomy, University of Otago, Dunedin)**[51]** *To the Caribbean and Beyond: Complete Mitogenomes of Ancient Guinea Pigs (Cavia porcellus) as a Proxy for Human Interaction in the Late Ceramic Age*

The Caribbean Ceramic Age (AD500–1500) was associated with increased interaction between the islands and mainland South America. The domestic guinea pig (*Cavia porcellus*) was introduced to the Caribbean post-AD500 through human transportation. Archaeological remains of guinea pigs are present on several Caribbean islands. This study used complete mitogenomes from ancient guinea pigs as a commensal model to identify likely human migration routes and interaction spheres within the Caribbean region. Possible origins of early historic European and North American guinea pigs were also determined. Complete mitogenomes of 23 ancient and two modern guinea pigs were obtained. The identified haplogroups indicate that two introductions of guinea pigs to the Caribbean likely occurred, both from Peru, to Puerto Rico (AD500) and the Lesser Antilles (AD1000). A potential origin for historic European domestic guinea pigs was identified as the Andean region encompassing Peru and Bolivia. A historic period North American guinea pig was found to have likely come from Peru. This study is the first to use next-generation sequencing to obtain complete mitogenomes of a commensal animal to investigate prehistoric interaction in the pan-Caribbean region, and results are in agreement with current archaeological evidence for human mobility and interaction in the Caribbean.

DeLance, Lisa (University of La Verne) and Jaime Awe (Northern Arizona University)**[147]** *Ancestor Veneration, Termination and Renewal: New Considerations of Construction Fill*

Archaeologists working in Mesoamerica frequently encounter construction fill within architecture. Construction fill has been variously used as a tool for determining architectural construction sequences, as a resource for seriation dating, and occasionally as a context for radiocarbon deposits. Although much information can be gleaned from examining construction fill, material culture found within such fill is frequently mentioned in passing as little more than refuse, if it is mentioned at all. This paper examines the phenomenon of material culture used in Formative Period construction fill at the site of Cahal Pech, Cayo, Belize and posits that the specific articles of material culture found within construction fill at Cahal Pech may not have been simply refuse but rather a special and highly significant form of ancestor veneration combining termination and renewal rituals to aid in the construction of new buildings.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Delaney, Colleen (Cal State Channel Islands) and James T. Brewer**[305]** *Stories from the Guadaluca: Changes in Land Use along the California Coast*

California State University Channel Islands is known as the location of the former Camarillo State Mental Hospital. The campus also serves as a case study for examining changes in communities and land use in California throughout time. Archaeological surveys on campus, artifact analyses, and historic records together document shifts in human activities at this location. This presentation outlines the long term use of this area by a noteworthy variety of people: the Chumash and their ancestors, Mexican rancheros and vaqueros, Euro-American farmers, WPA workers, mental health professionals, mental hospital patients, laborers at the hospital dairy/farm, and homeless members of the public. In particular, our discussion focuses on a probable Depression-era structure of unknown function.

DeLeonardis, Lisa (Johns Hopkins University)**[69]** *The Hidden Faces of Santa Cruz de Lancha: Ceramics and Structure in Eighteenth-Century Architecture*

The global exchange of ideas and practices in Latin American architecture during the viceregal period (ca. 1520–1825) remains one of the issues at the forefront of scholarly interest. Remarkable insights are gained about how ancient building materials were sustained and translated as architects and novices alike sought to align European design canons with local techniques and materials. Equally informative is how imported materials were incorporated into building practices.

In this paper, I analyze one of several construction techniques identified at Santa Cruz de Lancha, a Jesuit-managed hacienda in Pisco, Peru. The practice employed earthenware bottle fragments (botija) to create wall encasements or internal facing. Initially, the technique was thought to be a response to earthquake damage late in the site's history. Recent discovery demonstrates an earlier precedent, and one with consistent application throughout the site. Analysis of the site's ceramic assemblage informs questions about the choice of construction materials and draws attention to the range of imported and locally-produced earthenwares.

These findings widen the scope of building methods and materials utilized in viceregal building construction. They provide material evidence for ancient practices that were translated by Andean builders, and speak to their innovation.

Delgado, James (SEARCH Inc.)**[78]** *Telepresence Enabled Maritime Archaeology*

Advances in robotic and satellite technology have shifted ocean exploration into an interactive forum that links scientists and the public via "telepresence." Working with this paradigm, archaeologists have joined the ranks of ocean explorers on a variety of projects ranging from surveys to excavation in depths ranging from a few hundred to thousands of meters deep. The process has encouraged wider scientific integration, provided access to sites at depths previously not considered "workable," and also provided a powerful educational and outreach tool to share archaeological practice, methods, theory and ethics to a global, Internet-savvy audience.

[193] *Discussant***Delgado Espinoza, Florencio****[132]** *Interaction and Resistance against the Inka on the Land of the Cañaris, Southern Ecuador*

According to the early Spanish chronicles, the Cañaris were a constellation of chiefdoms which fiercely challenged the Inka expansion to the north. Early Texts show that war and conflict was the way they interacted in the region. As a conquest strategy during Wayna Qhpac's rule, the Inkas built important infrastructure in their heartland, such as Tomebamba in Cuenca and Ingapirka in Hatún Cañar, in addition to other smaller sites along the Qhpac Ñan. However, the archaeological evidence for the conflictive nature of their relationship is not clear. Research around Ingapirka shows that while the Inka built extensive and prominent infrastructure, and apparently incorporated the locals into their political and belief system, the Cañaris' households did not incorporate any Inka cultural effects in their domestic behavior, indicating instead that resistance was held steadfast at the domestic sphere.

Delgado Espinoza, Florencio [177] see Oyuela-Caycedo, Augusto

Delle, James**[208]** *"A Glittering Speculation": Archaeology of Jamaica's First Coffee Boom, 1790–1806*

In the late 18th century, the British colony of Jamaica entered the first of its several boom periods in coffee production. A highly addictive product that was at the time primarily a luxury good for a small domestic market, overproduction on the island resulted in attempts by the coffee industry to expand their markets in Great Britain and the European continent to the middle and working classes. Meanwhile, the rush to get coffee to the market resulted in a rapid expansion in the number and scope of slave-based plantations, owned by both wealthy speculators and local middling planters without the means to become established in sugar production. This paper will examine the material evidence of this first coffee boom, which one planter characterized in his correspondence as "a glittering speculation." Evidence presented will include excavation results from Marshall's Pen Plantation in the central Jamaica parish of Manchester, as well as survey data from the former Blue Mountain parish of St. Davids.

Delque-Kolic, Emmanuelle [175] see Leroy, Stéphanie

DeLuca, Anthony (University of Colorado Denver)**[30]** *From Cooperation to Competition: An Architectural Energetics Analysis of Labor Organization for the Construction of Circle 2 at Los Guachimontones, Jalisco, Mexico*

The Teuchitlán culture is one of many cultures in West Mexico during the Late Formative to Classic periods (300 B.C.—450/500 AD) that share in the tradition of burying some of their dead in shaft and chamber tombs. The Teuchitlán culture is noteworthy among their contemporaries for the large number of circular ceremonial buildings concentrated around the Tequila volcano and surrounding valleys. Los Guachimontones, located on the southern side of the volcano, is the largest site in the region with the largest number of public architecture and highest concentration of people. One such building, Circle 2, is among the largest documented guachimontones in the region. Using an architectural energetics analysis of Circle 2, I modeled how lineage based elites within a corporate system at Los Guachimontones may have organized labor for construction. The variable construction represented within Circle 2 suggests multiple labor recruitment strategies were employed. A labor collective was used to construct the foundational patio of Circle 2 followed by elites employing corvée labor to finish the remaining architectural features. The switch from cooperation to competition suggests alliances were temporary and geared towards aiding the community through the construction of public architecture.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Demarest, Arthur (Vanderbilt University)

[258] *Political and Economic Change on the Eve of the Classic Maya Collapse: Building on a "Ceramic Foundation"*

Joe Ball's research, his ceramic studies, his insistence on material culture as basis for work, and his honesty in critique of poorly grounded interpretation together provide a standard of building culture-history on solid ceramic studies, chronology, and material culture analyses. Many recent interpretations of Classic Maya society have not met that standard. Here we aspire to his bottom-up, material culture approach to interpretation in recent collaborative research in the western Peten and the southern "frontier" of the Classic Maya states. His emphasis on lab-driven research, detailed ceramic analyses and fine-grained chronologies and a "direct" style is shamelessly mimicked here, first to briefly criticize serious flaws in recent studies of economy, dynastic collapse, and other aspects of Classic Maya societies and social change. However, then we build positively on detailed ceramic classification, statistical study, chronology, and compositional analyses to reconstruct economic systems on a more solid, controlled data base. Those "ceramically-grounded" studies have revealed strengths and weaknesses in southern lowland political economies, ingenious attempts to adapt them to a changing Mesoamerican world, and reasons for the failure of those brilliant innovations. The field of ceramic studies remains central to any credible effort at culture-historical reconstruction and theoretical interpretation.

[142] *The Ancient Maya Settlement of Waybil, Belize: Middle-Level and Hinterland Settlement Investigations*

The Classic Maya, with their towering jungle temples and sprawling cities have been the focus of archaeological studies since the mid-1800s. Although numerous investigations have fostered considerable insights, important questions remain regarding the circumstances in which these settlements originated, interacted, developed, and were ultimately abandoned. The organization of Maya settlements is best conceptualized as a continuum consisting of three basic, but variable types, including: upper-level, middle-level, and lower-level settlements. This discussion reviews the primary research results for the full-coverage survey and test-excavation program conducted at the middle-level hinterland settlement of Waybil, Belize, Central America. The overall result was the collection of valuable information concerning the development of the central courtyard, peripheral settlement groups, and relic agricultural terraces found within the site. Middle-level settlements such as Waybil are unique units within the continuum as they are smaller and more specialized than upper-level settlements, but larger and more diverse than lower-level settlements. Thus, they are thought to have performed distinct roles and functions within the greater settlement matrix. Exploring the configuration of individual middle-level settlements is essential to improving our knowledge of ancient Maya socio-political and socio-economic interactions, hinterland archaeology, human-environment adaptive strategies, and the circumstances surrounding the Classic period "collapse".

[268] *Looking Closer at Those Dots on the Map: Documenting Mound Sites at St. Croix National Scenic Riverway*

Over the last four years, the Midwest Archeological Center has been conducting a project designed to gather information on mound and earthwork preservation across the Midwest Region of the National Park Service. St. Croix National Scenic Riverway in eastern Minnesota and western Wisconsin, is one of several parks included in the study. The St. Croix and Namekagon river valleys are home to mounds and earthworks of a variety of shapes and sizes. Some have been dated to the Late Woodland period and others are of unknown age. Part of our work at the park has involved revisiting recorded mound sites to determine their locational accuracy, in addition to simply clarifying which sites are on federal versus private land. A more significant portion of our work at the park has been devoted to conducting magnetometer surveys at three sites where mounds are extant. The magnetic data clearly indicate that subsurface portions of mounds and other types of earthworks are present at each site. While ground disturbing efforts at exploring these features is not recommended or planned, these data form a critical component of properly preserving, protecting, and interpreting these valuable archeological and ethnographic resources.

[130] *Archaeological Geographies—A Reflexive Consideration of the Impact of Archaeology across Racial and Socioeconomic Regions Using DINAA*

This paper uses "big data" about archaeological sites from the Digital Index of North American Archaeology (DINAA) to reflexively assess and interpret how archaeology has affected minority communities. DINAA's data set represents an almost complete record of the current extent of archaeological site definitions, within the project's area of effect. Therefore, collectively, these data can reveal information about archaeologists and archaeology as a discipline, as well as the past. As public spending, whether via heritage management or university research, is the impetus for most archaeological work in the United States, archaeological sites can be seen as a metric of sorts to gauge public spending, and develop a better understanding of where, and how monies have been invested around American communities over the past half century. This paper will use the free, open source, and publicly accessible DINAA database to examine the correlation of archaeological site density across the eastern US with US Census data on socioeconomic and demographic trends, with specific interest in parts of Appalachia, and historically African American communities, in order to begin to assess the impact of archaeological work on modern residents.

Dengel, Craig (CEMML @ Fort Polk, LA)

[332] *New Beginnings at Fort Polk, Louisiana: CRM Strategies for the Expansion of Training Lands*

Located in western Louisiana, Fort Polk has an extensive record of cultural resource management with more than 150,000 acres of land surveyed between 1972 and 2002. Over 3,500 sites have previously been identified and 600 of these evaluated for eligibility. Recently, the Army expanded the installation by 42,000 acres of new training lands in less than four years. So a new round of Phase I surveys for cultural resources were necessary. The completion of these surveys will allow natural resources management activities to begin, which in turn will protect training areas against wildfires, encourage reforestation, and integrate endangered species and game management. In coordination with the Louisiana SHPO and consulting Native American tribes, the work of evaluating and protecting significant historic and prehistoric sites is an on-going joint effort between the Army, the National Park Service, private CRM firms, and The Center for Environmental Management of Military Lands (CEMML) at Colorado State University. In this paper we discuss the coordination and cooperation necessary to survey such a large area in a relatively short time frame.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Dennehy, Timothy, Christopher Merriman (University of New Mexico) and Keith M. Prufer (University of New Mexico)**[77]** *Lithic Technological Changes from the Paleoindian to the Late Archaic: A Pilot Study*

How do subsistence-related changes impact lithic technology over the course of thousands of years? Three stratified rockshelters in Belize contain evidence of Paleoindian through Classic Maya period occupations. This span of time witnessed the initial hunting and gathering subsistence economy of the Paleoindian period, the introduction of horticulture and increasing reliance on cultivars in the Early Archaic, and the emergence of full-scale agriculture in the Late Archaic. Explaining variations in lithic technology during these millennia can shed light on the processes underlying the slow but steady increase in plant resources that preceded the adoption of agriculture. This study analyzes several chipped stone attributes—including cortex ratio, retouch intensity and frequency, and flaking type—of lithic assemblages from one such rockshelter known as Tzib'te Yux. By examining these traits in a subsample of artifacts, the authors will establish the ability of these methods to detect technological changes over time, and create a timeline of lithic technology using absolute dating methods. This study thus serves as a pilot study for a future project that will compare changes in mobility, subsistence economy, and lithic technology at all three rockshelters using the full assemblages available at each.

Dennett, Carrie (National Museum of Natural History, Smithsonian Institution, Washington, DC)**[263]** *It's Complicated: Making Sense of Material Monoculture in Multicultural Societies*

Ethnohistoric and colonial documents typically focus on detailing a socioeconomic and political landscape dominated by Chorotega and Nicaraog groups for contact-period Pacific Nicaragua. Yet these texts simultaneously indicate that other groups living in isolated communities or urban barrios were also commonplace and included Maribios, Mazatec, Chondal, Matagalpans, Sumo-Ulwa, and possibly Lenca and/or Maya-speaking peoples, among others. As archaeologists, we are aware—many of us dutifully placing the convoluted language distribution map in our culture history write-ups. Despite this, most of these groups are not factored into theoretical discussions and are rarely, if ever, seriously discussed as part of the region's archaeological past. Instead, a three-phase linear trajectory (Chibchan-Chorotega-Nicaraog) premised on 'great' migration events ending in regional domination by foreigners and their intrusive material monoculture has been the interpretive norm. This inconsistency begs the questions: Do we really believe complex multicultural lifeways magically appeared with or immediately before the Spaniards? And if multicultural lifeways were a pre-Columbian norm in this area, as complex social organization at contact suggests, why can't we see those other groups in the record? Using Sapoá-period (AD 800–1250) ceramics as a case study, this paper explores whether the assemblage represents 'Chorotega monoculture' or a complex multicultural aggregate.

Deter-Wolf, Aaron (Tennessee Division of Archaeology) and Tanya Peres (Florida State University)**[217]** *Archaic Tattooing and Bundle Keeping in Tennessee, ca. 1600 BC*

The Fernvale archaeological site in Williamson County, Tennessee, is a multi-component site that includes a significant Late Archaic cemetery and occupation dated ca. 1600 BC. Although the site was excavated in 1985, it was not fully analyzed or published for nearly three decades. Formal analysis of zooarchaeological materials from Fernvale took place from 2007–2012 as part of an overall effort to reassess the site assemblage. In this paper we describe findings generated by combining traditional zooarchaeological analysis with ethnohistorical research, ethnographic analogy, experimental archaeology, and use-wear analysis. By incorporating these various lines of evidence we are able not only to correct previous errors in species identification, but also to produce a contextual framework that informs our understanding of both emerging and entirely new aspects of Late Archaic lifeways. Through this interdisciplinary effort we are able to provide archaeological evidence of the oldest directly-identified bone tattoo implements in the world and to demonstrate the persistence of Native American bundle-keeping and tattooing traditions over more than three millennia.

When humans first colonized the Americas is becoming better understood by the addition of aDNA studies; however, the absolute dating of these late Pleistocene sites is crucial and depends upon accurate 14C dating of the fossils (i.e. bones, teeth and ivory). We re-dated vertebrate fossils associated with the North American butchering sites Wally's Beach (Canada), La Prele, also known as Fetterman (Wyoming), Lindsay (Montana) and Dent (Colorado). Our work demonstrates the crucial importance of sample preparation to completely remove contaminants derived from sediments or post-excavation museum curation. Specifically, our work illustrates that chromatographic methods, e.g. preparative High Performance Liquid Chromatography or column chromatography using XAD resins are the only efficient methods for removing geological and museum-derived contaminants. These advanced methods yield unquestionably accurate AMS 14C measurements that refine the ages of these sites and thereby advance our understanding of human population dispersals across North America during the late Pleistocene. We will present the new dating evidence and compare the results with previous determinations made using less refined techniques.

Devio, Jessica (Washington State University)**[76]** *Assessing Botanical Diversity of Late-to-Terminal Classic Households at Xunantunich, Belize*

Understanding household plant use can provide a wealth of data about subsistence practices, past agricultural systems, and strategies used to mitigate climatic stress. Plant use may also vary between households. By examining this variation, botanical data may yield further information on personal

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

preference and cuisine differences between households. Aside from consumption for subsistence, plants were used for a wide range of activities conducted by individual households. Botanical datasets may reveal other activities such as fertilization of garden plots or ritual activities. This paper examines the botanical diversity found in Late-to-Terminal Classic households near the site of Xunantunich in Belize. The paper discusses on-going research at the site and focuses on macrobotanical analysis of activity areas. The results are part of a larger research design combining both macrobotanical and microbotanical data which seeks to overcome some of the biases that are inherent in single methods of analysis. By incorporating macrobotanical and microbotanical remains, a wide range of plant remains will be represented that may be absent from carbonized assemblages alone. The paper further discusses a comparison of machine-assisted flotation versus the washover method for processing flotation samples.

[90] *Beyond the Farm: Forensic Taphonomy in East Tennessee*

The impact of Walter Klippel's teaching has provided his students the tools necessary to answer several critical questions faced by forensic anthropologists. Through his classroom tutelage countless numbers of graduates have the skills to recognize and categorize non-human bones. Beyond this zooarchaeological training, his research influence and guidance has also afforded both students and practitioners alike with knowledge to identify and document particular signatures of postmortem damage and taphonomy on human remains. His long term research leadership at the outdoor research facility at the Forensic Anthropology Center at the University of Tennessee has centered on establishing techniques to best assess postmortem animal modification. This research has led to improved means for identifying and understanding the postmortem signatures of animal activity, significantly contributing to forensic investigations. Additionally, he has contributed to the knowledge of estimation of the postmortem interval via his student-centered approaches to research in animal scavenging. As a result, the success of our forensic work is directly attributable to the contributions of Walter Klippel and his dedication to students and anthropological science.

Dewan, Eve (Brown University), Ian Kretzler (University of Washington) and Briece Edwards (Confederated Tribes of Grand Ronde, Historic Prese)

[114] *A Community of Heritage Practitioners: Keeping the Past in the Present at Grand Ronde*

For the Confederated Tribes of the Grand Ronde Community of Oregon, care of tribal heritage is an expression of sovereignty, cultural creativity, and connection to place. We discuss three arenas in which the Tribe draws on information about the past to reaffirm connections in the present. First, exhibits at the Chachalu Tribal Museum & Cultural Center, language immersion programs, and artistic pieces showcase how the diverse Native peoples of western Oregon overcame dispossession and removal to form the contemporary Grand Ronde nation. These Native-centered histories counter colonial narratives that relegate Native communities to a distant past and tragic present. Second, the Tribal Historic Preservation Office utilizes broad conceptions of heritage—placing tribal knowledge systems at the center—to protect archaeological sites and cultural properties threatened by development in the Tribe's homelands. A collaborative field school has contributed to these efforts by implementing a Grand Ronde-specific form of archaeological practice to investigate historic sites on the reservation. Third, tribal heritage infuses contemporary cultural practice, from song and dance at the tribal plankhouse to loans of historic objects to tribal members for ceremonial use. Within the Grand Ronde community, the past is present in ways that include and transcend conventional archaeological practice.

Dhody, Anna (Mütter Museum of The College of Physicians of Philadelphia) and Kimberlee Moran (Department of Chemistry, Rutgers University)

[107] *No Good Deed: The Recovery of Philadelphia's First Baptist Church Cemetery*

What to do when one box of bones becomes a whole cemetery? In late 2016, the Philadelphia Inquirer reported that human remains were uncovered at a local construction site, 218 Arch Street, formerly a cemetery that closed in 1859, its dead supposedly having been interred elsewhere. Because the site is privately owned and the construction privately funded, no clear legal guidelines exist governing authority over human remains. Seeing a potential research project, the authors contacted the developers and offered to take the small banker's box of human remains for analysis and reburial. Months later, the construction firm contacted the authors with a developing problem. Dozens of whole coffins were being unearthed daily, and no state or local government agency was willing to step in and take charge. In the absence of authority, with a construction deadline looming, the authors conducted a salvage archaeological operation to save the remains. This presentation will discuss the legal and ethical issues surrounding the Arch Street Project, which continues to evolve in magnitude and complexity.

[49] *Zooanthropomorph Iconography in the Gran Coclé, Gran Chiriqui and Tairona Areas*

The zooanthropomorphic beings present on some artifacts of the cultural areas Tairona (Colombia), Gran Coclé (Panama) and Gran Chiriqui (Costa Rica) dating back to pre-Columbian times have often been identified as shamans. But what are the iconographic elements that are in favor of such a precise interpretation?

To begin with, we did a thorough iconographical analysis aiming to determine taxonomically the animal component, the ratio between human and animal, and the precise anatomical elements that could be attributed to one or the other. In the second phase of this work the iconographic analysis has been cross referenced against the abundant anthropologic literature available on the subject of shamanism.

This process allows us to perceive better the diversity of possible interpretations for Zooanthropomorphic beings, which are not necessarily confined to a shamanic metamorphosis.

We can therefore reflect upon the spiritual and political context with more latitude, which is necessary for the information we have about either in the three concerned cultural areas is scarce.

[132] *Ychsma Cultural Identity in Armatambo during Inca's Occupation, Peruvian Central Coast*

This paper presents the results of a typology and iconographic analysis made on ceramic and textiles artifacts recovered at the Ychsma settlement of Armatambo. The Ychsma cultural affiliation of this archaeological site, which is located on a dense urban area south of Lima, is recognized in the literature (especially with the aerial photographs published by Kosok in 1965) but little detail has been published on the evidence of its affiliation and

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

character of occupation. We can confirm that Armatambo was densely occupied during the Late Horizon (1450–1532 AD) on the Peruvian Central Coast and was the local Ychsma harbour to gain access to the ritual site of Pachacamac, the Ychsma capital. We propose that archaeological evidence that we have recorded resulted from the political interaction between Incas and local Ychsma population, which reflect a scenario of tolerance toward the local elites and the cultural expressions in the lower valley of the fertile Rimac drainage.

[136] *Acoustic Effects at Las Cuevas Cave (Western Belize): An Archaeoacoustic Analysis of a Maya Cave*

The site of Las Cuevas (western Belize) has been identified as a mid-sized, Late Classic ceremonial and administrative center. Interestingly, given the importance of caves in Maya religion, the underneath part of the site has a large cave system. Research so far on this cave has focused on aspects that are common in cave archaeology: 1/ structures—in this case on the one hand the series of platforms built around a central, sunk cenote and on the other the walls subdividing the narrow part of cave into several distinct areas; 2/ pottery distribution in the different areas and platforms within the cave. Yet, in addition to the material remains within the cave, there are other aspects that are worth analysing. A decade ago Margaret Bruchez alluded in an excellent article that “subject to the precepts of science, archaeologists could collect the aural data as material artifacts, despite a previous regard of sounds as ‘immaterial’” (Bruchez 2007: 48). The aim of this paper is to show the results of our archaeoacoustic analysis in the cave of Las Cuevas highlighting the acoustic effects that have been detected as the most relevant and their relationship to particular parts of the cave.

Diaz-Guardamino, Marta (Cardiff University, United Kingdom)

[214] *Digital Imaging and Rock Art (Relational) Biographies: Reassessing Iberian Late Bronze Age “Warrior” Stelae*

Formal approaches to rock art traditionally focused on meaning and representation. Rock art images and panels were treated as static representations of symbolic frameworks while their materiality and active role in cultural production were overlooked. Rock art is the product of the dynamic interplay between people, tools and the rock surface. The properties of the rock panel have the capacity to shape rock art production as much as the skill and knowledge held by the engraver/painter and the social context in which these engagements take place. Furthermore, rock art panels may accrue complex biographies via multiple engagements.

I combine a relational-biographical approach with digital imaging technologies (e.g. RTI) to the study of rock art carvings as a way forward to address these questions. By focusing on the biographies of Iberian warrior stelae (how they were made, reworked, etc.), relevant details emerge: despite iconographic standardisation there is variability in the techniques and procedures deployed which are linked to the interplay between the stone, the skill of the carver and her/his knowledge of local rock art traditions; stelae can be reworked at later stages and reused in a variety of ways, opening up a debate about the temporality of rock art traditions.

[183] *Prehistoric Lake Cahuilla Shorelines Identified Using a Systematic Satellite Photograph and Ground Truth Methodology, Salton Sea Region, Imperial County, California*

Lake Cahuilla is the archaeological representation of the modern Salton Sea and represents one of the largest rift lakes in the Western Hemisphere. Formed in the Salton Basin by western-trending Colorado River runoff, in-fillings and outflows from the Colorado to the Lake and thence into the Gulf of California were episodic yet constrained by the vast Colorado River Delta. Because modern agricultural development has buried many of the ancient shorelines, the Lake’s Holocene oscillation history is difficult to identify and interpret. Recent improvements in satellite-based photographic quality have made it possible to use the desktop to hunt for prehistoric resources located on the margins of Lake Cahuilla. In this paper, we describe the discovery of a prehistoric cultural landscape made up of thousands of distinctive stone features known to local archaeologists as “fish-traps” using a systematic desk-top analysis and ground-truth process. Our research shows that at some period in the recent prehistoric past, the western shore of Lake Cahuilla can be identified in at least three stable strandlines between 40 and 90 feet below sea level and that these episodes may be datable.

[137] *New Insights for Provenance Studies of Iron Artifacts*

The study of the production and trade of metals is one of the means to highlight the technical and social organization of societies. Among several issues, the question of the provenance of the metal is of primary importance and can lead to enlighten the organization of the production (spatial and temporal structures of the chaîne opératoire) and of the supply networks. Concerning iron and its alloys, these last years have seen important developments in archaeological sciences to address the question of provenance. These approaches are based on both trace elements and isotopic approaches.

The aim of this paper is to discuss the principle, potentiality, advantages and limits of the archaeological science approach through the example of two provenance studies applied to different socio-economical contexts. The first one deals with the circulation of iron products in the North-Alpine area during the end of the First Iron Age (6th-5th c. BC). The second one concerns the use of iron reinforcements in the gothic monuments and cathedrals of the Middle Age in France. Finally, several prospects will be proposed for developing integrated and interdisciplinary provenance studies in the future.

[269] *The Ancestral Puebloan Community of Alkali Ridge: Investigating The "Prudden Unit" Paradigm*

The 2017 Alkali Ridge Data Modernization Project completed an intensive survey of 10 Ancestral Pueblo habitation sites within the Alkali Ridge National Historic Landmark as part of the ongoing collaboration between NMSU and the National Park Service to modernize data and conduct research. The 2017 fieldwork season focused on recording small residential sites in close proximity to community centers to examine the role small satellite habitations played in the Pueblo II-III period landscape of Alkali Ridge. We speculate that there may have been a regional shift in architectural patterns of the Alkali Ridge community that differ from those seen in the Mesa Verde core region. By analyzing the "Prudden Unit" archetype at Alkali Ridge, there is potential to demonstrate variation that occurred amongst small residential sites of the same unit type. This would permit a better understanding of the differential placement and function of these sites within the local community landscape. This poster will summarize the 2017 project data collected, as well as provide the basis to future research in examining potential functional variability of "Prudden Unit" sites in relationship to the Alkali Ridge community landscape.

[238] *Quantifying Energy Investment in Monuments (Ahu) on Rapa Nui (Easter Island) Using Structure from Motion Mapping*

Pre-European contact Rapa Nui (Easter Island) society is well-known for its substantial investment in monumental architecture, including over 300 platforms (ahu) and almost 1000 statues (moai). Recent theoretical and empirical research on the island suggests that ahu and moai were focal points for competitive and cooperative signaling by relatively small-scale communities dispersed across on the island. Evaluation of this hypothesis, however, requires the measurement of the amount of energy invested in the construction of these monuments and comparing these values to the relative quality of resources supporting local communities. Despite the significant amount of research directed towards Rapa Nui's monuments, we currently lack accurate, precise, and comprehensive estimates of monument size. To fill this gap, we used UAV-based photography and structure-from-motion photogrammetric tools to create scaled high-resolution, 3D representations of ahu. With these 3D models, we calculate volume estimates and use these values to derive energy investment estimates for each ahu. Using these data, we explore spatial patterns in energetic investment within and between local communities.

[171] *Vegetative Agency and Social Memory in Houselots of Ancient Cobá*

It is difficult to pin down the objective definition of a weed; rather, the idea of a weed is constructed through a set of characteristics that are, for the most part, dependent on context and relative interactions. Doody et al (2014) use Judith Butler's (1990) concept of performativity to describe this dynamic, ongoing construction as a product of the agency of both people and plants. Here we interpret studies on ancient Maya agricultural techniques through the lens of plant agency and human-plant relations. We aim to investigate the place-making of agricultural landscapes through an analysis of both helpful and destructive 'weed' agencies in traditional planting, weeding, and medicinal practices. Using new LiDAR data from Cobá, we examine the liminal spaces around houselots, sometimes called 'toft zones,' to look at time management and place-making at different temporal scales. This shifting social practice and place-making factor into the performativity of weeds, and vice versa. A result of this exercise is the problematization of what it means for a plant to be 'out of place' in the ancient Maya agricultural landscape (Head et al 2014) as well as a new appreciation of how certain plants impacted daily time management schemas.

Diserens Morgan, Kasey (University of Pennsylvania)

[42] *Navigating Narratives of the Past in the Present: Archaeology and Heritage Preservation in Tihosuco, Quintana Roo, Mexico*

A national narrative glorifying the deep past of Mexico was formed using archaeological sites. The government has gone to great lengths to rebuild and preserve many ancient indigenous sites and objects for use as national symbols and as a draw for tourism. However, this practice has contributed to the 'othering' of indigenous groups by placing the 'mysterious Indians' firmly in the past, and restricting the access of descendant communities.

Working within a modern Maya community, the members of the Tihosuco Heritage Preservation and Development project seek to add to the national discourse on patrimony by using a tool recognized by the nation state: archaeology. The project investigates the legacy of the Caste War of Yucatan (1847–1901), one of the most successful indigenous rebellions in the New World.

This paper explores the ways in which archaeologists can navigate between the constructed national narrative and producing knowledge that may subvert or run counter to it. How do we negotiate the tensions that occur between the communities and government agencies that both provide approval for our work? How do government control and conceptions of ownership impact archaeological work? What impact do national laws protecting patrimony have on those living within historic sites?

[142] *The Complex Community of Cerén, El Salvador: a Classic Maya Example of Heterogeneity*

The Loma Caldera eruption of c. AD 660 dramatically buried a sophisticated community built by craftspeople, architects, religious specialists, political leaders, and agriculturalists. As people fled for their lives, they left behind belongings and buildings. Results from decades of archaeological research at Cerén, El Salvador and in the surrounding Zapotitán Valley challenges an ethnocentric, over-simplified reconstruction of ancient socio-political organization. Cerén was not in the middle of a city, but neither was it isolated. The large regional center of San Andres was only 5 km away, yet Cerenians distinguished themselves with their own governance, religious ceremonies, feasts, the wide array of species they grew, and their earthen architecture (road, domiciles, and public buildings), that was unlike the stone construction of surrounding settlements. The Cerén community expressed and maintained their ideological, social, political, and economic autonomy, while remaining connected to the variety of other settlements throughout the valley. Engaged in larger Maya practices and trade networks of southern Mesoamerica, Cerenians crafted a lifestyle for themselves that enabled them to successfully subsist off the land on their own terms. Remains of such communities enhance our understanding of the socio-political spectrum and provide a graphic reminder of the liabilities of using simple dichotomies.

Dixon, E. James (Maxwell Museum)

[79] *Dennis Stanford: The Alaska Years and Beyond*

Dennis Stanford was first introduced to Alaskan archaeology in 1966 as a field assistant to Robert L. Humphrey during an archaeological survey in the Utukok River valley in the western Brooks Range. At the urging of John M. ("Jack") Campbell he began work near Point Barrow in 1968 to investigate controversial questions about the origins of Thule culture. Following brief investigations at the Utkiavik site, he focused his excavations south of Barrow at Walakpa, where he discovered more than 20 stratigraphic levels documenting the transition from Birnirk to Thule cultures. His analysis led him to conclude that the transition from Birnirk to Thule was correlated to climate change and possibly an over-reliance on seal hunting. His subsequent research interest in Alaska have focused the relationships between eastern Beringia and the first colonization of the Americas. In 1989–90 he served as Visiting Distinguished Professor, at the Alaskan Quaternary Center, University of Alaska Fairbanks where he taught Paleoindian archaeology and mentored students. His long engagement in Alaskan research has significantly influenced his contributions to the study of bone taphonomy, late Pleistocene paleoecology, and the first colonization of the Americas.

[212] *Divergence of Domestic Dog Morphology through Deep Time*

The modern domestic dog is behaviourally and morphologically far removed from its ancient counterpart. Increasingly, research has demonstrated that using modern comparative collections for identifying domestic animals in archaeological contexts is problematic. This is likely the result of the intensive breeding that modern animals have undergone in at least the last two centuries. It is unclear how far back the current modern morphology of dogs goes, or how different ancient dogs were from their modern descendants. Here we present the results of analyses examining the differences between archaeologically identified dogs with modern domestic dogs, modern wolves and Pleistocene wolves to see how these groups have morphologically diverged. To do this we will examine the morphologies of both the mandible and the first mandibular molar and compare the through-time shape change of archaeological dogs to the baseline of shape variation of each of the reference groups. The results of these analyses will go far beyond the simple identification of wild and domestic animals, as they will shed light on the changes brought about to one of the most important human-animal relationships across deep time.

Dobrov, Amanda (UC Berkeley)

[242] *Roman Amphorae of North Africa: Markers of a Pan-Mediterranean Economy*

This project is centered around the Roman amphorae excavated from the Palatine East Archaeological Project. The site is located on the northeast slope of the Palatine Hill in Rome. The ceramic deposits date from the first century to about the fifth of sixth century CE. I focus on the amphorae produced in North African, specifically those of Tunisian origin. My work is hoping to better understand the geographical location of production sites of these trade vessels.

The results of this project intend to highlight the role played by specific regions with Roman North Africa in the supply of foodstuffs to the urban centers, including northern Tunisia, the Sahel, Tripolitania, and the Kabylie of Algeria, from the early to the late empire.

The project involves the classification of the rim fragments by amphora class, the characterization of their fabric by means of the evaluation of photomicrographs taken with a digital microscope with a view to determining their likely provenience, and their quantification by the estimated vessel equivalents (EVE) technique.

All of this work has been done in close consultation with Michel Bonifay's 2004 publication, *Études Sur la Céramique Tardive d'Afrique*, and Simon Keay's 1984 amphorae handbook.

Dockrill, Stephen (Stephen Dockrill, University of Bradford) and Julie Bond (Archaeological Sciences, University of Bradford)

[135] *Swandro, Rousay, Orkney: Between Sea and Land*

The site of Swandro is on the eroding coastal fringe of the island of Rousay, Orkney and has been the focus of field training for the next archaeological generation between the University of Bradford, Archaeological Institute UHI and Hunter College, CUNY since 2010. Such sites are a finite resource, endangered by coastal erosion exacerbated by the effects of climate change. The site straddles both the shore and the land and consists of a Neolithic Chambered Cairn and a later settlement dating from the Early Iron Age to the Norse period. Archaeological investigation of the beach, where the sea has cut into the complex depositional sequence to form a series of terraces required an adapted response. Excavation over multiple seasons has enabled an understanding of the stratigraphic sequence and the process of erosion and also the development of new methodologies to facilitate its recording before the sea destroys the surviving evidence. The evaluation and excavation of the beach has provided an understanding of past environments, structural succession, economic and industrial activities. A key element of the work is creating public awareness of this fragile but valuable resource.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Dodge, Robyn (The University of Texas at Austin)[28] *Ongoing Household Research at Hun Tun: An Ancient Maya Hinterland Settlement in Northwestern Belize*

The ancient Maya site, Hun Tun is a Late-Terminal Classic commoner settlement located in northwestern Belize. Research at Hun Tun operates under the Programme for Belize Archaeological Project (PfbAP). Social complexity at the household level serves as a research theme for Hun Tun investigations. This paper addresses the ancient Maya commoners who lived in household contexts at Hun Tun while discussing how their role as a hinterland community contributed to ideas of household identity, social formation, and production within the larger La Milpa political capital. Ancient Maya commoners are great adapters to their environment responding to external cultural and natural pressures. Analysis of everyday material culture, monuments, and major architecture features from domestic contexts contribute to understanding the role of Hun Tun within the La Milpa hinterland. Interpreting the function and use of household spaces are crucial to understand the activities which took place. Knowledge about commoner rituals also serves to incorporate and legitimize Hun Tun within ancient Maya society. Specifically, ceramics, various lithic material assemblages, and small find material culture, are among the artifacts recovered from prominent features that will be discussed.

Doelle, William (Archaeology Southwest)[96] *Moderator***Doering, Briana (University of Michigan)**[283] *Exploring the Cause of the Athabaskan Migration through Isotopic and Geospatial Evidence*

Linguistic and archaeological evidence suggests that Athabaskan-speaking peoples rapidly spread south from present-day Central Alaska and Northwest Canada into the Great Plains region around 1000 years ago. Historically, explanations of this important event have centered on relatively small geographic regions and traditional methodologies. This paper offers an alternative view at both a much larger scale and using distinct methods. I argue that this significant migration event was driven by the increased importance of salmon and other fish in the Athabaskan diet, a hypothesis based on my on-going central Alaskan research, which employs a compound-specific isotopic analysis of soils, landscape modeling, and predictions from human behavioral ecology. The results of this research provide not only a more nuanced understanding of late prehistoric Athabaskan subsistence and culture, but also a novel perspective on human biogeography in the Americas prior to European colonization.

[250] *Chair***Doershuk, John (University of Iowa)**[166] *The University of Iowa American Indian Concerns Archaeological Field School—Putting the Zimmerman Vision to Work*

As an established scholar, Larry Zimmerman spent several years around the turn of the millennium at the University of Iowa where he served as a faculty member in the Department of Anthropology and Director of the American Indian and Native Studies Program. With the encouragement and support of then State Archaeologist of Iowa William Green, Larry and I initiated a program of study in 1999 emphasizing the teaching of high quality archaeological field techniques coupled with active exploration of American Indian concerns about how archaeology is often conducted. This field school represented a unique partnership of a wide variety of agencies, institutions, and individuals. With UI staff and faculty members as key personnel, the inaugural project also involved close collaboration with Plymouth County, Iowa officials; a Sioux City, Iowa archaeological consultant; Briar Cliff College as host institution and provider of food, lodging, and classroom/lab space; and several individuals associated with regional Indian tribes (Omaha, Sioux, Winnebago, and Meskwaki). We replicated our 1999 success in northwest Iowa with two additional editions of this Zimmerman-inspired field school configuration in 2000 and 2001.

Dolan, Sean (Los Alamos National Laboratory)[42] *Thinking outside the Excavation Unit: Lessons Learned from an Alternative Mitigation Project on the Pajarito Plateau, New Mexico*

Excavation is often the way to mitigate for the loss of cultural resources to comply with Section 106 of the National Historic Preservation Act. However, excavation is not always the most practical solution. A case study is presented to demonstrate how alternative mitigations advance the research value of cultural resources, and increase flexibility in land-use decisions by agencies while satisfying the mutual interests of stakeholders. In 2012, four prehispanic Ancestral Puebloan fieldhouses were impacted at Los Alamos National Laboratory due to tree thinning activities. The State Historic Preservation Officer (SHPO), Advisory Council of Historic Preservation, and Pueblo de San Ildefonso were notified, and a damage assessment report was written. A Memorandum of Agreement between Department of Energy and the SHPO was signed in 2016, and it stipulated that a fieldhouse context document be written in lieu of excavation. The document resulted in the acquisition of new research that advances northern New Mexico archaeology. Also, funds went towards the creation of a free public book to achieve wider public awareness about the local archaeology and cultural preservation. I identify lessons learned during this project and offer recommendations for future application of alternative mitigations.

Dollarhide, Eli (New York University)[121] *Revealing the Local: A Look Inwards at the Archaeology of Southeastern Arabia*

Rita Wright's valuable contributions to the archaeology of urbanism and holistic, multi-scalar approaches to settlement patterns is well-attested in her survey work along the Beas River Valley. This paper picks up these themes in a different region of the interconnected Bronze Age world that has been the focus of her research—ancient Oman.

Known as Magan in Mesopotamian texts, a considerable amount of research has been conducted on Bronze Age Oman by focusing on its external connections to other polities. In this paper, I present an alternative, hyper-local perspective on the archaeology of this area. Utilizing ceramic and survey data collected in the spring of 2017 from the region surrounding the UNESCO World Heritage Site of Bat and nearby remains at 'Amlah, this paper works to shift the focus of research on ancient Oman inwards by examining connections between settlements in the Bat region. An analysis of the ceramics collected in this area suggests a temporally dynamic landscape, with shifting centers of activity. Taking a localized, historically-particular approach to the archaeology of interactions in this small area ultimately reveals the significance of even the smallest known settlements in ancient Oman.

[196] *Chair***Domeischel, Jenna (Eastern New Mexico University), Jesse Tune (Fort Lewis College), Christine Gilbertson (Eastern New Mexico University) and Heather Smith (Eastern New Mexico University)**[222] *UAV-Based Mapping and Public Outreach at Blackwater Draw*

Remote sensing has dramatically changed the way we collect data at archaeological sites, and has added new and innovative methodologies to our fieldwork. It has also facilitated greater public engagement by making archaeology more accessible—this is especially true of sites that are considered remote or difficult to access because of challenging terrain. As part of the public outreach initiative of the new Blackwater Draw Museum and its associated website, an unmanned aerial vehicle (UAV) mapping project was undertaken to provide a layered interpretive experience for visitors. Visitors are only able to physically access limited areas of the archaeological site due to a variety of factors, most importantly their own safety and the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

safety of our archaeological resources. As a result of the UAV mapping project, the public, students, and researchers alike will be able to digitally access and explore the terrain outside of the marked roads. In this manner they will have the unique experience of seeing archaeology through an archaeologist's eyes, and be better equipped to understand the data collected throughout the site's history.

[139] *An Underground Home for Earthly Beings. Reconstructing the Archaeological Context of a Lot of Mesoamerican Mosaic Encrusted Artifacts in the National Museum of the American Indian Collections*

The National Museum of the American Indian holds a lot of Mesoamerican mosaic encrusted wooden masks and shields bought in 1921 from Carl A. Purpus, who stated they were found in a cave near Acatlán, Puebla (Mexico).

The presentation, besides including a brief description of the artifacts, is aimed at reconstructing the objects' unknown contextual information through a comparison with similar objects held in American, Mexican and European museums, some of them proceeding from scientifically excavated caves. The comparative analysis, integrated by information deriving from Mixtec codices and early colonial Spanish historical sources, suggests that a group of caves in Puebla and Oaxaca contained similar sets of sacred bundles representing earthly beings known as ñuhu in Mixtec language. The bundles must have been used in ritual performances related with the reciprocal exchange of gifts between humans and extra human beings. The aim of the paper is thus to provide the artifacts in the NMAI collection with some of the contextual information that was lost when they were looted from the cave. In this way, the artifacts reacquire their status of powerful instantiations of earthly fertility, thus becoming much more meaningful both for Mesoamericanist scholars and contemporary indigenous communities.

[141] *Renderings of Knowledge and History in the Jubones River Basin: Neutron Activation Analyses and Petrography in the Ceramics of Potrero Mendieta (ca. 1,000 BCE)*

Inter-regional interaction cannot be defined simply by the unambiguous material evidence of exotic materials but also by the knowledge associated with the manufacture and movement of those materials. And thus, the physical properties of these materialized practices, which include human and non-human agents, are not unmovable facts or culturally specific interpretations but part of the histories of social interaction. This case-study examines the results from the compositional analysis of the ceramic wares from the site of Potrero Mendieta, in southwestern Ecuador, and the historical processes of social interaction and movement of peoples associated with this context through different regions by way of the inter-Andean Jubones River Valley at around the first millennium BCE. This archaeological analysis departs from the notion that the "physical world" and the "social world" are mutually constituted. The application of archaeological sciences to analyze materials at the compositional level generates data suitable for the description and interpretation of the historical processes of human mobility and social interaction which in turn presents how materials and their physical qualities have functioned as participants and mediators of history and not only as a background to history.

[133] *Further Understanding of Subsistence and Settlement in the Later Mesolithic of Northern England*

We present the results of an integrated study of lithic microwear analysis and lithic sourcing at the large Mesolithic site of Stainton West. Microwear analysis helped to understand why the site was so large and how the occupants supported themselves while at the site. Microwear analysis of 700 artifacts led to 49% identification of use. There is much diversity in tool use: hide working, butchery (meat/fish), impact, antler/bone working, wood working, and plant working. Various patterns were detected between tool use and tool technology. Many of the numerous microliths showed impact damage, but are attributed to fishing rather than hunting. This conforms to the riverside location of the site on the River Eden. Hide working was primarily limited to dry hide, which supports the hypothesis that hunting was not the primary procurement activity and is also suggestive of a residential site, which is further supported by the diverse set of tools and wide range of activities represented. The sourcing study shows that raw material was procured from long distances in all directions. We conclude that the site was likely an aggregation site where many bands came together to exploit an abundant but temporary fish resource.

[296] *I Could Read the Sky and Make Nets: 19th Century Irish Taskscapes of Remembrance and Belonging*

19th century Irish emigrants from coastal settings, including the islands of western Ireland, traveled to America to establish better lives for themselves, their relatives, and their future offspring, often in new and very challenging urban settings. These islanders left their homes, the seascapes that framed their lives, and entered into a new placelessness. To Irish islanders living and working in America, crafts such as making fishing nets, provided a point of entry into the emotional landscape of memory and belonging. Nets were not just economic tools or objects; rather these practice helped islanders make their past meaningful through the repeated reenacting of crafts, and negotiate their place in the New World. Migration is, above all else, a dissociative event, one that fundamentally challenges an individual's sense of place, of home, and identity, and creates moments in which individuals reside in one place, but "belong" in another place. Combining oral history, folklore and documentary records, we discuss how the film *Nets of Memory* (Lionta na Cuimhne) explores how a 19th century Islander from Inishark, County Galway, Ireland, continued to make fishing nets for 40 years after emigrating to Clinton, MA.

[72] *Re-indigenizing Mitigation Processes and the Productive Challenge to CRM*

What is mitigation? By definition, it is reducing the severity, seriousness, or painfulness of an event, development, procedure, or situation. As part of CRM mitigation processes, direct, indirect, and cumulative effects must all be identified in order to address any competent approach to and for mitigation. A key question must then also arise within any mitigation process—by whom is mitigation developed and implemented and for what and whose interests, concerns, benefits, and well-being? The bureaucratic recognition of TCPs in Bulletin 38 and in 1992 amendments to the National Historic Preservation Act have provided productive directives to identify and consider properties vital to different cultural groups. These directives have concomitantly presented a challenge to consider what sound mitigation may—or may not—be, as the significance of such places are defined far more

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

by their integrity of associative relations. Avoidance is the mutually acceptable form of mitigation by tribes, agencies, industry and the CRM community; however, when it is agreed by all parties that avoidance is not feasible, we present examples from our experiences working with the Zuni of how cumulative effects and the Zuni worldview and associated cultural practices, must be considered and applied in the design of successful mitigation.

[265] *Mix, Mold, Fire! An Exploration of the Chaine Operatoire through the Eyes of an Apprentice Potter*

Pottery manufacturing in Early Bronze Age (EBA) Anatolia witnessed a host of technical innovations that transformed what had been a small-scale domestic activity into a specialist craft. At the proto-urban village of Seyitömer Höyük, dedicated pottery workshops appeared in the EBIII period (ca. 2250–2200 BCE), along with a suite of technical innovations, such as pottery molds, clay mixing pits, and clusters of pottery kilns. These advances allowed potters to manufacture more vessels with less effort, and represent a fundamental shift in the chaine operatoire, which is indicative of broader social and economic changes in the EBA. This poster presents the archaeological evidence for various stages of standardized pottery production, in comic book style. Sequential illustrations tell the story of an apprentice potter learning her craft under the tutelage of a seasoned corporate group of specialists. These fictional characters perform activities that are empirically attested at Seyitömer Höyük, and offer an approachable way for general audiences to engage with real archaeological data.

[323] *Pre-colonial Griddles in Central Nicaragua: An Archaeometric and Archaeobotanical Approach to Foodways at the Barillas Site, Chontales*
Since 2007, the Proyecto Arqueológico Centro de Nicaragua, directed by Alexander Geurds, has excavated several archaeological sites in Chontales, Nicaragua, northeast of Lake Cocibolca. This paper reports on fragments of ceramic griddles recovered in layers dated to cal AD 1275 and 1290 at the Barillas site—unprecedented find challenging our views on ancient foodways in the region. The paucity of these comales has hitherto co-determined narratives on human mobility from Mesoamerica, due to the debatable assumption that this type of artifact necessarily entangles consumption of maize tortillas.

In this paper, we present results on paleoethnobotanical and archaeometric analyses, discussing technological and provenance aspects related to the ceramic fragments and interpretations of the ancient starch remains attached to the earthenware retrieved during the excavations. Also, we will review techno-functional and use-wear aspects related to chipped stone artifacts found in the same context. The interdisciplinary approach to this dataset will shed light onto the ways people prepared and consumed food in Central America. Studying foodways is vital to understanding socially learned practices. This research on cooking dynamics will help expose the unique Central Nicaraguan perspective of food practices.

Donop, Mark (University of Florida)

[301] *Pot Souls and Kill Holes: Weeden Island Ceramics from Palmetto Mound, Florida*

Most of the ceramic vessels interred in Palmetto Mound (8LV2), were “killed” for reasons that are not adequately explained. These include biomorphic ceramic effigy vessels that depict or embody living things, or their characteristics. Using ethnohistorical and archaeological data, I suggest that the ceramics vessels in Palmetto Mound were considered to be animate, non-human persons with souls that were ritually killed, dismembered, and interred in the mound.

Donovan, Erin (Indiana University Purdue University Indianapolis) and Jeremy Wilson (Indiana University Purdue University Indianapolis)

[266] *Who Was Where: Georectification and Radiometric Dating of a Mississippian Mortuary Complex*

The Orendorf site is a Mississippian village and mortuary complex located in west-central Illinois. Salvage excavations between 1970 to 1990 have yielded one of the largest and best-preserved skeletal assemblages in the central Illinois River valley. The human skeletal assemblage from the Orendorf site has been ideal for a wide variety of bioarchaeological research, both invasive and non-invasive. Despite the attention given to the individuals, research focusing on the burial contexts and radiometric dating of the burials are lacking. Through georectification of spatial data from the original excavation paperwork, I have identified seven individual burials from distinct stratigraphic episodes within the burial mound excavated between 1986 and 1990 for radiocarbon dating. Establishing a chronology for the Orendorf mortuary complex allows for greater inter- and intrasite comparisons within the central Illinois River valley, as well as, a more nuanced understanding of previous bioarchaeological research conducted with the Orendorf skeletal collection within a temporal context.

[169] *Thirty Years Later. Revisiting the Tarascan City of Las Milpillás and Its Environment, Malpaís de Zacapu, Michoacán*

Thirty years ago, investigations in the city of Las Milpillás in the Malpaís de Zacapu, provided unprecedented insights on the origins of Late Postclassic Tarascan social organization. One was the highlighting of a unique kind of urban organization upon lava flows ; as in all four Tarascan cities of the Malpaís. Yet, unlike its counterparts, Las Milpillás specificity resides in the fact that a site portion lies upon older volcanics, providing arable lands at hand for the city dwellers to use. Today, newly acquired LiDAR imagery covering the entire city and its environment brought the research to a new scale and raises several important questions regarding the management of agrarian resources and their appeal for human settlers through time. In this work, we revisit Las Milpillás integration in its volcanic environment in light of the LiDAR imagery. We first present the methods implemented to extract data from the LiDAR derived DEM, and compare the results with the 1980's alidade field mapping. We then assess the human effort undertaken to take advantage of the environment in view of the numerous agrarian features brought to light. We finally discuss the potentiality of dating areas on the basis of human-modified landscape features.

[87] *Learning through the Children: An Experimental Analysis to Investigate the Relation between Childhood Pottery Making Techniques and Social Learning Strategies*

In Güner Coşkunsu's *The Archaeology of Childhood: Interdisciplinary Perspectives on an Archaeological Enigma*, Kathryn Kamp has discussed the potential to conduct experimental archaeology to assess childhood practice. In this paper, we follow Kamp and propose the use of experimental studies to explore the relation between different social learning strategies and material interactions. We investigated the performances of youth participants making pottery. Three forms of social learning were observed: 1. Participants who made a bowl by copying a pre-made bowl made by the authors, 2. Participants who made a bowl while watching the authors make a bowl, and 3. Participants who made a bowl while the authors made a bowl and described the actions. The results demonstrate patterns of different mental processes, of which caused participants to apply different methods of bowl making. Rather than basing inferences of the past on assumptions of child performance, experimental studies provide a greater opportunity to develop a more concrete understanding of the material indicators that archaeologists identify to assess child performance. These questions help enhance our understanding of childcare practices and the roles of childhood agents in broader social milieus. As a result, we produce a refined understanding of the archaeological past.

Dorshow, Wetherbee (University of New Mexico) and Michael Heckenberger (University of Florida)

[116] *Recent Investigations in the Upper Xingu Basin*

In the southern Amazon, two decades of rapid agro-pastoral development, extreme drought, and forest fires in the "arc of deforestation" threaten to precipitate an ecological oscillation of southern transitional forests from an eco-region dominated by closed tropical forest to one of open savanna and woodlands. Collaborative research conducted with the Kuikuro indigenous community in the Xingu River headwaters, involving archaeology, soil science, paleoecology, remote sensing, geospatial analysis, as well as, oral history and ethnographic investigation, documents human interventions into landscape of unprecedented scale, precision and planning in indigenous Amazonia. In the Xingu, indigenous knowledge and land management strategies, such as soil enrichment, wetland and fisheries management, and agroforestry, provide alternative pathways to ecological resilience and sustainable land use in the face of dramatic climate change during the Current Warming Period. This paper summarizes these findings, with an emphasis on a geospatial time-series analysis of Landsat imagery designed to identify the distribution, spectral signature, and potential functions of anthropogenic "Banded Forests" in the region.

[294] *Fire and Vegetation Dynamics: Blazing the Trail in Pre-contact Southern New England*

The concept that Native Americans were using fire for wide spread vegetation control and subsistence procurement during the pre-contact period in Southern New England has long been excepted as common practice, leading to changes in the landscape and then settlement patterns. However, save for the accounts of early explorers and colonists, whose goal was to solicit the "new land" as a familiar landscape and not an unknown wilderness, there is little supporting scientific evidence. This paper presents a component of a larger NSF-funded research project aimed to better understand the dialectical relationship among human activity (fire, land clearance, horticulture), vegetational dynamics, and climate by combining archaeological, paleoecological, and paleoenvironmental data. Overall, results of the multidisciplinary data analyses conducted thus far from state of Massachusetts and, further, from three distinct ecological zones within the state: Martha's Vineyard, the Taunton River Drainage Basin, and the Deerfield Valley, does not show clear influence of human agency on the environment during the pre-contact period.

Douglas, Diane (Applied EarthWorks)

[292] *Climate Change Adaptation: Implementing Indigenous and Local Knowledge to Increase Community Resilience*

Community resilience can be enhanced by engaging local and indigenous groups in the management of their cultural resources, both intangible and tangible. Many communities in developing nations were formally subjected to colonial governance, which imposed foreign architectural designs, irrigation agriculture and economic crops—and these systems vastly changed the social-cultural dynamics of these communities, often destabilizing systems that had been in place for generations. After colonial powers left, indigenous and local groups were left with trying to manage their countries/regions with systems poorly adapted to their geographic landscape. In many regions, climate change is stressing communities to the brink of failure. Millions of people are subject to starvation, social/political collapse, forced migration due to degradation of the environment, and loss of their cultural heritage and social-cultural identity. This paper presents an upper level course that helps graduate students identify ways that public/private partnerships can be implemented to help communities recall and implement indigenous and local knowledge (ILK), and in so doing make them more resilient to climate change. The course encourages graduate students to "adopt" a particular community and make it their dissertation or master's thesis and to design a "resilience through ILK" program in collaboration with local persons.

[114] *Integrated People, Practices and Knowledge in the Archaeology of Southwest Madagascar*

Since 2011 the Morombe Archaeological Project has undertaken archaeological survey, excavation and oral history recording in the Velondriake Marine Protected Area of southwest Madagascar. The project's aims are to investigate diachronic human-environment dynamics and refine our understanding of the region's settlement history by leveraging multiple scientific techniques and the collective historical and socio-ecological knowledge

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

base of Velondriake's living communities. The project is run by a diverse team of ancestors, elders, men, women and youth from different communities in Velondriake, representing five ancestral clans. In this paper we describe the outcomes of the project's approach to integrate diverse community members and collective knowledge in all aspects of the research and promote this approach as necessary in generating new and humanized narratives of human-environment interaction on the island of Madagascar.

Douglass, Matthew (University of Nebraska), Simon Holdaway (University of Auckland) and Sam Lin (University of Wollongong)
[200] *Investigating Prehistoric Land Use History and Place Use Variability with Low Density Surface Scatters of Stone Artifacts in the Oglala National Grassland, Northwestern Nebraska*

The USDA Forest Service National Grassland System consists of 20 individual native and restored prairie grasslands. While the scale of these areas allows landscape survey, this 'sea of grass' is a challenge for artifact and feature discovery due to vegetation cover, meaning archaeologists must use surface visibility created by erosion, deflation, and other natural and anthropogenic processes. Here we report on a collaborative student-training project between the Forest Service and the University of Nebraska on the Oglala National Grassland in far northwestern Nebraska. A record of low-density lithic scatters permits assessment of movement and land use history in different locations throughout the grassland. Using raw material variability, measures of reduction intensity, and cortex proportions, we assess in-flow of non-local and out-flow of local materials, and discuss the implication of this pattern for understanding the organization of lithic technology in this environment, and how spatial variation in this process relates to a deep history of landscape structure and land use.

[41] *Searching for the Denisovans*

In 2010, a finger bone discovered in Siberia was assigned using DNA to a previously unknown human group, the Denisovans. The Denisovans interbred with both Asian Neanderthals and modern humans over the past 100,000 years; their geographic distribution is now thought to have stretched from the Siberian steppes to the tropical forests of SE Asia and Oceania. Despite their broad spatio-temporal range, the Denisovans are only known from 4 bones, all from a single cave. This patchy knowledge of an entire human population significantly limits our ability to test hypotheses regarding routes and timing of people movements across Asia, the nature and frequency of interaction between archaic indigenous groups and migratory modern humans, and the mechanisms leading to sole dominance of our species.

In 2017, a new 5-year research project "FINDER", funded by the European Research Council, was inaugurated, its main purpose being the discovery of new Denisovans. We apply a novel combination of analytical methods, namely collagen fingerprinting, also known as ZooMS, radiocarbon dating and ancient DNA analysis, designed to identify, date and genetically characterize human fossils amongst thousand animal fragments excavated from Denisova and elsewhere in Siberia. The first results from this work are reviewed in this presentation.

Downey, Jordan
[303] *No-Budget Archaeology: Landscape Archaeology Using Free Data and Software*

Geographical Information Systems (GIS) and remotely-sensed data are now used ubiquitously in archaeology. While these tools offer incredible possibilities for landscape archaeology and can be extremely cost-effective compared to traditional survey methods, they are nevertheless costs that must be borne by research budgets and home institutions. Data acquisition can easily reach thousands of dollars, and industry-leading GIS software platforms require expensive annual licenses. But all hope is not lost for those of us with no budget: many governmental or academic agencies offer free data with fair-use licensing for academic research, and open-source or free-to-use software can perform powerful computations and create publication-quality maps. This poster presents several examples to highlight how no-cost data sources and software can be used to explore the archaeological landscape of the north coast of Peru from 500 B.C. to A.D. 500. Of course, such data cannot address all research questions and fieldwork is always necessary to ground-truth findings, but this poster will give hope to junior academics and professors emeriti alike by showing how you can continue to produce and disseminate new research with nothing more than a computer and an internet connection.

Downs, Lauren (AECOM) and Kyle Waller (University of Missouri)
[306] *Problematic at Best: Assigning Sex to Prehistoric Remains with Consistency*

Historically, the sex of prehistoric human skeletal remains has been visually assessed by researchers who are (hopefully) knowledgeable about the population being examined. However, methods of assigning sex can be largely subjective and often lead to inconsistent results. In this study, we consider human skeletal remains from the Medio period (A.D. 1200–1475) from Paquimé, a site in northern Chihuahua, Mexico, that was the economic and political center of the Casas Grandes region. The sexes of the human skeletal remains from this site have been assessed on three separate occasions (Benfer 1968; Butler 1971; Waller 2017) using a variety of methodologies, and have yielded significantly different results. We examine how these inconsistent analytical methods can influence more general interpretations of Paquiméan society, and consider how these results might be applied to broader studies of gender roles and status within prehistoric societies.

Doyle, James (The Metropolitan Museum of Art), Griselda Pérez Robles (Proyecto Paisaje Piedras Negras-Yaxchilan) and Edwin Pérez Robles (Proyecto Paisaje Piedras Negras-Yaxchilan)**[163]** *New Advances in the Conservation of Monuments at Piedras Negras, Guatemala*

In 2016, a pilot project began for the conservation of sculpted monuments including stelae, altars, and panels at the site of Piedras Negras, Guatemala. Since then, a team in conjunction with the international Proyecto Paisaje Piedras Negras-Yaxchilan has constructed new platforms with roofs to house the monuments, protecting them from further weathering, moisture, and biological agents. The results of the implementation of the innovative system—platforms of powdered lime and local stones, wooden supports made from local pucte trees, and semi-translucent polycarbonate roofs—are currently being monitored with respect to relative humidity and temperature. In 2017, notable reductions in microorganism and plant growth were observed.

Excavations and three-dimensional photogrammetric modeling are augmenting the data available for some well-known monuments, which will contribute to a new database of in situ and removed monuments and fragments in Guatemalan and international museum collections. Furthermore, archival research on Piedras Negras Stela 5, on loan from Guatemala to the Metropolitan Museum of Art, has revealed new information about the illicit removal of monuments from the site and their subsequent appearance on the art market in the United States and Europe.

Doyon, Luc (Université de Montréal & Université de Bordeaux)**[219]** *Aurignacian Projectile Points Do Not Represent a Proxy for the Initial Dispersal of Homo sapiens into Europe: Insights from Geometric Morphometrics*

It has been argued that Aurignacian projectile points made of antler, bone, or ivory represent a proxy for the initial dispersal of *Homo sapiens* into Europe. Our research reassesses this claim by using geometric morphometric analysis to study 547 Aurignacian osseous implements recovered from 49 European sites. This approach allowed the identification of eight volumetric templates reproduced by Aurignacian artisans during the manufacture of split-based points. Two templates were identified for massive-based points, one of which includes a number of variants. Spatial and chronological distribution of these templates suggests the dominant hypothesis must be reconsidered. We argue that Aurignacian armatures signal the development of innovative socioeconomic strategies by groups already present on the continent and linked to one another. In this case, the osseous armatures would have conferred an adaptive technological solution to prehistoric groups engaged in increased mobility. The subsequent adoption of the innovation at a continental scale must be linked with the dispersal of the Campanian Ignimbrite tephra. Finally, the replacement of split-based points by massive-based points suggests that an important transformation occurred in the technological strategies (i.e., curation versus expediency) implemented by earlier and later Aurignacians even though they favoured a similar mobility pattern.

Dozier, Crystal (Texas A&M University)**[36]** *Toyah Mitotes: Feasting in the Terminal Late Pre-Hispanic Southern Plains*

The proto-historic period within North America provides a framework for assessing the transformations brought on by contact and conflict between indigenous peoples and European colonizers. In central and south Texas, a distinct archaeological culture, Toyah, spans some 400 years, 1250–1650 CE. The hallmark projectile point and first systemic, locally-produced ceramic tradition in the area have intrigued archaeologists for over a hundred years; interpretations of the phenomena have been unsatisfactory as to the factors responsible for such a distinctive change in material culture within a foraging society. This paper argues that feasting theory provides an interpretative and explanatory lens for Toyah. With increasing population pressure on the landscape, interactions between foraging and farming groups across southern North America increased during the late Pre-Hispanic period. Large feasts, which the Spanish called mitotes, became important social mechanisms for crucial intergroup meetings for trade as well as political, marriage, and spiritual negotiations. Ethnohistorical accounts of mitotes complement the archaeological assessment of a feasting society.

Dozier, Danielle (Florida State University)**[102]** *Fire on the Waterfront: The Archaeology of an 1800s Storefront in Apalachicola, Florida*

In the 1840s, Florida was a large part of the trade and shipping networks of the Southeast United States. The Gulf coastal town of Apalachicola became the third largest port in Florida. This poster presents the archaeological evidence of a storefront located along Water Street in Apalachicola, Florida, built in 1837 and burned in 1844. The entire market place comprised of stores, clerk offices, and cotton warehouses, with this particular property (8FR1318) being B.S. Hawley's store. Nineteenth-century newspaper articles announcing the shipment of goods are compared to the archaeological evidence to show what was shipped, sold, and eventually burned in the store.

Drake, Lee (University of New Mexico)**[77]** *An Open-Source Calibration Framework for XRF*

The Lukas-Tooth and Price algorithm for empirical calibration of x-ray fluorescence systems has become the standard for archaeometry, particularly in obsidian sourcing. Here, a new way of using the computer language R and HTML5 websites is introduced to calibrate these systems.

Drake, Stacy (The Field Museum), Marla MacKinnon (The University of Victoria) and America Guerra**[15]** *Exploring Collaborative Curation of North American Human Remains*

In 2016, The Field Museum was awarded a National Leadership Grant from the Institute of Museum and Library Services (IMLS). The overall mission of this project is to “research, explore, develop, and implement thoughtful, practical, and forward-thinking practices for the ethical care of human remains.” The project is working to bring together stakeholders from collections-holding institutions, scientific research institutions, and Native American and First Nations communities to move beyond conversations of challenges imbedded within institutional collections of human remains by working together to establish shared protocols and principles involving these remains. This poster introduces the IMLS-funded collaborative project currently underway at The Field Museum and particularly focuses on the bioarchaeological and osteological work that is being conducted by the museum's newly hired bioarchaeologist and 2017 interns. The poster highlights a brief history of the project, and reviews the successes and difficulties of the developing osteological inventory process for these Native North American human remains, including ethical digital curation of human remains data, individuation of remains within commingled collections, rehousing individuals in conservation-approved materials, and accomplishing accurate osteological inventories of mummified individuals.

Drane, Leslie (Indiana University)**[301]** *Constructing Communities: A New Magnetometry Survey at the John Chapman Site*

The John Chapman site is a mounded village that lies along the Apple River in northwestern Illinois. At approximately A.D. 1050, it appears that Mississippian migrants traveled to the area and interacted with the Late Woodland people already occupying the land. Previous excavations in the northern portion of the site revealed John Chapman people changing their ceramics to emulate Mississippian styles, while keeping their houses Late Woodland-like. Recent magnetometry surveys targeted central and southern portions of the site that revealed high concentrations of materials during walk-over surveys with the goal of comparing potential habitation sites to the ones excavated in the north. This poster will display the subsurface anomalies picked up during the survey and discuss what this can inform us about landscape usage and communities.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Drapeau, Michelle (Anthropology, Université de Montréal) and Jesseca Paquette (Anthropology, Université de Montréal)**[219]** *Habitat Preferences in Early Hominins and the Origin of the Human Lineage*

Early hominins, such as australopithecines, are characterized by bipedality and enlarged posterior teeth. Originally, these traits were thought to be adaptations to an open environment. However, discoveries of older hominins, such as *Ardipithecus* that were possibly only occasionally bipedal and did not have enlarged teeth, have refocused the origins of early hominins within a much more closed, wooded setting. Even the later australopithecines are currently cast as inhabitants of mosaic environments encompassing some closed habitats. However, research in some localities that clearly sample closed habitats do not yield hominins. The four million-year-old Mursi Formation of southern Ethiopia is a good example: its fauna, and stable isotopes values from mammalian teeth and paleosol carbonates suggest a fairly closed woody cover, more so than in pencontemporaneous localities of the region. Yet, the Mursi Formation has no hominins while the other localities with dryer and more open habitats do, suggesting that early hominins could not occupy exclusively closed habitat and were reliant on resources found in more open settings. This type of habitat was novel and different from those exploited by our closest relatives, the great apes, and might be a defining characteristic at the origins of the human lineage.

Drass, Richard R. [268] see Trabert, Sarah

Draznin-Nagy, Sophia and Jeffery Clark (Archaeology Southwest)**[91]** *Pigment and Clay Variation in Polychrome Ceramics*

This poster presents the results of a project that attempted to replicate viable paint and clay combinations employed to make Salado and Maverick Mountain polychrome ceramics. We know from NAA and petrographic studies that both of these painted ceramics were locally produced and widely exchanged in the Upper Gila region. Local clays and pigments, from the Gila River Valley, were used to show how effectively different pigments adhere to clay. The study also provided an opportunity to explore the processing of organic and mineral materials potentially used as pigments. The study showed that several variables affect how pigments and clays interacted during the firing process including: the type of clay, type of pigment, time at which pigment was applied, firing temperature, and firing time. Using experimental techniques allowed for nuanced understandings of the results based on observations during various stages of production. The results of this project further show the complexity in manufacturing a polychrome vessel, from the clay type and paint recipe used to the firing technique.

Dresser-Kluchman, Elizabeth (Barnard College)**[259]** *Scarred Traces: Trees as Artifacts on the Northern Rio Grande*

In the Rio Grande del Norte National Monument, at the confluence of the Rio Grande and the Red River, groups of ponderosa pine trees are dotted with peeled trees, scarred by surrounding animals and weather as well as by human consumption of the trees' cambium. In most considerations of inner bark utilization, the threat of starvation is posited as the key motivation for bark-peeling. This landscape, however, lends itself to narratives that use trees as artifacts, among the full breadth of survey data, to consider its histories. Performing a landscape archaeology that takes these living artifacts of a visible food practice seriously raises questions for the process of looking at the landscape, by which trees become a powerful, if transient, player in a trajectory of landscape-based practices surrounding sustenance and sweetness on the northern Rio Grande.

Dublin, Susan-Alette (Hunter College)**[23]** *(Re)Building the Present, (Re)Claiming the Past: Architecture and Social Memory at the Medieval Monastery of Psalmodi, Gard, France*

This study employs archaeological and documentary evidence to examine adaptive reuse and social memory at the site of the medieval monastery of Psalmodi in Gard, France. During the late twelfth century, the abbey church was partially rebuilt, enclosing the footprint of an earlier church and maintaining early public space while transforming and enlarging monastic space. The reconstruction occurred shortly after a century of turmoil that saw the takeover of the monastery by a rival and the ultimate retention of Psalmodi's independence and sovereignty based on a forged foundation legend. I argue that the meshing of early and later architectural elements was an expression of social memory in the aftermath of a period when the independence and the very existence of the monastery and its community had been threatened.

Dubois, Jonathan (University of California, Riverside)**[264]** *We Are Kin with the Land: The Role of Rock Art Sites in the Negotiation of Social Relations in the North Central Andes of Peru*

Research in the highlands of Huánuco, Peru, has revealed rock art sites were used to establish, negotiate, and legitimize changing social relations for more than three millennia. Implementation of stylistic seriation bolstered by art from more securely dated archaeological deposits allowed for the development of a chronological sequence of rock art styles in Huánuco. The research revealed rock art played a prominent role in expressing changing social relations in the region. This paper focuses on the rockshelter, Gonga, and its rock art panel that was created and repainted multiple times over the millennia. An early painting depicts a human couple, while later repaintings emphasized the female character and the male figure was smeared with paint. I propose that the initial painting served to instantiate the people represented by the figures as founding ancestors of an ayllu (kinship group) based on the timing of the painting in conjunction with the appearance of public burial structures called chullpas. The highlighting of the female character at the expense of the male indicates a negotiation or contestation of prevailing social relations. Finally, I argue that rock art was a medium for negotiation because the mountains where they were painted were considered active, sacred agents.

Dudley, Meghan (University of Oklahoma)**[44]** *Identifying Hunter-Gatherer Socialized Landscapes in the Bridger Mountains, Montana*

Archaeologists working in the Rocky Mountains and throughout the world have long recognized that people invest social meanings into the landscape around them. Based on de Certeau's (1984) "Spatial Stories," these "socialized landscapes" consist of two archaeologically identifiable components: espaces (practiced spaces) and tours (practiced paths). I operationalize these ideas by creating archaeological expectations for six socialized landscape types and ask what types of socialized landscapes can we identify from a largely lithic archaeological record. I test my expectations with a pilot study in the Bridger Mountains, Montana. By controlling for time using projectile point types found at sites throughout the mountains, I conduct a series of four analyses by time period to determine what types of espaces and tours past peoples created. I then compare those results against my archaeological expectations and landscape types. Although this study reveals areas of the methodology and analyses that can be improved in future studies, my research suggests that we can use this approach to understand past hunter-gatherer socialized landscapes both in the Rocky Mountains and worldwide.

Duff, Andrew (Washington State University), Wesley Bernardini (University of Redlands) and Gregson Schachner (UCLA)**[218]** *The Homol'ovi Research Project—The View from ASU*

It is unlikely that we will see a research effort of the scope and duration of the Homol'ovi Research Program project replicated in the Southwest. It is the successful execution of this work by Chuck Adams and Rich Lange, unfolding over more than three decades, that we will attempt to contextualize from the vantage point of that other university in Arizona, ASU. We begin by reviewing the intellectual context of Southwestern research preceding the Homol'ovi project, in particular how the aftermath of the "complexity debates" shaped academic research going into the 1990s. A more productive environment for regional scholarship emerged, and a number of research products and approaches emanating from the Homol'ovi work informed research by ASU-associated scholars studying other Pueblo IV-era settlements and settlement clusters. The Homol'ovi program was a key hub in collaborative partnerships among scholars across multiple institutions and contexts (e.g., academic, tribal, governmental) that have enhanced our collective understandings of ancestral Puebloan settlements and the connections these have to contemporary Pueblo peoples.

Duffy, Paul R. (University of Toronto) and Péter Czukor (Eötvös Loránd University)**[295]** *Using Multiple Time Scales to Understand the Divergence of Prehistoric Social Trajectories in the Carpathian Basin*

A variety of new groups emerged during the Bronze Age in the Carpathian Basin—some had powerful rulers holding feasts and controlling the trade in commodities, and some were egalitarian peoples leaving little evidence for social differentiation outside of age and gender. This paper uses a comparative and multi-scalar perspective to study two different social trajectories in the Carpathian Basin during the second millennium BC: the Lower Körös Basin in Eastern Hungary, and the Danube and its tributaries in Central Hungary. We begin with coarse-grained chronological settlement data and consider the importance of foundational differences in population in both regions. We then look at the productive catchment and yearly agricultural needs of settlements, and weigh their likely importance in decision-making at the household level. Finally, we address how geographic location and compounding trade interests over successive generations potentially influenced the changing relationships between people and communities in the Körös and Central Danube regions in the second millennium BC.

Mortuary spaces often served as gathering points for disparate communities in the pre-Columbian past. The deep temporal associations of many burial mounds across the southeastern United States linked living societies to the ancestral landscape, thus creating a sense of social memory that penetrated both quotidian and ritualized social practice. Safford Mound (8PI3), a burial mound located near modern Tarpon Springs, Florida, embodies some of these characteristics. In this study, we qualitatively describe thin sections, and also present a gross paste characterization and technological analysis of ceramic vessels from the Safford assemblage. Although the excavations were poorly recorded, the sheer size and completeness of this assemblage provides us types of information usually unattainable through standard recovery methods. We use these data to investigate the ways in which vessel exchange and provenance at Safford represents both change and continuity in mortuary practice during the Woodland (1000 BC-AD 1000) and Mississippian Periods (AD 1000–1500). The results of these analyses ultimately suggest that Safford Mound maintained its social power during a period of immense sociopolitical realignment and reorganization. We view this pattern as indicative of the embeddedness of mortuary ritual within social life in the Gulf Coastal Plain.

Duke, Daron (Far Western Anthropological Research Group) and D. Craig Young (Far Western Anthropological Research Group)**[92]** *The Dated Paleoindian Archaeology of the Old River Bed Delta*

The Old River Bed delta is a premier open-air Paleoindian locality in the eastern Great Basin. Its chief distinction is scale—some 2,000 square kilometers-plus of nearly continuous and single-component archaeological material on what would have been the largest basin wetland in the region. But the record is largely surficial. In this poster, we detail a series of sites that have yielded temporal data from buried cultural contexts. The sites help clarify the broader associations of artifact types and shifting hydrology that have thus far defined the limits for examining change through time on the delta. These refinements have implications for our understanding of Paleoindian land use and technology throughout the region, and what life was like in Great Basin wetlands.

Duke, Guy (The University of Texas Rio Grande Valley), Sarah Rowe (The University of Texas Rio Grande Valley) and Brandi Reger (The University of Texas Rio Grande Valley)**[101]** *Figuring Things Out: 3D Models of Valdivia Figurines for Research and Outreach*

During excavations at the Valdivia site of Buen Suceso, Ecuador, in 2017 we recovered a number of figurines. Using in-field photogrammetry and post-field processing, we have created digital 3D models of these figurines. For us, the purpose of photogrammetric models is: 1) to facilitate comparisons across assemblages by a variety of scholars, and 2) for use in public education and outreach. While the creation of 3D images via photogrammetry is becoming more common in archaeological practice, the results of applying these methods are still only rarely publicly available. In fact, even at academic conferences, they are often employed within standard PowerPoint presentations with little opportunity for audience interaction. For this

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

reason, it is crucial to utilize various platforms in order to make these models more accessible to the public at large, including other academics. This allows for remote comparison of other figurine databases by archaeologists without needing to rely on two-dimensional photographs or drawings, as well as a fantastic educational opportunity for the public to see entire figurines and virtually turn them over in their hands in order to gain a greater appreciation for their craftsmanship and artistry as well as a deeper understanding of their cultural meaning and context.

Duke, Hilary (IDPAS, Stony Brook University, New York) and Sonia Harmand (Department of Anthropology, Turkana Basin Institute)

[329] *Hilary Duke and Sonia Harmand—A New Approach to the Evolution of Early Pleistocene Hominin Cognition and Technological Change: Examining the Technological Context of LCT Emergence 1.8–1.76 Ma at Kokiselei, West Turkana, Kenya*

The eastern African Early Pleistocene witnessed critical shifts in climate, environment, hominin anatomy and behavior. The lithic record shows change within this broader context. After 1.8 Ma, Large Cutting Tools (LCTs), such as bifaces, entered the hominin lithic repertoire. These artifacts are widely viewed as the first evidence of lithic shaping. Many archaeologists theorize both cognitive and practical differences between “flaking” and “shaping” among knapping strategies. Most of these cognitive models are based on our current understanding of living human cognition, not that of Early Pleistocene hominins. Little empirical evidence supports these concepts’ usefulness for Early Pleistocene archaeology and the study of hominin cognitive evolution. Further, we often lack holistic information about non-LCT components of Early Acheulean lithic assemblages. Early LCTs, and associated non-LCT lithics, occur in the Kokiselei Site Complex in West Turkana, Kenya (1.8–1.76 Ma). This project fills a gap in the empirical research necessary for testing hypotheses about “shaping” and LCT emergence through holistic technological analyses of both LCT and non-LCT lithics at Kokiselei and an experimental program that investigates the knapping strategies employed by hominins at Kokiselei. Here, non-LCT lithic components from Kokiselei are compared to data collected from an experimental lithic assemblage.

[177] *Modelling the Connectivity of Socioeconomic Networks of Copper Production in Ancient Northern Oman*

With over 5000 years of production history, Oman was a major ancient source of copper, participating in a trade network that supplied a large part of the ancient world, the extent of which has yet to be fully mapped. As part of the Archaeological Water Histories of Oman (ArWHO) Project, we have been working since 2012 in the Ad-Dhahirah Governorate of Oman to clarify the structure of ancient copper production networks. Methodologically, our investigations employ satellite imagery analysis to map copper resources, ground-truthing of resulting prospectivity maps, systematic and targeted archaeological survey, and x-ray fluorescence of slags and ores. While we are broadly concerned with understanding raw material exploitation, production, and circulation, this paper focuses on modelling Iron Age and Islamic Period networks of production. Sites which demonstrate shared production technologies are used as proxies for social network connectivity. We combine pXRF-derived geochemical analyses of copper slag with formal social network analytical methods (SNA). We use pXRF data to determine technological strategies employed by metal producing communities. We then compare geochemical data between sites to elucidate dynamics of inter-site relations. Combining site-centered data with regional survey data enables multi-scalar analysis that provides a novel view of ancient metal producing societies.

Duncan, Neil (University of Central Florida) and John Walker (University of Central Florida)

[333] *Donald Lathrap, the Tropical Forest, and Hemispheric Archaeology*

Donald Lathrap was a visionary anthropologist and archaeologist. His contributions always reflected the “big picture”: an understanding that all pre-Columbian culture history was intertwined, and that these connections went back through time to origins in the lowland tropics, or the Tropical Forest. He practiced an archaeology that gave equal weight to iconography and religious thought, and rim sherds and energetics. The most significant issues for Lathrap’s version of American Archaeology, is not an argument over the significance of the Amazon Basin in comparison to the Andes, or as a center for cultural innovation. The legacy of Lathrap is Hemispheric Archaeology, that there are deep cultural-historical connections across the Americas, particularly between the Andes and the Amazon that have explanatory value. The big picture is relevant both for maize farmers in the Mississippi Valley, tuber gardeners in the Pacific Northwest, and raised field builders in the Southwest Amazon. Such hemispheric explanations could be just-so-stories, but correcting for this danger is worth the effort, because as the evidence for earlier developments continues to accumulate, the big picture is getting bigger.

Dungan, Katherine (Center for Archaeology and Society, Arizona State University)

[287] *Secret Identities and X-Ray Vision: Applying CT-Scanning to Roosevelt Red Ware Formation Techniques in the Tonto Basin*

The techniques used to form ceramic vessels—in this case, coiling and scraping as opposed to the use of a paddle and anvil—have long been treated as key elements differentiating among archaeological “cultures” in the US Southwest. At the same time, finished vessels often retain little or no obvious visual evidence of the technique used in their formation, and this low visibility has implications for both ancient practice and modern archaeological analysis. We utilize computed tomography (CT scanning) to examine the formation techniques used in producing Roosevelt Red Ware in the Tonto Basin, an area with a deep history as a geographic and cultural frontier between archaeological traditions. While this pottery is ubiquitous in the 14th- to 15th-century Tonto Basin, contemporaneous sites otherwise show substantial differences in material culture and were likely home to diverse populations. Along with a broader examination of variation in Roosevelt Red Ware vessel forms and use among sites, exploring the techniques used to make these vessels in relationship to deep histories of ceramic production can shed new light on the place of this pottery in social diversity in the Tonto Basin and the greater Southwest.

[133] *Feeling the Juju: Archaeological Survey as Traditional Knowledge*

The practice of archaeological site reconnaissance falls within the western scientific tradition and relies on consistent methodology, precise measurement, and sampling strategies. However, there is also an experiential element to archaeological survey in which practitioners consciously and unconsciously observe patterns in the field that lead them to hunches or gut feelings that drift beyond quantifiable, empirical observation. While such hunches are occasionally crafted into hypotheses, they are more commonly shared and discussed among practitioners without finding their way into the official project record. The experiential knowledge obtained through archaeological survey is the result of accumulated observations of archaeological and geographic phenomena as well as interactions with the environment. From this perspective there is a common theme with forms of traditional knowledge especially those related to experiential knowledge acquisition and reading landscapes. This paper explores the premise of archaeological survey as a form of traditional knowledge.

[336] *The Role of Pastoralists and 'Operational Complexity' in Shaping the Materiality of Trans-Eurasian Exchange*

For decades, descriptions of prehistoric Eurasian pastoral societies would present ceramic typologies as material evidence for macro scale economic, social, and ideological cohesion—and trans-Eurasian interaction. However, recent investigations that focus more on human-environment interactions and domestic economies reveal a more dynamic and varied past in micro-regions of Eurasia. Pastoral strategies dating to the 3rd-2nd millennium BCE were regionally diverse, and societies were engaged in contacts that extended beyond the steppe world confines. These new discoveries bring material assemblages back into focus with the fresh purpose of scientifically examining the spectrum of technologies and social dynamics that generated the materiality of Eurasian pastoralism. Through a focus on mountain campsites in Kazakhstan, this paper proposes that 'operational complexity', a new theoretical term to describe the varied technological behaviors and learning contexts behind the production of household and ritual items, was a central factor in shaping the materiality of Eurasian pastoralism and trans-Eurasian exchange.

[254] *Domesticated Forests? Interpreting Agroforestry Practices from Diachronic Trends in Firewood Collection at the Classic Maya City of Naachtun*

What can be drawn from anthracological data to infer long-term socio-environmental dynamics among ancient Mayas is a question that has received little attention. At Naachtun (Northern Peten, Guatemala), we studied charcoal remains from archaeological contexts in relation with pedological data to reconstruct forest resources and land management through time. Since the beginning of Naachtun's occupation at the end of the Preclassic period (\approx AD 150), domestic firewood economy seems to have been closely linked to the local agrarian system. Wood was collected in semi-opened woodlands, suggesting a reliance on both fallow lands and preserved forests probably close to human settlements. In that context, the observation of an important shift in firewood collection strategies during the second half of the Late Classic period (AD 750–830), from opportunistic gathering of a wide range of forest species to a heavier reliance on fruit tree species, allows us to draw hypotheses on the intensification of arboriculture practices and the progressive transformation of woodlands around the site. As this shift occurred rapidly while the city experienced its demographic peak, it could express an adaptation strategy throughout Naachtun society, utilizing forest garden plots for its firewood supply as a result of higher pressure on local resources.

Dussubieux, Laure (Field Museum of Natural History), Thomas Fenn (California State Polytechnic University, Pomona), Shinu Abraham (St Lawrence University) and Alok Kanungo (IIT Gandhinagar)

[137] *Pushing Boundaries in the Scientific Investigation of Glass: A New Project to Source Ancient Indian Glass*

Scientific investigation of archaeological glass has advanced, beginning in the early 2000's, with studies relying more heavily on determination of trace element concentrations to differentiate production recipes depending on distinct ingredient sources and the use of larger corpuses of artifacts to more easily and reliably reveal production patterns. At the same time, isotope analyses (e.g., Pb, Sr and Nd) attempting to source raw materials used to manufacture glass in antiquity grew in importance, focusing mostly on glass produced around the Mediterranean basin.

In a new project, recently funded by the National Science Foundation (NSF), we will combine trace element and isotope analyses to study the ancient glass industry of South Asia which, despite its importance and impact within and beyond the Indian Ocean region, is still poorly understood. To this end, we will collect raw materials, test their suitability to obtain glass and compare the trace element and isotope signatures with those of different South Indian glass types. By connecting Indian glass types to potential production regions in South Asia, the results of this project will illuminate the spatial and temporal interconnections between cultures and regions of the Indian Ocean and beyond.

Duwe, Samuel (University of Oklahoma)

[131] *Not Abandoning the Middle Place: Rethinking the Historic Tewa Pueblo World*

In the 1500s the settlement patterns of the Tewa Pueblo world fundamentally shifted. The Rio Chama valley was a population center with 12 villages housing thousands of people at the beginning of the fifteenth century. By century's end it was nearly devoid of full-time habitation. The timing and causes of the protohistoric 'abandonment' of the Chama has sparked interest from archaeologists and historians. Was this movement out of the Chama the continuation of a centuries-long process of Pueblo coalescence, or rather a response to early Spanish contact and colonization? The latter idea is bolstered by the fact that the Chama is the ancestral homeland of Ohkay Owingeh where Governor Oñate established the first capitol of New Mexico in 1598.

I reframe this debate by assuming that the Chama was never abandoned. Based on archaeological, historic, and ethnographic documentation the Chama remains the heart of Ohkay Owingeh's cosmography, and was visited and occupied throughout the Historic period. Opposed to favoring a

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

prehistoric or historic cause for sixteenth-century landscape change, I take a 'long-view' that incorporates these disparate sources of knowledge and blurs the lines between history/prehistory to understand how the Tewa cosmos evolved in the face of dramatic change.

[86] *Passing the Paleo Drug Test: Testing for Medicinal Plant Use in the Paleoethnobotanical Record*

For decades, paleoethnobotanical research almost exclusively concentrated on reconstructing past subsistence economies. At 2011's SAA conference, I presented a paper entitled, *Toward A Paleoethnomedicine*. I suggested that paleoethnobotanical research should take inspiration from ethnomedicine (a subfield of ethnobotany) and concentrate on analyzing past people's healing practices and performances. This paper presents a method to operationalize this concept, a technique for analyzing paleoethnobotanical data to detect past medicinal plant usage. The general observations from ethnobotany/ethnomedicine about modern medicinal plant use gives researchers an idea of expected observations in the paleoethnobotanical/ paleoethnomedicine record. A common practice in macrofloral analyses is to calculate the ratio of a plant group (food, nut shell, charcoal etc.) in order to provide evidence of the certain activities at a site. This paper presents a new ratio extrapolated for plant observations from archaeological contexts and includes the results of a pilot study based on the paleoethnobotanical data from Birka and other Late Iron Age/Medieval sites in east central Sweden.

[154] *XRF Analysis of North Carolina Piedmont Ceramics to Locate Source of Production and Trade at Rural Plantation Sites*

Little documentation exists of the trade exchange occurring in the central Piedmont during the 18th and 19th century at wealthy plantation sites or at surrounding sites of lower economic status. In this historical archaeology research, I focus on understanding the socio-economic patterns of settlers in the more rural areas of the region at two plantation sites and wasters from a local kiln site from same time period. Using pXRF data of lead glazed earthenware I attempt to map ceramic regional origin using existing pXRF data of identical ceramic types. Non-local wares for comparison were chosen based on documented trading sites during the 18th and 19th centuries, including Britain, Philadelphia, the Chesapeake, South Carolina and the Northern Virginia Piedmont. I propose that the settlers' desire for independence and sustainability to form a nation independent from Britain would have been the primary factor in deciding where to obtain utilitarian vessels, rather than choosing non-local sources as an indicator of social status, i.e., local wares should be much more common than those from northern states or imports.

[220] *Hunters, Soldiers, and Holy Men: Exploring the Gendered Politics of Mission Landscapes in Alta California*

Space was paramount to Spanish missionary work in 18th and 19th century Alta California. This mission system was designed to irreparably reshape the Indigenous conceptual universe into that of a Christo-European worldview, to transform Native peoples into gente de razón. In addition, missions were the setting against which ecclesiastical and military colonists were in constant contact, and missionaries also used space as a moralizing tool, in an attempt to reform the lax morals of soldiers assigned to guard the missions. In this paper, I examine how the mission system reconfigured California's natural and cultural landscape, and the gendered politics underpinning these changes. I focus in particular on identifying disparate ideals of masculine gender among mission inhabitants, and suggest masculinity was a significant locus of both conflict and concord that helped to shape not only the missions themselves but Alta California as a whole.

[245] *Százalombatta Archaeological Expedition (SAX). Hungary: A 20-Year History of Theories, Methods, and Results of an International Project in Central Hungary*

This paper documents the theories, methods, and results of SAX, an international, collaborative Bronze Age project in the Carpathian basin. Three topics are emphasized: First is the value added by international collaboration, which creates an intellectual openness to research objectives and theoretical discussion. Second are technological transfer and creative problem-solving approach to field and laboratory research. And third is an inherent comparative agenda, for which results are seen always within broader regional, transregional, and world contexts. The project has produced 20 years of sustained research with substantial results on Bronze Age society along the Danube, a major transport route for metal.

Earley, Caitlin (University of Nevada, Reno)

[128] *Becoming Divine: Stone Sculpture and Deity Impersonation in Classic Veracruz Visual Culture*

Recent study of an hacha from Classic-period Veracruz in the collection of the Metropolitan Museum of Art reveals that hachas and palmas may have been used as costume elements in ritual performances related to the ballgame. As costume elements, these sculptures would have allowed actors to assume the identity of captives, rulers, or deities. This accords well with iconographic evidence of ballgame-related ritual performances in Veracruz, and suggests comparisons with artworks from other Mesoamerican cultures, in which rulers impersonate deities in performances associated with the ballgame. In this paper, I suggest that deity impersonation and performance are productive lenses through which to interpret ballgame-related sculpture, including yokes, hachas, and palmas. I examine a corpus of stone sculpture from Classic-period Veracruz, considering how such sculpture may have been used to invoke the presence of specific deities, and what it can tell us about the role of those deities in Veracruz culture. Incorporating comparative evidence from Central Mexico and the Maya area, I demonstrate that deity impersonation in Classic Veracruz worked to affirm political power, solicit the sanction of the divine, and express fundamental ideas about gods, the cosmos, and the continuation of time.

Earley-Spadoni, Tiffany (University of Central Florida)

[75] *Fear Written Large: Systematic Warfare and the Ancient Empire of Urartu*

This paper presents a Landscapes of Warfare case study, combining textual documentation, archeological data and GIS analysis to elucidate the effects of pervasive warfare on the development of Urartu, a highland empire that existed in the ancient Near East in the 1st Millennium BCE. Specifically, I argue that forts, fortresses and fortified settlements were strategically placed for both defensive communication as well as the systematic

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

surveillance of roads. The paper contributes to scholarly debates by showing that the evidence for systematic warfare conveyed by Neo-Assyrian texts and images stands in contrast to the primarily economic and ecological explanatory models offered to explain regional phenomena, indicating a need to integrate historical evidence with archaeological explanation. I conclude that signatures of warfare are discernible in landscape studies, and that GIS reconstructions provide powerful tools for evaluating them.

[142] *A Non-elite Termination Ritual at the Classic Maya Capital of Tamarindito*

In Classic Maya society, termination rituals were conducted to 'kill' buildings and artifacts, predominantly in elite contexts. The resulting deposits were rapidly deposited in intentionally damaged buildings. They contain dense artifact assemblages with exotic objects and refittable ceramic sherds. After burning them, the artifacts were covered with white marl. Here, we report the extensive excavation of non-elite Structure 5PS-12 at the outskirts of the Classic Maya capital of Tamarindito. Its use and abandonment date to the eighth century AD and towards the end of the site's royal dynasty. The destruction of its wall foundations and the even distribution of wallfall suggest that the building was dismantled. Wallfall and floor contained many complete tools and rare artifacts, particularly in the north annex. Refitted ceramic sherds indicate that partial vessels were broken apart and systematically distributed across the building. The lack of a marl cover and limited evidence of burning set Structure 5PS-12 apart from elite termination rituals. The artifact assemblage largely mirrors non-elite contexts and customs. Tamarindito Structure 5PS-12 attests to termination rituals as a ritual practice shared throughout Classic Maya society. Its specific characteristics manifest a discourse of social differentiation.

[310] *The Stable Isotope Ecology of Agriculture in the Eastern Maya Lowlands from the Preclassic through Colonial Periods*

The reconstruction of subsistence strategies using stable isotope analyses is integral to understanding the role of maize agriculture in the development and decline of ancient Maya society. Here we present stable carbon, nitrogen, and sulphur isotope data from over 230 radiocarbon dated human skeletal remains from western Belize dating from the Preclassic through Colonial periods (~1000 BC-AD 1700). Stable isotope data are also compared to paleoclimate proxy records to interpret the climatic contexts for changing agricultural practices. Results indicate that the Preclassic (1000 BC-AD 300) Maya of western Belize had diverse diets incorporating both maize and wild foods, which may have promoted resilience in the face of social reorganization and changing ecological systems at the end of the Preclassic period. During the Classic period (AD 300-900/1000), inter-individual isotopic variations indicate that high-status individuals had a narrow and highly specialized maize-based diet, which may have created a more vulnerable socio-economic system that disintegrated due in part to drought conditions during the Terminal Classic period. While maize continued to be a dietary staple through the Postclassic and Colonial periods, agricultural systems were impacted by severe multi-year droughts that resulted in high levels of mortality and migration across the Yucatán Peninsula.

[86] *An Examination of Circum-Alpine Lake Dwelling Botanicals at the Milwaukee Public Museum*

The lake dwelling sites of circum-Alpine Europe were discovered by the archaeological community in the mid-19th century and their artifacts were dispersed to museum collections in the United States and Europe. The Milwaukee Public Museum houses one such collection, which includes zoological material, textile fragments, tools, and carbonized botanicals and food. This paper focuses on the collection of plants and food, which come from Robenhausen, a lake-dwelling site south of Zurich. In studying this collection, there are a variety of factors that preclude traditional paleoethnobotanical methods. First, the protocol for handling carbonized botanicals from waterlogged sites is to maintain their moisture content, which is an impossibility in this context. In addition, since these excavations were carried out in the 1800s, artifacts were removed from the site without regard for stratigraphy and excavations were funded through the sale of Lake Dwelling objects, making quantification of these assemblages impossible. This paper examines the Milwaukee Public Museum's collection of botanical and food remains, given the limitations inherent in the study of waterlogged carbonized material excavated before modern paleoethnobotanical methods were developed. In addition, this paper/poster works toward the development of a methodology that can be applied to similar paleoethnobotanical museum collections.

[117] *Localizing the Narrative of Spanish Colonization in the Philippines*

The Spanish conquest of the Philippines consolidated the islands into a single political entity and subjected its diverse peoples to homogenizing colonial policies. However, indigenous responses to conquest were wide-ranging, which depended on the political and economic conditions of particular regions. To determine local patterns of responses to conquest, the Ifugao Archaeological Project (IAP) and the Bicol Archaeological Project (BAP) are working to produce localized archaeologies and histories to construct a Philippine-wide archaeology of colonialism. The IAP refutes dominant historical narratives surrounding the antiquity and nature of the highland Ifugao and their rice terraces. Rather than a people isolated from time and conquest, the IAP findings show that the Ifugao mobilized behind a concerted economic, political, and environmental restructuring as a pericolonial response to Spanish activities in the lowlands. In a similar vein, the BAP revisits historical narratives concerning the conquest of lowland Filipino groups. Informed by our work in the highlands, these archaeological investigations explore the under-documented indigenous experience surrounding Philippine-Hispanic churches and the early introduction of Spanish Catholicism.

Eche Vega, J. Eduardo (Universidad Nacional de Trujillo) and Jose Peña (University of South Florida)

[153] *La subsistencia en el sitio de El Campanario, Valle de Huarmey*

La obtención de alimentos es quizás la función de elemental prioridad que el poblador andino de la costa peruana haya tenido que afrontar desde sus inicios como sociedad pre-industrial. La subsistencia como mecanismo para el autoabastecimiento de alimentos ha llevado a las sociedades complejas a innovar ideas, tecnologías, redes de intercambio para asegurar una sobrevivencia compleja. No obstante, los diferentes aspectos tanto ambientales como sociales, políticos y económicos permitieron a estas sociedades de la costa peruana lograr cambios significativos en su dieta. Las excavaciones realizadas en el sitio El Campanario están ofreciendo nuevos datos en el comportamiento doméstico para la obtención de productos. Esta sociedad compleja, Casma (700-1400D.C), quizá haya logrado desarrollar a nivel familiar pequeñas "interrelaciones" para su subsistencia. En El Campanario, se ha logrado identificar restos de algodón, corontas de maíz, semillas diversas, restos óseos de acuñidos, restos óseos de peces, así como restos de redes de pescar. Qué tipos de actividades de subsistencia desarrollaron los pobladores de El Campanario. Qué tipo de estrategias de producción, de extracción o de intercambio realizaron.

Eckersley, Jaclyn (Brigham Young University)**[69]** *The Pottery of Beef Basin and Its Cultural Implications*

I present my completed thesis research hypothesizing that the chronology and culture of the prehistoric occupation in Beef Basin is reflected in ceramics and architecture. Beef Basin is located west of Monticello, Utah and south of Canyonlands National Park. Archaeologically it is located within the fluid boundary space between the Ancestral Puebloan and Fremont archaeological cultures. Although there has been a surge of recent research in the north periphery of the Ancestral Puebloan area, recent research in Beef Basin remains sparse. My research provides the first in-depth analysis, including neutron activation analysis, of ceramics from this region. My data set includes ceramics analyzed in the field as well as from the archaeological collection at the Natural History Museum of Utah. I discuss the results of my ceramic and architectural analysis within the context of the late Pueblo II period Chaco proliferation.

Edinborough, Marija (University College London) and Kevan Edinborough (University College London)**[88]** *Cranial and Dental Pathologies in Mesolithic-Neolithic Inhabitants of the Danube Gorges, Serbia*

We use anthropological data and a new statistical method to determine if there is a significant change to the health of people found in the Danube Gorges, Serbia (c. 9500–5500 BC), following the arrival of the Neolithic. A gross anatomical study of porotic hyperostosis and cribra orbitalia was undertaken on 113 individuals. The results show a high prevalence of porotic hyperostosis (89%) and a lower prevalence of cribra orbitalia (13%). 1308 teeth deriving from 89 individuals were examined for rate of tooth wear, caries, antemortem tooth loss and periapical lesions. Prevalence of caries increased after the Neolithic transition (6% vs. 10%). Whilst poor sanitation and various nutritional factors are probable causes of cranial pathologies, dietary practices and use of “teeth as tools” may have adversely affected dentitions of the observed individuals. Despite these new findings, rigorous statistical testing does not show a significant difference between adverse health indicators before or after the Mesolithic-Neolithic transition.

Edwards, Alexandra (University of Georgia), Robert Speakman (University of Georgia), Alice Hunt (University of Georgia), David Thomas (American Museum of Natural History) and Anna Semon (American Museum of Natural History)**[154]** *Lead Isotope Analysis of Bronze Bells from Spanish Colonization Era*

This study focuses on using analytical techniques, such as Multi-collector inductively coupled plasma mass spectrometry (MC-ICP-MS) and X-ray Florescence (XRF), to determine lead isotope levels of bronze bells from the Spanish colonization era within South Carolina and New Mexico. These values are compared both against one another geographically and against ore isotopic data within regional and possible imported geographic regions. The goal is to both discern whether these bells are locally sourced and manufactured or imported from Spain, and to create a baseline for isotopic values within the area. Preliminary studies using XRF against ores have shown that the bells recovered have been both a mix of locally sourced and imports from Spain.

Edwards, Briece (Confederated Tribes of Grand Ronde)**[331]** *Privileged Knowledge and Perspectives: Tribal Archaeology of, by, and for a Community in Oregon*

Today, the increased involvement of Tribes in Cultural resources and historic preservation has resulted in culturally specific understanding and knowledge being integrated into the shared heritage of place. This emerging shift toward Tribal inclusion in policies and understanding is also reflective in Tribal inclusion of archaeological practice and methods for reconnecting with place and practice. For the past five years The Confederated Tribes of Grand Ronde, has utilized archaeological methods in conjunction of traditional knowledge to re-connect with places of significance and bring cultural practice back to the landscape from which it has been absent for 150 years. This presentation will discuss the general policies the Tribe operates within, the perspectives of archaeological practice held in community, and the on-the-ground results case examples.

Edwards, Kyle (University of Virginia)**[104]** *Evaluating the Environmental Impacts of Colonial Settlement: A Palynological Study of La Cienega, New Mexico*

Using palynological data, this project attempts to contextualize the ecological impacts of Spanish settlement and land-use practices at LA 20,000 within a broader discussion of the long-term environmental history of La Cienega, New Mexico. This is essential because La Cienega has a deep and complicated settlement history that includes Puebloan, Spanish, and Anglo-American occupations. As a result, the ecological relationships created during initial colonial settlement must be considered in dialogue with pre-existing anthropogenic landscapes as well as subsequent environmental change. The data for this project come from a single sediment core that provides a 600-year history of La Cienega. Analyses were conducted by identifying zones within the pollen spectra and applying linear models, principal component analysis, and hierarchical clustering to verify trends within pollen assemblages. Ultimately, the results illustrate clear changes within local plant communities corresponding to Spanish settlement and long-term environmental trends not visible in site-specific samples. More pronounced environmental changes occurred in the 18th and 19th centuries, suggesting the impacts of colonial population growth and increased grazing. Moving forward, these results set the stage for further comparative palynological studies at LA 20,000 and show the efficacy of statistical analyses for identifying nuances in pollen data.

Edwards, Matt (SWCA Environmental Consultants) and Weston McCool (University of California, Santa Barbara)

[335] *Corridors of Conquest: The Nasca Headwaters during the Middle Horizon*

Global studies of ancient imperialism are beginning to focus on the importance of communication corridors (roads, canals, waterways, etc.) in the origins, formation, and expansion of empires. As the number of such corridors increase and intertwine, a network is formed on the landscape that many past empires, including—we believe—the Wari, augmented with considerable imperial investment. By constricting the number of reasonable overland routes, mountainous terrain can concentrate such imperial infrastructure along those natural corridors that simultaneously advance imperial interests (e.g., connecting allied or conquered territories while isolating others) and are suitable to the type of travel (e.g., messengers, trade caravans, armies, etc.) required to meet particular administrative, political, or economic needs. This paper reports recent results from continued research on the Wari presence in the headwaters region of the Nasca drainage in southern Ayacucho and interrogates these data through the lens of network imperial interaction.

Edwards, Richard (UW-Milwaukee) and Robert Jeske (UW-Milwaukee)

[26] *Maize's Role in the Diets of Late Prehistoric People Living in the Prairie Peninsula*

Population aggregation and shifts in material culture of the Late Prehistoric Eastern Woodlands (AD900–1100) has often been linked to the increase in the importance of maize in the human diet. In the Midwest, the development of distinct contemporaneous archaeological cultures (e.g., Oneota, Langford and Middle Mississippian) has often been connected to assumed differences in maize consumption. A commonly used model is that increased complexity in social structures result from, and/or are required for, increased production and consumption of maize. However, most comparisons among Late Prehistoric groups in Illinois and Wisconsin have relied on incompatible or incomplete datasets, or were of limited geographic scope. This paper applies the Canine Surrogacy Approach to add isotopic data about dietary profiles from Late Prehistoric sites across northern Illinois and southern Wisconsin. Coupled previously published data, a more nuanced pattern of the relationships among maize agriculture, political complexity, economic structures and social institutions emerges.

[11] *Modeling Hazard Risk, Vulnerability, Recovery, and Adaptation in Tilarán-Arenal, Costa Rica: An Integrative Approach to Disaster Studies*

The Tilarán -Arenal region of Costa Rica is one of the most volcanically active regions in the world. Despite the inherent hazard, people have occupied this region since the Paleo-Indian period (7000 B.C.). Numerous studies have explored volcanic eruptions as forcing mechanism that lead to culture; however, starting with the advent of sedentary villages during the Tronadora phase (2000–500 B.C.) until the arrival of Spanish in the 16th century, people maintained relatively small-scale, semi-horticultural societies. To explore the adaptability of the pre-historic peoples of this region, this research aims to address innovative ways people respond, recover, and mitigate disaster by dynamically modeling risk using GIS. This is important for the Tilarán -Arenal region as this is an area with variable topographic terrain and microclimates. The repeated volcanic eruptions were not uniform events with clearly demarcated boundaries but rather would have had diverse impacts even within relatively small geographic areas. In applying this methodology to the Tilarán-Arenal region, this research aims to expand beyond the pervasive holistic effects scenario that pervades disaster research.

Eguez, Natalia (Kiel University, Germany) and Carolina Mallo (Archaeological Micromorphology and Biomarkers -AMB)

[126] *Fluorescence Applied to Modern Carnivore Excrements. A Reference Collection for Archaeological Deposits*

Traditionally, coprolite identification in archaeology has been limited to hyenids, the most well-preserved and recognizable fossilized faeces, although non-hyena carnivore coprolites are also present in some Pleistocene deposits displaying a wide range of morphological variation (e.g., elongate, spherical, globular, sub-cylindrical, oval, tubular). Common micromorphological characteristics of these different excrements are the appearance of an amorphous phosphatic, optically isotropic and, a highly autofluorescent matrix, all of them related with bone ingestion and its fossilization. Here we present preliminary results from an experimental application of fluorescence techniques to measure wavelength indexes in thin section samples from a variety of different modern carnivore family excrements—canis, felis, and ursids—. The aim of this experiment is to test discrimination of proper faecal features from phosphatic aggregates and, to a greater extent, to help for a better recognition and identification of archaeological carnivore coprolites, as identification of non-hyeniid carnivore coprolites in the fossil register is vital for improving palaeoenvironmental and landscape reconstruction.

[30] *All Politics Isn't Local: The Role of Oxpemul in Classic Maya Geopolitics*

Oxpemul was one of several centers surrounding the city of Calakmul, within the region known as Uxte'tuun. Archaeological research at Oxpemul reflects occupation continuity from the Formative through Classic periods. However, hieroglyphic inscriptions indicate a late florescence in the mid to late eighth century. This paper explains this seeming contradiction from the perspective of broader geopolitical dynamics, particularly the rivalry between Calakmul and Tikal. Unlike other centers in Uxte'tuun, the dynastic history of Oxpemul is silent during the height of the Kaanul (Snake) Dynasty during the 'Three Kings Period' (AD 635–730), when Calakmul exerted direct rulership over subordinate kingdoms in Uxte'tuun. This could reflect either stagnation and decline, or a later rewriting of history following major political upheaval in the region. Following the decline of the Snake Dynasty, Oxpemul undertook a major campaign of monument construction, with kings holding both the local 'stone throne' and the enigmatic 'bat head' emblem glyph. These data indicate that Oxpemul benefitted from the decline of its more powerful neighbor and rose to regional preeminence under the aegis of Tikal. The history of Oxpemul provides an important window in the political strategies adopted by expansionist hegemonic states during the Classic Period.

[282] *Displacement and Burials in Wartime Acholiland; Archaeological Surveying and Ethnographic Research in Northern Uganda*

A multi-subfield anthropological research team from the University of Tennessee Knoxville has been conducting fieldwork in Acholiland since 2014 in order to analyze how improper burials are affecting the cultural and geospatial reality of post-war Northern Uganda. The project has primarily involved ethnographic research; however, archaeological surveying was introduced in 2016 for the purpose of locating and documenting wartime burials. The concerned burials are related to the 1987 to 2006 war between the Ugandan Government and the Lord's Resistance Army (LRA) rebels in which the local tribal population, the Acholi people, were subject to attacks from both sides during the war. Many civilian wartime burials are located in Internally Displaced Person's (IDP) camps, mass graves, or as skeletal surface scatters throughout the landscape. These forms of burials constitute a violation of traditional Acholi practices, which require graves to be placed on ancestral land in individual grave plots. Fieldwork conducted links the burials to spiritual disturbances as well as subsistence impediments within Acholi communities. Archaeological surveying provides evidence of the displacements and the violence committed against the Acholi during the war and survey reports may assist in establishing the location of burials for future exhumation and repatriation to ancestral lands.

[154] *Get the Lead Out! Establishing a Global Database for the Elemental Analysis of Roundball Ammunition*

Archaeologists with the LAMAR Institute and the National Park Service collaborated in an ambitious undertaking to characterize the elemental composition of round ball ammunition from early historic sites. Researchers used portable X-ray fluorescence (pXRF) technology to sample the elemental content of over 500 round balls from more than 17 different archaeological sites in eastern North America. These include samples from Native American and Euro-American settlements as well as French and Indian War, Revolutionary War, Indian Wars and War of 1812 sites. These preliminary data demonstrate that Antimony (Sb) and Tin (Sn) are very important elements for measuring differences in round balls. One goal is to elevate the diagnostic value of round ball ammunition so that we can determine where the lead came from, who was firing the bullets, and how access to lead varied over time. The pXRF information shows promise in identifying additives or contaminants introduced and military association. If combined with element data from lead ore sources, baseline information can be developed for comparison among battlefield assemblages and incorporated into a global dataset with the purpose of better understanding the geographic distribution of military supplies and military strategy at macro global and regional levels.

Elliott, Hannah (Binghamton University)

[300] *Camelid Exploitation at the Middle Horizon Site of Huari*

Excavations at Huari, the urban center of the Wari state in Peru's Ayacucho Basin, have uncovered well preserved faunal remains, with the majority belonging to native camelid species. While knowledge pertaining to camelid exploitation by the Wari people has been enhanced in recent years through excavations at sites such as Conchopata, little is known about camelid usage at the site of Huari. In this paper, I use osteometric analysis to identify specimens to the species level and to examine the distribution of camelid species using the faunal remains recovered during the 2017 excavations of Patipampa, the domestic sector located within the Huari capital and occupied during the Middle Horizon (AD 500–1000). The results of this preliminary analysis provide valuable insight regarding the usage and management of multiple native camelid species at Patipampa, shedding light on Wari economic and subsistence practices.

[161] *Evolution of the Anthropocene*

Why did humans, unlike any other multicellular species in the history of the Earth, gain the capacity to shift Earth into a new epoch of geologic time, the Anthropocene? Here, a general causal theory, sociocultural niche construction, is presented to explain long-term changes in Earth's ecology driven by societal dynamics across human generational time through sociocultural evolution of subsistence regimes based on cooperative ecosystem engineering, social specialization, non-kin exchange and energy substitution. It is these unprecedented anthroecological change processes that have enabled both the long-term upscaling of human societies and their unprecedented transformation of Earth. Regime shifts in human sociocultural niche construction over thousands of years can explain the sustained transformative effects of human societies on the Earth system. A global archaeology of the Anthropocene, combining both empirical and modelling approaches to reconstruct and examine the mechanisms underlying long-term evolutionary

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

regime shifts in sociocultural niche construction, are the key to gaining a deeper scientific understanding of both the past and future prospects for humanity and nonhuman nature.

[240] *Ancient Landscapes of Amazonia: A Study of Pre-Colonial Processes and Contemporary Use at Macurany, Brazil*

We analyze settlement organization and landscape modification at Macurany, a pre-Colonial terra preta site on the Middle Amazon River in Parintins, Brazil, within local and regional contexts. Pre-colonial land modifications dot the contemporary landscapes of Amazonia. Many such landscape features, such as anthrosols, elevated platforms, mounds, ramps, and riverine ports, are used today by contemporary inhabitants of Amazonia. New data gathered at Macurany reveals that ancient Amerindians altered the local landscape, creating ports and anthrosols. Topographic data sheds light on pre-colonial human-environment interactions and settlement organization at Macurany. Similarities with sites in the Central Amazon and Lower Amazon regions include anthrosols and ports, and possibly ring middens; Macurany is unique in the frequency and size of ports. Preliminary results suggest site organization was decentralized due to the spatial distribution, frequency, and size of the ports and depth and distribution of terra preta. Today, these ancient landscape features are managed and used by rural smallholders; although they may not knowingly engage with the past through these actions, they constitute a way of interacting with the material remains of the past. This analysis contributes toward an understanding of pre-colonial land modification and contemporary use of ancient landscape features in Amazonia.

Ellison, Leigh Anne (The Center for Digital Antiquity) and Francis McManamon (The Center for Digital Antiquity)

[231] *Sharing Curation Expertise and Space for Digital Archaeological Data*

Archaeologists are busy all the time. Often stretching to meet a variety of professional obligations. CRM and government agency archaeologists are among the most stretched given the different directions that pull upon their professional lives. Scholarly pursuits; administrative, bureaucratic, regulatory, and public outreach responsibilities related to physical sites and collections, easily fill or over-fill their schedules. Now the care and curation of digital data adds to the piling up of responsibilities. Digital data and the technical tools that create and enable its use present many opportunities for research and resource management. Digital technology makes data easily and widely accessible, sharing information, and enabling the creation of new interpretations and increase in overall knowledge. But, digital data must be curated or it will be lost. Digital curation doesn't just happen, it requires attention, special expertise, and long-term commitment to the curation enterprise. The Digital Archaeological Record (tDAR) is a repository where individual archaeologists, agencies, and organizations deposit their data (e.g., documents, images, data sets, and more). Once deposited in tDAR the data are curated by digital archival specialists who focus on ensuring the data are protected, made available as the depositor determines, and kept available for use and re-use.

[27] *Quantifying Inequality among Ancestral Pueblo Households*

Recent studies of household inequality in the central Mesa Verde region (CMV) and Chaco Canyon indicate that the degree of wealth inequality among ancestral Pueblo households remained relatively low in the CMV even as it increased dramatically in Chaco from the mid-800s through the early 1000s, based on Gini coefficients calculated on household floor area as a proxy for wealth. Beginning in the late A.D. 1000s, however, Gini coefficients increased among CMV households as well, reaching values as high as those for Chaco Canyon, and above the median for a recently compiled worldwide sample of prehistoric agriculturalists. Here we expand this analysis by calculating Gini coefficients through time for households in the middle San Juan and add some comparative ethnographic data from the Hopi pueblo of Orayvi (late 19th/early 20th century).

Elquist, Ora (Public Archaeology Laboratory, Inc.)

[294] *A Woman's Retouch: Lithic Recycling at the Strow's Folly Site (Locus 3), Wareham, Massachusetts*

Locus 3 of the Strow's Folly Site (19-PL-1161) in Wareham, Massachusetts represents a small, temporary camp. Archaeological investigations at the site resulted in the recovery of an unusual artifact assemblage believed to be associated with a single component dating to the Middle Woodland Period. Evidence for hunting was notably absent, and the presence of processing tools and relatively dense deposits of ceramics indicate that women were present at the site. Domestic activities associated with women are typically more apparent at sites of a more residential nature. Previous studies indicate that lithic assemblages associated with women's activities are oriented towards use of processing tools and the production of expedient flake tools. The site assemblage does not contain expedient tool forms, but does contain a number of reworked older diagnostic tools suggestive of a strategy of expedient tool production. Such tool recycling may be an indicator of women's activities that are otherwise less archaeologically "visible" at smaller, more ephemeral temporary campsites.

[188] *A Faunal Analysis of the Kirshner Site (36WM213)*

The Kirshner Site (36WM213) is a multi-component site in South Huntington township, Westmoreland county, Pennsylvania that contains two Middle Monongahela villages. Relatively little is known about Monongahela use of animals. Fortunately, good faunal preservation has made zooarchaeological analyses of materials from this site possible. Identifying and analyzing these faunal remains with respect to taxa and skeletal elements, as well as human and animal modifications, provides important new information. The distribution of faunal remains across the features of the site and its two components has been examined, as they have implications for relationships between the site's inhabitants and their environment. These data provide insights into the nature of this site and the activities of its occupants. Comparisons with other faunal studies, like those done on zooarchaeological materials from other Middle Monongahela sites, including the Johnston Site (36IN2) and the Hatfield Site (36WH678), further expands the understanding of the Kirshner Site and the Middle Monongahela tradition.

[92] *Evaluating a Stratified, Prearchaic, Open-Air Site in Grass Valley, Nevada*

Current views of the Prearchaic draw heavily from investigations of sites near pluvial lakes in the eastern and western Great Basin. The record from the Central Great Basin remains impoverished, largely due to the limited number of stratified archaeological sites containing well preserved material suitable for faunal analysis and radiocarbon dating. Recent investigations of an open-air site (26La4434) along the northern shore of Pleistocene Lake Gilbert in Grass Valley, revealed a buried deposit with preserved organic material, obsidian artifacts and Prearchaic time-markers. Here we report on ongoing investigations examining the stratigraphy, chronology, assemblage, and faunal remains recovered from the site. While faunal remains reflect

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

procurement of a broad array of prey including waterfowl, large mammal hunting was clearly an important activity. The site appears to represent at least two spatially discrete, single component campsites positioned to facilitate an intercept hunting strategy, as well as access to wetland habitats.

[299] *Relaciones Sociales y Medioambientales en Selin Farm a través del Análisis de su Conjunto Arqueomalacológico*

El motivo al cual se llevó a cabo la presente tesis es para adquirir conocimientos sobre las interacciones humanas con su medioambiente de las sociedades prehispánicas que vivieron en el Noreste de Honduras, por medio de un análisis de conchas de moluscos excavadas en el año 2016. Estas investigaciones son parte del Proyecto Arqueológico Regional Islas de la Bahía (PARIB). El material arqueomalacológico proviene del sitio arqueológico Selin Farm, ubicado en el departamento de Colón en las cercanías de la ciudad de Trujillo. Este sitio consiste de aproximadamente 22 montículos levemente organizados alrededor de una plaza central y de acuerdo a estudios previos se determinó que el sitio fue ocupado continuamente desde el 300 al 1000 d.C. Los montículos están compuestos en su mayoría de cerámica y conchas de moluscos, con algunos restos óseos y líticos. Se recuperaron 73 especies de bivalvos y gasterópodos y su análisis sugiere que los habitantes del sitio tenían un alto conocimiento de diversos ambientes a través del tiempo. La mayor parte de las presentes especies fueron explotadas para su consumo y en algunos casos el material adquirió un valor social sobre sus desechos orgánicos.

Emerson, Patricia (Minnesota Historical Society) and Nancy Hoffman (Minnesota Historical Society)

[138] *Technical, Political and Social Issues in Archaeological Collections Data Management*

Managing collections means ensuring the data about them are useful, available, and accurate. In addition to the technical aspects of data management, there are layers of political and social structure that direct the construction and use of collections data.

The Minnesota Historical Society employs a set of data standards that allows us to gather electronic cataloging data from a wide community of archaeology researchers depositing collections at MNHS. Though met with initial resistance, these standards have facilitated publication in Open Context as linked open data. Furthermore, institutional discussions concerning Creative Commons licensing and the cultural sensitivity of collections data were precipitated by publication.

Similarly, as Minnesota has prepared to roll out an electronic sites database, much of the development has dealt with defining standards for terminology and classification, highlighting the role of social agreement in data management. Establishing the technical requirements was challenging. Finding a way to accurately represent existing data in a useful, searchable manner has been equally challenging.

[217] *ZooArchNet: Linking Zooarchaeology Data to Archaeological and Biodiversity Information for Big-Data Archaeological Research*

Re-use of large zooarchaeological datasets offers new ways of tackling the grand challenges of archaeological science. But big-data research requires integrating multiple zooarchaeological datasets while maintaining the biological and archaeological details needed to contextualize the faunal information. Accessing and combining these data remains difficult despite the increasing use of open-access archaeological data publishers and archiving services, and the open-access, interoperable biological data of the global biodiversity data network (GBIF and associated worldwide nodes). We do not yet have a means to effectively integrate data among zooarchaeological, biological, and archaeological databases.

Here, we present ZooArchNet—a bridge between zooarchaeological data and the biological and archaeological open-access networks that will allow us to contribute meaningfully to big-data archaeological research. ZooArchNet is a collaborative project that spans expertise in zooarchaeology, archaeoinformatics, and biodiversity informatics and that links zooarchaeological data to the biodiversity distributed data network and the many publishers and archives of the developing archaeoinformatics infrastructure. We discuss the benefits and challenges of such a system based on our current work combining several millennia of Florida zooarchaeological data with Florida biodiversity data from the biodiversity network (represented by VertNet) and site-based archaeological context through links with archaeoinformatics (represented by Open Context).

[89] *Hide Processing in Prehistory: An Experimental Approach to Prehistoric Tanning Technologies*

The importance of skin processing technologies, in the history and dispersal of humankind around the planet cannot be overstated. This presentation outlines a systematic analysis methodology targeted at this specific material type, with the goal of determining the tanning technologies in use during prehistory, from extant archaeologically recovered processed skin objects. The methodology is a product of macroscopic and microscopic observations of a sample reference collection containing over 200 samples. Which were used to produce a database of defining characteristics and tendencies for each of six tannage types; wet and dry scrape brain tan, bark tan, alum taw, urine tan and rawhide. The sample collection is made up of twenty-two economically important species from both Europe and North America, as well as a collection of well used clothing and utilitarian items, made from traditionally processed skins. This research has demonstrated that archaeologically preserved objects made from processed skin can provide information about the tannage technologies in use prehistorically, as well as more detailed information such as manufacturing sequences and the conditions of use to which the object was subjected.

[22] *Iroquoian Chunkey*

Iroquoians played the hoop and pole game in Historic times, but there are no descriptions of Iroquoians playing chunkey, a variant of hoop and pole that makes use of a rolled stone disk. This has led to a widespread belief that chunkey was not played by Iroquoians. However, a symmetrical stone disk was recovered from the Eaton site, a mid-sixteenth century Erie village. Other researchers report stone disks from the following groups: Neutral (Bill Fox), Erie (Joshua Kwoka), Seneca (Martha Sempowski), Cayuga (Kathleen Allen), Mohawk (Wayne Lenig), and Susquehannock (Jim Herbstritt).

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

While none of these disks resemble the highly polished discoidals associated with Cahokia and related Mississippian centers, stone disks from Iroquoian villages could have been used in the game of chunky. The context in which chunky may have been played and its related symbolism is discussed.

Englehardt, Joshua (El Colegio de Michoacan) and Michael Carrasco (Florida State University)

[128] *Transformation of the Gods: Symmetry and the Construction of Mesoamerican Deity Systems in the Middle Formative*

This paper explores theoretical and methodological issues associated with the etic conceptualization of Mesoamerican deity systems and the identification of individual supernaturals in cross-cultural contexts. It critically focuses on previous classificatory systems of Olmec deities. Iconographers often identify individual deities on the basis of defining attributes or material accoutrements, frequently extending these identifications across contexts (as in Covarrubias' famous "evolution of the Mesoamerican rain god"). However, building in part on Eva Hunt's work, we find that the conflation or sharing of attributes among Formative period entities casts doubt on the validity of classificatory schemes that fail to adequately consider the fluidity of deities or their relationship to that which they personify. This "conceptual overlap" in Olmec art may lead to confusion, misidentification, or overly simplistic interpretations. It is argued that the construction of deity systems should consider such conceptual overlaps in representational art, in order to more fully unpack the multiple, non-hierarchical levels of significance imbricated in images of gods and supernaturals, as well as the dynamism of such representations within larger symbolic complexes. A range of data from various contexts are considered in an effort to evaluate the utility of cross-cultural analogies in comparative iconography.

[269] *An Examination of Food Storage Patterns in the Northern Southwest*

The purpose of this project is to identify patterns in Ancestral Puebloan food storage across the northern Southwest between AD 950 and 1300. Using legacy data from the Grand Canyon, I examine characteristics of food storage in canyon environments and then compare the results to southeastern Utah. To combat harsh environmental conditions and secure reliable resources, ancient people stored food in sealed masonry structures, or granaries, protected in alcoves high on canyon walls. These understudied archaeological features can be explored to learn vital characteristics of daily life and long-term subsistence practices. Although food storage is found within Ancestral Puebloan communities, many granaries are situated at great distances from habitation sites, in difficult to access-areas in canyon country. Using a foundation of Human Behavioral Ecology, I evaluate variability in both location and construction style of granaries. Variability of food storage practices adds to the conversation of complex human interaction within and among other human groups, with the environment, and mobility strategies across the northern Southwest.

Enloe, James (University of Iowa)

[124] *Spatial Analysis in the Woodland: Foraging Behavior in Sedentary Agricultural Societies*

Spatial analysis has the potential to yield substantial evidence about the organization of economic and social interactions of prehistoric archaeological sites. There is a growing body of ethnoarchaeological research that allows robust interpretations of spatial patterning in the open-air campsites of mobile peoples. The very fact that such sites may represent short-term, low density occupations means that the configuration of labor and activities may actually be clearer than in longer-term open-air or architectural sites, where accumulated activities create more ambiguous palimpsests. The content and configuration of occupied surfaces offer not only information about activities carried out there, but also the potential for interpreting the role of site usage within a larger settlement pattern. Even otherwise sedentary agricultural societies may have mobile components that fulfill other roles in their settlement and subsistence systems. An example from Woodpecker Cave, a Late Woodland rockshelter in Iowa, can be contrasted with the Paleolithic open-air sites of Pincevent and Verberie to give insight on the commonalities of behaviors and adaptive poses of site occupants identified through spatial analysis.

Ensor, Bradley (Eastern Michigan University)

[19] *The Western Chontalpa: What's in the Archaeological "Black Hole" of the Mesoamerican Gulf Coast?*

The Mesoamerican Gulf Coast figures prominently in grand schemes of interregional population interactions from Olmec to contact eras. However, most models of exchange, migrations, or identities rely on samples from Southern Veracruz, the Usumacinta, and the southern Isthmus without considering the vast Chontalpa in-between. This paper synthesizes new and old data on sites, intrasite spatial organization, and material culture from the Mezcalapa Delta for a synopsis on prehispanic settlement history, settlement patterns, and interpretations on intra- and interregional identities in the Western Chontalpa. These sources suggest low populations during Olmec times, growth in the Late Formative, a hiatus in the Early Classic, and significant growth in the Middle-Late Classic when the first states appeared. The greatest political centralization was in the coastal-levee transition zone, without significant incorporation in trade networks, suggesting a tributary economy focused on diverse local resources. The people of the region cannot be viewed as Olmec, Chicanel, Maya, Nahua or their subjects. Instead, changing local to interregional layers of cultural identities are interpreted for Formative to Late Classic times, which in the latter were variably negotiated by class. Implications on modeling broader patterns of exchange/interaction spheres in the Gulf Coast are discussed.

Eppich, Keith (Collin College)

[258] *The Function of Ceramic Analysis in the Maya Lowlands*

Why study ceramics at all? What is the point of analyzing hundreds and thousands of small, broken pieces of pottery? This paper explores these, and other questions, within the context of Classic Maya civilization. Too often, it seems, ceramic analysis is used as a loose chronological framework, used solely to construct broad frameworks of relative dating. These frameworks are then applied to archaeological assemblages, placing them within chronologically bounded "ceramic complexes" and geographically bounded "ceramic spheres." Then most ceramic analyses end. This paper argues that this is the point where real ceramic analysis should begin. Ceramic complexes should be broken down into distinct centuries and even individual decades, if possible. Ceramic analysis can be used to create absolute chronologies. Ceramic spheres can be subdivided, revealing the exchange of material culture between individual cities, communities, and households. Thus, ceramic analysis can shed significant light on cultural, social, economic, and political ties on such material exchanges. Such analysis can be shown by examining the recent work at El Perú-Waka', where internal social, political, and economic ties are shown, within the context of an absolute chronology.

[177] *Early Iron Metallurgy in the Caucasus: Filling in a Technological "Missing Link"*

In the study of technological transformations, there is often much discussion of how innovations are conditioned by earlier systems of technical knowledge. Identification of transitional features is often challenging, however, particularly for questions about the origins of iron smelting and its relationship with copper-base metallurgy. This paper discusses some unusual technological features in iron metallurgical debris (circa 8th-6th c. BC)

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

from a fortified hilltop site in the Caucasus, shedding light on the early development of iron technology. Macroscopically and microscopically, the slags are in most respects classic iron smelting slags. Larger fragments show the classic planoconvex shape of smelting hearth bottoms, and the slag microstructures are dominated by wüstite (FeO) and small particles of metallic iron. However, analysis of metal inclusions trapped within these slags shows that they contain small amounts of copper and arsenic. These results suggest that the iron forged in this workshop was smelted from the oxidized upper zone (gossan) of a copper-bearing polymetallic deposit. If so, this would provide the first direct evidence of a much-discussed theory that iron smelting emerged from experimentation with copper ore deposits, linking the invention of iron with earlier copper-base metallurgical traditions.

[116] *Flood Regimes, Earthworks, and Water Management in the Domesticated Landscapes of The Bolivian Amazon*

Exploitation and control of wetland resources was a major strategy of early sedentary peoples in many areas of the world. In some cases, indigenous knowledge about flood pluses and water dynamics and anthropogenic transformation of waterscapes increased to the point where some wetlands were transformed into domesticated landscapes. Analysis and interpretations of relevant radar (TerraSAR-X, ALOS SAR-X, Sentinel-1), multispectral (Landsat ETM and ETM+, ASTER), DEMs (SRTM, ASTER) satellite and aerial imagery is used map and understand the distribution, volume, and movement of water through anthropogenic landscapes in the Bolivian Amazon. Pre-Columbian peoples built numerous earthworks including raised fields, causeways, canals, fish weirs, and fish ponds within the seasonally inundated savannas and wetlands of the region. Our research attempts to show that these earthworks were created to capture, control, and manage large volumes of water, and as a result could produce, capture, and sequester carbon, aquatic/alluvial organic sediments, and aquatic food resources.

[66] *Burial Plots: Finding Theatre in the Thanatology of Colonial North Coast Peru.*

Spain's invasion of the Andes initiated a social drama unprecedented in the experience of the Andean natives. Spanish and Spanish-conscripted native chroniclers wrote extensively about Inca pageantry, spectacle, and ritual, and hastily attributed pagan belief to performances they witnessed or heard about. With equal haste, the Spanish appropriated performance as means of introducing and enforcing Christianity. In this paper, I treat performance as the central feature of Andean Colonial transition. Performance may be considered an ephemeral social feature but fortunately, in mortuary performances (dealing with death and treatment of the body); there are many theatrical elements that survive in mortuary contexts (e.g., staging, setting, costumes, make-up, props, and choreography). Archaeology, history, and ethnographic observation together illustrate that performance has alternately established, celebrated, or subverted Andean power relations during hundreds of years. Mortuary performances are especially excellent commentaries about the religious climate of Colonial Peru. I argue that the Colonial Spanish saw performance as evidence of belief and employed performance in the effort to transform pagan belief to Christian belief. Ultimately, communities, religion, and performance itself were transformed; integrated and reintegrated into dynamic personal and public expressions.

[63] *Cultural Heritage-Based Reminiscence Sessions in Open-Air Museum Settings to Enhance Well-Being of Persons with Dementia*

Background: The 3-year Active Ageing and Heritage in Adult Learning project (2014–17, EU Erasmus+ program) involved five open-air museums in Sweden, Denmark, Norway, UK, and Hungary. Sessions were conducted in venues matching the era of clearest memories for participating older persons with dementia (PwD), e.g., 1940-ties apartment. University researchers (Sweden, UK, & Denmark) evaluated the project. This presentation describes qualitative results.

The objective was to investigate if/how experiences of participating in reminiscence sessions held in open-air museum venues affected wellbeing in PwD.

Method: PwD (n 129) were interviewed individually or in groups. Third-person perspectives were gathered from carers accompanying PwD (n 75), and session facilitators (n 24) using questionnaires that included space for free-text responses. Interviews and free-text responses were analyzed with content analysis.

Results: Both museum venue and object handling stimulated PwD reminiscence.

Evidence strongly indicates that PwD wellbeing (denoted e.g., by showing pleasure, humour, creative self-expression, interest, sustained attention, and a sense of connection with others) was generally promoted through participation in museum-based reminiscence sessions.

Conclusion: Museum-based reminiscence sessions were successful for enhancing PwD well-being at the time of the session. Further research is needed to explore and compare long-range effects of sessions.

[241] *Cherokee-Spanish Interactions in the Middle Nolichucky Valley, Tennessee, Revealed by Geophysics and Targeted Excavations*

The Middle Nolichucky River in northeast Tennessee has been largely overlooked in Mississippian prehistoric narratives, but recent geophysical surveys and archaeological excavations at the Cane Notch site document a mid- to late- 16th century Cherokee Town with evidence of Spanish contact. Our multimethod approach includes sitewide magnetometry and a large portion covered with ground penetrating radar (GPR). Excavation of a house floor unearthed a rich assemblage of glass trade beads and pottery, and was dated to the mid- to late- 16th century. The house had burned rapidly and several pots appear to have been dropped during a hasty abandonment. A probable Spanish arquebus lead shot ball in the roof fall and other contact-era artifacts suggest contact with the Spanish. The site was featured in a documentary film, *Secrets of the Nolichucky River*, in 2017. A

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

host of other pre-contact and contact-era sites are known along this stretch of the Nolichucky, one of which is the focus of our current work. Magnetometry, GPR, and electromagnetic induction (EMI) survey at Runion reveal a large village with multiple housing clusters, a large public structure, and possible fortifications. Excavations will take place at Runion this summer.

[201] *"Fair Greece, Sad Relic:" Greek Archaeology at the Intersections of Power*

In this paper, I address the challenges faced by Classical archaeologists who wish to practice engaged archaeology in Greece. Two aspects of Classical archaeology's disciplinary history are particularly important for understanding the relationship between Greek archaeology (as practiced by American archaeologists) and modern Greece: first, Greek archaeology's early and close relationship with the ideology of Hellenism and, second, the ways in which archaeological work in Greece has intersected (or not) with ethnographic studies of Greek communities. I then explore some of the current institutional factors (many of them legacies of the discipline's trajectory) that either inhibit or fail to actively encourage collaborative archaeological practice in Greece. For archaeological projects supported by U.S. academic institutions, these include the academic position of Greek archaeology within Classics departments and the dismissal of Modern Greek as a legitimate field of study for Classical archaeologists. Finally, I suggest potential future directions for engaged archaeologies of Greece that directly confront this disciplinary legacy. How can Classical archaeologists both avoid uncritically promoting narratives of Classical Greece as the "birthplace of Western civilization" and actively advocate for collaborative practices within an academic power structure that is often unsympathetic to these concerns?

Ervin, Kelly (Washington University St Louis)

[156] *Parsing out the Pace of Occupation at Poverty Point*

Built by hunter-gatherers, the Poverty Point UNESCO World Heritage site is a three-square-kilometer earthwork complex of two massive mounds, several conical and flat-topped mounds, and six elliptical ridges enclosing a 17.4-hectare plaza. The Late Archaic Poverty Point culture (ca. 3800–3000 cal. B.P.) exhibited an unprecedented form and scale of social organization indicated by non-local material measured by the metric ton and the construction of extraordinary monumental architecture at a scale that surpasses most monuments built by North American agriculturalists. Numerous sociocultural models have proposed explanations for Poverty Point social organization. Previous investigations led some researchers to suggest evidence for a large, socially stratified permanent population where the ridges served as platforms for residential structures. Others claim the data do not support the presence of social hierarchy, year-round occupation, or houses on the ridges. Recent excavations during 2017 were undertaken within the earthen ridge complex. Fundamental goals of the project were to apply modern geoarchaeological techniques to obtain high-resolution stratigraphic and chronologic data for assessing the pace and timing of ridge construction and occupation. This type of geoarchaeological analysis within large monumental earthworks provides necessary information to understand the history of political, social and economic organization at Poverty Point.

Eschbach, Krista (Arizona State University)

[271] *Casta, Class, or Race? Social Transformations at the Colonial Port of Veracruz*

The social structure of colonial New Spain underwent large-scale transformations following the Spanish conquest. Changes in social categories of identification evolved through an interplay between religious and civil administrators—who attempted to control colonial populations—and local social relationships of interpersonal interaction. I examine social relations and changing categories of identification at the colonial Port of Veracruz. Throughout the colonial period, Veracruz served as a central gateway for African slaves entering New Spain. Subsequent biological and cultural mixing with European colonists and native peoples led to a substantial population of people of mixed African descent. Archaeological and historical investigations of Afromestizo neighborhoods provide information on local social reproduction and transformation—such as through the production and consumption of material culture, the use of urban space, and the formal application of social categories. These data provide an opportunity to begin to evaluate the transformation of casta categories, the development of economic classes, and the role of race among pluralistic African descendant communities in an urban setting.

Esdale, Julie (Colorado State University, CEMML)

[332] *Interdisciplinary Studies at Delta River Overlook Site, a Late Pleistocene to Late Holocene Multicomponent Site in Central Alaska*

Recent large-scale excavations at Delta River Overlook in the middle Tanana River basin yielded 12 components dating from the onset of the Younger Dryas (~12,860 cal BP) to the later Holocene (2300 cal yr BP). Well preserved faunal assemblages, including bison, are present in multiple components, with economic transitions evident at ~6000 cal yr BP. Several features and activity areas were analyzed, including ochre-rich processing areas. Over 20,000 lithic items have been analyzed, primarily from the 11,500 and 10,900 cal BP components, indicating multiple lithic reduction behaviors from cobble testing to tool maintenance. We present interpretations of site function, geological context, radiocarbon dating, component delineation, lithic, faunal, and spatial analyses that track technological and subsistence.

[252] *Ritual and Political Landscapes of the Preclassic Maya: A View from the Cival Region*

The link between Lowland Maya ritual and power relations during the Preclassic period has been so far approached primarily through iconographic, burial and artifact data at the local scale. Very little evidence exists linking notions of political authority, ritual practices and landscapes at the regional level. Recent survey and excavation data from the Cival region of Northeastern Peten, reveals a vast and complex settlement pattern. The Preclassic Maya city of Cival was surrounded by a network of ceremonial centers with monumental architecture. Through an analysis of architectural forms and functions, relative sizes and orientations, links are being identified and a model is proposed for regional political integration during the Late Preclassic period.

[78] *Submerged Landscapes and Shipwrecks: The Fractioning of Marine Archaeology(?)*

The study and management of submerged paleolandscapes is an extension of terrestrial prehistoric archaeology, but due to the location of the sites on now submerged lake margins and continental shelves, it is typically lumped into a general category of "underwater" or "marine" archaeology. Marine archaeology has been, and in many ways, still is, strongly associated with shipwrecks. In some ways, the lumping of shipwrecks and submerged landscapes into one category is beneficial, since many of the same tools, methods, and issues affect both submerged landscapes and historic resources. However, key differences are also present in both site distribution (shipwrecks are by nature portable sites) and theoretical approaches to identifying sites and investigating them. While there are clear differences between shipwrecks and submerged landscapes, is there a danger in further fractioning their practitioners? This paper will explore some of the benefits and highlight the pitfalls of treating all inundated sites as "marine archaeology".

[175] *The Past, Present and Future of Archaeological Lidar: A View from Southeast Asia*

In the last five years multiple campaigns of airborne laser scanning (or lidar) have been conducted by archaeologists over Angkor-period sites in Cambodia and neighbouring countries such as Thailand. Analysis of the lidar data is still underway and will continue for many years both in the lab and on the ground, but some key outcomes have now been published, and it is already clear that the advent of lidar represents an important milestone in the history of archaeological remote sensing. This presentation will locate lidar within the historical context of mapping and surveying the Angkorian world; summarise archaeological lidar projects in Cambodia and beyond that are completed or ongoing; present new tools and techniques that have been developed for analysis and interpretation; and discuss some key limitations and opportunities that arise as a result of the technology. The paper will canvas the potential for new acquisitions and comparative studies across the region in light of new developments in UAV technology, lidar miniaturisation, and the imminent deployment of high-resolution spaceborne lidar systems, and explore how research data might be integrated into global repositories of archaeological topography.

Everett, Genevieve (Indiana University of Pennsylvania, Department of Anthropology)

[334] *From Field School to Graduate School: How One Public Archaeology Program Has Made It All Possible*

The Paleoindian Period of New Hampshire has been studied extensively, particularly in the White Mountains. Volunteers and avocational archaeologists from the summer field school known as the State Conservation And Rescue Archaeology Program (SCRAP) have excavated several of the known Paleoindian sites in northern New Hampshire. Accessibility to the data recovered by SCRAP is an important aspect of this program, allowing many scholars to complete theses and dissertations using existing collections. This paper outlines how participation in the SCRAP field school has been beneficial to the author's academic career, including her current Master's thesis. The purpose of this thesis is to produce a spatial and statistical analysis of the artifact assemblage from excavation block K at the Potter Site (27-CO-60) located in Randolph, New Hampshire in comparison with the Jefferson VI (27-CO-74) salvage block in Jefferson, New Hampshire. This comparison not only examines the spatial relationships within one Paleoindian site (27-CO-60), but also helps the author make inferences about the similarities and differences between two Paleoindian sites in close proximity. Public archaeology programs such as SCRAP are a valuable part of North American Archaeology, without such programs this and other scholarly works would not be possible.

Everhart, Timothy (University of Michigan Museum of Anthropological Archaeology)

[190] *Approaching Monument Diversity in the Woodland Societies of the Central Scioto Valley*

The Woodland societies of the central Scioto Valley are renowned for various aspects of their ceremonial practices. Among the better known are craft production of ornate works from exotic materials and the erection of vast monumental landscapes. Those construction practices led to monuments with an incredible diversity of form, scale, and organization. This variability is yet difficult to explain, with the existing explanations differing widely and being inter-related with various other social and ideological factors. Additionally these explanations are based to some extent on limited and biased data sets. Alongside data collected from pre-existing museum collections, recent excavation of an earthen enclosure at the Steel Group offers new data to examine this question.

[299] *Los Recursos Culturales del Pasado en la Zona del Oriente: Represa Hidroeléctrica Patuca III*

En el marco de los estudios necesarios para obtener la licencia ambiental del Proyecto Hidroeléctrico Represa Patuca III se llevó a cabo el estudio arqueológico del área en donde se iban a realizar actividades de construcción de infraestructura. Se desarrolló el reconocimiento y prospección arqueológica sin pozos de prueba en 2007 y 2012 en la zona de embalse del proyecto hasta la cuota de 287 metros de altitud y el trayecto de la línea de transmisión. Éste se realizó por secciones en la primera y segunda terraza aluvial de los ríos Guayambre y Guayape hasta la confluencia de ambos con el Río Patuca, donde se construyó la cortina de retención. Los recursos culturales del pasado prehispánico que resultaron del reconocimiento y prospección arqueológica fueron una variedad de sitios y dispersiones de material lítico y cerámico de superficie. Se registraron cuatro sitios arqueológicos en la zona del embalse; Pueblo Viejo, La Sabana del Pueblo—con estructuras parcialmente visibles en la zona que va ser inundada—y los sitios Los Encuentros y Las Corrientes en la zona de influencia directa. Los sitios fueron mapeados y delimitados por recorrido de superficie, considerando la concentración y dispersión de material de material arqueológico.

[257] *The Nature of Leadership and Community Cohesion at Postclassic Xaltocan, Mexico*

Immediately after the consolidation of the Aztec Empire, Itzcoatl, the king of Tenochtitlan, ordered the destruction of the ancient codices from newly incorporated territories. By erasing these alternative histories, Itzcoatl paved the way for the construction of an official imperial history that bolstered the political aims of Aztec leaders. Nearly a century later, a second wave of erasures occurred when Spanish conquerors destroyed indigenous books and idols in an effort to eradicate blasphemous religious beliefs. Although indigenous accounts were eventually rewritten, largely at the hands of Spanish-educated indigenous elites, the diverse histories from Basin of Mexico polities that pre-dated the formation of the Aztec Empire remained lost. Only recently have archaeological investigations begun to demonstrate the diversity that characterized the Postclassic Basin of Mexico. Recent archaeological excavations at Xaltocan recovered the remains of successive structures that once housed Xaltocan's Postclassic political leaders. The structures and their associated artifacts reveal the distinctive political strategies utilized by Xaltocan's leaders. New revelations concerning the nature of leadership at Xaltocan, combined with other archaeological evidence from across the site, contradict or call into question certain long held historical assumptions about how Basin of Mexico polities functioned on the eve of the Aztec conquest.

Farahani, Alan (University of California, Los Angeles)

[4] *Change and Continuity in Agricultural Production in Iraqi Kurdistan, ca. 4000 BCE–1000 CE*

The archaeological site of Kani Shaie is a small (<3ha) tell site located in Iraqi Kurdistan not far from contemporary Sulaymaniyah. Archaeological evidence as well as radiocarbon dates procured from excavations at the site indicate in-habitation from at least 3500 BCE until the Middle Islamic period, ca. 1400 CE. Excavations in 2015 and especially 2016 included a substantial archaeobotanical sampling component, which entailed the sampling of every archaeological deposit and the subsequent spatial recording of those samples using electronic digital mapping methods. The paper presents the analysis of over 150 samples collected at the site, comprising about 800L of analyzed archaeological sediment. The paper identifies continuities and discontinuities in major food crops (emmer wheat, barley, fig, etc.) through time and the inferred relationships of Kani Shaie communities with the site in terms of agricultural production and food consumption, especially with respect to new foods that appeared in the later historic periods such as rice. The shifts in Kani Shaie's different modes of agricultural production, especially ca. 3500 BCE and later in 500 CE, reflect the interplay of new modes of social organization and local environmental realities.

Fargher, Lane (Centro de Investigación y de Estudios Avanzados del IPN) and Richard Blanton (Purdue University)

[257] *Multiethnic Landscapes, Inclusive Identities, and Collective State Building*

In small-scale societies, including territories of failed states and peripheries; regional landscapes are chaotic and rife with interpersonal violence, slaving, and social disorder, etc. Accordingly, organizing for collective defense and the management of common pool resources is vital for the survival of small communities occupying these zones. In such contexts, ethnic identities, constructed around concepts of blood, race, language, or locality, are important for achieving cooperation because they heighten trust that group members are willing to comply with the costs associated with collective action. Members "signal" their ethnicity and, thereby their commitment to costly moral values associated with cooperation by consuming ethnically appropriate material culture, speaking local dialects, and participating in community rituals. However, when such regions shift toward more centralized administration, multiethnic landscapes appear to pose impediments to achieving collective action at larger spatial scales. In such cases, larger more inclusive identities are hypothesized to be an important ingredient in overcoming inter-community distrust and the unwillingness of individuals with local identities to collectively bear the costs of regional public goods and/or collective defense. In this paper, I consider this supposition using cross-cultural data, as well as the case of the Late pre-Hispanic State of Tlaxcallan, in central Mexico.

[73] *Recontexting, Decontexting, and Un-Contexting the Great Gallery: "Alternative" Iconography and Romantic Exploitations of the Archaic Barrier Canyon Style*

The Barrier Canyon Style (aka. Barrier Canyon Anthropomorphic Style) is widely regarded as one of the more prominent and significant pictographic rock art styles in North America, and the Great Gallery from Horseshoe Canyon in Utah has long been recognized as both the type-site and arguably most prominent and complex of all Barrier Canyon Style sites. It is also the most overly exploited and often visually abused site in popular visual culture. Beyond scholarly reproduction, images of the Great Gallery are routinely co-opted through modern cinema, major museum exhibitions, and commercial branding. Such borrowings and exploitations typically show little concern for stylistic or archaeological accuracy, and in fact often intentionally distort or invent alternative histories to perpetuate agenda driven interpretations of the ancient style. This presentation considers the impact such "recontextualizations" have on both popular and scholarly perceptions of the specific style, rock art in general as an ancient form of human expression, and the role of factually accurate translation of documentary evidence into the popular realm.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Farnsworth, Paul (Temple University)**[67]** *The African-Caribbean Landscape of Wallblake Estate, Anguilla*

Historical archaeologists have explored the plantation landscapes of the Caribbean for more than 50 years, and there have been archaeological excavations at historical sites on every major island. However, there are still islands where there have not been any previous excavations at historic sites, including plantations. Anguilla was one such island until June 2017 when archaeological survey and excavations began at the Wallblake Estate to understand the plantation landscape and the major activity areas of the estate. The research project is focused on understanding the development of African-Anguillan culture from its origins in the boom and bust plantation economies of the seventeenth and eighteenth centuries, through the nineteenth and twentieth centuries. The research in the summer of 2017 has identified the site of the African village and excavated a sample of materials from it to compare to samples excavated at both the extant main house and kitchen. The results of the excavations and preliminary interpretations will be presented.

Farr, R. Helen**[54]** *Implications for Submerged Prehistoric Archaeology: Coastal Geomorphological Mechanisms on the Local Scale in the San Pasquale Valley, Bova Marina, Reggio Calabria*

Marine reconnaissance off the coast of San Pasquale, Calabria in southern Italy revealed a dense offshore terrestrial peat deposit dating to the mid Holocene. Subsequent radiocarbon dating of samples revealed a conflict with regional relative sea level curves and local patterns of terrestrial uplift. As such, initial analysis suggests that these deposits result from a local hyperpycnal flood event and are not subaerial drowned deposits resulting from Holocene coastal evolution and rapid marine transgression. This paper presents new palaeo-botanical analysis that provides insight into the local coastal environment. Additionally, with increasing recognition of the importance of studying submerged prehistoric landscapes, it documents a cautionary tale about the need to fully understand taphonomic processes and coastal dynamics on the local scale where systematic investigations are rare.

Farrell, Mary, Brian Bates (Longwood Institute of Archaeology), Craig Rose (Longwood Institute of Archaeology) and Walter Witschey (Longwood Institute of Archaeology)**[159]** *The Longwood Vulnerability, Potential, & Condition (VPC) Assessment Method: A Case Study from a Hurricane Sandy Project in Virginia*

Where cultural resources are increasingly threatened by the effects of a changing climate, the old model of preservation in place is no longer sustainable. For resource managers charged with the preservation of our cultural heritage, effective stewardship demands that managers are in a position to make data-driven decisions to prioritize the deployment of scarce financial resources to the most vulnerable cultural resources. Nowhere in Virginia are the effects of climate change more apparent than along the shoreline of the Chesapeake Bay, and nowhere else is scientifically derived data on those impacts more urgently needed. To generate this data, the Institute of Archaeology developed the Longwood Vulnerability, Potential, and Condition (VPC) Assessment method and applied it to the Hurricane Sandy Shoreline Survey in Lancaster, Northumberland, Middlesex and Mathews Counties. By triangulating the data from site vulnerability to quantify annual shoreline change rates, potential for undocumented resources through predictive modeling of the study area and the observed condition of known sites, the Longwood VPC Assessment method provides resource managers with a powerful tool for making informed, data-driven management decisions about archaeological sites and the level of threat to which each may be subjected.

Farrell, Sean (Texas State University)**[127]** *New Investigations of Bone Bed 1, Bonfire Shelter: A High-Resolution Analysis of Late Pleistocene Deposits*

This paper reports the results of new excavations of Late Pleistocene deposits at Bonfire Shelter, a stratified rockshelter in the Lower Pecos Canyonlands of Val Verde County, Texas. Previous excavations identified three bone deposits. Bone Bed 1, the oldest deposit, yielded a single uncalibrated radiocarbon date of 12,460 +/- 490 BP. Investigators in the 1960s and 1980s argued that the patterned distribution of megafaunal elements associated with large limestone cobbles in Bone Bed 1 suggests human subsistence activity. However, no formal artifacts were recovered. Mounting evidence for earlier than Clovis occupations elsewhere in Texas, combined with advances in dating technology and spatial analysis, catalyzed new research into Bonfire Shelter's deepest deposits. In the summer of 2017, Texas State University archaeologists excavated a 3x1m2 trench into intact Bone Bed 1 deposits. A three-tiered approach was implemented to identify evidence of human activity: targeted sampling for microdebitage in association with Pleistocene megafauna, a Structure from Motion (SfM) photogrammetry based spatial analysis of faunal remains, and a column sample addressing the depositional environment of the shelter over 12,000 radiocarbon years ago. If human activity is confirmed, these analyses have the potential to elucidate the subsistence strategies of southern Texas's earliest inhabitants.

Farrow, Clare (University of Alabama), Jessica Conway (Millersville University) and Haley Hoffman**[334]** *The Pennsylvania Precontact Predictive Model*

In 2015, the Pennsylvania Department of Transportation and the Federal Highway Administration sponsored the development of a predictive model for prehistoric site locations in Pennsylvania. Since the development and release of the model, numerous surveys have been performed across the state, and many new prehistoric archaeological sites have been identified and mapped. During the 2016 and 2017 summers, undergraduate and graduate archaeology students participating the Pennsylvania Department of Transportation's ESTI (Engineering, Scientific, and Technical Internship) program tested the efficacy and accuracy of the model. The 2016 interns mapped 132 phase 1 survey report results, locations and associated data into Pennsylvania's Cultural Resources Geographic Information System (CRGIS), and subsequently conducted analysis with this new data. In 2017, the interns concentrated on new phase 1 survey and Pennsylvania Archaeological Site Survey (PASS) site data from eight counties: Erie, Delaware, Lancaster, Berks, Bucks, Chester, Lehigh, and Cumberland. While the conclusions we have reached in this paper are preliminary and will require more years of analysis to fully understand, they reveal several interesting trends in cultural resource management (CRM) archaeological testing methods and model accuracy in different topographic regions of the state.

Farrow Ferman, Teara (Confederated Tribes of the Umatilla Indian Reservation)**[253]** *Partnerships Developed during the Ancient One History and Next Steps to Building Better Partnerships—A Tribal Perspective*

The Claimant Tribes worked whole-heartedly together for 20 years for the return of the Ancient One to his homelands. Throughout those twenty years, many partnerships were made with academia and federal agencies. However many challenges were encountered during the NAGPRA process. These challenges provided unexpected hurdles and trials for the Claimant Tribes in their fight for a cultural affiliation determination with the U.S. Army Corps of Engineers.

The range of challenges the Claimant Tribes faced and continue to struggle with encompass: demonstrating a continuous, documented history dating from 9000 years ago to present, absence of artifacts and analysis data from Columbia Plateau collections, maintaining collaborative and inclusive relationships between researchers and Tribes, conducting meaningful consultation, and ethical interpretations of NAGPRA. From a tribal perspective, the challenges can be overcome but will require outreach, training, research, ethical guidance, development of guidance documents, and possible legislative changes to NAGPRA's inadvertent discovery regulations.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

This presentation will provide an overview of the challenges and partnerships the Claimant Tribes made which resulted in examples and recommendations to remedy those challenges for the benefit of all our ancestors today and in the future.

[293] *Maya-Teotihuacan Relations Viewed from Front D at the Plaza of the Columns*

Two distinct excavation contexts from Front D in the Plaza of the Columns Complex yielded pictorial representations in different artistic media that strongly suggest the presence of Maya artists in Plaza 50, decades prior to the famous Teotihuacan "Entrada" of 378 C.E. in the Petén. Excavations at this civic-administrative structure at the heart of the ceremonial core of Teotihuacan have revealed a sequence of numerous plaster floors in Plaza 50 associated with Structure 44, whose form is reminiscent of Classic Maya "palace" structures. Hundreds of small mural fragments painted in Maya style were scattered beneath the deeper plaza floors, suggesting they were discarded there after the ritual destruction of at least one elaborately decorated earlier building. A contemporaneous termination ritual offering found nearby, adjacent to Structure 25C, contained incised ceramics that are also clearly executed in Early Classic Maya style, with seated human figures bearing elaborate adornments and plumed headdresses. Together these new data and their dating and contexts will allow scholars to address the problem of Maya-Teotihuacan relations in greater specificity and with more time depth than had previously been possible.

Faugère, Brigitte (University Paris 1)

[59] *Paleoindian and Archaic in North Centre and Western Mexico*

The Highlands of North Center and Western Mexico were occupied from the lithic period as testify paleo Indian vestiges (Clovis and Agate Basin points) found in several sectors. From the beginning of Holocene, only the excavations of some sites allow to recognize typological characteristics and to know how the archaeological material change through time. In this presentation, I will examine the available data, in particular the cases of the States of Querétaro and Michoacan, to show the specificity of lithic industry in the region during preceramic time.

Faulkner, Ivy (University of Minnesota)

[197] *The Ritual Performance of Gift Exchange in Archaic Greece*

Gift exchange is most often discussed as an economic transaction. Whether goods are exchanged for social, political or cultural capital, the model for examining the practice is based on a commodity framework. However, gift exchange is also a performance, often with prescribed behaviors based on the culture and the individuals participating in the exchange. This behavior clearly falls within the realm of ritual as much as that of trade or economics. In this paper, I discuss gift exchange as a performed ritual both within and across cultural groups. Furthermore, while gift exchange is a behavior between individuals, it often has larger ramifications for the communities these individuals inhabit. For example, gift exchange between political leaders may influence the lives of everyone within their society. This link between social organization and gift exchange is an important aspect of its power as a ritual behavior. In particular, I will discuss how ancient Greek elites used gift exchange as an important unifying ritual in order to connect disparate communities in order to maintain cooperative relationships.

Fauvelle, Mikael (University of California, San Diego)

[19] *A Tale of Two Peripheries: Recent Excavations at Fracción Mujular, Chiapas, Mexico*

Fracción Mujular is a modest residential site located on the Pacific Coast of Chiapas, Mexico. Long known for the Central Mexican iconography found on its carved stelae, investigations conducted during the winter of 2017 represent the first excavations of the site. This paper presents the results of these excavations, as well as subsequent laboratory analysis. We now know that Fracción Mujular has a history that covers over one thousand years of occupation, from the Early Classic to the Late Postclassic periods. Situated on top of the natural coastal choke-point of Cerro Bernal, Fracción Mujular would have had close access to important trading routes used throughout Mesoamerica's history; a detail that is evident in the material culture recovered in excavations. With a diverse ceramic assemblage and obsidian from at least 14 different sources, it is clear that Fracción Mujular was connected to trading partners from across Mesoamerica. I argue that despite its position on the periphery of several Mesoamerican exchange spheres, Fracción Mujular maintained preferential ties to Central Mexican centers—first Teotihuacan and then Cantona—throughout much of its history.

Fecher, Franziska (University of Zurich)

[299] *Cultural and Economic Interaction at Postclassic Guadalupe, Northeast Honduras*

The Postclassic settlement of Guadalupe is located on the northeastern coast of Honduras, near Trujillo. With its location inside the interaction sphere between Mesoamerica, Lower Central America and the Caribbean, it lies within a culturally dynamic region that has received influences from various areas during different times. With respect to the Postclassic period, it has been demonstrated that access and distribution patterns of resources and goods changed and new networks of interaction emerged. Communication routes along the coast gained importance. In Guadalupe, many objects were found that point to cultural and economic relations with Mesoamerica and Lower Central America, suggesting that the settlement might have functioned as a coastal trading center. The goals of the Proyecto Arqueológico Guadalupe, which has carried out archaeological investigations since 2016, are to find out what role Guadalupe played in these newly emerging networks and with what regions its inhabitants interacted.

[203] *"An Ever Widening Circle": The Lighthouse Site State Archaeological Preserve*

When John Elwell died in the late nineteenth century, newspapers characterized him as the "last of the Lighthouse tribe." When Sol Webster died in 1900, newspapers said he was the "last of the Lighthouse tribe." Before Mary Matilda Elwell died in 1928, she called herself the "last of the Lighthouse tribe." In fact, however, hundreds of descendants of the founding couple, the Narragansett Indian James Chaugham and his white wife Molly Barber, survive and, as historian Lewis Mills phrased it, have spread across the U.S. "in an ever widening circle." As a result of archaeological and genealogical

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

research, many people in that ever widening circle are now aware of the place where their ancestors sought sanctuary in northwestern Connecticut in the mid-eighteenth century. Their village has been the subject of an archaeological excavation and honored as a State Archaeological Preserve (SAP). That designation led to the publication of a booklet and the erection of signage. Inspired in part by the SAP program, more than sixty descendants of James and Molly made a pilgrimage in the summer of 2015, visiting the place that is much more than an archaeological site; it is their ancestral home.

[76] *Exploring the Edible Forest: Food Values and Archaeological Visibility of Indigenous Food Plants of the Maya Lowlands*

A review of 28 ethnographic, ethnobotanical, and botanical studies published since the 1930s identified 497 species of indigenous food plants used by the Maya in the lowlands of southeastern Mexico and upper Central America. This consideration of the Maya cornucopia focuses on the relative food values of the plants and the visibility of the species in the archaeological record. The diversity of food plants has significant implications for the reconstruction of ancient foodways, agricultural ecology, and the resilience of subsistence systems under stresses of demographic flux and climate change during both ancient and modern times.

[206] *Between Enlightenment and Structuralism: Bororo and Kadiwéu Collections outside Brazil, 1791–1938*

From the Philosophical Voyage to Brazil of Alexandre Rodrigues Ferreira in 1791 to the Brazilian fieldwork of the young philosopher Claude Lévi-Strauss from 1936 to 1938, nearly 4000 Bororo artifacts and more than 300 Kadiwéu pots were collected for museums in Europe and the United States by naturalists, anthropologists, missionaries, artists, and adventurers. What began as part of the project of the Enlightenment to catalog the world based on the principles of Linnaean taxonomy turned into a salvage operation to preserve vanishing traditional cultures. The objects filled the shelves of the storage rooms of museums, were more rarely seen in their exhibition halls, and almost never engaged the productive curiosity of scholars. This paper uses the Bororo and Kadiwéu cases to illustrate aspects in the history of ethnographic collecting and shows how the virtual gathering of this now widely scattered monumental corpus may at last be put to some beneficial use for new anthropological approaches and for the benefit of the source communities.

[36] *Tracing Sixteenth-Century Beads in South America to Understand Their Impact on Indigenous Ritual Practices and Material Culture at the Time of the Spanish Conquest*

Studying beads and changes in use of beads in a given population provide insight into the impact of outside influences on people in a given population. This research identifies bead types that were valued by indigenous cultures in South America prior to the Spanish Conquest in the Sixteenth-Century, and compares their frequency in six geographic regions within Peru, Ecuador, Venezuela, and Colombia with the frequency of glass beads brought by the Spanish to the same regions. This study examines close to 4000 beads across 50 bead attributes from several museum collections, primarily from The Peabody Museum of Archaeology and Ethnology at Harvard University and The Field Museum in Chicago. The frequency of bead colors and materials is analyzed to help determine the value of glass beads in these regions. If there were no cultural preferences or significance by color or material, the analysis should provide a random distribution of Spanish introduced glass beads throughout each region. However, statistical analysis of bead distribution shows that indigenous people did not replace pre-existing shell and stone beads with glass beads. This reveals that people in different regions rejected European glass beads presumably because of existing value systems and preferences.

[238] *A Study of 3D Photogrammetry and Oneota Ceramics*

3D photogrammetry is the process of creating a manipulable 3D model using only photos from a high-resolution camera that are then processed through computer software to extract 3D data and create a wireframe and mesh. This process can be accurate enough to measure a hairline fracture along the surface of prehistoric pottery with .1mm accuracy. Analyze the benefits of such methods, a study was conducted using Oneota ceramic artifacts of the La Crosse, Wisconsin locality that have been curated at the Mississippi Valley Archaeology Center, with the data compiled into a virtual database. Using typology, archaeologists have recognized differences in Oneota culture. Distinctive characteristics of Oneota ceramics are the motifs created by trailing along the surface of the still moist clay. The pot shape and contours can be recorded by taking photographs at multiple angles to be processed on a computer to create a digital replica that can be studied by anyone with internet access, data no longer restricted to a site whose physical artifacts are exclusively stored within the curation facility. 3D models can also be printed to be used as aids for teaching and studying different methods of analysis, such as typology.

[210] *Preliminary Results of Ground Penetrating Radar (GPR) Geophysical Prospection at the Neo-Punic/Roman Period Site of Zita, Tunisia*

During the summer of 2016, preliminary geophysical prospection survey using ground penetrating radar (GPR) was conducted at the Neo-Punic and Roman period site of Zita, Tunisia. Since the time available for the fieldwork was limited to two weeks, the survey focused on examining specific areas of the site to document certain architectural features, and in several locations where industrial activities were known to have occurred based on previous limited excavations. Additionally, a region identified as a "tophet", a sacred burial precinct for infants, was examined during the survey. Goals for the GPR survey were different in each area examined, and the results will aid in future excavations and paleoecological reconstructions.

Results from all survey areas will be briefly mentioned, but the paper will emphasize two main target areas. Two industrial sectors were surveyed, where iron metallurgy was practiced, and total slag volumes are estimated to assess the ecological legacy of the industry. A second area of emphasis

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

was the “tophet” burial precinct, for which the GPR survey produced unexpectedly clear results that enable analysis of the mortuary landscape. Implications of all the results will be briefly discussed, and directions for future GPR survey and excavation will be presented.

Fennelly, Katherine (University of Lincoln)

[87] *Educating Children of the Labouring Poor: Neepsend School and the Industrial City of Sheffield at the End of the Nineteenth Century*
In the nineteenth century, the northern city of Sheffield in England developed significantly as the city's traditional manufacturing output—metal and metalworking—was industrialised on a mass scale. To support this rapidly growing industrial city, services like railways and gasworks were constructed around the city perimeter, along with housing, shops, and other services and institutions. Neighbourhoods like the industrial colony of Parkwood Springs were home to long term residents, and a growing population of families. The city authorities became concerned with the formal education of these children of the industrial city, children of the 'labouring poor'. Built initially for the children—boys, girls, and infants—of men employed in the metal trades, the Neepsend School near Parkwood Springs attracted subscribers from across the city, as well as from within Parkwood itself. The school's situation, amongst the works of Neepsend, firmly embedded the children's education within the industrial cityscape. As an institution for the care as well as education, the building was carefully spatially divided and managed, communicating social behaviour as well as industrial training. Employing standing building survey, GIS, and archival research, this paper will examine the site of Neepsend School.

[11] *A GIS Approach to Settlement Patterns and Predictive Modeling in Chihuahua, Mexico*
In this study I analyzed the pattern of settlement for known Medio period (A.D. 1200–1450) sites in the Casas Grandes region of Chihuahua, Mexico. Locational data acquired from survey projects in the Casas Grandes region were evaluated within a Geographic Information Systems (GIS) framework to reveal patterns in settlement and site distribution. Environmental and cultural variables such as elevation, topographic aspect, slope, soil, distance to nearest water, and distance to nearest known ballcourt were calculated for each site in this region. It was expected that the relationships of correspondence between known sites and these variables would provide a quantitative framework that could be used to model the locational probability of unknown sites in the region. Through the use of GIS and statistical analyses, the results of this study were used to produce an archaeological site sensitivity map for this region of northern Mexico.

[90] *A Geoarchaeological Investigation of Site Formation Processes and Late Pleistocene and Holocene Environmental Change at the Foxwood Farm Site (38PN35)*

The Foxwood Farm site (38PN35) is deeply stratified (4.8 m) sedimentary sequence located on the Oolenoy River, near the boundary between the Piedmont and Blue Ridge in Pickens County, South Carolina. The lower most sediments, (4.8 to 3.2 m), consisting of channel gravels, lateral accretion sands, and clays, were deposited during the late Pleistocene prior to 12.6 ka. These sediments exhibit a fining upward sequence from channel gravels and sands, through bar sands, to a cap of clays. The upper alluvium (3.2m to surface) exhibit a well-defined series of discrete fluvial strata separated by three buried A-horizons. These strata are composed, primarily of overbank sands and indicate episodic deposition and erosion throughout the Holocene. The upper 2/3 of the Holocene strata contain multiple cultural components spanning 11ka to present. Radiocarbon and OSL dating of upper alluvium produce several distinctly different chronological models. The presence of an apparent peak in Pt is consistent with similar anomalous peaks found recently at several sites across North America at the onset of the Younger Dryas. 38PN35 not only provides a record of Holocene cultural adaptations but provides insight into the history of a fluvial system in the non-glaciated southeastern US from the late Pleistocene.

Ferland, Laurence (Université Laval)

[29] *Substances in Transition: Tell Construction in Chalcolithic Bulgaria*

Tells are living places continuously constructed and transformed by their inhabitants through their actions on the matter and objects constituting these places. In effect, the accumulation of clay, rubble and refuse on which houses are built and lives lived reflects daily actions, cultural events happening on longer cycles as well as environmental considerations. Therefore, the blend of things and matter that transited from the riverbed to houses, pots, and aggregated rubble and rubbish requires a special consideration: in this blend, things are not things and clay is no natural matter either. However, the breaking down of aggregates needs to be a means to understand their formation as the aim is to consider the lump of clay and objects as a whole, a tell being more than the sum of its parts. In order to investigate the intricate and flowing matter of the Chalcolithic tell of Petko Karavelovo, this paper focuses on the input of micromorphology. This approach allows comparing matter and its accumulation inside and outside the village's limits along with the natural soils. Artefacts belonging to the houses are also considered since dirt alone cannot tell the story of the tell people and their interactions with things and matter.

[216] *Entre símbolos de poder y género. Nuevas Interpretaciones sobre la Señora de Cao*

Excavaciones en el segundo templo de la Huaca Cao Viejo del Complejo Arqueológico El Brujo (valle de Chicama, costa norte centroandina), revelaron un hallazgo sin precedentes en la arqueología peruana. Este sector fue el lugar de enterramiento de tres personajes de alto estatus social, acompañados de otros dos individuos de menor jerarquía. En esta oportunidad presentaremos los resultados del proceso de apertura del fardo del personaje femenino conocido como la Señora de Cao. Diversos factores, tanto naturales como antrópicos, favorecieron la conservación excepcional del fardo, siendo posible realizar un registro detallado de su conformación. Se propone que el fardo presenta tres etapas de elaboración, siendo la

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

diferencia de contenido indicador de las mismas. La lectura de esta conformación ha permitido realizar diversas interpretaciones sobre el rol social y simbólico que envuelve a este personaje femenino.

[238] *Hidden Threat: Issues with Confidentiality and Protection of Digital Data*

With every trowel stroke, archaeologists expose layers of the past, allowing for the preservation of material while using destructive methods. Fortunately, with the formulation of research and documentation methods over the years, our destructive behavior has been offset with the increase of data and research possibilities. In more recent years, this data has taken on a digital format which has accumulated exponentially. As the amount of data produced from archaeological investigations increase every year, likewise has the threat of data loss and confidentiality issues. We have seen this in the last few years with cases of ransomware and the release of personal celebrity information. Although the archaeological record may not seem to match up to celebrity and corporate prestige, issues with sensitive cultural materials being exposed is of great concern. Without the proper standards in place to secure and safeguard data it will lead to a host of issues in the present and for future researchers. Using the Digital Archaeological Record (tDAR) as a case study, in this poster we hope to illustrate proper management and protection tools vital to ensuring archaeological data is safeguarded against security breaches and protected for the long-term preservation of data.

[299] *New Insights into Honduran Archaeology from the Recovery and Reanalysis of an Antique Lidar Dataset*

In response to the widespread destruction caused by Hurricane Mitch in 1998, the US Geological Survey conducted an extensive survey of 15 modern cities in Honduras. This 2000 survey was carried out by the Bureau of Economic Geology of the University of Texas, and the resultant data were used to generate flood risk maps. The survey also produced the first lidar data collection of a Maya site; however, in the early 2000s, lidar algorithms were not capable of performing the same tasks as today. The final elevation rasters that were archived by the USGS were low resolution and had very basic ground/non-ground classification which made archaeological interpretation difficult. Over the past two years semi-raw lidar data was recovered from old magnetic tapes. We have been able to reprocess these data using current algorithms at a level suitable for archaeological investigation. The newly processed data provides unique insight into Honduran archaeological sites as well as settlement patterns throughout a large part of the country. This paper discusses these lidar data from better-known locations such as Copan, the Sula and Comayagua Valleys, and from less-studied areas along the Atlantic Coast, the Aguan and Olancho Valleys, and the southern gulf of Fonseca region.

Fernandini, Francesca (Stanford University)

[295] *The Timespace of the Pre-Hispanic City of Cerro de Oro*

This work uses the concept of timespace (Schatzki 2010) to follow the construction and habitation of the prehispanic city of Cerro de Oro within the lower Cañete valley between ca. 500–900 AD. The concept of timespace assumes that the temporality and spatiality of the social are considered as intertwined elements that form the dynamic infrastructure where social phenomena such as power, social organization or coordinated action are constituted. These timespaces are embedded within a “deep time” approach that follows the entangled formation of a city through time and space, allowing to integrate the multiple dimensions and facets that characterize social processes. Moreover, this study proposes to reevaluate the concept of time, criticizing its use as an independent variable which is reduced, molded or extended to fit within “concise” or “logical” narratives of past events, in favor of a view that holds time as embedded within daily practices.

[58] *Embodying Identities: The Human Figure in Pre-European Native American Art*

Two- and three-dimensional human figures, and disembodied parts of figures, are commonly found across North America, and are considered important dimensions of Native American art. Figures appear in diverse media and sizes including stone, copper, shell, earthen effigy mounds, and petroglyphs/petrographs. In the literature, they are most frequently addressed as examples of art for the regions in which they are found, but rarely as pan-North American phenomena. A solely regional perspective implies that they only had local audiences. Human figures and disembodied parts are rarely examined, or compared/contrasted with reference to wider geographic regions as potentially having had diverse and travelling audiences. This regionalism has developed despite Omaha self-identification as having relocated several times, and the patchwork distribution of linguistic groups across North America for example, speakers of Siouan languages are found in both the Great Plains and South East. This research looks at full figures, hands, and hand and arm postures as one example of such widespread imagery. Hand and arm postures are significant not only for their variation in visual imagery, and in disembodied formats, but also their use in historic American Indian gestural sign language.

[21] *Chasing Red Herrings Down the Kelp Highway: Paleoindian Migration via the Pacific Coast is Unproven and Improbable*

Over the past two decades, migration of Paleoindian ancestors along the Pacific coast has become the dominant origin hypothesis mainly because: 1) arrival at Monte Verde by 14,300 cal BP (or even 19,000 cal BP, as recently claimed) requires a still earlier emigration from Beringia and 2) the alternative “ice-free corridor” ostensibly was not habitable by large herbivores before 13,000 cal BP. However, the coastal hypothesis cannot account for many inconvenient facts. These include: absence of pre-13,000 cal BP sites on long expanses of habitable and archaeologically visible coast, from the Aleutian Islands to the Atacama Desert; genomic evidence of all Native Americans’ descent from interior-adapted South Siberian and Clovis populations; and absence from coastal East Asia of both any credible ancestral non-microlithic archaeological complexes and the expected ancestral haplotypes (e.g., the Q-L330 male lineage) in ancient and recent genomes.

[224] *Evidence for Forest Clearance and Food Production in Lapita and Post-Lapita Fiji*

Investigations at the site of Qaraqara have sought to determine the antiquity of forest clearance and food production in Fiji. Located over 25 km inland from the coast, archaeological excavation has indicated that the site was used for habitation and cultivation, producing a ceramic-rich deposit that extends to a depth of 250 cm. Geoarchaeological analyses of sediment cores from Qaraqara reached 500 cmts, and document the formation of stable soils by 3000 BP, during the Lapita period. Plant microfossils identified through scanning electron microscopy analysis trace a synchronous decline in forest taxa, and a concurrent marked increase in grass taxa, providing a context for the sudden appearance of cultivated banana (*Musa* sp.) phytoliths. Radiocarbon dates obtained from identified charcoal and ceramic residues, as well as phytoliths and indicators for soil formation and stable carbon isotopes, further trace the history of habitation and food production at Qaraqara for the following millennium. Combined, these data provide critical evidence for the clearance of forest in the interior of Viti Levu, and the immediate commencement of food production in the late Lapita period.

[226] *Chaco Connections to Mesa Verde: An Engagement with Interregional Landscape Relationships*

Ideas of spiritual landscapes and aligned site orientations are gaining traction within the Chacoan archaeological community, and stand as strong examples of intentionally constructed macro-landscapes in the prehispanic Southwest. In this poster, these landscape relationships are extended towards a better understanding of interregional relationships in the four-corners, particularly to investigate inferred and intended relationships between Chaco Canyon and Mesa Verde. This analysis focuses on northern Chacoan outliers like Aztec and Holmes Group as demonstrations of intermediary locations between larger, more distinct cultural regions. Site relationships are investigated through several avenues: 1) geospatial analyses, with a focus on viewsheds, road orientations, and linear alignments; 2) site specific and remotely sensed data; and 3) chronological habitation data. These data demonstrate fluctuations in the northern reaches of Chaco and southern extensions of Mesa Verde throughout the PII and PIII periods, to postulate a diachronic and landscape scale perspective of relationships in the Southwest.

Figueiredo, Camila

[116] *Tapajó Group Routes Networks, Santarém and Belterra Region, Lower Amazon, Brazil*

From the 10th until the 18th century, the Tapajó Indians inhabited the present city of Santarém and the surrounding region. The material culture associated with this group is distributed between the Trombetas and Xingu rivers—west/east—and Almeirim until the middle Tapajós Rivers—north/south. Archaeological and ethnographic data demonstrate that the Tapajó produced the elaborate Santarém pottery. This particular region is characterized by a rich and varied archaeological modified landscape consisting of inland wells, Amazonian Dark Earth (ADE), anthropogenic forest and trail networks. For this presentation, archaeological sites located on the Belterra Plateau and inside the National Forest of the Tapajó are considered. The presence of old indigenous paths connecting archaeological sites on ADE soils on the plateau to the riverine environment and between settlements on the plateau suggest that archaeological sites located on different landscape types were interconnected and complemented each other in the Tapajó domain. In addition, a model created using ArcGIS spatial analyst toolbox proposes how the settlements in these peripheral areas were integrated and connected through a network of pathways and river to the Porto site, the heartland of the Tapajó group, in Santarém.

Figueroa, Alejandro (Southern Methodist University)

[299] *The Multiple Meanings of the Rock Art Landscape of Central and Southern Honduras*

The physical landscape of Honduras was and continues to be home to a diverse group of indigenous groups, each with distinct cultural traditions, artistic styles, and sociopolitical configurations. In prehistory, this landscape was imbued with cultural meaning in a variety of ways, from the monumental to the perishable. This paper presents and discusses what we know about the rock art of central and southern Honduras, which contains a variety of iconographic rock art styles within a very limited spatial scale. The location and content of these sites suggest the inhabitants of this part of Honduras assigned multiple, often overlapping meanings to major features of the landscape, particularly caves and waterways. While preliminary, the results of the work done so far in this region indicate strong symbolic connections with Mesoamerican groups to the north and Lower Central American groups to the south.

[105] *Fremont Maize Cultivation and Latest Holocene Climate Variability in the Cub Creek Archaeological District, Dinosaur National Monument*

The Cub Creek Archaeological District in northern Utah's Dinosaur National Monument was an early center of Fremont maize cultivation and village settlement AD 450–850. Cub Creek lies near the northern limit of maize cultivation in western North America in the foothills of the Uinta Mountain Range. We couple a Bayesian analysis of radiocarbon-dated pithouses and roasting features with a 2,115-year tree-ring reconstruction of August-July precipitation to explore relationships between Fremont subsistence and settlement strategies and climate variability. We propose a multi-stage model where the adoption of maize cultivation and development of pithouse hamlets was a response to regional drought ca. AD 500. Fremont subsistence and settlement reorganized during nearly a century of climate stability moving away from a focus on intensive maize cultivation and pithouse hamlets. During the Medieval Climate Anomaly, we suggest Cub Creek residents shifted strategies to a more foraging-dominated subsistence focus that still incorporated small-scale maize cultivation, but intensified collection of wild plant foods evident by numerous roasting features in the Cub Creek uplands. Our results challenge notions of regional abandonment and narratives of collapse and suggest that flexibility in subsistence options that strategically incorporated maize cultivation was a successful adaptation to climate variability.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Fischer, Lisa (Jamestown Rediscovery Foundation)**[286]** *The Search for Jamestown's 1617 Church: How Digital Technologies are Providing New Insights into an Old Site*

Digital technologies are changing fundamental approaches to archaeological excavation and analysis. The Jamestown Rediscovery project to examine James Fort, the first successful English settlement in North America, has been ongoing for more than 20 years. Recently the team has been working on re-excavating the site of three of Jamestown's 17th-century churches, the earliest of which is significant for having been the site of the first representative assembly meeting in English America in 1619. The church remains were first examined over a century ago by preservationists from the Association for the Preservation of Virginia Antiquities. Today the site is incredibly complicated because the fragmentary remains of the three buildings have been "cut" into small pieces by the numerous grave shafts dug into the church floors over time as well as the 20th-century archaeological test units. Digital technologies, from drone imaging to 3D modeling, are changing how the site is being recorded, assessed, and visualized, in ways simply not possible a century ago. The one thing that cannot be replaced by technology, however, is the examination of the features and subtle stratigraphic relationships by the archaeologists as they work to define and tease apart the three structures.

[286] *Chair*

Fish, Paul (Arizona State Museum) and Suzanne Fish (University of Arizona)**[131]** *Dimensions of Multi-ethnicity in Hohokam Society*

We examine multi-ethnicity as a persistent and integral dimension within an overarching concept of Hohokam as a holistic archaeological tradition centered on O'odham peoples in central and southern Arizona. Internal and external multi-ethnic relationships of many sorts abound in the ethnography, oral history, and ethnohistory of descendant O'odham peoples in former Hohokam territory. Post-contact O'odham sources document the expansive geographic range and the multi-faceted nature of such interchanges, with intriguing implications for pre-Hispanic times. As in the pioneering approach of Cal Riley, insights from all these sources are sought to better recognize and understand multi-ethnic relationships and interactions in the Hohokam archaeological record. We explore two contrasting arenas in which multi-ethnic participation may have been key elements: 1) subsistence intensification and sustainability, and 2) institutional transfer and innovation.

Fish, Suzanne [131] see Fish, Paul

Fisher, Chelsea (University of Michigan)**[142]** *Three Walks Through Tzacuil: Engaging the Rural Landscape of Central Yucatán 2000 Years Ago, 1000 Years Ago, and Today*

Tzacuil is a small archaeological site in the hinterlands of Yaxuná, a major center in the central Yucatán region of the northern Maya lowlands. Excavations of Tzacuil's nine house groups suggest that a community formed here twice: first during the Late Formative period (250 BCE—250 CE) and again in the Terminal Classic period (700—1100 CE). Both of these occupations coincide with population peaks at nearby Yaxuná. Judging by the ample open spaces surrounding the site's house groups, people living "out there" at Tzacuil may have been drawn to the opportunities presented by the relatively uninhabited intra-settlement landscape. With these open spaces as a starting point, this paper explores how people at Tzacuil physically moved within the intra-settlement landscape of their rural community. The transformation of intra-settlement spaces through the construction of formal and informal walkways suggests that the two chronologically distinct communities engaged with the rural landscape in remarkably different ways. Finally this paper extends the study of continuous human-landscape interactions at Tzacuil by sharing the results of a new community-based approach to landscape archaeology in the northern Maya lowlands, made possible by ongoing collaboration with the people of the modern town of Yaxunah.

Fisher, Christopher T. (Colorado State University)**[169]** *Characterizing Purépecha Urbanism*

At the time of European contact the Lake Pátzcuaro Basin (LPB) was the geopolitical core of the Purépecha (Tarascan) Empire (A.D. 1350–1520), and has long been recognized as a Mesoamerican core region. Cities were an important component of Purépecha statecraft but comparatively little is known about their general characteristics, organization, and evolution. Here I explore the use and division of space within the ancient city of Angamuco to document the development of social complexity, complex societies, and urbanism in the Michoacán region. I rely heavily on airborne LiDAR data to document the 'urban plan' to show that 1) Angamuco is hierarchically organized in space; 2) These spatial arrangements are associated with commoner and elite residential sections, ceremonial zones, and large public spaces; 3) Angamuco is multi-noded and vertically organized on a distinctive malpais landform.

Fisher, Lynn (Univ of Illinois Springfield)**[140]** *Lithic Production and Consumption in a Chert-Rich Upland: Exploring Local Patterns on a Neolithic Landscape in Southern Germany*

The intensity of extraction activities at Neolithic quarries and mines in Central Europe has fueled debate about the scale and organization of chert and flint extraction and exchange during this period. However, most studies of stone consumption and exchange in the region have been based on lowland settlement assemblages at some distance from stone sources. This paper presents results of a regional project combining survey, remote sensing, analysis of private collections, and test excavation to explore Neolithic use of locally abundant chert on the Swabian limestone uplands in southwest Germany. At the center of the studied region is a quarry landscape of pits and debris piles extending over 6 hectares. Radiocarbon dates on charcoal in pit fill indicate that the quarry was used in several episodes from 5000 to 2500 B.C. We combine attribute analysis of the quarry assemblage with comparisons to excavated and surface assemblages from surrounding locations to explore local variations and change through time in the use of the quarry and in the spatial distribution of lithic production activities across a settlement landscape. Results of this project contribute to an understanding of diversity in local patterns of lithic production, consumption, and exchange in the Central European Neolithic.

[140] *Chair*

Fissel, Mark (Augusta University)**[78]** *Marine Archaeology's Influence on Interpretations of Early Modern Warfare, 1975–2020*

Each succeeding generation of historians discovers and taps new types of evidence, prompting reconceptualization of what constitutes "history" and spawning new fields of study. Marine archaeology (and the overlapping fields of maritime archaeology and conflict archaeology) are instrumental not only in recovering new primary materials, but also in reconstructing historical interpretation and historical debates. To cite a solitary example, the teaming of marine archaeologist Colin Martin and historian Geoffrey Parker in evaluating artifacts recovered from wrecks of the Spanish Armada (1588) altered the courses of the military revolution debate and the relatively new theoretical fields of counterfactuals and virtual history (in the latter cases perhaps a fortuitous intersection of archaeology and postmodernism). This paper offers (1) a brief consideration of how marine archaeology has transformed the writing of the history of early modern warfare, and (2) a more substantial report on how marine archaeology is currently enhancing the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

study of early modern amphibious warfare in riverine, lacustrine, and littoral physical environments. The purpose is to spark interdisciplinary and cross disciplinary discussion of how marine archaeology is shaping the interpretation of the past in the 21st century.

Fitton, Tom (University of York, UK)

[210] *Comparative Evidence of Maritime Activity in the Early Swahili Harbours of Zanzibar*

The Swahili of East Africa are regarded historically as a maritime culture, whose coastal sailing networks and prosperous Indian Ocean trade connections can be dated back to at least the 7th century CE. Archaeological investigations have demonstrated that maritime elements were deliberately embedded in the architecture of the famous second millennium Swahili stonetowns, but a focus on urban areas has sometimes been at the expense of areas of potential maritime infrastructure within settlements, or of the broader maritime cultural landscape.

This paper presents the results of the author's recent PhD on the development of harbour areas and maritime activity in the coastal settlements of the Zanzibar Archipelago, using a GIS comparison of archaeological data drawn from previous investigations, remote sensing, and geophysical surveys. The research has demonstrated a pattern of harbour features and the preservation of a series of shoreline maritime activity areas through multiple phases of urbanisation, settlement decline, and redevelopment. The paper offers a hypothetical perspective on the development of a common spatial organisation within these settlements, as well as the growing maritimity of Swahili society, based around the activities and roles of communal maritime areas.

Fitts, Mary (NC Office of State Archaeology) and John Mintz (NC Office of State Archaeology)

[228] *Transcending Borders: A New Approach to Prehistoric Contexts in North Carolina*

The North Carolina Office of State Archaeology reviews information about hundreds of newly-identified archaeological sites each year and advises the State Historic Preservation Office regarding their ability to provide important information about the past. The need to synthesize accumulated data so that assessments of site significance can better reflect our potential state of knowledge is both pressing and daunting. Updating prehistoric contexts for North Carolina is a particularly challenging task due to the state's regionally diverse ecological settings and its position at the intersection of distinct sociopolitical networks centered to the north, south, and west. In this paper, we review existing spatiotemporal systems used to organize the study of North Carolina archaeology and propose modifications that take into account the research potential of border regions. By calling explicit attention to such boundary zones through time, we invite site assessments to address the potential for studying how American Indian communities in North Carolina creatively negotiated cultural, political, and economic differences. While such an approach requires the synthesis of a considerable amount of information, the rewards in our understanding of past social dynamics will be considerable.

Fitts, Mary [231] see Blewitt, Rosemarie

[211] *A Galactic Empire: Celestial Bodies and Imperial Ideology on the Wari Frontier*

The consolidation of Wari imperial power in the Osmore Valley was predicated on the perceived legitimacy of a common ritual ideology that situated elites and their subjects within an ordered cosmos. Recent archaeoastronomical surveys of the administrative and ceremonial citadel on Cerro Baúl and elite contexts on neighboring Cerro Mejía have identified alignments of ceremonial architecture with recurrent astronomical phenomena at both sites, suggesting that observation of the heavens reinforced the ritual power structure of imperial Wari society. The celestial alignments of Cerro Baúl's Temple of Picchu Picchu and Temple of Arundane represent a hegemonic syncretism, subsuming the worship of local apu into the imperial orthodoxy of the Wari cosmos. Additionally, a newly identified solar calendrical complex on the summit of Cerro Mejía may have further served to expand the ideological authority of Wari elites. By structuring a social and ritual calendar around the observation of astronomical phenomena, the elite class legitimized their cosmological paradigm through elaborate public ceremony.

Fitzgerald-Bernal, Carlos (Universidad Santa Maria La Antigua)

[260] *El Gran Chiriquí desde Veraguas: dinámicas fronterizas y definición subregional*

Se presenta una re-evaluación de la frontera oriental del Gran Chiriquí y su relación con la sub-región de Veraguas del Gran Coclé en Panamá Central. A partir de hallazgos recientes de petrograbados en el sur de Veraguas y una revisión de la literatura, se reconocen las limitantes inherentes a una definición estática de fronteras culturales y se analiza la "chiricanidad" de la cultura material veraguense como ejemplo de las dinámicas históricas en la conformación de entidades regionales. Se contrasta la información lingüística, genética y etnohistórica con el registro arqueológico no publicado contenido en Estudios de Impacto Ambiental a fin de reconocer particularidades subregionales relevantes. Finalmente, se analizan las interpretaciones sobre la conformación de sociedades jerárquicas en Veraguas y se comparan con las trayectorias mejor conocidas de los cacicazgos del Gran Coclé a fin de evaluar si la singularidad iconográfica y simbólica evidentes en la orfebrería, cerámica y lítica de Veraguas durante el último milenio antes de la conquista europea son un correlato de identidad sociopolítica subregional.

Fitzhugh, William

[79] *Shock and Awe: An Insider's View of the "Stanford Phenomenon"*

In the early 1970s Clifford Evans created a "Paleoindian Program" at the Smithsonian's National Museum of Natural History. Clovis was well-established in the literature, but its origins and antecedents were mysterious. Dennis Stanford had just received his PhD on Thule culture studies in Barrow, Alaska, but his real love was Paleoindians. After arriving at the SI he picked up the mantle of the Institution's pioneering Paleoindian researcher, Frank Roberts, and instituted large-scale projects at Jones-Miller, Dutton-Selby, and other sites. Decades of federal funding provided resources for long-term research. Year-after-year, his papers, reports, and lectures (many to amateur and popular audiences) generated solid data and tested intriguing and sometimes highly controversial hypotheses. He served as chair of the Anthropology Department, trained students, and built a Paleoindian collection that became a national resource and attracted worldwide attention. This paper presents an insider's forty-year perspective of the "Stanford Phenomenon"—how it changed Smithsonian science, challenged his colleagues, and brought public awareness to America's first peoples.

Fitzpatrick, Scott (University of Oregon)

[170] *Banking on Stone Money: The Influence of Traditional "Currencies" on Blockchain Technology*

Centuries ago in western Micronesia, Yapese islanders began traveling to the Palauan archipelago to carve their famous stone money from limestone, which they then transported back to use in a variety of social transactions. While commonly referred to as 'money', these disks were not currency in the strict sense, though their value is not dissimilar to other traditional and modern objects where worth is arbitrary based on both real and perceived attributes (e.g., size, shape, quality, pedigree, or other factors). These characteristics have corollaries in today's society for material culture and electronic cryptocurrencies that use blockchain technology—essentially, digital ledgers that track financial transactions in real time across a computer

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

network to ensure that they are seamless and incorruptible. Here I argue that transactions involving traditional forms of 'money' or exchange valuables are the precursor to Bitcoin and other technologies that demand a unified and continuous chain of information to ensure that the value is known and ownership indisputable. This research suggests that Yapese stone money is just one of many cases in the ancient past of humans, through social networks, attempting to create accurate and unbroken lines of communication so that economic relationships can be established, maintained, and rectified.

Flad, Rowan (Harvard University)

[181] *Little Bronze Things: What They Do and How They Do It in the Early Bronze Age in NW China*

Small bronze objects, some tools, others ornaments, and yet others of undetermined function, are the earliest known Bronze objects in China. Many of these objects are found in sites from Northwest China that date to the early part of the second millennium BC. Their manufacture seems to have been conducted locally on a small scale in this region, and yet the transformation of matter that their production entailed played a role in large scale transformations of society—ultimately culminating in the massive production of metal later in the same millennium by the expansive, highly centralized, literate state of the Shang. What did these little bronze things do in the Qijia and other cultural contexts in which they are found during this early stage? Did they play a role in transformations of political power? Or did they remain rather ineffective in the political realm until later manifestations of metallurgy emerged? How do the roles of these things relate to similar objects in imperial contexts?

[122] *Symbolic Associations: Assessing the Co-occurrence of Ash and Turquoise in the Ancient U.S. Southwest*

Ash provides a ritually meaningful medium through which to alter or close spaces. In the U.S. Southwest, the patterned deposition of ash in archaeological contexts has been linked to practices of purification and the preservation or suppression of social memory. Turquoise also carries important symbolic meanings in the region, with notable links to moisture, sky, and personal and familial vitality. In archaeological contexts of the Pueblo Southwest, turquoise is often associated with ash or related features like hearths, suggesting an intentional link. This material linkage may represent a broader North American pattern as the association of ash/hearth and turquoise is apparent in multiple cultural contexts. We explore evident connections throughout North America before intensively examining co-occurrences at sites in the Homol'ovi Settlement Cluster, a late prehispanic series of ancestral Hopi pueblos in northeastern Arizona. We address the prevalence and contextual patterning of ash, hearths, and turquoise within the Homol'ovi pueblos to assess their potential role in feature and structure closure practices. We consider the likely symbolism of archaeological patterns using traditional Pueblo perspectives.

Fladeboe, Randee (University of Florida)

[217] *Investigating Feather Harvesting of Captive Macaws at Wupatki Pueblo, Arizona*

Macaws were imported into the pre-Hispanic American Southwest from central Mexico for hundreds of years; it is generally projected that the purpose of this practice was to supply feathers for ritual purposes. Recent zooarchaeological research has demonstrated that the wing feathers of Southwestern turkeys were regularly plucked, as evidenced by significant scarring on the birds' ulnae. The author observed the presence of this scarring on the wing elements of archaeological macaw specimens from Chaco Canyon, New Mexico. This paper details a macroscopic analysis of macaw skeletal remains from another major husbandry center, Wupatki Pueblo in Arizona, to provide further evidence that Pueblo peoples from different regions were engaged in the regular harvesting of feathers from live macaws. This information lends insight into the practices of macaw husbandry in the prehistoric Southwest and the nature of interaction between different groups engaged in the care and utilization of these transplanted birds.

[120] *Recycling on Fishtail Points: Morphological and Fatty Acids Analysis*

Fishtail points constitute a flexible type that exhibits morphological variability, in part unrelated to spatial and chronological factors. Assemblages from the Argentinian pampas include small, medium and large points, produced either on a flake blank or by bifacial thinning on a biface, with or without fluting, with rounded or angular shoulders, that is, presenting variable sizes, design and manufacturing techniques. These variations were partly the result of the production of objects intended for different functions and partly of point life history. Regarding this life history, we here address a conservative strategy affecting Fishtail points in several localities in South America: recycling. Under the term recycling, we consider points modified by retouch to produce a different tool. Fifteen artifacts recovered at Cerro El Sombrero Cima, representing 16% of the point assemblage at the site, are considered recycled tools made on Fishtail points. They were identified through macroscopic observation of traits on edges and tips and the general artifact shape; possible uses of these recycled tools are studied through fatty acid analysis. Although points are transformed into different artifacts, such as side scrapers, knives, notches or drills, the characteristic Fishtail shape is recognizable, reinforcing the importance this design played in early societies.

[15] *Ersersaaneq Project: Creating Knowledge Through Images*

In 2016, the Ersersaaneq project was instigated by three students from the University of Greenland to create an online repository of 3D models of the Gustav Holm collection.

In Greenlandic the word ersersaaneq captures the idea of producing knowledge through the creation of visual images.

The goal is to digitally re-unify parts of the collection and develop coherency within a global context. Project partners include Greenland National Museum, The Smithsonian Institution and The National Museum of Denmark. These institutions house parts of the collection and will make the artifacts

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

available for the project.

The Ersersaaneq team has tested and developed a cost-effective strategy to create an online database of 3D images to be a universally accessible educational resource. Brief descriptions accompany the images in both English, West Greenlandic and East Greenlandic to provide historical and cultural context, ensuring the local community easy accessibility.

Making these materials universally accessible also demonstrates that these materials are not only important to Greenlandic history, but are also part of a larger global collection of indigenous world heritage.

Fleisher, Jeffrey (Rice University) and Stephanie Wynne-Jones (University of York)

[170] *The Copper Coins of the Kilwa Region, Tanzania, AD 1000–1500: Creating a Regional Currency in an Indian Ocean World of Coins*

The residents and rulers of Swahili towns along the eastern African Swahili coast fashioned cosmopolitan worlds through their participation in long-distance trade both across the Indian Ocean and into the continental interior, their conversion to Islam, and the construction of cities that incorporated styles from across the Indian Ocean world. The creation and use of a local coinage—silver from the 8th-10th centuries, and copper from the 11th century onward—is often viewed as a way that town leaders emulated features in the Islamic heartland thus linking towns to it. Although the copper coins of the Kilwa region clearly referenced and emulated coin systems in the Indian Ocean world, they were not, we argue, meant to connect Swahili towns to that broader world. This coinage, minted at Kilwa Kisiwani, was used only in a small region of the coast, and found at three towns (where they are plentiful in the archaeological record). We argue that the leaders of these towns created their local coinage as a medium of everyday exchange among the general populace, cognizant of the usage of coins more broadly within the Indian Ocean world, but as an effort to materialize power and authority locally.

Fleming, Arlene (World Bank)

[247] *Challenges for Archaeologists: A Changing Climate Is Only One Development*

There is general awareness among cultural heritage professionals, including archaeologists, that a drastically changing climate requires re-examination of our responsibilities and practices for identifying, documenting and managing sites and objects. The occurrence and effects of phenomena such as warming temperatures, sea-level rise, desertification, violent storms, and flooding, are frequently discussed. However, the socio-economic ramifications of a changing climate and severe weather events, and their potential effect on heritage and archaeology, are less often considered. These effects include conflict, migration and displacement of populations, and economic dislocation, as well as weakening governmental authority and structures. Such effects are already apparent, and they may worsen as climate disturbances become more severe. Most international agreements relating to these situations are based on national governing authority and date to a time when climate change and its effects were not considered. What are the limitations of these agreements, and how effective are they for current and future stewardship of heritage and archaeological resources?

[14] *Ancient DNA Perspectives on Kinship and Racialized Labor at a 17th Century Delaware Frontier Site*

The Avery's Rest archaeological site near Rehoboth Beach, Delaware, represents an early phase of European colonization in North America. Previous archaeological and osteological analysis conducted by the Archaeological Society of Delaware and the Smithsonian Institution, respectively, indicated the presence of two burial clusters containing 11 excellently preserved individuals, one containing individuals of European ancestry and the other individuals of African ancestry. Ancient DNA (aDNA) analysis was subsequently undertaken to identify the phylogeographic origin of and possible kinship between individuals at the site. We successfully extracted and sequenced the mitochondrial DNA (mtDNA) control region for all 11 individuals. Our results confirmed the geographic ancestry assigned to these individuals through osteological analysis. In addition, they revealed that half of the eight European individuals shared the same mtDNA haplotype, suggesting they were maternally related, while the three African individuals appear to have originated from different areas of Africa. Together, the aDNA data and burial organization of Avery's Rest provides insights into the organization of labor at the site, suggests that kinship was an important influence during the early colonization of the New World, and reveals new details about slave trade origins on the 17th century Chesapeake frontier.

[224] *Revealing Woodland Period Landscape Use at Rat Island, Hamilton Ontario Using Itrax™ XRF Soil Chemical Analysis*

With its ability to identify slight changes in chemical signatures from small easily obtained soil cores, Itrax™ core scanning provides an unparalleled opportunity to understand anthropogenic impacts on soils and explore the history of landscapes. Located in Lake Ontario less than 500 meters off the shore of Cootes Paradise, Rat Island (AhGx-7) enabled the integration of multi-element x-ray fluorescence analyses into a traditional excavation program. This small island, initially surveyed and excavated in 1969, 2001, and 2002, yielded artifacts representative of the surrounding Princess Point Archaeological Complex. Our project produced evidence of variable intensities of occupation across the site and within specific strata. This method minimizes environmental impact and field collection time while extending the boundaries of site investigation beyond those typical of small-scale traditional excavation. The method's low impact and ease of collection has also allowed us to compare Rat Island to other sites in the area and contrast patterns of landscape use between Archaic and Woodland time periods. Overall, our study shows how Itrax™ core scanning can extend site-based research and develop a basis for articulation with regional landscape-based research programs.

[66] *Processing Personhood: Mortuary Activity from the Middle to Late Woodland in the Lower Illinois River Valley*

While archaeological engagement with the body as a locus of embodied agency has proliferated in recent years, this study is the first to rigorously apply theories of personhood to the lengthy burial rituals documented within interment facilities of Woodland burial mounds from the North American Midcontinent. This study aims to explore conceptions of the body, dividuality, embodiment, and personhood through the analysis of skeletal material from the Middle Woodland Gibson Mounds Site (n=19) and the Late Woodland Helton Mounds Site (n=2). Osteological data gathered in this study includes an inventory, as well as the estimation of sex, age, and minimum number of individuals. Through the study of skeletal material recovered from these sites, we show the prevalence of hand and foot bones in Middle Woodland processing pits as well as the continued prevalence of extended treatment for adult males. These trends, as well as those concerning long bone frequency and the positioning of final interments, are explored through theoretical frameworks of embodiment, performativity, and dividuality. Our analyses provide insights into Woodland peoples' perceptions of personhood and contribute to the growing body of literature that embraces the benefits of a thoroughly social approach to the interpretation of archaeological and osteological data.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Fletcher, Roland (University of Sydney)**[213]** *Low-Density, Dispersed Urbanism in the Tropical World: Some Global Implications*

Though low-density, dispersed urbanism is conventionally understood as a feature only of modern industrial societies there was actually substantial low-density, dispersed urbanism in the agrarian world of Central America, Sri Lanka and SE Asia during the 1st and early 2nd millennia CE. These cities, such as Tikal, Anuradhapura and Angkor with areas between 200 and a 1000 sq km, substantially altered their natural environment and were dependent on massive infrastructure. They were then impacted by severe climate change which picked out their basic operational vulnerabilities. The trajectories of agrarian-based large, low-density cities tell a disturbing story. Despite their diverse histories and economies the demise of the great cities led to a similar outcome. Their entire urban heartland regions, covering thousands of square kilometres, reverted to village-scale life. Low-density urbanism never recovered. The long-term story of large, low-density settlements is not an encouraging indicator of the long-term viability of the giant, low-density, industrial-based urban agglomerates of the 21st century. Our present-day circumstances are disturbingly similar. We should beware if the same outcome were to happen to our present-day, giant low-density cities.

Flint, Richard (Latin American and Iberian Inst., Univ. of NM) ()**[131]** *Crossroads of Disciplines: Precipitating Causes and Latent Causal Conditions*

Historians and archaeologists are habitually drawn to one or the other of two very different types of causal explanation. Those habits arise in great measure from the two distinctly different kinds of data that the two disciplines deal with. Archaeological causal explanations are frequently limited to "latent causal conditions," that is, environmental and cultural (thus anonymous and collective) vulnerabilities or proclivities, broad-scale physical and societal pushes and pulls that set the stage for changes in human behavior. Historical causal explanations, on the other hand, typically emphasize "precipitating causes," the acts or reactions of individual people that constitute in aggregate any societal change. Satisfactory explanations of changes effected by humans require both modes of explanation.

Fishing was a crucial aspect in the lifeway of ancient coastal societies. Along the Pacific Coast, the appearance of shell fishhooks has been interpreted as part of different contexts of growing population, economic specialization, and social complexity, among others. Along the coast of the Atacama Desert (18° to 26° Lat. South), fishhooks on *Choromytilus chorus* shells (mussel) appear in archaeological sites located along 1.6 thousand kilometers of coast with dates around 7500 years BP. Around 4500 BP, shell fishhooks disappeared from the Chilean archaeological record and were replaced by hooks made of cactus spines and animal bones. During the ~3000 years that hooks on mussel shells were present, archaeological deposits show evidence of increasing social complexity, specialized maritime economy and semi-sedentary settlement systems. Changes in hook's shapes are also identified. Observed changes in fishing technology suggest deep changes within ancient fishing communities of South America, which were probably linked by long distance movements of people along thousands of kilometers. The present work will discuss the archaeological context of mussel shell fishhooks within the transitions experienced by Middle Holocene fishing communities of the Northern Coast of Chile.

Flowers, Kataryna (University of North Carolina at Charlotte)**[241]** *Inequality and Consumption Patterns in the North Carolina Piedmont*

Rural farmstead archaeology is often overlooked in favor of research into larger, urban centers. Rural archaeology is an important area of research because for most of American history, the majority of the population lived in rural settings. In addition, the late-19th and early-20th centuries were periods of rapid change in the American South. Farm modernization and southern urbanization affected people at all levels of the socioeconomic ladder. This poster will display the results of an economic scaling analysis of ceramic assemblages from two different late-19th century sites in the piedmont of North Carolina. The analysis will include both locally produced ceramics as well as non-local wares that were mass produced and available commercially throughout the U.S. A statistical comparison of the overall value of the ceramics at each site will be used to explore how patterns of consumption in the rural South were affected by commercialism, socioeconomic status, and inequality.

Flynn, Erin (PAL)**[294]** *The Cutting Edge: Versatility and Preference for the Semi-lunar Knife in the Southern New England Archaic*

Semi-lunar knives, or ulus, have been considered a diagnostic tool of the Laurentian Late Archaic in the Northeast since William Ritchie's 1940 report on the Robinson and Oberlander No. 1 sites in upstate New York. Archaeological research conducted since Ritchie's definition of the Laurentian Aspect demonstrate semi-lunar knives were used in New England long before 5,000 B.P. and occur in both coastal and interior settings. Recently identified semi-lunar knife fragments from a coastal Laurentian site on Block Island, Rhode Island resulted in a new research project addressing the introduction, dispersal, and functions of this tool form. PAL reviewed archaeological literature and artifact collections containing semi-lunar knives from southern New England. Our analyses included basic attributes, such as use wear, material type, manufacturing process (chipped vs. ground), decoration, and hafting elements, combined with site location, cultural attribution, and radiometric dating, where available. Use wear analyses were supplemented by protein, starch, and phytolith residue analyses of two specimens from curated collections. Although semi-lunar knives can no longer be considered "diagnostic" of the Laurentian Late Archaic, their broader association with northern fishing and maritime cultures remains.

Foecke, Kimberly (The George Washington University), Douglas Meier, Edward Vicenzi, Russell Graham and Adam Creuziger**[77]** *Microanalysis of Taphonomic Alteration on Skeletal Material—A Novel Approach to Identifying Damaging Sulfur Compounds*

The geochemistry of taphonomic alterations affecting buried bone has been little studied, yet has vast implications for scientific interpretation of archaeological and paleontological specimens in a world now embracing chemical methods in geoarchaeology. This investigative study of black surface staining on mammalian sub-fossil bone excavated from the bed of the Santa Fe River in northern Florida exemplifies the need to carefully evaluate post-depositional alteration. Such stains typically are attributed to secondary mineralization of manganese oxides, however microanalysis revealed no evidence for manganese but instead identified crystals of pyrite within a thick red and black banded stain, identified as iron oxide and a ferric tannate complex respectively. Based upon multiple analytical methods, reaction mechanisms are proposed. This study debuts a novel sample preparation method for high-vacuum analysis of bone material, and demonstrates a cost-effective method to differentiate between damaging pyrite and

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

other inert sulfur compounds in specimens. Results indicate that fossil coating types are extremely dependent upon the chemistry of the environment in which they are buried. Further, it is proposed that staining phenomena affecting fossils may pose risk to collections if not properly identified, treated, and curated.

[197] *Tibetan Mani Stones and the Materiality of Text*

Mani stones are large stone slabs with Buddhist prayers carved into their surface. In many parts of Tibet, Buddhist pilgrims carry these heavy stones during pilgrimage as an act of devotion. Pilgrims subsequently dry stack Mani stones into large structures including temples, walls and piles outside major religious intuitions. These structures lay, both literally and figuratively, outside of monastic control. In this paper I examine the varied ways Buddhist pilgrims use Mani stones, materialized prayers that most pilgrims cannot read, to shape and alter their religious lives—acts of individual devotion that organically create a shared sacred landscape.

[19] *Is That Awl? Olmec Jade Artifacts as Elite Tools, Ornaments, and Inalienable Goods*

Recent research has re-identified certain enigmatic Gulf Coast Olmec greenstone artifacts as elite versions of textile-making tools. These artifacts, which include Middle Formative picks, figural celts, clamshell and plaque pendants, and objects designated as “spoons,” were likely used by elites as both functional objects and high-status adornment, as illustrated in the contemporary sculpture. Most examples of these artifacts are found in caches and graves of distant and/or later civilizations, apparently after they had experienced long use-lives; while still identifiable, most are extensively reworked and could no longer function as tools, becoming primarily symbolic—or their symbolism had been co-opted and transformed through recarving and recycling. Analysis of the few examples found in Formative period graves reveals considerable use-wear and breakage, re-sharpening, and reshaping; some were reworked to the point where they are barely recognizable, apparently retired only after they were largely unidentifiable. Such find contexts suggest that these artifacts functioned as inalienable goods—revered, elite possessions that were reserved, inherited, and treasured as symbols of association and status. Perhaps even more significant, the fact that these tools also served as status symbols suggests that in these Formative societies, social status could be gained through personal agency as well as heritage.

[286] *Toward an Automated Model for Archaeological Site Detection in Eastern Botswana, a Clustering Method*

This paper is an effort to create a predictive model for archaeological sites in an area of Eastern Botswana. With a rather arid climate, much of Botswana's ground surface (and archaeology) is easily visible to airborne and spaceborne sensors. Without sufficient training data for supervised classification, an iterative spectral clustering method was used to group spectrally similar pixels from multispectral imagery into a large number of spectrally distinct but unknown classes. By visually assessing and removing classes that do not correlate with known sites in the region, the remaining classes provide a map for prospective site locations. This work illustrates how satellite imagery and digital remote sensing methods enable the inspection of large areas with little processing time, something that would be impossible from the ground in a single field-season. Also illustrated by this work is the need for on-the-ground inspection of the prospective sites to confirm their existence and to improve the model.

[174] *Southern Alpine Late Paleolithic and Mesolithic landscapes*

Thanks to the intense fieldwork carried out by different institutions since the 1970s, the south-eastern Alps represent one of the most detailed case-studies in Europe documenting the occupation of mountain areas by foraging groups. The known sites and find-spots attesting the Late Paleolithic and Mesolithic occupation of this area amount to several hundred. This evidence shows that foraging groups settled in the Southern Alpine region following the melting of glaciers and the re-colonization of mountain slopes by vegetation and fauna during the Lateglacial starting around 17,000 years cal. BC. As environmental conditions became more favorable human occupation intensified. At the same time seasonal displacements towards alpine pastures reached progressively higher altitudes. In the early Holocene Mesolithic hunter-gatherers are attested along the belt of territory spanning between 1,900 and 2,300 m a.s.l. Although most of the currently available archeological evidence consists of lithic scatters the development of multi-disciplinary studies has allowed the reconstruction of a thorough frame-work. Despite the need for a higher investment of energies—both in biological and technological terms—the upland environments of the Southern Alps have represented an ideal opportunity for the last hunter-gatherers-fishers of the Italian peninsula allowing expansion to newly exploitable territories.

[95] *Recipe for Daub? A Comparative Petrographic Study of a Common Construction Component in the Maya Area*

Daub is characterized as a mixture of a plastic substance, like natural clay or plaster, and an organic, fibrous binder, which is applied and smoothed against a stick or wood structure to construct a wall. This building strategy is used extensively throughout the world, past and present, yet studies have tended to focus exclusively on identification of component ingredients, rather than compositional and provenance characteristics that offer insights related to resource procurement patterns, variability in daub compositions across time and space, and what contiguous and divergent compositions suggest about development and traditions of construction practices. In this study, we present the results of a comparative petrographic analysis of clay artifacts commonly identified as ‘daub’ from Late Classic Maya residential buildings situated in three different environmental zones around the site of El Pilar, Belize. We identify and compare the compositional components of artifacts from valley, foothill, and ridgeland environments and consider their compositional and provenance characteristics in light of formal definitions of daub as a building material, daub recipes, and the nature and significance of variability in these artifacts across the landscape.

[20] *Meet the Neighbours: Evidence for Interaction between the Austronesian Lapita Culture and Non-Austronesian Communities in Papua New Guinea*

The Lapita colonisation was the greatest seafaring migration in human history, occupying all the major island groups in their eastward migration across the Pacific, where they became the ancestors of the Polynesians. The orthodox model for their origin is as an Austronesian movement out of Asia, from where they moved into Island South East Asia, and then into the islands of the Bismarck Archipelago of Papua New Guinea, where the culture that we recognise as Lapita was born. Yet major questions still remain as to the nature and origins of Lapita, particularly how much of their culture was a Neolithic package brought out of Asia, and how much has been influenced by contact with Non-Austronesians. This is an important question as it cuts to the core of identifying the development of Pacific cultures.

The Triple-I model proposes that the Lapita Cultural Complex evolved from intrusion into new territories, innovation of new technologies, and integration with established communities. Yet most Lapita sites are found on previously uninhabited Pacific islands, therefore what actual evidence is there for interaction with other communities? This paper will examine this fundamental assumption by investigating potential links between Lapita and non-Lapita communities on mainland Papua New Guinea.

Ford, Ben (Indiana University of Pennsylvania)

[78] *Public Engagement through Maritime Landscapes*

The future of American Archaeology lies in its ability to engage the public and demonstrate the field's relevance to a broad range of communities. One way that maritime archaeology can contribute to this future is through identifying and interpreting maritime landscapes. A maritime landscape approach draws on the "lure of the sea" that attracts many people to shipwreck studies, but engages larger constituencies through place-based history. Geographic space is one of the things that all people share and maritime landscapes loom large for many cultures due to the power, beauty, bounty, danger, and opportunity that water bodies hold. Maritime landscapes also allow for alternative histories to exist in the same space because landscapes are interpreted through a cultural lens. Groups that may be disenfranchised by the colonial histories often associated with shipwrecks can connect with maritime archaeology through the physical remains of their ancestors' maritime occupations and beliefs. In these, and other ways, a maritime landscape approach gives maritime archaeology a broad church perspective that will help ensure a long, productive, and engaged future.

[36] *Commensal Politics, Intersectional Politics: Serving Ceramics at Early Colonial Achiutla, Oaxaca, Mexico*

In this paper I present findings from recent excavations of a high-status indigenous residence at the site of San Miguel Achiutla, Oaxaca, Mexico. The data show that, contrary to typical expectations, frequencies of elaborate indigenous Mixtec polychrome serving wares rise considerably from the Postclassic to the Early Colonial period, rather than these ceramics being replaced by European style ceramics. Nevertheless, residents of Achiutla did indeed have access to European glazed wares, and used tin-enameled majolicas with considerable frequency, in particular. I attribute this pattern to indigenous nobles having served as primary interlocutors between Spanish authorities and their broader native constituencies following the social upheaval of the Conquest. As such, they would have negotiated with and attempted to appease the demands of both of these different groups simultaneously. I suggest that the ceramic patterning indicates they did so in part through commensal politics, entertaining these various groups at feasting events. I contextualize the archaeological data with ethnohistorical evidence to illustrate how this made for a rather delicate balancing act for colonial indigenous elites.

Forest, Marion (Arizona State University)

[169] *Houses in the City: Domestic Economy and Space at Malpaís Prieto, Michoacán*

Compared to other Postclassic cultures, not much attention has been given to the organization of daily life and domestic space in the Tarascan tradition. The political, religious and economic systems have been the focus of most archaeological and ethno-historical research, leaving the household systems understudied. It is yet critical to understand the fundamental role of household in the community organization, specifically in the context of the growing social and political complexity that led to the emergence of the Tarascan State. In this paper we synthesize the data collected at different domestic units (commoner and elite houses) excavated at one of the earliest Tarascan city: Malpaís Prieto, located in Northern Michoacán, Mexico. We examine the spatial organization (e.g. architecture, activities), the production and consumption of goods (e.g. ceramics, lithics and faunal remains), in order to reconstruct the daily life at this early urban site, discussing the social, economical and spatial systems of households, and their role in the urban community structure.

[16] *Comparing Lithic Procurement and Use Within the Foxe Basin, Nunavut*

This paper presents a systematic review and update on the nature of stone tool use in the Foxe Basin region throughout the Paleo-Inuit period (2,500 BCE-1,600CE). The Foxe Basin was previously thought to have been a core area of ecological stability/predictability that supported an uninterrupted occupation throughout the Paleo-Inuit timespan. Given the untenability of the core area model and that populations fluctuated over time and space, a reevaluation of lithic technologies and their change through time can help distinguish how the transfer of cultural information took place, and in turn how social life responded to drastic demographic change. Paleo-Inuit use of stone tools was a varied and highly skilled discipline involving intimate knowledge of the land, the properties of stone, and the appropriate ways of crafting tools. Using data from recent surveys and excavations, this talk seeks to identify and contrast patterns of lithic raw material procurement and tool production, and their relationship with key demographic changes that took place throughout Pre-Dorset and Dorset occupations of the region.

Forte, Maurizio (Duke University)

[118] *Digital and Poly-sensing Archaeology: From Remote Sensing to Smart Trowels*

Duke University started in 2014 a multidisciplinary archaeological research project involving the use of advanced digital technologies and focused on the Etruscan and Roman site of Vulci (Italy). Vulci, (10th–3rd c. BCE), in the Province of Viterbo, Italy, was one of the largest and most important cities of ancient Etruria and one of the biggest cities in the 1st millennium BCE in the Italian peninsula. The project integrates the use of multispectral cameras by drones/UAV, georadar, digital photogrammetry, image modeling, and laser scanning. GIS, Web-GIS, and online repositories guarantee the integration and standardization of all of the data. In this domain, Duke is developing a specific Web-GIS platform in Geonode for the integration and sharing of spatial and georeferenced archaeological data. New digital tools, such as special trowels (named "smart trowels") with multiples sensors are experimented during the archaeological excavations. The main goal is to collect geometric data but also additional information concerning the features

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

and components of the soil. High-resolution sensors coupled with novel photogrammetry processing techniques allow for the reconstruction of landscapes in three dimensions and for virtual reality applications such as the DIVE (Duke Immersive Virtual Environment).

[73] *House of Shields: Social and Spatial Trends of Rock Art in the Tsegi Region*

This study examines the spatial patterning of shield iconography at late Pueblo III sites (A.D. 1250–1300) in the Tsegi Canyon system, as an indicator of shared group identity. In the mid-13th century, the Tsegi Canyon region of northeastern Arizona followed a greater regional trend of communities coalescing into defensive high canyon alcoves, accompanied by the adoption of shield iconography, likely influenced by Fremont traditions to the north. These images are variously interpreted to represent clan symbols, warning signs to enemies, or magically imbued protective icons. In the Tsegi area, this motif followed a strict spatial pattern of placing large, usually white, shield imagery on the right side of cliff dwellings. By comparing the spatial placement of shield imagery on Pueblo III sites throughout the Northern Southwest, it is evident that the communities of the Tsegi Canyon system may be differentiated through their commitment to the placement of these iconic, highly visible pictographs on the right side of cliff dwellings. Rather than the imagery adorning the shields, group affiliation among Tsegi populations is best demonstrated by this formalized placement of the motif on defensive sites.

Forward, Kathleen (Trent University)

[37] *Community Complexity and Collapse: A Settlement Analysis of the Ancient Maya Site Contreras Valley, Belize*

The city-state of Minanha, located in west central Belize, reached its zenith and most culturally complex stage by the Late Classic period, 675–810 AD. Only a century later, its royal court had “collapsed”. Contreras Valley is a small farming community in the settlement region of Minanha. Decades of research at Minanha and the analysis of artifact frequencies from commoner households allows for a better understanding of the intra- and inter-community social practices occurring at the site of Contreras Valley and within the greater Minanha area. A community archaeology framework is utilized to explore the integrative social, political, and economic strategies of this commoner population. This framework allows for a peripheral perspective on the “rise” and “fall” of the royal court, providing a more holistic analysis of Minanha’s history. As Contreras Valley was able to sustain a population whilst its royal court disintegrated, the resilience of this group of individuals will generate an increased cognizance of how a community copes with and continues to thrive in a climate of political chaos and instability.

[188] *From Excavations to Occupations: Characterizing the Faunal Assemblage of a Late Woodland Site*

Analysis of a faunal assemblage gives us direct evidence of a subsistence base of archaeological occupation. Woodpecker Cave is a Late Woodland rockshelter site used by the University of Iowa as a field school for student education. The site was first excavated by Warren W. Caldwell after his initial surveying in 1956. In the subsequent years since the university first began excavations in 2012 with Jim Enloe as supervisor, students have expanded the excavation area horizontally leading to portions of levels being excavated throughout different years. The site is excavated in arbitrary ten centimeter levels below datum. To present, each year’s faunal assemblage has been examined by a succession of students for annual reports submitted to the Army Corps of Engineers (CoE). For research purposes, we have chosen to look at level five, excavated during three different seasons, because it appears to have coherent spatial structure, anchored by a hearth with different tasks indicated by distributions of various classes of artifacts. This analysis combines several years’ collections of animal bones from level five to give an integrated, coherent faunal assemblage. This will be viewed in the context of the evident spatial structure for interpretation of site function.

[78] *The Indigenisation of Maritime Archaeology*

Indigenous peoples remain under-represented in maritime archaeology. What strategies are maritime archaeology practitioners using to increase Indigenous participation? This paper introduces the concept of Indigenisation—institutionalised (normative practice) change efforts towards Indigenous inclusion underpinned by principles of recognition and respect for Indigenous peoples, knowledges and cultures—to the discipline of maritime archaeology. Drawing on the Design and Evaluation Framework for Indigenisation (Rigney 2017), this paper identifies five change efforts for maritime archaeology: assembling resources, engagement, working together, building confidence and excellence and equity. It recommends the deliberate involvement of Indigenous peoples in the study, research and management of maritime archaeology, while shifting accountability for Indigenous inclusion to maritime archaeology practitioners. Indigenous maritime archaeology is everybody’s business.

[259] *The Aquatic Imaginary of Ancestral Tiwa Landscapes*

In this paper, I explore Ancestral Tiwa rock modifications and linguistic conventions to identify what might be referred to as an “aquatic imaginary” governing Pueblo engagement with the northern Rio Grande landscape. The movement of water, it is argued, emerged out of a preceding Archaic preoccupation with the movement of animals as the dominant new way of both conceptualizing ecological systems and intervening in those systems through the organization and modification of stone. Evidence from both the early twentieth century linguistic research of John Peabody Harrington and the more recent archaeological research of the Gorge Project in the Rio Grande del Norte National Monument is used to support the argument.

[22] *Conceptualizing Lithic Technological Variation in the Late Archaic Period: A Case Study of the Broadspear Assemblage Type*

The archaeology of the Archaic Period in Northeastern North America is dominated by site-based research used as a springboard for discussing regional and pan-regional concepts and ideas. New results are often understood using paradigms created from these studies of singular origin. The present paper takes a different approach and discusses the author’s exploration of the broadspear lithic toolkit phenomenon across the Northeast. The

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

collections-based study in question updates known datasets of broadspear-context sites to reflect recent research, and takes advantage of these robust datasets using an outline-based geometric morphometric analysis to inform metric variation across the study region. This paper summarizes the results of this research program to date with an emphasis on learning networks and large-scale cultural dynamics in the Late/Terminal Archaic Period.

Fox, Georgia (California State University, Chico)**[208]** *Poison or Pleasure: The Archaeology of Tobacco and Sugar*

The deep history behind what anthropologist Sidney Mintz refers to as the “stimulant or drug foods” reflects collective choices that transformed the socioeconomic fabric of early modern life. The archaeological record can reveal the physical manifestation of such choices through the myriad assemblages of artifacts that bear witness to the adoption of stimulant foods and also the tragic outcomes from the production of these commodities. In this paper, I will discuss my long-term archaeological research in the Caribbean on both tobacco and sugar in the context of foregrounding consumer desire, which provoked a series of events and changes that resulted in structural inequalities, new forms of materiality, and varying impacts on landscapes and people. The Caribbean region provides an excellent laboratory in which to study the impacts of the production and adoption of stimulant foods. As a gateway to the New World, the Caribbean was a frontier where novel ideas, commodities, and the adoption of new habits converged and were amplified through emerging identities and acts of resistance in a variety of colonial contexts.

Fox, Sherry (Eastern Michigan University), Sandra Garvie-Lok (University of Alberta) and Steve Friesen (University of Texas)**[298]** *An Osteological and Isotopic Assessment of Diet at Ancient Corinth and Ancient Paphos*

Corinth and Paphos were two key centers of the ancient Mediterranean during the Hellenistic and Roman eras. While the commercial and political lives of these communities have been studied, less is known about aspects of day to day life such as diet and health. Here we present some insights based on paleopathology and collagen stable isotope analysis.

This study ($n = 275$ individuals for Paphos; 94 individuals for Corinth) suggests populations that were under a certain amount of stress. Mean statures were relatively low, and rates of cribra orbitalia and porotic hyperostosis suggest that periods of dietary deficiency were fairly common.

Collagen stable isotope values were obtained for 34 humans and 17 comparative fauna from Corinth. Due to preservation issues, only six human values are available for Paphos. These are similar to those found for Corinth, suggesting a broadly similar diet at the two sites. Overall the human collagen values show a distinctive pattern of low $\delta^{13}C$ and high $\delta^{15}N$ compared to human values observed elsewhere in Greece. Carbon routing models and documentary evidence suggest that this pattern may reflect a largely grain- and oil-based diet whose modest protein component included marine products such as dried fish and garum.

Fox, Steve (Northern Arizona University) and Jaime Awe (Northern Arizona University)**[30]** *The Bonds that Bind Us: The Analysis of Terminus Groups in the Belize River Valley*

Previous archaeological investigations of terminus groups in the Maya Lowlands concluded that these architectural complexes served either cosmological, ritual, or economic purposes. In an effort to test these models, we investigated causeway terminus groups at Cahal Pech and Baking Pot. Subsequent comparisons of the Cahal Pech and Baking Pot data with that from other sites in the Belize Valley, Caracol and Tikal, strongly suggest that while there was some regional diversity in the significance of these architectural complexes, their primary role was likely to produce ideological messages that politically and ritually connected hinterland communities with their site cores.

Foxhall, Lin (University of Liverpool)**[54]** *Greeks in the Mountains: New Insights on the Landscapes of Ancient Greek ‘Colonization’ in Calabria, Southern Italy*

This paper investigates the political and economic landscapes of Greek ‘colonization’, using as a case study the upland and lowland landscapes investigated by survey and excavation by the Bova Marina Archaeological Project. The study region lies between two neighbouring ancient Greek city-states, Rhegion and Locri Epizephyrii, established in the late 8th-7th century BCE. Ancient classical texts present a picture of deep, long-term hostility between them, as well as with the indigenous population. Following the historical narrative derived from texts, traditional scholarly thought places Greek settlement largely in lowland areas close to the coast. However, there is evidence of Greek settlement dating back to the 6th century BCE high in the Aspromonte mountains (1300m asl) as well as on the coast. The archaeological evidence reveals more complexity than text-based narratives, with significant differences in political and social organization between upland and lowland zones. Material cultural evidence suggests that notions of ‘Greek’ and ‘indigenous’ need to be questioned and problematized. Sovereignty of the urban centres over the lands in this ‘in-between’ zone appears constrained and patchy. Applying modern concepts of boundaries and borders is probably anachronistic, and our evidence suggests that the inhabitants simultaneously enacted multiple, alternative constructions of ‘territory’.

Foxhall Forbes, Helen (Durham University)**[54]** *Caught between East and West: Southern Calabrian Political Landscapes and the Mediterranean World, 400–900 CE*

Calabria in the first millennium CE does not fit easily into many of the established narratives that are usually applied either to the western or the eastern Mediterranean, nor yet into standard categories of periodisation, which often carry implicit assumptions related to these narratives. Using material, visual, and textual evidence, this poster explores fifth- to ninth-century southern Calabrian political landscapes, particularly the area around Bova Marina, in their broader Mediterranean contexts. In this period, Calabria experienced some continuity with the western Roman Empire alongside changes brought about by Byzantine (re)conquest of southern Italy and its absorption into the Eastern Roman Empire; but the longstanding presence of Greek culture had never been completely erased by Romanisation in any case. Calabria’s settlements, economy, and religious life in this period show links to both Rome and Constantinople. Caught between East and West, however, Calabria in the period 400–900CE is usually perceived as being marginal to both of these centres and is therefore frequently neglected in scholarship. By showing the extent of Calabria’s connectivity to both East and West in this period, this poster suggests new ways of understanding the contribution of southern Calabria’s political landscapes to the Mediterranean world in the period 400–900CE.

Frachetti, Michael (Washington University in St. Louis)**[283]** *Mobility and Migration as Ecological Processes in Ancient Eurasia*

New research in the field of aDNA has re-invigorated debates about migrations across Eurasia in prehistory. Emerging data in this field demands that we interrogate how mobility and migration from an ecological and demographic perspective, since these factors influence our interpretation of the still emerging genetic data. In this paper I present the archaeological conditions of the Eurasian steppe ca. 3000–2000 BCE applied to a spatial model with the goal of generating a more complex ecological picture of mobility, migration, and demographics in Early Bronze Age Eurasia.

Fraga, Tiago Miguel (Archaeofactory), Jorge Freire (EV2) and Tiago Dores (Divefactory)**[68]** *Reading the Unseen: The Lagoa de Óbidos Maritime Cultural Landscape*

Lagoa de Óbidos is an example of a decaying sea body that has influenced human occupation since, at least, the Mesolithic period. In fact, in historical times, humankind has been fighting, and losing, against the natural disappearance of this body. This has led to the continuous adaptation of the local populations, and in fact reinventing innovative ways of cooperation with the environment. Starting from harvesting resources in pre-historical times, to building maritime infrastructures in classical and medieval times, to present day maritime leisure touristic activities. Our research stems from a CRM project that spanned almost three years of research. Within this project was done remote sensing, underwater archaeology, cultural and ethnographic studies, resulting in several interesting finds and a better understanding of this Lagoon. We intend to present a journey into this area in its broader concept. Starting with its rich ethnographic material, following with historical knowledge and presenting the archaeological evidences that demonstrate its uses along the ages. The underlying understanding is that this environment led to an insular maritime culture, one of the many that add to the greater diversity of the Portuguese Maritime Culture tapestry.

Frahm, Ellery (Yale University)**[137]** *Pack Your Boots, Trowel, and Ray Gun: Advances in Portable XRF for Archaeological Science*

Portable XRF instruments have advanced considerably over the past decade, and many of their technical advancements are highly useful for the archaeological sciences, especially compared to fields like art conservation. The newest generation of detectors and their processing electronics, for example, make measurements significantly shorter, allowing characterization of much larger assemblages. Other advances, though, involve more than mere speed. Ruggedized instruments are dust-proof, water-resistant, and drop-protected. Vacuum pumps or helium tanks are no longer needed to measure light elements. Instead, a built-in barometer can measure air pressure to automatically correct measurements whether at sea level or high altitude. Other advances improve accuracy and reproducibility. New detectors, for example, minimize X-ray peak overlaps, as do sophisticated fundamental parameters correction algorithms. Certain instruments even use simulated photons, sent through the system milliseconds before each measurement, to maximize repeatability between the first and 500th measurements. Other advances aid collaborations and innovative research designs. For example, an embedded GPS receiver geo-tags each measurement for integration with GIS, and wireless networking enables real-time data sharing via the cloud. Discussed applications include ceramic analysis, sourcing hundreds of obsidian artifacts per day as they are excavated, soil and sediment analysis, and mapping outcrops in the field.

[177] *Chair***France, Christine (Smithsonian Museum Conservation Institute) and Haiping Qi (United States Geological Survey)****[88]** *Hydrogen Isotopes in Archaeological Bone Collagen: Potential Combined Influence of Meteoric Water and Protein Intake*

Hydrogen isotopes in archaeological bone collagen (i.e. $\delta^2\text{H}$ -collagen) are poorly understood, but can potentially facilitate new understanding of the complex relationship between trophic level (i.e. animal protein consumption) and meteoric water controls on hydrogen isotopes in omnivorous humans. These concurrent influences on human $\delta^2\text{H}$ -collagen values were examined in 11 North American archaeological sites. The $\delta^2\text{H}$ -collagen values were compared to bone hydroxyapatite oxygen isotopes (i.e. $\delta^{18}\text{O}$ -HAP) and bone collagen nitrogen isotopes (i.e. $\delta^{15}\text{N}$ -collagen), which are proxies for meteoric water influence and amount of consumed protein, respectively. Pooled site data yield moderate correlation between $\delta^2\text{H}$ -collagen and $\delta^{18}\text{O}$ -HAP and moderate correlation between $\delta^2\text{H}$ -collagen and $\delta^{15}\text{N}$ -collagen. Conversion of $\delta^2\text{H}$ -collagen and $\delta^{18}\text{O}$ -HAP to meteoric water values yielded a similarly moderate correlation with a $\delta^2\text{H}/\delta^{18}\text{O}$ slope below 8, the expected value observed in meteoric water. Conversion to theoretical hydrogen isotope values free of trophic level influences resulted in a weak correlation with $\delta^{15}\text{N}$ -collagen, suggesting that direct trophic level enrichment/depletion is not controlling the disparity between expected and measured values. The deviations are hypothetically caused by non-local food sources and a decoupling of expected $\delta^2\text{H}/\delta^{18}\text{O}$ relationships as individuals consumed more meat and decreased in vivo non-essential amino acid production.

Franchetti, Fernando (University of Pittsburgh), Miguel Giardina (Conicet), Loukas Barton (University of Pittsburgh) and Clara Otaola (Conicet)**[249]** *Hunter-Gatherer Adaptation in the Deserts of Northern Patagonia*

Arid environments (marked by scarce water and heterogeneous resources) constrain human adaptation. In this paper, we explore changes in the use of land in the Diamante Valley, Mendoza province, Argentina, during the Holocene. The principal aim of this exploration is to test the validity of a perceived intensification process in the area of North Patagonia where we conducted a systematic random surface sampling in three ecological zones: the Highlands, the Piedmont and the Lowlands. Within these zones, three 100km² areas were selected along with a sample of 400 hectare units in each to make meaningful comparison of each environment. Here, we present the results of lithics analysis that compares the different proportions of units with archaeological materials from each ecological zone. With this, changes in subsistence and settlement patterns in the Late Holocene are monitored through differences in raw materials proportions, as well as in the densities of instruments, debitage and cores.

Franklin, Kathryn (The Oriental Institute at the University of Chicago)

[220] *Landscapes of the Silk Road: Written, Imagined, and Embodied Spacetimes*

This paper approaches Silk Road-landscapes as imagined topographies, a particular inheritance of the medieval culture of travel, and of its representations of the world(s). How we imagine the 'Silk Road' landscape is therefore rooted in assumptions about categories and conditions of agency (social and historical), and about space. These include mobility, transcendence, and visibility—both in the landscape and in the record. Travel and cosmopolitan encounters along roads (Silk or otherwise) are chrono-topoi (spacetimes) which structure our historically-situated regard of spaces, such as mountain valleys and expansive deserts.

Working in local landscapes of medieval Armenia, I problematize the idea of Silk Road space, thinking not only about mobility and contact, but also about spaces of care, hospitality, and comfort. Critical to the theme of this session, these spaces and practices are gendered, embodied, they depend on vulnerable spacetimes and 'quotidian' actors, as well as particular ideas of 'culture' and 'nature.' In this paper I will explore how picking at the gendered structuring of Silk Road narratives both requires that we deploy archaeological data in different ways, and also leads to larger-scale untanglings of understandings about large-scale exchange, culture 'contact' and the distinctions between pre-modern and modern worlds.

[242] *An Analysis of Obsidian Consumption in the Postclassic Coatlan del Rio Valley*

This poster presents a technological analysis of obsidian artifacts from two Aztec-period surface collections in the Coatlan del Rio Valley, located in what is now the modern state of Morelos, Mexico. The deposits are from residential terraces collected in 4 x 4 m units. Designs on ceramics collected with the lithics indicate primary occupation after 1400 CE. This study has two primary objectives: first, we technologically classify the artifacts in the collections; second, we evaluate whether there is any evidence to suggest that flaked stone tool production took place on the residential terraces. If blades were produced in these contexts, we would expect to find prismatic blade cores and discarded blades with production errors; if bifaces were produced, we would expect to find thinning debitage. Our analysis will allow us to infer whether the assemblage is indicative of household workshops or goods obtained through a market system. The results of this study will provide a new perspective on exchange during this time, such as the production stage in which lithic materials arrived in the valley. Using prior data from Yautepec, Cuexcomate, and Capilco communities, this research adds to comparative information available about Aztec period household-based obsidian consumption in Prehispanic Morelos.

Frantz, Laurent (Queen Mary University London)

[212] *Ancient Dog Genome Preserved in Tumor Provides Novel Insights into the Domestication of Dogs*

Transmissible cancers are mostly known from Tasmanian devils, soft shell clams and dogs. In dogs, the Canine Transmissible Venereal Tumors (CTVT) manifests as genital tumors and spreads between dogs (usually during mating) by the transfer of living cancer cells. This tumour first originated in the cells of an individual dog, up to 11,000 years ago, and possesses the genome of that founder dog. As such, CTVT cells contain an ancient living genome (the founder's dog genome) that was passed along dogs for thousands of years. Interestingly, with CTVT cells have now infected dogs all across the world, yet the genome of these tumors has largely preserved the features of the founder's dog genome. Here I will present results obtained from novel ancient dog genome sequences that were analysed alongside CTVT genomes. I will show how the CTVT genome can be utilized not only to reveal the evolutionary history of the founder dog but also to provide novel insights into the domestication history of dogs, especially in the Arctic.

[16] *Genetic and ZooMS Identification of Marine Mammal Bone from Norse Sites in Iceland and Greenland: Insights into Historic Ecology and Norse Economies*

Evidence from Arctic and North Atlantic archaeological sites shows marine mammals were frequently used by Norse settlers in Greenland, Iceland and the Faroe Islands. Archaeofaunal assemblages often yield a wealth of complete bones, however, species-level identification is not possible for heavily fragmented specimens. Therefore, specific details about marine mammal utilization are often unquantified and marine species identification largely remains unverified. This paper reveals utility of ZooMS (zooarchaeology by mass spectrometry) and genetic analysis of ancient mtDNA to examine Norse uses of whales at an array of sites in Iceland and Greenland over the course of the Middle Ages (~800–1500 CE). The analysis of mtDNA and collagen collected from these sites yields new information on the importance of cetaceans and pinnipeds during this period. Comparison of samples and their suitability for mtDNA analysis also underscores the loss and degradation of genetic material in rapidly degrading Arctic contexts. With this loss, it is challenging to detect changes in marine mammal utilization and species composition through periods of climate change. Additionally, these data provide critical insight into premodern economies, and a snapshot of mammal community ecology and levels of genetic diversity prior to the advent of industrial-scale exploitation beginning in the 16th century.

[156] *Seismic Survey of Poverty Point Mound A*

Poverty Point is a UNESCO World Heritage Site known for its monumental earthworks. The largest and most significant feature on the site, Mound A, is over 21 meters high and 200 meters long. Currently, it is believed to have been built in three months at most. This supports the idea that there was a central leader directing its construction, a more socio-politically complex society than previous hunter-gatherer populations in North America. Evidence of stratigraphic layering, however, is an indication of a slow mound construction over centuries. Gaining insight of the construction style and timeline of Mound A will lead to an improved understanding of the site. Mound Builders have been known to cap mounds built in stages. If Mound A was built in stages it is likely capped with more dense material than the dirt surrounding it. To better understand the construction history of Mound A, we conducted a seismic reflection survey over the mound. The seismic data had a normal moveout correction, it was stacked, and migrated. Additionally, with the application of quadcopter-based photogrammetry, a three-dimensional digital model of Mound A was developed to display and assist in further understanding of these data.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Frederick, Jennifer, Ray Hewitt (Bureau of Land Management) and Marilyn Walker Cunningham (Bureau of Land Management)**[261]** *Unmanned Aerial Systems in Federal Cultural Resource Management*

Although use of Unmanned Aerial Systems (UAS), or what are commonly known as drones, has become popular among the general public over the years, federal land management agencies are just beginning to realize their potential for cultural resource management. The Bureau of Land Management, Las Cruces District Office (LCDO), has recently obtained UAS resources and trained staff capable of collecting data that is useful for a variety of resource management issues. In particular, the LCDO UAS team has provided high resolution imagery to assist in resource documentation, site monitoring, and mapping of resource degradation. The data collected via UAS has enabled resource specialists to calculate rates of erosion at a damaged Pueblo site situated on an arroyo bank. Areas of the site that are at high risk of being lost to erosion can be targeted using this data. This is one example of the utility of UAS for cultural resource management, but the implications of this technology are enormous for land managing agencies. Large areas can be covered in a short period of time. The data obtained is high quality, allowing the agency to use the best science available for its mission objectives.

Frederick, Kathryn (Michigan State University)**[133]** *Identifying Subterranean Storage Features: A Cautionary Tale*

Recent research in northern lower Michigan systematically tested the ability to identify subterranean food storage features using surface criteria. Subterranean storage features were used during the late Late Woodland period (AD 1200–1600) in parts of the Michigan Inland Waterway. Such cache features prolong the availability of food stuffs and mitigate against the risk of food shortage. This paper discusses the research methodology required for identifying such features. While many are identifiable by their symmetrical circular depression, and apparent spatial clustering, an insufficient number have been ground truthed. Recent fieldwork revealed that identifying subsurface features may be more elusive than believed. Excavation of suspected cache pits resulted in negative results, leading to a re-evaluation of the sampling criteria and methodology, and resulting in a multi-disciplinary approach employing the soil sciences to create a more efficient ground truthing strategy. This presentation discusses the necessity for reliable and efficient ground truthing, and provides a refined multi-disciplinary sampling methodology.

Frederick, Melissa (VCP St. Louis) and Grace Gronniger (VCP St. Louis)**[326]** *Artifact Highlights from the Yeo Site (23CL199): A Kansas City Hopewell Site*

The St. Louis Veterans Curation Program has close to 50 investigations currently being processed in our lab. One of these investigations is from the Smithville Lake Project area in the Kansas City District. This investigation alone contains materials from 27 different sites including the Yeo Site (23CL199) and dates to the late 6th to 7th century A.D. The site was excavated by Kansas State University archaeologists ca. July 1976 and this past year, veteran technician began processing the materials. The technicians came across many diagnostic artifacts, including a largely intact ceramic bowl and cup, ceramic rims, bone awls, and projectile points. Their work combined with the materials still to be processed in our archives will be available on The Digital Archaeological Record (tDAR) and aid future researchers interested in the only known single component Kansas City Hopewell site within Smithville Lake.

Freeman, Jacob (Utah State University)**[105]** *The Effects of Economic Complexity and Temperature on the Long-Term Energy Consumption Dynamics of Human Societies*

Increases in energy consumption correlate with social and political development in human societies, as well as increasing human impacts on ecosystems. Thus, understanding the underlying drivers of energy consumption in human societies may provide insights into the processes of social evolution and rapid social change (collapse). In this paper, we develop a model of energy consumption in human societies based on population size, economic complexity and temperature. We demonstrate the usefulness of the model with global data on contemporary societies. Next, we use a large sample of radiocarbon dates to estimate changes in energy consumption by human societies over the last 8,000 years in Utah. Following the predictions of the model, we use assemblages from Utah caves to measure changes in economic complexity and paleoenvironmental datasets to estimate changes in temperature. We use these estimates of economic complexity and temperature to explain variation in the Utah radiocarbon curve over the last 8,000 years. Our results illustrate the importance of understanding the underlying dynamics of energy consumption in human societies to explain social and political development, as well as rapid reorganization in human social systems.

Freeman, Jacob [105] see Latorre, Claudio

Freeman, Jeremy (Great Basin Institute)**[168]** *Using Rock Art as a Medium for Teaching STEM Concepts*

As budgets grow slimmer and curricula become more rigid, teachers are often faced with the necessity to either eliminate or limit the number of school fieldtrips. With tightened budgets teachers are compelled to choose which fieldtrips to retain and which ones to eliminate. These choices are often based on cost, availability of transportation, or are based on what the teacher hopes students will gain from the experience. The goals of the fieldtrip generally align with the educational guidelines provided by each state. This often means that archaeological modules or archaeology-themed fieldtrips are eliminated or reduced from curricula. Though archaeology-based curricula may not be a teaching priority, the multi-disciplinary nature of archaeology can be easily implemented for STEM concepts. Although most teachers are aware of this they lack the experience to implement these concepts in archaeology-themed modules. This paper describes how two rock art sites were used to teach Montessori students about scientifically-based classifications. First, students were introduced to the process of archaeological classification. Then working in groups students worked together to classify rock art figures. Students were then given an opportunity to refine their classifications through a peer review process and then implement what they had gained from the discussion.

Freeman, Mark (University of Tennessee) and Jeanne Moe (Bureau of Land Management)**[286]** *Project Archaeology: Assessing Paper and Digital Approaches to Online Learning*

Project Archaeology is a comprehensive national archaeology education program, jointly sponsored by the Bureau of Land Management and Montana State University, which uses archaeological inquiry to foster understanding of past and present cultures; improve social studies and science education; and enhance citizenship education to help preserve our archaeological legacy. To date it has reached more than 15,000 educators with curriculum guides, activity guides, and professional development. These educators reach an estimated 300,000 learners each year in classrooms and informal settings.

Since 2003 the Investigating Shelter units—teacher-led and designed for upper elementary to middle school students—have been available both digitally online, and as printed materials. The units present both archaeological practice and discoveries through different types of shelter—a Tipi, a slave cabin, and an Earthlodge. The online version allowed for the addition of interactive elements and media, potentially supporting different learning styles. Based on classroom research, and situated in a broader literature, this paper will discuss the comparative strengths and weaknesses of the digital component and traditional models for teaching archaeology and digital literacy, and consider plans for future assessment.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Freire, Jorge

[78] *The Future of Maritime Archaeology of Portugal: The Strategy for Socialization and Education. The Example of Cascais*
Cascais Municipality has developed a comprehensive program management and valorisation of Underwater Cultural Heritage. Based on Maritime Cultural landscape epistemology it aims to enable a novel approach to integrated management with a dual goal of knowledge and enjoyment. Within methodological lines of this program have grown the actions related to education. From the theory of actor network—has been introduced the theme in the local community, allowing for public enjoyment in situ but, also, through the educational sector of the Museu do Mar Rei d. Carlos. Other related experiences at sea, such as biology and engineering, have created their own sensory elements, developing forms of communication and awareness under “Lab”. Furthermore, within the relationship of identity with memory, we have two shipwrecks with strong historical connections to the Portuguese Armada. This has served as a starting point for awareness-raising initiatives and deeper valorisation of these sites. In addition, we have implemented educational policies following the guidelines set by the Monitoring Committee of the UNESCO 2001 UCH Convention. These educational policies will set the groundwork for project growth through the UNESCO associated schools Network and the network of Learning Cities.

Freire, Shannon (University of Wisconsin-Milwaukee)

[215] *Six Impossible Things before Breakfast: Understanding Space and Place at the Milwaukee County Poor Farm Cemetery*
From 1878 through 1974 Milwaukee County utilized four locations on the Milwaukee County Grounds for burial of more than 7,000 individuals, primarily paupers, the institutionalized, and the unidentified. Two archaeological excavations in 1991 and 1992 and again in 2013 resulted in the recovery of over 2,400 individuals from one of those cemetery locations. A comprehensive understanding of the spatial organization and use life of this site has been complicated by the cemetery's history of anonymization and neglect. Nevertheless, the identification of specific 'keystone' individuals has proved possible, providing a fruitful avenue of inquiry to discern burial patterning and internal dates through comparison with the Register of Burial, a document that outlines date of burial and grave location. Strontium isotope analysis has been successfully utilized as part of a multifaceted tool kit to identify individuals in both expected and unanticipated ways. This paper presents several case studies featuring the contributions of strontium research to successful identifications and thereby our understanding of space and place at the Milwaukee County Poor Farm Cemetery.

[129] *Making an Ancestor at Actuncan: Exploring the Origins, Health, Burial Treatment and Taphonomy of a Late Classic Maya Residential Eastern Structure*

The patio adjacent to the eastern structure of Group 1 at the site of Actuncan served as a burial ground for generations. At least twelve individuals in more than seven graves were buried at one of the oldest residential groups at the site during the Late Classic period (AD 600–900). Eastern structures were used to bury revered ancestors in the Belize River Valley, but nearly all of the Actuncan Group 1 burials were disturbed by later burials. When was it acceptable to disturb an ancestor, and how did appropriate treatment of the dead change after burial? This paper explores the relationship between burial practices and the identities of the dead, including osteological analysis of early childhood health and evidence for diet and migration using strontium, carbon, and oxygen isotopes. The re-use of important places over generations shows how ancestors played a role in maintaining memory in the urban landscape.

French, Kirk (Pennsylvania State University)

[222] *Cheap Beer and Generic Weenies vs. Craft Brews and Artisan Sausages—The Archaeology of Tailgating at Penn State University*
Although arriving early to an event and consuming food and beverages outside of an arena arguably has its origins in ancient Rome and Greece, the popular and ritualized tailgating associated with American college football is a behavior that warrants archaeological investigation. The Tailgating Behavior Project is attempting to better understand these communal events through ethnographic interviews and garbological/archaeological surveys at Penn State's Beaver Stadium at University Park, Pennsylvania. Interviews of tailgaters were conducted on game days at multiple locations that were selected based on parking price (\$20—\$500 per game). The following morning a crew of undergraduates returned to the same areas to record the refuse left behind. The project offers valuable data on consumer behavior while providing a unique opportunity to demonstrate the basics of archaeological research to students.

French, Jennifer (University College London)

[329] *Opening Remarks: The Archaeology and Palaeoanthropology of Non-modern Humans*

The study of archaic hominins (non-modern humans) poses some unique challenges to archaeological interpretation, and relies on close integration of archaeological data with those from other allied fields including palaeoanthropology, genetics, primatology, and ethnography. In this opening paper, I reflect on some of the recent advances and discoveries in these fields which are changing the ways in which we both conduct and conceptualise research in to non-modern humans in archaeology. I then introduce the main themes of the symposium, including models of interaction between different hominin species, the interpretation and analysis of material culture produced by archaic hominins, and the question of the cognitive abilities of non-modern humans and how these can be inferred from archaeological data.

[86] *Tastes of Home: Food Cultures of Roman Britain Auxiliary Soldiers*

This study addresses the influences that culture and ethnicity have on dietary patterns, specifically looking at the variances in food culture amongst the myriad of ethnicities comprising the ranks of the Roman Britain auxiliary troops. The following research correlates ethnic identity with food culture by analysing the variances in archaeological food remains from 15 Roman forts garrisoned by auxiliary troops and comparing these variances to other published archaeological work from throughout the Roman Empire. Faunal data is represented by the Number of Individual Specimens Present (NISP), Minimum Number of Individuals (MNI), and distinguishable butchery patterns. Floral data is represented by varying frequencies of species in the macrofossil plant record. Statistical and graphical representations of both the floral and faunal data test the significance and strength of the outliers and patterns. The results demonstrate statistically significant variations in the faunal data, along with unique patterns in the floral data, suggesting a direct

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

correlation to the cultural regions from which the soldiers originated. This research ultimately demonstrates how the international identities of the Roman Britain auxiliary soldiers are represented through their food consumption patterns in the archaeological record, adding to contemporary food studies of dietary relations to culture and identity.

Friberg, Christina (University of California, Santa Barbara)

[26] *Think Locally, Act Globally: How a Local Perspective Informs the Broader Narrative of Mississippianization in the American Midwest*
The 'Mississippianization' of the Midwest unfolded during the late 11th and early 12th centuries as interactions with Cahokia influenced aspects of local community organization, ceremonialism, material culture, and access to exotic raw materials. For local peoples, these encounters and affiliations also facilitated interactions between Mississippian groups beyond Cahokia. The direct proximity of the Lower Illinois River Valley (LIRV) to the Greater Cahokia area enabled certain social, political, and economic interactions with American Bottom Mississippians that did not transpire with more distant groups, resulting in the closer adoption of Mississippian lifeways than observed further north. However, new data from the Audrey-North site (11Ge20) in the LIRV (AD 1100–1150) illustrate the localization of Mississippian practices in a village uniquely positioned within a vast network of long-distance exchange and sociopolitical interaction. This research adds to the growing narrative of local innovation and interregional interaction in the Mississippian Midwest. This paper further seeks to demonstrate the complexity of cross-cultural encounters and the value of the local perspective.

Fricke, Felicia

[67] *Slavery in the Dutch Caribbean: A Case for the Use of Qualitative Data in Sensitive Archaeological Contexts*
Qualitative data are often overlooked in archaeological research in favour of quantitative data which can provide statistical results. However, there are many contexts where qualitative data (such as oral historical accounts) can provide valuable information on meaning and personal significance. This is beneficial in projects addressing topics such as inequality and colonialism. The author therefore presents qualitative data from her doctoral thesis in order to demonstrate the importance of this sensitive approach, which encourages archaeological research to have a positive social and political impact.

The research discussed here addresses the lifeways of enslaved individuals on the Dutch Caribbean islands of St Eustatius, St Maarten and Curaçao. It incorporates data from material culture, oral history, and osteology into a thematic analysis. Often used in the social sciences, this approach allows diverse datasets to be combined through their organisation into 'themes'. Through this, the researcher gains an impression of the information that is meaningful and important for descriptive purposes.

The author encourages archaeologists to consider qualitative data in their own research, especially the utilisation of oral history interviews which promote community involvement and contribute to the decolonisation of the discipline.

Fridberg, Diana (Proyecto Regional Arqueológico La Corona)

[337] *The Zooarchaeology of La Corona: Sustenance and Symbol*
The tropical lowland surroundings of La Corona support a wide range of indigenous fauna. Zooarchaeological analysis demonstrates that the site's ancient inhabitants made use of this diversity, exploiting many terrestrial and aquatic taxa in subsistence and ritual activity. This paper summarizes major zooarchaeological findings from the duration of the La Corona Regional Archaeological Project. Excavations at La Corona have not targeted areas expected to be "fauna rich" and have produced approximately 5,000 specimens, but this relatively low count belies the interpretive value of the material. Zooarchaeological remains at La Corona from a discrete feasting event and palace middens reveal dietary flexibility and breadth by the high elite, including exploitation of smaller-bodied mammals. Animal bodies in these contexts operate as symbol as well as subsistence. This symbolic role is also present in faunal remains from burials at La Corona, where both fresh- and saltwater aquatic species associate the deceased with the watery Underworld. The diversity of remains found at La Corona, coupled with the rich information that deposits have provided to date, indicate the site's noteworthy potential to inform our understanding of ancient Maya human-animal relations.

Friedel, Rebecca (The University of Texas at San Antonio) and M. Kathryn Brown (The University of Texas at San Antonio)

[76] *Communing with the Gods: The Paleoethnobotany of Fire Rituals*
The importance of fire in Maya rituals is well-known, both archaeologically and ethnographically. Fire, which is symbolic of the life cycle in Maya ideology, has been used as a means of communicating with the supernatural world in order to manage specific aspects of everyday life, such as the success of the agricultural season. In the archaeological record, we find evidence for ancient fires as features consisting mostly of burnt plant remains, some of which resemble modern Maya fire altars both materially and spatially. In this paper we present archaeological and paleoethnobotanical evidence from fire features recently excavated within E-Group complexes at the sites of Early Xunantunich and Buenavista del Cayo. We argue that the characteristics of these features suggest that these fires were ritual in nature. Therefore, the types of plants used to start and fuel these ritual fires likely held special significance to the ancient Maya as they were "sacrificed" to the Gods. Paleoethnobotanical studies are often focused on reconstructing the ancient environment and subsistence strategies. This study highlights the important use of paleoethnobotanical data to shed light on past ritual activities and ideologies.

Fries, Eric (UNLV)

[11] *Testing a Multi-Modal Remote Sensing Approach for Detecting Ancient Maya Sites With Low-Resolution Data*
In the absence of LiDAR and similar high-resolution data products, an alternative approach was developed to model and predict site location information from low-resolution, publicly available datasets such as ASTER, LANDSAT, and aerial photographs. Manipulating and combining the analyses of multiple datasets permits refinement of modeling and detection capabilities. A large database of known sites, in assorted topographic and vegetative conditions and degrees of exposure, was used as a training model to test and improve the accuracy of the method, followed by ground truthing of initial results and subsequent model refinement. In addition to use of this model for detection on its own, the method results could also be used for quickly identifying and targeting areas of interest in higher resolution products such as LiDAR, if and when they become available.

[31] *A Network Model of Co-Rulership and Community Ritual in Teotihuacan: From Neighborhoods to Districts*
Experts remain divided about the nature of the sociopolitical system of ancient Teotihuacan, which was one of the earliest and largest urban civilizations of the Americas. Excavations hoping to find compelling evidence of a powerful dynasty of rulers, such as a royal tomb, keep coming away empty-handed. However, the alternative possibility of a corporate or collective government, perhaps headed by a small number of co-rulers, also remains poorly understood. A third option is that the city's collective government began as a fully decentralized network of neighborhood representatives, but this kind of arrangement seems susceptible to the problems of cooperation and action coordination. Previously we used a computational model to show that in principle this latter worry is unfounded, as long as we assume that the network's topology could be transformed via community rituals and was not strongly subdivided (Froese, Gershenson, and Manzanilla 2014). Here we extend this model to investigate whether

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

centralized hierarchy could mitigate the negative effects of strong divisions. The new results reveal a peculiar synergy between hierarchy and community ritual in that only their combination improved the extent of coordination, which is consistent with portrayals of the elite as religious specialists serving the public.

Frost, R. Jeffrey (California State University-Stanislaus)

[260] *Continuity and Change in Chiriquí Period Village Organization*

Chiriquí Period (700–1500 CE) archaeological sites have been the subject of systematic scientific research for more than 50 years. However, archaeologists are only recently beginning to define and understand regional and temporal variations in artistic styles, settlement patterns, and village organization. In this paper, I summarize emerging patterns in village placement, cemetery organization, and the construction of public space. Continuities in the elements of constructed spaces, such as the use of conical house forms, cobble pavements, and public plazas, endure for the duration of Chiriquí, but the ways that these architectural features were interpreted and arranged changed dramatically, particularly during the tenth and fourteenth centuries, likely signaling the key changes in ideology and social dynamics that occurred across the region.

[41] *New Insights into the Chronology of Late Middle Paleolithic Occupations in Southwestern France*

The southwest of France is well-known for the wealth and number of sites attributed to the Middle Paleolithic. The archaeological sequences reflect an apparent heterogeneity of Neanderthal behaviors, based on the apparent variability of the lithic technological systems adopted by human groups over time. This has led to a range of different interpretations of the archaeological evidence. What is apparent is that a reliable chronology is key if we are to understand Middle Paleolithic lithic variability throughout this time period and its relationship to change in paleoclimate and paleoenvironment. In this study, absolute dates were obtained from several major archaeological sites (e.g. La Ferrassie, Roc de Marsal, La Quina) by applying improved luminescence dating methods. By measuring the time elapsed since minerals were last exposed to daylight, this technique enables the direct dating of sediments associated with archaeological remains and periods of human occupation at an individual site. The combination of luminescence results with other absolute techniques allows us to establish new chronological frameworks for these sites. In this paper, we will present results which provide new insights for our understanding of Neanderthal adaptation strategies, activities and cultural change in European populations during this period.

[185] *Entheseal Changes in Bronze and Early Iron Age Mongolia*

Extensive bioarchaeological research has addressed questions about stress, pathology, and activity in agricultural and semi-agricultural populations throughout the archaeological record, yet comparable studies pertaining to nomadic pastoral and semi-pastoral groups are relatively rare. During the Bronze Age in the Eurasian Steppes, archaeological evidence suggests a transition of lifeways from semi-sedentary agricultural to nomadic pastoralist. Entheseal analyses in bioarchaeology introduce an exciting avenue to ask new questions about the physical effects these lifeways have on those who practice them. This study aims to investigate the extent of enthesal changes among Bronze and Early Iron Age populations in Mongolia as both sedentary and pastoral groups were contemporaneous. Entheses of the upper and lower limbs were scored for 54 individuals dating from the Bronze Age and Early Iron Age. Scores between and within the two periods were compared and enthesal differences between sexes, age, body size, and site location were analyzed. The goal of this study is to answer if there are differences between the two periods and which factors influence the differences.

[140] *Cultural Landscapes of Glass Buttes, Oregon*

Located on the northern fringe of the Great Basin, in Lake County, Oregon, the Glass Buttes volcanic complex is the most important obsidian toolstone source in North America. Glass Buttes obsidian is world renowned because it is colorful, abundant, available in large pieces, and of extremely high quality for making flaked stone tools. Throughout the late Pleistocene and Holocene, Native Americans have continuously used Glass Buttes obsidian, and it was widely traded in the Pacific Northwest and beyond. Glass Buttes obsidian has also been historically instrumental in pioneering archaeological lithic technology research and is of special importance to the modern flintknapping community. Now, new research shows that in addition to being a major obsidian toolstone source, Glass Buttes is also a focal point in a Native American spiritual landscape punctuated by hundreds of rock features. These rock features comprise a complex associated with the prominent Glass Buttes peak. This spiritual landscape overlays the lithic landscape and the two are inexorably linked together. On-going ethnographic research conducted by Native American tribes is revealing another dimension to this important place and elucidates the relationships between the cultural landscapes of ancient times as well as in the present.

[300] *What's a Niche Got to Do with It? Spatial Analysis of Nched Structures at Patipampa and Other Middle Horizon Sites*

Excavations at the Middle Horizon (AD 500–100) capital city of Huari in the summer of 2017 focused on understanding processes of urbanization and the resulting realities of everyday life in the domestic sector of Patipampa. Several of the architectural spaces exposed during excavation were more intensively investigated. This paper focuses on the architectural space containing niched walls in order to understand how the Wari utilized this type of space in comparison to the uses of the other rooms excavated in this residential sector. I will discuss the diversity of materials recovered from the unit as well as compare the ceramic cache located in this unit with one encountered in a different compound. Additionally, I will use the preliminary findings to explore the similarities and difference this space shares with niched structures reported from other Middle Horizon Wari sites.

[129] *Residential Trajectories of Commoner, Elite, and Noble Spaces at Actuncan, Belize*

This paper summarizes the archaeological investigations of ten residential units at Actuncan that likely represented three distinct social strata: commoner, elite, and noble. We explore the trajectories of these residences from the Preclassic to the Terminal Classic period. Data suggest that although political authority in the Mopan River valley shifted throughout Actuncan's long occupation, many commoner residences maintained local identities and residential continuity through time. However, the exact patterns of prosperity varied between residential groups. In contrast, elite residences show evidence of abandonment and reoccupation while the noble residence was occupied for a relatively short period. Elite and noble trajectories appear to have been strongly tied to shifting power structures, whereas commoner trajectories were less dependent on political transitions. Understanding strategies employed by residents during shifts in local political authority is an important foundation for interpreting broader political dynamics, including relationships between residents and rulers, and how rulers were able to create, legitimize, and maintain power and authority.

[47] *Identifying Lithic Technological Strategies at the Late Paleoindian Sentinel Gap Site Using 3D Digital Morphometrics*

The Late Paleoindian Sentinel Gap site, located along the Columbia River in central Washington, provides a unique data set of bifaces and projectile points/knives (pp/ks) from a single occupation episode dating to c. 10,200 radiocarbon years BP. In addition to over 60 partial and complete bifaces and 11 pp/ks recovered during excavations, 15 lithic debris accumulations interpreted as debitage "dumps" were excavated. The refitting of flakes from one of these features revealed the original core as well as compelling evidence that at least some dump features represent single biface reduction episodes. Most recovered pp/ks were manufactured from non-local materials, indicating construction elsewhere and curation on-site. This study aims to identify technological techniques associated with biface and pp/k manufacture using data derived from 3D models. In addition, the potential for different knappers is examined using 3D digital morphometrics. Comparison of the technological details of lithic tool reduction strategies within the samples of locally manufactured bifaces and introduced pp/ks provides fresh insights on lithic tool manufacturing strategies and the applicability of 3D digital morphometrics as an investigative tool.

[141] *Investigations on the Chaîne Opératoire, Technique and Practice: Formative Period Pottery Workshops in the Cochabamba Valley*

The High Valley in Cochabamba yields two different ceramic wares, which on first sight may demonstrate a homogeneous society. But by investigating the chaîne opératoire, the two wares each show a different set of variables on technique and practice in the production process, and, therefore, must have been produced in separate workshops. Although there is a functional aspect of each ware on the one hand, the differences can also be interpreted as expressions based on a "habitus" of technical practices and routines of physical behavior on the idea of how to produce an object, on the other hand. Thus, the wares may be linked to different social, economic or political groups inhabiting the valley, which maintained a local distribution system for the acquisition of each of the products.

[231] *Approaches, Rationales, and Challenges to Maintaining Site Inventory in the National Parks*

For over a century, the National Park Service (NPS) has worked to preserve natural and cultural resources in more than four hundred park units for future generations. In addition, the National Historic Preservation Act (NHPA) requires all federal agencies to maintain inventories of their historic properties. For decades, the NPS has relied upon three inventory systems: The List of Classified Structures, the Cultural Landscapes Inventory (CLI), and the Archeological Sites Management Information System (ASMIS). These systems began decades ago as paper files and continue today as electronic databases accessed via the internet.

The inventories allow NPS to maintain and update critical information including resource type, location, condition, threats, and disturbances. As the relevant technologies continue to develop with what seems like increasing rapidity, even these relatively modern databases are being rapidly rendered obsolete. The NPS Cultural Resources, Science, and Partnerships directorate has begun work to modernize these systems, and to facilitate their further integration with GIS technologies and other NPS programs, and incorporate elements of the now defunct Ethnographic Resources Inventory (ERI). This paper discusses the issues faced as NPS updates these crucial tools for a second century of service.

[268] *Warren Grove Survey and Evaluation Project: A Study of Historic Charcoal Production within the Pine Barrens of New Jersey*

Throughout two field seasons (2015–2017), the University of Montana and GAI Consultants (UM-GAI) conducted a Section 110 archaeological survey and evaluation project at Warren Grove Gunnery Range (WGGR), Burlington County, New Jersey (9,911 acres). The UM-GAI team completed archaeological survey of all accessible areas of the range making it one of the most expansive survey projects within the New Jersey Outer Coastal Plain. The study identified and evaluated a total of ten sites and recommended two sites relating to historic charcoal production as eligible for listing in the National Register of Historic Places. UM-WG-1, a probable collier's camp site, and UM-WG-9, a cluster of at least 8 potential charcoal kiln remnants, were investigated through a combination of historical background research, pedestrian survey, close-interval shovel testing, geomorphological sampling, and ceramic analysis. These sites represent a mid-to-late nineteenth century charcoal production complex, only a few of which have been archaeologically investigated in this portion of the Pine Barrens. With the collaboration of academic and business institutions, the Warren Grove Survey and Evaluation Project serves as an example of an efficient approach to the identification and protection of cultural resources in a region relatively unknown to the archaeological community and the public alike.

[139] *Going Retro: Reconstructing NMAI Collections Histories*

The National Museum of the American Indian and its predecessor, the Museum of the American Indian, have long suffered a reputation for poorly documented collections. Assuming that documentation never existed or was at some point discarded; researchers have been largely unable to take full advantage of the scientific and research value of NMAI collections. In 2010, NMAI staff began a project to overturn this reputation. By retroactively implementing an accession lot system and creating virtual accession files of digitized documents, we have reunited documentation stored in NMAI archives with associated objects. The project reverses the typical methodology of starting with an object and searching for its related documentation; instead, we have systematically reviewed archival documents, matched them with objects, and connected sometimes far-flung and previously lost bits of information. As a result, we have uncovered detailed and complex connections between our objects and hundreds of collectors and archaeologists not previously visible in our museum catalog, all of which is readily available to researchers. To date, 88% of NMAI collections have been re-associated with their documentation, providing us with new understandings of our collections and creating new opportunities for research use of NMAI's vast collections.

[53] *Resurrecting Mother Washington: The Dissonance of Washington's Youth*

Powerful messages concerning ideal gender roles feature prominently, if latently, in Washington biographies. Most contemporary narratives suggest that George succeeded despite the "selfish" efforts of his widowed mother. Archaeological investigations at Washington's childhood home underscore the dissonance between the material culture of his youth and popular stories about his upbringing. This site was wrested from strip mall development thanks to the persistent efforts of preservationists. Archaeological investigations supported by The George Washington Foundation were designed to discover the location of the remains of Washington's original boyhood home. However, these excavations have accomplished something far more significant: they are producing copious evidence that demonstrate adroit management of the household and plantation by mother Washington. Despite these discoveries, narratives that dismiss mother Washington's efforts not only persist, but continue to thrive; the legacy of a powerful, patriarchal political environment.

Gallareta Cervera, Tomás (Kenyon College) and Brett A. Houk (Texas Tech University)

[30] *A Tale of Two Cities: A Comparison between Preclassic and Classic Formation of Two Maya Cities*

Research on ancient Maya cities is generally modeled after large sites with massive architecture, dynastic burials, and written records documenting the activities of divine rulers. However, the development of these cities is the exception, rather than the norm, since the majority of Maya sites did not reach such enormous proportions, yet many of them likely qualified as cities from a functional standpoint. Hence, a research on non-massive cities, "from the bottom up," is crucial to understand the development of ancient Maya urbanism. Investigations at the archaeological sites of Chan Chich, in northwestern Belize, and Kiuic, in the Puuc zone of the Yucatán Peninsula, have recovered evidence of emerging and established monumental precincts during the early Middle Preclassic and Late Classic period, respectively. The different social and political developments of these sites are in tandem with the construction of architectonic complexes defined as royal courts, the heart of ancient cities. In this paper, using stratigraphic, architectural, and artifactual evidence, we examine the role of non-dynastic cities in the urbanization of the Maya lowlands. Research at these two sites illustrates distinct social processes, at different times and places, both of which resulted in local traditions of cities and court authority.

[51] *Ceramic Manufacturing and Distribution Networks in Early Jamaica: Interpretive Implications of LA-ICP-MS and NAA Analyses on Coarse Earthenwares from 18th-Century Plantation Contexts*

Archaeologists have long been intrigued by hand-built, open-fired coarse earthenwares found on 18th- and 19th-century sites occupied by enslaved Africans in the Caribbean and United States. In Jamaica, these hand-built coarse earthenwares, often referred to as Yabbas, were likely manufactured and marketed by enslaved specialists. Several different varieties of glazed and/or kiln-fired coarse earthenwares, not easily assigned to a known ware-type, are also routinely found in plantation contexts. Their origins, and the role they played in local markets, are debated. This poster explores the interpretive implications of the results of laser ablation-inductively coupled plasma-mass spectrometry (LA-ICP-MS) and neutron activation analysis (NAA) on nearly 400 coarse earthenware sherds from eighteenth- and early-nineteenth-century plantation contexts across Jamaica. Using comparative datasets from the UK, US, and Caribbean, we pinpoint sources for the coarse earthenware and explore the temporal and spatial patterns in the use of earthenware from different sources. Finally, we assess how changing consumer demand by both enslaved Africans and plantation owners influenced ceramic manufacturing and distribution networks in early Jamaica.

Gallivan, Martin (William & Mary)

[119] *Violence, Dislocation, and Social Transformation in the Chesapeake, AD 1300–1500*

Beyond the Mississippian frontier in Southwest Virginia, Algonquian and Siouan societies in the Chesapeake pursued their own culture histories, evidently independent of developments in the American Midcontinent and Southeast. And yet, between AD 1300 and 1500 a set of social changes cascaded from the Blue Ridge Mountains to the Chesapeake Bay which may correspond with developments highlighted in this symposium. How did the late precolonial collapse, social fragmentation, and violence of the broader Eastern Woodlands intersect with Chesapeake culture histories? This paper begins to assemble the evidence from which to explore this question. In the Ridge and Valley province, ceramic distributions point toward rapid population shifts while stoutly-fortified settlements began to appear with frequency by the fourteenth century. Piedmont and Coastal Plain communities

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

also began to raise palisades at the same time that they adopted communal burial practices, ramped up maize production, and constructed ceremonial ditch enclosures at central places. Not all of these developments link directly to the collapse of Mississippian mound centers and resulting social dislocation, yet it is also clear that Native societies in the Chesapeake were entangled within historical processes which played out over multiple scales.

[162] *Recent Research on the Formative and Early Classic Periods in the Yaxhom Valley, Yucatán*

Previous investigations by the Bolonchen Regional Archaeological Project demonstrated that the Valle de Yaxhom, in the Puuc region of Yucatan, was a significant locus of monumental construction during the latter Middle Formative and early Late Formative. Two large acropoli, the Acropolis Yaxhom and the Acropolis Lakin, were previously mapped and tested, but the nature of accompanying residential construction remained unknown. Two other sites with megalithic architecture, Nucuchtunich and Nohoch Cep, suggested a transitional occupation from the Late Formative to the Early Classic period based upon limited reconnaissance. LiDAR coverage of the region in May of 2017 facilitated the identification of a great many more structures as well as contextualizing them in their physiographic settings. As a result, we identified two large platforms that were anomalous in form and located close to the Acropolis Lakin as candidates for test excavations. Five other sites were intensively surface collected. Given our uncertainty as to the date of the megalithic sites and our lack of an Early Classic ceramic sample, we also targeted the main civic structure from Nucuchtunich for testing. This paper reviews the results of this work together with comments on the ceramics collected.

Gamble, Lynn (University of California, Santa Barbara)

[170] *Origin and Use of Shell Bead Money in Southern California*

The Chumash Indians of southern California made and used beads of stone, bone, and a variety of species of shell for over 8,000 years. A noted shift in shell beads occurred about 800 years ago with the appearance of a new bead type, cupped beads, made from the thick callus of the *Callianax biplicata*, a portion of the shell that had previously not been used. These types of beads were common throughout the Chumash region and elsewhere during the Late period and have been identified as money beads on the basis of their distributions in cemeteries and other contexts. They are more widely distributed than other bead types, indicating that most individuals had access to them, although certain individuals were buried with hundreds or thousands of cupped beads while others had significantly fewer. Ethnographic and ethnohistoric accounts document that shell bead money was used for many types of transactions, including the purchase of subsistence items such as fish, acorns, seeds, and otter skins; most manufactured goods, including steatite ollas and digging stick weights; and some services, such as transporting people or goods in plank canoes between the islands and the mainland.

Gamblin, Katherine (Florida State University)

[102] *An Analysis of the Industrialization of the Bourbon Industry in Kentucky: 1870s-Prohibition*

Bourbon has been distilled in Kentucky throughout the state's history and has influenced how cities in Kentucky have grown over time. Throughout the 1870s, a major rise in the number of distilleries in the state grew as wealthy patrons began buying up small, family-run distilleries and expanding them into a large-scale, booming industry that aimed to answer the demand for bourbon throughout the US. In order to fit the demand, bourbon barons began crafting ways to make more gallons per day, allow for consistency in flavor during aging from barrel to barrel, permit production to occur at a year-round basis, and ensure that customers would be consuming safe liquor. This poster presents some of the archaeological and historical evidence of innovations that allowed for the industrialization of the industry by looking at the Old Fire Copper (OFC) Distillery site, the R.P. Drake (later Turner Springs) Distillery site, and the Eagle (later Green River) Distillery site. Particular attention will be paid to how the sites adapted to the Prohibition period in the state of Kentucky and the US.

Gancz, Abigail (University of North Carolina, Chapel Hill)

[47] *Raw Material Quality and Spatial Patterning at Shawnee-Minisink*

The Shawnee-Minisink Site is one of the most spatially intact Paleoindian sites in eastern North America. Located in the Upper Delaware Valley of Pennsylvania, the site includes an occupation area spanning 60 x 95m which dates to circa 12,900 CalBP. Over 18,000 point-provenienced lithics have been excavated from a 360 meter-squared area. The lithic artifacts consist primarily of the local black flint as well as of various exotic cherts. Because it is well dated, spatially intact, and likely represents a single occupation, the Shawnee-Minisink site is an optimal candidate for spatial analysis research. As part of an ongoing project examining the Paleoindian level of Shawnee-Minisink site, this work investigates the spatial patterning of lithic raw materials which may relate to the organization of activity areas, variation in tool manufacturing techniques, and group composition.

Gandy, Devlin and David Robinson (UCLAN)

[214] *The Gordian Knot: Novel Methods for Digitally Identifying, Defining, and Separating Unique Rock Art Elements*

In rock art research the stratigraphy of a rock art panel can offer great insight into the temporality of a panel, which can then inform many other aspects of analytical inquiry. Yet, making the necessary distinctions between elements is often difficult—as images fade and are worn by time, or the subjective nuances of the recorder. This paper explores novel means of identifying, defining, and separating unique rock art elements in digital space within different digital methodologies.

[218] *Digital Public Archaeology at Homol'ovi: The Arizona State Museum's Contributions to the Digital Humanities*

Under the guidance of E. Charles Adams and Richard C. Lange, the Homol'ovi Research Program (HRP) was one of the first archaeological research programs in the southwest culture area to incorporate three-dimensional computer aided drafting (3D CAD) into their archaeological practice. By the adoption of a 3D modeling strategy, the HRP was able to foster concurrent developments in new media technologies to better share archaeological research with the general public. Through the use of 3D modeling of deposit-based archaeological data, digital conjectural reconstructions, animations, and even virtual reality applications have been utilized to both further the interpretation of the archaeological record and share this record with an interested public audience. The experiences resulting from this effort serve as a model of a variety of best practices and lessons learned for future research in digital public archaeology.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Garay-Vazquez, Jose (University College London), Michele Wollstonecroft (University College London) and Dorian Fuller (University College London)

[86] *"Tell me what you are eating and I tell you who are you": Differences in Subsistence Systems of Elite and Non-Elite Gamo Society of the Ethiopia Highlands during Historical Times*

There is little archaeobotanical data from Ethiopia, in this presentation, we will be comparing samples from two historic domestic archaeological sites spanning from late seventeenth centuries to the late eighteenth century A.D. within the same environment (Gamo highlands in Southern Nations, Nationalities, and Peoples Region (SNNPR), Ethiopia) with the intention of examining status differences through subsistence remains. The food habits of past human societies are of importance because the act of cooking is a central task for humans, and various social phenomena influence the activities of food procurement and production. The research question guiding this investigation is What status differences can be identified between Gamo Mala and Gamo Tsoma-mala society through the archaeobotanical analysis of charred plant remains, and to what extent does this information reflect aspects of social identity and community boundaries". The status differences were not identifiable since the archaeobotanical assemblages were composed of similar taxa. Detailed examination of samples using scanning electron microscope analysis provided data of processing practices, and cooking preferences of tuber foods from non-elite contexts on the southwestern highlands. The presence of cotton in both archaeological sites raises the possible cultivation of a cotton species indigenous to the highlands.

Garbellano, John Michael and Christopher Wolff (University at Albany)

[50] *Maritime Archaic Spearpoints: A New Examination of Their Context and Chronology*

This research focuses on the morphology, chronology, and provenience of nipple-based spear points found in Newfoundland and Labrador. Nipple-based points are primarily thought to date between 7500–6000 B.P. and are associated with the early Maritime Archaic tradition, Newfoundland and Labrador's earliest inhabitants. A recent find of a nipple-based point at the Stock Cove site (CKAI-3) in eastern Newfoundland suggests that, based on a series of new AMS dates, the chronology of this point type either extends deeper into the Archaic period or eastern Newfoundland was colonized earlier than previously thought. Lithic analysis of the Stock Cove artifact will be discussed and the results will be put into the larger cultural context of Maritime Archaic lithic technology and what it might mean about the colonization process of eastern Newfoundland.

[209] *Towards a More Systematic Approach to Analyzing Artistic Influences: A View from the Pacific Coast of Southeastern Mesoamerica*

Artistic evidence of interactions is among the most salient and most debated in terms of the relationships that it represents between different polities and regions. Traditionally, the focus of analysis is on stylistic and iconographic influences and a discussion of retention of original meanings or evidences of disjunctions. Based on my research on the topic of Classic Period interactions from the Pacific Coast of Chiapas, I have come to the conclusion that our perspectives are much too narrow. In Mesoamerica, color, composition, medium, style, and iconography among other elements of art must be taken in consideration as well. Each of these components can be potentially leveraged to signify specific meanings and relationships in artistic form. In this paper, I would like to propose a more systematic approach to understanding interactions and their artistic manifestations using evidence from the Pacific Coast of Chiapas and Guatemala as a case study.

[169] *Bioarchaeological Insights into Social Resilience and Change during the Postclassic at the Ancient Purépecha City of Angamuco, Michoacán, Mexico*

Little is known about the impact of Purépecha Empire formation on the skeletal health and well-being of communities within the core zone of the Lake Pátzcuaro Basin, Michoacán, during the Postclassic period (AD 1000–1500). Here we report on recent bioarchaeological investigation of 19 mortuary contexts from the ancient Purépecha city of Angamuco located within the imperial heartland. We have identified at least seven different mortuary treatments from Angamuco and we compare these contexts with what is known from other Tarascan sites. A total of forty individuals were examined from the burials, including four males, thirteen females, thirteen individuals of indeterminate sex, and ten subadults. All of the individuals were examined for evidence of nonspecific indicators of physiological stress (porotic hyperostosis, dental enamel defects, periosteal reactions), disease and systemic stress, traumatic injury, degenerative diseases, and body modification, among other conditions. These pathological conditions, coupled with the results of stable isotopic analysis of bone carbonate and collagen, yield important insights regarding the impact of empire formation on the Angamuco population.

Gardner, A. Dudley (Western Wyoming College)

[43] *Apishapa Structures and Subsistence Strategies in Purgatoire Canyon Colorado*

From 2002 to the present we excavated five Apishapa Structures in the Purgatoire Canyon. This presentation will provide a brief synthesis of structural types and food ways of the sites inhabitants. It appears that maize and a variety of wild plants made up a considerable portion of the Apishapa diet. Analysis of the floral remains from these sites indicate the sites inhabitants relied heavily on available edible plants but also consumed exotics such as pecans. This brief synthesis puts forth our initial analysis of macro and micro floral samples from excavations along the Purgatoire River.

[91] *Creating 3D Models of Artifacts and Features using Photogrammetry*

During the 2015 and 2016 University of Texas at San Antonio Field Schools we made use of new low-cost photogrammetry techniques to document metates and rock ring features at Early Agricultural period sites along the Upper Gila River in southeastern Arizona. We systematically photographed a number of ground stone tools and rock ring features using point-and-shoot cameras. These photos were then processed using Agisoft's Photoscan software to produce colored 3D computer renders of the artifacts and features. We were able to demonstrate that our method produces models that are accurate to the shape and scale of the physical items. This method also allowed us to document them with minimal impact to the features and without collecting the artifacts. While still in the early stages of development, this approach may have long-term potential to enhance archaeological documentation and collaboration.

[183] *Where Are the Boot Marks? Evaluating the Overmountain Victory National Historic Trail*

The Overmountain Victory National Historic Trail is a Revolutionary War route used by an estimated 1,040 patriot militia during the Kings Mountain campaign of 1780. It totals approximately 272 miles from the mustering point near Abingdon, Virginia, to Sycamore Shoals (near Elizabethton, Tennessee); from Sycamore Shoals to Quaker Meadows (near Morganton, North Carolina); from the mustering point in Surry County, North Carolina, to Quaker Meadows; and from Quaker Meadows to Kings Mountain, South Carolina. Almost none of the route exists as an original and discernible trail and there are many places where the route has been heavily disturbed or encroached upon by modern land uses. There are currently 19 National Historic Trails in the United States, delineated to follow as closely as possible the original overland or water routes important to the history of the nation. How do you best evaluate, protect, and preserve not only an extremely long linear cultural resource but also one that has little to no physical manifestation?

[183] *Chair*

Garraty, Christopher (Logan Simpson)

[69] *Non-native Incorporation of Native American Technologies in Historic Period Arizona*

Numerous archaeological studies of European-Native American interaction in the Americas during the colonial and historic eras focus on the processes by which Native American households and communities procured and adopted (or resisted the adoption of) European technologies and material culture. Comparatively few studies have addressed instances in which non-Native households incorporated Native American technologies and material culture. Recent archaeological investigations in Tempe and Phoenix, Arizona, show that many non-Native households procured and used Native American pottery during the late 1800s and early 1900s, including undecorated pots designed for domestic use. Some pots might have been obtained as souvenirs or art pieces, but the majority appear to have been obtained for utilitarian purposes, indicating a clear recognition and appreciation of the technical qualities of Native American-made pottery among many non-Native households. Examinations of the ceramics and their recovery contexts, in conjunction with a review of the historic record, help clarify the technical attributes, chronology, ethnic affiliations, and the social and economic contexts in which non-Native households adopted and used these Native American technologies.

Garrett, Zenobie (New York University)

[197] *The Diachronic Landscape of Ceremony at the Irish "Royal" Site of Dun Ailinne*

The site of Dún Ailinne (Knockaulin) in County Kildare is one of four major ceremonial sites of the Irish Iron Age. Although numerous ceremonial centers of various size dotted the Irish landscape, Dún Ailinne, along with Teamhair (Tara), Emain Macha (Navan Fort), and Crúachain (Rathcroghan,) stand out due to their size and location. These characteristics indicate that the sites would have been major foci of ceremonial activity, and would have impacted the ceremonial activity itself. Although excavations have largely focused on the sites themselves, archaeologists have long acknowledged the importance of the larger "sacred" landscape in which these major ceremonial sites are situated, postulating that their proximity, visually and physically, to other sites in the landscape would have had an important effect on the performance and experience of ritual and ceremony. As such, these landscapes are not "monolithic" entities of sacredness, but have unique developmental trajectories that may have played an important role in shaping and reflecting emerging ideas in the local community. This paper seeks to understand how the development and evolution of the larger landscape would have impacted the local performance and experience of ritual and ceremony at Dún Ailinne.

Garrido, Francisco (Museo Nacional De Historia Natural) and Diego Salazar (Universidad de Chile)

[100] *The Diversity of Mining Infrastructure and Organization in the Southern Provinces of the Inca Empire*

Despite the importance of mineral and metal production for the Inca's political economy in the Collasuyu, mining infrastructure during this period encompasses a range across scale, spatial structure and labor organization. This diversity reflects both the variability of Inca state interventions and independent enterprises working outside of the imperial political economy. Generally, state mining is evidenced by Inca-style architecture, including formal public spaces or plazas; social-aggregation practices for political ends; Inca-sponsored productive rituals; a functional differentiation in the spatial organization of the campsite (which also reflects social differences within the mining community); a focus on ore extraction rather than multicrafting; and a state-sponsored nonlocal provisioning of agricultural produce.

Yet simultaneously and intriguingly, some sites do not fit these parameters, and maintain a continuity with previous forms of mining exploitation. In some cases, such sites of typically small-scale mining represent the prevalence of local groups of aspiring elites that required a constant supply of sumptuary goods for their social differentiation. Thus, this presentation argues that these different mining modes represent the diversity of economic conditions during the Late Horizon in the distant provinces of the Inca empire.

Garrison, Amanda (Central Michigan University)

[205] *Bones at the End of River Street: A Graphic Ethnography of a Bridge in Lansing, Michigan*

There are bones of a bridge in Lansing exposed on the muddy banks of the Grand. In this cityscape, a "Sortatropolis", a once urban space now emaciated and exhausted. There would have been nothing special about this bridge to make its 1987 demolition, its absence, a remarkable tragedy, except that its disappearance can be directly connected to the long exhale of this once thriving capital. The Sortatropolis is haunted by the ghosts of auto industry moguls, lumber barons, and boot-strapping millionaires, and in the mix of dirt and time, the stories of those that escape history's telling outnumber those presented; the same ghosts labored for the sake of those who are privileged to make their own destinies. There are politics to and in forgetting. This paper will be a graphic presentation of the story of this bridge: the River Street bridge in this Rust Belt city of Lansing, Michigan reveals the interests embedded with racism, misogyny, class politics, and the State, along with concrete and steel that used to span the Grand River and connect the city to itself. The bones mark the consequence of change, the making of "progress," and an unleashing of capitalism on the Sortatropolis.

[80] *Living in a Contested Landscape: Adapting Settlement Decisions in the Buenavista Valley, Peten, Guatemala*

Conflict pervaded the civilizations of ancient Mesoamerica from an early time. In the Maya lowlands, the physical vestiges of defensive fortifications date to the Late Preclassic period, while textual evidence of conflict comes from the subsequent Early Classic period. This paper examines settlement changes within the context of a contested landscape. The Buenavista Valley, largely controlled during the Classic period by the kingdom of El Zotz,

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

extends out west from the great city of Tikal. However, the Preclassic city of El Palmar preceded this kingdom, established by the first lowland settlers on the western edge of a large wetland. Originally considered a minor site, LiDAR data reveals that El Palmar was in fact a sizeable early community that would have rivaled the emerging kingdom at Tikal. El Palmar was suddenly abandoned between AD 100–200 and a century later, elite settlements emerged on heavily fortified, escarpment edge hilltops. The pervasive Preclassic residential platforms on the valley floor were never matched during the Classic period. Household construction techniques varied by elevation during the Classic period, suggesting that the geopolitical interactions of the local dynasty at El Zotz did in fact affect the greater population and not simply elites.

Gary, Jack (Thomas Jefferson's Poplar Forest)

[39] *Regular Irregularity: Archaeological Evidence at Thomas Jefferson's Poplar Forest for Intersecting Garden Traditions*
The geometric structure of 17th through 19th century designed landscapes in Virginia has been well documented archaeologically. The composition of elements in these landscapes shows how their designers manipulated geometric forms, architectural conventions, and standardized measurements to impose order in the garden. By the end of the 18th century fashionable American gardens tended towards irregular picturesque compositions, however the arrangement of individual garden elements to achieve that effect was rooted in the established traditions of geometric regularity. The interplay between these two styles can be seen explicitly at Poplar Forest, Thomas Jefferson's retreat and plantation in Bedford County, Virginia. Not only does the overarching structure of the designed landscape exhibit this quality but archaeological evidence also shows how geometric forms structured individual garden elements. Archaeological remains of "tree clumps", a staple of picturesque English landscapes, reveal Jefferson's use of various geometric forms to create a naturalistic composition. This paper will contextualize this archaeological evidence through a synthesis of period gardening treatises in Jefferson's possession and an examination of his other designed landscapes. The result is a more nuanced understanding of the evolution of early American garden design.

Garza, Elisandro (CUNY)

[77] *Spondylus Shells in Pre-Columbian Copan: Their Religious and Economic Significance*
This work offers a brief discussion on the importance of *Spondylus princeps* and *Spondylus calcifer* in the ceremonial, and economic life of ancient Copan. Archaeological contexts at the site indicate that the uses of *Spondylus*, either as non-worked valves, or finished artifacts was restricted to a small high-status sphere of Copan society. Additionally, contextual data indicate that the *Spondylus* was used in a least three ritual activities: as offering in burials; caches; and canceling of building. These uses of *Spondylus* shells appear to be constant from the Early Classic to the Late Classic period. The lack of information from the Postclassic period, hinders conclusions regarding the commerce of *Spondylus* shells during this time. The two species of *Spondylus* analyzed in this work are found in the Pacific Coast, from California down to Ecuador. Defining the chronology of the *Spondylus*, chain of production, and the frequency of acquisition offers an opportunity to add new data on economic, and political interaction between Copan and others neighboring settlements in the Maya and non-Maya area.

Garzon-Oechsle, Andres (Department of Anthropology, Florida Atlantic University)

[324] *Results of Survey and Analysis of Manteño Archaeological Sites with Stone Structures in the Upper Río Blanco River Valley, Manabí, Ecuador*

This paper will present the results of a three-year effort to survey and document Manteño archaeological sites with stone structures within the limits of the Upper Río Blanco River Valley in Southern Manabí. The region is home to 40 known Manteño sites with more than 100 stone structures across the river valleys of La Encantada, Las Tusas and La Mocora that carve the foothills of the Bola de Oro mountain. The Florida Atlantic University Archaeological Fieldschool in Ecuador, directed by Valentina Martinez, recorded 23 of these sites and 94 stone structures in the summers of 2015, 2016 and 2017. The analytical portion of this study utilizes the dimensions and features along with the location and orientation of each structure to create categories that will serve to better understand how the Manteño utilized their space. Geostatistical tools in GIS helped create categorical maps for interpretation. Our results suggest that the Manteño maximized their ability to utilize the limited available flat space and densely occupied the area. These Manteño settlements in the foothills of Bola de Oro are not small peripheral occupations but mirror the large dense populated foothills of other Manteño centers such as Jaboncillo y Hojas in central Manabí.

Gastelum-Strozzi, Alfonso (UNAM), Ingris Peláez Ballestas (Servicio de Reumatología Hospital General de México), Jesús Zarco Navarro (Centro Inah-Michoacán, Instituto Nacional de Antro) and José Luis Punzo Díaz (Centro Inah-Michoacán, Instituto Nacional de Antro)

[55] *Tomography and Photography Studies of Funerary Urns from South Central Michoacán México*
This poster presents the results of the application of computational methods to classified archaeological deposits contained within cinerary urns. The method uses morphological properties and textural parameters to create quantitative descriptors that can be related to archaeological interpretations of the objects. The Pre-Columbian cinerary urns were discovered in the municipality of Huetamo, Michoacan, Mexico. The method uses information obtained from a Computed Tomography scan of each urn and photography of fifty bones separated into five sets classified by anthropology experts with respect to their color and the relation of the color to the temperature at which the bone was burned. From the scans and photographs, topological, morphological, and textural parameters are obtained. The CT-scan provides form and textural information related to density values and the photograph provides mean color values of each set of bones related to the temperature. Finally, the relation of voxel intensity (CT-scan) is related to bone color image textures. To simplified this section of the research a phantom is proposed where an artificial cinerary urn was build using bones from the excavation providing with an urn where the bone color of each volume obtained from the CT-scan is known.

[94] *Making Theory Fun: Combining Archaeological Theory with Active Learning Exercises in Teaching North American Prehistory*
Active learning opportunities within undergraduate archaeology courses enable students to move beyond memorizing culture history. In a North American Archaeology course taught at the University of South Florida, we combine concepts from archaeological theory with active learning exercises specific to North American culture areas. Examples include students weighing the costs and benefits of hunting megafauna with atlatls from varying distances, playing a game centered on Great Basin-themed optimal foraging decisions, recreating a Pacific Northwest Coast potlatch, and partaking in a Cahokian game of chunky. By incorporating a variety of active learning opportunities, with lectures that welcome student discussion, and readings from popular archaeology topics, a North American Archaeology course becomes an interactive opportunity for undergraduate learning and community-building.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Gauthier, Nicolas (Arizona State University)

[221] *Agricultural Niche Construction in Roman North Africa: Simulating Irrigation and Deforestation on a Desert Margin*

Earth system models are climate models capable of simulating land-atmosphere feedbacks and the complex biogeochemical and biogeophysical processes that drive them. These models are particularly well-suited to studying the impact of preindustrial land use on regional climate change, as they explicitly resolve the impacts of irrigation, deforestation, and agropastoral production on the flow of water and energy between the land and atmosphere. Generating realistic maps of past land use is a difficult task, so paleoclimatologists often rely on static, coarse-resolution estimates derived from present-day conditions. In this poster, I present agent-based modeling as an alternative method to generate dynamic land-use maps that continuously contribute to and adapt to environmental variability. Using Roman North Africa as a case study, I show how such a coupled modeling approach is indispensable for understanding the coevolution of human societies and their natural environments.

Gauvin, Ingrid-Morgane (University at Albany, SUNY)

[22] *Technological Know-How and Lithic Production in the Mid-Hudson Valley: Observations from the Terminal Archaic*

Know-how is an archaeologically observable counterpart of the knowledge of technological agents, as it is the material capacity of an agent to apply known techniques. Both elements are not necessarily in exact equivalence, as an agent's aptitude and willingness to apply techniques may not reflect their full knowledge. Know-how is identifiable by the stigmata left by applied techniques on artifacts and materials. Separating aptitude (or "skill") from the examination and interpretation of know-hows can allow for a non-hierarchical and non-classificatory examination of technological variation, allowing for the comparison of seemingly different technological traditions without overt judgement of past agents. This paper examines and contrasts spatio-temporal trends of technological variation within Terminal Archaic Narrow Stemmed Point Tradition (4 500 calBP- 3 200 calBP) and Broadpoint Tradition (3 900 calBP—3 200 calBP) lithic assemblages in the mid-Hudson valley of New York, with a focus on the utilization of Normanskill chert.

[22] *Chair*

Gavette, Peter (National Park Service)

[179] *Resurrecting Bentley: Etiology of a Surgeon's Detritus*

Seven years ago the National Park Service rehabilitated several of the oldest remaining buildings at Point San Jose (now Fort Mason) in San Francisco. On October 25, 2010, while monitoring lead remediation efforts around the former Army hospital (1863–1903), archaeologists discovered a pit containing hospital waste which included the commingled human remains of multiple individuals. Diagnostic bottles recovered from the feature support a deposit date of between 1860 and 1890. Historic research on the Point San Jose hospital and staff reveals that Edwin Bentley, a surgeon stationed there between 1869 and 1875, was responsible for the illicit burial. Further forensic research on the human remains provides amazing insight into the origin and identity of the deceased, as well as the developing field of anatomy in the late 19th century.

[179] *Chair*

Gay, Brandon and Paul Goldstein (UC San Diego)

[100] *A Sense of Place: A GIS Study of Late Intermediate Period and Inca Settlement Patterns in Moquegua Peru*

This study investigates geospatial relationships among Late Intermediate Period (1000–1400 CE) and Inca settlement patterns within the Moquegua River drainage of southern Peru which were first identified in the 1990s by the Moquegua Archaeological Survey (MAS). A prevalence of walls and defensive locations and a largely vacant no-mans-land between downvalley Chiribaya and Chiribaya-San Miguel and upvalley Estuquiña settlements likely evidences an increased level of inter-cultural conflict in the region during the LIP that may have continued in the Late Horizon. Inca influence locally appears to be indirect, and primarily through interaction with some Estuquiña sites, suggesting connections with highland partners. Using viewshed and comparative least-cost analyses in ARC-GIS, this study explores how Chiribaya, Estuquiña and Estuquiña-Inca settlements interacted or competed for the surrounding river valley through their direct or indirect control of resources, and their ability to defend against each other. Through the identification of these prime factors, this study aims to understand how the placement of settlements corresponds to the larger web of social interactions.

Capriles (Department of Anthropology, Pennsylvania State)

[105] *Assessing Impacts of Late Holocene Environmental Variability on the Demography of Prehispanic Societies in Northern Chile (18°-29°S)*

Agricultural communities began to spread over much of the Atacama Desert (18°-29°S) at 3.5 ka BP, triggering unprecedented levels of population growth. In inland areas and particularly along desert oases, this phenomenon featured increasing complexity in food-production systems and sedentary lifestyles with population aggregating in architecturally complex villages. Whereas, littoral populations maintained marine foraging and fishing strategies with limited inland food-resources. Both lifestyles persisted up to the European conquest, which came on the heels of significant population decline throughout the entire continent. Here, we bring together paleoecological, archaeological and paleodemographic evidence to explicitly explore the role of past ENSO-induced climate changes in determining spatial convergences/divergences in demographic trajectories, temporal continuities/discontinuities in resource exploitation (i.e. subsistence-strategy), and technological/cultural innovations of Atacama Prehispanic populations. Results show that over the previous three millennia these societies underwent important centennial-scale demographic fluctuations. As agrarian and foraging strategies are highly sensitive to water availability and ecosystem productivity in this arid bioclimate, both coastal and inland groups experienced boom-bust cycles. Changes observed during the last 3.5 ka BP correlate with variations in the activity/intensity of ENSO, a major driver for modern bioproductivity and variations in hydroclimate. [164] *The Kaiparowits Puebloans: Kayentan or Virgin Migrants?*

More than 50 years ago archaeologists identified a high-density of Puebloan habitations on the Kaiparowits Plateau in southern Utah. Analysis of pottery from these habitations by James Gunnerson and Florence Lister resulted in conflicting interpretations of cultural affiliation. Gunnerson argued for a Virgin affiliation whereas Lister argued for a Kayentan affiliation. Lister's interpretation triumphed and the Puebloan occupation of the Kaiparowits

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

was attributed to migration from the south during Pueblo II. Architectural and artifactual evidence fails to support a Kayentan migration but rather an expansion of Puebloan groups from the west and southwest.

Geiger, Elspeth (University of Michigan)

[36] *Contact, Exchange, and Identity Revisited: A Closer Look at Michigan's Garden Peninsula Archipelago*

There has been a growing recognition within studies from across the US that the dynamics of contact-period interactions are not a homogenous process. Instead, the diversity inherent in these interactions points to the need for further research on local manifestations of these European and Native contact situations.

In this paper, I analyze material recovered from the Summer Island Site off the coast of Garden Peninsula in MI. The Anishinaabeg communities within Northern Michigan were connected through complex kin networks and trade relationships that allowed clans to take advantage of new trading opportunities. The goal of this paper is to discuss archaeological implications of ethnic and social boundaries at the periphery of the Straits of Mackinac.

Gentil, Bianca (The Pennsylvania State University)

[48] *The People's Response to Change: Settlement Patterns During the Classic-Postclassic Transition in the Puebla-Tlaxcala Valley, Mexico*

The Puebla-Tlaxcala Valley in Central Mexico went through significant settlement, economic, and political shifts during the Classic-Postclassic transition, yet there is no clear picture of what happened during the Epiclassic (600–900CE) or the Early Postclassic (900–1250CE) outside of large primary sites such as Cacaxtla and Cholula. A multi-faceted study was developed to target this issue, with a particular focus on rural sites that supported known large centers. Since the early years of archaeology, settlement pattern studies provide a regional perspective necessary to fully comprehend the social, economic, and political dynamics of a particular society. Based upon surveys conducted in the 1960s and 70s, presented here are the results of a key-site survey of 20, small, mid-level, and large sites in the Puebla-Tlaxcala Valley and the analysis of site associated surface material. This survey provides a foundational step in the overall goal of anchoring the chronology, exchange networks, and understanding of the overall development of the region during a time of strong social, ecological, and economic fluctuation.

Gentil, Verna (Georgia State University)

[330] *Settlement Patterns at the Ancient Maya Port Site of Conil*

The ancient Maya port site of Conil is located in the modern community of Chiquilá on the north coast of Quintana Roo, Mexico. In 1528 Francisco de Montejo, a Spanish conquistador, reported that Conil was a large town consisting of 5,000 houses. William Sanders was the first archaeologist to work at the site in 1954, but the site core was not formally mapped until 2005 by Glover. Further work was conducted in 2014, 2016, and 2017 as part of El Proyecto Costa Escondida (PCE). Data collection and analysis for these surveys was conducted through the use of advanced geospatial technologies. Based on the findings of this work, Conil appears to have been one of the largest settlements along the northern coast of the Yucatan during two periods of occupation, the first dating to the Late Preclassic and the second, dating to the Late Postclassic. This paper will discuss the settlement patterns observed at this site as they relate to the periods of occupation and known sites within the region.

George, Nicole (University of Nevada, Reno)

[92] *A Geochemical Analysis of Concave Base and Western Stemmed Tradition Projectile Points in Southeastern Oregon*

The relationship between concave base and Western Stemmed Tradition (WST) projectile points in the Great Basin is not well-understood. They may represent sequential Late Pleistocene technologies, coeval technologies used by different ethnolinguistic populations, or different components within the same toolkits. To explore the latter possibility, I collected geochemical sourcing data for both types of artifacts recovered from three adjacent valleys in southeastern Oregon: (1) Warner Valley; (2) Guano Valley; and (3) Hawksy Walksy Valley. I compared source provenance to determine if there are significantly different toolstone conveyance patterns, with the expectation that there should be no differences if concave base and WST points were part of the same toolkit. The results provide insight into what the two Late Pleistocene technologies may tell us about how and when groups colonized the northern Great Basin.

[13] *Tracking Changes in Nearshore Ecology over 2000 Years in Southern Yap, Western Caroline Islands*

The initial human settlement of Yap, Western Caroline Islands (northwest tropical Pacific), is one of the least understood in Pacific prehistory, although new archaeological research is beginning to address this issue. Excavations at the southern site of Pemrang in Yap, western Caroline Islands (northwest tropical Pacific) have revealed multiple rich, well-stratified deposits of shell and pottery spanning the known occupation sequence of Yap and extended the date of early human activity by ca. 400 years to ca. 2400–2200 cal BP. A stark difference in the type of shell recovered from two deposits, supported by a suite of new radiocarbon dates, suggests rapid environmental change in southern Yap. This paper presents preliminary results of isotopic analysis (^{13}C and ^{18}O) of radiocarbon dated shell to identify nearshore ecological conditions in southern Yap at the time of initial human settlement.

[23] *An Integrated Approach to Ceramic Material: An Example of Interdisciplinary Research on Commingeoise, a French Late Medieval Ware (13th–16th c.)*

"Commingeoise", a Late Medieval domestic ware of southern France, is a very current but problematic diagnostic artifact, as it has thus far been poorly defined. The chronology of its production is first of all not precisely established. Furthermore, a simple macroscopic description has historically been used to identify this ceramic type. A more rigorous characterization is necessary in order to clearly define Commingeoise. Finally, although dispersed throughout a large and relatively well-defined geographic area, no production workshop of the Commingeoise has been identified so far, and the domestically utilized pots characteristic of this ceramic type are generally produced locally. Thereby, this research discusses new developments in answer to the questions on its origins, homogeneity, and organization of production and diffusion.

To answer all these different issues, and to develop a broader understanding of Commingeoise ware, this research employed multidisciplinary methods. A typo-chronological study was carried out to standardize chronological data on Commingeises. It was completed by technological study and experimental archaeology to identify the technologies used in the chaîne opératoire of this ceramic type. In addition, bulk chemical analysis (of both ceramics and sampled raw materials) and petrography enabled advancements in characterizing and determining the origins of Commingeoise ware.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Geurds, Alexander (University of Oxford)**[108]** *The Original Is (Still) the Winner: Replicas and Fakes as Bound by Authenticity*

Authenticating relations are defined by artisanship, temporality, value-making and ethnographic authority. These relations are visible in contemporary museum settings as well as in the art world as such, and may be particularly poignant in the case of the Caribbean and Central America with its diverse manifestations of emotive styles and materials such as wood and stone. Historically deep and widespread, 19th and 20th century Central American trafficking of pre-Columbian things was tied to foreign-owned plantations and centred on San Jose, Costa Rica, leading to a scarcity of a 'Nicaragua' provenance indicator in current-day museum signage. Eventually, archaeology emerged from such uncontrolled collecting and now works to counter looting, yet market demand for objects remains stable.

This paper explores the ongoing resilience of authenticity and its persistence in the global art market. I argue that this is in part due to the ascribed inspirational value Amerindian objects hold in modern art, as argued in the notion of primitivism. Primitivist art is seen in opposition to modernity, ascribing it legitimacy through temporal or cultural distance. With some exceptions, programs focussed on revitalizing artisanship and producing high-quality copies or working on stylistic and technical innovations are countered by rendering this primitive authenticity.

Ghaheri, Fatemeh**[86]** *Neo-Assyrian Empire: Agriculture and Agricultural Strategies Based on Phytolith Analyses*

The Neo-Assyrian empire is known as one of the major empires in the Ancient Near East. Ruling in Mesopotamia during the Iron Age, they had a well-organized agricultural system. In this paper, I will utilize phytolith analyses to investigate the impact of the Neo-Assyrian empire on agriculture and land-use. I will compare the elite-controlled agriculture with the crop choices of peasant farmers. It's likely that the peasant farmers would have chosen more resistant and reliable types of plants for their own food which would reduce the risks of unexpected natural disasters such as droughts and floods. In order to conduct this research, I use phytolith data from Iraqi Kurdistan, at on-going excavations of Assyrian-period sites in the Peshdar Plain, including two main sites: Gird-I Bazar and Qalat-I Dinka, directed by Professor Karen Radner, University of Munich. These two sites are very promising for this research. Gird-I Bazar is a non-elite farming and production village, and Qalat-I Dinka is an administrative center being sustained by Gird-I Bazar. Thus, the two will cover the empire's impact on agriculture and the farmers' choices in cultivation and production.

Ghasidian, Elham (Leverhulme Centre for Human Evolutionary Studies, University of Cambridge) and Saman Heydari-Guran (Leverhulme Centre for Human Evolutionary Studies)**[174]** *Cultural Diversity in the Zagros Mountains and the Expansion of Modern Humans into the Iranian Plateau*

Located in western Eurasia, at the crossroads of human migrations out of Africa during the Pleistocene, the Iranian Plateau stands at the centre of models of anatomically modern human dispersals out of Africa. This paper aims to understand the cultural diversity among the first modern human populations in the area, and the implications of this diversity to evolutionary and ecological models of human dispersal through the Iranian Plateau, by re-examining four key UP lithic assemblages from the sites Warwasi, Yafteh and Pasangar of the west central and Ghār-e Boof Cave of the southern Zagros Mountains of Iran.

The results demonstrate that there is a significant degree of cultural diversity rather than homogeneity among the UP throughout the different Zagros habitat areas as a result of the relative geo-topographical isolation of the different areas occupied favouring different ecological adaptations. Based on the chronological and geographical patterns of Zagros UP variability, we propose a model of an initial phase of localised and patchy development of the early UP in the region, with limited subsequent contact among these first UP groups. This has important implications for the origins of biological diversity in the early phases of modern human colonisation of Eurasia.

Gibb, James (Smithsonian Environmental Research Center)**[42]** *Pig Manure and Swizzle Sticks: Defining an Archaeological Site Type*

Low-density scatters of historic-era artifacts can be interpreted as byproducts of manure spreading. These are pieces of trash inadvertently mixed with food refuse that was fed to pigs. While most of these artifacts were not ingested, they became mired in the resulting manure which farmers spread on their fields as fertilizer. Whether or not a scatter of late historic artifacts represents manure spreading or some other kind of behavior can be tested archaeologically, and that is the subject of this paper. Archival data confirm that archaeological findings at the Ellsworth K. Russell farm site (18AN917) in Maryland connect World War II era commercial and institutional kitchens in Washington, DC, with the feeding of pigs and subsequent use of their manure on nearby fields.

Gibbon, Elizabeth [211] see Jennings, Justin

Gibbons, Kevin (University of Maryland)**[195]** *Pervasive Landscapes of Inequality: Want and Abundance within a Hyperobject*

As globalization matures, environmental, social, and economic factors continue to create ever-expanding landscapes of inequality. Among these drivers, human-driven environmental degradation has, for centuries, operated as a significant producer of inequality. Anthropogenic climate change today perpetuates and strengthens these multi-generational, regional-scale phenomena of landscape change. These processes, such as sediment erosion in Iceland during the past millennium, create a 'second nature' landscape of human design that create and reinforce resource scarcity and thus, social and economic inequality. These 'second nature' landscapes are self-perpetuating; their cause so viscous and nonlocal that they regularly defy our perception. Timothy Morton has referred to objects such as climate change as 'hyperobjects.' This paper discusses the implications of hyperobjects for archaeology and historical ecology in the context of the long-term roots and intersectional character of resource justice issues. Further work to understand and contextualize the multi-generational human-environmental feedbacks that perpetuation landscapes of inequality and resource scarcity has the potential to generate insights into contemporary dilemmas and provide archaeologists with anchors for advocacy strengthened by data over the longue durée.

[275] *The People of Solomon: Performance in Cross-Cultural Contacts between Spanish and Melanesians in the SW Pacific 1568–1606*

In 1568, 1595 and 1606 Spanish expeditions out of Peru explored the Solomon Islands (S.W. Pacific) with the intention of establishing colonies. The motivations for these voyages were an uneasy amalgam of ambitions for Imperial and familial advancement, attempts to find the gold mines of Ophir, and religious fervor for converting indigenous populations. Despite repeated historical retelling, little attention has been paid to the structures of the cross-cultural encounters described in the original narratives. Ethno-historical analysis reveals an extraordinary diversity of responses in these interactions, from prosaic trading, through to willful acts of physical and sexual aggression, and highly charged spiritual contests. While the Spanish presence was largely ephemeral, with even the nascent colonies lasting only several weeks, the sometimes dramatic shifts in status from transitory explorer, to colonist, to survivor often resulted in similarly significant transformations in relations with indigenous groups. Beyond the documentary record, the archaeological record also shows evidence of longer-term repercussions and attempts by indigenous groups to mitigate these transitory exchanges. In particular this paper will follow in the tradition of Australian Pacific ethno-historians such as Denning and Clendinnen in exploring the nature of performance within these cross cultural encounters.

Gibson, D. (El Camino College)

[37] *When Irish Eyes View Maya Classic Period Political Systems*

Several debates have endured for decades within the field of anthropological archaeology as to the character of lowland Classic period Maya political organization. Scholars have been struck by the contrast between Maya regal-ritual centers possessed of impressive monumental architecture with the minimal references from the documentary record to any kind of bureaucratic organization. There is disagreement as to the scale of the larger Maya polities and whether or not some polities had begun to move away from kinship as a central organizing principle. There are even more fundamental disagreements as to whether some or most Maya Classic period political systems could be termed states, and if so, the degree to which political power was centralized in the institution of kingship.

The political systems of early medieval Ireland resemble those of the Classic period Maya on many grounds. The scalar, organizational and demographic attributes of Maya and Irish political systems will be compared systematically in order to tease out the factors that may account for their similarities. Models pertaining to chiefdoms and states will be evaluated as to their suitability.

[224] *Late Holocene Oyster Reef Development and Its Impact on Calusa Natural Resource Utilization, Estero Bay, Southwest Florida*

The Horseshoe Keys are an extensive oyster reef ecosystem within manageable paddling distance from Mound Key, Estero Bay, Southwest Florida, the site of the Calusa's political center beginning ~AD950. The Calusa thrived in this bay, partially due to the natural resources available, including these oyster reefs. Sediment cores from this region show a rich history of reef development dating to ~2200 yBP. The reefs exhibit an ecological succession shifting from a vermetiform gastropod community to oysters ~600 yBP, a time when Calusa exploitation of oysters began at Mound Key. Reef history varies between the northern and southern regions of Horseshoe Keys. Northern reefs developed upon mangrove peats and began their history with a rich molluscan fauna indicative of a higher, near marine salinity. Alternatively, the southern reefs developed upon a graminoid marsh with subsequent bay and reef faunas dominated by brackish mollusks. These differences suggest that the Estero River was a formidable freshwater source near Mound Key with more marine conditions located short distances away within the reef tract. Studying these gradients from the geological perspective combined with findings from the archaeology of Mound Key allows for a holistic understanding of environmental change and resource utilization by the Calusa.

[88] *Close-Range Photogrammetry Applications in Outdoor Forensic Scene Documentation*

The use of close-range photogrammetry (CRP) for 3D documentation is becoming a standard practice for archaeological site documentation. Less explored, however, is the utility of CRP to document forensic scenes, especially those involving skeletal remains. Since digital camera documentation is already a standard practice at forensic scenes, additional data captured for CRP can be included alongside standard site photography. The purpose of this research is to demonstrate the utility of incorporating CRP into already established scene documentation protocols. To exhibit the process of outdoor scene documentation, three mock scenarios using faux human osteological material were created in a typical Central Florida pine flatwood environment: limited and large surface scatters, and a partial exhumation. Each scene was documented with a digital camera, both hand-held and mounted, as well as with and without ground control points. Overall, the 3D models constructed of the burial proved to be more conducive to CRP due to the uniformity of the ground surface. The models constructed of the ground surface scatters proved more difficult to create due to the complex nature of the ground surface vegetation. Additionally, an overview of best practices for field data collection, post-processing standards, and output capabilities will be further discussed.

Giersz, Milosz (University of Warsaw)

[211] *The Force Awakens: The Nature and Chronology of Wari Presence in the Huarmey Valley*

Since the fundamental work of Dorothy Menzel, it has been suggested that a new center of power and prestige arose on the North-Central Coast of Peru during the late Middle Horizon, and that its focal point was probably located in the Huarmey Valley. Unfortunately, this hypothesis has not been empirically confirmed for more than 40 years, due to the lack of strong evidence based on systematic archaeological research. Since 2010 an international team of scholars performs multidisciplinary research at Castillo de Huarmey, a Middle Horizon coastal provincial center and Wari necropolis, where imperial mausoleum with the first undisturbed Wari high elite women's multiple burial was discovered. Using a broad methodological spectrum, including bioarchaeological and biogeochemical analyses, archaeometry, geoarchaeology, 3D HDS scanning and architectural analysis, the archaeologists brought to light local Middle Horizon cultural panorama and the nature and chronology of Wari imperial presence in its northwestern province.

[201] *Slavery and Colonialism: Selectively Embracing and Erasing the Past in The Gambia*

Banjul was founded in 1816 as part of the British efforts to block the slave trade on the Gambia River. A planned urban center, the city developed around a series of neighborhoods designated as colonial, merchant, and African laborer spaces. Amongst the most prominent settlers were the Aku (Liberated Africans) from Sierra Leone and French traders from Goree who were instrumental in the growth of the colonial economy. The Banjul Heritage Project seeks to highlight contributions of the different residents to Banjul to the unique character of its neighborhoods, through community engaged research. This was at odds with the former Jammeh government which sought to exploit the nation's connection to the slave trade via Alex Haley's Kunta Kinte while erasing most physical traces of the nation's colonial past in the capital. Entire narratives have been created and imposed on the landscape around Kinte's home village of Juffure, and remnants of British rule in the capital were systematically removed. This paper addresses some of the challenges encountered during three field seasons in Banjul including the absence of an engaged community in the face of a rapid dissolution of a resident population and the legalized destruction of colonial period sites.

[105] *Contrasting Human Demography Trends between Hunter-Gatherers and Farmers as Response to Climate Change: Central Western Argentina as Study Case*

The Late Holocene archaeological record of central western Argentina shows a mosaic of human strategies, ranging from farmers to hunter-gatherers. This presentation evaluates if differences in subsistence practices among groups in a similar biophysical environmental generated different demographic and socio ecological responses to climatic change over the last 3000 years. We use radiocarbon dates as a proxy for human population size and growth rates and ^{13}C and ^{15}N stable isotopes on human bone as proxy for human diet. We observe correlations between these proxies in relationship to the paleoecology of the region. We expect a stronger increase in radiocarbon frequency (SPD) in "northern farming areas" than in "southern hunter-gatherer" areas. On the other hand, a decline of radiocarbon date density will start around ca. 500 years BP in all areas but more abrupt falls could be recorded in "northern farming areas". This drop in density is discussed in relationship with LIA climatic pattern. In terms of human diet, we expect decreasing diversity as the SPD curve approaches its peak and then "collapses".

[332] *Prehistoric Use of the Wind Creek Locality at Fort Riley, Kansas*

Fort Riley Army Installation in northeastern Kansas is bordered by Wildcat Creek, a tributary of the Kansas River that has a high density of prehistoric sites, including Smoky Hill hamlets and base camps. We review the CEMML surveys and site exams along Wind Creek—a tributary of Wildcat Creek—that have produced an unexpected density of upland prehistoric sites.

In this context, we discuss the prehistoric sites types found along Wind Creek and explore how they are part of settlement patterns within the larger Wildcat Creek watershed. We also examine differences in the artifact assemblages from 40 sites along Wind Creek, including the presence/number of hafted bifaces, scrapers, expedient tools and various types of debitage. Notably, the diagnostic hafted bifaces found along Wind Creek indicate that the area was used, at least sporadically, during the Archaic, Woodland and Late Prehistoric periods. A number of scrapers found at sites along Wind Creek conversely indicates the importance of hide-processing or perhaps wood-working in the area. We suggest that the Wind Creek locality contained important resources, perhaps available seasonally, that were exploited by prehistoric groups with habitations and base camps along Wildcat Creek.

Gill, Lucy (University of California, Berkeley)

[263] *Towards a Nonlinear History of Lake Cocibolca, Nicaragua*

Traditional narratives within Nicaraguan archaeology, based on primarily ethnohistoric rather than archaeological evidence, have privileged the arrival of external actors from Central Mexico at the expense of indigenous developments and have emphasized imposed change rather than situated continuity. Especially given that as archaeologists, our primary sources are material culture, we should approach mobility from a materialist engagement with the flows and hardenings of matter, *sensu* Manuel De Landa. This framework will allow for more nuanced interpretations of multidirectional movement, as well as an acknowledgement of the emergent properties that may have arisen from these interactions. Such a nonlinear approach will require a redefinition of the spatial logics of orientation posited by culture-areas, aided by employing the concept of landscape as defined by historical ecology. It will move towards a re-entanglement of humans and environments, which I argue are enmeshed and inseparable. My research centers around Lake Cocibolca, tracing flows of lacustrine resources between the multiple communities of practice situated around and within it and the sedimentation of these flows in the landscape. It is an explicit attempt to illustrate the vital role of multiple forms of localized movements, which have been overlooked in favor of unidirectional trans-isthmus migrations.

[302] *Reflectance Transformation Imaging: New Methods in Documenting Preclassic Maya Graffiti from Holtun, Guatemala*

In the late 19th century, explorers identified graffiti etched in stucco walls of residences, palaces, and temples in the Maya Lowlands. By the mid-20th century, scholars acknowledged that the ancient Maya produced these incised images. Today, archaeologists struggle with documenting these instances of graffiti with precision and accuracy, often relying solely on to-scale line drawings to best represent the graffitied image they see before

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

them. These images can be complex, multilayered, and difficult to see so identifying the sequence of creation of the incisions can be challenging. Reflectance Transformation Imaging (RTI) is a method that uses a moving light source and photography in order to visualize, interact with, and analyze a three-dimensional object in a two-dimensional image. Performed on a series of 20 unique graffiti from the Maya archaeological site of Holtun, RTI showed promise as a viable technique for documenting and preserving graffiti as cultural heritage and for providing new information about an enigmatic aspect of Maya archaeology. Additionally, RTI is compared to other common methods used to document incised graffiti in the Maya lowland area including to-scale line drawing, tracing, photogrammetry, and scanning to determine what unique information, if any, can be gained using this method.

[41] *Shedding New Light on Upper Paleolithic Cultural Landscapes of Northern Mongolia*

Ongoing research on the Pleistocene of northern Mongolia has revealed intriguing patterns in the Upper Paleolithic cultural landscapes of the region. The distribution of sites suggest that maintaining social networks was potentially as significant as subsistence and shelter considerations for these early nomadic hunter-gatherers. In 2017, fifteen new Upper Paleolithic sites were documented in the Ikh Tolboriin Gol (Big Tolbor River, n=45) and Naryn Tolboriin Gol (Narrow Tolbor River, n=9) valleys of the greater Selenge River Basin that feeds Lake Baikal farther north, bringing the total number for the Tolbor locality to 83 sites (including 29 sites from the neighboring Kharganyn, n=17, and Altatyn, n=12, rivers). Site distributions indicate a settlement preference for south- and east-facing slopes, warmth from solar exposure and shelter from cold northern winds, with prominent viewsheds of surrounding terrain for game monitoring, and locations near either mountain passes or confluences with the Selenge River, or secondary and tertiary drainages, for maintaining social networks.

[156] *The Rings of Poverty Point, UNESCO World Heritage Site: A Geophysical Investigation.*

The concentric ring features at the Poverty Point World Heritage site are monumental structures a kilometer and a half in diameter at their widest point. Though these impressive structures went unnoticed for many years after the identification of the area's other archaeological resources, they are now recognized as a unique attribute of an already remarkable site. Here, we use multiple geophysical methods to attempt to characterize the construction of these features. Initially assumed to have been created in a single construction episode, we argue that these earthworks experienced several iterations before appearing in their current configuration, and what we see now is the most recent stage of a more dynamic process. We also use these methods to evaluate prior claims of other features present within, under, or on top of the rings to assess whether there is evidence of habitation on the rings.

[221] *Paleotemperature Reconstructions of the Upland United States Southwest for the Last 2,000 Years*

While paleoclimate reconstructions have improved across the last decade, the data and models are often still difficult to access, process, and interpret. However, improvements in these techniques, and the increasing breadth of paleoclimatic proxies available have furthered our understanding of the effects of climate-driven variability on past societies. Here we introduce a model being implemented by the SKOPE Project—Synthesizing Knowledge Of Past Environments. This application (openSKOPE.org) allows users to select a geographical extent and time interval, and subsequently obtain paleotemperature reconstructions for a given climate parameter. We use pollen data from the Neotoma Paleocological Database (neotomadb.org) to produce low-frequency temperature reconstructions from the Modern Analog Technique (MAT). MAT builds a relationship between modern climate data and associated modern pollen spectra, and relates this pairing to fossil pollen assemblages based on the use of an appropriate multivariate distance metric. While the application is designed to cover the continental United States, our initial efforts focus on the upland United States Southwest during the last 2000 years. The MAT reconstructions can be used to modify productivity reconstructions for temperature-sensitive plants such as maize within social-environmental models, and to explore a variety of questions surrounding social and cultural responses to climate change.

[91] *Similarities and Differences Between Upper Gila and Mimbres Valley Ceramics in Southwestern New Mexico*

Although both the Mimbres and the Gila valleys are within the Mimbres region and are not far apart, they seem to have rather major differences in the numbers of rooms per room block, the numbers of room blocks per site, and the designs painted on Mimbres black-on-white pottery. In this poster, we report similarities and differences between Mimbres Valley (MV) and upper Gila/western Mimbres (UGWM) pottery designs. We start by defining and quantifying style elements seemingly more common in the UGWM—herringbone lines, triangular faces with white circle eyes, rim triangles, square scrolls, rim band number, and absence of figures. To determine if these elements truly are more common on UGWM pottery, we analyzed bowl data in several ways. First, we examined every documented bowl excavated from UGWM sites to measure element frequency. Then, we observed the presence/absence of these elements on bowls sourced to the UGWM through NAA, regardless of where they were excavated. Finally, we analyzed a sample of bowls excavated and sourced to the MV to determine if these elements appear at the same frequency as on UGWM bowls. Ultimately, we hope this study will illuminate why these differences between valleys might have occurred and their significance.

[13] *Illuminating the Obscure: Using Legacy LiDAR Data to Define and Interpret a WWII Airfield on the Island of Tinian, Commonwealth of the Northern Mariana Islands (CNMI)*

Tinian International Airport in the CNMI is a repurposed portion of West Field, a WWII U.S. airbase constructed in 1944 for B-29 operations against Japan. In 2017, HDR conducted a cultural resource inventory for proposed airport infrastructure improvements, focusing on West Field and the adjacent Japanese-built Gurguan Point Airfield. Survey was complicated by dense secondary forest that obscures the two airfields, rendering many features invisible from the air. To assist with mapping these features, legacy LiDAR data collected in 2006 was obtained from the USACE. Although these data required considerable processing and classification prior to use, they allowed mapping of large features with greater speed and accuracy than could be accomplished in the field. Additionally, 21 LiDAR anomalies identified as potential features were uploaded to tablets used to navigate in the field. Consequently, the most common anomalies (“10m-diameter round pits”) were verified as bomb craters created during the U.S. invasion. Recognizing that clusters of craters should indicate heavy bombardment of a specific target, HDR investigated a cluster in the LiDAR data and located

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

a previously unidentified Japanese gun position. This demonstrates the economic and scientific value of older “found” datasets for documenting and interpreting cultural features large and small.

Gilmore, Zackary (Rollins College) and Kenneth Sassaman (University of Florida)

[95] *Clay Resource Variability and Stallings Pottery Provenience along the Savannah and Ogeechee Rivers*

An understanding of the raw materials available to ancient potters is essential to archaeological considerations of vessel production and provenance. Consequently, the collection and analysis of raw clay samples has become a common component of such studies. This poster presents the results of compositional analyses of clays from along the Savannah and Ogeechee Rivers in Georgia and South Carolina via petrographic point-counting and neutron activation analysis (NAA). These analyses were conducted as part of a larger project focused on reconstructing the ceramic social geography of Late Archaic Stallings societies, makers of North America's oldest pottery technology. While multiple studies have demonstrated the feasibility of geochemical sourcing in other parts of the American Southeast, this is the first such investigation centered in the Savannah River Valley and the first systematic attempt to determine the provenance of Stallings vessels. Our results show that clear patterned differences in the mineralogy and chemistry of clay resources exist both between Savannah and Ogeechee Rivers and along the length of the Savannah. These data suggest a high potential for not only distinguishing between local and nonlocal vessels but also determining the direction (i.e., upriver versus downriver) of pottery movement.

Gingerich, Joseph A. M. (Ohio University)

[124] *Modeling Discrete Paleoindian Work Areas*

At many archaeological sites, discrete concentrations of artifacts or the clustering of similar tool types are often interpreted as individual work areas or evidence of specific activities. Using sets of refitted artifacts from the Shawnee-Minisink site, representing individual knapping and tool use events, I examine the relationship between known work areas and areas with varying artifact densities, where activities are less defined. By examining the relationship between refit distance, artifact density, raw material use, and the spacing of features the location of certain features or activity areas may be predictable at other hunter-gatherer sites. These results are considered in concert with the duration of site occupation and the spacing of activity areas at other Paleoindian sites.

Giomi, Evan (University of Arizona)

[184] *The Chronology of Goat-Springs Pueblo*

The site of Goat Springs Pueblo, in Socorro County, NM, is unusual for a relatively low density of artifacts compared to a large investment in architecture at the site. Consequently, the development of a site chronology is necessary to establish whether the low density of artifacts is attributable to a short period of occupation (or series of short occupations)—despite the considerable investment in architecture—or if another explanation is necessary. Complicating the construction of a chronology for the site is the difficulty in using conventional ceramic typologies at Pueblo IV and early Colonial Pueblo sites in southern New Mexico. While the Rio Grande Glaze Ware sequence has chronological utility for sites in northern New Mexico, the chronological associations of the ware are much less secure for sites in southern New Mexico. As such, careful examination of stratigraphy, non-local diagnostics, and possible building events is necessary to establish a chronological sequence for Goat Springs Pueblo. This research is also potentially useful in a wider sense for improving the chronological utility of the Rio Grande Glaze Ware sequence at sites in Southern New Mexico.

[125] *Thieves, Stowaways, Hitchhikers, and Hangers-On: The Commensal Niche in the Prehistoric Caribbean*

Prehistoric commensal animal relationships are understudied for the Caribbean, with little explicit consideration for the defining attributes of the insular commensal niche or what taxa may be rightly considered commensal. Here, I address these issues by clarifying the nature of Caribbean commensalism with respect to synanthropy, domestication, animal management, and phoresy. I consider which vertebrate and invertebrate taxa most likely enjoyed commensal relationships with humans in the pre-Columbian era and argue that many native mammals were probably ill-suited for synanthropy, in contrast to certain birds, reptiles and invertebrates. The more prominent mammalian commensals in the Caribbean are introduced synanthropes—species which were likely transported to the islands specifically because of this relationship and the degree of mutualism it conferred.

[75] *Defensive Landscape and the Naturalization of Social Inequalities in Southwestern Colombia (2200–1800 BP)*

The prehispanic societies from the Cauca river Valley, Colombia, have been portrayed as classical examples of the development of political complexity caused by intergroup conflict for basic resources in constrained environments. However, the existence of warfare in the region itself has not been backed by strong archaeological evidence. The re-analysis of the earth structures of the archaeological site of Malagana, in southwestern Colombia, suggest the existence of regional warfare, which provided the social context for the institutionalization of hierarchical positions. The spatial arrangement of the defensive structures in Malagana became both political and ideological strategies to mask and naturalize relationships of inequality. This was achieved by segregating and limiting the access of most of the population to public areas.

Giron-Ábrego, Mario (Boston University)

[48] *Points of Early Human Mobility: A Preliminary Synthesis of Paleo-Central American Sites*

This poster addresses an understudied area relevant to the initial peopling of the Americas: what are the earliest indications of human activity in Mesoamerica (particular emphasis on Guatemala)? Its geographic location and its relatively narrow expanse make the southern half of Middle America the natural stage to funnel terrestrial and coastal/riverine routes of early human migrations. Despite this consideration, archaeological research targeting Paleoamerican horizons [pre-12,800 BP] in this area has only witnessed intermittent treatment, in part due to a rich tradition intensely focused in Maya archaeology, mainly in Guatemala and Belize. An intriguing aspect of the Paleo-Central American legacy is the coexistence of two great contemporary lithic traditions of the American continent: South American “Fishtail” points and North American Clovis assemblages. This may suggest that Central America was a zone of technological innovation where traditions merged. A preliminary analysis of available fluted points from Central America vs. North American Clovis points to an expansion of this techno-complex at least as far as Venezuela. Moreover, morphological similarities between Central American lanceolate points and Clovis collections from the U.S. South-Eastern/Gulf regions indicate that a set of cultural connections may have existed along a now submerged Late Pleistocene Atlantic coast.

[83] *A Probabilistic Approach to Constructing Networks in the Kuril Islands*

One of the persisting challenges in archaeological network analysis is how to incorporate both temporal and spatial information into network models generated from the archaeological record. This paper tackles this issue by introducing a protocol that places probabilistic weights on potential network connections between archaeological sites, combining time-varying probabilities quantifying contemporaneous site occupation and space-dependent probabilities based on geographic distance. The construction of such network models will be illustrated using radiocarbon data from the Kuril Islands of Northeast Asia. Previous work in this region indicates episodic fluctuations in population density over time, with the breakdown of social networks likely playing a pivotal role in adaptive vulnerability and population decline. By creating a multivariate time series comprising thousands of fine-grained probabilistic networks, we examine long-term trends in network structure in the Kuril archipelago and interpret how these changes relate to demographic transitions. Ultimately, we argue that the data-driven, probabilistic approach to network construction we introduce will better prepare archaeologists to interpret network models across broad temporal scales.

[206] *Reassembling The Social Organization: Uniting Museums, Archives, and Indigenous Knowledge around Franz Boas's 1897 Monograph*
Franz Boas's 1897 report, *The Social Organization and the Secret Societies of the Kwakiutl Indians*, was a landmark in anthropology for its integrative approach to museum collections, photographs, and sound recordings as well as text. However, both Boas and his Indigenous collaborator George Hunt remained dissatisfied with the published text, laboring for decades to correct and supplement it. They left behind a vast archive of materials related to the book's creation and afterlife that are now widely distributed across institutional, disciplinary, and international borders. This paper discusses a collaborative project to create an annotated critical edition of the work that unites published and unpublished materials with museum collections and with Kwakwaka'wakw knowledge in an interactive, multimedia website. Archival revelations about the truly co-authored nature of the original text allow us to better situate the contexts and methods of creating ethnographic knowledge in terms of the Indigenous ontologies it purports to represent. We are harnessing digital technologies to return sensory richness to Boas and Hunt's synthetic text, to reactivate disparate and long dormant museum collections, and to restore cultural patrimony to its Indigenous inheritors.

[38] *Seasonal Mobility Patterns During the Middle Holocene on Santa Cruz Island, California*

Data derived from oxygen isotope profiles of mussel shells suggest that sites in the interior of Santa Cruz Island dating between 4700 and 3400 cal BC, the period of the island's "red abalone middens," were occupied during the spring through early winter, with little or no occupation during the main winter months. In contrast, a small number of oxygen isotope profiles indicates that a large coastal site was occupied predominantly during the winter and possibly also the fall, with no occupation from late spring through early summer. Floral and faunal remains obtained from another large coastal site, as well as characteristics of its deposits, suggest occupation from late spring through early fall and possibly occupation during winter months. Although data are still scanty, small groups of island occupants appear to have occupied sites in the island's interior during the warm seasons of the year, when various plant food resources would have been available, and also aggregated at a coastal site for acquisition of marine resources. Aggregation also occurred at another coastal site during winter months not only for acquisition of marine resources but also for various social activities.

[162] *Sabanas and the Sea: The Yalahau's Ecological Niches and Preclassic Populations*

The Yalahau region of northern Quintana Roo, Mexico is one of the few regions in the Maya Lowlands where a robust Preclassic population was not followed by the emergence of Classic period polities. For that reason it is an important area when trying to understand the unique characteristics of the Preclassic period in the Northern Lowlands. The Yalahau region is defined physiographically by freshwater wetlands (sabanas), which stand in stark contrast the rest of the Northern Lowlands. These wetlands were utilized by Preclassic inhabitants of the region for agricultural purposes and helped support a dense Preclassic population. The wetlands are framed to the north by the Yalahau Lagoon and Holbox Island. Research by Proyecto Costa Escondida members have revealed the dynamic nature of the coastline during the Preclassic period and there seems to be a correlation between the changing nature of the coastline with the utility of the inland freshwater wetlands for the region's inhabitants. This paper brings together paleoenvironmental and archaeology research from the wetlands and the coast to investigate how these two ecological niches created opportunities for a Preclassic florescence in the region, while subsequently playing a significant role in the region's depopulation in the Early Classic.

[17] *Wari's Hallowed Ground: Interpreting the Mortuary Complex of Cotocotuyoc, Cuzco, Peru*

The Wari settlement of Huaro, located southeast of the Cuzco Valley in the Southern Highlands of Peru, contains a mortuary complex known as Cotocotuyoc. This towering plateau site, which overlooked the entire Huaro Wari settlement, was one of several urban components that made up a more than nine hectare Wari center, occupied for over 500 years. Excavations at Cotocotuyoc generated telling evidence for who built and occupied this settlement and how they were treated upon their deaths and in the afterlife. This presentation examines these data in order to shed light on the individuals interred at Cotocotuyoc and their potential roles as members of the greater Huaro Wari provincial node. Burial style and construction, individual age, sex, and health, and accompanying grave goods are described and discussed. It is argued that Cotocotuyoc served as both an early and late Wari cemetery, and as a place of ancestor worship with ties to the watery underworld and the mountain spirits or apus, as they are known today. Additionally, it is proposed that Cotocotuyoc was considered a hallowed burial ground for both the early founding societal elite and the last of the imperial community from the Valley.

[138] *Exhibit Development through Partnerships with American Indian Tribes and Museums*

Decisions regarding the use of museum collections in exhibits that interpret the history and culture of American Indians have often been made by non-natives, without the input of the people the exhibits are about. History Colorado was recently presented with a situation that allowed the museum to do the opposite. The Ute Indian Museum is one of History Colorado's community properties and is one, if not the only, state-owned museum dedicated to an American Indian group—the Ute people. In 2013, the state provided funding to expand the 56-year old museum and challenged the museum to raise funding to completely renovate the exhibits. From the very beginning of the project, the three Ute tribes were active partners. This paper details the process agreed upon by the partners to complete the building expansion and new exhibits. Our collaboration has produced a vibrant, gathering place for Ute and non-Ute people alike, with exhibits that tell the past and contemporary stories of Ute people in their voices.

Gokee, Cameron

[210] *Multispectral Satellite Imagery for Mapping, Modeling, and Interpreting the Archaeological Landscape of Bandafassi, Senegal*

The Bandafassi Plateau of southeastern Senegal today defines a landscape in which ethnic identities (Bedik, Peul, and Malinke) appear to be grounded in "traditional" patterns of settlement and land use, and yet oral histories speak largely of movement at multiple scales—from the fission and fusion of villages, to the migrations of hunters and merchants, to the arrival of foreign invaders and colonial powers. Seeking to better chart the interplay between natural environment and social history across this region over the past two millennia, the Bandafassi Regional Archaeological Project (BRAP) has since 2013 begun to integrate survey and excavation data on past human activities with spatial analyses of the relations among sites and geographical features. This paper explores three applications of Landsat 8 OLI/TIRS satellite imagery within the BRAP research program: (1) mapping geomorphological features across the regional landscape; (2) developing a predictive model of site locations for future survey; and (3) interpreting how the physical landscape has historically enabled and constrained the social production of identity, including "traditional" ethnic boundaries, in southeastern Senegal. The paper concludes by raising methodological caveats and ethical concerns about the use of satellite imagery in the archaeology of Africa.

Goldberg, Paul (Boston University)**[182]** *Soils, Sediments, Archaeology, Micromorphology, and Vance Holliday*

Soils are different from sediments. Many of these differences have been revealed by Vance Holliday during his career, through field work and numerous publications that have significantly influenced all disciplines. Nevertheless, there is a tendency to treat any soft stuff that is being excavated as "soil", and this confusion needs to be continuously corrected. Here, I present a number of examples of the use of archaeological micromorphology to highlight the distinctions between soils and sediments and show that sometimes, things that look like soils aren't really. I will use examples from sites in the US and the Old World to illustrate these points.

Golden, Charles (Brandeis University), Alejandra Roche Recinos (Brown University) and Andrew Scherer (Brown University)**[109]** *Flows of Value, Debt, and Goods in the Usumacinta River Basin*

Scholars considering Classic period Maya economies have long viewed acquisition, production, and trade primarily through the dual lenses of tribute to royal courts and barter among the populace. Recent archaeological discoveries and theoretical models have broadened our perspective to allow the Classic Maya the marketplaces and market economies that were once believed to be innovations of Postclassic Mesoamerica. Yet, we still know little about notions of currency, value, and debt—well documented in cases like the Aztec Empire—that might make better sense of the currents that energized and kept moving the flow of goods from Highlands to Lowlands, and center to periphery, in Classic Maya kingdoms. In this paper we draw upon the archaeological data from urban and hinterland sites in the Piedras Negras and Yaxchilan kingdoms of the Western Maya lowlands to develop a framework model for understanding the relationship between the flow of value and debt, and the production and exchange of long-distance goods and local materials in the Usumacinta River Basin.

Goldstein, Lynne (Michigan State University)**[1]** *Discussant***Goldstein, Paul (UC San Diego)****[181]** *Walking in Tiwanaku Shoes: Small Things, Quotidian Cues and Tiwanaku Identities in Diaspora*

In the absence of living interlocutors for the Andean Tiwanaku state society (AD 500–1000), we ask how Tiwanaku peoples imagined and reproduced themselves as social beings. A conventional view poses that Tiwanaku civilization at its apogee was unified by common membership in, or allegiance or aspiration to, an elite political culture, as evidenced by a high culture of specialized craft production, elite ritual functions, and religio-political iconography. This paper instead applies practice theory to preserved quotidian items from Tiwanaku personal spaces, positing that Tiwanaku identities were also inscribed, and can be reliably read, in the material record of daily life. Quotidian Tiwanaku material culture represents the countless repetitive tasks that make up most of humans' days on earth—the "small things forgotten" that James Deetz described, considered through lenses of habitus, structuration and materiality. Utilitarian artifacts from recent household and mortuary excavations at the uniquely well-preserved town sites in Tiwanaku's lowland provinces are considered. We will walk in Tiwanaku people's shoes, both figuratively and literally, and consider the meaning of uniquely "Tiwanaku ways of doing" in everyday attire, instruments, toys, and agrarian, craft, culinary and household tools and tasks.

Goldstein, Paul [100] see Gay, Brandon

Goldstein, Steven (Max Planck Institute for the Science of Human History)**[198]** *Resilience Theory and Human-Environment Interactions during the Early Holocene at Lothagam-Lokam, Northern Kenya*

The pluvial conditions during the African Humid Period of the Early-to-Mid Holocene profoundly influenced environments across northern and eastern Africa, expanding lakes, rivers, and grassland ecologies. Archaeologists have often explained human responses to these increasingly aquatic environment as in terms of an increasing reliance on fisher-hunter-gatherer economies. Similarly, once the AHP ended, humans abandoned these lifeways. These perspectives are overly deterministic; in this paper, we approach this problem by adapting a Resilience Theory framework to examine a (type site?) case-site on the Lothagam-Lokam site near Lake Turkana, Kenya. New excavations at Lothagam-Lokam have uncovered a sequence of small-scale local environmental shifts with interstratified cultural horizons that spans the entire Holocene. We argue that people's decisions to intensify or re-organize their economic strategies shaped their options and cultural attitudes in responding to subsequent stresses when faced with small-scale environmental fluctuations around Turkana. The interconnected cultural and economic systems gradually assembled through multiple resilience cycles ultimately conditioned responses to more extreme events such as the 60 m drop in Turkana's lake level at the end of the AHP. Our application of Resilience Theory at Lokam provides a potential path forward for more nuanced discussions of human-environment interactions during the AHP.

[198] *Chair***Golitzko, Mark (University of Notre Dame), James Zimmer-Dauphinee (Vanderbilt University) and John Edward Terrell (Field Museum of Natural History)****[83]** *A Dagger to the Heart? Testing Assumptions of Archaeological Network Analysis with New Guinean Ethnographic Collections*

Progressive cultural and biological diversification and divergence over space and time is one of the grand meta-narratives of archaeological thought. Much of the method and theory employed in support of this narrative is arguably at odds with what Emirbayer and Goodwin label the "anti-categorical imperative" at the heart of social network relational thinking. Here we utilize spatial network models within the broader family of Exponential Random Graph Models (ERGMs) to examine the relationship between style and technology of ethnographic material culture from Papua New Guinea (decorated bone daggers), language, and a set of more or less plausible geographically patterned social network formations derived from ethnographic data and network theory. We argue that material cultural diversity, language patterning, and social network structure are inextricably linked, but may

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

each be governed and shaped by differing processes and motivations. Our analysis of ethnographic material culture also lays bare some of the issues inherent in using archaeological material culture as a proxy for social network structure.

[22] *Cobble Reduction and Tool Manufacturing along the Atlantic Coastal Plain: An Example from Prince George's County, Maryland*
Cobble extraction and systematic lithic reduction activity areas are commonly found along the Atlantic coastal plain from the Early Archaic through Woodland periods. This process, typically involving the collection of high quality quartz and quartzite cobbles for processing, was documented 100 years ago by William Henry Holmes for the Piney Branch quarries in Washington, D.C. Excavations conducted by TRC at the Accokeek sand and gravel mine in 2014 identified 12 archaeological sites, two of which (18PR1079 and 18PR1081) were further examined through Phase II investigation in 2017. Excavations yielded large quantities of quartz and quartzite debitage and staged bifaces likely sourced from exposed cobble beds in an adjacent streambed. The sites represent intensive lithic reduction activity areas dating from the Early Archaic through the Early Woodland periods. The predominance of locally available raw material in the lithic assemblage indicates extraction of local raw materials and on-site cobble reduction and tool manufacturing. Several contemporaneous sites that also represent local raw material extraction areas and cobble reduction stations are located in the project area vicinity. Analysis of the lithic assemblage from this extraction site furthers our understanding of cobble reduction activity in a broader perspective of Atlantic coastal plain sites.

[221] *Holocene Palaeoenvironmental Changes in Southeastern Mozambique: The Case of the Inhambane Bay*
Geoarchaeological surveys were conducted in 2016 and 2017 to better understand the environmental history and landscape evolution of the Inhambane coastal area, Southeastern Mozambique, aiming to know the environmental context of human occupation of the Tofo, Praia da Rocha and Chibuene archaeological sites. To reach this aim, 4 cores were collected in a mangrove area of the Inhambane estuary, an area both influenced by sea-level and climate changes. All the boreholes were georeferenced and the study area was overflown with a drone to collect photogrammetric data. Core samples were used for geochemical, texture and diatom analysis. Diatoms will be used as the main palaeontological proxy, because they are unicellular algae with a short-live cycle and largely sensible to environmental variables such as salinity, sediment texture and duration of the tidal inundation. Preliminary data on the cores sedimentological description (encompassing the last 4700 years), geochemical and diatom results are presented. These results are mainly showing changes due to the mangrove lateral progradation, which is probably responsible by an environment alternation between more and less hydrodynamic environments.

[306] *Taphonomic Examination of the Skeletal Collection from Etlatongo, Mixteca Alta, Oaxaca*
Recent excavations at the Middle Formative (850—400 BCE) site of Etlatongo, in the Mixteca male bearing striking red stains on the anterior cranium. These findings may suggest alteration of remains associated with burial rituals. However, human remains may be modified through several post-mortem taphonomic effects, including: trauma, rodent activity, discoloring, staining, cultural modification, interment rituals, damage throughout archaeological investigation procedures, biological and environmental effects. Here we present a preliminary assessment of taphonomic variability among the Etlatongo sample, using a combination of quantitative and qualitative bioarchaeological methods to distinguish skeletal modification resulting from cultural practices vs. post-depositional alteration. We propose that from this sample there is high variability attributed to cultural modification and environmental factors. However, the state of decomposition and completeness of this collection makes distinguishing post-mortem practice indistinct in many cases.

[114] *Finding a Grand Ronde Way: Building Epistemological Bridges through Collaborative Field Practice*
In the language of self-determination, an indigenous archaeology is an expression of the sovereignty of a tribal nation to determine how its heritage will be cared for, now and into the future. Tribes, however, encounter several capacity-related challenges in developing tribally-specific heritage management plans. These challenges include the lack of funding for tribal historic preservation and repatriation, shortage of qualified staff, and, most significantly, operating within a heritage framework that was not designed with the needs or interests of tribes in mind. Given these significant challenges, how can an indigenous nation make archaeology work for and in accordance with tribal needs and values? Using the case study of Field Methods in Indigenous Archaeology, this paper evaluates how community-based research with the Confederated Tribes of Grand Ronde Community of

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Oregon contributes to a uniquely Grand Ronde way for doing archaeology. Preliminary outcomes from FMIA suggest that indigenizing archaeology not only transforms our discipline's relationship with and to indigenous communities, but builds our—archaeologists' and tribes'—collective capacity to care for and protect tribal heritage for future generations.

[59] *Paleoindian Sites from Central Mexico: Paleoenvironment and Dating*

During the last 20 years we have studied systematically several important Paleoindian sites from Central Mexico doing detailed stratigraphic studies, paleoenvironmental reconstructions (pollen, diatoms, tephra studies) and radiocarbon dating. The sites include: Peñon Woman III skeleton, Santa Isabel Iztapan Mammoths with associated lithics, Tlapacoya Man Skull, Tocuila Mammoths, Tequixquiatic Late Pleistocene Fossils and Tepexpan Man Skeleton.

We present here a general model of strong environmental changes occurring during the Late Pleistocene-Early Holocene transition that affected human and megafaunal communities in this area. Together with the presence of large volcanic eruptions from Nevado de Toluca and Popocatepetl Volcanoes that produced important tephra markers in the Basin of Mexico. The earliest directly dated human, Peñon Woman III (Age: 10, 755 +/- 75 BP) is one of the most complete and well preserved Paleoindian skeletons from the Americas.

The Santa Isabel Iztapan Mammoths I and II were found together with lithics of Scottsbluff, Lerma and Angostura types and obsidian prismatic blades but not with Clovis type points normally associated with mammoth kill sites and butchering. The lithics were found in a layer after the Pumice with Andesite tephra layer (PWA) and they have an estimated date between 14,500 BP and 10,900 BP.

[70] *State of Conservation of the La Venta Stone Sculpture Corpus*

The stone sculpture corpus originally found in La Venta is one of the most important collections of Olmec art in Mexico. It is currently exhibited in five different museums in Tabasco and Mexico City. The state of conservation of the almost 50 sculptures (whole and fragments) at the Parque Museo La Venta in Villahermosa are of particular interest because they have been exhibited in an open air museum for the last six decades. A summary of a recent and detailed study of the state of conservation of this corpus will be presented, as well as recommendations for its better presentation and conservation.

González López, Angel (UC Riverside)

[31] *The Imperial Stone Sculpture of Tenochtitlan: Changes and Organization*

The rise of the Aztec Mexica Empire is well represented in the archaeological record, especially through the wide spread evidence of stone sculptures in the main Precinct of the imperial capital. In less two hundred year of history, the island became the principal producer of these artifacts. Its workshops created not only numerically more pieces, but also monumental pieces and sculptures with complex iconography and new discourses. This paper will discuss the problem of using the term "Aztec" to describe this art style, which has resulted in the homogenization of diverse groups and factions in and around the basin. I will analyze the nature and direction of its change through time and across space, such as sculptures from Tula, Culhuacan, Azcapotzalco, and other urban centers inside the Basin of Mexico. Here, I will deal with iconographic changes to develop stages of time, as a methodological tool. Units of cultural similarities present in one specific area serves as a more useful way of organizing changes than the traditional periods of time in archaeological research. This shift will facilitate the organization of the profuse evidence of stone sculpture and analysis from a stylistic approach that also draws on contextual and calendric information.

[98] *Rooms in Rome: Production, Function, and Conservation of Ancient Roman Mosaics and Frescoes*

In this poster, we explore the production and conservation of mosaics and frescoes, examining their co-occurrence in high elite domestic spaces and how they reveal the varying function(s) of these spaces. Citing both archaeological examples from Villa Cotanello and Villa di San Cesareo, each about

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

a day's journey from Rome, as well as museum collections, we emphasize the importance of conservation. Standard archaeological practice often consists of removing objects from in situ contexts and transferring them to a lab for further research. Unfortunately, in many cases, the objects are poorly stored and forgotten, leading to deterioration over time. We argue archaeological projects must prioritize proper storage to avoid deterioration and enhance conservation efforts. This will positively impact how projects approach delicate contexts while strengthening interpretation.

[40] *Soundscapes and Visionscapes: Investigating Ancient Maya Cities with GIS and 3D Modeling*

Researchers have been applying Geographic Information Systems (GIS) to examine the roles of visibility and movement in archaeological landscapes around the world. However, few studies have investigated the role sound potentially played in structuring experience in ancient cities. To begin to fill this gap, this paper builds on our initial investigations to develop new geospatial and virtual reality (VR) methods to examine ancient acoustics. For the ancient Maya, sight and sound worked in concert to create synesthetic experiences that influenced daily life and shaped society. To explore this interaction, we apply a combination of GIS modeling: viewshed analysis, soundshed analysis, and an Urban Digital Elevation Model (Urban DEM) generated from airborne LiDAR and 3D modeling data. This approach provides an opportunity to perform computational analysis on a simulated ancient landscape rather than the contemporary landscape. We then take these GIS-derived computational data into a VR environment to combine sound and vision to illustrate the complementary roles of visual and auditory experience at ancient Copan.

Goodwin, Whitney (Southern Methodist University)

[299] *Ceramics Inside and Out: Food, Style, and Identity in Coastal Northeastern Honduras during the Selin Period (AD 300–1000)*

Prehispanic populations of northeastern Honduras were positioned at the border of Mesoamerica and Lower Central America. Previous research on ceramic style suggests local affiliation shifted over time from north to south as part of an adept strategy to navigate the complex political and social landscape of the region through the promotion of an inclusive group identity. This study explores the actual implementation of that strategy by investigating communal feasting contexts where symbolically significant ceramics were used and incorporates new information about local identity and affiliation through a complementary study of foodways. Tracing changes in these traditions over time elucidates the ways in which these materials were articulated in practice to create enduring symbols of identity. Recent findings from the 2016 field season of excavation at the Selin Farm site are presented and directions of future research in the Guaimoreto Lagoon area are outlined.

[107] *The Ethics and Practice of Forensic Archaeology, Unfunded Mandates, and the Unidentified*

In 2001, California passed SB 297, which mandated that coroners "shall collect samples for DNA testing from the remains of all unidentified persons and shall send those samples to the Department of Justice for DNA testing and inclusion in the DNA data bank." This legislation, which was largely unfunded by the state, expanded existing DNA testing programs to include remains from cold cases that were being stored by state agencies and remains that had been interred in cemeteries throughout the state. This paper will discuss the challenges of creating a prioritized list of individuals to be exhumed from a potter's field in San Bernardino, California, when various stakeholders approach questions of ethics and identity from different perspectives. The results of a multi-year project will be summarized, with attention given to how the realities of forensic fieldwork and early successes in identification contributed to reconsiderations of who could and should be included in this attempt to identify the unknown.

[136] *Role of Rockshelters and Caves in Yokuts and Western Mono Cultures*

Yokuts and Western Mono tribes of central California had close cultural ties. While the Yokuts were the most numerous and the dominant culture, many people were bilingual. They shared themes in their pictographs, petroglyphs, and cupules, which are cultural traits of a ceremonial nature that are archaeologically identifiable, and are generally agreed to have magico-religious significance. Forty-one percent of the paintings in their territory occur in shallow caves and rockshelters, which vary in size. Size restricts the number of paintings, as well as the number of people viewing them. Some rock shelters can accommodate a dozen people, while others only one to two. Many sites include cupules and/or bedrock mortars, which suggest women's participation. The surroundings also vary. Many of the rockshelters and shallow caves are hidden, while others could have been viewed by the village, which suggests that there are public and private sites. This paper discusses the relationships between site size, surroundings, and contents. The physical similarities and differences of each site are compared within the tribal area, and across dialect borders. The performer's and audience's roles in the production of rock art, as well as, the purpose and beneficiaries of the performance will be addressed.

Gordon, Falcia and A. Brooke Persons (Office of Archaeological Research)

[63] *Recent Investigations at the 18th Century Fort Frederik Archaeological Site and Cemetery, St. Croix, US Virgin Islands*

In 2010, a tropical storm disturbed human remains and archaeological deposits at the Fort Frederik Archaeological Site, a multicomponent site consisting of dense 18th-19th century midden deposits associated with Fort Frederik, a two-story fortification (est. 1760) dating to the colonial development of St. Croix, then a part of the Danish West Indies. Subsequent investigations, including a geophysical survey, subsurface testing, and osteological analysis, have identified a cemetery within the site and clarified the chronological association of the disturbed remains. This presentation summarizes recent investigations, contributing to a broader understanding of the site, colonial St. Croix, and events associated with Emancipation.

[250] *The Lithic Landscape of the Nenana Valley: Investigating Land-Use and Toolstone Procurement Activities in Interior Alaska*

Investigating prehistoric landscape use is significant in answering questions about the adaptive strategies and behaviors of prehistoric Beringians. How can we define the lithic landscape? How did humans provision themselves in eastern Beringia, and how did these provisioning behaviors change through time? Toolstone procurement and selection behaviors influence toolkits, mobility, and settlement strategies; therefore, they are important in explaining prehistoric behavioral adaptation and the complexities of landscape use. We can begin to explore toolstone procurement in the Nenana Valley of central Alaska through geochemical sourcing studies. Portable x-ray fluorescence (pXRF) is a useful geochemical tool for characterizing non-obsidian volcanic materials (basalts, dacites and andesites). In an effort to define the lithic landscape in the Nenana Valley and explore hunter-gatherer land-use strategies, this paper presents results of a raw material survey conducted during the 2015–2017 field seasons aimed at mapping the distribution of knappable volcanic materials in the valley. It then compares results of geochemical (pXRF) analyses of artifacts from several Late

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Pleistocene and Holocene sites with both primary (outcrop) and secondary (alluvium) sources within the valley to understand and explore how local materials were utilized by prehistoric Alaskans in Eastern Beringia.

[265] *Results of a Pilot Study on Wari and Loro Ceramic Pigments from Southern Peru*

In this poster we summarize the results of a pilot study applying LA-ICP-MS analysis to the pigments of 50 Middle Horizon (AD 750–1000) ceramic sherds, with the goal of investigating shared ceramic technologies between people of the Wari and Loro cultures. The sample was taken from four sites: one local site in the Nasca region (Huaca del Loro), and three Wari sites, two located in the Nasca region (Pataraya and Pacheco) and one in the highlands (Jincamocco). INAA conducted on the same sherds has revealed a similarity in paste composition between Loro and Wari ceramics. This is particularly interesting as 1) this paste source may have had symbolic significance to the Nasca, and 2) the relationship between Wari and Loro peoples appears otherwise strained, though there are indications that the local Nasca culture received some deference from the Wari. In this study we ask whether Loro and Wari potters also shared pigment recipes, with implications for how extensively potters interacted, shared their technological practices (and possibly meanings), and how the Wari presence might have influenced Loro access to pigments. The answer to this question will in turn inform broader understandings regarding the interactions of these two groups.

[117] *Iberian Mines and Imperial Matters: Re-conceptualizing Labor, Technologies, and Communities of Practice in Roman Iberia*

The landscapes of the Iberian Peninsula were famous in antiquity for their richness in metals, and scholars have long claimed that these metals were a draw for colonial interest in the region from early on. This is especially true following the Roman conquest of Iberia in the late 3rd century BCE, when the scale of mining increased dramatically to accommodate the growing needs of the Roman empire. This was made possible through dramatic shifts in the organization of labor and the technological practices surrounding mining. Scholars often attribute these changes to Roman innovation, ignoring the long-term history of indigenous mining in many areas and the potential significance of local people in the successes of the industry. In this paper, I challenge this conventional interpretation and explore the diverse contributions of local people to the mining industry, from their knowledge of local resource distribution to their work as laborers in mining and subsidiary industries. I argue that Roman conquest transformed the everyday lives of local people, who in turn participated in the diverse communities of practice in Roman mining landscapes, contributing knowledge, skills, and resources that fueled an industry that was key to the creation of the Roman empire.

Goudge, Charlotte (University of Bristol)

[208] *"Do you think I am an automaton?": Post-emancipation Caribbean Factories and Social Industrialism*

Studies of industrial production have taken a prominent position within social theory. Social implications of factories and productive landscapes in the Caribbean have often been obscured by the socio-cultural palimpsest of plantation environments. Material culture studies of Caribbean factories, both structures and machinery, can be vital descriptors regarding enslaved and emancipated labour narratives. The connection between industrialisation, machinery, slavery, and manumission underlies major themes of the plantation organism. The industrialisation of the factory complex generated a newly habituated space and altered perceptions of workspaces from one of slavery and semi-artisanal, cottage-manufacture to constant mechanised motion, noise and 'free'-production. Using the term anthropomorphic-machinism to cover both the relationship of workers to technologies being manipulated, it is possible to characterise the effect of machinery on the organisms themselves (labourers). Despite their continued financial confinement, Abolition marked the 'freedom' of the labourer from the yolk of oppressive production. The introduction of industrialised steam machinery replaced the corporeal labour of the enslaved. The relationships developed between the labourer and the workplace is depicted within their interaction with procedure, machinery, technology and, eventually, the product. This paper will discuss the major themes displayed within archaeological processes and the material life of industrialised Caribbean factories.

[241] *An Archaeological Perspective on Oral Traditions, Regarding Migration, of the Northern Caddoan Speaking Tribes*

Affiliating prehistoric archaeological sites with contemporary indigenous communities in American archaeology is often met with skepticism and criticism. As a means for overcoming the inherent criticism; I utilize the oral traditions, regarding migration, of the Northern Caddoan speaking tribes as a means to construct a relative chronology for which these populations moved across the landscape in prehistory. Then I compare the relative chronology with the archaeological record. By comparing site assemblages and settlement patterns of affiliated historic sites with archaeological sites in regions suggested as being prehistorically occupied by the Northern Caddoan speaking tribes. This research offers a means for corroborating the archaeological record with indigenous oral traditions regarding migration.

[223] *An Experimental Archaeological and Digital Approach to Understanding the Manufacture of Slate Fishing Knives in Southwestern British Columbia*

Despite longstanding anthropological concerns with the origins of intensive delayed-return subsistence economies on the Northwest Coast, the use and production of slate fishing knives has received little attention. Owing to specific design attributes, thin slate fishing knives were critical to the necessarily efficient and rapid processing of tens of thousands of salmon in a span of only three or four months. Although anthropologists have a reasonably good understanding of how slate knives were used, there is a paucity of ethnographic and historical data addressing how these critical tools were made. This poster highlights experimental archaeological research addressing the stages, techniques, and organization of slate knife production with an eye toward understanding variability in the byproducts of knife-making activities. A key feature of our project is a companion study of the tool-making process using large-scale, digital, multimedia data gathering and analysis techniques. Digital video and digital photography are used to capture

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

important information on how toolmakers change their bodily orientation to stage-specific crafting work, the tool-making implements they use, and the social interactions and discourses that mediate the work. We argue that these data are crucial to an understanding of the embodied, tactile, and otherwise sensorial experiences of tool production.

[332] *2017 Excavations at McDonald Creek (FAI-2043), A Multicomponent, Open-Air Site in the Tanana Flats Training Area, Fort Wainwright, Central Alaska*

In 2013 our team began a 3-year testing project to assess the research potential of the recently-discovered McDonald Creek archaeological site (FAI-2043). The site is located in the Tanana Flats of Central Alaska south of Fairbanks. Site testing indicated a well-stratified and reasonably preserved multicomponent site situated in unconsolidated eolian sand and silt deposits atop an ancient alluvial landform. Three cultural components have been identified so far, dating to the early Allerød, Younger Dryas, and Middle Holocene intervals, respectively. Thousands of archaeological materials, including lithic debris and faunal and floral remains, associated with domestic features such as hearths and possible dwellings abound in the lower two components.

In June and July of 2017 we began large-scale block excavation of the site in an area where we found living floor debris during the testing phase of the project. We excavated 21 m² through the Younger Dryas-aged living floor. Here we report results from the 2017 field season as well as preliminary analyses of various material remains from work conducted to date.

[35] *New Insights from Old Wood: A Case Study from the Southeastern United States*

In the southeastern United States, as well as in North America more broadly, archaeological wood charcoal continues to be an underutilized data source. In this paper, I review previous North American studies and models of prehistoric fuelwood collection. I use these past studies to highlight how wood charcoal data might contribute new insights on the archaeological record. I also present findings from a recent analysis of wood charcoal from three sites in the North Carolina Piedmont. This new data is framed as a case study to demonstrate how such information can be put to use.

Graham, Elizabeth (Institute of Archaeology), Richard Macphail (University College London), Phillip Austin (University College London) and Lindsay Duncan (University College London)

[224] *Marco Gonzalez, Ambergris Caye, Belize—Evidence for Salt Production*

Investigations carried out at Marco Gonzalez, a Maya site on Ambergris Caye in Belize, were aimed at examining site formation processes, particularly the dynamics that led to dark surface and subsurface soils (Maya Dark Earths), which have a higher nutrient capacity than would be possible under natural conditions. Sediments of critical interest in soil formation were those deposited in the Late Classic period and associated with intensive processing. Features of the ceramics in the deposits as well as the coastal location led us to suspect salt processing. The evidence that resulted from soil micromorphological investigation of these deposits provided further supporting evidence in the identification of tidal flat muds, some of which adhered to the vessel interiors. The tidal flat sediments were likely collected to concentrate salt as brine, and the brine was then heated in the ceramic containers to drive off water and produce salt for shipment.

[79] *Paleoecology of the Late Pleistocene Fauna from the Lamb Spring Site, Colorado*

The Lamb Spring site located in central Colorado is a late Quaternary locality with stratified Pleistocene and Holocene faunal remains. The late Pleistocene component is dominated by mammoth (*Mammuthus columbi*) but contains other grazing taxa like horse, bison, American camel, Harlan's ground sloth, etc. The general lack of microfauna from this horizon makes detailed paleoecological interpretations difficult. However, the megafauna point to a dominance of grassland with the possibility of scattered trees. This grassland/savannah environment and the Lamb Spring fauna are similar to other faunas throughout the plains region. It is similar structurally to the Arctic Steppe biome but it can be clearly differentiated from it by species composition. We suggest that the more "southern" environments of the central and southern Great Plains may have been a different super province, the Mammoth Grassland/Savanna.

[118] *Machine Learning the Visual Rhetoric of the Trade in Human Remains*

There is a thriving online trade, and collector community, that seeks specimens of numerous categories of human remains. This commerce is facilitated by posts on new social media such as Instagram, Facebook, Etsy, and, until recently, eBay and operates within a complex ethical and legal landscape. This presentation will share key results of ongoing work to data mine these online markets on both new social media and multi-lingual e-commerce platforms. In particular, we are interested in the possibilities presented by machine learning and other ways to 'train' the machine to identify the illicit, the illegal, and the unethical. Can we design ethical archaeological machines? We will discuss the relevance of applying digital humanities tools, how to do so, key findings from previous research on the Instagram collecting community, and ongoing work expanding beyond Instagram. At the very least, we believe that machine learning does reveal important, otherwise hidden, aspects of the visual and textual rhetoric that underpins the sale, trade, auction (and sometimes forgery) of the dead.

[302] *The Risk of Dying in Ancient Societies. Vulnerability from a Bioarchaeological Approach, Theoretical-Methodological Model*

The goal of my research is to design a theoretical-methodological model to evaluate the vulnerability to death in past urban societies. Every human being is exposed to risk, but depending on the social and biological characteristics of individuals may be more or less susceptible to irreversible damage. The risk is a dynamic concept; thus, vulnerability may only be evaluated in terms of relative parameters. In this study, I will focus specifically on the risk of death in past urban societies in connection with the everyday life, using the archaeological contexts to create social variables. This theoretical and methodological model proposes four areas to assess vulnerability as follow: Demographic dynamics, Frailty, Inequality, and Embodiment. The first three areas are used to apply statistic model, while the fourth area, is based on qualitative analysis.

To test this theoretical and methodological model that I am proposing, I am applying this model of Vulnerability in a Mesoamerican sample, at Monte

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Alban city, the most ancient urban settlement in Mexico. Wherein, preliminary results already shows that the propensity of risk of death during the adulthood increased, in correlation with house size and location of the house.

Grant, Christopher (University of Chicago)

[190] *Perspectives from a Privy Past: Neighborhood and Race in Late Nineteenth-Century Creole New Orleans*

The Faubourg Tremé is often referred to as America's oldest African-American neighborhood and has been the site of significant social, cultural, and political developments in New Orleans for the past two hundred years. From the colonial period onward, the neighborhood fostered the growth of the city's Creole population and displayed a distinct cultural and demographic makeup unmatched in other parts of the American South. In recent decades, scholars have considered the Tremé as a rich site of cultural production, situating the history of the neighborhood within wider discussions of immigration, creolization and race. But as the twentieth century neared, the city's ancient population entered a period of diminishing social and economic prosperity—an era often subject to literary tropes of decay and decline. Privy finds from a household in the Tremé provide an alternative perspective—one that situates the neighborhood's residents in wider networks of urban and demographic change. This poster re-examines the historical and symbolic importance of the Tremé by close examination of a single late-nineteenth/early-twentieth-century privy. The privy deposits offer a hidden history of the neighborhood as well as renewed insight into the methodological value of the privy as a central resource in historical archaeology.

Grant, Madison (University of California, Santa Barbara) and Jacqueline Pittman (Rowan University)

[223] *An Experimental Approach to Fracture Variation Attributed to Weapon Morphology Using Replica Chankan Maces*

The use of stone weapons is prevalent throughout the history of the Chanka (C.E. 1050–1400), a civilization that inhabited the Apurímac region in Peru and once rivaled the great Incan Empire. Accordingly, the impact fractures such weapons create provide direct evidence to deciphering the deaths of these Andean warriors and their violent past. This project seeks to provide experimental evidence of fracture variation attributed to differences in weapon morphology, which can be compared to the blunt force trauma identified on recovered skulls. The study focuses on two distinct weapons frequently observed in the Chankan archaeological record: the star mace and the circular mace. The weapons were reconstructed in accurate weight and form from casts of authentic artifacts and will strike 10mm-thick casts of dental plaster, which mimic the frontal bone—a probable surface for impact damage in hand-to-hand combat. To achieve an accurate result, the experiment will consist of no less than 100 trials. Preliminary assessment suggests the star mace will result in the most fractures due to its several points, rolling across the frontal bone to create multiple areas of impact damage; however, the greater weight of the circular mace is expected to result in wounds of greater depth.

Grap, Rachel (University of Kentucky)

[238] *Landscape Scale Ground Penetrating Radar and Magnetometry at Tel Shimron, Jezreel Valley, Israel*

Situated in Israel's Jezreel Valley, Tel Shimron holds the remains of occupations from the Early Bronze Age through to the 20th century. It is one of the largest tels in the region, but had not been excavated before this summer. The Tel Shimron Excavation project aims to investigate tel stratigraphy and better understand regional dynamics with the Galilean Hills and the Mediterranean agricultural economy. We began in 2016 by conducting geophysical surveys over much of the tel to investigate the uppermost strata. Desiccated soils, modern constructions, steep terrain, and tall vegetation in many areas severely limited options for instrumentation and data collection strategies. Our choice to use ground penetrating radar and magnetometry over 6 hectares of the tel proved to be very successful. The combination of features identified in the geophysical data and recent excavations have revealed occupations from the Middle Bronze Age, Byzantine, Mamluk, and early 20th century. This poster illustrates these results and explores how features and stratigraphic layers are manifest in GPR and magnetometry data.

[211] *Enduring Traditions, Material Transformations: Understanding Wari State Influence in Highland Ancash, Peru*

Scholars have debated the nature of Wari state expansion during the Middle Horizon in north-central Peru for decades, suggesting both top-down imperialism and local resistance. While our paper does not aim to resolve this issue, we put previously reported datasets into conversation to examine both social change and cultural resilience in the Middle Horizon (MH). We draw on ceramic and mortuary evidence from the Callejón de Huaylas region of highland Ancash and identify the incorporation of a "Wari international identity" into local practices, embedded in previously developed Recuay (Early Intermediate Period) traditions. Specifically, we question the nature of Wari statecraft and extent of ideological influence by contextualizing changes in material culture within traditions and practices that endured during the MH. We end our discussion with an overview of findings from the 2017 excavation season at the Recuay site of Jecosh, situating results within a broader regional context. Jecosh offers an ideal case study to examine Wari presence in the region due to its strategic location along important trade routes. Although the Recuay kaolin ceramic tradition faded during the MH, certain cultural practices continued, suggesting resilience via syncretism and the development of new social and economic relationships with foreign groups.

[83] *Taught or Copied? Using 2-Mode Network Visualization to Distinguish between the Two*

Traditional research on European Upper Paleolithic social networks rely on raw material sourcing as well as the distribution of similar "artistic" styles. This project aims to improve the methods of the latter. While similar representations found in different sites have often been assumed to represent the presence of social contacts between those sites, the possibility that such representations were exchanged or even simply copied without direct contact has always loomed over researchers' head. In this research, I use an experiment to evaluate the retention of motor habits in the production of different designs, and demonstrate the potential of using 2-mode analysis of design and technique when studying art to differentiate between copied and taught designs. I then apply this method to portable art objects of the Cantabrian Magdalenian to shed light on the social networks that may have taken place during that period. These networks are compared to the ones identified solely through design to demonstrate the importance of considering technique when looking at cultural transmission.

[39] *A Prelude to Displacement: An Archaeological Reconstruction of Community History at San Pablo and Barrio del Hoyo in Tempe, Arizona*

Recent excavations on the Arizona State University Tempe campus provide a glimpse into the early 20th-century Mexican-American neighborhoods of San Pablo and Barrio del Hoyo. Located next to the original campus grounds, San Pablo and Barrio del Hoyo were residential and commercial hubs of

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

early Tempe. After World War II, urban development and renewal efforts by the university and land developers targeted these two neighborhoods for campus expansion and displaced their residents, quickly destroying the neighborhoods with the construction of apartments, dormitories, and other university buildings. Domestic features excavated in these two neighborhoods show us that, in the decades preceding their destruction, both neighborhoods were thriving, with residents of a variety of different incomes who pursued various economic pursuits—not unlike the Euro-American neighborhoods of early Tempe. San Pablo and Barrio del Hoyo were not blighted or in need of renewal and the eventual fates of these neighborhoods reflected their status as minority communities within Tempe, a lack of political power, and structural racism. In this way, San Pablo and Barrio del Hoyo are similar to other examples of the destruction of Mexican-American communities in the West, such as Barrio Libre in Tucson and Chavez Ravine in Los Angeles.

[63] *Ethnoarchaeology of Water Resources in a Landscape without Rivers: Using Limestone Solution Cavities to Study Settlement and Subsistence Activities in a Yucatec Maya Community, Mexico*

Ethnoarchaeological investigations in the Yucatec Maya community of Xculoc recently included inventorying the location and uses of a range of small-large water sources. This karst landscape has no surface rivers, ponds, or lakes. Currently, the community uses a deep well at the former hacienda in this location. However, at least 60 years ago most families that coalesced into this village were distributed in relation to smaller reliable water sources near the current community location. Field research located the known water sources and their uses. These solution cavities in the limestone bedrock range from large and deep sources that contain water year-round fed by vadose water flow to small and ephemeral pockets that are seasonally filled by rainfall. All of the identified water sources (sartenejas, aguadas, and cenotes) are maintained and still used at least periodically for apiaries, incidental agricultural use, laundry washing, drinking water sources for groups working away from the village, and as locations to check for game during hunting trips. Our research addresses how these sartenejas and aguadas can be used to study past settlement in the region of Xculoc, as well as past and present economic activities.

[121] *Introducing Urbanism, Technology, and Identity: Celebrating the Comparative Archaeology of Rita P. Wright*

In this talk, we introduce the papers of the session, which reflect the many threads of Rita P. Wright's contributions to archaeology. Prof. Wright has established a suite of concepts and critiques that generate a comparative framework that is not restricted to a single geographical area. In her early work on ceramic production and craft, Wright synthesized the anthropology of technology with the archaeology of the Indo-Iranian borderlands, laying the foundation for a technological approach that transformed the archaeology of South Asia. Her critical re-evaluation of early cities, states, and complex societies incorporated past people and groups previously omitted from investigation, bringing to the forefront the political and economic dimensions of households and other social entities. Her work also drove the archaeology of identity and gender, correcting traditional approaches that too often left humanity out of explanations of the past. She has also established a landscape approach that examines the social relations that connected the city of Harappa to its many surrounding settlements, she has revealed rural/urban interactions that drove the emergence and transformation of urbanism. The impact of these contributions is ongoing, and has set the agenda for a new generation of comparative archaeology.

[111] *Evaluating Dietary Change: Adaptive Strategies within the Northern Everglades and Surrounding Areas*

Throughout the past several millennia South Florida has been subject to profound environmental changes. As such, by examining paleoenvironmental change on seasonal and climatic scales, we can further understand this unique environment and infer how it has shaped human and animal histories of the past. This work will be carried out by employing broad spectrum ecological theories which shall provide the necessary framework to understand past resource scheduling, seasonal mobility patterns, and fluidity of resource utilization by the paleo-inhabitants of the region. Inferences based on several sites across South Florida will illustrate the paleo-resiliency of the regional inhabitants to adapt to variable environmental change including fluctuations in water levels and vegetative communities. A broad regional framework analyzing zooarchaeological materials from sites within the Northern Everglades and surrounding areas will contribute to the knowledge-base of the area from the Late Archaic Period to the present. Accordingly, this research has implications for conservation biologists in understanding prehistoric human exploitation of white-tailed deer in Southwest Florida prior to significant anthropogenic changes over the past several hundred years.

[301] *Geophysical Survey and Remote Sensing at Gast Farm, Southeast Iowa: Hidden Mounds and Middle and Late Woodland Community Plans*

Gast Farm (13LA12), situated on a Mississippi River valley alluvial fan, has been a focus of interdisciplinary study since 1990. Surface collections and excavations documented two Woodland communities and one mound. The Weaver community (Late Woodland, ca. A.D. 400) was determined to have been a circular village with a central plaza, but details of the Havana community (Middle Woodland, ca. A.D. 100) and mound structure were not clear. Aerial imagery seemed to indicate the presence of geometric earthworks. Magnetic survey in 2016 confirmed the circular-plaza layout of the Weaver village and discovered that the Havana community was apparently organized as a ca. 130 x 110-m ring of domestic features surrounding a central

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

plaza. This may be the first complete plan of a Havana village (as opposed to a hamlet) to be documented. The 2016 survey also found no evidence of geometric earthworks but discovered six additional mounds.

Greene, Janaka (Texas State University)

[127] *Investigating the Cody Complex at the Capshaw Site, a Late Paleoindian Site in Texas*

This paper presents the results of an investigation conducted at the Capshaw site, a lithic scatter site, located within the Southern High Plains region in the panhandle of Texas. The Southern High Plains region is well-known for its rich archaeological record of Paleoindian peoples, however the Cody period remains relatively poorly understood. The paper will first describe the history of the site from its discovery in 2013 through archaeological surveys with explorative field school excavations conducted in 2015. Magnetometry survey was conducted in 2017 as an attempt to locate buried cultural features. Further excavations were carried out later in the Fall of 2017. However, the focus of this paper is to present the results of the lithic and geoarchaeological analyses of the material from the Capshaw site in order to interpret whether Cody peoples used the site as a residential camp, a kill site, or a special activity site by comparing the assemblage to models derived from archaeology and ethnology. The Capshaw site represents a unique set of data which could help answer broader questions regarding Cody period settlement and social organization in the Plains region. Lastly, this paper also comments on the direction of future research about Cody peoples.

[67] *Black Virginians and Locally Made Ceramics in the Shenandoah Valley*

One thing for which Virginia's Shenandoah Valley is known is its active antebellum ceramic industry. While predominantly German and Scots-Irish peoples colonized the region from the 1730's onward, it was the Germans who brought their potting traditions to the Valley. By 1745, German potters began to fill local needs for ceramics, a trade which grew in importance over the next century and a half. These vessels took on more than just utilitarian roles, as choosing to purchase locally made ceramics over imported wares allowed Valley residents to perform various ethnic, regional, and racial identities. As a result, researchers portray these pots as inherently White things, made by Germans for Germans (and their Scots-Irish neighbors). This does not hold up, however, when we add Black Virginians into the picture. From free Black potters and enslaved peoples who labored for White potters to enslaved consumers who bought local vessels for themselves, Black Virginians in the Valley regularly interacted with these ceramics. This paper explores the connections between Shenandoah Valley ceramics and free / enslaved peoples, allowing us to view these vessels in a new light—one which better reflects the region's diversity.

[125] *Living on the Edge: Dogs and People in Early New Zealand*

New Zealand is situated on the southern margins of the Polynesian triangle in the Pacific Ocean. Its temperate climate and environment differs greatly from the tropical central East Polynesian islands, from where its first human colonists originated. Although possessing plentiful bird life, sea mammals and other marine taxa, people faced challenges adapting their tropical horticultural practices to this new land. This paper explores the changing fortunes of people and dogs during the settlement and occupation of New Zealand, and the extent to which early dog populations may reflect the economic success or otherwise of associated human communities.

[101] *3D Scanning the Virgin Mary in the Toast: Using Handheld Digital Imaging Technologies to Explode the Myth of Pareidolic Illusions in the Ancient Maya Underworld*

Cave archaeologists around the world are increasingly utilizing many new platforms and techniques to document subterranean artwork, including digital imaging and scanning technologies. In this presentation I demonstrate a portable and cost-effective approach to digital imaging of parietal art. To this end, I used an Occipital Structure Sensor 3D scanner, mounted on an iPhone 6, to document various monumental modified speleothem sculptures in the subterranean realm of the ancient Maya of Belize, Central America. In addition to comparing and contrasting the methodologies, results, costs, time, and logistics involved with this system to other popular scanning systems, I provide ideas suggestions for those who may be interested in carrying out similar initiatives in the future.

Grinnan, Nicole (Florida Public Archaeology Network)**[194]** *Discussant*

Grinnan, Nicole [78] see Scott-Ireton, Della

Grody, Evin and Darryl Wilkinson (University of Cambridge)**[259]** *Fleeced Landscapes: Colonial Herding Practices in Northern New Mexico*

Investigating how the presence and use of herded domesticates shaped life and the landscape in the Rio Grande gorge, this paper draws on a particular case study to explore the interactions between the endemic and the introduced within colonial herding practices. One strand of analysis will involve zooarchaeological and taphonomic data from colonial domestic contexts—predominantly based upon excavated midden deposits from selected sites in the Embudo Valley. This will be coupled with a consideration of archaeological survey data pertaining to herding encampments identified across the broader northern Rio Grande region. By combining both these distinctive, but complementary, lines of evidence we will offer a multi-scalar account of the impact of colonial modes of pastoralism within a New Mexican context. Themes to be examined will include changes in dietary practices within the home and village, patterns of labor and movement with respect to herding economies, and transformations in entire landscapes wrought via the large-scale introduction of new species of domesticates. Each of these themes will be brought together in order to think about the impact of colonial herding on the deep ecologies of the broader American Southwest.

Gronniger, Grace [326] see Janesko, Sarah

Grooms, Seth, Edward Henry (Washington University in St. Louis), Kelly Ervin (Washington University in St. Louis) and Tristram Kidder (Washington University in St. Louis)**[291]** *Beyond Good Grey Culture: Rethinking Early Woodland Origins in the Lower Mississippi Valley*

The origins of Early Woodland cultures have long been poorly understood, but recent data from sites in the Yazoo and Tensas basins, and from sites along the coast are providing new perspectives on the development of the Woodland tradition in the Lower Mississippi Valley. In this paper we summarize Steve Williams' contributions to understanding Woodland origins and update his work with new data. In contrast to earlier thinking, recent research shows that Woodland peoples in the Lower Mississippi Valley have complicated ancestries with multiple histories. These aren't monolithic Good Grey Cultures; instead, the Early Woodland is a period of dynamic change as vibrant populations adapted to novel environmental and social circumstances following the collapse of Poverty Point.

Gruber, Anya**[104]** *A Palynological Approach to Colonial Agro-Pastoral Activities at LA 20,000, New Mexico*

The local environment at LA 20,000 played a major role in influencing what kinds of activities could take place at the ranch built by Spanish colonizers in the 17th century. Palynological analysis is used here to understand how the environment changed over the course of the colonial era and, in turn, inform what types of activities were performed at the site. My research identifies and quantifies plant taxa using palynology in order to understand land use at LA 20,000, a 17th century rancho site in New Mexico, and asks how the local environment and natural resources offered opportunities as well as limitations to the people living on the land. A diachronic approach will characterize plant populations before and after the establishment of LA 20,000, while a synchronic approach focusing on the 17th century colonial period will assess pollen signatures from different activity areas around the site, including the house, barn, and corral, in order to understand the specifics of Pueblo and Spanish land use practices, such as field crop production and livestock management. Together, these approaches inform the relationship between Spanish colonialism and the creation of social identity through food production and consumption.

Gruntorad, Kelsey A. [187] see Tappan, Katie K.

Grunwald, Allison (Independent Researcher)**[204]** *Analysis of the Faunal Remains at the Arch Street Cemetery Site*

Prior to moving the burials within the First Baptist Church of Philadelphia cemetery to a new location in 1860, a local newspaper of the time documented that the neighboring tenement houses used the open space as a dumping ground. Artifacts recovered from this deposit include pottery sherds, pieces of glass bottles, leather shoe soles, metal objects, and the remains of shellfish and domesticated animals. Many of the animal bones show signs of butchery, indicating that the remains are from food waste. Oyster, clam, sheep (mutton and lamb), and cattle were consumed by these tenants, as well as medium and large fowl, likely chicken and turkey. The goal of this paper is to quantify and analyze the faunal remains and compare the data to what we know of contemporary nineteenth-century Delaware River Valley resident diets.

Gruver, Stephanie (Northern Illinois University)**[221]** *Mesodesma donacium as a Paleoclimatic Archive on the Coast of Peru*

Quebrada Jaguay is one of the earliest maritime settlements in the New World. The southern Peruvian coastal site was occupied from the Terminal Pleistocene to the Middle Holocene ~13 to 8 ka and demonstrates a society highly dependent upon marine resources. Archaeological deposits excavated in the 1990's and 2017 contained high volumes of marine faunal remains, predominantly the surf clam *Mesodesma donacium*, which accounts for 99% of the shell remains. *M. donacium* are used in this study to examine seasonality of occupation and paleoenvironmental conditions. Incremental stable oxygen isotope ratios from the calcium carbonate of the shells allow for sea surface temperature (SST) reconstruction from the onset of shell development until harvest.

Reconstructing SST from multiple shells allows for the development of monthly averages during site occupation. The final temperature sequence of each shell defines the season of harvest, which then informs on the seasonality of human occupation. Periods of environmental instability, such as El Niño events, are identifiable as significant deviation from the monthly SST averages. Paleoenvironmental reconstructions of Quebrada Jaguay provide insights on occupation patterns as well as how early inhabitants of Peru responded to environmental instability.

Gu, Haibin**[284]** *The Character of Carbonized Rice in Hunan Archaeological Site*

Based on the comprehensive analysis of grain shape and embryos of carbonized rice from archaeological sites, the author draws conclusions as follows:

- There is a difference in shape of spikelet base between cultivated rice and wild rice, but it is difficult to make comparable measurements. Therefore, it is possible to identify rice by using the characteristics of the spikelet base based on one's experience, but it is difficult to make comparisons between different researchers.
- According to my study, some wild characteristics still can be observed on the cultivated rice of the Qujialing Culture dated to 5000 years ago. This

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

suggests that some changes of morphological characteristics may have lagged during the process of rice domestication.

c. Based on the results of discriminant analysis, the percentage of cultivated rice gradually increases :47%→67%→79%→92%. This pattern suggests that the morphological characteristics of rice changed gradually during the process of rice domestication. The origin of cultivated rice is therefore a long evolutionary process.

d. However, in the rice domestication process, the evolutionary speed of change differs for grain shape, awn, and embryo.

[212] *Dog-Assisted Hunting Strategies in the Early Holocene Rock Art of Saudi Arabia*

The UNESCO world heritage sites of Shuwaymis and Jubbah, in northwestern Saudi Arabia, are extremely rich in early Holocene rock art. Hunting scenes illustrate dog-assisted hunting strategies from the 7th and possibly the 8th millennium BC, predating the spread of pastoralism. The engravings represent the earliest evidence for dogs on the Arabian Peninsula. Though the depicted dogs are reminiscent of the modern Canaan dog, it is unclear if they were brought to the Arabian Peninsula from the Levant or represent an independent domestication of dogs from Arabian wolves.

A substantial dataset of 147 hunting scenes shows dogs partaking in a range of hunting strategies adapted to the environment and topography of each site. All depicted dogs appear to share the same phenotypic traits, and hunting scenes show up to 21 dogs in a single group. Particularly notable is the inclusion of leashes on some dogs, the earliest known evidence in prehistory. The leashing of dogs not only shows a high level of control over hunting dogs before the onset of the Neolithic, but also that some dogs performed different hunting tasks than others.

[173] *Albarradas, Solarés, and Classic Maya Land Tenure in Northwestern Belize*

The traditional, but yet poorly-defined, view of Classic Maya (AD 250–850) land tenure was that control was somehow vested in the royal and elite parts of society with “commoners” occupying land at royal pleasure. The exceptions to this pattern were known in “urban” cities such as Coba and Chunchucmil in the northern Yucatan and some coastal locations such as Playa del Carmen and Cozumel. However, the latter instances are commonly thought to date to the Postclassic period and were believed to be a departure from the Classic period pattern.

A LiDAR survey in 2016 of northwestern Belize revealed large blocks or groups of residences with boundary walls at the sites of Xnoha, Grey Fox and Blue Creek. Several hundred residential houselots have boundary walls enclosing areas of 1000–1500 square meters. The potential implication of this discovery is that Maya “commoners” had very different principles of land tenure than we understood and that they were more akin to our private ownership than we previously understood.

[73] *The Rock-Art of Central-West Brazil: New Studies from Chapada dos Guimarães / MT*

A new project carried out in the region of the Rio Vermelho / São Lourenço river basin in the central-western region of Brazil started in 2016. This project focus on the studies of the initial stages of the establishment of the hunters gathers groups in this region. It is intended through excavations, surveys and research in rock art to show patterns of the peoples who inhabited that region. The first systematic field surveys within this project, entitled “Archeology in the Pantanal region” recorded a total of 12 rock-art sites. Here it will be presented the first systematic approaches in these sites, considering the character of the diversity of rock art in this region, still little explored.

Guengerich, Anna (Vanderbilt University)

[178] *The Messy East: Regional Models and Their Complications in the Chachapoyas Area of Peru*

The Chachapoyas area has long been considered an internally coherent archaeological and sociohistorical region, one of the few associated with the Eastern Andes. Recent research, however, reveals significant environmental and cultural diversity and calls into question whether “Chachapoyas” can meaningfully be understood as a single region. There is little evidence for any practices that both unified it internally while distinguishing it from others, and ongoing research at the site complex of Tambillo in comparison with other areas of Chachapoyas indicates that the most productive approach at this stage is to focus on characterizing social and cultural patterns at the local level. Determining how, or whether, higher-order sociocultural units were constituted at the regional level requires greater bodies of data than those currently available. In this situation, it is both analytically productive and potentially more accurate to understand all interactions as inter-regional, even among groups that were once considered to belong to the same “region.” Similar geographical and environmental conditions found in many parts of the Eastern Andes suggest that it is important to more broadly evaluate the importance of scale and landscape in characterizing inter-group interactions, and to reconsider models developed from coastal and highland contexts.

[264] *Feline Pedestal Sculptures, Cacao, and the Late Formative Landscape of Mesoamerica*

Pedestal sculptures featuring supernatural felines with cacao drupes projecting from their foreheads dotted the Late Formative landscape of the Pacific slope and adjacent Guatemalan Highlands. In this paper we consider the implications of the replication of this sculptural form, its role in articulating an elite agenda linked to the production of cacao, and its pertinence to sites of varying scale and relative regional authority. A similar suite of meanings

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

engaged with cacao and supernatural characters persisted during the Classic period, especially in courtly circles. Yet the iconographic and social antecedents for these concepts emerged far earlier, likely between 500–300 BC. We explore the ways in which these Late Formative messages of elite authority, expressed metaphorically but laden with the economic implications of cacao production, proliferated across the physical landscape of Mesoamerica by the advent of the Late Formative period. We also consider what they tell us about the porous boundaries between cultivated and “wild” spaces and the ways in which they factored into elite rhetoric.

[219] *A GIS Approach to Landscape Legibility and Its Role in Late Pleistocene Hominin Dispersals*

The large-scale colonization of unfamiliar environments by Late Pleistocene humans would have required advanced navigational abilities. Archaeological signatures of spatial cognition are difficult to identify in Prehistory, although the presence of well-dated sites can help us track human mobility across the landscape. In this research, we test whether structural properties of the environment played an important role in helping humans navigate new landscapes, providing affordances for wayfinding that enabled people to quickly assimilate and make sense of their surroundings. To this end, we model a key geographic concept: landscape legibility. We present the results of a multi-scalar spatial analysis of Proto and Early Aurignacian site distribution in Western Europe, testing whether landscape legibility was a key factor in conditioning where people settled.

[125] *Archaeological Rat Diets Reflect Settlement Density: An Isotopic Investigation of Historical Rat Bones from Urban and Rural Sites in Upper Canada*

Over the past 1000 years, rats have spread out globally to become among the most ubiquitous and prolific pests in the world. While the global success of rats is largely owed to their ability to exploit human societies for food, shelter, and transportation, there has been relatively little research exploring rat behavior in urban contexts, where rat populations have been most successful. In this study, I use stable carbon and nitrogen isotope analyses of archaeological rat (*Rattus* sp., n=87) bone collagen from 10 nineteenth-century urban and rural sites around the historical city of York (now Toronto) in Upper Canada (now Ontario, Canada) to assess past rat diet and foraging behavior. Rat stable isotope values show significant differences in dietary composition and diversity between urban and rural sites. Results from analyses of rats are interpreted within a framework of isotopic data from domestic animals including cats, dogs, and raccoons to better understand how different anthropogenic habitats influence the urban ecology of rats. These findings highlight the potential for using isotopic analyses of archaeological fauna to explore ecological and commensal relationships between humans and animals in urban spaces through time.

[3] *Trans-Himalayan Material Culture of India: Special Reference to Steatite Bead*

Trans-Himalayan archaeology was always neglected by the historians and Archaeologist. But some recent excavations and my Ph.D. field work presented an interesting view of Trans-Himalayan culture. The burial culture of this region dated back to 600–200BCE. I found here the remains of Pyro-technological activities. Steatite bead was first time found in Trans-Himalaya. They are in size from 2 to 4 mm in diameter, 1to3 mm in height, and hole width is about 1 mm. The beads were examined by using SEM and XRD. XRD examines shown that the beads are prepared of enstatite, a Mg-bearing pyroxene, and cristobalite, a high-temperature polymorph of quartz, formed when quartz is heated at 900–1470 °C. Our primary results suggest that the beads were prepared by heating talc to a high heat. First a paste was made from milled talc, water and a binding material. The paste was then molded into elongated shape and heated at a high temperature. This firing process made the paste hardened and transformed the talc into enstatite and cristobalite. Lastly the shape was cut into the form of beads. I would like to present this work and also few other metallurgical activities which were also take place here.

[283] *Lessons from the Past: The Grand Human Journey to the New World*

Migration is a fundamental aspect of humanity and archaeologists have long been interested in studies of human mobility. Some archaeologists have taken a historical ecological approach to understanding human movement and how a deep history can inform on mobility in contemporary society. By leveraging knowledge from a variety of disciplines, these archaeologists have made great strides in our understanding of past human movement as it relates to postglacial human dispersals and climate change, a pertinent topic for today. The initial human migration into the New World is an early human dispersal that has become a focal point in mobility research that strives to understand the impacts that climactic change and shifting environments have on human's ability to successfully migrate and adapt to new lands. This presentation considers our current state of knowledge not only on how humans may have migrated into North and South America and adapted to their new surroundings, but also on what may have caused this initial migration to occur. Decades of interdisciplinary research, including more recent innovative projects, provide a wealth of data to consider how and why humans made the grand journey to the New World, and what this may mean for today's society.

Gustas, Robert (University of Victoria) and Kisha Supernant (University of Alberta)

[239] *Theoretical Frameworks for Modelling Late-Pleistocene Coastal Migration into the New World*

Spatial modeling of early prehistoric maritime movement on the Pacific Northwest Coast is important in contemporary archaeology because it can help locate new sites in a landscape which has radically changed over the last 20,000 years. Here we present the theoretical framework used in a research project which modeled maritime movement using least cost path analysis (LCP) to determine the routes most likely to have been traveled by the inhabitants of the Dundas Islands, British Columbia over the last 16,000 cal yr BP. Two cases studies are presented to illustrate how this framework which hybridizes elements of landscape and migration archaeology can be used to suggest maritime migration routes. The resulting movement paths were systemically analyzed and locations with high probabilities of use as movement corridors and stopping points were identified. This work is some of the first to apply LCP to seascapes and marine migration in North America and the results have the potential to lead to a better understanding of migration during the Late Pleistocene. Increasing our ability to predict the location of drowned sites on the Northwest Coast is an important step in furthering our understanding of this areas human history.

[38] *Mapping Prehistoric Behavior Patterns at a Lithic Tool Stone Source in the Colorado Desert: Results of Geospatial Analysis at CA-IMP-008/H*

This paper sets out results obtained following a Geographic Information Systems (GIS) analysis of the spatial patterning of stone tools at a study area in the Colorado Desert of southern California. Stone tools are examined based on their utility for an explanation of their use and importance in the lives of prehistoric foragers. Current efforts to understand the prehistory of the region is undertaken, mostly, by environmental consultants in the private sector of archaeology as part of a formal [legal] obligation prior to large land development in the form of green energy projects. The results of such analyses seldom make it to the public as published material. This study employs an academic lens to extrapolate qualitative information from quantitative data from previously unpublished cultural resources management (CRM) investigations in the region. The application of optimal foraging theory, to this study, allows for the examination of human and environmental factors and constraints facilitating predictions and interpretations of prehistoric forager behaviors and their occurrence and frequency in the archaeological record at the study area.

[124] *Behavior from Spatial Structure in Archaeological Sites: A Working Model Based on Dukha Ethnography*

Archaeologists commonly observe clear qualitative structure in the spatial distribution of artifacts deposited in archaeological sites. Quantification and interpretation of such structure remains a major challenge. Drawing on multiple field seasons of observation among the Dukha—residentially mobile reindeer herders of the Mongolian Taiga—we present a likelihood based method for quantifying site-level structure in the use of space. This ideal ethnographic case in which behavior-structure relationships are well defined, allows us to explore the extent to which behavioral inferences may be derived from archaeological structure. Behaviors of particular interest here include general activity types and seasonality of occupation.

[291] *Viewing Ceramic "Types," "Varieties," and "Modes" from a Practice-Based Perspective: Case Studies from the Greater Southwest*

As a student of Jimmy Griffin and Irving Rouse, much of Stephen Williams' early archaeological research involved the typological analysis of pottery collections from the American Southeast to reconstruct regional culture history. Later, as Director of the Peabody Museum, he played an important role in facilitating the development of a new generation of archaeological and materials science approaches to pottery analysis at Harvard with the construction of the Putnam Laboratory. This paper uses current ceramic materials analysis techniques and case studies from the Rio Grande and Casas Grandes regions of the Greater Southwest to explore how mid-century taxonomic units, such as "type," "variety," and "mode," can have continuing usefulness as conceptual frameworks for understanding pottery technology and production sequences as socially learned and culturally embedded practice. We reconstruct these shared communities of knowledge and practice at varying local, regional, and inter-regional scales and discuss how these practices inform our archaeological perception of standard cultural historical typological categories.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Hackenberger, Steven (Central Washington University) and Lourdes Henebry-DeLeon (Central Washington University)**[253]** *Paleoarchaic Cultural Affiliations on the Columbia Plateau*

Two decades of mortuary and bioarchaeology studies have built evidence for determinations of cultural affiliation for human remains and artifacts associated with the Paleoarchaic and Early Middle Archaic periods. Background studies (under NAGPRA: Kennewick by 2000 and Marmes in 2004, 2010, and 2012) outline major lines of evidence for determining probable affiliation. Sufficient and necessary evidence are subjects of healthy debate. Diversity in burial practices and artifacts unites more than divides Columbia Plateau communities from early times. Patterns in the locality and stages of mortuary practice (including cremation), combined with shell and ochre grave goods, strengthen models of dynamic social networks. Traditionalists and scientists are reconciling the personal identities of early ancestors. Their identities are complex and can include their status as elders and survivors, as well as their roles as individuals and explorers. Bioarchaeological studies (DNA, isotopes and trace elements), supported by Native Americans, will no doubt refine models of interaction spheres inside and outside of the Columbia Plateau. Advances in these analyses help better explain the interactions of culture and environment in shaping populations and personal life histories. Therefore, such studies will contribute to fuller understanding of the compelling identities of individuals we commemorate.

Hadden, Carla (Center for Applied Isotope Studies, UGA), Margo Schwadron (National Park Service Southeast Archeological Cent), Alexandra Parsons (National Park Service Southeast Archeological Cent) and Taesoo Jung (Georgia Museum of Natural History, UGA)**[217]** *Paleoecology, Paleoclimate, and Paleoecology at the Turner River Mound Complex, Everglades National Park*

The Turner River Mound Complex is an intensively modified landscape consisting of numerous shell mounds and other shell work features such as ridges, walkways, canals and ponds. Located in the Ten Thousand Islands region of Everglades National Park, a subtropical mangrove estuary, the complex is an unusual example of the prehistoric tradition of shell-built architecture in Southwest Florida. In this project we combine traditional zooarchaeological analyses, stable isotope sclerochronology, and direct dating of faunal remains to address two key questions: (1) What was the paleoenvironmental setting at the time settlement began, and when and why was it abandoned? And (2) is there evidence of sea-level or paleoclimatological change associated with site abandonment? Vertebrate and invertebrate faunal remains indicate a resilient resource base, consisting of animals that were well-suited to dynamic coastal environs, such as oysters and sea catfish. Preliminary data indicate that accumulation of domestic refuse began ca. AD 220–570 and ended ca. AD 690–1000, and that some vertical mixing has occurred within the 110-cm stratigraphic column. Oxygen isotope sclerochronology on modern and archaeological oysters indicate changes in climatological and hydrological conditions at the Turner River locale over time, potentially related to changes in sea level and/or precipitation.

Hadi Curti, Giorgio [72] see Dongoske, Kurt E.

Hadick, Kacey**[130]** *Archaeological Storytelling: Narrative Construction Using Virtual Reality*

Virtual reality (VR) is an exciting new medium for interactive storytelling and holds great promise as a way to raise awareness of heritage sites and the conservation challenges they face. VR can also be used as a way to provide virtual access to parts of an archaeological site that may be too sensitive for traditional tourism activities. In 2017, CyArk developed three virtual reality experiences of geographically diverse archaeological sites around the world that are being adversely impacted by climate change. The application includes Mesa Verde National Park in the American Southwest, the archaeological complex of Chavin de Huantar in the Peruvian highlands and the historic Ayutthaya in Thailand. The application will be available via mobile device on the Samsung Gear VR and the Oculus Rift virtual reality platforms. Each experience will combine 360 degree video interviews with scientific experts, dynamic audio interviews with site managers, digitized objects from several museum collections as well as fully navigable virtual environments of the archaeological sites. Brought together in VR the diverse multimedia contribute to a richer narrative. CyArk will show example content from the experience and will share the results of the public launch.

Hadley, Dawn (University of Sheffield)**[87]** *Chair***Hagerman, Kiri (UCSD)****[25]** *Changing Representations of Gender in Ceramic Figurines during the Emergence of the Teotihuacan State*

This paper investigates transformations in the construction and expression of gender in the Basin of Mexico from the late Middle Formative through Classic periods (approx. 600 BC- AD 600). Ceramic figurines from the sites of Teotihuacan, Axotlan, Cerro Portezuelo, and Huixtoco are used to explore how elements of gender were constructed and communicated in the region over the course of a millennium, and how these practices underwent a radical transformation during the emergence and expansion of the Teotihuacan state. The selection and combination of sexual attributes and decorative elements such as clothing and jewelry were changeable strategies for depicting social identity. In contrast to earlier methods for depicting feminine and masculine bodies, Teotihuacan period figurines emphasized decorative cultural attributes over physical ones—a strategy that quickly spread to rural communities in the region. The most striking transformation occurred in representations of women, which were nude and commonplace during the Formative periods, but became fully clothed and scarce during the Classic period, when the Teotihuacan state was at its height and Basin of Mexico society was increasingly socially stratified.

Hagopian, Janet [164] see Roberts, Heidi

Haile, James [212] see Larson, Greger

Haines, Julia (University of Virginia)**[308]** *The Archaeology of Mauritian Indentured Labor: Social Life and Death*

This paper provides a comparative case study for archaeological studies of slavery and indenture. I investigate the 19th century landscape and material culture of indentured laborers on the Bras d'Eau sugar estate in northeastern Mauritius, Indian Ocean. After emancipation, indentured laborers lived and worked within the same physical plantation landscapes as the enslaved individuals who came before them. However, Asian indentured laborers in Mauritius were immigrants and migrants: one-third returned to their homeland at the end of their five-year contracts and the other two-thirds remained on the island and eventually became the demographic majority. In spite of the relatively shallow period of occupation in Bras d'Eau, indentured laborers left a material imprint on the landscape. Mapping and excavations of industrial building, laborers' barracks, houses, and courtyards revealed possible Southeast Asian roots in the spatial organization of the living quarter and artifacts of mixed Asian, Indian and European origins. To better understand this particular context of unfree labor, I bring Patterson's conception of "slavery as social death" into conversation with literatures on transnational identities and migrations. These two theoretical perspectives frame indentured laborers' material practices as the processes of social life that emerge out of processes of social death.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Halcrow, Sian [87] see King, Charlotte

Hale, Micah (Dudek), Adam Giacinto (Dudek) and Nicholas Hanten (UC Davis)[225] *Micro Currencies Can Rapidly Appear Among Energy Maximizers: A Case Study from the Southern Sierra Nevada Foothills*

A recent, large-scale archaeological investigation in the southern Sierra Nevada foothills revealed the development of a locally circumscribed steatite bead-making industry. Made from a local steatite source, these rough, thin, square beads are accompanied by the entire range of production debris and bead making tools, collectively dating to the post-Mission historic period. I argue these steatite beads represent a micro-currency developed as an energy maximizing response to decreased availability of California's shell bead money.

Haley, Brian [265] see Lopez, Kirsten

Halford, F. Kirk (BLM, Idaho Deputy Preservation Officer/State Archaeologist)[261] *Getting out of the Box: New Horizons for Cultural Resources Data Management and Analyses*

Following the 50th anniversary of the National Historic Preservation Act of 1966 (NHPA), we are compelled to take both a retrospective and introspective view of the NHPA, and in particular the implementation of Section 106. Though making great strides, Section 106, the primary driver of Cultural Resource Management (CRM), is still boxed in by rote inventory and unimaginative interpretation and implementation. This paper will suggest ways we can break out of the box through better data management and analytical application. We'll review a national initiative by BLM to create cultural heritage resource data standards and the importance of applying more rigorous data management principles to landscape level planning and data modeling, facilitating proactive versus reactive resource assessments and the development of appropriate treatments of cultural heritage values.

Hall, Amanda (University of Florida)[81] *Uncovering the Mystery of the Lamar-like Clay Objects*

For decades, stamped and plain clay objects recovered from post-contact Native American sites between the 1950s and 1990s in the Florida panhandle have puzzled researchers. The objects are believed to have been produced by the Apalachee Indians living in the region. However, little is known about the techniques used to manufacture them or what purpose they served. These artifacts are generally referred to as Lamar clay balls owing to some having stamped patterns similar to Lamar-like stamped pottery associated with the Apalachee missions culture. The objects are unique in the sense that they do not resemble other types of baked clay objects found in the Southeast. A recent analysis of over 300 Lamar-like objects recovered from eight different sites, combined with archival and ethnographic data, has provided information regarding their manufacturing and possible function. The results of analyses are presented in this paper.

Hall, Sarah (Arizona State University), Eric Bartelink (California State University, Chico) and Julia Prince-Buitenhuys (University of Notre Dame)[179] *Dietary Variation at Point San Jose, San Francisco: Stable Isotope Evidence from a Late 19th Century Medical Waste Pit*

This study used stable carbon and nitrogen isotope analysis to evaluate dietary variation among 30 adult individuals from a commingled assemblage recovered at Point San Jose (now Fort Mason), California (1863–1903). These remains comprise mostly middle-aged adults, both male and female, and two or more ancestral groups. The assemblage was recovered from a medical waste pit with evidence of anatomical dissection, suggesting that these individuals were likely of low socioeconomic status. Right tali (MNI=22) and eight skulls, a total sample of 30, were sampled for isotopic analysis.

Stable isotope data from the Point San Jose (PSJ) sample were compared to two other contemporaneous samples: the Santa Clara Valley Medical Center (SCVMC) cemetery sample in California and a multi-regional, North American sample. Analyses suggested that PSJ $\delta^{13}\text{C}$ collagen values were distinct from all groups except SCVMC, while $\delta^{15}\text{N}$ values were notably different from all groups except SCVMC and the southern U.S. sample. Bone apatite carbon values further contextualized these results. Despite diverse ancestries and different burial contexts, this study tentatively suggested that Bay Area Californians of low socioeconomic status shared a similar diet during this period.

Hall, Tegan [175] see Penny, Dan

Haller Von Hallerstein, Sophia (Institute for Archaeological Sciences, Paleoanthropology, Universität Tübingen), Dorothee Drucker (Paleobiology, University of Tuebingen, Germany) and Kurt Rademaker (Northern Illinois University, USA)[2] *Multi-isotopic Paleo-diet Reconstruction in a High Altitude Rockshelter of Southern Peru*

Expanding on a previous report, we expand the results of the analysis of stable carbon, nitrogen, and sulfur isotope analyses from collagen of three Early and two Late-Middle Holocene adult human burials with coeval fauna remains of Cuncaicha rock shelter in the Peruvian Puna. We also reconstruct important aspects of the ecology of the Pucuncho Basin, in which Cuncaicha is located, using new and published isotopic values of archaeological and modern fauna and plants. Sulfur isotope values indicate a distinct local geochemical signal, and contribute to the development of models for the interpretation of paleo-diet. Nitrogen and carbon isotope values show a human consumption of protein from local highland animals and plant, adding to our understanding of human behavior in extremely challenging environments. We address issues of aridity and altitude in isotope signals, and chronological variation in productivity and foraging. As one of the oldest archaeological sites in South America for which stable isotope data are available, the apparent prolonged occupation of the Pucuncho Basin is important for understanding early forager settlement strategies and resource exploitation in puna ecosystems, and thus for the onset of adaptations to high altitude.

Halligan, Jessi (Florida State University)[244] *Terminal Pleistocene Climate Change and Shifting Paleoindian Landscapes in North Florida*

Much of the Southeastern United States suffers from poor organic preservation. Direct dating of archaeological components is often impossible, and intact paleoenvironmental sequences are very rare, especially for the terminal Pleistocene. Inundated terrestrial sites in the Aucilla River of northwestern Florida can overcome both of these difficulties, with archaeological materials buried within directly-dateable intact strata containing well-preserved paleobotanical and faunal remains. Strata from different inundated sites can be correlated regionally by soil development and radiocarbon dates. These sites can provide high-resolution and in-depth multi-proxy records for environmental changes occurring during the terminal Pleistocene and early Holocene (ca. 18,000–7500 cal BP). Because these paleoenvironmental data are also associated with cultural materials, these records can also shed light on Paleoindian and Early Archaic lifeways.

Halligan, Jessi [78] see Waters, Michael

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Halling, Christine (Louisiana Department of Justice) and Ryan Seidemann (Louisiana Department of Justice)**[107]** *Following the Storm: Ethical Considerations for Historic Cemetery Disruptions after Natural Disasters*

Louisiana is known for its historic and iconic cemeteries which feature above ground monuments, vaults, and tombs. However, equal numbers of cemeteries are in-ground, and are often lost or forgotten. Due to the accessibility of the above-ground cemeteries, these spaces make for easy targets of vandalism, are used for religious worship, impede construction efforts, and become impacted by natural disasters. The in-ground cemeteries are often encountered in urban development and during disaster reconstruction. Each of these scenarios present ethical conundrums when planning archaeological responses. For example, when do religious practices venture too far and become vandalism? When should urban development become more important than the history and protection of the dead? When a disaster requires months of effort, how are recovery efforts and cemetery preservation balanced? Working in Louisiana's historic cemeteries presents a unique sphere where interaction with the dead and living communities is intertwined so deeply, they cannot be separated. This presentation addresses that situation, following the recent natural disasters so often encountered in Louisiana; and how ethical considerations and the affected communities succeed when both groups align with intended action.

Halmhofer, Stephanie**[14]** *The Blown Glass Beads of Garden Bay, British Columbia*

In May 2015, a disturbed burial was uncovered in Garden Bay, British Columbia, within close proximity to the large shíshálh village site of Sexwamin (DjSa-3). Found in association with the burial were 244 intact smooth, unadorned mold-blown (SUMB) glass beads and 40 SUMB glass bead fragments. Due to their extremely fragile nature, blown glass beads are rare in archaeological contexts and the beads from Garden Bay are from one of only five sites in North America where SUMB glass beads have been found. The beads from Sexwamin are: 1) the first of their kind found in British Columbia, 2) first of their kind reported in Canada, 3) the first of their kind found in a mortuary context, and 4) the largest collection from the five North American sites. These beads were likely manufactured during the late 19th century in the western region of the Czech Republic formerly known as Bohemia, which by this time had become the world-leader in blown-glass bead manufacture and exportation. This presentation will discuss this unique style of glass bead and what they might begin to tell us about Sexwamin.

[313] *Chair***Halperin, Christina (Université de Montréal), Jean-Baptiste Le Moine (Université de Montréal) and Enrique Perez Zambrano (Universidad de San Carlos)****[230]** *Infrastructures of Moving Water at a Terminal Classic Maya Site in Petén, Guatemala*

What are the temporal dynamics of water infrastructures? Recent research at the Maya site of Ucanal in Petén, Guatemala, has identified several water management features, such as canals, dams, baffles, and roads, many of which drain water away from the site core and towards a nearby river, the Río Mopan. The heavy focus on water drainage rather than water storage is seemingly incongruous with paleoclimate data, which reveal evidence of droughts during the height of the site's occupation. This paper considers the historical context of waterways at the site from different temporal scales: the *longue durée* in which infrastructure construction is placed within a broad temporal framework of the site's development and paleoclimate data, the temporal fluctuations of dry and wet seasons, the temporality of monumental time, and the everyday of water infrastructure use and maintenance.

Halstad McGuire, Erin (Department of Anthropology, University of Victoria)**[94]** *Cultivating Curiosity: Experimental Archaeology in Undergraduate Courses*

This poster examines the use of experimental archaeology as a teaching tool in undergraduate courses. It looks at issues relating to the design, implementation, and assessment of experimental archaeology projects in upper division courses ranging from 30 to 70 students. The case studies examined here involve group-based projects centred on topics in medieval archaeology from the University of Victoria. Methods for monitoring student projects and assessing diverse experiments will be discussed. Experimental archaeology projects, though potentially challenging for instructors, are a powerful means to engage deeper student learning both in terms of archaeology as a discipline and within specific regional/topic areas of archaeology.

Hambacher, Michael**[133]** *Traverse Ware: A Case Study in Ceramic Regionalization, Style Horizons, Interaction Patterns, and Ethnicity in the Late Prehistoric Upper Great Lakes*

Among the many changes that take place during the Late Prehistoric period in the Upper Great Lakes are greater levels of regionalization and shifts in region-wide interaction patterns. These changes are generally viewed as being reflected in varying degrees of similarity and dissimilarity in ceramic wares, decorative styles, and technology seen across the region during this period. Suites of ceramic types and decorative styles have also been used to link particular ceramic groupings with specific ethnic or tribal groups and their protohistoric antecedents. Using Traverse wares from northwestern Lower Michigan as an example, this paper will explore a number of aspects about the nature and meaning of Late Prehistoric ceramics in the region. Characterization of Traverse ware provides a basis for examining patterns of group identity and intergroup interaction patterns, as well as the meaning of stylistic horizon markers that aid in unifying and differentiating archaeological groups and broader implications about the relationship between ceramics and ethnic identity in the region.

Hamblin, Andrew [238] see Baxter, Carey

Hambrecht, George (University of Maryland College Park)**[195]** *Zooarchaeology, Shifting Baselines and a Rapidly Changing Climate*

Anthropogenic climate change will both aggravate existing and create new situations in which local communities encounter the power of larger networks looking to either exploit or manage resources in their area. This paper will discuss a variety of ways in which zooarchaeological data investigated in a historical ecological mode might be useful in such circumstances. Zooarchaeology creates a deep context for human and animal dynamics. It investigates anthropogenic as well as environmental influences on communities in the past. Due to this, zooarchaeology should be in a position to help mediate future conflicts over the exploitation and management of animal species that will only increase in the face of anthropogenic climate change. This paper will focus on the relevance of shifting baseline data and zooarchaeological approaches to this phenomenon in the context of local communities and anthropogenic climate change.

Hamilton, Derek (Scottish Universities Environmental Research Centre), Kerry Sayle (Scottish Universities Environmental Research Centre), Colin Haselgrove (University of Leicester) and Gordon Cook (Scottish Universities Environmental Research Centre)**[29]** *Application of Multi-Isotopic Analysis ($\delta^{13}C$, $\delta^{15}N$, and $\delta^{34}S$) to Examine Mobility and Movement of People and Animals within an Iron Age British Society*

The middle of the Iron Age in southern central Britain (c. 400–200 cal BC) is a period that is often seen as becoming regionally inward-looking. A primary focus of the mixed agriculturalists is on building and maintaining massive hillforts. There is very little long-distance exchange or trade noted in the archaeological record, and the metalwork at the time takes on insular forms (e.g. involuted brooches) that separate it from the Continental connections observable in both the Early and Late Iron Age.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

This paper will present the results of recent multi-isotopic work ($\delta^{13}C$, $\delta^{15}N$, and $\delta^{34}S$) on human and animal bone collagen from the Wessex sites of Suddern Farm and Danebury hillfort, which alter this narrative. We suggest that the high variability in $\delta^{34}S$ observed within the horses is directly related to these animals being used to cover large distances, while these same numbers in cattle are indicative of them being moved potentially upwards of 100–300 km prior to their death and deposition. The scale of the mobility within the animal populations leads us to question the broader economy and social connections at this time.

Hamilton, Marian (University of New Mexico), Cyler Conrad (University of New Mexico), Patricia Crown (University of New Mexico), Wirt Wills (University of New Mexico) and Emily Lena Jones (University of New Mexico)

[115] *Carbon, Nitrogen, and Oxygen Stable Isotope Ratios from Room 28 Lagomorphs*

Stable isotope analysis is a powerful tool for investigating ecological change and human impact in the past. Here, we present carbon, oxygen, and nitrogen stable isotope results from lagomorphs excavated from Room 28 alongside those from two other archeological sites within Chaco Canyon (Pueblo Bonito middens and the Bc57 site) as well as modern lagomorphs collected opportunistically during archeological survey. Oxygen isotope ratios remain consistent between time periods and locations, which is inconsistent with the idea that oxygen isotopes can be used as an indicator of long-distance procurement of small mammal fauna in ancient Chaco Canyon. Carbon isotopes are enriched for archeological versus modern fauna suggesting a heavier C4 plant component to past lagomorphs' diets. Room 28 lagomorphs are also significantly more enriched and more highly variable in their nitrogen isotope ratios than those from modern collections. This pattern of enriched carbon and nitrogen isotopes archeologically is not observed in rodents, suggesting that the lagomorph differences are not purely the result of ecological change. Rather, these results are consistent with the garden-keeping hypothesis, in which ancient people in Chaco Canyon supplemented the diets of lagomorphs with agricultural crops (maize) from fertilized fields.

Hamilton, Michelle [90] see Devlin, Joanne

Hammer, Emily (University of Pennsylvania)

[230] *Water and Pasture Infrastructure of Mobile Pastoralists in Southeastern Turkey*

Archaeology has long seen mobile pastoral societies as largely materially "invisible" both in the realms of portable artifacts and of infrastructure projects such as buildings and landscape modification. Recent studies have sought to alter this impression as part of larger trends that seek to ground our understanding of pre-modern pastoralists in concrete faunal, botanical, isotopic, landscape, and historical data, which clearly show the effect that pastoral practices and infrastructure have had on cultural landscapes through time. I draw on ethnographic and archaeological case studies from the Middle East to discuss some general political, social, and environmental issues affecting the elaboration of pastoralist infrastructure in seasonal territories and the complex relationships transhumant people have with the infrastructure of surrounding sedentary communities. Drawing on archaeological survey data, I also discuss water and pasture infrastructure of the last 500 years in southeastern Turkey and the changing political environment in which this infrastructure was used by mobile pastoralists to live in a "marginal" area under the Ottoman and modern Turkish states.

Hammerstedt, Scott (University of Oklahoma), Amanda Regnier (University of Oklahoma) and Marc Levine (University of Oklahoma)

[248] *The Discovery of a New Buried Building on Monte Albán's Main Plaza*

Large-scale geophysical survey was conducted at Monte Albán's Main Plaza during the summer of 2017. The results suggest the presence of a substantial, but previously unknown, building with associated features located in the west-central portion of the plaza near Building H. In this paper, we describe our findings and present our preliminary interpretation of the geophysical data.

Hammerstedt, Scott [119] see Savage, Sheila

Hampton, Ashley (University of Montana)

[239] *A Stone Throw(n) Away: Examining the Interconnection between Identity and Division of Labor through an Evolutionary Analysis of Household Spatial Organization*

This study examines issues of cultural change/continuity as embodied within a singular multi-generational housepit (Housepit 54) located within the Bridge River site in the Mid-Fraser Canyon, British Columbia, Canada. Previous research has focused on understanding the changing social dynamics at both a village and household-level, examining shifts from a more collaborative to competitive framework in response to external environmental pressures. As interpersonal dynamics within Housepit 54 were renegotiated within a context of increased competition, this study will address how—if at all—such changes beget corresponding shifts in identity-defining tasks in order to better understand the recursive relationship between culture, environment, and individual agency. If hunter-gatherer identities were tied to resource-extraction activities (i.e. individuals who hunted had identities based around such hunting practices) then changes in resource access may have caused subsequent, measurable shifts in identity. This study uses ArcGIS in order to examine the fine-grained detailed evolution of spatially-defined activity within HP54 in order to illuminate the interplay between personal identity, cultural transmission, and emergence of inequality.

Haney, Emily (BLOOMSBURG UNIVERSITY OF PENNSYLVANIA)

[302] *Mortuary Vessels at the Maya City of El Peru-Waka'*

Residential burials are useful tools that help archaeologists better understand domestic ritual practices at the household level. With the household acting as a unit of social identity, funerary practices help archaeologists relate said practices to prominent trends of the time. These include, but are not limited to social and religious structures, identity, power, and social reproduction. One of the many types of artifacts that often appear in Classic Maya burials that are significant to burial practices are ceramic vessels. Through the utilization of several whole ceramic vessels uncovered during the 2017 field season at the Maya city of El Peru Waka', this poster will attempt to explore the use of ceramics in funerary contexts at the site. In looking at mortuary vessels recently excavated in El Peru's Chok Group, funerary contexts can help to reveal domestic ritual trends and purposes. After recovery of the vessels in the 2017 field season, they were brought to the lab where they were cleaned and analyzed. By using the type variety method, examining the vessels for presence of use ware, and original funerary context (through drawings and photographs) a better narrative of ceramic use in domestic funerary contexts is revealed.

Haney, Jennifer [135] see Walker, Karen

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Hankins, Sharon and Megan Skillern (University of Texas at Austin)**[243]** *Experimental Ceramic Technology: Colha, Belize*

We have been very fortunate this year to have Dr. Fred Valdez, Luisa Aebersold and their team graciously contribute to our research program in ceramic technology. They took time during their extremely busy field season to bring clay for our team to prepare and attempt to build pottery at Programme for Belize Archaeological Field School.

We have two different types of clay to research. The first clay is yellow clay CH4444. The second clay is iron-rich, red clay CH2222. Our first task was to visually analyze the artifacts from the two different lots. CH4444 was associated with archaic tools. CH2222 was associated with Preclassic pottery. We designed four different techniques to prepare the clays for our study. Our first group of CH2222 was aged directly in water and hand sieved. Both clays were moist from retrieval. This became problematic for the iron-rich clays. The clays were extremely difficult to break down. We dried them in open baskets.

The remaining CH2222 and CH4444 were prepared by hand. Due to the weather and the iron-bearing clays these processes took several days to accomplish.

Hanks, Bryan (University of Pittsburgh, Department of Anthropology) and Miroslav Kocic (University of Pittsburgh)**[245]** *Reassessing Neolithic Settlement Patterning in Central Serbia through Geophysical and Geochemical Survey*

This paper details the results of recent large scale pedestrian, geophysical and geochemical surveys on Late Neolithic Vinca culture sites in Central Serbia. New data relating to settlement patterning, household organization, and diachronic developments will be discussed through combining surface survey and analysis and remote sensing. Results from these studies are adding a new perspective to conventional models for the Neolithic transition and the emergence of early village societies in southeastern Europe.

Hanks, Bryan [106] see Canaday, Timothy

Hanley, Jacob [21] see Cottreau-Robins, Catherine (Katie)

Hann, Don**[106]** *Obsidian Procurement Patterns in the Strawberry Mountain Wilderness*

Cultural resources in wilderness areas can be difficult to manage due to a lack of dedicated funding and few undertakings which trigger survey through the National Historic Preservation Act. After a series of extensive wildfires in the 1990s the Malheur National Forest surveyed much of the Strawberry Mountain Wilderness Area using volunteers from the Forest Service's Passport In Time program. Crews documented several extensive obsidian dominated lithic scatter sites. The debitage and other artifacts recovered illustrated the full range of lithic reduction stages suggesting a nearby source of natural obsidian. Additional survey failed to locate any usable obsidian sources within the wilderness. X-Ray Fluorescence (XRF) characterization identified the two primary obsidian sources from these sites several miles, and approximately 2000 feet below, the sites in the wilderness. Likely travel routes between the obsidian sources and lithic reduction sites in the wilderness can be inferred from the XRF data.

Hanna, Jonathan**[108]** *Discussant***[108]** *Chair*

Hanna, Jonathan [34] see Mistretta, Brittany

Hannigan, Elizabeth (Boston University), Shintaro Suzuki (Universidad del Valle de Guatemala), Felipe Trabanino (Universidad Nacional Autónoma de México) and Boris Beltran (Proyecto Arqueológico Regional San Bartolo- Xultún)**[306]** *A Biological Profile of an Individual from Xultún Using Bioarchaeological, Starch, and Isotopic Analyses*

Micro and macroscopic bioarchaeological analyses enable archaeologists to generate biological profiles of past individuals, including characteristics such as diet, sex, age, occupational stress, pathologies, and social status, among others. In this paper, we discuss the significance of a Maya individual by constructing a biological profile from both micro and macroscopic analyses. The individual of interest was excavated during the 2012 field season at Xultún, Guatemala in a patio situated in the southeast portion of the site. The burial contained the remains of two additional individuals and was located just outside the Grupo TaaJ structure, a small mural room dating to the Late Classic period. Through the use of microscopic analyses, such as starch and isotopes, and multiple macroscopic analyses, we provide a thorough investigation of this individual's life, as preserved in the archaeological record, in order to provide insight into the importance of the burial and the role of both women and book makers in Maya society. Furthermore, this study expands on the role of an individual in Maya society and how that is reflected in a mortuary context, more specifically in the Classic period site of Xultún.

Hannus, L. Adrien [223] see Behling, Emma

Hanratty, Colleen [173] see Guderjan, Thomas

Hansch, Jakob**[239]** *Quantifying the Qualitative: Locating North-Central Kansas Burial Mounds*

Scattered through parts of northeastern and north-central Kansas are prehistoric burial sites in the form of low rock and earthen mounds located atop bluffs overlooking stream valleys. In Kansas, the Unmarked Burial Sites Preservation Act exists to protect these sites, but this law is only effective if the location of these features is known. Most prehistoric mounds in this region are subtle in appearance, making them difficult to recognize. If sites are not recorded and protected, they may be unintentionally or intentionally destroyed. Using Geographic Information Systems (GIS) software and the Kansas State Historical Society Archaeological Site Inventory, a map was created pinpointing the locations of recorded burial mounds in Clay, Geary, Pottawatomie, Riley, and Wabaunsee counties. Geographic associations of known mounds relative to topographic and hydrologic features were highlighted in order to recognize spatial patterns and simple statistical procedures were used to predict areas with high potential for past use as prehistoric burial sites. Samples of these areas were targeted for pedestrian survey to identify and record additional burial mound features with the overall goal of helping protect prehistoric burial sites in northeastern Kansas. Four burial mound sites were recorded because of these surveys.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Hansell, Patricia (Temple University)

[112] *Discussant*

Hansen, Daniel (University of Michigan)

[25] *Death and Identity at Monte Albán*

Archaeologists have long striven to interpret mortuary rituals as qualitative signs of a living people—indices of sex, gender, age, status, wealth, and craft. Though the doctrine “as in life, so in death” can have some merit for archaeological inquiry, viewing mortuary ritual in this manner ignores the social act itself, which is one of the most intimate, personal, and weighted actions humans produce, serving, among other roles, to return the society to homeostasis in the wake of the loss of a member. In interpreting mortuary ritual as a means to resolve a social death within a group, close ties emerge with ethnic and group identity. Rather than a passive reflection of a culture in life, mortuary ritual is an act constitutive of ethnicity.

This paper examines inhumation practices at Monte Albán in the Oaxaca Valley from ca. 500 BCE until Spanish conquest, traditionally periodized as Monte Albán I-V. Drawing on primary data from past excavations, including those of Alfonso Caso in the early 20th century, it is an attempt to synthesize an identity-driven interpretation of mortuary ritual in Monte Albán, an urban center whose ethnic history is a source of ambiguity.

Hansen, David (Nazarbayev University) and Elissa Bullion (Washington University in St. Louis)

[185] *Cranial Modification in Medieval Central Asia*

This study examines the practice of cranial modification at the 12th-13th century site of Kalmikkilgan in modern day Uzbekistan. According to historical sources, the medieval period in Central Asia was a time of reshaping ethnic, religious, and political identities: Islam spread widely across the region, waves of Turkic peoples migrated into the region, and a series of large territorial states rose to power. This period has been understudied from an archaeological perspective, leaving gaps in our understanding of how groups and individuals expressed identity in these shifting social landscapes. One practice that bioarchaeologists have focused on in the examination of identity is cranial modification, due to its highly visible nature. Cranial modification has been identified in several individuals from the Kalmikkilgan site in the Khorasm region. To document the types and degrees of modification present, we digitized three-dimensional cranial landmark data and analyzed shape difference between individuals using finite element scaling analysis. Our results indicate that at least two types of cranial modification are present, with one individual lacking evidence of modification. This range may be indicative of a desire to visibly express identity in a period during which social changes were occurring rapidly across many spheres of life.

Hansen, John (American Museum of Natural History)

[138] *When Is “Near” Close Enough? Old Data, New Interfaces and an Imperfect Present*

The Division of Anthropology at the American Museum of Natural History launched its first online database in 1995. The image-oriented interface proved attractive to an audience with a moderate level anthropological background. Later, in response to numerous requests, unimaged archaeological collections with more technical data were offered through a password protected interface. As of September 2017, 250,000+ files with images were publicly available, the combined online database representing 450,000+ records.

There are continuing issues with the source material, legacy data and user experience. Many database projects were underfunded and resulted in data inaccuracy. Inadequate context discourages novice users. Most frustrating is the lack of definition in object name and provenience. Although the inclusion of scans of original documentation mitigates some user dissatisfaction, the situation limits the use of existing web services.

Even with these problems, the database has proved popular and useful. The web-based interface has permitted an agile, flexible and relatively easily modified presentation of data while maintaining integrity with the original catalogue. The resulting tool is not only the primary means of external access to our collections for students, educators, researchers and casual visitors but has become a valuable resource for divisional staff as well.

Hansen, Richard, Edgar Suyuc-Ley (Mirador Basin Project), Carlos Morales (FARES Foundation; Université la Sorbonne, Paris), Beatriz Balcarcel (FARES Foundation; UNAM, Mexico) and Stanley Guenter (FARES Foundation; Mirador Basin Project)

[252] *The Monumentality of the Preclassic Maya of the Mirador Basin, Guatemala*

Archaeological investigations in 51 ancient sites within the geographical confines of the Mirador Basin of northern Guatemala have identified an extraordinary emphasis on monumentality in art and architecture dating well into the Middle and Late Preclassic periods of Maya occupation. The structure and format of this phenomenon is replicated in early complex societies in other parts of the world, and suggests a consistent human behavior of predictable characteristics. The analyses and forms of the varied demonstrations of monumentality provide an insight into economic, political, and social structure among the Preclassic Maya and, in particular, the unusual and precocious cultural development in the Mirador Basin.

Hanson, Kelsey (University of Arizona)

[136] *On the Persistence of Tradition: Caves, Ritual Performance, and Secrecy among Multi-ethnic Communities in the U.S. Southwest*

Discussions of ritual performance in the U.S. Southwest are often restricted to the analysis of architecture in residential settings, leaving the potential role of caves largely absent from regional discourse. As settings that are less accessible to the entire community, caves likely represent important venues for ritual performance whose participation is intended only for a select audience. The aims of this paper are twofold. First, through the reevaluation of select wooden ritual assemblages from caves in the U.S. Southwest, this paper addresses the distinctive role of these items in ritual performance—from production, use, and appropriate storage in caves. Second, using a case study based on a reevaluation of the ceramic and wooden ritual assemblages from the Point of Pines caves in east-central Arizona, this paper considers the persistence of ritual performance among multi-ethnic communities, asking to what extent the use of these caves represent incompatible imported traditions practiced in secret. By facilitating secrecy, I argue that caves serve as especially important settings for maintaining diverse religious traditions in multi-ethnic communities, allowing for the persistence of otherwise incompatible practices.

[105] *Modeling Hunter-Gatherer Population Dynamics on the Texas Coastal Plain during the Holocene*

A radiocarbon database is used to model prehistoric population dynamics on the Texas Coastal Plain in the context of Holocene climate change. Hunters and gatherers participated in a multifaceted social and ecological system that appears to have been highly resilient to climatic impacts by

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

utilizing multiple ecological zones and participating in wide-ranging social networks for over 6000 years. Climatic fluctuations include a dry middle Holocene and fluctuating but wetter late Holocene. During the early and middle Holocene the region experienced rising sea-levels followed by stabilization. Expectations from archaeological data indicate populations experienced a number of substantial population fluctuations, peaking during the Late Archaic period (4000–800 BP) and sharply declining during the Late Prehistoric period (800–350 BP). We will compare the patterns in the radiocarbon database to these expectations and Holocene climatic reconstructions.

Hardy, Thomas (University of Pennsylvania)

[295] *Assembling Empire: Continuity and Change in the Long-Term Development of the Inca Empire*

This paper explores the use of assemblage theory, derived from the work of theorists such as Deleuze, Guattari, and DeLanda, as a way of overcoming inherent problems in earlier attempts at understanding sociopolitical change. Exploring the implications of this historical materialist approach involves linking processes operating at different scales of time, and tracing historical genealogies of practice and the ways they were assembled to produce political sovereignty. I argue that not only are the conditions for sovereignty necessarily in place long before the emergence of particular regimes, but that the production and maintenance of these kinds of social relations are rooted in material culture over the *longue durée*. Research conducted at Minaspata, a multicomponent site located in the Lucre Basin, Cuzco, Peru, in the heartland of the Inca state, suggests that the emergence of Inca imperialism in the 14th–15th century CE was the result of a complex set of social relations, materialities, cultural practices, and ontologies that were “assembled” over the previous several centuries. These assemblages were produced through the interactions between humans and the broader material world and were transformed as they were drawn together, with distinctive historical genealogies that flowed at different temporalities.

[80] *Walking through Mayapán*

I present a preliminary analysis of movement through the Postclassic political capital of Mayapán. The architectural features at Mayapán are some of the most densely concentrated of sites in ancient Mesoamerica, but its organizational principles defy explanation. Almost two decades of fieldwork, including using electronic total stations, RTK survey-grade GNSS, UAV-based aerial photography, and an aircraft-borne LiDAR survey of a 40 sq km area centered on Mayapán’s defensive wall, allows mapping of much of the distribution of public architecture, dwellings, platforms, property walls, pathways, and non-residential features across the city and the region. This database is the basis for revealing the forces that drove the development of Mayapán’s urban form. I focus on the role of walled pathways in relation to the locations and forms of key public architectural features, walled houselots, cenotes, the defensive wall, and major gateways.

[306] *Hoxie Farm: Bioarchaeology of a Late Prehistoric Community in Northeastern Illinois*

The Upper Mississippian (A.D. 1400–1500) Hoxie Farm site is one of the best documented late prehistoric sites in Cook County, Illinois. In 1953, Elaine Bluhm and David Wenner from the Field Museum of Natural History organized a volunteer crew of professional and avocational archaeologists to salvage portions of the site in advance of construction of the first interstate highway (I-80) in Illinois. In 2000–2003, the Illinois State Archaeological Survey (ISAS) conducted additional excavations at this site in response to planned construction activities on I-80. In total, these investigations documented thousands of habitation features, several longhouse structures, and nearly 70 burials. In this poster we highlight the bioarchaeology of the Hoxie Farm site. Mortuary patterns at the site hint at cultural connections with both Fisher and Oneota traditions in central and northern Illinois. Skeletal evidence for violent death and postmortem modification of isolated human elements (burning, cut marks, incised designs) reflect the dynamic cultural environment of Hoxie Farm, one that included conflict. A diet comparatively low in maize, high rates of nutritional stress and infectious disease observed within this population may reflect these challenging environmental and cultural conditions.

[156] *New Evidence for Poverty Point’s Complex Developmental History*

Magnetic survey at Poverty Point reveals new information about ritual facilities, ridge construction and use, and a complex developmental history that included both planned and organic growth. Thirty-eight circles (diameters range from 8 to 66 m with a mean of 35 m) in the plaza are interpreted as ritual facilities. Targeted excavation in four circles encountered large postholes in three but the fourth consists of pits. Magnetic images suggest closely spaced postholes in many circles, possibly indicating rebuilding by inserting new posts between older removed posts. Some circles overlap with and—assuming ridge slopes were steep—may predate the inner ridges. The concentric ridges are distinguished by negative magnetic “perimeter” anomalies and habitation materials. Innermost Ridges 1 and 2 have multiple perimeter anomalies suggesting extensive rebuilding. Ridges 3–5 lack that evidence of reconstruction and presumably date later. Planning is evident at Poverty Point, but several stages of ridge construction, extensive rebuilding of some ridges and circles, and overlapping ritual circles and domestic ridges suggesting shifts in activity patterning are inconsistent with interpretations that imply nearly synchronous construction and rigid adherence to a detailed masterplan.

[266] *The State of the (Conch) Republic: Renewed Archaeology in the Imperiled Florida Keys*

Although the Florida Keys’ archaeological record famously made possible the seriation of south Florida pre-Columbian ceramic styles in 1949, this 356 km² archipelago has been largely ignored by academic archaeologists ever since. Today, Keys archaeological sites and historical properties are plagued by tourism-related development, a multi-faceted issue that is exacerbated by the compounding effects of weekly tidal erosion and seasonal tropical storms. Consequently, an untold number of sites have already been destroyed, and extant sites are at high risk of permanent inundation and/or demolition. Existing collections are therefore a crucial and fruitful resource in an area of such unfortunate circumstance. To be sure, they offer the best—and often the only—opportunity to study the diverse cultures that occupied this region in pre- and proto-historic times. With this poster, I highlight the history of terrestrial archaeological investigation in the Florida Keys; present a summary of ongoing collections-based geochemical research; and

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

most importantly, demonstrate how and why these small islands played a significant role in pan-regional maritime networks that extend from the 14th century into contemporary times.

Harkleroad, Eric

[29] *New Perspectives on Warfare in the Iron Age of Wessex*

Wessex, a region of southern England, has been the subject of more study than almost any other region of the UK. While much excavation has focused on the Iron Age little work has focused on the role of warfare at that time. Discussions of warfare have led to antithetical conclusions by researchers utilizing the same material with much of the disagreement stemming from fundamentally different interpretations of equivocal evidence and assumptions about life in the period. Some of this is ultimately founded on untested models and questionable historic accounts. I propose a new method of approaching warfare utilizing what I am calling bellicose references as a way of cutting through and resolving many of the issues that have complicated the study of warfare. Based in Practice Theory, specifically the idea of habitus, bellicose references are a conceptual tool that shifts focus away from the presence or absence of warfare and instead puts the focus on how these materials manifest socially, putting the focus on human action and practice. I demonstrate the usefulness of this approach utilizing data from Wessex and show how this, in conjunction with other information from the region, gives a more holistic understanding of violence and conflict.

[135] *Climate Change and the Rapid Loss of Organic Deposits in West Greenland*

The REMAINS (REsearch and Management of Archaeological sites IN a changing environment and Society) of Greenland project has explored a number of factors that currently threaten Greenland's archaeological landscape in the coming decades. This paper reviews recent work as well as the problems and threats to coastal and inland middens along the country's West coast and adjacent inner fjord systems. Information gathered in recent years provides a baseline for "ground-truthing" predictive models of preservation and deterioration of material such as bone, antler, baleen, wood, leather and feathers frequently observed in relative states of decay in the middens. Loss of organic integrity in West Greenland is variable but overall the preliminary data suggests that regardless of age and geographical location, archaeological deposits within the study area are vulnerable. Discussion of these data are situated in the context of the next ten, twenty and fifty years intervals from a heritage management perspective and the possible scenarios we can expect as climate uncertainties continue to eradicate Greenland's once outstanding archaeological legacy. The underlying theme is that there is a crucial need for greater international attention around the rapid loss of archaeological sites, features and deposits in the circumpolar North.

Harrington, Lucy (Mercyhurst University)

[22] *Measuring Mobility by Proxy: Use and Maintenance of Lithic Tools in Pennsylvania from Paleoindian to Middle Archaic Times*

Archaic peoples in Pennsylvania were less mobile than their Paleoindian predecessors. One form of evidence supporting this argument is the increased use of local lithic raw materials in the Early and Middle Archaic. The utilization and retouch of unifaces and bifaces is a second form of evidence of mobility. The production of tools designed for long-term use and maintenance is associated with highly mobile groups where maximizing tool use-life reduces transport cost and reduces risk when moving into areas with little or only poor quality lithic raw material. This study reports on the examination of changes in biface and uniface resharpening using Andrefsky's Hafted Biface Retouch Index (2006), Kuhn's geometric index for the reduction of unifaces (1990) and a new index for the utilization of unretouched flakes in an effort to examine the relationship between changing levels of use and mobility over time. The materials included in analysis are from 11 lithic assemblages previously excavated from well stratified sites in Pennsylvania dating from the Paleoindian to Middle Archaic periods.

[16] *Inuit Sled Dogs in the Contact Landscape: An Isotopic Investigation of Dog Provisioning in 16th–19th Century Labrador, Canada*

The 16th through 19th centuries witnessed increasing cross-cultural interactions between the Inuit of the Labrador coast and European explorers, traders, and missionaries. The effects of colonialism in this period have been studied with respect to Inuit identity, material culture, gender, and social organization, but the nature of Inuit-animal relationships has received comparatively less attention. In addition to occupying a prominent social role, the sled dog facilitated Inuit mobility and hunting practices, but required considerable care and provisioning. In this paper, we employ carbon and nitrogen isotope analysis of bulk bone collagen and amino acids to examine sled dog feeding practices between the 16th and 19th centuries. We analyze the remains of 60 archaeological dogs from six Inuit winter house sites from Labrador's north and central coasts. While all of the dogs included in this study consumed predominantly marine-based protein, we note a degree of inter- and intrasite variation in both the carbon and nitrogen isotope values of the dogs. This variation is further explored with reference to the settlement history of Labrador, and to other stable isotope datasets from the Eastern Arctic to better understand the changing role of the dog in Inuit society.

[240] *GIS Applications in the Analysis of Prehispanic Settlement in Cajamarca, Peru*

The Cajamarca Valley of northern Peru has seen changing settlement patterns throughout its nearly 12,000 year human occupation. Although several archaeological surveys have taken place in and around the basin over the past 70 years, this is the first project to apply the tools of Geographic Information Systems to this existing settlement data. This region-scale analysis is a significant addition to the traditional archaeological research in Cajamarca which has focused largely on the excavation of particular sites. The employment of nearest neighbor, central feature, view shed, and least costs analyses is revealing significant demographic change from the Formative Period through the Late Horizon. Analyses point to significant clustering of sites during the Formative Period with populations focused on large ceremonial mound sites in the basin. During subsequent periods, settlement oscillates between higher and lower elevation zones implying both economic and defensive pressures on settlement. The novel application of GIS tools

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

to existing settlement data is allowing us to speak to issues of population movement in the region with greater confidence than has been the case in the past.

Harris, Edwin (Colorado State University) and Christopher T. Fisher (Colorado State University)

[31] *GIS Analysis of the Road Network at the Postclassic Purépecha Site of Angamuco, Mexico*

The growing adoption of LiDAR for archaeological analysis makes determining how ancient peoples modified, interacted and moved through the landscape more practical. Initial analysis of the LiDAR produced imagery covering the Postclassic (1000–1520 CE) Purépecha site of Angamuco, located in the Lake Pátzcuaro Basin of Michoacán, Mexico showed a highly urbanized multi-nucleated settlement sprawled across 26km² of an ancient lava flow, with a complex urban structure. Here I discuss the results from a project to identify and extract road networks from the city. The Purépecha relied upon two primary types of roadways, typical ground level paths and elevated “highways” known as huatizi. By using the GIS software ArcMap, the possible roadways were identified visually by a combination of multiple data visualizations including Hillshade, Sky View Factor, and Openness Factor. A Least Cost Path analysis (LCP) was also applied to the entirety of the site to locate the most economical routes for comparison. The combination of the visually identified road network and the LCP provides a means to determine the pre-planning and organizational decisions involved in control of movement through the city.

[103] *Employing Bayesian Probability Theory to Diverse Applications Relevant to Archaeology*

The principle of equifinality describes a system where an end state may be reached from a variety of conditions and in a variety of ways and has proved to be a confounding element in several areas in archaeology. Archaeological data commonly occur in both qualitative and quantitative form and Bayesian modeling, coupled with modern computational routines, permits multiple data types to be incorporated into a single synthetic probability model. The Bayesian approach makes probability statements given observed data, constructing posterior probability statements about unknown model parameters including unknown (unobserved) data.

Here we describe how Bayesian inference offers a solution to several areas relevant to archaeology. We use a Bayesian algorithm to make categorical assignments for unknown archaeological samples in three analytically similar contexts: identifying bone surface modifications, distinguishing between heated and untreated silcrete, and distinguishing the chemical signatures from discrete volcanic eruptions. In each example, we use large samples of observed reference data to train the respective models. Out-of-sample cross validation is then used to assess model performance and predictive ability before analyzing archaeological samples. Monitoring posterior distributions of unobserved data result an assignment of probability associated with individual unknown (archaeological) samples, thereby formally addressing the issue of equifinality.

[83] *Lithics and the Late Prehistoric: Networks and Interaction on the Southeastern Columbia Plateau*

The people of the Columbia Plateau have been frequently characterized as a homogenous culture despite a 3,000-year depth of history and large spatial extent. Moreover, differences in artifact form, assemblage composition, and household features belie this characterization. The changing natural and social environment can be detected in modifications in cultural technology, and relationships among distinct groups can be inferred. The research presented here tracks these changes. By using concepts from evolutionary and social network theories, this study employs obsidian provenience sourcing and the morphometric analysis of projectile points to trace the ways people dealt with these environmental and social pressures through shifting adaptive strategies and increased intergroup interaction. Ultimately I ask can the cultural learning and adaptive strategies of late prehistoric cultural groups be identified in the variability of southeastern Columbia Plateau projectile points? And, how does obsidian procurement reflect changing cultural interactions and exchange networks in the southeastern Columbia Plateau over the past 3,000 years?

[103] *A Site Is Not a Centroid: Modeling Archaeological Landforms and Uncertainty with Bayesian Distribution Regression*

A Bayesian model of Distribution Regression using a Mean Embedding Ridge Regression (MERR) algorithm is developed to address two primary shortcomings of current Archaeological Predictive Modeling (APM) practice; 1) neglecting the richness of archaeological landforms by collapsing a site to a single point or observation; and 2) disregarding the implicit and explicit uncertainty of archaeological data, predictions, and model parameters. This research addresses the first hurdle by developing a Logistic MERR approach to Distribution Regression. This method first samples a distribution of variable measurements from the spatial area of each site, then uses a kernel to project the distributions into a non-geographical feature space to calculate mean embeddings, finally Kernel Ridge Regression estimates similarity coefficients for inference and prediction. The primary benefits of the MERR approach to APM are the consideration of archaeological landform richness and variation, explicitly modeling similarity between sites and the environment, and allowing for similarity metrics specific to archaeological research questions. The second hurdle is addressed by applying the MERR method within a Bayesian framework for probabilistic modeling. As such, the uncertainty of data and parameters can be explicitly modeled with priors resulting in a posterior predictive distribution useful for quantifying and visualizing risk.

Harris, Sarah (Connecticut College), Moriah McKenna (Connecticut College) and Anthony Graesch (Connecticut College)

[303] *(Im)movable Stone: a Comparative Analysis of Fieldstone Concentrations in Southern New England*

Fieldstone concentrations are rarely accorded much significance in historical and archaeological studies of eighteenth and nineteenth century farmsteads in southern New England. This poster highlights research addressing the surface piles of stone remaining in and beyond the abandoned fields of colonial and early American farms. Whereas many have assumed that fieldstone was eventually or meant to be incorporated into the thousands of miles of stone walls that crisscross New England's contemporary landscape, our research suggests that farmers may have allocated stone-clearing labor to a variety of purposes. We present the results of fieldwork aimed at systematically recording and mapping formal variability in fieldstone concentrations in relation to other field attributes—wall height, field size, proximity to barways—at/on three farmsteads. These data are then used to (1) explore how we might discern Indigenous from European stone features and, in cases of the latter, to (2) recognize different forms of labor allocated to field maintenance. In particular, we distinguish between the products of labor allocated to (a) permanent storage of fieldstone outside of stone walls, (b) temporary staging of fieldstone for later removal, (c) creation and management of water supplies for animal herds, and (d) disposal.

[139] *Re-contextualizing Pre-Columbian Gold and Resin Artifacts from Panama in the National Museum of the American Indian*

Until recent years the study of Pre-Columbian gold and resin objects from Panama was slow to progress due to the relative scarcity of archaeological projects excavating these materials. While the original contexts of many museum objects have been lost, the collection of Panamanian gold and resin in the National Museum of the American Indian was re-evaluated for its potential to answer key questions about the ancient craftspeople of this region.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

To ensure accurate provenience information was associated with each artifact, research was undertaken in the archives of the NMAI. The resulting letters and field notebooks provided insight into the fascinating history of these objects. Scientific analysis further contextualized these objects in terms of the materials and fabrication techniques. Compositional analysis of 231 gold objects using XRF revealed significant patterns related to the source of the raw materials and the technological choices that went into making them. Three resin objects also underwent FTIR and GC-MS analysis to identify the plant source of the resin. This project has produced valuable technical data on this region that has been relatively understudied archaeologically and additional detailed information has been added to the museum records for each of the objects in this study.

Harrison, Laura (University of South Florida)**[130]** *Digital Heritage in Archaeology in the 21st Century*

The recent 'digital turn' in archaeology has spurred methodological advances and new research directions, with wide ranging impacts at multiple scales. The proliferation of imaging, remote sensing, laser scanning and photogrammetry applications has, at times, outpaced considerations about data archiving, digital epistemologies, and accessibility. This can lead to circumstances in which the creation of digital datasets is privileged over public dissemination or scholarly output—a situation that ultimately undermines the democratization of science. The future of digital heritage in archaeology thus lies in the integration of methodological approaches to digitization with explicit project outcomes targeted at various communities and stakeholders—an approach that might be thought of as “applied digital heritage.” To illustrate this concept in practice, I offer a case study from the UNESCO World Heritage site of Villa Romana del Casale in Sicily, which was recently digitized with terrestrial laser scanning. These 3D data were incorporated into a research agenda and public outreach activities that bring issues of heritage accessibility, assessment, and digital knowledge production to the foreground.

Harrison, Ramona (University of Bergen, Norway)**[135]** *Saving Siglunes from the Sea*

Siglunes is one of a series of endangered sites in N Iceland where we investigate: the emergence and long-term development of Icelandic fisheries and marine mammal hunting, the changing connections between Eyjafjörður and the larger North Atlantic trade and exchange during the Viking Age and medieval times, processes of marine erosion and its effect on archaeological sites for heritage management efforts in Iceland and the wider region. The site's archaeological and environmental samples can provide us with information on Viking Age fishing strategies in the North of Iceland, and serve as a case study on the origins and subsequent development from artisanal to larger-scale commercial fishing enterprise in the 13th and 14th c. Thus fueling a growing industry that transformed Atlantic economies in the 17th-18th c. and underwrote emergence of the early modern world system. However this site is in immediate danger from ongoing coastal erosion and some of the structures observed in 2008 on the fishing site have since been truncated by the sea. This paper presents new results from ongoing analysis and contributes to the discussion on addressing ongoing cultural heritage as well as scientific data loss due to erosion forces magnified by global climate change effects.

Harrower, Michael [177] see Dumitru, Ioana

Harry, Karen (University of Nevada-Las Vegas)**[218]** *Shrines, Dedication Practices, and Closure Activities at Lava Ridge Ruin*

Lava Ridge Ruin, located on the Shivwits Plateau near the northern rim of the Grand Canyon, is a late Pueblo II period site associated with the Virgin Branch Puebloan culture. Excavations at the sixteen-room pueblo suggest that its inhabitants used natural and cultural objects to maintain historical connections with their ancestors and with previously occupied settlements, as well as to signify their connection to important places on the landscape. These connections are reflected in the very location of the pueblo, which encircles a shrine (or ritual cache) created more than a hundred years before the settlement was established. The connections are further reflected by dedicatory materials, often associated with the Grand Canyon, placed in the building's architecture during construction; as well as by specific closing rituals that marked the pueblo's abandonment. The implications of these behaviors for understanding the worldview of the people who lived on the Shivwits Plateau is discussed.

Harvey, Amanda (University of Nevada, Reno), Julie Hoggarth (Baylor University) and Jaime Awe (Northern Arizona University)**[14]** *Maya Diet during the Postclassic to Colonial Transition: Tipu and Baking Pot Oral "Health" and Isotopic Signatures*

The Colonial site of Tipu and pre-contact site of Baking Pot offer a unique perspective of the transition of Maya life in western Belize after Spanish contact. Tipu is a borderland town largely occupied from AD 1541–1704. Baking Pot was a regional civic-ceremonial center continuously occupied from the Late Preclassic (~400 cal BC) to the Terminal Classic periods (cal AD 800–900), and later reoccupied during the Late Postclassic (cal AD 1280–1420).

Oral "health" and carbon and nitrogen isotopic values were assessed from skeletal samples. Baking Pot bone collagen isotopes are lighter than Tipu (-11 (+1.0) and -9.8 (+1.4), respectively), suggesting slightly more consumption of C3 foods. Apatite supports a greater consumption of C3 foods at Baking Pot -6.6 (+0.6) compared to Tipu -5.3 (+1.4). Nitrogen values are the same, Tipu +9.2 (+0.8) and Baking Pot +9.2 (+1.3). Isotopic values are

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

indicative of a diet of marine fish and maize at both sites. Oral conditions vary. By tooth count, Baking Pot has more instances of caries compared to Tipu, but more individuals from Tipu experienced tooth loss during life. The differential dietary patterns are reflective of varying oral condition frequency and overall oral "health."

Harvey, Virginia (The University of Manchester), Linas Daugnora (Klaipeda University) and Michael Buckley (The University of Manchester)

[43] *Collagen Fingerprinting on Neolithic Fish from Lithuania*

Archaeological fish remains are more taphonomically sensitive than those of other vertebrates as they are typically smaller and less biomineralised. Therefore, it is essential to retrieve as much information as possible from assemblages that favour their preservation. One of the most time- and cost-efficient methods of objectively achieving faunal identity in ancient bone is collagen fingerprinting technique 'ZooMS' (Zooarchaeology by Mass Spectrometry). ZooMS harnesses the potential of preserved collagen, the most dominant and time-stable protein in bone, to generate peptide mass spectra that are diagnostic of faunal identity. Here, ZooMS is applied to 116 fish bone samples from a ~5000 year old assemblage from the Šventoji region of Lithuania to deduce species identity and construct assemblage compositions. Identifications from ZooMS analysis uncovered incorrect morphological identifications in 14% of the fish samples analysed. Furthermore, through the analysis of over twenty different species, we demonstrate the ability to distinguish between closely diverged members of the *Salmo* spp. (salmon) and *Scophthalmus* spp. (turbot) genera; some of the taxa most frequently misidentified in this assemblage. This research highlights the great potential for applying ZooMS to archaeological fish remains that are otherwise often left unidentified.

[254] *The Flavors Archaeobotany Forgot*

Archaeobotanists find herbaceous plants in their collected macrobotanical collections regularly. Usually they are associated with animal fodder and fuel. But what if they were condiments? Recently there has been more information on wild herbaceous plants and insects as part of rural people's cuisines. These oft-hidden ingredients should be recalled when taxa lists are studied, as some could have been important if rarely used spices and flavoring ingredients. We see, for example, that some creations in Europe's cuisine are entirely composed of what some might call weedy species. Consider the ingredients of cordials across Europe, drinks that can include up to 15 'wild' taxa. These plants were collected, nurtured and cultivated in and around kitchen gardens and houses. For example, the current Italian kitchen garden weed *Portulaca* was not only eaten in salads in the past and into the present in some rural locations, but it also interestingly has helpful blood pressure lowering capacities, further suggesting that local weeds that grew next to people's houses and in their nearby kitchen gardens were potentially essential to cuisines, flavors, as well as the health of the inhabitants.

[123] *Language Shift and Material Practice*

The model of linguistic creolization had a particular impact on archaeological practice. Drawing inspiration from Sidney Mintz's and Richard Price's *Birth of African American Culture* (1992), archaeologists have been quick to recognize how they could use the concept to interpret material culture and relations of power. Indeed, the histories and processes associated with settler colonization in the Caribbean, including indigenous displacement, forced migration of Africans and the appropriation of land and labor of both made it untenable to employ strategies that equated culture, biology, and language. The model helped archaeologists imagine, if not analyze, a less static understanding of social, political, and economic boundaries that shaped the colonial past. In this paper I build on this scholarship to consider a longer term set of processes that shaped Dominica's landscape in the early modern period and that continue to reverberate today. Specifically, I rely on linguistic and archaeological evidence to parse some of the historical threads and relations of power.

[261] *Archaeological Resource Protection: Challenges to Federal Enforcement of Antiquity Law among Land Managing Agencies*

The Archaeological Resources Protection Act (ARPA) of 1979 was partially intended to address shortcomings in previous federal antiquities law. While the act corrected constitutional deficiencies with the Antiquities Act, federal land management agencies still grapple with a number of practical, cultural, and institutional barriers in carrying out archaeological law enforcement. This paper examines issues facing ARPA enforcement from the perspective of a land management agency. Case studies and court opinion will be used to highlight the relevant issues. These challenges include the use of science in a courtroom, logistical issues of carrying out a multi-year legal investigation, getting the support of the United States Attorney, archaeologists serving as law enforcers, facing the court of public opinion, and assigning monetary values to cultural items.

Haviser, Jay (St. Maarten Archaeological Center)

[337b] *Legacies of Syncretism and Cognition: African and European Religious and Aesthetic Expressions in the Caribbean*

Incipient aspects of syncretic processes among Africans and Europeans had begun on the African continent from the fifteenth century, with a particular reference noted for religious practices. Considering the relatively isolated participation of the two groups within the early interactive sphere of West Africa, as well as the in-situ contexts of the African cultures, some syncretical expressions were evident, yet due to the disproportional ratio of populations, were more subtle on the continent. However, once the various African populations were forcibly transported to the Caribbean, eliminating a strong homogeneity of cultural traditions, the degree of interactive exchange between Africans and Europeans increased dramatically, resulting in more complex and open forms of syncretism. This presentation seeks to provide a discussion of how African-European syncretic processes manifested themselves in successful forms, such as with benign cognitive compromises relating to religious practices, as well as how these syncretic processes were also rejected, such as with conflictive cognitive aspects in forms of aesthetic expression. It is proposed here that variable degrees of syncretical effectiveness were based on the fundamental variation of African and European cognitive approaches, with two archaeological case studies presented, one of successful syncretism and another rejected syncretism on St. Maarten.

Hawkins, Stuart and Sue O'Connor (The Australian National University)

[125] *Pigs by Sea: The Establishment of Pig Husbandry on Wallacean Islands during the Late Holocene*

Domestic pigs play a crucial role in the socioeconomic systems of Island Southeast Asian cultures today. However, the timing of their introduction into the region during the late Holocene and details of their use by prehistoric inhabitants is not entirely clear. The introduction of domestic pigs by maritime Neolithic horticulturalists to the Wallacean island region of eastern Indonesia and Timor-Leste, which has never been connected to a major landmass, appears to have been an advantageous adaptation to these terrestrial depauperate environments. However, the archaeological record is complex with the possibility of independent domestication events in this region. This paper seeks to improve resolution of these issues by reviewing the evidence for pig domestication in Wallacea while adding new zooarchaeological evidence of pig vertebrate remains recovered from cave and rockshelter sites excavated in the lesser Sunda islands of Alor, Timor, Iembata and Pantar.

[259] *Inscribing and Reinscribing Place: The Persistence of Hot Spring Sites in the Northern New Mexico Landscape*

This paper examines the ways in which humans create meaningful and enduring relationships with significantly unique environmental locations through a discussion of hot springs in the Rio Grande Gorge and Taos plateau. These springs demonstrate continual persistence as meaningful sites of visitation, of marking, and of cultural importance for those dwelling in the Taos area from the archaic to the contemporary. Through an exploration of the markings and constructions around the springs, I hope to elucidate how the layering of culturally significant markers and the residues of past visitations shape the subsequent connections to these sites. The paper will then focus on the capitalistic interventions onto and the post-capitalistic interactions with the sites to elucidate ideas of ownership, restriction, and reclamation of these environmentally and culturally significant locations.

Haynes, Gary (University of Nevada-Reno)

[79] *Elephant-Hunting with D. Stanford*

Dennis Stanford's work at the Dutton, Selby, Lamb Spring, and Inglewood sites was a major part of his lifelong search for breakthrough evidence about North America's earliest human encounters with mammoths. He encouraged me to study the megafaunal bones from those sites, and gave me room to disagree with him. His support allowed me to start looking into new ways to understand how the bones were modified and how such sites came to be. This presentation ties together data from those fossil sites with results of my actualistic research on megafaunal bones, starting with carnivore feedings at the National Zoo, and moving on to field studies of modern bonesites in North America, Australia, and Africa. Thanks to Dennis, critically important lessons have been learned about megafaunal bone assemblages. For example, we know that noncultural processes can spirally break proboscidean bones in ways that may be mistaken for human-caused fracturing, and that mortality profiles of multi-mammoth assemblages may reflect causes of death. Mammoths and other proboscideans feature prominently in debates about the evolution of human abilities to exploit large mammals, and Dennis Stanford has done much to advance the state of our knowledge.

[73] *Shrines, Pilgrims, Pilgrimages in the Caribbean?*

There is some suggestion in the literature, most explicitly developed by Espenshade (2014) for Puerto Rico, that major enclosures, particularly with rock art, at some point in their life cycle could be considered shrines or special religious places that increasingly attracted visitors or pilgrims from non-local on- and off-island locations. Pilgrimage rounds are well-established components of religious systems both past and current in various parts of world, including the incorporation of a prehistoric rock art site in a present-day Voudou sacred journey on Haiti. The degree to which this concept applies in a prehistoric Caribbean setting will be examined through detailing probable archaeological correlates of pilgrimages and comparing rock art locations in the Greater and Lesser Antilles.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

He, Yongshan (University of Toronto) and Chen Shen (Royal Ontario Museum; University of Toronto)**[24]** *What Can Artifacts Do: A Case Study of Miniaturized Architectural Models in Early China Tombs*

One major shift in mortuary practices that happened over the Han dynasty (202 BCE–220 CE) China, from burying bronze/pottery vessels to burying miniaturized architectural models, was usually explained as a result of the contemporary ideology of “treating the dead as alive”, or as a reflection of the social-economic transformation. While these previous interpretations invariably presumed that artifacts were passive representations and projections of ideological/social conditions of their contemporary people, the current paper intends to show the active roles of artifacts by shifting the main question from “what did grave goods represent or reflect” to “how did they influence people and what were their effects”. To do this, the paper first demonstrates that the material context created by existing pottery vessel styles was crucial for the emergence of granary terracotta as the earliest type of miniaturized architectural model; then it discusses how the newly invented granary models, by evoking the cognitive concept of miniaturism through their concrete material forms, resulted in a new category of grave goods being made and popularized, and eventually transformed people’s tomb practices. Thus artifacts should be seen as actively participating in social processes, influencing how people interact with and understand their world.

Headrick, Annabeth (University of Denver)**[209]** *Out of Clay and into Stone: The Emergence of Warriors at Chichen Itza*

In the Early Classic period a distinct characteristic of Central Mexican art is the appearance of warriors in public art. To the contrary, these figures generally appear on more private, personal items in the art of the Classic Maya, though their proliferation on these media distinctly rises in the Late Classic. In a remarkable development, the presence of warriors in public art explodes in Early Postclassic Chichen Itza. While central Mexican influence may have sparked this development, this paper explores the tangled web of cultural traditions, exposing the very Maya origins of many of these “portraits.” Looking primarily at the sculptural art of the Temple of the Warriors, the hybridity of this phenomenon will be emphasized. In addition, the individualization of the various figures testifies that a Maya concept of self within society characterized Chichen’s social organization, even as new segments of society asserted their status within the city.

Hechler, Ryan (Tulane University)**[178]** *Over the Andes, and Through their Goods: Integration Period Relations in Northern Ecuador*

While highland Peru’s Late Intermediate Period (AD 1000–1400) is characterized by community isolation, regional violence and shrinking exchange networks, the contemporary northern Ecuadorian Late Integration Period was a time of large-scale interregional activity that saw the flourishing of market economies. The northern Ecuadorian Andes demonstrated highly diverse cultural practices amongst an intimately connected Barbaocoan world that stretched from between the highlands of northern Ecuador and southern Colombia to the Amazon and the Pacific coast. Late Integration Period groups such as the Caras, Yumbos, Quijos, and Pastos were intimately connected via political affiliation and economic exchange—relations that were built and sustained in highly varied environments. This region proved the most difficult to subdue during the late Inka conquest of the region. The Inkas’ imperial attempts to segregate the subjugated highland Caras from surrounding groups via constructing the highest concentration of fortifications in the Pre-Columbian Andes proved insufficient to quell ties with unconquered selva communities, which maintained complex relations throughout Inka and Spanish colonialism.

Heckenberger, Michael (University of Florida) and Wetherbee Dorshow**[161]** *Anthropocene Amazonia, Beyond the Buzzword: Centennial-Scale Anthropogenic Influences on Southern Amazonian Forests, 1000–2000 CE*

The Anthropocene is defined here as the time when human-induced alterations of the environment become a driver of regional and global climate. The Amazon has very deep histories of human alterations of forest systems, but settled occupations that dramatically altered forest structure in regional systems of Late Holocene age, particularly following the Medieval Warm Period (MWP), ca. 900–1300 CE. Global population loss in the Old World, beginning in the 13th century, and the demographic collapse of New World populations, following European contact, resulting in the LIA, creating the closed forest conditions that characterize the Amazon today. During the Current Warm Period (CWP) deforestation threatens to force a near-term tipping event in the southern Amazon and other areas. This paper summarizes data from archaeological and paleoecological work in the transitional forests of the southern Amazon over the past millennium, including past adaptations to warmer climates in the MWP, such as large-scale forest management. These can provide practical solutions to changes afoot today in the CWP.

Hedquist, Saul (University of Arizona)**[218]** *And the Legacy Continues: Homol’ovi Looking Forward*

This paper honors the anthropological contributions of the Homol’ovi Research Program (HRP) and its directors. We reflect on the conception and implementation of field and curation protocols that enabled years of innovative research into ancient Pueblo lifeways, work that continues today. Though fieldwork in the region has ceased, researchers still benefit from exceptional field recording standards, sound conservation techniques, and an explicitly behavioral project methodology. HRP was particularly meticulous in its attention to nuanced variation in archaeological deposits. In homage to the latter, we outline a case study of depositional content at Homol’ovi I, a late prehispanic Hopi village and the most intensively excavated site within the Homol’ovi Settlement Cluster. Using HRP data, we examine the co-occurrence of marine shell and turquoise—two relatively rare and symbolically important material varieties. Despite their scarcity, however, both were commonly deposited together at Homol’ovi I. We consider the social

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

implications of the pairing, past and present, using archaeological and ethnohistorical insights. Our collections-based study demonstrates the lasting benefits of detail-oriented field techniques, an enduring hallmark of the HRP.

[200] *Lithic Analysis of Paleolithic Surface Scatters from Pleistocene River Terraces in the Republic of Serbia*

During the past two decades Paleolithic research in Serbia has rapidly expanded with numerous cave sites currently under excavation. However, this focus on caves in largely upland terrain may create a biased understanding of the Paleolithic record. Typically, open-air sites are integrated into research projects to correct for this bias. Unfortunately, Serbia has very few open-air sites, requiring us to use other sources of evidence as proxies for understanding the Paleolithic record in lowland areas. One underutilized source of data is Lithic Surface Scatters.

This presentation describes the Paleolithic surface material gathered from Pleistocene river terraces in Serbia and how researchers are using it to understand the Paleolithic record in the country outside of cave contexts. In addition to identifying the typological and technological affinities of these artifacts, I will also assess whether the presence (or absence) of surface material in different regions of Serbia is the result of taphonomic factors, differential landform preservation or survey selection bias.

[215] *Establishing Cultural Affinity through Multiple Lines of Evidence*

Repatriation and reburial efforts following the 2006–2008 excavation of the Alameda-Stone cemetery—a multiethnic, historical-period cemetery in downtown Tucson, Arizona—required a determination of cultural affinity for all human remains recovered from the civilian section. Goldstein played a key role in developing for the project a transparent and objective biocultural approach to determining cultural affinity that overcame problems encountered by previous projects in assessing cultural affinity. The approach relied on the equal weighting and assessment of three lines of evidence: contextual (i.e., archaeological evidence for mortuary treatment and social identity), osteological (i.e., the physical characteristics of the skeleton), and historical evidence (i.e., research into how the cemetery was used and the cultural traditions and identities of the people buried there). For each individual, the three lines of evidence were carefully reviewed and compared and a likelihood statement based on the distribution of all three lines of evidence was made (highly likely, multiple affinities, or culturally indeterminate). This model approach led to the identification of cultural affinity for nearly fifty percent of the 1,202 individuals recovered from the Alameda-Stone cemetery and successfully met the requirements of the stakeholder groups that claimed remains from the cemetery and Pima County, the project sponsor.

Heide, Gregory and Stuart Chilvers (Colville National Forest)

[106] *A View to Wilderness—The Salmo Lookout Tower and the Salmo-Priest Wilderness Area*

The Salmo-Priest Wilderness Area is a 41,335-acre wilderness area in the Selkirk Mountains, in northeast Washington. The wilderness area is within the Colville and Kaniksu National Forests. The area is noted for providing habitat for a number of threatened or endangered species including woodland caribou, grizzly bears, and grey wolves. Access to the area is limited to a few trails and visitation to the area is low. The Colville National Forest offers an alternative way to enjoy this wilderness area and explore a unique cultural property by visiting the Salmo-Priest Fire Lookout. Built in 1965, this R-6 flat cabin lookout is listed on the National Historic Lookout Register. The tower is accessible by a road, but is located on the border of the wilderness area. The lookout recently underwent rehabilitation in hopes of turning the tower into a recreation rental. This historic structure's accessibility to the public and unique location next to a hard to access wilderness area, offer an opportunity for all people to both enjoy wilderness and live history, if only briefly, by experiencing a life similar to the fire lookout staff who used to man the tower.

Heidkamp, Blair (University of Cincinnati)

[265] *Spinning through Time: Comparing Spindle Whorl Assemblages from the Southern Levant*

Spindle whorls, a flywheel attached to a shaft used for the production of thread, are one of the only artifacts related to the textile industry which survives in the archaeological record. At the crossroads between Anatolia, Mesopotamia, and Egypt, the southern Levant is at the intersection of cultural and technological change, particularly throughout the chronological scope of my study: the Pottery Neolithic, Chalcolithic, and Early Bronze I periods. There has yet to be a comprehensive study of spindle whorl assemblages covering the entirety of the southern Levant over multiple chronological periods. As a part of my Master's thesis, I collected data from published sources to create a database of whorls. I noticed specific trends in the data, most notably, a shift with primarily ceramic whorls in PN assemblages to a majority of EBI whorls made of stone. Evaluating the observed trends in spindle whorls, along with identifying the materials and potential processes individuals were using to spin thread, I was able to draw conclusions about the prehistoric textile industry in the southern Levant.

Heilen, Michael (Statistical Research, Inc.), Monica Murrell (Statistical Research, Inc.), Phillip Leckman (Statistical Research, Inc.) and Robert Heckman (Statistical Research, Inc.)

[268] *Exploring the Relationship between Surface and Subsurface Contexts in the Permian Basin, Southeastern New Mexico*

Analysis of previous cultural resource management investigations conducted in the Permian Basin of southeastern New Mexico indicate that many data are of poor quality, unstandardized, and of limited utility for comparative purposes or regional planning. Part of the problem is the limited understanding of which methods are best suited for site recording and testing and, more specifically, how observations made at the site surface correspond to subsurface content. This poster presents an experimental project sponsored by the Bureau of Land Management that investigated how survey, site-recording, and subsurface testing methods can be used to improve the analysis and interpretation of sites in southeastern New Mexico. Four previously recorded sites were re-recorded with the transect recording unit (TRU) system, then tested through a continuum of hand and mechanical techniques and subjected to intensive geoarchaeological investigations in order to identify techniques best suited to understanding their significance, integrity, and subsurface potential. The results of these efforts were analyzed to better understand the costs and benefits of the TRU system for survey and site recording, identify analytical procedures for leveraging TRU data in a management context, and assess the utility and reliability of different test methods commonly employed during site testing.

[129] *Ancient Maya Land Use: Water Management and Agricultural Production at Actuncan, Belize*

Research conducted during the 2015–2017 Actuncan Archaeological Project field seasons revealed several land use strategies utilized during the Late and Terminal Classic periods, including terracing, agricultural plots, and cobble mounds. Excavations conducted in the Northern Neighborhood of

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Actuncan exposed two terracing methods: 1) terraforming, in which earthen berms created to facilitate water drainage and 2) two small agricultural plot systems filled with a large amount of redeposited domestic trash. Such high levels of redeposited domestic trash, and the arrangement of these plots, suggest that agricultural and water drainage activity took place at an intra-household or larger community level. In addition, a number of linear cobble mounds have been found east of Actuncan along the Mopan River floodplain. Based on soil chemistry and proximity to the river, this area may have been used as a cacao orchard, thus creating an economic opportunity that could have benefitted the entire community. Together, these systems reflect how the ancient Maya at Actuncan managed water and agricultural production, and the scale at which these technologies were administered. These systems would have required collaboration between multiple households, creating community-wide cooperation towards food production (through terracing and agricultural plots) and for economic activity (through cacao orchards).

[122] *An Archaeology of Ash? Exploring Chacoan Contexts and Practices*

The goal of this paper is to bring together disparate data sources on various Chaco-era sites both within Chaco Canyon, NM and outside (Salmon Pueblo) to examine the use of ash in intramural contexts. In light of recent work on the dimensions of animation, precedence, ancestors and heirlooms evident in Chacoan architecture, what patterns emerge regarding the deliberate use and deposition of ash? And how might we use Puebloan ethnographic accounts of ash to help inform our interpretations? This paper aims to contribute to the growing body of research on archaeological ash deposits.

Heizer, Melanie (University of Victoria)

[238] *Photogrammetric Results of Cemetery Inscription Analysis*

Being presented here are the results from the digital work done in the cemetery. Focusing on revealing the lost inscriptions, the goals of this project have been to corroborate the list of people buried in the cemetery, and identify the names and dates of those either not listed or those for whom the records are not complete.

In using photogrammetry, burial monuments in the Emanu-El cemetery in Victoria, BC are being rediscovered and assessed for cultural preservation purposes. This digital technology is being used in conjunction with archival research, looking at the individuals buried in this cemetery. By identifying the names and dates associated with the monuments, we are able to recreate an identity for the individuals buried here. Additionally, we are able to assess which monuments are in danger of environmental damage, and identify them for potential preservation efforts. This digital project has been run alongside other archaeological and cultural surveys in the cemetery.

[82] *Variations in Settlement Patterns and Neighborhood Organization in Early Horizon Peru*

This paper examines forms of proto-urban settlements in coastal Ancash, north-central Peru, centered on the Nepeña Valley. During the Early Horizon (800–100 BC), the region witnessed the development of culturally and economically interrelated settlements with varying degrees of architectural density and complexity. Most of these centers were organized around clusters of walled enclosures with duplicate domestic facilities interpreted as multi-functional residential complexes, or compounds. Based on spatial, architectural and excavation data, these compounds are interpreted as major foci of daily activities and interactions, as well as public events housed in patios and plazas at the heart of most compounds. Depending on their scale and complexity, some of the compounds can be considered neighborhoods. In this paper, we explore what the neighborhood concept entails for these groups in terms of sociopolitical organization through a review of Early Horizon excavation and settlement pattern data. Major variables include: “compact” and “dispersed” architectural patterns; ephemeral, generational, and multi-generational architectural scales; access patterns; life cycles of compounds; and material patterns of use. We compare these results with other settlements in the region in order to gain comparative insights into the diversity of residential adaptations during the first millennium BC.

Hemer, Katie (University of Sheffield)

[87] *Non-adult Dis/ability and Care in Early Medieval Britain*

A child who is unwell or physically impaired naturally causes concern and anxiety for his or her parents/carers. For many in today's modern society, accessible medical care means that the challenges associated with caring for a sick or disabled child can be overcome or, at least, minimized. But how did parents/carers respond and adapt to the demands of ill-health and physical impairment in children during the early medieval period? In seeking to address this question, this paper will explore evidence for physical impairment (e.g. achondroplasia) from the analysis of non-adult skeletal remains from early medieval Britain. Through an exploration of the burial rites accorded to physically impaired children, this paper will consider whether or not parents/carers put in place any provision for their child either during and/or after life, and whether such evidence offers insight into early medieval attitudes towards dis/ability.

[94] *Investigating a Shotgun House: “Who Knew Shelter Was So Emotionally Charged?”*

Investigating a Shotgun House, a Project Archaeology: Investigating Shelter case study, asks students to use multiple data sources (oral history, historical documents, architecture, and archaeology) to examine a single question: what can we learn about the lives of mid-20th century urban working-class people from the study of their homes? In this case, shotgun houses. Formal field testing in elementary school classrooms, and interviews with piloting teachers and their students documented that the unit is a highly motivating teaching tool that promotes deep conceptual understanding of basic historical, anthropological, and archaeological content, concepts, and methods while eliciting empathetic attention to issues of social justice, agency, and civic engagement. Our research also determined that the unit is an excellent model of an active learning, inquiry-based teaching approach. Inquiry-based teaching begins with a question, and requires content, data, analysis, thinking, and drawing conclusions to answer it. For many teachers and students, inquiry represents a major pedagogical paradigm shift. If deep conceptual understanding is a course goal, instructors

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

should consider incorporating some aspect of an inquiry-based approach in their teaching. Our poster presents a brief overview of the unit, highlighting its inquiry approach and its social justice aspects. A mini lesson is provided.

Henderson, John (Cornell University) and Kathryn Hudson (University at Buffalo)

[299] *Toward an Ulúa World: Defining, Delimiting, and Interpreting Interaction Networks*

Framing the lower Ulúa valley and adjacent regions as part of a southeastern Mesoamerican frontier has always entailed an interest in external relationships, especially those connecting frontier regions with the Maya world to which they were supposedly peripheral. The belief that the periphery was occupied by simple non-Maya societies, lightly "influenced" by their more civilized western neighbors, appeared early in the development of orthodox frameworks and continues to influence archaeological perspectives. The advent of World Systems Theory and other core-periphery perspectives brought an interest in the character of the relationships but little advance in attention to the material remains that might reflect the supposed derivative nature of frontier cultural patterns.

Understanding interaction requires methodologies that move beyond unilateral region-to-region or community-to-community connections and focus instead on the development of innovative approaches to documenting multiple overlapping networks connecting many groups within many communities. Taking ceramic systems as our focal point, we explore the potential of pottery to map links among lower Ulúa valley groups and their counterparts in adjacent regions. Delineating the distributions of these likely traces of interaction illustrates a new and more sensitive framework for assessing the movement of ideas and things in a complex landscape.

Henderson, Lucia (Independent Scholar)

[176] *Looking Beyond Teotihuacan in the Art and Architecture of Early Classic Kaminaljuyu*

This paper examines the foreign connections evidenced by the material record of Early Classic Kaminaljuyu. The author discusses the ways in which public art, architecture, and elite funerary contexts evolved at Kaminaljuyu during this time, evaluating how these changing styles may have tied into evolving relationships with distant sites and regions such as Teotihuacan, Veracruz, and the Maya lowlands. The Early Classic relationship between Kaminaljuyu and Teotihuacan has, in many ways, eclipsed the myriad other relationships evidenced by Kaminaljuyu's material record during this time. The singular scholarly focus on the interaction between these two sites has created the impression that Early Classic Kaminaljuyu had a single, monolithic approach to foreign style and a single, primary foreign relationship. Stepping back to consider this time period more holistically, however, a pattern emerges instead of diachronic change and synchronic variation, with Kaminaljuyu laying claim to evolving sets of relationships with numerous foreign powers through time. In sum, this paper seeks to both dig deeper into the nature of the Early Classic relationship between Kaminaljuyu and Teotihuacan as well as give a stronger voice to other connections encountered in the art and architecture of Early Classic Kaminaljuyu.

[175] *Space, the Iron Frontier: Production, Spatial Organization and Historicity of Iron Metallurgy within the Angkorian Khmer Empire, Cambodia (9th to 15th c. CE)*

Iron production was a critical process in the expansion of the Angkorian Khmer Empire. Recent surveys by INDAP around the Phnom Dek region have revealed a massive industrial landscape that appears to have fueled Angkor's expansionist ambitions between the 11th to 13th centuries. This paper presents a spatial and morphological GIS analysis of hundreds of slag concentrations mapped in this region to evaluate changes in the scale and organization of metal production. Combined with pXRF data of tap slags analyzed in the field, we model smelting recipes zones around Phnom Dek to reveal patterns of ore selection and producer practice. The results dovetail with the rigorous artifact-based analyses conducted by IRANGKOR with the overall goal of tracking how the Khmer iron economy functioned and impacted development of the most expansive state in mainland Southeast Asia.

[140] *From Quarry to Mine: Citronelle Gravel Extraction in Southwest Mississippi*

Excavation was performed on the periphery of a substantial Pliocene-age deposit of Citronelle gravel in southwest Mississippi, 20 miles north of the Gulf Coast. This gravel deposit, which covered hundreds of acres, represents the southern-most exposure in the region. Historic Citronelle mining throughout the twentieth century has extirpated the signature of primary lithic reduction deposits; however, a discrete loci of cultural material spanning two millennia remains intact, and buried beneath the mine tailings. This paper provides information on the activities conducted during stone-seeking forays from the coast and includes a discussion on historic period mining.

Henebry-DeLeon, Lourdes (Central Washington University)

[253] *Born and Bred on the Columbia Plateau: The Ancient One in Time and Place*

In looking at all available population specific data for the Columbia Plateau, the Ancient One falls within the variability exhibited on the southern Columbia Plateau at the same time period and throughout time. He was not outside of the norm for the population existing during the Early Cascade period when he was alive and for the population that followed for which he has a shared group identity. The Ancient One's biological identity, cranial morphology, stable isotope values, and DNA data reflects the most recent and direct lines of evidence establishing a distinct, identifiable earlier group. Biological and other evidence provides a sufficient link to culturally affiliate the identifiable earlier group through time to nearby populations. The same biological evidence, seen in the Ancient One is present within the regional area of the wider Columbia Plateau through time.

[177] *No Fire without Wood? Some Reflections on Late Pleistocene Pyrotechnology in Northern Tundra Environments (East Siberia, Interior Alaska)*

The use of alternate fuels such as grasses, bones or dung has often been interpreted as a typical response of Late Pleistocene (LP) hunter-gatherers to harsh environments, in which woody resources are scarce. In the context of early human dispersal from south-east Siberia into the Americas, the question of prehistoric migration and settlement is closely linked to the one of fuel availability, fire being considered, to the same extent as food, a vital element for survival. However, data regarding the modalities of LP fuel and fire use in Siberia/Beringia are still too scarce to integrate pyrotechnology into the reflection about ancient human behaviour and adaptation to cold climates. New multi-proxy fuel analyses (wood charcoal, phytoliths, burned bone remains) of two LP sites, Kovrizhka IV (Irkutsk region, Russian Federation) and McDonald Creek (Alaska, USA), allowed us to obtain first results on the neighbouring vegetation as well as on fuel management practices in the shrub-tundra zone. Hearth micromorphology is also planned at these sites and will provide valuable complementary data on feature formation and functioning. Our results will be discussed in light of the current hypotheses on prehistoric fuel use as well as ethnographic examples from eastern Siberia.

[262] *Coastal-Highland Interaction in Early Formative Period Mesoamerica: The Ceramic Affiliations of La Consentida*

Early Formative period pottery from the site of La Consentida in coastal Oaxaca, Mexico, bears indications of both local developments and interregional influences. In previous papers, I have presented stylistic evidence for interaction between La Consentida and potters from distant West Mexican traditions such as Capacha and Opeño. While some of La Consentida's decorated Tlacuache phase vessels suggest involvement in a system of long-distance interaction along Mesoamerica's Pacific coast, more utilitarian wares such as globular jars and undecorated hemispherical bowls imply affiliations closer to home, specifically with Early Formative period highland assemblages of the Espiridión, Tierras Largas, and Purrón phases. In this paper, I discuss formal similarities between highland pottery and La Consentida's Tlacuache phase assemblage. On the basis of these affiliations, I propose a model in which La Consentida's diverse ceramics are explained as partly the result of the cooperating or even conflicting emphases of overlapping interaction spheres: one along the Pacific coast and one tying the coast to the southern and central Mesoamerican highlands. These patterns suggest that people at La Consentida both maintained some traditional practices of Red-on-Buff potters in adjacent regions and self-consciously participated in a coastal interaction network involving more superficial decorative styles.

[332] *Long Leaf, Fire and Hunter-Gatherers of the Carolina Sandhills*

In presettlement times long leaf pine forest dominated the Carolina Sandhills, where frequent wildfire, sandy soil and steep hydrologic gradients produced high biodiversity, but low hunter-gatherer carrying capacity. Land-use models based on the results of systematic shovel testing across 162 square miles at Fort Bragg, North Carolina, indicate continuous occupation throughout prehistory, small group size and short terms of residential tenure. Although the archaeological site is the unit of resource management, most sites comprise multiple components, and comparing component spatial density across presettlement vegetation communities and wildfire-frequency zones provides a means for exploring prehistoric land use. Archaic components are more dense in Xeric Longleaf Pine–Wiregrass Sandhills communities where upland flats offer long sight lines and minimal topographic relief, ideal for overland travel, logistical procurement, large game hunting and family-band migration. The spatial density of Woodland components is higher in Mesic Longleaf Pine–Wiregrass Slope, Small Stream Swamp and Depression Pond communities where less frequent, lower intensity wildfire encourages deciduous mast-bearing trees and richer soil for horticulture. Quantifying cultural component spatial density across vegetative community type also provides a standard for evaluating the research potential of resources, determining NRHP eligibility, and ranking potentially eligible resources for further testing.

Herckis, Lauren (Carnegie Mellon University)

[22] *Archaeology as Anthropology: Chaîne Opératoire and the Analysis of Contemporary Technologies*

The application of archaeological methods to modern contexts is an emergent trend in cultural anthropology. This paper presents a case study of chaîne opératoire methodologies in the analysis of modern technologies. New materialist ontologies and digital archaeologies offer powerful tools for understand the past. Behavioral archaeologists apply method and theory to relationships between people and things in all times. Dawdy, McGuire and others address the current archaeological turn in anthropology. The application of archaeological methods in analyses of contemporary material landscapes and social contexts isn't new. This paper adds to the ongoing discussion, arguing that these efforts provide data to refine our understanding of the past and also contribute to our understanding of the present. Transformations in social and material landscapes are entangled today as they were in the past. Many factors, including acquisition of raw material, discard, refinement, and locality have significant effects on the chaîne opératoire of modern technologies. Social factors contribute to the spatial arrangement of craft production, elaboration, use, and repair at a research university. A chaîne opératoire approach provides an integrated understanding of production processes related to educational technologies, exposing complex relationships between labor, emergence and diffusion of technological traditions, and exploitation of available resources.

[241] *Where the Devil Don't Stay: The Role of Moonshine Production in the Mountains of North Carolina*

Since the mid-nineteenth century, the vast majority of local whisky production has been unregulated and illegal. Both production and distribution of illicit liquor moved underground with the passing of the 18th Amendment—known as the Prohibition—in 1919. This economic shift occurred in tight-knit mountain communities where knowledge has been vigilantly guarded. This continuous whisky production cycle has resulted in the deep social, economic, and cultural ties that persist in the Catalochee region of Haywood County, North Carolina. The objective of this project is to chronicle this intimate economy through the medium of videography. This is examined through interviews of both current and former “moonshiners,” as well as people who have spent their entire lives in the region. From these oral histories we can begin to extrapolate the impacts—both beneficial and destructive—of illicit alcohol production. The past and present socioeconomic climates share a common denominator in the moonshine production, commercialization, and consumption that is so deeply rooted in western North Carolina.

Hernandez, Christine (Tulane University) and Dan Healan (Tulane University)

[169] *The Ceramics and Chronology of the Ucareo-Zinapécuaro Obsidian Source Area, Michoacán, Mexico*

Sourcing studies conducted over the past 45 years have identified obsidian from the outcrops around Ucareo and Zinapécuaro, Michoacán in archaeological sites located across Mesoamerica including San Lorenzo, Xochicalco, Tula, Chichén Itzá, and Tzintzuntzan. Archaeological investigations including survey and excavation conducted by Tulane University during the 1990s have provided the first detailed information on prehispanic settlement and obsidian exploitation within what is now called the Ucareo Zinapécuaro obsidian source area (Healan 1997, 1998; Hernández 2006). In this presentation, we formally introduce the regional ceramic sequence and chronology established for the source area and adjacent northeastern Michoacán. While based on the sequence and chronology published by Gorenstein (1985) for neighboring Acámbaro, Guanajuato, our investigations have produced a considerably refined and expanded sequence made possible by a much larger data set and chronometric dating of 30 radiocarbon samples. The result is a ceramic and cultural chronology that encompasses nearly 2,000 years of dynamic prehispanic occupation, obsidian exploitation, and long distance exchange.

[167] *Examining Environment, Ecology and Patterns of Maya Culture at Mensabak, Chiapas, Mexico*

Our study examines the interplay of the environment, topography, conflict, and social change. Recent research stresses the role of environmental and ecological fluctuations in the Classic Maya collapse (AD 700–1000). Scholars have linked drought cycles and changing climate to increased warfare and culture change at the end of the Classic Period (AD 200–900). However, numerous studies highlight that not all places in the Maya area collapsed, some communities grew and continued to be places of human settlement for many centuries. More local high-resolution environmental data are necessary to understand the interplay of environment, ecology and Maya culture change. This paper examines data from the Selva Lacandona region to understand how climate and ecology may be linked to social transformation within the vicinity of Lake Mensabak. After the collapse, the Maya lowlands were massively de-populated, but during the Late Postclassic (AD 1200–1600) Lake Mensabak became a place of renewed settlement. As Maya migrated to the lake for its aquatic resources and defensible landscape, elites chose islands with elevated terrain to instantiate a cosmological/ideological scheme. People of lesser rank resided near the lake shore and at lower elevations, which were areas of lesser religious importance and more exposed to attacks.

[173] *Industrial Heritage and Henequen Landscapes: The Social Spaces along the Conkal-Progreso Railway in Northern Yucatan (1886–1950)*

From the second half of the nineteenth century the Yucatecan henequen industry experienced an extraordinary growth that would result in a “Gilded Age”. The most notorious vestiges of this era are the henequen haciendas, which were dispersed across the entire peninsula and whose ruins evoke nostalgia for an era of industrial and commercial splendor. By the end of the century, new developments in communications and construction industries also appeared. Yucatán’s accelerated economic growth, tied to the henequen boom, resulted in new transport infrastructure such as the railroad, which became the force behind the growth of agricultural, industrial, and commercial production on the peninsula. A narrow-gauge railway that ran from the town of Conkal to the Port of Progreso is a clear example of a capitalist project of that epoch which brought changes to the Yucatec landscape and the social relations that impacted native populations. This paper focuses on the survey and register of archaeological evidence along this railway using modern technologies such as UAV’s, as well as excavation, and material culture analysis. Our goal is to illustrate how economic boom and industrialization had drastic environmental, social, and cultural repercussions within indigenous communities of the Yucatan peninsula.

[57] *Where Are You Staying? Lodging Facilities in San Juan, Puerto Rico*

In the 19th century there was a large influx of people traveling to Puerto Rico, many stayed in lodgings throughout the capital city of San Juan. This study focuses on the hotels, guest houses and hostels within the walled city, currently known as Old San Juan, during the late 19th century and early 20th century. Using primary sources that include photographs, maps, blueprints and newspaper advertisements, the goal of my research is to establish the location of this type of businesses. Also, to address issues related to the movement of foreigners from various social groups within the city. Once the location was pinpointed, a virtual map was created to include streets views, data related to the location, rates and clientele, and other relevant details. A list of lodging facilities was used to visit the location and photograph the buildings, and to cross reference it with the cultural resources management projects that have been completed. The data produced by this study can be used to develop a larger project that includes excavations in some of these locations.

Hernández, Mario

[260] *Análisis geoespacial de la distribución de sitios arqueológicos en la Sub-Región Diquís, Región Gran Chiriquí*

La Sub-región Diquís de la Región Gran Chiriquí posee a la fecha un total de 1.595 registros de sitios arqueológicos documentados en la Base de Datos Orígenes del Museo Nacional de Costa Rica. El presente trabajo expone los resultados logrados al aplicar un análisis geoespacial diseñado para conocer la distribución de dichos depósitos arqueológicos, en un contexto fisiográfico modelado para tal efecto mediante sistemas de información geográfica (SIG), que permite aproximarse a las características de la ocupación precolombina de la sección noroeste de la región Gran Chiriquí aprovechando los datos de antigüedad y funcionalidad que se consignan en la mencionada base de datos.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Esta investigación busca conocer la dispersión y concentración de sitios arqueológicos en diferentes unidades paisajísticas de índole fisiográfica, para aportar a la discusión sobre la localización propuesta de asentamientos de la fase Aguas Buenas (500 a.C.-800 d.C.), con una tendencia en las tierras altas de esta sub-región en contraste con la frecuente distribución de yacimientos adscritos a la fase Chiriquí (800–1550 d.C.) en las tierras bajas. La distinción de las distintas funcionalidades de estos yacimientos, según las diferentes fases, ha permitido brindar aproximaciones al uso de la tierra en tiempos prehispánicos para la sub-región bajo estudio.

Hernandez Garavito, Carla (Vanderbilt University)

[257] *From there, a great long time ago, even before the Incas were born: Representations of the Inka Empire among the Lurin Yauyos*
Andean archaeology consistently uses the Spanish colonial written record as a guide in interpreting the characteristics of the different societies that fell under the Inka rule. However, a growing body of scholarship on the material culture of such incorporated societies shows that the nature of their relationship with the Empire was variable, and that Inka control was not territorially continuous. One key strategy through which the Inka incorporated these groups was the entangling and capture of their local religious practices with those of the official state cult. In this paper, I propose to flip this model and ask how local polities interpreted the Inka within their own memory and history. In other words, what were the narratives that some of these polities spanned to define their own standing within the Empire? I focus on the Yauyos people from the highlands of Lima, Peru. Through and archaeological and historical analysis, I argue that local rituals and spaces served as the critical medium through which the Yauyos defined their own interpretation of the Inka and their new position within their empire, thinking of themselves as allies as of the Inka as subjected to their own local deities.

[57] *Documenting the First Battle of the Spanish-Cuban-American War (1898): Insights for an Archaeological Perspective*
The Spanish-Cuban-American War of 1898 constituted not only the events leading to the start of the first modern war but also marked the beginning of the colonialist expansion of the United States throughout the world. The explosion of the USS Maine in Havana's harbor has often been interpreted as the excuse used by the US to get involved in the Cuban War of Independence; a war that Cubans and Spaniards had been fighting since 1895, but rooted since 1868. Previous research has traditionally focused in the naval encounters of the Spanish and US fleets in Santiago de Cuba, or the end of the war with the occupation of Puerto Rico, the Philippines, and Guam, thus underestimating the role of the Cuban troops and leaving the early events of the war poorly explored. Our research focuses on the first battle of the war, which occurred on Matanzas Bay, Cuba, on April 27th, 1898. Historic documentation from Cuban, Spanish, and US archives is analyzed, and compared to the available archaeological data, to deepen the understanding of the defensive and offensive strategies employed, and their impact on the media and their publicist strategies.

[270] *Movement in Moquegua: Detecting Differential Activity Types via the Knee in a Tiwanaku Subgroup*
Previous studies regarding femoral fossa morphology center on risk levels and variables associated with non-contact anterior cruciate ligament (ACL) injury. Increased risk of ACL injury is associated with smaller femoral fossa size. While fossa size is influenced by many variables, biologically “plastic” responses to early life experiences, such as traversing local topography or cultural factors, are appearing to emerge as perhaps the most impactful. Due to the crucial nature of the knee, it is one of the most common locations of focus to detect how stressors of daily life (e.g. movement, activity) shape the underlying skeletal structures. Available studies of the skeletal elements of the knee almost exclusively focus on linear landmark measurements as methods for analysis. Such reductive methodology neglects the three-dimensional, dynamic nature of this joint. This research seeks to present an alternative methodology utilizing digital models that tests for skeletal differences at the knee between subsistence/activity groups (settled agriculturalists versus pastoralist/lama caravanners in a Tiwanaku sample). The use of three-dimensional models is intended to more accurately represent the complexity of the knee joint in analytics, results, and interpretations of the movements and activities of past populations.

[249] *The Thorny Problem of Spondylus Sourcing in the Ancient Andes*
Archaeologists have long been fascinated with the exploitation and exchange of *Spondylus* spp. across the ancient world. This is especially true for the Andes, where the “thorny oyster” has been found far afield from its tropical breeding sites along the coasts of Ecuador and northern Peru. However, factors such as the uneven development of archaeology between Peru and Ecuador and the persistence of certain myths about Andean *Spondylus* have led to a “black-boxing” effect where exchange from Ecuador to Peru is assumed rather than tested. This paper briefly presents the state of understanding in Andean *Spondylus*, as relates to: its exploitation by ancient people; its exchange through the coast, highlands, and jungle; its production into remarkable artifacts of beauty and importance; and its cosmological significance for numerous Andean societies. This review highlights the potential impact of developing techniques to source *Spondylus* shells from their coastal Ecuadorian and Peruvian breeding grounds on the study of the ancient Andes. The paper will present preliminary results of archaeometric sourcing efforts, the difficulties of extending this technique into the Andean paleoclimate, and the implications of defining the sources of *Spondylus* for exchange in the ancient Northern and Central Andes.

[86] *Comparing Starch Granules from Wild and Cultivated Solanum jamesii to Determine the Effects of Domestication*

The processes, antecedents, and outcomes associated with plant domestication have been central themes in archaeological and interdisciplinary research for the last century. While domesticates can often be readily distinguished from their wild progenitors both genetically and morphologically, the steps leading to domestication (transport, selective harvest, deliberate seed dispersal, active plant management, i.e. cultivation) can be difficult to track archaeologically. Techniques for identifying morphological changes in macrobotanical remains (e.g. seeds, fruits, caryopses) from archaeological sites have been well established, but there are virtually no systematic studies on how to identify morphological changes in microbotanical remains (e.g. starch granules) despite claims that larger granules are characteristic of domesticated species. Here we test the hypothesis that domesticated plants produce larger starch granules than their wild progenitors. We measured granules from the Four Corners potato (*Solanum jamesii*) that were a) grown in the wild, b) associated with archaeological sites, c) propagated in a greenhouse, and d) cultivated in a garden. This systematic approach provides the first attempt to establish a protocol for identifying the domestication process in starch granules.

[167] *A Movement at the Margins: An Icelandic Rural Transformation at the Edge of the 19th Century Atlantic World*

In the early modern Atlantic World, core/periphery mercantile economics ascribed a marginal place for Iceland. The island's role in trade involved the production of low-cost bulk goods destined for markets mostly via Denmark into the 19th century. The focal area of this paper, the rural and upland Mývatn region, was in some ways socially and ecologically marginal even within Iceland. The growing environment was affected by unpredictable cold weather while volatile erosion zones hemmed local grazing land and hayfields. Although the community was home to two small rural municipal centers, it was distant from coastal trading points. Through interdisciplinary archaeology, environmental investigation, and documentary evidence, this paper investigates and describes how people in Mývatn managed ecological productivity and economic engagement at a periphery. We find that their significant efforts to secure abundance from marginal places was inseparable from social transformations through which the community ultimately assumed an influential role in changing the conditions of regional and national trade. This integrated social and ecological approach contributes to understandings of marginality as not an essential property of landscapes and societies, but one that is actively produced and contested through relations at many scales.

[288] *Skeletal Health and the Impact of Agriculture within the Mixtec Population from Etlatongo, Mixteca Alta, Oaxaca during the Middle Formative*
Sedentism and agriculture had major impacts on early human societies by increasing social complexity. Some scholars attributed an intensification of inequalities to a greater dependency on agriculture. This dependency, consequently lead to decreased health status of the non-elite/rulers population. Our goal is to address the overarching question of, how did agriculture impact ancient societies? And specifically, does the emergence of agriculture correlate with decreased health? Therefore, we assess the impact of agriculture within the Middle Formative (850—400 BC) population from the Mixtec prehispanic society from Etlatongo, located in the Nochixtlán Valley, Oaxaca. We use archaeological and bioarchaeological data to evaluate health of 21 individuals and compare them with other skeleton collections within the same time period, from the Mixteca Alta, Valley of Oaxaca and the Coastal regions, all from Oaxaca. Through these comparisons, we propose that it is possible to extrapolate that agriculture does impact human health in the Middle Formative Mixteca Alta population.

[41] *Neanderthals, Denisovans and Modern Humans: Unravelling the Chronology of the Middle to Upper Palaeolithic of Eurasia*

For more than half a century Paleolithic archaeologists have grappled with radiocarbon-based chronologies that are often contradictory and imprecise. Several key debates in the Palaeolithic have their roots in basic issues related to chronology; did the Aurignacian predate the Chatelperronian in some regions of Europe? When did Neanderthals disappear? How long did anatomically modern humans (AMH) and Neanderthals overlap, and what implications did this have for interaction, acculturation or interbreeding? Without reliable time control, these questions are unanswerable and unravelling the Paleolithic remains a distant and virtually unachievable goal.

Recent research in AMS dating has seen significant improvement in the situation, however. One of the main areas of improvement has been in chemical pretreatment and sample decontamination which has resulted in superior purification, particularly of bone proteins targeted for dating. We have been working on dating >100 sites covering the Middle to Upper Paleolithic transition across Eurasia. We have used optimized techniques of AMS dating as well as OSL dating, coupled with Bayesian modeling, to produce robust site chronologies. Combining results from absolute dating with paleo-genomics results in novel insights into what happened between 70 and 30,000 BP in Eurasia, as we will summarise in our presentation.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Highcock, Nancy (New York University)**[121]** *Dress Pins, Textile Production, and Women's Economic Agency across Early Second Millennium Anatolia*

Nearly seventy years of excavations at Kültepe have yielded a remarkable assemblage of material reflecting the rich and fluid daily lives of the Anatolians, Assyrians, and others who inhabited such a dynamic and cosmopolitan city. A diverse category of objects, metal dress pins, has been recovered from burials at Kültepe and other Middle Bronze Age Anatolian sites, providing tangible connections to the ancient people who wore them. Previous scholarship has focused on the style and origin of these pins, generally associated with female adornment, but both the cuneiform and material records also allow for glimpses into the economic power they held for women during this period. For example, the Old Assyrian mercantile indicate that pins could function as working capital in times of need. Furthermore, the survival of their impressions on crescent-shaped loom weights across Anatolia also demonstrate their importance to the economic agency of women. Through a study of the various types of pins and their associated objects within the contextual framework provide by the texts, this paper will explore the multiple roles of these personal objects and analyze how both Anatolian and Assyrian women used pins to mediate the social, religious, and economic worlds in which they navigated.

Hilbert, Klaus**[116]** *A History of Knowledge of the Amazonian Dark Earths*

The anthropogenic origin of the Amazonian dark earths (Terra Pretas) has been a methodologically assured fact for 70 years. Especially during the last 30 years, Terra Preta have been scientifically investigated with increasing intensity and in an ever-widening context. Currently, the dominant concept guiding research is the idea of binding atmospheric carbon which artificially produced dark earths. The large-scale production of terra preta is said to be an efficient instrument to combat global warming. This talk attempts to present a history of the knowledge on Amazonian dark earths (terras pretas) focusing not only on scientific knowledge but also takes into account traditional indigenous knowledge. At the end, I show, that without indigenous knowledge, modern terra preta research would not exist. This has bearings for ethical evaluation of applied modern terra preta research.

[116] *Discussant***Hildebrand, Elisabeth (Stony Brook University)****[297]** *Ritual Sites as Anchors in a Dynamic Landscape: The Social and Economic Importance of Monumental Cemeteries Built by Eastern Africa's Earliest Herders*

In eastern Africa, herding was the earliest form of food production, supplanting fishing-hunting-gathering around Lake Turkana (northwest Kenya) ca. 5000–4000 BP. Fueled by the dramatic recession of Lake Turkana 5300–3900 BP, which made fishing less predictable and exposed vast plains of rich pasture near the lake, early herding probably involved both in-migration of pastoralists and adoption of livestock by local fishers. As herding took hold a mortuary tradition developed, with megalithic 'pillar sites' serving as communal cemeteries. Construction (massive platforms, mortuary cavities >100m² dug into sandstone bedrock, and columnar stones hauled up to 1 km from their source) and use (interment of several hundred estimated individuals over a few centuries, accompanied by adornments and intricately decorated pottery) attest to the sites' commemorative significance. As physical landmarks and settings for unifying rituals, pillar sites would have anchored early herders within an otherwise fluid physical and social landscape as Lake Turkana retreated, rainfall diminished, and mobility increased. Periodic assembly of otherwise dispersed groups to perform ritualized interment would have facilitated diverse forms of social interaction—including information sharing, formation of exchange networks, and negotiations and strategic decisions about herd movements—essential to the success of early pastoral economies in eastern Africa.

Hill, Brett (Hendrix College) and Bernard Siquieros (Tohono O'odham Nation Cultural Center and Museum)**[331]** *Observations on Collaboration between O'odham and Hendrix Students*

Historically, anthropologists have tended to treat Native Americans as subjects more than as colleagues. This tendency is in the midst of reorientation as Native people everywhere assert their interest in heritage through the modes of Western professional discourse. We have recently worked together on a collaborative educational project to bring together O'odham and non-Native students to consider heritage from multiple perspectives. Together, we visited museums, monuments, archaeological sites, and other ancestral locations in Arizona, Arkansas, Washington D.C., and New York. Through shared travel and discussions we experienced diverse places where Native American and Euro-American expressions of heritage are created. We considered the nature of concepts like ancestor and native in different contexts, and discovered new insights. At the same time, we discovered challenges and some solutions to practical problems facing collaboration. Disparities in training, funding, and expected benefits influenced decisions and outcomes. Approaching these challenges with a sense of partnership, we achieved synergy that suggests productive new possibilities for anthropology. Far from producing a compromise, we found exciting new opportunities for anthropology as a field of understanding and relationship building.

Hill, Christopher L.**[224]** *Sedimentary and Taphonomic Contexts of Quaternary Vertebrate Fossils in the Northern Rocky Mountains*

Quaternary vertebrate assemblages from the northern Rocky Mountains can be used to understand the biogeographic consequences of climate change. Some localities contain strata from before the Last Glacial Maximum (LGM), while others consist mostly of Late Glacial and Holocene deposits. The Merrell Local Fauna is from a stratigraphic sequence in Centennial Valley. Radiocarbon dates range from >52,000 to 19,000 BP and fossils are in lacustrine deposits, fluvial sediments, and a debris flow. The Blacktail Cave sequence extends from prior to the LGM to the Younger Dryas (37,000 to 10,270 BP). The fossil assemblage includes large- and small-sized mammals. Strata are composed of silts, clays, sands, and gravels along with rockfall and travertine. Strata at Sheep Rock Springs, Indian Creek, and MacHaffie incorporate fossils that are younger than the LGM and can be compared to Late Glacial-Holocene sequences in Idaho and localities on the Northern Great Plains. A diverse set of sedimentological and taphonomic contexts are associated with these localities which contain cave, alluvial, eolian and paludal/lacustrine deposits. These sedimentary sequences can be used to examine patterns of landscape evolution and ecological change before, during and after the LGM, including conditions associated with the Younger Dryas and the Pleistocene-Holocene transition.

Hill, David (ASET Siftung)**[95]** *Exploring the Interaction of Culture and Technology in the Acoma Culture Province*

The Acoma Culture Province is the geographic expanse of the ancestral homeland of the Pueblo of Acoma documented for adjudication through the Indian Claims Commission and through archaeological research. Pottery made during both the prehistoric and historic periods found within the Acoma Culture Province was made using crushed potsherds as an addition to the pottery clay. The practice of adding crushed potsherds represents a cultural choice for Acoma potters, a choice that has considerable time-depth. Pottery containing crushed pot sherds appears around A.D. 900 in decorated and

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

undecorated utilitarian vessels, a practice that continues today. The continued use of crushed pottery sherds as a component of Acoma ceramic technology represents an example of a conservative technology.

Hill, Erica (University of Alaska Southeast)

[216] *Women, Sex and Sacrifice in Moche Iconography*

Moche iconography depicts women in ritual roles as priestesses, objects of sacrifice, and possibly as deities; however, the roles of ordinary women have received much less attention from archaeologists. This paper explores the nature of women's power in Moche society as represented in iconography and as inferred from bioarchaeological data, contrasting the roles of women in elite and non-elite contexts. With the exception of elite women performing rituals, Moche ideology inextricably linked women's power and status to the female body itself, primarily in sexual and sacrificial contexts.

[182] *A Reexamination of the Nature and Context of the Finley Paleoindian Bison Bonebeds in Southwest Wyoming*

The Finley site is in the western Killpecker dunes in the Green River valley in southwest Wyoming, and consists of at least two Cody age bison bonebeds. For modern Paleoindian researchers, Finley still poses important questions and offers several potential avenues for research. The prior work with the Finley faunal remains, as well as our current investigations, demonstrate that the site is associated with an enormous collection of bison remains that are thought to have been killed on site or nearby. Our reexamination of the site combines a taphonomic-based zooarchaeological analysis of the bison remains from both components with additional field-based investigations of the geoarchaeological context of the bonebeds. This work is being undertaken in order to 1) improve our understanding of the natural and cultural formational histories of the deposits, 2) evaluate prior interpretations concerning site function and season of occupation, and 3) evaluate how the Finley site improves our understanding of regional Paleoindian chronostratigraphy and paleoenvironments. Ultimately, our goal is to evaluate the validity of the prior interpretations of the site and consider the importance of the site to understanding the Paleoindian occupation of North America.

[175] *Networks of Power: Sandstone Temple Production in the Provinces of the Angkorian Khmer Empire*

Anthropological research suggests that early states and empires frequently relied on state-sponsored building projects to produce networks of state control and identity on the landscape. The production and use of monumental architecture, however, can also be influenced by local agency, resilience and/or resistance, and degrees of socio-political autonomy. Rather than a homogenous blanket of state/imperial power, the result is a mosaic of core state control and local choices across the landscape. Focusing on the Angkorian Khmer Empire (9th to 15th c. CE), this paper employs a landscape network approach to investigate degrees of state control and evidence of intermediate elite power, thus providing a more dynamic perspective of the imperial landscape. These investigations are informed through an analysis of the assemblage of provincial sandstone temples, which were key loci for the negotiation of state and intermediate elite power within the Khmer Empire. Emphasis is placed on understanding the geographic distribution of temples, the acquisition of sandstone for temple production, and temple form and organization, as variations in these variables may reflect different intermediate elite strategies and levels of agentive decision making.

[19] *Los Horcones, Offering 1: The Archaeology of Music and Ritual on the Pacific Coast of Chiapas*

Offering 1 from Los Horcones is an assemblage of figurine masks, whistles, rattles and vessels that offers an interesting opportunity for analysis that provides information of the auditory, olfactory, and visual experience of this small ritual. The offering, initially thought to be simply a collection of figurines and masks, were later discovered to be whistles—small musical instruments whose simplicity belies the importance of the meanings they encoded. Experimental archaeological analysis revealed that some made a variety of avian sounds, along with several other unidentified sounds. The whistles were played and recorded using a B-flat tuner that then allowed the recording of the range for each working whistle. Variations in notes and performed sounds varied based on whether the player approached them as whistles, flutes, or trumpets and the body size and lung capacity of the player. While the exact songs and notes of the whistles may never be fully elucidated, we were able to propose some potential applications in ceremony, and entertainment.

[80] *Households, Growth, Contraction, and Mobility at the Classic Maya Center of Naachtun*

At Naachtun, extensive excavation programs carried out in monumental Group B, a compact set of three large elite clusters of residential compounds located in the site epicenter, and intensive test-pitting programs applied to the residential zones which surround the monumental core, have enabled us to understand the site occupation development during the Classic phases. We identify contraction, dispersal and expansion where and when most households units were occupied. We compare these space-time dynamics in epicentral Group B and surrounding urban residential zones, explore their articulation, and discuss possible intra-site population mobility. Although some of the dynamics resulted from royal-court elite attraction and urban planning, the permanence of a dense, post-dynastic occupation, and new housing practices in Group B indicate that people did not need rulers' coercion to organize and modify their settlement in accordance with what they perceived to be their socioeconomic interests.

[169] *Petrographic Perspectives on the Ceramic Complexity in the Lake Pátzcuaro Basin*

Archaeologically known ceramic pastes from the Lake Pátzcuaro Basin, Michoacán, Mexico, involved long-lived paste recipes that have been identified both visually and via neutron activation. This paper focuses upon Late Postclassic Tarascan state-period ceramics (AD 1350–1525) and contextualizes new petrographic data within the regional geology and prior research in order to assess aspects of the longevity and complexity in potter's paste choices within the basin.

[41] *Fire in the Early Pleistocene: Evidence for the Use of Fire by Hominins at the 1.5 mya Site of FxJj20 AB, Koobi Fora, Kenya*

The Cooking Hypothesis contends that fire use became common in the Early Pleistocene and was part of a suite of characters that were associated with the appearance of *Homo erectus*. The morphological changes associated with *H. erectus* support this hypothesis. Archaeological evidence for the control of fire in this time period is generally sparse, and arguments for controlled fire at early sites have been controversial. Here we present evidence for fire use by early hominins at the open-air site of FxJj20 AB, Koobi Fora, Kenya. Bone and sediment exhibiting FTIR signatures consistent with burning at high temperatures have been recovered from a single horizon. A magnetic anomaly has been identified close to a cluster of artifacts. Micromorphological analyses indicate site formation processes with relatively little post-depositional modification. This is further supported by fabric analysis. The site is one of the earliest known sites, to date, with evidence for an association of fire and human activity. This validates a methodology for investigating early fire by highlighting the importance of using techniques geared toward identifying and verifying combustion features in open air contexts. This research was supported by the U.S. National Science Foundation, OISE awards 1358178 and 1358200.

[182] *A North American Plains Perspective on the East European Paleolithic*

For historical reasons, the Middle and Upper Paleolithic record of Europe has been viewed largely through the prism of rockshelters in the southwestern corner of the continent. Europe is dominated geographically, however, by an immense plain that stretches from the Carpathians to the Ural Mountains, much of which is devoid of natural shelters. Vance Holliday has made a significant contribution to the study of soils, stratigraphy, and site-formation process in open-air Middle and Upper Paleolithic sites on the central East European Plain. More generally, he has enhanced our understanding of these sites by introducing a North American Plains perspective to their analysis and interpretation.

[172] *CollectionSpace at the Phoebe A. Hearst Museum of Anthropology: A Strategic Information Platform for Cultural Heritage Collections*

Museums use collection management systems to manage metadata about objects in their collection and track transactions such as loans and exhibitions. At UC Berkeley however, museums are turning the open source CollectionSpace system into a strategic platform for research, education, and public service. The Hearst Museum of Anthropology is in the midst of a major effort to improve the quality of the data documenting its collection of approximately 3.8 million objects. With this improved foundation, the Hearst Museum and its partners in Research IT have turned attention to the most important priorities for cultural heritage information preservation, sharing, research and education. This case study will describe how the Hearst

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Museum uses CollectionSpace and its partnerships with Research IT and the CollectionSpace community to accomplish these goals. Particular attention will be given to how the Hearst Museum and its community stakeholders have made decisions about when and how to share sensitive information such as field collection location and photos of sacred objects. The paper will conclude with the emerging challenges and opportunities that the Hearst Museum and its partners are considering, including building in support for managing and displaying 3D models and improving support for research, education, and public service.

[282] *No Man Is an Island: Death and Burial on the Island of Haffjarðarey*

During the 13th century Iceland became a major hub of the North Atlantic fishing industry sparking international conflict over fishing rights between mercantile interests from Norway, Denmark, England, the Netherlands and Northern Germany. From ca. 1200—1563 the Catholic Church and cemetery on the island of Haffjarðarey served as the burial place for the large geographic region of Eyjahreppur in western Iceland. The church and cemetery were closed during the Lutheran Reformation and the island was subsequently abandoned. Folklore intended to support this abandonment appeared soon afterwards and generated a negative perception of the island as a place of death and danger. Early 20th century accounts considered Haffjarðarey an unlikely location for an important community gathering place due to difficulty of access and apparent isolation, however recent research has demonstrated quite the opposite. The medieval population of Eyjahreppur was engaged in the international fishing industry. Human remains exhibit pathological features suggesting they experienced the long-term impacts of unique local and global political, economic, and cultural influences. This paper discusses the human skeletal remains from the Haffjarðarey church cemetery and interpretations of community attachment (topophilia) and fear (topophobia) during a period of increasing global contact and conflict.

[275] *Colonization, Transformation and Continuities in the Indigenous Caribbean*

The indigenous peoples of the Caribbean were the first to have suffered European colonization of the Americas. From the arrival of Columbus in 1492 the insular territories were transformed in a massive slave raiding arena in which the knowledge of so-labelled 'indios' was used and manipulated by the Europeans and transferred across the Caribbean Sea. Indigenous peoples were put to work in the goldmines and farms of Hispaniola, Cuba and Puerto Rico or in the pearl fisheries in Cubagua. On the other hand, in the Greater Antilles the encomienda system generated an intensive exploitation that disarticulated the indigenous societies and transformed their sociocultural practices. The influence of a forced African diaspora, and the concomitant Amerindian-African-European inter-cultural dynamics at play changed the indigenous Caribbean landscape forever. The impact of these initial acts of colonialism and the role played by the Amerindian populations in the colonial process are often discounted for and remain up until today a far neglected chapter in global history. Despite the infamous genocide that took place, indigenous cultural and religious continuities are strongly represented in today's multi-ethnic and multi-cultural society of the Caribbean.

[90] *Cultural, Taphonomic, and Biogeographic Considerations of Black Footed Ferret at the Burntwood Creek Bison Kill Site, Central High Plains, USA*

Feature 15-1 at a 9,000 year old bison kill site in Rawlins County, northwest Kansas yielded remains of black footed ferret (BFF) and numerous other species. Here we summarize cultural and taphonomic factors related to the feature's formation and review BFF biogeography for the early Holocene period in the central Plains region. The diverse fauna from this feature and its varied modifications may reflect special cultural behavior associated with the bison kill at Burntwood Creek. Both natural and cultural processes contributed to formation of this distinctive feature, and some elements may represent part of a "medicine" bundle.

Hoggarth, Julie (Baylor University)

[147] *Using Bayesian Radiocarbon Chronologies in Conjunction with Artifact Inventories to Reconstruct the Timing and Formation of Peri-abandonment Deposits at Baking Pot, Belize*

A variety of functions have been proposed for 'problematic deposits' across the Maya lowlands. All of the explanations have archaeological and temporal implications that have rarely been operationalized together to gain better insights into the nature of these deposits. In this presentation, we describe these features as 'peri-abandonment deposits', as all proposed explanations imply that the events that led to the formation of the deposits occurred around the time (or after) ceremonial centers experienced political and/or demographic decline. We use evidence from the site of Baking Pot as a case study to test multiple hypotheses for the formation of these deposits and to illustrate the utility of the combined use of Bayesian radiocarbon chronologies, calendrical dates of hieroglyphic texts, and artifact proportions to better understand the timing and artifactual composition of each feature. Finally, we discuss the temporal and depositional differences between multiple peri-abandonment deposits at Baking Pot and contrast these data with radiocarbon evidence for political and demographic decline at the site and across the broader Belize River Valley.

[337a] *Beyond Repatriation at the Smithsonian's National Museum of Natural History*

Congress intended federal repatriation legislation to go beyond removing collections from museums. They hoped that it would lead to new relationships between Native Americans and museums that would recognize the interests of all parties. The Anthropology Department of the Smithsonian's National Museum of Natural History has worked, through its Repatriation Office and other programs, to collaborate with tribes and Alaskan Natives on projects that go beyond repatriation to include initiatives with 3D replication, traditional care, language revitalization, and cooperative curation. Repatriation is about fostering new relationships for the long term not the short term rush to meet a deadline or check a bureaucratic box.

Hollingshead, Analise (Florida State University) and Morgan Smith (Texas A&M University)

[102] *A Fabric and Spatial Analyses of the Artifacts Recovered from the Ryan-Harley Paleoindian Site (8JE1004) in North Florida*

The Ryan-Harley site (8JE1004) is a Suwannee point site located in North Florida along the Wacissa River. Ryan-Harley is significant because it is the only archaeological site in the Southeast United States where diagnostic Suwannee material has been recovered in-situ within a discrete geological layer through extensive excavations. A broad faunal assemblage interpreted as dietary remains was also recovered from the same stratigraphic layer as the Suwannee material. Taxa identified include extinct Pleistocene species such as tapir, horse, giant tortoise, and muskrat. This association relatively dates Ryan-Harley to the terminal Pleistocene, most likely between 10,900 14C yr B.P. to ~10,500 14C yr B.P. The association of lithic and faunal material at the site is critical to the interpretation and proposed age of the site. We examine this association through fabric and spatial analyses of artifacts and faunal material recovered at the Ryan-Harley site to test the null hypothesis that the site represents an intact Suwannee campsite. We compare how cultural material accumulates due to post-depositional processes with how intact archaeological deposits are oriented in space to determine which case compares most favorably to the lithic and faunal material at Ryan-Harley.

Holloway, Caitlin (National Park Service; UA Museum of the North)

[250] *Hearth Features in High-Latitude Environments*

The depositional context of many high-latitude archaeological sites often inhibits preservation of hearth features and associated organic remains. When preserved, subsurface hearth features provide insight into the role of plant resources in prehistoric hunter-gatherer economies. This research addresses questions of taphonomy, paleoecology, and prehistoric plant use with archaeobotanical analysis of hearth features from sites located in Yukon-Charley Rivers National Preserve and Gates of the Arctic National Park and Preserve. The results inform on the deposition and preservation of archaeobotanical remains in high-latitude environments and contribute to our understanding of arctic and subarctic forager exploitation of plant resources.

[290] *Macrobotanical and Pollen Analysis of the Canada Alamosa Project*

Analysis of macrobotanical materials from the Cañada Alamosa Project began with materials from the 1999 field season and continued to materials from the 2011 season. The samples were retrieved from four sites (LA 1125, LA 2292, LA 88891, and LA 88889). A total of 1,359 samples were analyzed for this project. In total, 223 individual specimens of corn cob fragments were examined via digital electronic photography (Table 2). A total of 3,052 individual cupules provided measurements for our database which was then used to compare types of remains. New methods were developed during this project, which allowed us to obtain large quantities of measurements on the charred cob fragments without harming the specimen. The improvement of digital electronic photography allows measurements to be taken off the digital pictures instead of directly on the specimen. All cobs examined were photographed and then measurements taken on the photos.

[136] *Acts of Nature and Culture: Caves, Performance, and Transformation*

The role of performance in disaster risk reduction provides the focus for evocative recent discussions of somatic experience, embodied knowledge, and climate change (e.g., Cosgrove and Kelman 2017). In this paper, I'd like to expand this perspective on the perception of dynamic environments through consideration of how material residues in caves link to large-scale transformations in the complexly entwined natural and cultural landscapes outside of the caves. I draw on four seemingly disparate cave contexts: a 7,400 year stratigraphic sequence in Banda Aceh, Indonesia that extends the record of tsunami events beyond what oral history provides; a preceramic rock shelter in western Panama with an unusual lithic cache interpreted as evidence for the earliest example of shamanistic practice in Central America; a coastal cave in northern Patagonia, Chile filled with prehistoric rock art and the bones of a child; and the paleolithic caves of Matera, Italy, which helped secure the city's designation as a European Capital of Culture for 2019. In each case, whether in prehistoric or contemporary contexts, I posit that acts and actions performed in caves link the performers literally to a scale that is geological in span and chthonic in association.

[199] *Persistent Places in the Prehistoric Wabanaki Homeland: Understanding the Role of Lithics in Interaction, Exchange, and Territoriality on the Maritime Peninsula*

This paper will present a method for addressing questions of prehistoric Wabanaki territories and territoriality, human movement and exchange, and how persistent places in the prehistoric landscape of the Lower Saint John River (LSJR) shaped ancient Wabanaki ontology, and so too, the archaeological record. Persistent places like bedrock lithic sources may shape human movement; however, patterning in the distribution of stone tools may provide more than just settlement and exchange information. The bedrock source for Washademoak multi-coloured chert (WMCC) lies nearby what has been historically viewed as a boundary between the traditional territories of the Mi'kmaq and Wolastoqiyik people (e.g., Ganong's 1899 "Map No. 12"). WMCC is a ubiquitous stone tool material found throughout the LSJR sub-region during the Maritime Woodland Period (ca. 3000–500 BP) and appears as a (presumably) traded material in assemblages outside of the LSJR. Thus, the location of the bedrock source may have facilitated social interaction between different ethnic groups. The material has a diverse range of colours and qualities for which preferences may have changed over time. Further, WMCC, at least within the LSJR, may have been distributed differentially over time into the late pre-Contact period, and potentially on into the protohistoric period.

[70] *Cultural Exchange in Times of Crisis: A Historical Perspective from Mexico of the 1930s and '40s*

During the depths of the Great Depression and prior to and after World War II, Mexico's Museo Nacional de Antropología undertook exchanges, or canjes, of archaeological pieces with a variety of museums, disseminating small portions of its collection across the nation and the world. Actual trades of archaeological works were completed in the early 1930s with museums in Yucatán, Mexico; Lima, Peru; and New York and Chicago in the United States. There were more limited exchanges of casts with museums in Berlin and Brussels. In 1948, a particularly large swap was completed with the Brooklyn Museum. Other interchanges were contemplated, but apparently not completed, with museums in Colombia, Madrid and Philadelphia. Many of these trades were linked by the involvement of Alfonso Caso, the most famous Mexican archaeologist of his generation, and an important figure in archaeological bureaucracy of Mexico of the 1930s and '40s.

What were the kinds of objects that Mexico's National Museum offered to and received from these other museums? What were the motivations for and circumstances of such exchanges? The incentives behind such exchanges seem to have transcended the needs of the Museo's collection, and were related closely to cultural diplomacy at the time.

[313] *You Read It; Don't Forget It: Designing Activities That Help Students Learn*

Ideally, exercises and activities for an open textbook should encourage students to engage with and apply the information beyond a single course. This session provides a reflection on the process of designing resources that activate student motivation to engage with content, and provide checks on student understanding (for students and instructors). Activities are also a means for students to practice retrieving what they have learned so they can use it in other situations, and provide ways for students to use study approaches that work for learning archaeology, which can be different from approaches they have learned for other subjects.

Hoogland, Menno (Leiden University), Angus Martin (Leiden University) and Corinne L. Hofman (Leiden University)

[123] *Reimagining Creole. The Deep History of Mixed Identities in the Windward Islands, Lesser Antilles*

The Lesser Antilles are known as an arena of to- and froing of peoples from different areas of the insular Caribbean and coastal mainland areas of south America during its entire pre-colonial history. Migration, and intensive networks of human mobility and exchange of goods and ideas have created diverse ethnic/cultural communities across these small islands. These, coupled with constantly shifting alliances among the various peoples have resulted in what can only be described as Creole communities. This paper will examine the ideal of Creole in terms of the mixed identities that emerged among the Windward Islands of the Lesser Antilles in pre-colonial times and we will look into the historiographical and emerging archaeological information we have on formation of Kalinago and Garifuna identities during early colonial times.

Hoopes, John (University of Kansas)

[291] *Fantastic Archaeologist: Stephen Williams and the Perennial Task of Debunking Pseudoarchaeology*

The history of archaeology is replete with assertions about lost tribes, sunken continents, and ancient aliens in the context of failed hypotheses, deliberate hoaxes, and intentional frauds. Williams chronicled these, in the process helping others hone skills in critical thinking. New technologies proliferate spurious explanations of the past that archaeologists must continually address. As the Talmud says, "It is not your responsibility to finish the work of perfecting the world, but you are not free to desist from it either". This paper offers strategies based on Williams' methodology, ones based in meticulous historiography and evaluations of the cultural and historical contexts of specific individuals, their possible motivations, and critical examination of the specific paradigms, theories, and evidence that conditioned their claims. Williams demonstrated that many myths promulgated today have deep roots in American history and that familiarity with this background is a valuable element of successful, ongoing, scholarly refutation of claims from the "wild side" on the fringes of science.

[68] *Exploring Classification Methods for Drone Based Imagery on the Peruvian North Coast*

With the growing availability of high-resolution aerial imagery, capabilities for spatial and land use analyses also become more of a possibility to researchers. Drones are becoming more affordable with sensors capable of capturing imagery at sub-meter resolutions. Ground cover classification allows further investigation into land use, disturbance and site integrity. This paper discusses the use of supervised and object based classification methods using image analysis software and high-resolution imagery obtained from unmanned aerial systems. It also discusses the use of multispectral imagery in drone-based survey applications and capabilities for classification based on varying image resolutions. Best practices for maintaining resolution and image integrity are discussed along with processing capabilities based on project goals. A training area located near Peru's North Coast is used to create classification parameters, which is then tested against similar areas on the North coast. Utilizing this method, we are able to classify land use, disturbances, and cultural sites with some limitations.

Hopkins, Maren (Anthropological Research, L.L.C.)**[131]** *Archaeology and Ethnohistory of the Western Papagueria: Let's Not Forget the People*

The O'odham and other tribes of southern Arizona and northern Sonora have occupied the Western Papagueria since time immemorial. This dry and desolate corner of the Sonoran Desert is home to rich histories and living traditions that have left their subtle marks on the land, and that archaeologists have continuously tried to identify, describe, and interpret. For too long, ethnographic and ethnohistoric records from this region have run in parallel to the archaeology; however several recent studies demonstrate the value in merging these accounts to construct a comprehensive picture of people on the land that includes perspectives about their own experiences and worldviews. Work on the Barry M. Goldwater Range, Organ Pipe Cactus National Monument, and in the proposed area of the Great Bend of the Gila National Monument, draws on ethnographic and ethnohistoric accounts to understand the archaeology, and on archaeology to make sense of the longevity and fortitude of living Native American traditional cultural practices. Following, and hopefully adding to, the legacies of Father Kino, Carl Lumholtz, Ruth Underhill, Julian Hayden, and countless others who devoted themselves to the Western Papagueria, this work reinforces the significance in working with the people who are behind the material record.

Horn, Sherman (Grand Valley State University) and Anabel Ford (University of California, Santa Barbara)**[302]** *Through a Scanner...Darkly? LiDAR, Survey, and Mapping at the Ancient Maya Center El Pilar*

Survey at the ancient Maya center El Pilar, along the border between Belize and Guatemala, has incorporated LiDAR imagery since 2013, allowing expansive—yet targeted—coverage of settlement beyond the monumental core. Successive field seasons have revealed a complex picture of landscape modification, resource extraction, and settlement concentration in different micro-environmental zones around the city center. Our fieldwork in 2017 had three foci: 1) explore and map the Amatal Supercluster, a grouping of domestic and monumental structures identified in LiDAR imagery west of the monumental core; 2) remap the minor ceremonial center K'um, where LiDAR signatures suggested a more complex site than was recorded in the 1990s; and 3) survey the area between these centers and validate settlement remains suggested by analysis of LiDAR imagery. We present our results and examine relationships between settlement, landscape modification, and resource use around El Pilar. We further explore the differences between what LiDAR returns indicate and what is discovered by putting survey boots on the ground. Our results suggest new survey protocols, such as those we present, are necessary to fully realize the power of LiDAR as a survey tool in the Maya Lowlands.

Horning, Audrey (College of William and Mary)**[327]** *Ethics, Positionality, and Pragmatism: Archaeological Approaches to Identity and the Role of Archaeological Practice in Conflict Transformation*

The 'ontological turn' in archaeology encourages the decentering of the human subject, and the longstanding focus upon identity, in favour of exploring material relationalities. While the discipline may congratulate itself for finally finding a way out of the twin traps of Enlightenment dualism and the humanism which underpins neoliberal geopolitics, it runs the risk of becoming even less relevant to society at large at a time when global conflicts are widely understood through the lens of competing and contested identities. Such identities are often framed as rooted in archaeological pasts as much mythical as material, but no less efficacious in the present. Drawing from experience in Northern Ireland, the discussion will focus upon the contribution of pragmatic philosophy in not only shaping ethical archaeological practice in conflict and post-conflict setting, but allowing for a significant and socially valuable role in conflict transformation.

[296] *Discussant***Horowitz, Mara (Purchase College SUNY)****[40]** *Performative Aspects of Early Monumental Architecture at Late Bronze I Phlamoudhi-Vounari, Cyprus*

The small (1 hectare) site of Phlamoudhi-Vounari was built in Late Cypriot IA:1 and abandoned early in Late Cypriot IIA, a lifespan of c. 200 years. This paper presents a 3D model and spatial analysis suggesting that the site functioned as a stage during community gatherings (and greeting visitors). Vounari's plan is unique on Cyprus: a likely man-made, eight-meter-high mound topped with a sequence of superimposed structures. Initially built with open access to the summit from the higher south side landscape, the monumental plastered north ramp, double gateway, 16 x 16m stone façade platform, and circuit wall added to Vounari in Phase IV restricted access to the hilltop as well as creating an imposing effect. Using a viewshed approach, this paper examines the monumental north façade and broad plaster ramp as seen from the seaward approach. As a comparanda to Vounari, the New World platform mound phenomenon is reviewed. These sites also arguably functioned as stages for ceremonial community activities that reinforced the corporate identity even as an elite class was beginning to emerge and increasingly circumscribe the space for themselves. This analysis is relevant to the ongoing debate about the first emergence of complex society in Cyprus.

Horowitz, Rachel (Tulane University)**[140]** *Chert Extraction and Production in Resource-Rich Regions: Chert Economies among the Late Classic Maya of Western Belize*

Global studies of raw material extraction permit us to examine the methods and involvement of different individuals in the extraction and production of lithic materials. One variable which can influence the organization of extraction and production is the abundance or scarcity of raw materials in a region. This paper addresses the extraction and production of chert materials among the Late Classic Maya (A.D. 600–900) in the lowland Maya region, specifically western Belize, a chert-rich area, to address the relative economic involvement of varying individuals in those processes and how these activities linked people throughout the region. Specifically, this paper compares the extraction mechanisms and reduction sequences from a chert quarry and production area, Callar Creek Quarry, and a nearby production area, Succotz Lithic Workshop, using detailed lithic attribute and aggregate analyses to examine regional trends in lithic production and the economic activities involved in these trends. This paper finds that householders living adjacent to chert source areas produced specialized lithic materials for exchange through a range of mechanisms, including reciprocal and market exchanges, thus creating regional connections. The density of chert sources in the region influenced both people's abilities to produce tools but also the mechanisms of their exchange.

Hosoya, Leo Aoi [24] see Owlett, Tricia

Houk, Brett A. (Texas Tech University)**[147]** *"Problematic Deposits" at Chan Chich, Belize*

The Chan Chich Archaeological Project has documented two types of terminal, above floor "problematic" artifact deposits in a number of different locations and contexts at the site of Chan Chich, Belize. The first type comprises light scatters of "exotic" ceramics and other artifacts on the steps to range buildings in epicentral courtyards. The second type is a dense artifact deposit in an ashy matrix at the base of a platform face in a hilltop, elite courtyard. Compositionally, the second type closely resembles a midden; however, the context—within an "elite" courtyard at the base of a masonry building—seems to warrant calling it something other than a midden. Compounding the categorical confusion are nearly identical features found in residential courtyards near the site center. Based on their association with domestic structures, excavators have classified these features as middens despite the fact they occur on courtyard floors, against buildings, rather than off the back of the structures. This paper describes the different types of terminal, above floor deposits at Chan Chich, focusing on composition and context. Comparisons are made to features at other sites in the region, including the archetypal Problematic Deposit 2 at Dos Hombres, to highlight regional trends.

Housse, Romuald (Université Paris 1—Panthéon Sorbonne)**[75]** *Beyond the Wall: Defensive Arrangements, Conflicts and Coexistence Inside an Andean Oasis during the Late Intermediate Period (1100–1450 AD)*

Located on the western foothills of the Andes, in the region of Tacna, the study area seems to have been densely occupied during the Late Intermediate Period (1100–1450 AD) as the recent archaeological research carried out in the area has demonstrated it. The many agricultural terraces and irrigation canals, as well as the numerous residential settlements, some of which are fortified, seem to demonstrate a strong desire for control and management of resources among the different groups occupying the area. Indeed, this region is known to be one of the many archipelagos of the Andean verticality and, on the northern margins of the Atacama desert, it can be also considered as a real oasis where different groups of people lived to harness resources together.

During a period known as violent, like the LIP, the study of the hillforts named pucara can allow us to better understand the prehispanic occupation of this complex area and shed light on the modalities of coexistence within a multi-ethnic archipelago. Thus, many questions can be raised: How does resource sharing work? Is there a separation between the different groups? What are the role and functions of the defensive sites?

Howell, Cameron (ERM)**[81]** *Ritual Circuits and the Distribution of Exotic Sherds in Hopewell Contexts*

The exchange of exotic goods between disparate geographic and cultural groups across the Midwest and Southeast is a hallmark of the Hopewell Period. Ceramics are recognized by archaeologists as an important component of this interaction sphere. This exchange is usually conceptualized as whole vessels moving across the landscape. In this paper, it is posited that sherds could be the unit of exchange instead. Using ritual circuits as a theoretical framework, this preliminary paper seeks to lay a foundation for how sherds can be reinterpreted as imbued objects on their own, and representative of complex social interactions during the Hopewell Period

Howey, Meghan (University of New Hampshire)**[133]** *Mishipishu and Danger in the Inland Waterway Landscape of Northern Michigan*

The Inland Waterway is a series of lakes, rivers, and streams that creates an inland route between Lakes Michigan and Huron. During the 1970's, Lovis helped lead the NSF-funded Inland Waterway Project which involved survey and test excavations. The results of this research have been vital in advancing understandings of hunter-gatherer-horticulturalist social, economic, and ideological processes in the region and beyond. In a 2001 article, Lovis argued a set of clay products found at the Johnson site, a Late Woodland site from the Inland Waterway Project, were clay effigy representations of bear and Mishipishu. In this paper, inspired by this work, I examine a set of clay products recovered from other sites in the Inland Waterway region as similar possible Mishipishu effigies. Mishipishu is a complexly powerful, seductive, and dangerous underwater panther known as the head of all water spirits. Ethnohistoric accounts indicate this manitou was a malevolent figure in dreams of hunters as well as one that received special prayers for

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

protection when ricing or fishing. I interpret these figurines as features connected to the need for accurate socioecological information among hunter-gatherers occupying physically and socially dangerous landscapes, another important concept reiterated by Bill throughout his career.

[95] *Mineralogy without Minerals: A Proposed Methodology for Reconstructing the Original Compositions of Highly Altered Ceramic Bodies Using Thin Section Petrography*

The rock and mineral fragments present in archaeological pottery, whether naturally occurring in the clay component or intentionally added as a temper, often serve as the primary geologic basis for provenance ascription in petrographic analysis. In certain contexts, however, the original compositional characteristics of pottery have been highly altered through technological or postdepositional processes. In these situations, accurate characterization and sourcing of original raw material ingredients must be based on a wider range of microscopic attributes than the rock and mineral assemblage alone. This is especially the case when diagnostic aplastic components have been completely removed.

We present two case studies of Late Classic Maya pottery from archaeological sites in Belize in which the original mineralogy of the raw material ingredients and paste recipes were reconstructed in the complete absence of actual rock and mineral fragments. We discuss the factors contributing to the removal of these essential fabric components, which are different in each case, and their identification. We propose a methodology for the reconstruction and description of the original compositions of highly altered ceramic bodies using a descriptive systems approach that integrates an appropriately broad range of microstructural and textural criteria, which are oftentimes otherwise ignored.

[238] *Digital Deforestation: DTM Generation with Agisoft Photoscan*

Image-based Modeling (IBM) is an increasingly-applied technique for field archaeologists for generation of high-resolution spatial data. IBM is effectively and easily applied for generation of Orthophotographs and Digital Surface Models (DSMs). Yet raw DSMs are not suitable for analysis or mapping purposes in vegetated environments due to the fact that they contain measurements of trees, bushes, and even architecture, ancient and modern. Archaeologists often instead require Digital Terrain Models (DTMs), showing only the surface of the underlying earth, for cartography or volumetric calculations. Fortunately, the popular IBM software package, Agisoft Photoscan, contains point cloud classification functionality, allowing researchers to categorize points according to their location or color. By doing so, users can classify and then disregard vegetation in generating elevation models, and in doing so produce a true DTM without the need for complex GIS manipulation. This poster displays an Agisoft-based DTM-generation workflow, using the Mycenaean site of Kastrouli, Greece, as a case study.

[16] *Beach Level Chronology and Paleodemography at Alarniq, Northern Foxe Basin, Arctic Canada*

In this paper we discuss beach level chronology and settlement at Alarniq—the ‘type-site’ for Dorset culture history and one of the largest Dorset archaeological sites in the Eastern Arctic. The Dorset occupation at the site extends approximately 3 km along a succession of raised gravel beach ridges, ranging in elevation between 8 to 24 m asl, and is almost entirely comprised of semi-subterranean structures that would have been occupied during the cold season. The number of houses varies across the beach ridges suggesting populations fluctuated throughout the site’s use. However, new radiocarbon analyses indicate that all houses between 22–16.5 m asl are of the same general age, and that paleodemography at Alarniq is less straightforward than suggested by the number of features per beach ridge. Here we examine how settlement at the site was impacted by the season of occupation, and discuss how ideal house construction locations seem to be a stronger indicator of the placement of winter houses at the site versus proximity to the shoreline.

Hoxha, Timothy

[73] *An Archaeological Analysis of Identity as Presented in Southwestern Indigenous Rock Art*

Rock art panels in the American Southwest contain defining markers of Archaic, Hohokam, Anasazi, Fremont and Historic Ute social practices. This paper will employ archaeological social theory and various communication theories to decode tribal information, including identity, that indigenous people recorded on rock surfaces.

Through case study analysis of particular physical characteristics for several rock art panels, this paper will analyze their potential applications as ancient communication platforms. It will compare, as evidence, shared characteristics between modern and ancient aboriginal cultures, such as matriarchal social values; religious practices, including dance ceremonies and pilgrimage rituals; and political identity formation via the development of tribal states.

This paper will use linguistics and semiotics theories to illustrate ways in which indigenous rock art sites may have:

- 1) Showcased tribal council leadership through defined characterizations of political and social roles;
- 2) Instructed populations in visual communication literacy to publicize and interpret significant events;
- 3) Cultivated tribal thinking to encourage conformity through social and ceremonial participation; and
- 4) Displayed advancements in technological communication.

Assessing rock art through the lens of archaeological social theory and various communications theories can provide unique insights into the social practices that defined ancient indigenous life in the American Southwest.

Hoyle, Alesia (University of Texas at San Antonio) and Sonia Alconini (University of Texas at San Antonio)**[207]** *Water Management, Pastoralism and Settlement Shifts in the Andean Apolobamba Region*

The qochas of the high-altitude Bolivian Apolobamba Puna region had a pivotal importance in the local agropastoral economies. Fed by snow melt and inner water sources, the qochas formed a complex hydrological system along the rich marshes. Although we do not know their origins, some of these qochas were modified during the Late Intermediate period, and a network of canals expanded in order to accommodate increasingly specialized pastoralism. Later the Inka arrival prompted specialized agriculture and pastoralism in the hands of increasingly diverse ethnic groups. We explore these changes by comparing the shifts in the size and settlement distribution around the qochas, and the symbiotic relations maintained between farming and pastoral communities along the ecological spectrum. This information will be useful to assess the different forms of social integration that such groups maintained, the archaeological evidence of ayllu-like organizations, and the importance of qocha systems in the reorganization of the landscape.

Hruby, Julie (Dartmouth College)**[298]** *Building a Statistical Model to Evaluate the Sexes of Ancient Greek Fingerprints*

While fingerprint impressions have been used archaeologically to approach a range of cultural questions, the methodologies developed to date tend to be labor intensive, statistically unsophisticated, or require large numbers of complete prints. Recently, numerous quantitative print attributes that correlate with sex in modern populations have been discovered, almost always from two-dimensional data. It is probable that there are additional, yet-unrecognized features that correlate with producer attributes, especially if we include three-dimensional data. This project is a collaboration between an archaeologist and two professional mathematicians, with the goal of building a mathematically rigorous model for sexing ancient prints. The reference sample upon which it is based is a set of high-resolution 3D scans of fingerprint impressions left by modern Greek potters of both sexes; they were chosen on the basis that they are the closest population group, both genetically and occupationally, to their ancient predecessors. A scan of a print provides a high-resolution representation, akin to a digital elevation map of the topography of the print, including ridge patterns, overall size, shape, and depression depth. We plan to use high dimensional multivariate statistical techniques to develop informative metrics that show high predictive power for the sex of the imprint maker.

Hruby, Zachary (Northern Kentucky University)**[330]** *Obsidian Trade at the Edge of the Maya World*

The position of Vista Alegre at the Northeastern edge of the Yucatan Peninsula, a gateway between the Caribbean and the Gulf of Mexico, made it a strategic location for circumpeninsular maritime trade in Pre-Colombian times. A robust sample of obsidian artifacts from the Terminal-Postclassic transition increases our understanding of trade relations between the eastern and western sides of the Maya world. Technological and source analyses of obsidian artifacts from the site are presented to fill in gaps in our knowledge, not only of Terminal and Postclassic trade, but also first evidence from Early Classic and Preclassic deposits.

Hrynck, Gabriel (University of New Brunswick)**[199]** *The Devil's Head Site in Maine: The Organization of the Protohistoric Wabanaki World*

Archaeological studies of the Protohistoric period in Maine and the Maritimes have emphasized cosmology implicitly through their focus on copper kettle burials. Archaeologically, copper kettle burials may be the only truly diagnostic archaeological manifestation of the Protohistoric period in this region. The Wabanaki ethnographic record reveals that seemingly mundane activities—the organization of space, the disposal of animal remains, for instance—were also central to Wabanaki relational ontology. The Devil's Head site, located on the St. Croix River, in the Passamaquoddy Bay region of Maine (the "Far Downeast"), has yielded features with Protohistoric radiocarbon dates, a rarity on the Maritime Peninsula, as well as Late Maritime Woodland features. In this paper, I employ the organization of space and the disposal of food remains at Devil's Head to consider changes and continuities in cosmology from the Late Maritime Woodland to the Protohistoric period.

[293] *Zooarchaeology and Bioarchaeology: Ceremonial Feasts and Human Caches at Plaza of the Columns Complex, Teotihuacan*

Preliminary analyses of the zooarchaeological assemblage from the Plaza of the Columns Complex illustrate a snapshot into past human activities such as specialized ceremonial events and faunal acquisition strategies for food consumption. The fauna from this complex, located just northwest of the Sun Pyramid, add to the database of forty years of archaeofaunal exploration throughout Teotihuacan. Here, we focus upon animal species distributed among four areas to understand the economic and ritual activities that took place in this complex.

Results from our analyses revealed intra-site variation among the general debitage fills and areas used for human caching and burnt offerings. One front, in particular, located along the Avenue of the Dead, featured a high concentration of human remains. These remains exhibited cranial deformation and some also teeth modifications atypical for Teotihuacan. Even further, one mound excavation revealed a burnt offering site where the zooarchaeological assemblage was predominately lagomorph and avian remains, mainly that of cottontail rabbit and partridge. High volumes of these easily managed species suggest the offering was representative of a ceremonial function like a feasting event, and furthermore, provides evidence that the Teotihuacanos were provisioning and managing these animal species for larger purposes.

[99] *Pastoral Neolithic Mortuary Site Sedimentology at Noomparrua Nkosesia, Kenya*

Mobile pastoralism was the earliest form of food production in eastern Africa. The spread of pastoralism in Kenya c. 5000–1200 BP involved peoples with diverse subsistence patterns and material culture repertoires. However, little is known about the social landscapes and mortuary practices in southern Kenya. The mosaic of Pastoral Neolithic burial traditions across Kenya is diverse, ranging from monumental pillar sites to the north to cairns and rockshelter cremations to the south. In 2016, members of a Maasai community in the Loita Hills discovered a unique Pastoral Neolithic mortuary site named Noomparrua Nkosesia (GxJg2). This rockshelter held the remains of five cremated individuals, approximately 90 ground stone bowls and 44 obsidian artifacts, but no grindstones. We report on the chronology, stratigraphic profile, and formation processes of this site. Particle size, magnetic susceptibility and FTIR analyses demonstrate the presence of distinct layers of ash and red ochre at the site. Our analyses provide insight into mortuary practices clearly distinct from those at Elmenteitan cremation sites such as Njoro River Cave.

[118] *Tracing Ice Age Artistic Communities: 3D Digital Modeling Finger Flutings*

Finger flutings are lines and markings drawn with the human hand in soft cave sediment in caves and rock shelters throughout southern Australia, New Guinea and southwestern Europe, dating back to the Late Pleistocene. Two decades ago, Kevin Sharpe and Leslie Van Gelder developed a rigorous methodological framework for the measurement and analysis of finger flutings that allows researchers to identify characteristics of the creators, such as age, sex and group sizes. However, despite a comprehensive framework of study, data collection is still reliant on in-field measurements and is often constrained by physical challenges within the caves. With advances in technology, new methods of digital documentation are emerging. Creating three-dimensional models of finger fluting panels would allow for off-site measurements and other forms of analysis. This paper presents the results of an experimental archaeology project that tests three different 3D scanning techniques to determine the most appropriate method for the documentation of finger flutings based on factors such as portability, cost, efficiency, accuracy, as well as other challenges present in cave and rock shelter settings. A consistent method of 3D documentation for finger flutings will allow researchers to document sites globally and give rise to new perspectives and questions.

[101] *Immersive Augmented and Virtual Reality for Archeological Sites Exploration and Analysis*

Immersive technologies such as virtual reality (VR) and augmented reality (AR), in combination with low cost yet high quality photogrammetry techniques, are beginning to change the way that archaeologists understand space and place. The availability of affordable immersive technologies is dissolving natural boundaries of space and time, and offering new ways of communications. The maturity of existing software environments such as Unity additionally allows for integrating spatial analysis tools into immersive environments, boosting archaeological research. We present the results of recent field work at the ancient Maya site of Cahal Pech, located in the Belize Valley of west-central Belize. We used a range of environmental sensing technologies, 3D modeling (e.g., structure from motion mapping and hands-on modeling) and 360° photography/videography of architecture to create an immersive experience for Cahal Pech (for an overview see: <http://sites.psu.edu/archaeology/>). Importantly, we developed a field protocol that could be implemented at other archaeological sites to allow researchers to view, interact with, and analyze data both on and off-site immersively. Our goal is to create a comprehensive suite of immersive applications for important Maya sites across Belize to enhance site visits, enable immersive tours and virtual time travel (VTT), and create immersive archaeology workbenches for researchers.

Hubert, Erell (Montreal Museum of Fine Arts)

[216] *Moche Women: Multiple Realities and Alternative Powers*

The growing breadth of data coming from scientific excavations of Moche sites in different valleys along the north coast of Peru has led to major advances in our understanding of the diverse ways of being Moche as well as the complex relationship between religious and political powers. How gender relations played into these Moche experiences however remains relatively understudied. Here, I specifically focus on the place of women in Moche society through time and space. Some women have now been shown to have played leading roles in practices linked to the dominant Moche ideology. However, these women appear to have lived mostly in the northern part of the Moche sphere and were exceptional in the way their status and gender identity intersected. Furthermore, beyond the positions of various women within the dominant hierarchical structure, the combination of multiple lines of evidence reveal alternative spaces where and ways in which the power of women may have been enacted.

Huckell, Bruce (University of New Mexico)

[182] *Black and Blue, Red and Yellow: Clovis Exploitation of a Central New Mexico Lithic Source*

Along the western edge of the Rio Grande Valley in Central New Mexico is a huge expanse of late Cenozoic volcanics, including a high-quality hydrothermally altered rhyolite. Colloquially known as Socorro jasper, at least one source of this material was exploited frequently by Clovis groups.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

This paper describes this source—the Black Canyon quarry—and the physical and geochemical properties of the “jasper” from it. Recent and continuing studies of its use by Clovis groups are reviewed, and its role in technological organization in central New Mexico is considered. The Mockingbird Gap site and the newly discovered Blue Canyon site reveal that Clovis groups practiced flexible strategies for procurement, reduction, transport, and consumption of this material. It is hypothesized that biotic and abiotic resource distribution and mobility strategies, in relation to the source location, appear to underlie this flexibility. The hypothesis is evaluated using these two sites, examining the composition of artifact assemblages of transported versus locally consumed Socorro jasper. Finally, comparisons are made with similar patterns of lithic source exploitation by Clovis foragers elsewhere in North America.

[165] *Bones Left Behind: Living Spaces at a Residential Compound at Cerro la Virgen, a Rural Chimu LIP Settlement*

Cerro la Virgen (CLV) is a town-sized LIP site located in the Moche Valley a few kilometers from Chan Chan, the administrative and political center of the Andean polity of Chimú. Previous studies have focused on ceramics and regional politics (Keatinge 1974, 1975), the kinds of plant and animal remains found in residential dumps (Pozorski 1976, 1979; Billman et al in press), and multiple lines of evidence for the nature of the political relationship between the residents of CLV and the leadership and residential population at Chan Chan. What was life like at home for households at CLV? This study looks at the remnants of a single residential compound, originally one among hundreds, and asks how room sizes and spatial relationships, in conjunction with a detailed look at vertebrate remains left behind, both near the floors and in the fill above them, can contribute to a fuller understanding of the use and reuse of space within a residential context.

[85] *Arboriculture, Translocated Flora, and Ecological Inheritance in the Marquesas Islands, East Polynesia*

Contact-period accounts point to considerable variability in Polynesian agronomic production systems. In the Marquesas Islands, a mountainous island group in the eastern Pacific, food production in the proto-historic period was narrowly focused on tree cropping and breadfruit cultivation in particular. Early western visitors remarked on the archipelago's large and thriving island populations, and their stable and productive arboricultural systems. In this paper, we present the results of a multi-valley archaeobotanical study that documents the timing and character of native forest transformations and the creation of anthropogenic ones on Nuku Hiva, the largest island in the archipelago. The evidence suggests that early niche construction activities (forest clearance, species replacement, erosion management, and the creation of extensive tree plantations) gave rise to an ecological inheritance that was beneficial to the long-term fitness of Marquesan populations. We consider the co-evolution of local landscapes, translocated arboreal flora, and Marquesan societies.

[104] *Analysis of Rio Grande Glaze Ware Glaze F Pottery from LA 20,000 Using Petrographic and Chemical Composition Techniques*

The pre-Revolt period (1598–1680) in New Mexico was a tumultuous time characterized by the forced making and breaking of ties between Spanish and Indigenous peoples on the Spanish Colonial settlement landscape that resulted in the circulation of cultural and economic resources. For Pueblo communities, colonial incursions significantly affected daily life through the ravages of war and disease, the privations of taxation and religious persecution, and the disruption of traditional economic and resource allocation practices that accompanied the introduction of Spanish goods and new domestic plants and animals. This poster presents combined petrographic and chemical composition data from the analysis of 28 Rio Grande Glaze F ceramic sherds from the site of LA 20,000, a seventeenth-century rural Spanish ranch just outside of Santa Fe, New Mexico. This analysis was carried out to investigate the procurement, production, and movement of late glaze wares and their raw material constituents in order to examine the structure and scope of social networks connecting Spanish and Pueblo households and communities.

[273] *El caso Huarco y la hegemonía Inca en el valle bajo de Cañete*

En el valle bajo de Cañete, la élite Huarco compartía una tradición cultural similar con las élites vecinas a lo largo de la costa centro-sur; a la llegada de los incas, esta tradición se mantuvo pero reconfiguraron sus estrategias políticas y económicas. De esta manera lograron proteger sus relaciones interregionales en este territorio, con el fin de aprovechar los beneficios de la presencia inca en el valle.

El Huarco, de acuerdo a los relatos etnohistóricos fue un señorío fuerte e independiente, también es señalado como un señorío que formó parte de una confederación política conquistada por los incas. Las investigaciones arqueológicas priorizaron el análisis estilístico; como consecuencia, su

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

organización política, económica y cultural se redujo estrictamente a un espacio geográfico determinado.

Por ello, actualmente nos replanteamos la idea de cómo la costa centro-sur fue ocupada por uno o más grupos sociales en tiempos pre-incas y su posterior desarrollo bajo la dominación inca.

El presente trabajo analiza los materiales cerámicos recuperados durante dos temporadas de excavaciones en el sitio arqueológico El Huarco-Cerro Azul (Proyecto Qhapap Nan-Ministerio de Cultura) con el fin de caracterizar la ocupación del sitio y comprender la adaptación o transformación de sus instituciones bajo la conquista inca.

Huffer, Damien (Postdoctoral Fellow, Stockholm University) and Shawn Graham (Dept. of History, Carleton University)

[88] *Bioarchaeological Approaches to Investigating Supply, Demand and Authenticity in the Colonial-era Human Remains Trade*

During the Colonial era, numerous “trophy skulls” from various Indo-Pacific cultures entered Western museum and private collections, and continue to be sought as “authentic” collector’s items. However, very little bioarchaeological research exists investigating their provenience, intra-cultural variation in decoration and manufacture, and how examples created for Indigenous ritual use differed from those created for sale to Colonial explorers at the beginning of ‘curio’ trade, let alone what characterizes a modern forgery. Using c. late 1800s-early 1900s Dayak and Asmat “trophy skulls” as a case study of the global trade in the “exotic” dead, this presentation will discuss preliminary results from in-progress research on numerous museum collections. The systematic database created will allow for a much more detailed examination of variation in source, manufacture and use. Combining morphological, biodistance (metric and non-metric), and biogeochemical (strontium and lead isotope ratio) data analysed at the individual and population level, key findings to date will be discussed in the context of how a multi-faceted bioarchaeological approach can improve our ability to understand the Colonial-era roots of modern markets.

Huffman, Thomas (University of the Witwatersrand)

[32] *Excavations at Great Zimbabwe: Commoner Housing versus Elite Enclosures*

Salvage excavations in the 1970s at the famous capital of Great Zimbabwe, southern Africa, uncovered several residential complexes dating to Periods IVb (AD 1300–1450) and IVc (AD 1450–1550). Overall, granaries and middens surrounded closely-spaced houses of commoner families living between the Outer and Inner Perimeter Walls. These high-density concentrations stood in marked contrast to the open spaces typical of elite enclosures. One midden against the Outer Perimeter Wall yielded a copper coin minted in Kilwa in honour of al Hasan bin Sulaiman (AD 1330 and 1333). Within the compounds, most structures had undergone several renovation stages. In addition, separate kitchens and sleeping houses—together with split fireplaces—show a change in attitudes about male and female roles. Among other things, the excavations showed that Great Zimbabwe was a dynamic town rather than a vacant ceremonial centre.

Huggins, Kathleen (University of California, Berkeley)

[141] *It's (Not) Just a Phase: Characterizing Surfacing Techniques in the Ancient Andes*

This presentation introduces a technique for quantitative analysis of ceramic surface topography, using false-color images generated through reflectance transformation imaging and automated quantitative analysis using cell-counting software. A preliminary study of surface topography variation in Early Formative and Middle Formative ceramics from Chiripa, Bolivia, will be presented, along with an outline of a reference database, Ceramic-Surface Topography of the Andes. The purpose of this study has been to expand the documentation and analysis of surfacing techniques. Alongside extensive attributional analysis, expedient quantitative analysis of various surface-topographies can enrich operational sequence studies and illuminate the creative environment in the past. The time spent burnishing a ceramic is a compressed time of repetitive and monotonous actions, when gestures blur into the next as easily as the former, and the non-linearity of productive labor can be seen and heard. Burnished ceramics, like quilts in a knitting circle, were audience to the kinds of social interactions which reinforce ties, circulate gossip, and hash out political grievance and agreement. Bringing surface-topography into the larger project of attribute analysis and archaeometry may help in understanding the relationship between the production of objects and political objectives.

[186] *Lithic Raw Materials and Social Landscapes: Mica-Lamented Quartzite Tools from Slocan Narrows, Upper Columbia River Area*

Utilitarian stone tools produced from raw materials that are linked to a place or landscape of significant social, ritual, and economic importance likely still carry that importance when tools are transported away from their source. Such objects can serve as indices of social relationships, economic priorities, and ritual practices. By transporting and using these objects, communities would have daily reminders of their connections to important places and activities that take place there. Ethnographically, the Sinixt People of the Upper Columbia seasonally migrated within their territorial range from Kettle Falls, WA north to Revelstoke, BC. Slocan Narrows is a pithouse village located in the center of that traditional territory. Excavations at Slocan Narrows recovered an assemblage of mica-lamented quartzite tools from a geological formation at Kettle Falls, nearly 200km away. We demonstrate the utilitarian use of these quartzite tools through microwear and experimental analysis in conjunction with archaeological and ethnographic contexts. We suggest the daily practice of using these tools at Slocan Narrows linked inhabitants at the site to prominent fishing grounds at Kettle Falls that had social, economic, and ritual significance. This highlights the importance lithic raw materials can have in conveying social information and connecting people to landscapes.

[125] *Competition for Resources: How Commensal Competition Informs Us of Past Human Activity*

Humans have a dramatic impact on environments around them. They augment, manipulate and engineer local environments to their own benefit, often resulting in a concentration of easily available food and nest sites. These anthropogenic resources and environments are readily exploited by a myriad of other organisms. These organisms, in local and neighbouring environments, engage in a range of different relationships with humans, reflecting the level of interaction and dependence. Due to the ubiquitous nature of some of these organisms and their sheer numbers, it is often assumed that humans provide a predictable and buffered environment, free from the normal annual cycles of resource availability and climate. However, this is a serious misconception, which can lead to a misunderstanding of the dynamics and intense competition experienced by organisms living within anthropogenic environments. A re-examination of human constructed environments illustrates why and how certain species survive, providing greater

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

insights into how we impact organisms around us. Here we examine the evidence for (un)predictability in anthropogenic environments and competition in modern and ancient commensal species to identify the true nature of this relationship and what it reveals about the human past.
